The statement that TOP application of the RC Methodology will always result in identification of the appropriate Facility Ratings and steady-state System voltage limits is incorrect. It assumes that the RC Methodology is complete and comprehensive. Qualifying all results will be accurate based upon on the use of RC Methodology may not always be true. It is clear that if the RC Methodology is used that the TOP is in

compliance, but not that the results will always be 100% accurate or complete.

No, we do not think the expectations are clear based on the language proposed. We believe that the proposed language makes the issue somewhat confusing. The requirement should more simply outline responsibilities and expectations. An entity is expected to operate within its facility limits, if stability limitations are present, this would rise to the categorization level of an SOL. From this point, the determination of an IROL may be ascertained.

No, we do not believe the RC should be responsible for establishing stability limitations even when more than one TOP is impacted. We do not believe that all RCs throughout all of the Interconnections regularly perform stability studies, or are even set up to perform these studies at all. We believe that coordination should take place between impacted TOPs prior to being relayed to the RC.

Yes, we agree, but that's already achieved by the RC developing IROLs, which can be restricted by stability limitations.

As such, we do not believe R3 in FAC-014-3 is needed given that the RC is required to develop IROLs and the TOP for SOLs combined with the proposed revised definition of SOL (with our suggested wording change indicated in the FAC-011 Comment Form), whose determination must meet acceptable BES performance with respect to Facility rating, System voltage limits, and stability limitations. System limitations are a measure or a restriction which needs to be respected in assessing BES performance, but itself not an SOL or IROL. However, by virtue of developing SOLs and IROLs that simultaneously satisfy all three restrictions (Facility Rating, System voltage limits and stability limitations), the BES is deemed to be reliable if operated within these limits.

While we concur with the SDT that "not all stability limitations are automatically IROLs" and that "there may be instances of local, contained instability that are not appropriately designated an IROL", SOLs that have local impact only are also developed respecting stability limitations. With the TOP establishing stability limitation SOLs and the RC establishing stability limitation IROLs, we do not see a reliability gap and are unable to identify what other stability limitations may exist that could impact more than one TOP in an RC Area that are not already covered by IROLs.

In brief, we believe the determination of SOLs and IROLs should be governed by the follow basic principles:

1. **The RC develops the SOL and IROL calculation methodologies considering the restrictions imposed by/performance criteria for Facility Rating, System voltage limits and stability limitations, along with the scope of single and multiple contingencies to be observed and the acceptable BES performance.**
2. **The RC develop the method and criteria for establishing IROLs;**
3. **The TOP calculates SOLs, which have local area impact;**
4. **The RC calculates IROLs, which have impacts on more than one TOP areas.**

We suggest the SDT to develop the FAC standards based on the above basic principles as opposed to trying to find holes in them and propose requirements that are duplicative or unnecessary. (please see our argument that stability limitations are not IROLs in the FAC-011 Comment Form).

Yes. If a TOP establishes a lower SOL for any reason, the neighboring TOP should be forced to use the most restrictive SOL. The RC is the appropriate entity to study and enforce these situations. It may be helpful to clarify that TOP studies will feed into this process, rather than being the sole responsibility of the RC (if this is so).

Peak supports this concept that RCs should collaborate with TOPs in the establishment of stability limitations where more than one TOP is impacted; however, a potential unintended negative consequence of the language as proposed is that TOP-to-TOP coordination, collaboration, and communication could be diminished. TOPs that might have otherwise been working collaboratively with neighboring entities might use the language in proposed R3 as a justification for “lowering the bar”, potentially creating a TOP mindset that says, “It’s not my responsibility – it’s the RC’s responsibility – so, I no longer need to work with my TOP neighbor in addressing these stability limitations.” The language should not serve as an enabler for lowering reliability the bar.

No, we do not agree that the RC should be the only entity responsible for providing other entities within the RC Area the established SOLs. It is not clear to us why relaying this information should lie solely with the RC. We believe the TOP should be allowed to relay this information to let other entities know if they will be impacted by the SOL. We understand that even if a TOP were to communicate this information with other impacted entities, the RC would still need to be notified as well. To allow for flexibility of multiple avenues of communication as well as allowing for the RC to be notified, we	

suggest the drafting team consider the following:

" Each Reliability Coordinator shall ensure that SOLs in its RC Area are provided to adjacent Reliability Coordinators within an Interconnection…"

The above language and the use of the term "ensure" makes certain that the information is relayed appropriately, but allows for flexibility in who shall relay said information.

WAPA's concern that this interpretation would hamper TOP-to-TOP communication and timing, e.g. Seasonal Studies usually have a few old facility ratings that are identified and this information is required well before the RC needs it.

Also it conflicts with TOP-003-3 R3 & R5 and could be duplicative of IRO-010-2.

WAPA does believe that the RC should be the "clearing house" for SOL information (among other things) come Day 0-1.

The RC should also provide SOLs to RCs outside of its interconnection.

Texas RE is concerned with the use of the phrase “reliability-related need” as it is subjective and will be difficult to determine. Texas RE sees no harm in removing this phrase so the RC must provide the information when asked by Transmission Operators, Transmission Planners, and Planning Coordinators within its Reliability Coordinator Area.

[THESE COMMENTS REPRESENT SPP STAFF COMMENTS] It will make the communication more consistent in the long run if all entities know that the RC will be the one communicating the information. However, we request that in order to avoid making this requirement an administrative nightmare, the requirement should be restated to require the RC to make changes to SOLs ‘available’ rather than requiring them to demonstrate communication (which also requires proof of receipt). The unintended consequence of the requirement as proposed is that the RC now has to maintain and validate constantly the list of entities who need this information. TOPs, other RC's, and other entities who need the data, also share in the obligation to make sure they get it. Putting it solely on the RC to communicate it, removes any obligation from other entities to make sure they have the SOL information they need. Additional Rationale may be needed to further explain this.

Yes, the RC should have this responsibility. However, we consider that the standard gives a simplified picture of the complexity of communicating an SOL. For example, an SOL is not a static value : it can depend on many factors and evolve through time. We store (and calculate) SOLs in a complex EMS application. The information can be difficult to extract and even once communicated, difficult to interpret by the receiving entity. Some guidance around expectations for this communicated SOL should be circulated for comment in a future draft. The above problem is compounded if, as the requirement implies, an entity will receive all established SOLs. Since an entity is probably only interested in the SOLs that can affect it and does not wish to be submerged by all existing SOLs in the RC area and communicating all SOLs to all entities distributes sensitive information more broadly than necessary to support reliability, we propose limiting the required distribution of SOLs, perhaps "Each RC shall provide SOLs for its RC Area **that may impact the other entity** (…)" or alternatively "Each RC shall provide SOLs for its RC Area to entities **that have a reliability-related need** (…)"

The 4.1 sub-requirement seems redundant and unnecessary. The SDT should consider rewording R4 in a single part. Other suggestions: "Each RC shall provide any updates to the SOL values established dynamically or offline (…)" Since the SOLs provided in R4.1 may include IROLs, is it possible that the corresponding Tv may also have been updated. Thus: "Each RC shall provide any updates to the SOL values and corresponding Tv if applicable (…)"

Part 4.1 needs to be revised if R4 is changed such that the TOP is responsible for communicating SOLs to others. Wrt what is required for communicating updates to dynamically updated limits, we are unable to answer that part since Part 4.1 makes references to R1 and R3 is, neither of which have anything to do with SOLs.

1. With the way Requirement R4 is written, it is not clear if a dynamically determined Facility Rating (that is telemetered in real-time for example) is required to be communicated (in Real-time?) to the TP and PC also. There may be value in requiring that information be provided to the TP and PC (such as the range of dynamically determined values experienced); it is not clear what needs to be provided.

2. We suggest adding some tie to the IRO-010 and TOP-003 Standards such as “4.1 The Reliability Coordinators shall provide any updates to the SOL values established as part of Requirement R1 or Requirement R3 to impacted TOPs in its Reliability Coordinators Area in a mutually agreeable periodicity and format as stated in the Reliability Data Specifications established in IRO-010 and TOP-003.”

Because of the importance of operating to SOLs, the time to communicate updates needs to be specified. Propose the following wording to Part 4.1:

The Reliability Coordinators shall provide any updates to the SOL values that affect System Operating Limits established as part of Requirement R1 or Requirement R3 to impacted TOPs in its Reliability Coordinator Area within 15 (fifteen) minutes of being calculated.

No, we do not believe the language provides sufficient clarity regarding what is required for communicating updates to dynamically updated limits. It is unclear what the drafting team means by dynamically updated limits. The term dynamically updated limits does not appear in the requirement, and it is not very clear on what this alludes to. Also, we are unsure of the necessity of Part 4.1. We believe that this may already be accomplished via the IRO and TOP standards.

When SOLs are communicated, it must also be communicated how those SOLs are to be used, e.g. time limits associated with each rating, temperatures associated with each rating, whether ratings can be interpolated between temperatures, etc..

No. Dynamically determined facility ratings are not mentioned at all in the language, so I'm not sure how it provides any clarity. Entities that use dynamically determined ratings should be required to effectively communicate those ratings in real time to the RC and all effected entities. Those entities should be required to fully implement an operating agreement specifying the use of Dynamic ratings with adjacent TOPs before they can be used in the Planning Horizon or Operating Horizon.

Why does Part FAC 14 part 4.1 not cover TOP ratings provided in FAC 14 R7? Shouldn't FAC 14 R7 include language similar to FAC 14 Part 4.1 regarding regular updates, format, and periodicity of updates? This does not preclude the TOP from providing the information to someone, but the standard responsibility should be on the RC who gathers all the SOLs from all the TOPs.

The RC should have flexibility in determining what is appropriate for its particular RC Area. The time frame of the communications could be outlined in the RC SOL methodology. RCs may just provide TOPs with access to a RC area ratings database instead of providing communications, it may be worth looking into if this type of communication would be acceptable or if notification of ratings changes is what the standard drafting team is looking for. For large RC areas with a large number of TOPs these notifications could become numerous for the TOPs and contain information they don't care about.

[THESE COMMENTS REPRESENT SPP STAFF COMMENTS] We agree that the RC should communicate updates as soon as possible in order to facilitate accurate OPAs and RTAs; however the nature of the updates may not always be time sensitive. For example an update to an SOL that may be effective at a future date. It may be difficult to set a minimum acceptable time in the standard to cover all the various types of updates that may be received. Including a timeframe may result in a requirement that is too prescriptive and would result in requiring a specific means of exchanging information in order to meet the requirement. The RC could describe the method and timeframe within its data exchange documents in IRO-010.

In 5.2, the term "value" does not seem appropriate. The value of the IROL is only relevant for a specific system condition. The IROL calculation method that includes the IROL values for various System conditions should be shared when[GM1] appropriate. We note that R5 and R4 are highly redundant in structure. Since we argue for a rewrite of R4 in the previous questions, we suggest that R4 and R5 could be combined, and a sub requirement of R4 drafted to address SOLs that are IROLs have an additional series of content requirements as per the actual subrequirements of 5.

Texas RE suggests adding a Requirement to FAC-014-3 to address operating states where the next contingency has the potential to cause System instability, Cascading outages or uncontrolled separation.

Note that the IROL provision to the PC/TP is very appropriate and should be in-line with a methodology to identify IROLS. Part 5.4 includes “angular stability” which may or may not be covered by the newly proposed SOL definition. The SOL definition is too wide and does not provide the proper guidance expected with a definition.

Yes, we agree that the RC is best suited to provide this IROL information to TOs and GOs in this instance. As stated earlier, while the RC may be best suited in this instance, we do believe that the TOP is capable of, and should be included in the establishment and communication of IROLs in some instances as well.

Suggest Requirement R6 to read:

R6. Each Reliability Coordinator with an established IROL shall provide to the Transmission Owners and Generation Owners identification of the Facilities they own that are critical to the derivation of that IROL.

I would also add an RC requirement to positively state that no TO or GO facilities were pertinent to the derivation of an IROL – otherwise, a missed notification could be construed as “no facilities”. Also, prefer “pertinent” to “critical”.

The requirement needs to be reworded in a single part to reduce confusion and facilitate compliance.	

Since the need for IROL information is related to FAC-003, the information given to the TOs and GOs should be limited to what they need to apply FAC-003 and using the same language as FAC-003 to avoid any confusion. Thus we propose: "R6.1 Identification of the **lines** that are owned by that entity, which **are an element of an** IROL."

1. We believe it would be difficult to come up with a timeframe that would not result in an administrative requirement. TO and GO tasks are not typically related to Real-time reliability, so establishing a time limit is not related to preserving reliability. It's simply facilitating compliance. 2. TOP's and then GOP's should receive the information necessary for Real-time operation in a timeframe necessary to protect BES Reliability. The TO and GO would need the information for future Planning requirements and therefore we believe the RC should NOT delay in notifying TOs and GOs of their ownership of those facilities since they have supportive reliability related tasks (FAC-003, CIP, etc.) to perform. Any time limit should be based on effectively facilitating those activities.

Texas RE recommends setting a time limit for providing the IROL information to the Transmission Owners and Generation Owners within its RC Area since certain activities, such as CIP-014-2 activities, may have to occur after the provision. Texas RE recommends IROLs be established in the planning horizon so TOs and GOs would be notified prior to the IROL becoming operational. The proposed revisions to the SOL definition no longer requires IROLs to be established in the planning horizon.

Texas RE recommends the SDT consider the following:

- It appears the applicability section of FAC-003-4 intends that IROLs will be identified in the planning horizon, since section 4.3.1.2 uses the language "Operated below 200kV identified as an element of an IROL under NERC Standard FAC-014 by the Planning Coordinator."
- If the PC is no longer required to have an SOL methodology, it is unlikely that the PC will identify IROLs. Does this mean that elements of an IROL are no longer applicable in FAC-003-4 since they were not identified by the PC?
- If the purpose of this requirement is to make TOs and GOs aware of compliance obligations related to Facilities identified as part of an IROL (FAC-003-4), how will this be handled for IROLs that are established in real-time due to system configuration, but retired after outages are returned to service?
- How will TOs and GOs be compliant with FAC-003-4 if they are not aware their Facility is an element of an IROL until the end of the calendar year?
- The Applicability section 4.1.1.3 of CIP-014 includes Transmission Facilities at a single station or substation location that are identified by its Reliability Coordinator, Planning Coordinator, or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies. If the PC and TP are no longer required to identify IROLs, does this mean that these Facilities will not be identified as applicable until a real-time IROL is identified? If so, the implementation of physical security measures may not be completed for years after the IROL is identified.

11. Do you agree that there is a reliability-related need for the RCs and TOPs to obtain the information from the Planning Assessment and Transfer Capability analysis for the purpose of identifying instability risks when establishing SOLs (and IROLs)? Are there other "studies" that are currently performed that should also be included in this communication requirement?

Amy Casuscelli - Xcel Energy, Inc. - 1,3,5,6 - MRO,WECC,SPP RE

Answer	No
Document Name	

Comment

We subscribe to the MRO NSRF's comment that is provided below:

There is not an operating horizon reliability need for RCs and TOPs to have planning horizon Planning Assessments and Transfer Capability analyses because any future system performance deficiencies will be mitigated by Corrective Action Plans before the planning horizon timeframe becomes the operating horizon timeframe. In addition, planning horizon studies have some fundamental differences from operating horizon studies that reduce the worth of planning horizon finding for operating horizon purposes. Planning horizon studies are chiefly performed for firm Transmission Service and firm forecasted Load conditions. Operating horizon studies are performed for non-firm Transmission Service and non-firm, more accurately forecasted Load conditions. Operating horizon studies generally simulate only generator, line and transformer N-1 event contingencies, but planning horizon studies simulate a wider spectrum of planning event contingences (P1-P7), which include more severe, but less probable events. If there is a reliability-related need to know the expected system performance in the operating horizon for firm Transmission Service and Load operating conditions or for less probable planning event contingencies then RCs and TOPs can perform these types of simulations themselves as needed.

Planning Assessment results are available to the RC from the PC. However, most of this information will not be applicable in the Operating Horizon, and we should not overburden the RC with voluminous results of non-applicable information. Planning Assessment results are dependent on specific generation dispatch, system configuration, load level, location and type of fault, clearing times (including failure of some equipment to clear), etc. In our opinion, it is doubtful that this planning information would be used to develop SOLs and IROLs.

We question the placement of this requirement which requires a Planning Coordinator or Transmission Planner to act. We think that this requirement would be more suitable in the TPL-001-4 and FAC-013-2 standards where the requirements for distribution of the associated assessment results already exist. A compliance “trap” may be created by placing a requirement to communicate the results in another standard not directly associated with performance of the assessment results being communicated. Note that these two standards already require distribution of the assessments, when requested, to functional entities with a reliability need. While we agree that information from a Planning Assessment or Transfer Capability Assessment may be of some overall value to RC’s, we fail to clearly understand how this information will be of direct value to the RC in the near-term operation of the system. For example, from an operational standpoint, a RC or TOP is dealing with the system based on whatever outages Generation and Transmission exist or the load levels they are at currently. Some useful information may be gleaned from the results of a TPL stability assessment, but this won’t help directly determine what operators are facing in the day ahead or month ahead from a stability standpoint.

Comment	

While this may be a good practice and the information may be helpful for the RC and TOP to be aware of the stability risks/phenomena, this does not rise up to a standard level since the RCs and TOPs should already have some knowledge or will conduct some sensitivity testing to gauge the stability performance to begin with. We suggest to remove it.

Comment

[THESE COMMENTS REPRESENT SPP STAFF COMMENTS] It is not clear which Transfer Capability assessment the requirement is referring to? Is it the one in FAC-013? Not all Transfer Capability assessments are stability based. Also, we would like further explanation from the team regarding how and what planning assessment information should be communicated from other requirements such as FAC-013, TPL-001, and IRO-017. Guidance from the team that it interprets the information to come from XYZ would be helpful.

We request that the team provide clarity that information needed from the planning assessments related to stability should be limited to only those applicable to the RC. For example, the RC should have little interest in an identified stability issue in the long term (10 years) that may have projects constructed to resolve by then.

Concern: We infer that including “Transfer Capability assessments” is related to FAC-013 Requirements. The FAC-013 Standard is only applicable to PCs, not TPs. Also, FAC-013 does not require stability analysis for Transfer Capability assessment. In consideration of FAC-013, proposed FAC-014-3 R8 should not imply the necessity for stability analysis for Transfer Capability assessment. **Suggestion**: Delete “and Transfer Capability assessment” from proposed FAC-014-3 R8 language.

See Seminole's response to question 14 below. CIP-014 requires the TO to perform a transmission analyses designed to identify the Transmission station(s) and Transmission substation(s) that if rendered inoperable or damaged could result in instability, uncontrolled separation, or Cascading within an Interconnection. This analysis is typically performed by the TP or PC; however, there is no requirement in CIP-014 as drafted, that requires the TO to notify the RC of such stations, which may be information that the RC should be aware of to understand the sensitivity/criticality of the identified stations.

Requirement might be redundant:

FAC-013-2 R5 already requires the Transfer Capability assessment to be provided to those entities that make a written request, which can easily be the RC and TO.

TPL-001-4 R8 already requires the Planning Assessment to be provided to those entities that make a written request, which can easily be the RC and TO.

FAC-011-4 requires the RC to consider the stability limitations provided by the PC in accordance with FAC-014-3 but perhaps this standard should simply refer to stability limitations identified by the PC in FAC-013 and TPL-001.

Greg Davis - Georgia Transmission Corporation - 1 - SERC

Answer	Yes
Document Name	

Comment

The characteristics of the transmission models (generation dispatch, load levels, topology, etc) used in planning studies are vastly different from those used in analysis of the operational time horizon. Therefore, establishing SOLs based on a planning study, is typically not feasible.

However, there are certain configurations or multiple contingencies that are assessed by planners in accordance with TPL-001-4 that operators may need to be aware of. This is primarily true for instability risks that may not be analyzed in operational studies for some areas. It is up to the RC (and the tools available to them) to determine if establishment of an SOL based on a limitation identified in a planning study is appropriate for its area.

Planning horizon information from Planning Assessments (TPL-001-4 standard) and Transfer Capability analyses (FAC-013-2 standard) may help RCs and TOPs become aware of potential operating horizon reliability-related needs. However, actual operating horizon reliability needs can only be determined from studies of operating horizon system conditions and contingencies, which are different from the planning horizon system conditions and planning event contingencies. Information from planning horizon studies only provides ideas or hints of prospective operating horizon reliability-related needs.

Planning Coordinators and Transmission Planners perform (or will begin to perform) planning horizon studies that are beyond the FAC-013-2 and TPL-001-4 standards. These studies are, or will be, performed for the FAC-002-2 (Interconnection Studies) standard, PRC-006-2 standard (UFLS), the present EOP-003-2 and future PRC-010-1 (UVLS) standards, and the present PRC-015-0 and future PRC-012-2 standards (RAS). Study results from these other standards may also be helpful to RCs and TOPs.

Study results that may be helpful to RCs and TOPs are not limited stability results. Steady-state overload, over-voltage, and under-voltage results may also be helpful to RCs and TOPs become aware of prospective operating horizon reliability-related needs.

There is a need for this information. However, R8 requires each PC and TP to communicate the results of their Transfer Capability assessments, but FAC-013-2 only requires each PC to perform this type of assessment. There is not a requirement for TPs to perform Transfer Capability assessments, but this requirement implies that TPs should perform this assessment. The language should be changed. Also, I believe that it would be more efficient for the PC and TP communicate only the instabilities identified in the assessments instead of providing all of the results of the assessments.

In Requirement R8, Texas RE recommends changing “the results of the stability analysis” to “any instability”.

Texas RE also recommends adding another requirement for each PC and TP should be added that matches Requirement R6.

R9. Each Planning Coordinator and Transmission Planner shall provide any instability identified in its assessments to each affected Transmission Owner and Generation Owner the following:

9.1 The identification of the Facilities that are owned by that entity, which are critical to the derivation of an instability.

The information in the Planning Assessment and Transfer Capability analysis is important for identifying instability risks. However, BPA believes that the stability results that need to be communicated should be those results where Stability is the defining limit in the near term Planning Horizon. If the SOL is Thermally limited, there is no need to communicate the Stability limit.

Because Peak is registered as an RC, Peak is not intimately familiar with the various types of studies performed in the planning horizon and whether or not those studies stress the system sufficiently to uncover potential instability risks. So long as instability risks are adequately identified in the planning horizon and communicated to the RC and impacted TOPs in the operations horizon, there may be no need for additional studies.

Response	

12. Are there additional “studies” or activities that planners should undertake (beyond those currently required in the current standards, including TPL-001-4 and FAC-013-2) to identify instability risks? If so, please describe.

Colleen Campbell - ACES Power Marketing - 6 - NA - Not Applicable, Group Name ACES Standards Collaborators	
Answer	No
Document Name	
Comment	

1. FAC-013 is only applicable to the Planning Coordinator, so the way R8 is worded seems to obligate the TP to provide a Transfer Capability assessment that is not required to have. This is creating a new TP requirement.

2. There are planning horizon studies performed for the PRC-006-2 standard (UFLS), the present EOP-003-2 and future PRC-010-1 (UVLS) standards, and the present PRC-015-0 and future PRC-012-2 standards (RAS) and the results may be of interest or value to RCs and TOPs. We are not aware of any RC or TOP need for additional planning studies.

As noted in the response to Question 11, Planning Coordinators and Transmission Planners perform (and will begin to perform) planning horizon studies that are beyond the FAC-013-2 and TPL-001-4 standards. These studies are, or will be, performed for the FAC-002-2 (Interconnection Studies) standard, PRC-006-2 standard (UFLS), the present EOP-003-2 and future PRC-010-1 (UVLS) standards, and the present PRC-015-0 and future PRC-012-2 standards (RAS). Study results from these other standards may also be helpful to RCs and TOPs prospective operating horizon reliability-related	

needs.

Historically, transmission planner's studies have been concerned with generation in the planner's area serving load in the planner's area. These studies tend to miss reliability risks due to loop-flows or transfers into, out of, or across systems. Transmission planners should be required to study realistic levels of transfers, load and generation dispatch similar to the language in FAC-011-4 R4.3 and share the results with the TOP and Reliability Coordinator. It is imperative that transmission planners are studying the flows on the system that the operators are experiencing in real-time, regardless if the flows are firm, non-firm or loop flows.

Planners often perform special studies that aren't required for the TPL and FAC standards, and these studies may identify instabilities that need to be communicated. In Requirement R8, Texas RE recommends the changing "the results of the stability analysis" to "any instability" and removing "Planning Assessments and Transfer Capability".

13. With regard to Part 8.3: The SDT believes that the information listed in Part 8.3 is critical for RC and TOP awareness and understanding of the instability risks identified in the planning horizon and the listed mitigation measures employed to address those risks. Do you agree? If not, please explain why you believe it is not critical that the RC and TOP obtain this information from the planning entities?

Amy Casuscelli - Xcel Energy, Inc. - 1,3,5,6 - MRO,WECC,SPP RE	
Answer	No
Document Name	
Comment	
The Part 8.3 information may be of some interest or value to RCs and TOPs, but we do not believe it is critical for RC and TOP awareness and understanding of the instability risks in operations horizon. It is highly unlikely that RAS, UVLS, or UFLS based on planning horizon study system conditions and planning event contingencies are applicable or critical to operating horizon study system conditions or operating event.

In our opinion the RC should not be concerned for stability results in the planning horizon, which covers system conditions up to 10 years in the future. (The TP should be working to address these stability concerns, before they would be a concern to the RC.) At a minimum, the stability assessment results in requirement R8 should be more narrowly focused to the near-term horizon. If operational awareness of instability risks is that important, then a requirement for a seasonal stability assessment should be added to the TOP standards. We believe this would provide much more useful information than the stability results to satisfy standard TPL-001-4.

The Part 8.3 information is critical and may help RCs and TOPs become aware of potential operating horizon reliability-related needs (both steady state and stability). These results provide the RC and TOP an awareness and understanding of risks that are identified in the planning horizon that may occur under other conditions applicable to the operating horizon.

FAC-011/14 addresses SOL/IROL -methodology, setting, communicating. R8, as written, does not address these issues. The proposed R8 should also include the criteria used by the PC and TP for identifying System instability (ref. TPL-001-4 R6) because these may differ from those defined by the RC in FAC-011 R4.1. However, with the retiring of FAC-010, the revised FAC-011 and FAC-014 should not be applicable to the PC or TP. Any requirement for sharing studies from other standards should be incorporated within the relevant standards (TPL, …). Overall, we think that FAC-011 and FAC-014 should be merged in a single standard applicable to the RC and TOP with regards to the establishment of	

SOL/IROL. Also, there should be more consistency between the TPL standard and FAC-011/014. Although we recognize the differences between the planning and operating functions, those standards have a lot in common in terms of the studies performed to ensure power system reliability.

1. We believe Requirement R8 is partly duplicative of Requirement R3 in IRO-017-1, which will become effective on 4/1/2017. IRO-017-	

1/Requirement R3 obligated PCs and TPs to share their (entire) Planning Assessment with affected RCs. We propose the following:

a. In the near term Requirement R8 be worded as in IRO-017-1/Requirement R3, but obligate PCs and TPs to share their (entire) Planning Assessment with affected TOPs; and

b. In the long term, remove Requirement R8 after IRO-017-1/Requirement R3 is modified to add the obligation to share Planning Assessments with affected TOPs.

However, the Requirement R8.3 obligation to share RAS, UVLS, and UFLS study results (even those unrelated to instability) with RCs and TOPs is not duplicative of other requirements, and may be of some value to RCs and TOPS.

Requirement R8 is partly duplicative of the Requirement R3 in the IRO-017-1 standard, which will become effective on 4/1/2017.) IRO-017-1_R3 will obligate PCs and TPs to share their (entire) Planning Assessment with affected RCs. As noted in the comments for Question 11 and Question 12, there are other studies performed for other existing or future standards (FAC-002-2, PRC-006-2, EOP-003-2, PRC-010-1, PRC-015-0, and PRC-012-2) that could be placed in FAC-014-3 or the other standards. It may be practical in the near term to place the desired communication requirement in FAC-014-3 for now, and in the long term to have them placed in the applicable standards.

If it is determined that RCs and TOPs need Planning Assessment stability information from standard TPL-001-4, then this requirement should be added to TPL-001-4 and not included in FAC-014-3. Requirement R8 of standard TPL-001-4 already requires planning study assessment results to be sent to the PC. The RC could be added to this requirement, or the PC could provide this information to the RC.

We believe that this requirement should be placed in TPL-001-4 standard since its reliability objective is fundamentally the same as the existing R8 in TPL-001-4 which requires providing the annual planning assessment to certain functional entities. Note that most of the information specified in sub-parts 8.1 to 8.4 above (other than UVLS and UFLS assessment) is included in the TPL planning assessment. Also, we not that part 8.3 is redundant to part 8.4 - all the mitigation actions listed in part 8.3 as essentially examples of Corrective Action Plans employed in the planning assessment.

The requirement to communicate the information identified in R8 is more appropriately required as part of the standards that requires the analysis, ie. TPL-001-4 and FAC-013-2. Having two individual standards that require analysis and a totally seperate standard with only requirement that requires the analysis of the non-affiliated standards to be communicated to the RC/TOP becomes problematic. Also, FAC-013-2 R5 as written (reference below), does not preclude the RC or TOP as a functional entity, if they so desire, to request the results of the FAC-013 assessment today, so I am not sure what value R8 of FAC-014-3 provides. FAC-013-2 R5: "However, if a functional entity that has a reliability related need for the results of the annual assessment of the Transfer Capabilities makes a written request for such an assessment after the completion of the assessment, the Planning Coordinator shall make the documented Transfer Capability assessment results available to that entity within 45 calendar days of receipt of the request." In regards to TPL-001-4, Seminole believes it to be more appropriate for the FAC drafting team to communicate a recommendation to the TPL-001-4 SDT to modify R8 of TPL-001-4 to either require the PC to provide the results of its Planning Assessment to the RC and/or TOP or use similar language that is in FAC-013-2 R5 where the language does not preclude any entity that has a reliability need for the results.

I believe this requirement would be more appropriate in the other standards mentioned. Those standards include other requirements relating to communication of assessment results where this requirement would fit in easily and therefore it would be less likely to be overlooked. It may be necessary, however, to include this requirement in this standard until FAC-008 and FAC-013 can be revised.

The proposed requirement should ideally be located in the TPL and FAC standard. That insures that it remains consistent with the standard product that it references and puts it in the logical place. It would not make sense to have a SOL methodology sharing requirement in the TPL standards, so having an assessment sharing requirement in the FAC standard is equally out of place. However practicality of the standards development process may require that it be here in the FAC 14 standard.

The purpose of FAC-014 is to establish and communicate SOLs. SOLs are established by the RC based on the analysis the RC deems appropriate for its area, which includes credible instability risks identified in planning studies. FAC-014 appears to be the correct medium to use for the communication of necessary planning information.

AZPS agrees that the RC and TOPs should receive this information, however in FAC-014 AZPS believes it is more appropriate to write the standard from the focus of the RC and TOPs and not from the PC and TPs. The PC and TPs are already required to provide the information via other standards. In FAC-014 the requirement should be for the RC and TOPs to appropriately review the Assessments sent to them from the PC and TPs to increase awareness.

The proposed requirement is appropriately placed in FAC-014, but FAC-013 needs to be enhanced to require the Planning Coordinator to include stability analysis in it's Transfer Capability studies.

The proposed requirement would be more appropriate in TPL-001-4 since TPL-001-4 already addresses the stability studies and Planning Assessment performed by the PC and TP and this requirement says stability issues identified by the PC and TP should be communicated to its RC and impacted TOPs.

Unofficial Comment Form for FAC-014-3

Project 2015-09 Establish and Communicate System Operating Limits

Do not use this form for submitting comments. Use the electronic form to submit comments on **Project 2015-09 Establish and Communicate System Operating Limits** (SOL). The electronic form must be submitted by **8 p.m. Eastern, Friday, August 12, 2016.**

Additional information is available on the project page. If you have questions, contact Lacey Ourso, Standards Developer by email or phone at 404.446.2581.

Background Information regarding Project 2015-09 Establish and Communicate System Operating Limits

Before submitting comments with regard to the proposed changes to FAC-014-3, please review the background information section provided in the “Unofficial Comment Form for FAC-011-4.” That document contains foundational information that must be reviewed in order to have a complete understanding of the proposed changes to FAC-014-3.

Proposed Revisions, Background Information and Questions

Proposed Reliability Standard: FAC-014-3, Requirement R1		
Proposed New/Revised Requirement	**Explanation of Proposed Revision**	**Relevant Requirements in Existing Reliability Standard(s)**
R1. Each Reliability Coordinator shall establish Interconnection Reliability Operating Limits (IROLs) for its Reliability Coordinator Area that are consistent with its System Operating Limit Methodology ("SOL Methodology") as established in FAC-011-4.	The current FAC-014-2 Requirement R1 requires that the RC ensure SOLs and IROLs are established pursuant to its SOL Methodology. This creates a situation where the RC is responsible for "ensuring" actions out of its control. The proposed revisions do not change the intent of the standard –that the RC develop the SOL Methodology for establishing SOLs in its RC Area, and the TOP following the RC SOL Methodology in establishing those SOLs. Accordingly, the proposed Requirement R2 requires that the TOP establish SOLs as required by the RC SOL Methodology. The SDT believes this clarifies the appropriate responsibilities of the respective functional entities, while not creating ambiguity in the requirements in requiring the RC to do something that the TOP is, in all actuality, required to do. Additionally, this requirement carries forward the obligation of the RC to establish IROLs for its RC Area. The RC maintains primary responsibility for establishment of IROLs because these limits have the potential to impact a Wide-area.	**Mapping to existing FAC standards under revision:** • FAC-014-2 Requirement R1 – Requires the RC to ensure SOLs and IROLs are establishing for its RC Area, consistent with its SOL Methodology. • FAC-014-2 Requirement R2 – Requires the TOP to establish SOLs consistent with the RC SOL Methodology.

Question 1: Do you agree with that the Reliability Coordinator (RC) should have primary responsibility for establishing IROLs for its RC Area? If not, please provide your comments on the appropriate break down of responsibilities (between RC and TOP) in establishing IROLs.

☒ Yes

☐ No

Comments:

Proposed Reliability Standard: FAC-014-3, Requirement R2		
Proposed New/Revised Requirement	**Explanation of Proposed Revision**	**Relevant Requirements in Existing Reliability Standard(s)**
R2. Each Transmission Operator shall establish SOLs for its portion of the Reliability Coordinator Area consistent with its Reliability Coordinator's SOL Methodology.	The SDT has removed language from the existing FAC-014-3 Requirement R2 that states the TOP, "shall establish SOLs (as directed by its Reliability Coordinator)" because it causes confusion and may be incorrectly understood to mean that the RC will issue a "Directive," or that TOPs are only required to establish SOLs if they have been "directed to by their RC." This is not the intended meaning of the requirement, thus, the drafting team has removed the unnecessary and potentially confusing language. The proposed language makes clear that the TOP is the entity responsible for establishing SOLs, and these SOLs must be established in accordance with (*i.e.*, pursuant to the "direction") identified in the RC's SOL Methodology.	**Mapping to existing FAC standards under revision:** • FAC-014-2 Requirement R1 – Requires the RC to ensure SOLs and IROLs are establishing for its RC Area, consistent with its SOL Methodology. • FAC-014-2 Requirement R2 – Requires the TOP to establish SOLs consistent with the RC SOL Methodology.

Question 2: The proposed revisions work together with the proposed revisions to the definition of SOL. The new requirement makes clear that the TOP will establish SOLs in accordance with the RC SOL Methodology. This means that the TOP will follow the RC Methodology to determine: applicable Facility Ratings for use in operations (see, proposed FAC-011-4 Requirement R2); applicable steady-state System

voltage limits to be used in operations (see, proposed FAC-011-4 Requirement R3); and, the applicable stability limitations, if any, that are to be used in operations (see, proposed FAC-011-4 Requirement R4). Do you believe that it is clear that the TOP must establish SOLs in accordance with what is outlined in the RC Methodology?

☐ Yes

☒ No

Comments: It is unclear that the TOP must establish all stability limits since R3 infers that this is solely an RC responsibility. This should be clarified by identifying each of the 3 types of limits in R2.

<u>Question 3</u>: TOP application of the RC Methodology will always result in identification of the appropriate Facility Ratings and steady-state System voltage limits, however, it may not always result in identification of stability limitations (this is *only if* there are no applicable limitations specific to the TOP). If there are appropriate stability limitations (identified as a result of implementing the RC method for determining the stability limitations in proposed FAC-011-4 Requirement R4), then the TOP will identify these SOLs. Do you believe this is clear from the language of the requirements (both in FAC-14-3 Requirement R2 combined with the proposed revisions to FAC-011)?

☐ Yes

☒ No

Comments: It is unclear that the TOP must establish all stability limits since R3 infers that this is solely an RC responsibility. This should be clarified by identifying each of the 3 types of limits in R2.

Proposed Reliability Standard: FAC-014-3, Requirement R3		
Proposed New/Revised Requirement	**Explanation of Proposed Revision**	**Relevant Requirements in Existing Reliability Standard(s)**
R3. Each Reliability Coordinator shall determine stability limitations to be used in operations when the limitation impacts more than one Transmission Operator in its Reliability Coordinator Area consistent with its SOL Methodology.	The proposed approach by the SDT is that the RC SOL Methodology will set the method for how all stability limitations for its RC Area must be established (see, proposed FAC-011-4 Requirement R4). The RC SOL Methodology must, among other things, specify the stability performance criteria for single Contingencies and multiple Contingencies,	**<u>Mapping to existing FAC standards under revision:</u>** • <u>N/A</u>: This proposed requirement addresses what the SDT believes to be a gap in the existing requirements.

Proposed Reliability Standard: FAC-014-3, Requirement R3		
Proposed New/Revised Requirement	**Explanation of Proposed Revision**	**Relevant Requirements in Existing Reliability Standard(s)**
	including any margins applied (see, proposed FAC-011-4 Part 4.1); meet the performance criteria for certain identified Contingencies listed in the standard (see, proposed FAC-011-4 Part 4.2); and describe how instability risks are identified (see, proposed FAC-011-4 Part 4.3). The TOP is required to establish stability limitation SOLs in accordance with everything outlined in the RC SOL Methodology. However, in addition to what is outlined above, the SDT believes that to the extent there are stability limitations that may impact more than one TOP in its RC Area, the RC should be responsible for determining these stability limitations (in accordance with its RC SOL Methodology – see, proposed FAC-011-4 Part 4.6). The purpose of providing a separate requirement for the RC to address this specific type of stability limitation is to provide clarity that there may be a stability limitation that is not appropriately labeled an “IROL,” and thus, would not be covered by proposed Requirement R1. It is the position of the SDT that not all stability limitations are automatically “IROLs.” For example, there may be instances of local, contained instability that are not appropriately designated an “IROL,” because labeling it as an IROL may require the TOP to take actions such as pre-Contingency load shedding, that is not warranted, and could actually cause a bigger	

Proposed Reliability Standard: FAC-014-3, Requirement R3		
Proposed New/Revised Requirement	**Explanation of Proposed Revision**	**Relevant Requirements in Existing Reliability Standard(s)**
	reliability impact. However, when the stability limitation impacts more than one TOP, the SDT believes the RC should have primary responsibility for establishing that SOL.	

Question 4: Do you believe that the RC should be responsible for establishing stability limitations used in operations where more than one TOP is impacted?

☒ Yes
☐ No
Comments:

Proposed Reliability Standard: FAC-014-3, Requirement R4		
Proposed New/Revised Requirement	**Explanation of Proposed Revision**	**Relevant Requirements in Existing Reliability Standard(s)**
R4. Each Reliability Coordinator shall provide the SOLs for its RC Area to adjacent Reliability Coordinators within an Interconnection and Reliability Coordinators who request and indicate a reliability-related need for those limits, and to the Transmission Operators, Transmission Planners, and Planning	The proposed Requirement R4 maintains the part of existing FAC-014-3 Requirement R5 which requires the TC to send the SOLs for its RC Area to adjacent RCs. The SDT has created a new/separate requirement related to communicating established IROLs (see proposed FAC-014-4 Requirement R5). The SDT added Part 4.1 to require the RC to provide updates to the SOLs to the impacted TOPs. It is expected that the RC and TOPs will establish a mutually agreeable means	**Mapping to existing FAC standards under revision:** • FAC-014-2 Requirement R5 – Requires the TOP to establish SOLs consistent with the RC SOL Methodology.

Proposed Reliability Standard: FAC-014-3, Requirement R4		
Proposed New/Revised Requirement	**Explanation of Proposed Revision**	**Relevant Requirements in Existing Reliability Standard(s)**
Coordinators within its Reliability Coordinator Area. **4.1.** The Reliability Coordinators shall provide any updates to the SOL values established as part of Requirement R1 or Requirement R3 to impacted TOPs in its Reliability Coordinators Area in a mutually agreeable periodicity and format.	(pursuant to IRO-010-2 and TOP-003-3) for exchanging dynamically determined Facility Ratings or stability limitations.	

Question 5: Do you agree that the RC should be the only entity responsible for providing other entities within its RC Area the established SOLs? If no, do you believe the entity that establishes the SOL (either the RC *or the TOP*) should be the entity that communicates the SOL to other entities? Please explain.

☐ Yes

☒ No

Comments: The RC should not be the only entity responsible for providing other entities the established SOLs. The entity that establishes the SOL should communicate the SOL to the rest of the entities within the same RC area to provide a common source of information.

Question 6: With regard to proposed Part 4.1: Do you believe that the language provides sufficient clarity regarding what is required for communicating updates to dynamically updated limits? If not, what language do you propose?

☐ Yes

☒ No

Comments: Instead of RCs, TOPs should communicate the SOLs they establish, including dynamically updated limits, consistent with R2 as well.

Question 7: With regard to proposed Part 4.1: Do you believe a specific timeframe should be included that sets the minimum acceptable time for when the RC must provide the communications, or should the RC have flexibility in determining what is appropriate for its particular RC Area?

☐ Yes

☒ No

Comments: The RC or TOP should have flexibility in setting a time requirement. However, entities in the same RC area should agree to a time requirement that allows the entity receiving the data to be consistent with the timeframe specified in IRO-010-2 and TOP-003-3.

Proposed Reliability Standard: FAC-014-3, Requirement R5		
Proposed New/Revised Requirement	**Explanation of Proposed Revision**	**Relevant Requirements in Existing Reliability Standard(s)**
R5. Each Reliability Coordinator with an established IROL shall provide the following IROL information to adjacent Reliability Coordinators within an Interconnection, to other Reliability Coordinators that indicate a reliability-related need for the information, and to the Transmission Operators, Transmission Planners, and Planning Coordinators within its Reliability Coordinator Area: **5.1.** Identification of the Facilities that are critical to the derivation of the IROL. **5.2.** The value of the IROL and its associated IROL T_V. **5.3.** The associated Contingency(ies). **5.4.** The type of limitation represented by the IROL (*e.g.*, voltage collapse, angular stability).	See above explanation. This requirement was previously combined with the requirement to provide updates to both SOLs and IROLs (existing FAC-014-3 Requirement R5). The SDT separated these into two requirements – one for SOL and one for IROL – so that greater detail could be provided regarding the type of IROL-information that must be communicated by the RC.	**Mapping to existing FAC standards under revision:** • FAC-014-2 Requirement R5 – Requires the TOP to establish SOLs consistent with the RC SOL Methodology.

Question 8: Do you agree with the information identified in Parts 5.1 through 5.4? Is there any additional information that the RC should provide regarding IROLs? Are there any additional entities that should be included in this requirement and receive the information from the RC?

☒ Yes
☐ No

Comments: It may be a good idea to identify if it is a static value, fixed value, or dynamically calculated value.

Proposed Reliability Standard: FAC-014-3, Requirement R6		
Proposed New/Revised Requirement	**Explanation of Proposed Revision**	**Relevant Requirements in Existing Reliability Standard(s)**
R6. Each Reliability Coordinator with an established IROL shall provide the following IROL information to Transmission Owners and Generation Owners within its RC Area: **6.1.** Identification of the Facilities that are owned by that entity, which are critical to the derivation of the IROL.	In FERC Order No. 777, FERC directed NERC to develop a means to assure that IROLs are communicated to transmission owners (*see*, P6 and P41). The purpose of this proposed requirement is to address the concerns raised by FERC in Order No. 777. The RC is required to provide the IROL information identified in Part 6.1 to Transmission Owners and Generator Owners in its RC Area. The SDT included Generator Owners because it believes that GOs, in addition to TOs, need to receive information relating to facilities that are critical to the derivation of the IROL. The SDT did not combine this with proposed Requirement R5 because the team believes that the owners only need IROL information related to their facilities that are critical to the derivation of the IROL. However, the owners do not need the information identified in proposed Parts 5.2 through Part 5.4, and further, this information may contain sensitive	**Mapping to existing FAC standards under revision:** • N/A: This proposed requirement is intended to address the issues raised in FERC Order No. 777.

Proposed Reliability Standard: FAC-014-3, Requirement R6		
Proposed New/Revised Requirement	**Explanation of Proposed Revision**	**Relevant Requirements in Existing Reliability Standard(s)**
	operator information not appropriate for open-ended sharing.	

<u>Question 9</u>: In consideration of the FERC directive regarding communicating IROL information to the Transmission Owner, do you agree with this proposed new requirement? If not, please explain the basis for why you do not support the proposed requirement, and the alternative language you are proposing to address the issues raised in FERC Order No. 777.

☒ Yes
☐ No
Comments: ERCOT asks the SDT to consider simplifying R6 and R6.1 into a single requirement.

<u>Question 10</u>: Do you believe a specific timeframe should be included that sets the minimum acceptable time for when the RC must provide the information to the Transmission Owner and Generator Owner?

☐ Yes
☒ No
Comments: No, a specific timeframe should not be included. If the SDT decides to include a timeframe, ERCOT requests it be consistent with other standards, (e.g. 30 days).

Proposed Reliability Standard: FAC-014-3, Requirement R7		
Proposed New/Revised Requirement	**Explanation of Proposed Revision**	**Relevant Requirements in Existing Reliability Standard(s)**
R7. The Transmission Operator shall provide any SOLs and updates to those limits to its Reliability Coordinator and to the	The SDT did not make substantive changes to this requirement; however, the requirement previously existed	**<u>Mapping to existing FAC standards under revision:</u>**

Proposed Reliability Standard: FAC-014-3, Requirement R7		
Proposed New/Revised Requirement	**Explanation of Proposed Revision**	**Relevant Requirements in Existing Reliability Standard(s)**
Transmission Service Providers that share its portion of the Reliability Coordinator Area.	as a "part" of a requirement and it is now a stand-alone requirement.	• FAC-014-2 Part 5.2 – Requires the TOP to provide its SOLs to the RC and Transmission Service Providers in its portion of the RC Area.

Question: None.

Proposed Reliability Standard: FAC-014-3, Requirement R8		
Proposed New/Revised Requirement	**Explanation of Proposed Revision**	**Relevant Requirements in Existing Reliability Standard(s)**
R8. Each Planning Coordinator and Transmission Planner shall communicate the results of the stability analysis identified in its Planning Assessment and Transfer Capability assessment to each affected Reliability Coordinator and Transmission Operator. This shall include: **8.1.** The type of the instability (*e.g.*, voltage collapse, angular instability,	Under proposed FAC-011-4 Part 4.4, the RC SOL Methodology must consider the stability limitations provided by the Planning Coordinator. Also, proposed FAC-014-3 Requirements R2 and R3, the applicable entities are required to establish stability limitations (if any) in accordance with the RC SOL Methodology. This requirement is intended to complement proposed FAC-011-4 Part 4.4 by ensuring that the planning entities provide the results of their stability analysis, including a list of those contingencies that are expected to produce the more severe System impacts, to the affected RC and TOP.	**Background regarding existing standards *not* under revision by SDT:** • TPL-001-4 • FAC-013-2 **Mapping to existing FAC standards under revision:** • FAC -011-3 Part 3.3 • FAC -014-2 Requirement R6

Proposed Reliability Standard: FAC-014-3, Requirement R8		
Proposed New/Revised Requirement	**Explanation of Proposed Revision**	**Relevant Requirements in Existing Reliability Standard(s)**
transient voltage dip criteria violation); **8.2.** The Contingencies which result in the instability; **8.3.** Any Remedial Action Scheme action, under voltage load shedding (UVLS) action, under frequency load shedding (UFLS) action, interruption of Firm Transmission Service, or Non-Consequential Load Loss that was employed (or invoked) to address the instability; and, **8.4.** Any Corrective Action Plan associated with the instability.	This information may be relevant to the operating conditions for which the RC and TOP are determining SOLs. Further, FAC-013-2 requires that the PC have a methodology and annual assessment that identifies the weaknesses and limiting Facilities that could limit the ability of the Transmission System to reliably transfer energy. The results of the assessment, including the methodology used in the analysis, may contain information that may be relevant to the RC and TOP analysis for determining SOLs (and IROLs).	

Question 11: Do you agree that there is a reliability-related need for the RCs and TOPs to obtain the information from the Planning Assessment and Transfer Capability analysis for the purpose of identifying instability risks when establishing SOLs (and IROLs)? Are there other "studies" that are currently performed that should also be included in this communication requirement?

☒ Yes
☐ No

Comments: UVLS studies may also identify instability risks.

Question 12: Are there additional "studies" or activities that planners should undertake (beyond those currently required in the current standards, including TPL-001-4 and FAC-013-2) to identify instability risks? If so, please describe.

☐ Yes
☒ No
Comments: RCs and TOPs should conduct the additional “studies” to ensure they have an operational perspective, whether planning staff or some other contractor performs the task in their behalf.

<u>Question 13</u>:With regard to Part 8.3: The SDT believes that the information listed in Part 8.3 is critical for RC and TOP awareness and understanding of the instability risks identified in the planning horizon and the listed mitigation measures employed to address those risks. Do you agree? If not, please explain why you believe it is not critical that the RC and TOP obtain this information from the planning entities?
☒ Yes
☐ No
Comments:

<u>Question 14</u>: Do you agree that this proposed requirement is appropriately placed in FAC-014, or do you believe the proposed requirement should be placed in another standard (*i.e.*, TPL-001-4 and FAC-013-2)?
☒ Yes
☐ No
Comments:

Proposed Definitions of:
"System Operating Limit" (SOL) and "SOL Exceedance"

Term: "System Operating Limit" (SOL)

Revised Definition:

Facility Ratings, System Voltage Limits, and stability limits used in the operation of the BES.

Redline Definition:

Facility Ratings, System Voltage Limits, and stability limits used in the operation of the BES.

~~The value (such as MW, Mvar, amperes, frequency or volts) that satisfies the most limiting of the prescribed operating criteria for a specified system configuration to ensure operation within acceptable reliability criteria. System Operating Limits are based upon certain operating criteria. These include, but are not limited to:~~

- ~~Facility Ratings, (applicable pre- and post-Contingency Equipment Ratings or Facility Ratings)~~
- ~~transient stability ratings (applicable pre- and post- Contingency stability limits)~~
- ~~voltage stability ratings (applicable pre- and post-Contingency voltage stability)~~
- ~~system voltage limits, (applicable pre- and post-Contingency voltage limits)~~

Term: "SOL Exceedance"

Definition:

An operating condition or analysis result characterized by any of the following, as determined in Real-time monitoring, Real-time Assessments (RTA) or Operational Planning Analysis (OPA):

The pre-Contingency state indicates any of the following:

- Actual flow through a Facility is above the Facility's Normal Rating
- Actual bus voltage is outside normal System Voltage Limits
- A stability limit established to prevent instability without a Contingency is exceeded
- A stability limit established to prevent the Contingency from resulting in instability is exceeded

The calculated post-Contingency state indicates any of the following:

- Flow through a Facility is above the Facility's highest Emergency Rating, or above a Facility Rating for which there is not sufficient time to reduce the flow to established acceptable levels should the Contingency occur

- Bus voltage is outside the highest or lowest emergency System Voltage Limit, or outside a System Voltage Limit for which there is not sufficient time to bring the bus voltage to established acceptable levels should the Contingency occur
- Defined stability performance criteria are not met

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Standards Authorization Request Form

When completed, email this form to:
sarcomm@nerc.net

NERC welcomes suggestions to improve the reliability of the bulk power system through improved reliability standards. Please use this form to submit your request to propose a new or a revision to a NERC's Reliability Standard.

Request to propose a new or a revision to a Reliability Standard			
Title of Proposed Standard(s):	Establish and Communicate System Operating Limits		
Date Submitted:	September 29, 2017		
SAR Requester Information			
Name:	Project 2015-09 SDT		
Organization:	NERC		
Telephone:	404.446.9691	E-mail:	steven.noess@nerc.net
SAR Type (Check as many as applicable)			
☒ New Standard ☒ Revision to existing Standard		☒ Withdrawal of existing Standard ☐ Urgent Action	

SAR Information
Purpose (Describe what the standard action will achieve in support of Bulk Electric System reliability.):
The project will revise requirements for determining and communicating System Operating Limits (SOLs) used in the reliable planning and operation of the Bulk Electric System (BES).
Industry Need (What is the industry problem this request is trying to solve?):
FAC standards fulfill an important reliability objective for determining and communicating SOLs used in the reliable planning and operation of the Bulk Electric System (BES). Revisions are necessary to improve the requirements by eliminating overlap with approved Transmission Planning (TPL) requirements, enhancing consistency with Transmission Operations (TOP) and Interconnection Reliability Operations (IRO) standards, and addressing issues with determining and communicating SOLs and Interconnection Reliability Operating Limits (IROLs).

SAR Information
Brief Description (Provide a paragraph that describes the scope of this standard action.)
The proposed standards project will revise the requirements for determining and communicating SOLs and IROLs to address issues identified in Project 2015-03 Periodic Review of System Operating Limit Standards. The resulting standard(s) and definition(s) will benefit reliability by improving alignment with approved TPL and proposed TOP and IRO standards. The project may result in development of one or more proposed Reliability Standards and definitions and may consolidate reliability objectives from the existing three Reliability Standards. Where necessary, the standard drafting team (SDT) will review and modify existing Reliability Standards and NERC Glossary terms (definitions) for incorporating the new and/or revised definitions.
Detailed Description (Provide a description of the proposed project with sufficient details for the standard drafting team to execute the SAR. Also provide a justification for the development or revision of the standard, including an assessment of the reliability and market interface impacts of implementing or not implementing the standard action.)
The standards development project will consider recommendations from Project 2015-03 Periodic Review of System Operating Limits. This review included inputs from the Independent Experts Review Project (IERP), FERC Directives, and Paragraph 81 concepts. When completed, the project will address all issues identified in the Periodic Review Recommendations (PRRs) for FAC-010-3, FAC-011-3, and FAC-014-2, including: • <u>Propose retirement of FAC-010-3.</u> BES planning is covered under approved TPL-001-4 which provides comprehensive requirements for a variety of contingencies. The standards project will propose retirement of FAC-010-3. • <u>Clarify acceptable System performance criteria for the operations time horizon.</u> The proposed standards project will develop continent-wide standards for system performance in the operations time horizon to replace currently-enforceable requirements in FAC-011-3 that specify acceptable system performance through the Reliability Coordinator's (RC) SOL methodology. Development of a table similar to TPL-001-4 Table 1 with appropriate requirements for the operations time horizon would enhance clarity and consistency. This project will determine the appropriate family of standards for this table. • <u>Propose requirements to address identified reliability issues.</u> Requirement(s) will be developed to address FERC Order No. 777 directive for the communication of IROL information to Transmission Owners (P6 and P41). FERC Order No. 777 states: *“As discussed below, we also direct NERC to develop a means to assure that IROLs are communicated to transmission owners.”* (P 6) *“NERC should establish a clearly defined communication structure to assure that IROLs and*

SAR Information
changes to IROL status are timely communicated to transmission owners...One way to achieve this objective...is to modify FAC-014 to require the provision of IROLs to transmission owners. However, we leave it to NERC to determine the most appropriate means for communicating IROL status to transmission owners." (P 41) • <u>Revise or develop new definitions to provide clarity and alignment with how SOLs are treated in proposed TOP and IRO standards developed in Project 2014-03 Revisions to TOP and IRO Standards.</u> This work may include, but is not limited to, revising the definition of System Operating Limit (SOL) and creating a new definition for SOL Exceedance. The project will also address the issues identified in the FAC PRRs related to the application of the IROL term. Proposed definitions should provide clarity and consistency to establishing SOLs and IROLs and promote a common understanding of what it means to establish and exceed SOLs. The SDT will review the existing body of NERC Reliability Standards and NERC Glossary terms (definitions) and where appropriate, modify those standards and definitions by incorporating the new terms and/or definitions of SOL Exceedance and System Voltage Limit, as well as the revised definition of SOL. The SDT will coordinate with other drafting teams on relevant standards as necessary. • <u>Clarify responsibilities for establishing and communicating SOLs.</u> The project will propose requirements to clearly delineate the functional entity responsibilities for determining and communicating each type of SOL (Facility Ratings, System voltage limits, voltage stability limits, and transient stability limits) where not already addressed in existing standards (*e.g.*, FAC-008). • <u>Develop revised or new requirement(s) that facilitate transfer of necessary reliability information between the planning and operating entities for establishing and communicating System Operating Limits.</u> Revise requirements to conform to the Results-Based Standards format, functional entity terms found in the NERC Functional Model, guidelines for compliance elements, and NERC standards for content and quality (Independent Experts Review Project).

Reliability Functions	
The Standard will Apply to the Following Functions (Check each one that applies.)	
☐ Regional Reliability Organization	Conducts the regional activities related to planning and operations, and coordinates activities of Responsible Entities to secure the reliability of the Bulk Electric System within the region and adjacent regions.

Reliability Functions		
☒	Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator's wide area view.
☐	Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time.
☐	Interchange Authority	Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas.
☒	Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
☐	Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area.
☒	Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area.
☐	Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
☒	Transmission Owner	Owns and maintains transmission facilities.
☒	Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
☐	Distribution Provider	Delivers electrical energy to the End-use customer.
☒	Generator Owner	Owns and maintains generation facilities.
☒	Generator Operator	Operates generation unit(s) to provide real and Reactive Power.
☐	Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
☐	Market Operator	Interface point for reliability functions with commercial functions.
☐	Load-Serving Entity	Secures energy and transmission service (and reliability-related services) to serve the End-use Customer.

Reliability and Market Interface Principles	
Applicable Reliability Principles (Check all that apply).	
☒	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☒	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and Reactive Power supply and demand.
☒	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.
☐	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☒	7. The reliability of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Does the proposed Standard comply with all of the following Market Interface Principles?	Enter (yes/no)
1. A reliability standard shall not give any market participant an unfair competitive advantage.	YES
2. A reliability standard shall neither mandate nor prohibit any specific market structure.	YES
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard.	YES
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards.	YES

Standards Authorization Request Form

When completed, email this form to:
sarcomm@nerc.net

NERC welcomes suggestions to improve the reliability of the bulk power system through improved reliability standards. Please use this form to submit your request to propose a new or a revision to a NERC's Reliability Standard.

Request to propose a new or a revision to a Reliability Standard			
Title of Proposed Standard(s):	Establish and Communicate System Operating Limits		
Date Submitted:	September 29, 2017		
SAR Requester Information			
Name:	Project 2015-09 SDT		
Organization:	NERC		
Telephone:	404.446.9691	E-mail:	steven.noess@nerc.net
SAR Type (Check as many as applicable)			
☒ New Standard ☒ Revision to existing Standard		☒ Withdrawal of existing Standard ☐ Urgent Action	

SAR Information
Purpose (Describe what the standard action will achieve in support of Bulk Electric System reliability.):
The project will revise requirements for determining and communicating System Operating Limits (SOLs) used in the reliable planning and operation of the Bulk Electric System (BES).
Industry Need (What is the industry problem this request is trying to solve?):
FAC standards fulfill an important reliability objective for determining and communicating SOLs used in the reliable planning and operation of the Bulk Electric System (BES). Revisions are necessary to improve the requirements by eliminating overlap with approved Transmission Planning (TPL) requirements, enhancing consistency with Transmission Operations (TOP) and Interconnection Reliability Operations (IRO) standards, and addressing issues with determining and communicating SOLs and Interconnection Reliability Operating Limits (IROLs).

SAR Information
Brief Description (Provide a paragraph that describes the scope of this standard action.)
The proposed standards project will revise the requirements for determining and communicating SOLs and IROLs to address issues identified in Project 2015-03 Periodic Review of System Operating Limit Standards. The resulting standard(s) and definition(s) will benefit reliability by improving alignment with approved TPL and proposed TOP and IRO standards. The project may result in development of one or more proposed Reliability Standards and definitions and may consolidate reliability objectives from the existing three Reliability Standards. Where necessary, the standard drafting team (SDT) will review and modify existing Reliability Standards and NERC Glossary terms (definitions) for incorporating the new and/or revised definitions.
Detailed Description (Provide a description of the proposed project with sufficient details for the standard drafting team to execute the SAR. Also provide a justification for the development or revision of the standard, including an assessment of the reliability and market interface impacts of implementing or not implementing the standard action.)
The standards development project will consider recommendations from Project 2015-03 Periodic Review of System Operating Limits. This review included inputs from the Independent Experts Review Project (IERP), FERC Directives, and Paragraph 81 concepts. When completed, the project will address all issues identified in the Periodic Review Recommendations (PRRs) for FAC-010-3, FAC-011-3, and FAC-014-2, including: • <u>Propose retirement of FAC-010-3.</u> BES planning is covered under approved TPL-001-4 which provides comprehensive requirements for a variety of contingencies. The standards project will propose retirement of FAC-010-3. • <u>Clarify acceptable System performance criteria for the operations time horizon.</u> The proposed standards project will develop continent-wide standards for system performance in the operations time horizon to replace currently-enforceable requirements in FAC-011-3 that specify acceptable system performance through the Reliability Coordinator's (RC) SOL methodology. Development of a table similar to TPL-001-4 Table 1 with appropriate requirements for the operations time horizon would enhance clarity and consistency. This project will determine the appropriate family of standards for this table. • <u>Propose requirements to address identified reliability issues.</u> Requirement(s) will be developed to address FERC Order No. 777 directive for the communication of IROL information to Transmission Owners (P6 and P41). FERC Order No. 777 states: *"As discussed below, we also direct NERC to develop a means to assure that IROLs are communicated to transmission owners."* (P 6) *"NERC should establish a clearly defined communication structure to assure that IROLs and*

SAR Information
changes to IROL status are timely communicated to transmission owners...One way to achieve this objective...is to modify FAC-014 to require the provision of IROLs to transmission owners. However, we leave it to NERC to determine the most appropriate means for communicating IROL status to transmission owners." (P 41) • Revise or develop new definitions to provide clarity and alignment with how SOLs are treated in proposed TOP and IRO standards developed in Project 2014-03 Revisions to TOP and IRO Standards. This work may include, but is not limited to, revising the definition of System Operating Limit (SOL) and creating a new definition for SOL Exceedance. The project will also address the issues identified in the FAC PRRs related to the application of the IROL term. Proposed definitions should provide clarity and consistency to establishing SOLs and IROLs and promote a common understanding of what it means to establish and exceed SOLs. The SDT will review the existing body of NERC Reliability Standards and NERC Glossary terms (definitions) and where appropriate, modify those standards and definitions by incorporating the new terms and/or definitions of SOL Exceedance and System Voltage Limit, as well as the revised definition of SOL. The SDT will coordinate with other drafting teams on relevant standards as necessary. • Clarify responsibilities for establishing and communicating SOLs. The project will propose requirements to clearly delineate the functional entity responsibilities for determining and communicating each type of SOL (Facility Ratings, System voltage limits, voltage stability limits, and transient stability limits) where not already addressed in existing standards (*e.g.*, FAC-008). • Develop revised or new requirement(s) that facilitate transfer of necessary reliability information between the planning and operating entities for establishing and communicating System Operating Limits. Revise requirements to conform to the Results-Based Standards format, functional entity terms found in the NERC Functional Model, guidelines for compliance elements, and NERC standards for content and quality (Independent Experts Review Project).

Reliability Functions	
The Standard will Apply to the Following Functions (Check each one that applies.)	
☐ Regional Reliability Organization	Conducts the regional activities related to planning and operations, and coordinates activities of Responsible Entities to secure the reliability of the Bulk Electric System within the region and adjacent regions.

Reliability Functions	
☒ Reliability Coordinator	Responsible for the real-time operating reliability of its Reliability Coordinator Area in coordination with its neighboring Reliability Coordinator’s wide area view.
☐ Balancing Authority	Integrates resource plans ahead of time, and maintains load-interchange-resource balance within a Balancing Authority Area and supports Interconnection frequency in real time.
☐ Interchange Authority	Ensures communication of interchange transactions for reliability evaluation purposes and coordinates implementation of valid and balanced interchange schedules between Balancing Authority Areas.
☒ Planning Coordinator	Assesses the longer-term reliability of its Planning Coordinator Area.
☐ Resource Planner	Develops a >one year plan for the resource adequacy of its specific loads within a Planning Coordinator area.
☒ Transmission Planner	Develops a >one year plan for the reliability of the interconnected Bulk Electric System within its portion of the Planning Coordinator area.
☐ Transmission Service Provider	Administers the transmission tariff and provides transmission services under applicable transmission service agreements (e.g., the pro forma tariff).
☒ Transmission Owner	Owns and maintains transmission facilities.
☒ Transmission Operator	Ensures the real-time operating reliability of the transmission assets within a Transmission Operator Area.
☐ Distribution Provider	Delivers electrical energy to the End-use customer.
☒ Generator Owner	Owns and maintains generation facilities.
☒ Generator Operator	Operates generation unit(s) to provide real and Reactive Power.
☐ Purchasing-Selling Entity	Purchases or sells energy, capacity, and necessary reliability-related services as required.
☐ Market Operator	Interface point for reliability functions with commercial functions.
☐ Load-Serving Entity	Secures energy and transmission service (and reliability-related services) to serve the End-use Customer.

Reliability and Market Interface Principles	
Applicable Reliability Principles (Check all that apply).	
☒	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☒	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and Reactive Power supply and demand.
☒	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.
☐	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.
☐	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☒	7. The reliability of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Does the proposed Standard comply with all of the following Market Interface Principles?	Enter (yes/no)
1. A reliability standard shall not give any market participant an unfair competitive advantage.	YES
2. A reliability standard shall neither mandate nor prohibit any specific market structure.	YES
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard.	YES
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards.	YES

Unofficial Comment Form

Project 2015-09 Establish and Communicate System Operating Limits (SOL and SOL Exceedance Definitions)

Do not use this form for submitting comments. Use the electronic form to submit comments on the **Project 2015-09 Establish and Communicate System Operating Limits** project, SOL and SOL Exceedance definitions. The electronic form must be submitted by **8 p.m. Eastern, Monday, October 30, 2017**.

Documents and information about this project are available on the project page. If you have questions, contact either Senior Standards Developer, Darrel Richardson at (609) 613-1848 or Al McMeekin at (404) 446-9675.

Background Information

As part of Project 2015-09, the standard drafting team (SDT) is proposing a revision to the definition of System Operating Limit (SOL), and is proposing a new definition for SOL Exceedance. The rationales for these definitions are captured in the accompanying document. It is critical that commenters read the accompanying definitions rationales prior to completing this comment form to understand why these definitions are being proposed and why they are crafted the way they are. The two definitions SOL and SOL Exceedance work together to clearly identify what SOLs are and what it means to exceed them.

One of the objectives of the SOL and SOL Exceedance definition is to codify the concepts in the whitepaper prepared by the SDT for Project 2014-03 Revisions to TOP and IRO Standards (the "Project 2014-03 Whitepaper"), which served as a conceptual basis for the development of the Transmission Operations (TOP) and Interconnection Reliability Operations and Coordination (IRO) standards that were modified as part of Project 2014-03. The Project 2015-09 SDT recognizes that while the Project 2014-03 Whitepaper provided clarity on the SOL and SOL exceedance concepts, reliability would be further enhanced by modifying the SOL definition in the NERC Glossary and developing a new defined term SOL Exceedance to better align the definitions in the NERC Glossary with that whitepaper and the manner in which the SOL concept is used in the TOP/IRO Reliability Standards. The SDT believes that the proposed SOL and SOL Exceedance definitions and the proposed related FAC standards improve reliability by creating better alignment with the currently effective Transmission Planning, TOP, and IRO standards, improving clarity, and reducing redundancy.

In addition to the *System Operating Limit and SOL Exceedance Rationale*, the SDT has provided the *SOL Definition Impact* spreadsheet for review. This spreadsheet identifies every occurrence of the SOL term in the body of standards, which includes those that are subject to enforcement, those that are subject to future enforcement, and those that are filed and pending regulatory approval, and those that are pending regulatory filing. The *SOL Definition Impact* spreadsheet identifies not only occurrences of the SOL term in the requirements, but also includes occurrences of the term in purposes, measures, VSLs, Attachments, Guidelines and Technical Basis, and other definitions. Each occurrence contains a recommendation of changes, if any, including recommendations for standards that should be modified to integrate the SOL Exceedance term.

If the industry sees value in modifying the definition of SOL and creating a definition for SOL Exceedance, the SDT expects to follow this posting for comment with a subsequent posting for ballot of the revised SOL definition, the new SOL Exceedance definition, and the revised Reliability Standards that incorporate the new SOL Exceedance definition.

Please provide your responses to the questions listed below along with any detailed comments.

Questions

1. Industry responses to the initial posting for informal comment in July of 2016 indicated general support for revising the SOL definition. Since that time, a few key events have occurred that may relate to the need for modifying the definition of SOL:
    a. In Order 817 FERC approved the TOP and IRO standards which became effective on April 1 of 2017.
    b. The NERC SOL Whitepaper entitled, “System Operating Limit Definition and Exceedance Clarification” which served as a conceptual basis for these TOP and IRO standards was referenced in paragraph 69 of FERC Order 817.
    c. The NERC SOL Whitepaper is included in the list of ERO Enterprise-endorsed Implementation Guidance documents in the Compliance Guidance section of NERC’s website.

    Given the above, and considering the rationale provided in the supporting document, do you support the SDT’s proposal to revise the current SOL definition? (Clarification: this question is not asking of you agree with the proposed definition. That will be addressed in a separate question. This question is focused on the need to modify the SOL definition at all.) Please explain your response.

    ☐ Yes
    ☐ No

    Comments:

2. Industry responses to the initial posting for informal comment in July of 2016 indicated general support for creating a new definition for SOL Exceedance. Since that time, a few key events have occurred that may relate to the need for creating a new definition for SOL Exceedance:
    a. In Order 817 FERC approved the TOP and IRO standards which became effective on April 1 of 2017.
    b. The NERC SOL Whitepaper entitled, “System Operating Limit Definition and Exceedance Clarification” which served as a conceptual basis for these TOP and IRO standards was referenced in paragraph 69 of FERC Order 817.

c. The NERC SOL Whitepaper is included in the list of ERO Enterprise endorsed Implementation Guidance documents in the Compliance Guidance section of NERC's website.

Despite these key events, many TOP and IRO standards require specific action based on SOL exceedances. For example, TOP-001-3 Requirement R14 states, *"Each Transmission Operator shall initiate its Operating Plan to mitigate a SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment."* The initiation of a TOP's Operating Plan per Requirement R14 depends completely on that particular TOP's interpretation of what it means to exceed an SOL. Several other TOP and IRO standards a similarly structured, where the actions taken in accordance with that requirement are governed by the TOP's or Reliability Coordinator's (RC) interpretation of what it means to exceed an SOL. As explained in the definitions rationales, the SDT contends that the absence of a definition could result in inconsistent interpretations of SOL exceedance that could compromise the intent of the standards and ultimately could compromise reliability. For this reason, the SDT is proposing to define SOL Exceedance and to incorporate that definition into the body of Reliability standards as described in the SOL Definitions Impact spreadsheet.

Given the above, and considering the rationale provided in the supporting document, do you support the SDT's proposal to create and implement a definition for SOL Exceedance? (Clarification: this question is not asking of you agree with the proposed definition. That will be addressed in a separate question. This question is focused on the need for having a definition of SOL Exceedance.) Please explain your response.

☐ Yes
☐ No

Comments:

3. The definitions rationales describe the improved clarity and consistency gained by the revised SOL definition. With the proposed definition, it is clear that SOLs are an input to Operational Planning Analyses (OPAs) and Real-time Assessments (RTAs), where the OPA and RTA are used to determine whether those SOLs are being exceeded for the pre- and post-Contingency states, given system conditions. This revised definition is designed to make use of the new TOP and IRO requirements for RCs and TOPs to perform OPAs and RTAs.

   Facility Ratings and System Voltage Limits are not determined by a "study"; rather they are inputs to the "study". On the other hand stability limits are determined through a "study"; however they are still inputs into the OPA and RTA process. FAC-011-4 Requirement R4 and subparts addresses the establishment of stability limits. Under the proposed definition, SOLs are simply the Facility Ratings, System Voltage Limits, and stability limits used in operations, which necessitates their use as an input into OPAs and RTAs.

Considering the simplified approach to SOLs described here and the explanations provided in the definitions rationales, do you agree with the proposed SOL definition? Please explain your response and/or provide alternative language.

☐ Yes
☐ No

Comments:

4. The definitions rationales provide a rationale for the need for a definition for SOL Exceedance. The proposed definition for SOL Exceedance is intended to codify the concepts in the NERC SOL Whitepaper which describes SOL exceedance as unacceptable system performance for the pre- or post-Contingency states with regard to Facility Ratings, System Voltage Limits, and stability limits. The proposed definition of SOL Exceedance along with the proposed definition of SOL describes what SOLs are and what it means to exceed them.

   Considering the explanations provided in the definitions rationales, do you agree with the proposed SOL Exceedance definition? Please explain your response and/or provide alternative language.

   ☐ Yes
   ☐ No

   Comments:

5. The post-Contingency portion of the proposed definition of SOL Exceedance includes three bullet items. This question focuses on the third bullet item:

   > The calculated post-Contingency state indicates any of the following:
   > - Defined stability performance criteria are not met

   The definitions rationales describe the intent of this bullet. In summary, established stability limits are not addressed by this bullet; established stability limits are addressed by the third and fourth bullet under the pre-Contingency state portion of the SOL Exceedance definition. This bullet is intended to apply only to those TOPs or RCs that additionally use real-time tools to determine whether or not defined stability performance criteria are being met in real-time operations in response to Contingency events. As is described in the definitions rationales, the SDT contends that any instance of not meeting stability performance criteria as indicated by these technologies should be considered as an SOL Exceedance because it triggers the appropriate response of the implementation of an Operating Plan to mitigate the condition. This use of real-time tools in this manner, however, does not make use of an established limit (i.e., a "value"); rather, the system is evaluated against defined stability performance criteria to determine if that criteria is being met or not. (Note that FAC-011-4, Requirement R4, Part 4.1 requires the RC's SOL Methodology to specify stability performance criteria.) If a TOP or a RC does not use real-time tools in this manner, then this bullet of the proposed SOL Exceedance definition would not apply to that TOP or RC, and the fourth bullet under the pre-Contingency section of the SOL Exceedance definition would govern stability performance.

Considering the explanations provided here and further explained in the definitions rationales, do you agree that the proposed SOL Exceedance definition should include this bullet item? Please explain your response and/or provide alternative language.

☐ Yes
☐ No

Comments:

6. The SAR is being revised to authorize the SDT to review the existing body of Reliability Standards and NERC Glossary of terms, and where necessary, modify those standards and definitions to incorporate the new terms and/or definition(s) of SOL Exceedance and System Voltage Limit, as well as the revised definition of System Operating Limit. The SDT has identified the standards and terms they contend would benefit from this incorporation and has included them in separate documents with this posting for your review. Do you agree with the SDT's selections? If not, please explain your response.

   ☐ Yes
   ☐ No

   Comments:

7. If you have any other comments **that you haven't already provided** in response to the above questions, please provide them here.

   Comments:

NERC Glossary Definitions: System Operating Limit and SOL Exceedance Rationale

Introduction

The standard drafting team ("SDT") for *Project 2015-09 Establish and Communicate System Operating Limits* developed these rationales to explain the modifications to the definition of the term "System Operating Limit" ("SOL ") and the definition for the new term "SOL Exceedance" to be incorporated into the Glossary of Terms Used in NERC Reliability Standards ("NERC Glossary"). As discussed below, the purpose of the proposed new and modified term is to provide greater clarity and consistency in establishing SOLs and develop a common understanding of what it means to exceed SOLs.

Background

The use of SOLs is a foundational concept in NERC's Reliability Standards as operating within SOLs for the pre- and post-Contingency state is a primary aspect of reliable Bulk Electric System ("BES") operations. An SOL is currently defined in the NERC Glossary as:

> *The value (such as MW, Mvar, amperes, frequency or volts) that satisfies the most limiting of the prescribed operating criteria for a specified system configuration to ensure operation within acceptable reliability criteria. System Operating Limits are based upon certain operating criteria. These include, but are not limited to:*
>
> - *Facility Ratings (applicable pre- and post-Contingency Equipment Ratings or Facility Ratings)*
> - *transient stability ratings (applicable pre- and post- Contingency stability limits)*
> - *voltage stability ratings (applicable pre- and post-Contingency voltage stability)*
> - *system voltage limits (applicable pre- and post-Contingency voltage limits)*

As discussed in the whitepaper prepared by the SDT for Project 2014-03 Revisions to TOP and IRO Standards (the "Project 2014-03 Whitepaper"), which developed the currently-effective Transmission Operations ("TOP") and Interconnection Reliability Operations and Coordination ("IRO") Reliability Standards, while the term SOL is used extensively in the NERC Reliability Standards, there is significant confusion with, and many widely varied interpretations and applications of, the term SOL. While the Project 2014-03 SDT did not seek to modify the SOL definition, they drafted the Project 2014-03 Whitepaper to describe their understanding of the SOL term/concept and to "bring clarity and consistency to the notion of establishing SOLs, exceeding SOLs, and implementing Operating Plans to mitigate SOL exceedances." The Project 2014-03 Whitepaper served as the conceptual basis for the development of the currently-effective TOP/IRO Reliability Standards.

As described in the Project 2014-03 Whitepaper, the central principles of the SOL concept in NERC's Reliability Standards is to:

1. Know the Facility Ratings, voltage limits, transient Stability limits, and voltage Stability limits, and

2. Ensure that they are all observed in both the pre- and post-Contingency state by performing a Real-time Assessment.

The first principle (i.e., know the Facility Ratings, voltage limits, and stability limits) is accomplished through the definition of SOL and Reliability Standards FAC-011 and FAC-014. The SOL values used in operations are determined pursuant to methodologies required by the Facilities Design, Connections and Maintenance ("FAC") group of Reliability Standards. Specifically, currently-effective Reliability Standard FAC-011-3 requires each Reliability Coordinator (RC) to have a documented methodology for developing SOLs (and criteria for identifying Interconnection Reliability Operating Limits ("IROLs")) within its Reliability Coordinator Area. Further, under currently-effective Reliability Standard FAC-014-2, TOPs must establish SOLs consistent with the RC's methodology and RC must determine which of those SOLs are IROLs.

The second principle (i.e., observing the SOLs in both the pre- and post-Contingency state) is accomplished through the requirements in the TOP/IRO Reliability Standards. Pursuant to the construct in the currently-effective TOP/IRO Reliability Standards approved in Order No. 817,[1] TOPs and RCs must assess system conditions, identify expected or actual SOL exceedances (including for the subset of SOLs designated as IROLs) and take steps to address any such exceedances to avoid the possibility of further deterioration in system conditions. Specifically, during the operations planning time horizon, RCs and TOPs must perform Operational Planning Analyses ("OPAs") to assess whether the planned operations for the next-day will exceed SOLs (including IROLs) within their area.[2] If the OPA identifies any potential exceedances, the RC and TOP must have an Operating Plan to address the exceedance.[3] Additionally, in Real-time, RCs and TOPs must perform Real-time Assessments ("RTAs") every 30 minutes to determine whether there are any expected or actual exceedances of SOLs (including IROLs) based on Real-time conditions.[4] If the RTA identifies any such exceedances, the RC and TOP must initiate an Operating Plan to mitigate the SOL exceedance.[5] If there is an expected or actual IROL exceedance identified in the RTA, the exceedance must be resolved within the IROL T_v, which can be no longer than 30 minutes.[6]

Following the development of the currently-effective TOP/IRO Reliability Standards, NERC initiated a periodic review of the requirements in the Facilities Design, Connections, and Maintenance ("FAC") group of Reliability Standards addressing SOLs. The periodic review team identified a need to revise or develop

---

1 *Transmission Operations Reliability Standards and Interconnection Reliability Operations and Coordination Reliability Standards*, Order No. 817, 153 FERC ¶ 61,178 (2015).

2 IRO-008-2, Requirement R1; TOP-004-2, Requirement R1.

3 IRO-008-2, Requirement R2; TOP-004-2, Requirement R2.

4 IRO-008-2, Requirement R4; TOP-001-3, Requirement R13.

5 IRO-008-2, Requirement R5; TOP-001-3, Requirement R14.

6 IRO-009-2, Requirements R1-R4; TOP-001-3, Requirement R12.

new definitions to be incorporated into the NERC Glossary to provide greater clarity and consistency in establishing SOLs and promote a common understanding of what it means to exceed SOLs. The periodic review team recognized that while the project 2014-03 Whitepaper provided clarity on the SOL concept, reliability would be further enhanced by (1) revising the SOL definition in the NERC Glossary, and (2) developing a new defined term SOL Exceedance. These two enhancements help to better align the definitions in the NERC Glossary with the Project 2014-03 Whitepaper and better support the SOL exceedance concept used in the TOP/IRO Reliability Standards. Subsequently, to address the issues identified in the periodic review, NERC initiated Project 2015-09 to revise the requirements for, and definitions related to, the methodology used for establishing and communicating SOLs.

The definition of SOL and the Reliability Standards that address SOLs – FAC-010, FAC-011, and FAC-014 – have remained essentially unchanged since their initial versions were approved and adopted in 2007. Since that time, many improvements have been made to the body of reliability standards, specifically those in the TPL, TOP, and IRO family of standards. The former TPL-001, -002, -003, and -004 Reliability Standards have been replaced with TPL-001-4, all of the TOP standards were replaced with the currently effective TOP-001, TOP-002, and TOP-003, and several IRO standards have been replaced as well. The definition of SOL and the FAC standards that address SOLs are inextricably linked to many of the TPL, TOP, and IRO standards, as they all address in some manner the foundational reliability concept of acceptable system performance. One of the primary objectives of Project 2015-09 is to make changes to the SOL definition and the related FAC standards to create better alignment with the currently effective TPL, TOP, and IRO standards. The SDT's proposal to revise the definition of SOL improves clarity, reduces redundancy, and creates better alignment and continuity with the currently effective TOP and IRO standards. In addition to revising the SOL definition and developing a definition for a new NERC Glossary term SOL Exceedance, the SDT for Project 2015-09 also developed a definition for a new NERC Glossary term System Voltage Limit to provide additional clarity and a common understanding as to the meaning of system voltage limits.

Modifications to SOL Definition

The Project 2015-09 SDT proposes to define the term System Operating Limit (SOL) as:

Facility Ratings, System Voltage Limits, and stability limits used in the operation of the BES.

The SDT's intent was to simplify and clarify the SOL definition by eliminating ambiguities such that SOLs are easily identifiable and easily measurable. The currently-effective SOL definition states that SOLs "are based upon certain operating criteria." The modified definition eliminates the phrase "are based upon" to more accurately state that the SOLs are the actual operating parameters which are to be observed for the pre- and post-Contingency states, leaving no confusion as whether a Facility Rating, stability limit, or voltage limit is an SOL. The unambiguous language in the modified definition should help facilitate a more consistent application of the SOL concept within the electric industry.

Facility Ratings, System Voltage Limits, and stability limits are the three types of operating criteria included in the existing SOL definition and carried forward into the modified definition that must be accounted for to ensure reliable operations. Facility Ratings must be established in accordance with Reliability Standard FAC-008-3. System Voltage Limits, as discussed below, is proposed to be defined as "the maximum and minimum steady-state voltage limits (both normal and emergency) that provide for acceptable System performance." Stability limits includes both transient stability limits and voltage stability limits. The intent of using the "stability limit" term (as opposed to the NERC Glossary term "Stability Limit") is to allow for a number of different types of stability-related limitations or phenomena, including, but not limited to, sub-synchronous resonance (SSR), phase angle limitations, transient voltage limitations on equipment, and weighted short-circuit ratio (WSCR). The Glossary term "Stability Limits" is not appropriate for use in the revised definition because its use is limited to a maximum power flow value. While some entities may use maximum power flow values as a means by which to prevent instability, this approach represents only one particular method and may be too restrictive for some entities. Reliability tools allow entities to monitor and control parameters other than maximum power flow values in order to demonstrate acceptable stability performance.

Unlike the existing SOL definition, the proposed definition includes the phrase "used in operations" to distinguish those Facility Ratings, voltage limits, and stability limits that are used in planning. The SDT determined that the SOL concept should be limited to the operational time horizon and thus proposes to retire FAC-010-3. The Facility Ratings, voltage limits, and stability criteria used in the planning horizon are developed according to FAC-008-3 and TPL-001-4 and, as a result, there was no additional reliability need to require Planning Authorities to develop SOLs to be used in the planning horizon. The SDT concluded, however, that there was a reliability need to coordinate the Facility Ratings, voltage limits, and stability criteria used in planning with those used in operations. The SDT developed proposed Reliability Standard FAC-015-1 to address that issue.

Furthermore, as discussed in detail below, the SDT determined that references to "most limiting criteria", "specified system configuration", "acceptable reliability criteria", and "pre- and post-contingency" in the currently-effective definition of SOL were adding to industry confusion as to what constitutes an SOL. These phrases are no longer necessary since they are reliable operations concepts that are addressed in the new TOP/IRO Reliability Standards, the proposed FAC-011-4 Requirement R4, and further reinforced with the proposed definition of SOL Exceedance.

<u>Most limiting Criteria</u> – The SDT concluded that removing the "most limiting criteria" concept in favor of designating all Facility Ratings, System Voltage Limits, and stability limits as SOLs is better aligned with the requirements in the TOP/IRO Reliability Standards. As noted above, under the TOP/IRO Reliability Standards, each RC and TOP must perform Operational Planning Aanalysis (OPAs) and Real-time Assessments (RTAs) to assess conditions in the day ahead and Real-time horizon and, if it identifies any actual, expected or potential SOL exceedance, take appropriate mitigating action to maintain pre- and post-contingency reliable operations. Under the currently-effective SOL definition, RCs and TOPs must initially determine which operating parameter is the most limiting at that point in time to be designated as the SOL and then determine if there are any actual, potential, or expected exceedances of that SOL. The SDT understands that this has caused some confusion within industry. Specifically, it may be unclear in Real-time operations when an SOL ceases to be an SOL because it is no longer the "most limiting criteria."

Confusion is introduced when the most limiting criteria (and thus the SOL) changes from one RTA to the next.

The SDT determined that it is more straightforward to simply categorize all Facility Ratings, System Voltage Limits, and stability limits as SOLs. In performing OPAs and RTAs, RCs and TOPs should be assessing conditions as it relates to any operating parameter or reliability limit, not the most limiting parameter or limit based on a particular prior analysis. Under the new TOP and IRO requirements, RCs and TOPs are assessing conditions to determine whether there are any actual, potential, or expected exceedances of any Facility Rating, System Voltage Limit, or stability limit, which would necessarily include the most limiting of those parameters/limits. In this manner, the "most limiting criteria" concept is subsumed within the requirements of the TOP/IRO Reliability Standards and it is not necessary that it be included in the SOL definition. In short, the proposed SOL definition creates a simplified approach. There is no need to continuously identify and communicate the ever-changing "most limiting" criteria. Entities must simply operate – and plan to operate – to prevent any exceedance of a Facility Rating, System Voltage Limit, and stability limit.

The SDT determined that the removal of the "most limiting criteria" from the SOL definition represents an improvement to reliability. The "most limiting criteria" can adversely impact reliability by masking instability risks that may exist slightly beyond the point of the most limiting condition. To illustrate, where prior studies indicate that a thermal limitation is the "most limiting criteria," if the studying entity does not study the performance of the system appreciably beyond this thermal limitation to reasonably expected stressed conditions, it cannot be safely concluded that a more significant instability risk does not exist slightly beyond the point where the "most limiting criteria" exists. Because actions may be taken in the actual system conditions that mitigate thermal and voltage limitations identified as a "most limiting criteria", it may be necessary to identify where subsequent operation may approach a point of instability. Consistent with this concept, the RC and its TOPs have the responsibility of identifying instability risks in accordance with the Reliability Coordinator's SOL Methodology, as required by FAC-011-4 Requirement R4.

<u>Specified System Configuration</u> – The SDT proposes to remove reference to a "specified system configuration" as that concept is also subsumed within the TOP/IRO Reliability Standards. Specifically, in performing OPAs and RTAs, RCs and TOPs must consider specified system conditions such as transmission and generation outages, generation output levels, and load levels. Further, the majority of Facility Ratings and System Voltage Limits are not dependent upon system configuration whereas stability limits are frequently dependent on system configuration. System configuration for the establishment of stability limits is addressed in proposed FAC-011-4, Requirement R4. Because the "specified system condition" is addressed within the definition of OPA and RTA, and because it is also addressed in FAC-011-4 requirement R4 for instability issues, including the phrase "specified system configuration" in the definition of SOL is redundant, unnecessary, and may cause confusion.

<u>Acceptable Reliability Criteria</u> – As with the above two components, the "acceptable reliability criteria" concept is best addressed through requirement language. The SDT determined that the SOL definition should focus simply on what constitutes an SOL and the requirements should focus on methodologies for establishing those SOLs and on ensuring that they are honored in OPAs and RTAs to provide for reliable

operations. Requirement R4 of proposed FAC-011-4 requires the RC to specify stability performance criteria in its SOL Methodology for single Contingencies and for identified multiple Contingencies. Further, the proposed definition of SOL Exceedance addresses stability performance and specifies the reliability criteria for Facility Ratings and System voltage limits for the pre- and post-Contingency states. Taken together with the requirement to study the limits in OPAs and RTAs, the revised FAC-011 and the new definition of SOL Exceedance addresses operation within acceptable reliability criteria.

Pre- and Post-Contingency – The current SOL definition specifies for each of the listed operating limits that it is for pre- and post-contingency states. The SDT determined that the SOL definition need not include such specificity. First, the definitions of OPA and RTA include pre- and post-Contingency analysis. As OPAs and RTAs are the mechanisms in the Reliability Standards for determining potential SOL exceedances (OPA) and actual SOL exceedances (RTA),[7] and because the pre- and post-Contingency states are included in the definition of OPA and RTA, there is no need to duplicate the "pre- and post-Contingency" language in the definition of SOL. Additionally, the pre- and post-Contingency concept is inherent in the definition of some SOLs. For example, many stability limits are defined to prevent instability for specified Contingency events. Accordingly, the pre- or post-contingency nature of an established stability limit would be covered by FAC-014-4 Requirement R4 instead of through the SOL definition. Furthermore, the pre- and post-Contingency operating conditions are addressed in the proposed definition of SOL Exceedance as it relates to Facility Ratings, System voltage Limits, and stability limits.

One aspect of the improved clarity of the revised definition of SOL is seen in its intended use. Under the revised definition, SOLs are intended to be used as an input into the OPA and RTA process.[8] The OPA and RTA process itself examines SOLs for the pre- and post-Contingency states and determines whether the SOLs are being exceeded. Accordingly, while SOLs are an input to the OPA and RTA process, SOL exceedance is the output of the OPA and RTA process. The proposed definition of SOL Exceedance is discussed below.

Lastly, as with the currently-effective SOL definition, the proposed SOL definition does not include reference to IROLs. IROLs, as currently defined, are a subset of SOLs that, if exceeded, "could lead to instability, uncontrolled separation, or Cascading outages that adversely impact the reliability of the BES." The determination of when an SOL should be designated as an IROL is most appropriately addressed in the RC's SOL methodology. There is no need to mention IROLs in the definition of SOL.

SOL Exceedance Definition

Many of the TOP/IRO Reliability Standards use the phrase "SOL exceedance" or otherwise reference the concept of "exceeding an SOL." As discussed above, the actual, potential, or expected exceedance of an SOL as identified by OPAs and RTAs requires applicable RCs and TOPs to develop Operating Plans and take

---

[7] In Order No. 705 (at P 162), the Commission stated that system performance is determined through studies, stating "the Commission believes that to demonstrate the pre- and post-contingency performance metrics required by [FAC-010-1] Requirements R2.1-R2.2 an assessment or analysis would need to be performed. As such, Requirements R2.1-R2.2 provide for actions that go beyond NERC's characterization of the subject of the requirements as limited to a list of topics that must be included in a methodology. Therefore, we conclude that these Requirements are more Docket No. RM07-3-000 - 79 - properly treated as implementation or operational requirements that may have a direct impact on reliability."

[8] Some Reliability Coordinators and Transmission Operators may establish stability limits in the context of an OPA or RTA. For entities who adopt this approach, the stability SOL would be established – and its exceedance determined – as part of the OPA or RTA.

mitigating action in accordance with those Operating Plans to address the exceedance. Without a clear and consistent understanding of what it means to exceed an SOL, however, RCs and TOPs may apply the requirements in the TOP/IRO Reliability Standards inconsistently, which could result in widely varying reliability performance. For example, TOP-001-3 Requirement R14 states:

> R14. Each Transmission Operator shall initiate its Operating Plan to mitigate a SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment.

The initiation of a TOP's Operating Plan per Requirement R14 depends completely on that particular TOP's interpretation of what it means to exceed an SOL. One TOP might interpret SOL exceedance to not include the post-Contingency state when identifying SOL exceedance; rather, it would look only to pre-Contingency (or actual) flows to make that determination. Such an interpretation, however, compromises reliability and is not consistent with the intent behind the SOL exceedance concept, as described in the Project 2014-03 Whitepaper, upon which the TOP/IRO Reliability Standards are based. Nevertheless, because there is no definition of the phrase "SOL exceedance" or specific requirements on how to identify an SOL exceedance, nothing prevents a Transmission Operator from adopting such an interpretation.

To ensure there is a common understanding of what it means to exceed an SOL, the Project 2015-09 SDT proposes to add the term SOL Exceedance to the NERC Glossary with the following definition:

> *An operating condition or analysis result characterized by any of the following, as determined in Real-time monitoring, Real-time Assessments (RTA) or Operational Planning Analysis (OPA):*
>
> *The pre-Contingency state indicates any of the following:*
>
> - *Actual flow through a Facility is above the Facility's Normal Rating*
> - *Actual bus voltage is outside normal System Voltage Limits*
> - *A stability limit established to prevent instability without a Contingency is exceeded*
> - *A stability limit established to prevent the Contingency from resulting in instability is exceeded*
>
> *The calculated post-Contingency state indicates any of the following:*
>
> - *Flow through a Facility is above the Facility's highest Emergency Rating, or above a Facility Rating for which there is not sufficient time to reduce the flow to established acceptable levels should the Contingency occur*
> - *Bus voltage is outside the highest or lowest emergency System Voltage Limit, or outside a System Voltage Limit for which there is not sufficient time to bring the bus voltage to established acceptable levels should the Contingency occur*
> - *Defined stability performance criteria are not met*

The following is a discussion of each of the components in the proposed SOL Exceedance definition:

Component #1 – *An operating condition or analysis result characterized by any of the following, as determined in Real-time monitoring, Real-time Assessments (RTA) or Operational Planning Analysis (OPA):*

The TOP/IRO Reliability Standards require the RC and the TOP to perform OPAs to assess whether its planned operations for the next day will exceed any of its SOLs. Per the definition of OPA, these assessments must address both the pre-Contingency state and the post-Contingency state based on expected system conditions. If the OPA identifies an SOL exceedance, the TOPs and RC are required to develop an Operating Plan(s) to address the SOL exceedances identified in the OPA. SOL exceedances are also identified as part of Real-time monitoring and RTAs. Per the definition of RTA, these assessments must address both the pre-Contingency state and the post-Contingency state using real-time data. If Real-time monitoring or the RTA identifies an SOL exceedance, the TOPs and RC are required to implement an Operating Plan to address that SOL exceedance. Accordingly, an SOL exceedance is fundamentally an identified operating condition or an expected or potential operating conditioned determined by an analysis of system conditions or expected system conditions.

Component #2 – *The pre-Contingency state indicates any of the following; The calculated post-Contingency state indicates any of the following*

As is discussed in the Project 2014-03 Whitepaper, unacceptable system performance for either the pre- or the post-Contingency state translates to an SOL exceedance. Consistent with the Project 2014-03 Whitepaper, the proposed definition of SOL Exceedance is based on the system performance requirements described in FAC-011-3 Requirement R2.1 and R2.2, which address both the pre- and post-Contingency states.

The proposed definition refers to the "*calculated* post-Contingency state." That is because when OPAs and RTAs are performed, RCs and TOPs use the analysis tools or processes to determine, or calculate, how the system is expected to perform in response to Contingency events.

The proposed definition does not specify whether the post-Contingency state is applicable to single Contingencies or multiple Contingencies. The SDT intends for this issue to be addressed in the RC's SOL Methodology. Currently-effective Reliability Standards FAC-011-3 Requirement R2.2 provides that acceptable system performance for the post-Contingency state is applicable to the single Contingencies specified in Requirements R2.2.1 through R2.2.3. These same single Contingencies are addressed in proposed FAC-011-4 Requirement R5.1.1. Nevertheless, some RCs establish stability limits for certain multiple Contingency events. Per proposed FAC-011-4, Requirements R5.3 and R5.4, the RC's SOL Methodology is required to specify which multiple Contingencies are required to be included for the establishment of stability limits and for stability performance in OPAs and RTAs.

Component #3 – *The pre-Contingency state indicates: … Actual flow through a Facility is above the Facility's Normal Rating*

The SDT determined that any persistent exceedance of a Normal Rating should be regarded as an SOL exceedance, even if the exceedance occurs for an acceptable duration.[9] This approach accomplishes the intended reliability objective of triggering the appropriate action (i.e., implementing an Operating Plan to address the exceedance). If such an exceedance is identified during an OPA, the relevant TOP or RC must have an Operating Plans to mitigate the SOL Exceedance. If identified in an RTA, an actual SOL Exceedance triggers the implementation of Operating Plans to mitigate the SOL Exceedance. The specifics and the timing of those mitigating actions must be contained in the Operating Plan.

Component #4 – *The pre-Contingency state indicates: … Actual bus voltage is outside normal System Voltage Limits*

The language in this component mirrors the language in the preceding bullet applicable to Facility Ratings. The same concepts described above apply.

Component #5 – *The pre-Contingency state indicates: … A stability limit established to prevent instability without a Contingency is exceeded*

The SDT concluded that it is possible to establish a limit to prevent instability from occurring without a Contingency. For example, transfer analyses might indicate that at a certain level of MW transfer over a Facility, the knee of a PV curve is reached without a Contingency. While such limits might not be as common as those that are associated with a Contingency, it is possible for such pre-Contingency instability conditions to occur, therefore it is included in the SOL Exceedance definition as these instances should be addressed in an Operating Plan. Such limits are often established through studies performed one or more days prior to Real-time, though the value of such a limit may be calculated in Real-time. If the TOP or RC does not establish this type of stability limit, then this component of the SOL Exceedance definition would not apply to that TOP or RC.

Component #6 – *The pre-Contingency state indicates: … A stability limit established to prevent the Contingency from resulting in instability is exceeded*

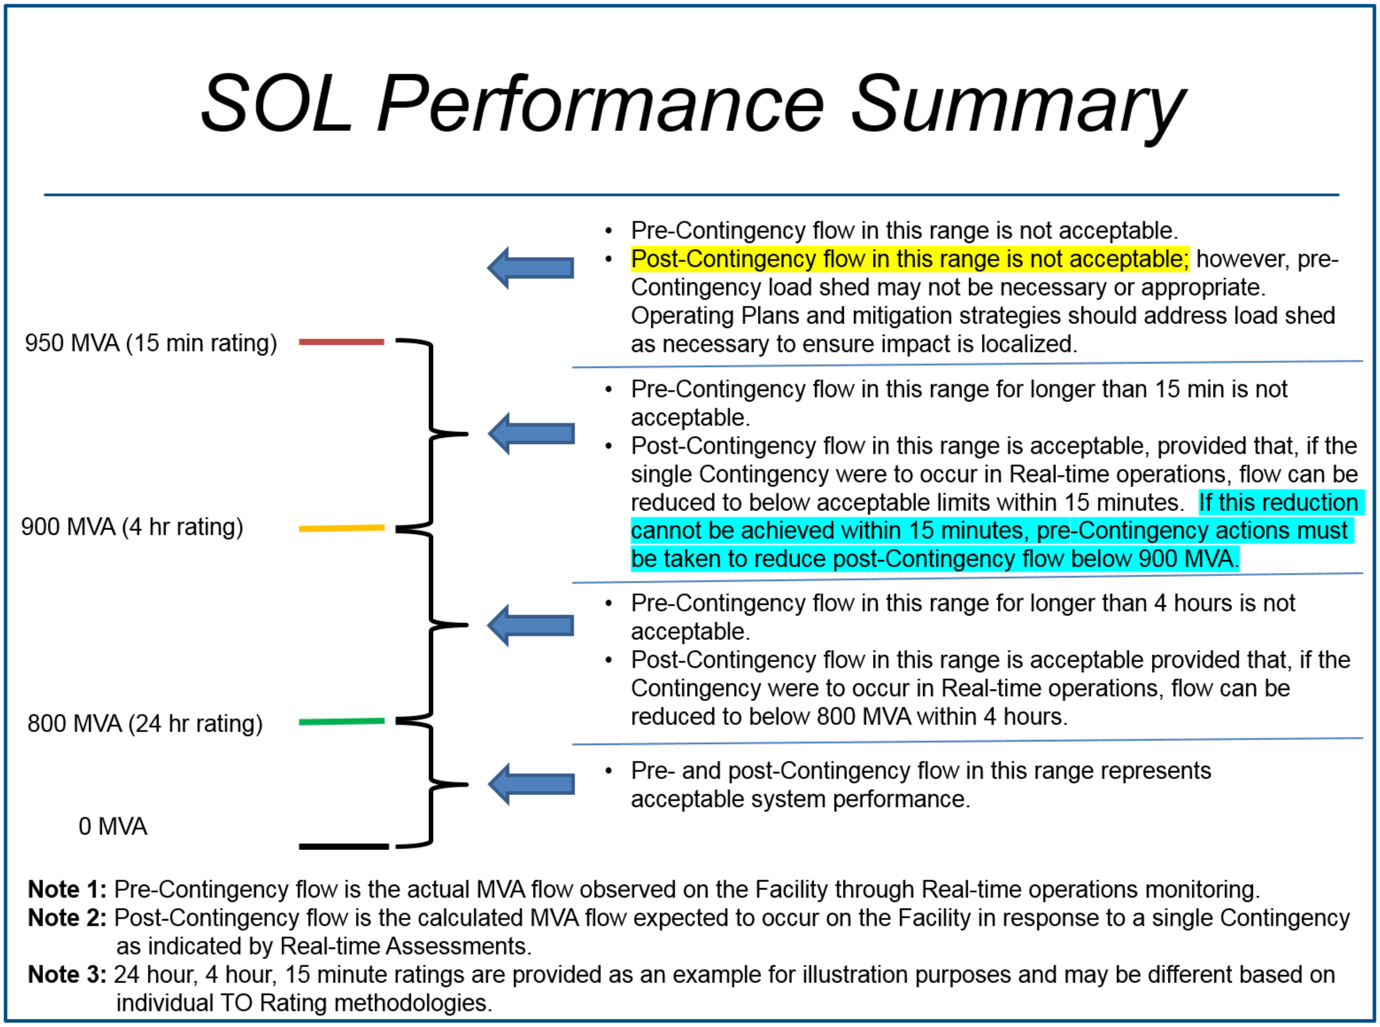
The majority of stability limits are established to prevent instability from occurring in the event of certain Contingencies. When the system is operated within this type of stability limit, it is expected that the system would remain stable should any of the identified Contingencies occur. Conversely, when this type of stability limit is being exceeded, the system is not expected to remain stable should any of the identified Contingencies occur. While this type of stability limit is monitored in the pre-Contingency state, it actually addresses post-Contingency instability. For example, a transmission interface might have a voltage stability limit of 1000 MW to prevent Contingency X from resulting in voltage instability. If flow on the interface is kept below 1000 MW, the system is expected to remain stable should Contingency X occur; however, if flow on the interface exceeds 1000 MW, the system is expected to experience voltage instability should Contingency X occur. These types of stability limits are typically established through studies performed one or more days prior to Real-time; however, the value of these limits may be calculated in real-time.

---

9 Emergency Ratings will always equal to or greater than the Normal Rating.

Component #7 – *The calculated post-Contingency state indicates: … Flow through a Facility is above the Facility's highest Emergency Rating, or above a Facility Rating for which there is not sufficient time to reduce the flow to established acceptable levels should the Contingency occur*

The SDT concluded that the two instances contained within this item provide additional clarity that could prevent inaccurate interpretations of what it means to exceed an SOL. The intent behind this component of the definition is to reflect the concepts described in the Project 2014-03 Whitepaper with regard to Facility Rating exceedances, specifically, the two highlighted items in the diagram below. The portion of the definition that states, *"Calculated post-Contingency flow through a Facility is above the Facility's highest Emergency Rating"* is intended to specifically address the operating state highlighted in yellow. This operating state is considered an SOL Exceedance because this designation accomplishes the desired outcome by triggering mitigating action through the implementation of an Operating Plan. In this scenario, the System Operator has no time to implement post-Contingency mitigation actions (i.e., actions that occur after the Contingency event occurs); therefore, pre-Contingency mitigation actions consistent with the Operating Plan must be taken to reduce the calculated post-Contingency flow. The portion of the definition that states, *"…or above a Facility Rating for which there is not sufficient time to reduce the flow to established acceptable levels should the Contingency occur"* is intended to address the operating state highlighted in light blue. Again, in this scenario, the System Operator does not have adequate time to implement post-Contingency mitigation actions ; therefore, pre-Contingency mitigation actions consistent with the Operating Plan must be taken to reduce the calculated post-Contingency flow. This operating state is also considered an SOL Exceedance because this designation accomplishes the desired outcome by triggering mitigating action through the implementation of an Operating Plan.



Component #8 – *The calculated post-Contingency state indicates: … Bus voltage is outside the highest or lowest emergency System Voltage Limit, or outside a System Voltage Limit for which there is not sufficient time to bring the bus voltage to established acceptable levels should the Contingency occur*

The language in this component mirrors the language in the preceding bullet applicable to Facility Ratings. The same concepts described above apply. Regarding time-based System Voltage Limits, the proposed definition acknowledges that time-based System Voltage Limits are used by some TOPs and RCs. The proposed definition provides the operational flexibility for the use of time-based voltage limits in the same manner that time-based Facility Ratings are used.

As an example, a TOP could have a NORMAL System Voltage Limit of +/- 5%, an EMERGENCY System Voltage Limits of +7% and -10%, and an additional short term EMERGENCY HIGH System Voltage Limit of +10% for 15 minutes. Applying a 15 minute time value to the short term EMERGENCY HIGH System Voltage Limit of +10% could allow post-Contingency operator action to mitigate a concern as opposed to enforcing pre-Contingency action plan. In this example, a calculated post-Contingency voltage above 107% of normal but below 110% could be resolved with post-contingent action, which could be described in the Operating Plan.

<u>Component #9</u> – The calculated post-Contingency state indicates: … Defined stability performance criteria are not met

The requirements in FAC-011-4 and FAC-014-4 address the establishment of stability limits and IROLs:

1. FAC-011-4 Requirement R4, Part 4.1 requires the RC's SOL Methodology to specify the stability performance criteria that is to be used for the establishment of stability limits.
2. FAC-011-4 Requirement R4 Part 4.2 requires that stability limits are established to meet the criteria specified in Part 4.1 for the Contingencies identified in Requirement R5.
3. FAC-014-3 Requirement R1 requires the RC to establish IROLs in accordance with the SOL Methodology.
4. FAC-014-3 Requirement R2 requires the TOP to establish SOLs in accordance with the SOL Methodology.
5. FAC-014-3 Requirement R4 requires the RC to establish stability limits when the limit impacts more than one Transmission Operator in its Reliability Coordinator Area in accordance with its SOL Methodology.

The end result of these requirements is that stability limits – some of which may be IROLs – will be established in accordance with the RC's SOL Methodology. These stability limits are addressed through the third and fourth bullets in the pre-Contingency state section of the SOL Exceedance definition which state:

The pre-Contingency state indicates any of the following:

- A stability limit established to prevent instability without a Contingency is exceeded
- A stability limit established to prevent the Contingency from resulting in instability is exceeded

Accordingly, if any defined stability limit is exceeded, the third and fourth bullets in the pre-Contingency section addresses those as SOL Exceedances. These stability limits can be determined prior to Real-time, or they can be determined in Real-time through the use of Real-time stability tools. With the adoption of technology implementations, some TOPs and RCs are using stability analysis tools to calculate stability limits in Real-time using the actual system conditions as an input to the analysis. Such implementations bring a significant improvement to the accuracy of stability limits. However, regardless of when the stability limit is calculated, the above bullets apply regarding when an actual SOL Exceedance of these stability limits occurs.

However, some implementations of Real-time tools in operations, particularly transient stability tools, present a challenge to the historical paradigms of operating within established limits. For example, Real-time transient stability tools have the ability to assess actual system conditions to determine whether the system is expected to be transiently stable (or to meet certain transient performance criteria) for a set of modeled Contingencies. Real-time transient stability tools give TOPs and RCs the ability to determine in Real-time whether or not a given Contingency would result in acceptable damping or acceptable transient voltage response. When such tools are used to determine acceptable transient system performance, the tools may not calculate "an SOL" (a stability limit) in the traditional sense, i.e., the tools may not calculate a value that, if operated within, prevents the system from exceeding transient performance criteria should the critical Contingency occur (which would be monitored under the fourth bullet under the pre-Contingency section of the SOL Exceedance definition). Rather, these tools can be used in a manner to indicate when the transient performance criteria are being, or are expected to be, met.

Modern technology implementations of stability analysis tools have the ability to inform System Operators at any moment in Real-time whether the system is “stable” or whether it is “unstable” for the next Contingency event without the use of a traditional “SOL value”. For entities that use such tools as an additional mechanism to determine Real-time instability (above and beyond monitoring any defined stability limits established per the Requirements referenced in items 1-5 listed above), if defined stability performance criteria are not being met, an Operating Plan should be implemented to mitigate the condition. Such an approach represents a significant improvement in the accuracy of monitoring for acceptable stability performance in response to Contingencies; however, such an approach may not utilize an “SOL value” (a defined stability limit value) that is monitored in the traditional sense. This type of assessment, while not utlilizing a defined SOL value, does evaluate for acceptable system stability performance (i.e., post-Contingency stable operations), and as such, should be integrated into the definition. The SDT believes that operating entities should be encouraged to integrate new technologies to improve the accuracy of its reliability assessments, and that any instance of not meeting stability performance criteria as indicated by these technologies should be considered as an SOL Exceedance because it triggers the appropriate response of the implementation of an Operating Plan to mitigate the condition. It is important that the SOL Exceedance definition be “technology neutral” by addressing the techniques used to identify unacceptable stability performance in addition to the conventional or historical methods of performing studies, establishing a defined limit based on those studies, and then operating within that defined limit in Real-time.

If the TOP or RC does not utilize Real-time stability tools to determine the system’s response to Contingency events and to evaluate that response against defined stability performance criteria, but solely utilizes a more traditional approach for establishing stability limits (i.e., limit “values”) to address system instability, then the third bullet in the post-Contingency section of the proposed SOL Exceedance definition would not apply to that TOP or RC, and the fourth bullet under the pre-Contingency section of the SOL Exceedance definition would govern stability performance.

It should be noted that the third bullet in the post-Contingency section is going above and beyond the other components of the SOL Exceedance definition that addresses traditionally defined stability limits (the fourth bullet under the pre-Contingency section of the SOL Exceedance definition). The third bullet under the post-Contingency section is included in the definition of SOL Exceedance to enhance reliability by requiring that any operating condition characterized as “unstable” as determined by Real-time stability analysis tools is also regarded as an SOL Exceedance in order to trigger the implementation of an Operating Plan to address the condition. It important to note that TOPs and RCs that use Real-time stability analysis tools in this manner are also required to monitor any traditionally defined stability limits and to consider any exceedance of those limits under the the third and fourth bullets under the pre-Contingency section of the SOL Exceedance definition.

Page(s)	Requirement Details
21	Bullet item under Managing Contstraints: Identify and monitor SOL's & IROL's (TOP, RC)
25	Criterion 2.6 includes BES Cyber Systems for those Generation Facilities that have been identified as critical to the derivation of IROLs and their associated contingencies, as specified by FAC-014-2, Establish and Communicate System Operating Limits, R5.1.1 and R5.1.3.
28	Criterion 2.6 includes BES Cyber Systems for those Generation Facilities that have been identified as critical to the derivation of IROLs and their associated contingencies, as specified by FAC-014-2, Establish and Communicate System Operating Limits, R5.1.1 and R5.1.3.
12	The Reliability Coordinator shall review Transmission outages and work with the Transmission Operator(s) to see if it's possible to return to service any Transmission Elements that may relieve the loading on System Operating Limits (SOLs) or Interconnection Reliability Operating Limits (IROLs).
10 of 22	Event Type: IROL Violation (all Interconnections) or SOL Violation for Major WECC Transfer Paths (WECC only) Threshold for Reporting: Operate outside the IROL for time greater than IROL Tv (all Interconnections) or Operate outside the SOL for more than 30 minutes for Major WECC Transfer Paths (WECC only).
12	There is a checkbox for IROL Violation (all Interconnections) or SOL Violation for Major WECC Transfer Paths (WECC only)
12-13	See EOP-011-1 tab
1	A Facility Rating is essential for the determination of System Operating Limits.
1	A statement that the assessment shall respect known System Operating Limits (SOLs).

1	Transmission Owners shall have a TMIP detailing their inspection and maintenance requirements that apply to all transmission facilities necessary for System Operating Limits associated with each of the transmission paths identified in table titled “Major WECC Transfer Paths in the Bulk Electric System.”
4	1) A list of Facilities and associated Elements necessary to maintain the SOL for the transfer paths identified in the most current Table titled “Major WECC Transfer Paths in the Bulk Electric System;”
1,2, 4	Each Reliability Coordinator shall monitor Facilities, the status of Special Protection Systems, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.
8 (multiple)	See IRO-002-4 tab
2	Each Reliability Coordinator shall monitor Facilities, the status of Remedial Action Schemes, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.
1	To ensure coordinated action between Interconnections when implementing Interconnection-wide transmission loading relief procedures to prevent or manage potential or actual SOL and IROL exceedances to maintain reliability of the bulk electric system.
1	To coordinate action between Reliability Coordinators within the Eastern Interconnection when implementing transmission loading relief procedures (TLR) for the Eastern Interconnection to prevent or manage potential or actual System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances to maintain reliability of the Bulk Electric System (BES).

1	Each Reliability Coordinator that initiates the Eastern Interconnection TLR procedure to prevent or mitigate an SOL or IROL exceedance shall identify the TLR level and the congestion management actions to be implemented, and shall update this information at least every clock hour (except TLR-1) after initiation up to and including the hour when the TLR level has been identified as TLR Level 0.[1]
1	To provide and execute transmission loading relief procedures that can be used to mitigate SOL or IROL exceedances for the purpose of maintaining reliable operation of the bulk electric system in the ERCOT Region.
1	The RC shall have procedures to identify and mitigate exceedances of identified Interconnection Reliability Operating Limits (IROL) and System Operating Limits (SOL) that will not be resolved by the automatic actions of the ERCOT Nodal market operations system.
1	The RC shall act to identify and mitigate exceedances of identified Interconnection Reliability Operating Limits and System Operating Limits that will not be resolved by the automatic actions of the ERCOT Nodal market operations system, in accordance with the procedures required by R1.
1, 5	Each Reliability Coordinator shall perform an Operational Planning Analysis that will allow it to assess whether the planned operations for the next-day will exceed System Operating Limits (SOLs) and Interconnection Operating Reliability Limits (IROLs) within its Wide Area.
1, 5	Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities.

2, 7-8	Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the results of a Realtime Assessment indicate an actual or expected condition that results in, or could result in, a System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance within its Wide Area.
2-3, 9-11	Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R5 has been prevented or mitigated.
12	various (Same exact language is found in the Associated Documents section of IR0-008-2, IRO-014-3, TOP-001-3, TOP-002-4) See Associated Docs tab.
2-3	Each methodology shall describe the method used to account for the following limitations in both the pre- and post-contingency state: 1.1.1 Facility ratings; 1.1.2 System voltage limits; 1.1.3 Transient stability limits; 1.1.4 Voltage stability limits; and 1.1.5 Other System Operating Limits (SOLs).
4	Determine the incremental Transfer Capability for each ATC Path by increasing generation and/or decreasing load within the source Balancing Authority area and decreasing generation and/or increasing load within the sink Balancing Authority area until either: - A System Operating Limit is reached on the Transmission Service Provider's system, or - A SOL is reached on any other adjacent system in the Transmission model that is not on the study path and the distribution factor is 5% or greater[1].

3,6	Each Transmission Operator shall establish the TTC at the lesser of the value calculated in R2 or any System Operating Limit (SOL) for that ATC Path.
3	Establish the TFC of each of the defined Flowgates as equal to: - For thermal limits, the System Operating Limit (SOL) of the Flowgate. - For voltage or stability limits, the flow that will respect the SOL of the Flowgate.
1	Reliability Coordinator operating personnel shall place particular attention on SOLs and IROLs and inter-tie facility limits. The Reliability Coordinator shall ensure protocols are in place to allow Reliability Coordinator operating personnel to have the best available information at all times.
12	Rationales for R1, R2, and R5.
3	[R5.] Each Responsible Entity shall: [R5.1] Identify BES Elements for which dynamic Disturbance recording (DDR) data is required, including the following: [R5.1.2] Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL).
33	Permanent System Operating Limits (SOLs) are used to operate the System within reliable and secure limits. In particular, SOLs related to angular or voltage stability have a significant impact on BES reliability and performance. Therefore, at least one BES Element of an SOL should be monitored.
2-3	Transmission Operators shall adjust the SOL and operate the facilities within established limits.

29	Rationale for R8 - Requirement R8 supports the integrated and coordinated approach to UVLS programs directed by Paragraph 1509 of Order No. 693 by requiring that UVLS Program data be shared with neighboring Planning Coordinators and Transmission Planners within a reasonable time period. Requests for the database should also be fulfilled for those functional entities that have a reliability need for the data (such as the Transmission Operators that develop System Operating Limits and Reliability Coordinators that develop Interconnection Reliability Operating Limits).
3	Each Planning Coordinator shall, at least once each calendar year, provide notification of each generator, transformer, and transmission line BES Element in its area that meets one or more of the following criteria, if any, to the respective Generator Owner and Transmission Owner: Criteria: 1. Generator(s) where an angular stability constraint exists that is addressed by a System Operating Limit (SOL) or a Remedial Action Scheme (RAS) and those Elements terminating at the Transmission station associated with the generator(s). 2. An Element that is monitored as part of an SOL identified by the Planning Coordinator's methodology[1] based on an angular stability constraint. [1] NERC Reliability Standard FAC-014-2 – Establish and Communicate System Operating Limits, Requirement R3.

16-17	R1 Criterion - The first criterion involves generator(s) where an angular stability constraint exists that is addressed by a System Operating Limit (SOL) or a Remedial Action Scheme (RAS) and those Elements terminating at the Transmission station associated with the generator(s). For example, a scheme to remove generation for specific conditions is implemented for a four-unit generating plant (1,100 MW). Two of the units are 500 MW each; one is connected to the 345 kV system and one is connected to the 230 kV system. The Transmission Owner has two 230 kV transmission lines and one 345 kV transmission line all terminating at the generating facility as well as a 345/230 kV autotransformer. The remaining 100 MW consists of two 50 MW combustion turbine (CT) units connected to four 66 kV transmission lines. The 66 kV transmission lines are not electrically joined to the 345 kV and 230 kV transmission lines at the plant site and are not subject to the operating limit or RAS. A stability constraint limits the output of the portion of the plant affected by the RAS to 700 MW for an outage of the 345 kV transmission line. The RAS trips one of the 500 MW units to maintain stability for a loss of the 345 kV transmission line when the total output from both 500 MW units is above 700 MW. For this example, both 500 MW generating units and the associated generator step-up (GSU) transformers would be identified as Elements meeting this criterion. The 345/230 kV autotransformer, the 345 kV transmission line, and the two 230 kV transmission lines would also be identified as Elements meeting this criterion. The 50 MW combustion turbines and 66 kV transmission lines would not be identified pursuant to Criterion 1 because these Elements are not subject to an operating limit or RAS and do not terminate at the Transmission station associated with the generators that are subject to the SOL or RAS.
17	R1 Criterion - The second criterion involves Elements that are monitored as a part of an established System Operating Limit (SOL) based on an angular stability limit regardless of the outage conditions that result in the enforcement of the SOL. For example, if two long parallel 500 kV transmission lines have a combined SOL of 1,200 MW, and this limit is based on angular instability resulting from a fault and subsequent loss of one of the two lines, then both lines would be identified as Elements meeting the criterion.
4	Each Transmission Operator shall perform the following as necessary for determining System Operating Limit (SOL) exceedances within its Transmission Operator Area:

5	Each Transmission Operator shall initiate its Operating Plan to mitigate a SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment.
5	Each Transmission Operator shall inform its Reliability Coordinator of actions taken to return the System to within limits when a SOL has been exceeded.
5-6	Each Transmission Operator shall operate to the most limiting parameter in instances where there is a difference in SOLs.
7, 19	See TOP-001-3 tab
4-5	[R10.] Each Transmission Operator shall perform the following for determining System Operating Limit (SOL) exceedances within its Transmission Operator Area:
5	Each Transmission Operator shall initiate its Operating Plan to mitigate a SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment

6	Each Transmission Operator shall initiate its Operating Plan to mitigate a SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment
6	Each Transmission Operator shall operate to the most limiting parameter in instances where there is a difference in SOLs.
9	Each Transmission Operator shall retain evidence and that it initiated its Operating Plan to mitigate a SOL exceedance as specified in Requirement R14 and Measurement M14 for three calendar years.
24	See TOP-001-4 tab
1,4	Each Transmission Operator shall have an Operational Planning Analysis that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any of its System Operating Limits (SOLs).
1,4	Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1.

10	See TOP-002-4 tab
2	Each Transmission Operator shall specify a system voltage schedule (which is either a range or a target value with an associated tolerance band) as part of its plan to operate within System Operating Limits and Interconnection Reliability Operating Limits.
13	See VAR-001-4.1 tab
n/a	Operation of the Bulk Electric System that violates or is expected to violate a System Operating Limit or Interconnection Reliability Operating Limit in the Interconnection, or that violates any other NERC, Regional Reliability Organization, or local operating reliability standards or criteria.
n/a	A transmission facility (line, transformer, breaker, etc.) that is approaching, is at, or is beyond its System Operating Limit or Interconnection Reliability Operating Limit.

n/a	A System Operating Limit that, if violated, could lead to instability, uncontrolled separation, or Cascading outages that adversely impact the reliability of the Bulk Electric System.
n/a	Individuals who perform current day or next day outage coordination or assessments, or who determine SOLs, IROLs, or operating nomograms,1 in direct support of Real-time operations of the Bulk Electric System.
n/a	The maximum flow capability on a Flowgate, is not to exceed its thermal rating, or in the case of a flowgate used to represent a specific operating constraint (such as a voltage or stability limit), is not to exceed the associated System Operating Limit.

n/a

n/a

n/a

The RC shall provide evidence including documentation of procedures to identify and mitigate exceedances of identified IROLs and SOLs to demonstrate compliance with Requirement R1.

To demonstrate compliance with Requirement R2, the RC shall provide evidence, such as system logs, voice recordings, or operating messages that shows that it acted to identify and to mitigate exceedances of IROLs and SOLs in accordance with the procedures required by R1.

n/a

Each Reliability Coordinator shall have evidence that it has a coordinated Operating Plan for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of the Operational Planning Analysis performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities. Such evidence could include but is not limited to plans for precluding operating in excess of each SOL and IROL that were identified as a result of the Operational Planning Analysis.

Each Reliability Coordinator shall make available upon request, evidence that it informed impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, of its actual or expected operations that result in, or could result in, a System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance within its Wide Area.

Each Reliability Coordinator shall make available upon request, evidence that it informed impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R5 has been prevented or mitigated.

A description of the method used to account for the limits specified in part 1.1. Methods of accounting for these limits may include, but are not limited to, one or more of the following:
o TFC or TTC being determined by one or more limits.
o Simulation being used to find the maximum TFC or TTC that remains within the limit.
o The application of a distribution factor in determining if a limit affects the TFC or TTC value.
o Monitoring a subset of limits and a statement that those limits are expected to produce the most severe results.
o A statement that the monitoring of a select limit(s) results in the TFC or TTC not exceeding another set of limits.
o A statement that one or more of those limits are not applicable to the TFC or TTC determination.

n/a

Each Transmission Operator shall provide evidence that it used the lesser of the calculated TTC or the SOL as the TTC, by producing: 1) all values calculated pursuant to R2 for each ATC Path, 2) Any corresponding SOLs for those ATC Paths, and 3) the TTC set by the Transmission Operator and given to the Transmission Service Provider for use in R7and R8 for each ATC Path.

n/a

NONE

n/a

n/a

n/a

The Generator Owners and Transmission Operators shall have documentation describing all actions taken that adjusted generation or SOLs and operated facilities within established limits.

n/a

Each Planning Coordinator shall have dated evidence that demonstrates notification of the generator, transformer, and transmission line BES Element(s) that meet one or more of the criteria in Requirement R1, if any, to the respective Generator Owner and Transmission Owner. Evidence may include, but is not limited to, the following documentation: emails, facsimiles, records, reports, transmittals, lists, or spreadsheets.

Each Transmission Operator shall have, and provide upon request, evidence that could include but is not limited to Energy Management System description documents, computer printouts, SCADA data collection, or other equivalent evidence that will be used to confirm that it monitored or obtained and utilized status, voltages, and flow data for Facilities and the status of Special Protection Systems as required to determine any System Operating Limit (SOL) exceedances within its Transmission Operator Area.

Each Transmission Operator shall have evidence that it initiated its Operating Plan for mitigating SOL exceedances identified as part of its Real-time monitoring or Real-time Assessments. This evidence could include but is not limited to dated computer logs showing times the Operating Plan was initiated, dated checklists, or other evidence.

Each Transmission Operator shall make available evidence that it informed its Reliability Coordinator of actions taken to return the System to within limits when a SOL was exceeded. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, or dated computer printouts. If such a situation has not occurred, the Transmission Operator may provide an attestation.

Each Transmission Operator shall have, and provide upon request, evidence that could include but is not limited to operator logs, voice recordings, electronic communications, or equivalent evidence that will be used to determine if it operated to the most limiting parameter in instances where there is a difference in SOLs.

n/a

Each Transmission Operator shall have, and provide upon request, evidence that could include but is not limited to Energy Management System description documents, computer printouts, Supervisory Control and Data Acquisition (SCADA) data collection, or other equivalent evidence that will be used to confirm that it monitored or obtained and utilized data as required to determine any System Operating Limit (SOL) exceedances within its Transmission Operator Area.
Each Transmission Operator shall have evidence that it initiated its Operating Plan for mitigating SOL exceedances identified as part of its Real-time monitoring or Real-time Assessments. This evidence could include but is not limited to dated computer logs showing times the Operating Plan was initiated, dated checklists, or other evidence

Each Transmission Operator shall inform its Reliability Coordinator of actions taken to return the System to within limits when a SOL has been exceeded
Each Transmission Operator shall have, and provide upon request, evidence that could include but is not limited to operator logs, voice recordings, electronic communications, or equivalent evidence that will be used to determine if it operated to the most limiting parameter in instances where there is a difference in SOLs.

Notes
Not related to FAC SDT project, but it does need to be modified.
Speaks to adjustment to SOLs and/or alleviating loading on SOL/IROL. No changes required.
IF a Facility Rating is an SOL, then by default, it is essential for determining SOLs. Tis statement is not necessary in the purpose of FAC-008, but it does no harm.

Not related to FAC SDT project, but it does need to be modified.
Not related to FAC SDT project, but it does need to be modified.

While the proposed definition of SOL dos not allow for "Other SOLs" as listed in R1.1.5, this requirement does not cause a problem. It will just never be used.

The term "Burden" is used once in the body of Reliability Standards. BAL-005-0.2b requirement R3 states, *"A Balancing Authority providing Regulation Service shall ensure that adequate metering, communications, and control equipment are employed to prevent such service from becoming a Burden on the Interconnection or other Balancing Authority Areas."* This standard has been replaced by BAL-005-1 which is pending regulatory approval.
The term "Constrained Facility" is not used in the current body of Reliability Standards

2.4 Evaluating and mitigating Transmission limitations. The Reliability Coordinator shall review Transmission outages and work with the Transmission Operator(s) to see if it's possible to return to service any Transmission Elements that may relieve the loading on System Operating Limits (SOLs) or Interconnection Reliability Operating Limits (IROLs).

3.3 Reevaluating and revising SOLs and IROLs. The Reliability Coordinator shall evaluate the risks of revising SOLs and IROLs for the possibility of delivery of energy to the energy deficient Balancing Authority. Reevaluation of SOLs and IROLs shall be coordinated with other Reliability Coordinators and only with the agreement of the Transmission Operator whose Transmission Owner (TO) equipment would be affected. SOLs and IROLs shall only be revised as long as an EEA 3 condition exists, or as allowed by the Transmission Owner whose equipment is at risk. The following are minimum requirements that must be met before SOLs or IROLs are revised:

3.4 Returning to pre-Emergency conditions. Whenever energy is made available to an energy deficient Balancing Authority such that the Systems can be returned to its pre-Emergency SOLs or IROLs condition, the energy deficient Balancing Authority shall request the Reliability Coordinator to downgrade the alert level.

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Changes made to the proposed definitions were made in order to respond to issues raised in NOPR paragraphs 55, 73, and 74 dealing with analysis of SOLs in all time horizons, questions on Protection Systems and Special Protection Systems in NOPR paragraph 78, and recommendations on phase angles from the SW Outage Report (recommendation 27). The intent of such changes is to ensure that Real-time Assessments contain sufficient details to result in an appropriate level of situational awareness. Some examples include: 1) analyzing phase angles which may result in the implementation of an Operating Plan to adjust generation or curtail transactions so that a Transmission facility may be returned to service, or 2) evaluating the impact of a modified Contingency resulting from the status change of a Special Protection Scheme from enabled/in-service to disabled/out-of-service.

Rationale for R2:
Requirement R2 from IRO-002-3 has been deleted because approved EOP-008-1, Requirement R1, part 1.6.2 addresses redundancy and back-up concerns for outages of analysis tools. New Requirement R4 has been added to address NOPR paragraphs 96 and 97: "…As we explain above, the reliability coordinator's obligation to monitor SOLs is important to reliability because a SOL can evolve into an IROL during deteriorating system

Operating Plan - An Operating Plan includes general Operating Processes and specific Operating Procedures. It may be an overview document which provides a prescription for an Operating Plan for the next-day, or it may be a specific plan to address a specific **SOL** or IROL exceedance identified in the Operational Planning Analysis (OPA). Consistent with the NERC definition, Operating Plans can be general in nature, or they can be specific plans to address specific reliability issues. The use of the term Operating Plan in the revised TOP/IRO standards allows room for both. An Operating Plan references processes and procedures, including electronic data exchange, which are available to the System Operator on a daily basis to allow the operator to reliably address conditions which may arise throughout the day. It is valid for tomorrow, the day after, and the day after that. Operating Plans should be augmented by temporary operating guides which outline prevention/mitigation plans for specific situations which are identified day-to-day in an OPA or a Real-time Assessment (RTA). As the definition in the Glossary of Terms states, a restoration plan is an example of an Operating Plan. It contains all the overarching principles that the System Operator needs to work his/her way through the restoration process. It is not a specific document written for a specific blackout scenario but rather a collection of tools consisting of processes, procedures, and automated software systems that are available to the operator to use in restoring the system. An Operating Plan can in turn be looked upon in a similar manner. It does not contain a prescription for the specific set-up for tomorrow but contains a treatment of all the processes, procedures, and automated software systems that are at the operator's disposal. The existence of an Operating Plan, however, does not preclude the need for creating specific action plans for specific **SOL** or IROL exceedances identified in the OPA. When a Reliability Coordinator performs an OPA, the analysis may reveal instances of possible **SOL** or IROL exceedances for pre- or post-Contingency conditions. In these instances, Reliability Coordinators are expected to ensure that there are plans in place to prevent or mitigate those **SOLs** or IROLs, should those operating conditions be encountered the next day. The Operating Plan may contain a description of the process by which specific prevention or mitigation plans for day-to-day **SOL** or IROL exceedances identified in the OPA are handled and communicated. This approach could alleviate any potential administrative burden associated with perceived requirements for continual day-to-day updating of "the Operating Plan document" for compliance purposes.

Compliance/Data Retention
Each Transmission Operator shall retain evidence for three calendar years of any occasion in which it has exceeded an identified IROL and its associated IROL Tv as specified in Requirement R12 and Measure M12 and that it initiated its Operating Plan to mitigate a SOL exceedance as specified in Requirement R14 and Measurement M14.

TOP-001-3 also contains the same write-up as seen in the Associated Docs tab

Rationale for Requirement R14:
The original Requirement R8 was deleted and original Requirements R9 and R11 were revised in order to respond to NOPR paragraph 42 which raised the issue of handling all SOLs and not just a sub-set of SOLs. The SDT has developed a white paper on SOL exceedances that explains its intent on what needs to be contained in such an Operating Plan. These Operating Plans are developed and documented in advance of Real-time and may be developed from Operational Planning Assessments required per proposed TOP-002-4 or other assessments. Operating Plans could be augmented by temporary operating guides which outline prevention/mitigation plans for specific situations which are identified day-to-day in an Operational Planning Assessment or a Real-time Assessment. The intent is to have a plan and philosophy that can be followed by an operator.

Rationale for Requirement R18:
Moved from approved IRO-005-3.1a, Requirement R10. Transmission Service Provider, Distribution Provider, Load-Serving Entity, Generator Operator, and Purchasing-Selling Entity are deleted as those entities will receive instructions on limits from the responsible entities cited in the requirement. Note – Derived limits replaced by **SOLs** for clarity and specificity. **SOLs** include voltage, Stability, and thermal limits and are thus the most limiting factor.

Includes the same occurrences as TOP-001-3 plus the one below

Rationale for Requirement R10:
New proposed Requirement R10 is derived from approved IRO-003-2, Requirement R1, adapted to the Transmission Operator Area. This new requirement is in response to NOPR paragraph 60 concerning monitoring capabilities for the Transmission Operator. New Requirement R11 covers the Balancing Authorities. Monitoring of external systems can be accomplished via data links.
The revised requirement addresses directives for Transmission Operator (TOP) monitoring of some non-Bulk Electric System (BES) facilities as necessary for determining System Operating Limit (SOL) exceedances (FERC Order No. 817 Para 35-36). The proposed requirement corresponds with approved IRO-002-4 Requirement R4 (proposed IRO-002-5 Requirement R5), which specifies the Reliability Coordinator's (RC) monitoring responsibilities for determining SOL exceedances.
The intent of the requirement is to ensure that all facilities (i.e., BES and non-BES) that can adversely impact reliability of the BES are monitored. As used in TOP and IRO Reliability Standards, monitoring involves observing operating status and operating values in Real-time for awareness of system conditions. The facilities that are necessary for determining SOL exceedances should be either designated as part of the BES, or otherwise be incorporated into monitoring when identified by planning and operating studies such as the Operational Planning Analysis (OPA) required by TOP-002-4 Requirement R1 and IRO-008-2 Requirement R1. The SDT recognizes that not all non-BES facilities that a TOP considers necessary for its monitoring needs will need to be included in the BES.

The non-BES facilities that the TOP is required to monitor are only those that are necessary for the TOP to determine SOL exceedances within its Transmission Operator Area. TOPs perform various analyses and studies as part of their functional obligations that could lead to identification of non-BES facilities that should be monitored for determining SOL exceedances.
Examples include:

- OPA;
- Real-time Assessments (RTA);
- Analysis performed by the TOP as part of BES Exception processing for including a facility in the BES; and
- Analysis which may be specified in the RC's outage coordination process that leads the TOP to identify a non-BES facility that should be temporarily monitored for determining SOL exceedances.

TOP-003-3 Requirement R1 specifies that the TOP shall develop a data specification which includes data and information needed by the TOP to support its OPAs, Real-time monitoring, and RTAs. This includes non-BES data and external network data as deemed necessary by the TOP.
The format of the proposed requirement has been changed from the approved standard to more clearly indicate which monitoring activities are required to be performed.

Rationale for Definitions:
Changes made to the proposed definitions were made in order to respond to issues raised in NOPR paragraphs 55, 73, and 74 dealing with analysis of **SOLs** in all time horizons, questions on Protection Systems and Special Protection Systems in NOPR paragraph 78, and recommendations on phase angles from the SW Outage Report (recommendation 27). The intent of such changes is to ensure that Real-time Assessments contain sufficient details to result in an appropriate level of situational awareness. Some examples include: 1) analyzing phase angles which may result in the implementation of an Operating Plan to adjust generation or curtail transactions so that a Transmission facility may be returned to service, or 2) evaluating the impact of a modified Contingency resulting from the status change of a Special Protection Scheme from enabled/in-service to disabled/out-of-service.
TOP-002-4 also contains the same write-up as seen in the Associated Docs tab

Rationale for R1:
Paragraph 1868 of Order No. 693 requires NERC to add more "detailed and definitive requirements on “established limits” and “sufficient reactive resources”, and identify acceptable margins (i.e. voltage and/or reactive power margins)." Since Order No. 693 was issued, however, several FAC and TOP standards have become enforceable to add more requirements around voltage limits. More specifically, FAC-011 and FAC-014 require that System Operating Limits (SOLs) and reliability margins are established. The NERC Glossary definition of SOLs includes both: 1) Voltage Stability Ratings (Applicable pre- and post-Contingency Voltage Stability) and 2) System Voltage Limits (Applicable pre- and post-Contingency Voltage Limits). Therefore, for reliability reasons Requirement R1 now requires a Transmission Operator (TOP) to set voltage or Reactive Power schedules with associated tolerance bands. Further, since neighboring areas can affect each other greatly, each TOP must also provide a copy of these schedules to its Reliability Coordinator (RC) and adjacent TOP upon request.

Rationale for R2:
Paragraph 1875 from Order No. 693 directed NERC to include requirements to run voltage stability analysis periodically, using online techniques where commercially available and offline tools when online tools are not available. This standard does not explicitly require the periodic voltage stability analysis because such analysis would be performed pursuant to the SOL methodology developed under the FAC standards. TOP standards also require the TOP to operate within SOLs and Interconnection Reliability Operating Limits (IROL). The VAR standard drafting team (SDT) and industry participants also concluded that the best models and tools are the ones that have been proven and the standard should not add a requirement for a responsible entity to purchase new online simulations tools. Thus, the VAR SDT simplified the requirements to ensuring sufficient reactive resources are online or scheduled. Controllable load is specifically included to answer FERC's directive in Order No. 693 at Paragraph 1879.

Rationale for R3:
Similar to Requirement R2, the VAR SDT determined that for reliability purposes, the TOP must ensure sufficient voltage support is provided in Real-time in order to operate within an SOL.

Standards Announcement

Project 2015-09
Establish and Communicate System Operating Limits
Definitions of System Operating Limits (SOL) and SOL Exceedance

Informal Comment Period Open through October 30, 2017

Now Available

A 30-day informal comment period on the definitions of System Operating Limits (SOL) and SOL Exceedance is open through **8 p.m. Eastern, Monday, October 30, 2017**.

Commenting

Use the Standards Balloting and Commenting System (SBS) to submit comments on the two revised definitions. If you experience any difficulties using the electronic form, contact Nasheema Santos. An unofficial Word version of the comment form is posted on the project page.

If you are having difficulty accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out, contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern).

- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

The drafting team will review all responses received during the comment period and determine the next steps of the project.

For more information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer, Darrel Richardson (via email), or at (609) 613-1848.

Comment Report

Project Name: 2015-09 Establish and Communicate System Operating Limits | SOL and SOL Exceedance Definitions

Comment Period Start Date: 9/29/2017

Comment Period End Date: 10/30/2017

Associated Ballots:

There were 36 sets of responses, including comments from approximately 92 different people from approximately 74 companies representing 10 of the Industry Segments as shown in the table on the following pages.

Questions

1. Given the above, and considering the rationale provided in the supporting document, do you support the SDT's proposal to revise the current SOL definition? (Clarification: this question is not asking of you agree with the proposed definition. That will be addressed in a separate question. This question is focused on the need to modify the SOL definition at all.) Please explain your response.

2. Given the above, and considering the rationale provided in the supporting document, do you support the SDT's proposal to create and implement a definition for SOL Exceedance? (Clarification: this question is not asking of you agree with the proposed definition. That will be addressed in a separate question. This question is focused on the need for having a definition of SOL Exceedance.) Please explain your response.

3. Considering the simplified approach to SOLs described here and the explanations provided in the definitions rationales, do you agree with the proposed SOL definition? Please explain your response and/or provide alternative language.

4. Considering the explanations provided in the definitions rationales, do you agree with the proposed SOL Exceedance definition? Please explain your response and/or provide alternative language.

5. Considering the explanations provided here and further explained in the definitions rationales, do you agree that the proposed SOL Exceedance definition should include this bullet item? Please explain your response and/or provide alternative language.

6. The SAR is being revised to authorize the SDT to review the existing body of Reliability Standards and NERC Glossary of terms, and where necessary, modify those standards and definitions to incorporate the new terms and/or definition(s) of SOL Exceedance and System Voltage Limit, as well as the revised definition of System Operating Limit. The SDT has identified the standards and terms they contend would benefit from this incorporation and has included them in separate documents with this posting for your review. Do you agree with the SDT's selections? If not, please explain your response.

7. If you have any other comments that you haven't already provided in response to the above questions, please provide them here.

CenterPoint Energy Houston Electric, LLC (“CenterPoint Energy”) supports the SDT’s proposal to revise the current definition of SOL and generally supports the revised definition with the exception of the use of “stability limit” within the definition of SOL. We understand from comments made during an industry webinar that this use of “stability limits” is not the same definition of “Stability Limits” used in the NERC Glossary. We believe this to be confusing to the industry. If the SDT’s use of the term does not align with the NERC glossary term, then it needs to be clearly represented for the	

industry to know and understand the difference. Additionally, the NERC SOL whitepaper also uses a variation of “Stability limit”.

Scott Downey - Peak Reliability - 1

Answer	Yes
Document Name	

Comment

Peak supports the need for revising the defintion of SOL and creating a new definition for SOL Exceedance. Peak believes that the SOL definition needs to be revised and that a clear definition for SOL Exceedance needs to be created and implemented in the body of the NERC Reliability Standards. Doing so would result in improved clarity and consistency and would prevent entities from adopting interpretation of SOL Exceedance that do not provide the level of reliability intended by its use in the TOP and IRO standards. Peak also believes that the key events mentioned in question #1 do not provide a sufficient basis for addressing the clarity and consistency problems associated with the current defintiion of SOL and the absence of a defintion for SOL Exceedance as described in the supporting documnet "NERC Glossary Defintions: System Operating Limit and SOL Exceedance Rationale."

This question is focused on the need for having a definition of SOL Exceedance.) Please explain your response.

Lauren Price - American Transmission Company, LLC - 1 - MRO,RF

Answer	No
Document Name	

Comment

The justification for creating an SOL Exceedance definition, as described in the "NERC Glossary Definitions: System Operating Limit and SOL Exceedance Rationale" document, is speculative in nature. Specifically, the SDT expresses the concern that "[o]ne TOP might interpret SOL exceedances to not include the post-Contingency state when identifying SOL exceedance". However, the existing NERC definitions for OPA and RTA coupled with the requirements of the TOP-001-3 and TOP-002-4 standards logically combine to require an entity to evaluate the system for SOL exceedances for the post-Contingency condition. As such, there is insufficient reasoning to create a new definition for SOL Exceedance.

The SDT's concern appears to be with the wording of TOP-001-3 R14. Although ATC believes that there is no conflict or gap, a SAR could be written to improve the TOP-001-3 R14 requirement if the SDT still believes that there is an issue with the language.

Pamela Hunter - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC, Group Name Southern Company

Answer	No
Document Name	

Comment

We do not believe it is necessary that NERC define SOL Exceedance. Operating outside an SOL in Real-time is an exceedance of the limits. An SOL that is predicted to be exceeded using RTA and OPS is a predicted exceedance, or a potential exceedance, but until it actually happens, it is not an exceedance. We believe it is important to keep a Real-time exceedance and an exceedance predicted by RTA or OPA separate from each other.

Michael Cruz-Montes - CenterPoint Energy Houston Electric, LLC - 1 - Texas RE

Answer	No
Document Name	

Comment	
CenterPoint Energy does not support the creation and implementation of a definition for SOL Exceedance. We believe that the proposed term SOL Exceedance could potentially confuse the industry and take away from the clarity provided to the industry with the proposed revisions of the SOL definition. Furthermore, we believe that the proposed revisions to the definition of System Operating Limit (SOL) provide the industry with a clear and concise definition of the term; therefore, the industry understands that an exceedance to an SOL is when the applicable electrical values have gone beyond those established Facility Ratings limits, System Voltage Limits, and stability limits used in the operation of the BES.

Glencoe supports the SDT's proposal to create a definition of SOL exceedance, **as long as that definition would NOT cause unintended consequences in terms of setting unrealistic expectations or imposing additional and undesirable administrative compliance burden on numerous entities**. In this effort, the SDT should carefully assess repercussions on reliability and efficient market operations.

Comment	
While very close, it is felt that a tweak to the language can provide clarity in how RTM, RTAs, and OPAs are performed. Consider using: “Facility Ratings, System Voltage Limits, and stability limits **more restrictive than Facility Ratings (including margins if required)** used in the operation of the BES.” This ensures that RTAs and OPAs are not checked against Facility Ratings and then separately stability limits; it should only be the more limiting of the two. Other “studies” are still required to verify if stability limits are more restrictive, but are not needed as part of the RTAs and OPAs.

ITC agrees that the proposed SOL definition provides clarity and removes ambiguity. However, because the term "System Voltage Limit" is included in the definition of SOL, the definition of "System Voltage Limit" should be considered in this comment form. Assuming the definition of "System Voltage Limit" stands as currently proposed, ITC would approve of the proposed SOL definition.

Comments: ATC has three comments with the proposed SOL definition:

1. The existing SOL definition contains important language regarding the "applicab[ility]" of the limit used. This clarity is missing from the proposed SOL definition revision. ATC believes the existing definition is better than the proposed definition from this perspective although entities could read “applicable” into the proposed definition as needed.
2. The term SOL is not used in proposed standard FAC-015-1 for the planning horizon. However, the concept does exist in the proposed standard. The proposed SOL definition only calls out the operating horizon and would be improved by recognizing the planning horizon as well. ATC recommends that the proposed SOL definition be edited to address this omission with wording like, “. . . used in the operation and planning of the BES”.
3. Similar to ATC’s response to Question #5 (below), stability limits can be a difficult to understand term to use in the SOL definition, especially since it is undefined. The SOL Exceedance definition tries to aid entities that establish and monitor SOLs by including the terms “stability performance criteria” to cover a wider range of system phenomenon than traditional stability limits (e.g., voltage stability, angular stability, system stability). For question #5, ATC recommends the use of “system performance criteria” to recognize that the underlying issue may not be a traditional stability problem but some other important system performance limit that is being exceeded. The underlying system issue is then represented by a proxy “stability limit” to keep the system within the bounds of acceptable performance. It would seem that this type of clarification would be more reasonably provided in the SOL definition and not the SOL Exceedance definition. Alternatively, the SDT could create a “Stability Limit” definition, which would then be referenced in the SOL definition by using the capitalized term. If a Stability Limit definition is created, the definition would then need to clearly indicate that both traditional stability issues and other system performance criteria issues (such as voltage ride through curves, angle difference from system reference angle, margin from voltage collapse point, system damping attenuation, etc.) can be represented with Stability Limits.

We agree with the proposed definition, but in practice in order to remain within SOLs in operations is often the use of pre-determined transfer and monitoring of specific interfaces (either thermal, voltage stability, or transient stability). The concept is introduced in the rationale for component #5 and #6 of SOL exceedance, but more rationale regarding how a transfer interface is managed versus the simplified SOL definition would be helpful. Also, the use of "lower case" stability limits rather than the defined term causes some confusion. Why use the defined term for FR and SVL, but not stability limits? What is a stability limit for the purpose of the SOL definition?

4. Considering the explanations provided in the definitions rationales, do you agree with the proposed SOL Exceedance definition? Please explain your response and/or provide alternative language.

Lauren Price - American Transmission Company, LLC - 1 - MRO,RF	
Answer	No
Document Name	

Comment

The proposed SOL Exceedance definition is unworkable as written.

The definition has a fundamental flaw as it is attempting to create a one size fits all definition for two very different situations. The two situations are: (1) real-time situations (Real-time Monitoring and Real-time Assessments), and (2) static situations (Operational Planning Analysis). As categories of these situations imply, there are different time components associated with an SOL Exceedance in each situation that are not adequately addressed by the proposed SOL Exceedance definition.

There are three primary concerns with the definition as written and applied towards real-time situations: (1) the pre-Contingency language, (2) the post-Contingency language, and (3) purpose of the definition.

1. The pre-Contingency portion of the definition is not workable because it assumes a static system and does not account for timeframes associated with operating to various SOLs in real-time situations. Specifically, the first two bullets require the use of a "Facility's Normal Rating" and "normal System Voltage Limits", which are not applicable to a system that has just suffered a contingency. As recognized in the post-Contingency language, once a contingency has occurred the actual flow on the system may exceed the Normal Rating and/or the actual voltage may be outside of normal System Voltage Limits. Prior to the contingency occurring, this was not an SOL Exceedance but now that the contingency has occurred it shall be deemed an SOL Exceedance solely because of the definition's pre-Contingency language. The definition does not recognize that the new pre-Contingency state has flows below the "Facility's highest Emergency Rating" but above the Normal Rating. This condition is not an SOL Exceedance because the system is operating as designed and is not experiencing unacceptable system performance. Flows will be able to be returned below the Normal Rating within the applicable timeframe. The TOP should not have to deem this an SOL Exceedance because the SOL has not been exceeded.
2. The post-Contingency portion of the definition is not workable because is assumes a static system whereas there are constantly changing real-time inputs of a possible post-Contingency state. Assessing the post-Contingency state represents only a snapshot in time. However, due to the way contingency analysis tools work, it can be several minutes before another snapshot of the real-time inputs calculates the newly expected post-Contingency state. The definition means an entity has an SOL Exceedance for even a single post-Contingency state result, which may not be valid due to the fluidity of the system, especially in a market. Given the way the STD is intending to use the definition (i.e. as a driver of action to mitigate the issue), the post-Contingency language would need to include reference to a **persistent** post-Contingency state indication.
3. The SDT explains that the purpose of this definition is to drive an action, which is not the purpose of a definition. As stated in the rationale document (p. 9), the SDT believes the proposed definition "accomplishes the intended reliability objective of triggering an appropriate action". NERC definitions should not drive requirements for entities. Rather, this function is accomplished by the requirements within the NERC Standards. A proposed definition should define what an SOL Exceedance is or is not. The proposed definition does not create this level of clarity because the SDT has developed a definition with a particular required action in mind (e.g., see above regarding the "pre-Contingent state" language). A proposal for edits to the definition is given below and these proposed edits will achieve the intended outcome the SDT desires because the edits recognize the time-based nature of limits, which the SDT recognizes in its rationale document (cf. p. 11).

ATC recommends that the SOL Exceedance definition not be created. However, if the definition will be created, ATC recommends that the two separate definitions be created to recognize the difference between real-time and next contingency situations regarding SOL exceedances. If two definitions will not be created, at a minimum, edits must be made to the "pre-Contingency state" language so that the definition does not reference "normal" ratings or voltage limits. This specific language should be changed to refer to "applicable" ratings and "applicable" voltage limits because of the explanation above regarding the definition applying to real-time situations immediately following a contingency (i.e. what was not an SOL exceedance suddenly becomes an SOL exceedance, which is not logical from a definition standpoint).

Proposed definitions for SOL Exceedance in both RTA and OPA would bring clarity to the industry. The proposed definitions are as follows:

SOL Exceedance - Real-time:

An Operating condition or analysis result characterized by any of the following, as determined in Real-time monitoring or Real-time Assessments (RTA):

The pre-Contingency state indicates any of the following:

- Actual flow through a Facility is above the Facility's applicable Rating for a time period longer than deemed acceptable.
- Actual bus voltage is outages applicable System Voltage Limits" for a time period longer than deemed acceptable.
- A stability limit established to prevent instability without a Contingency is exceeded for a time period longer than deemed acceptable.
- A stability limit established to prevent the Contingency from resulting in instability is exceeded for a time period longer than deemed acceptable.

The calculated post-Contingency state indication persists for any of the following:

- Flow through a Facility is above the Facility’s highest Emergency Rating, or above a Facility Rating for which there is not sufficient time to reduce the flow to established acceptable levels should the Contingency occur
- Bus voltage is outside the highest or lowest emergency System Voltage Limit, or outside a System Voltage Limit for which there is not sufficient time to bring the bus voltage to established acceptable levels should the Contingency occur
- Defined stability performance criteria are not met

SOL Exceedance - Next Contingency

An Operating condition or analysis result characterized by any of the following, as determined in Operational Planning Analysis (OPA):

The pre-Contingency state indicates any of the following:

- Flow through a Facility is above the Facility's normal Rating
- Bus voltage is outages normal System Voltage Limits
- A stability limit established to prevent instability without a Contingency is exceeded
- A stability limit established to prevent the Contingency from resulting in instability is exceeded

The calculated post-Contingency state indication persists for any of the following:

- Flow through a Facility is above the Facility’s highest Emergency Rating, or above a Facility Rating for which there is not sufficient time to reduce the flow to established acceptable levels should the Contingency occur
- Bus voltage is outside the highest or lowest emergency System Voltage Limit, or outside a System Voltage Limit for which there is not sufficient time to bring the bus voltage to established acceptable levels should the Contingency occur
- Defined stability performance criteria are not met"

These changes will allow the definition to work in the pre-Contingency state as envisioned by the SDT while also clarifying that an SOL exceedance after a contingency occurs in real time only exists if the actual flow or the actual voltage (i.e. the new pre-Contingency state) is outside of the applicable limit for an applicable period of time. In addition, these changes provide the needed clarity for post-Contingency situations.

NIPSCO is not in agreement that an SOL Exceedance has occurred if the flow is over a rating for an “Acceptable duration” being the time allowed for the next emergency rating. We do agree that an exceedance would occur if outside that “acceptable duration”. In the explanation the Standards Develop Team states that “any PERSISTENT exceedance of a Normal Rating should be regarded as an SOL exceedance, even if the exceedance occurs for an acceptable duration.” The word “persistent” and the idea that there is NOT an “acceptable duration” for the flow to go over the Normal Rating seem to contradict. Also the SOL Performance Summary on page 11 of the Rationale document states, “Pre-Contingency flow in this range (between normal and first emergency) for longer than 4 hours is not acceptable.” How does this fit the explanation? Is 4 hours the acceptable duration? And if it is not acceptable to go beyond the 4 hours then we assume less than 4 hours is acceptable. If so, how can an SOL exceedance be acceptable since by the SDT definition for a flow above normal there is an SOL exceedance? We believe the MISO definition for Pre-Contingency as it relates to Facility Ratings is better. The MISO definition is as follows:

SOL Exceedance Based on Real-Time Flows

A. Actual steady state flow on a BES Facility is greater than the Facility’s highest Emergency Rating for any time period.

B. Actual steady state flow on a BES Facility is above the Normal Rating, but below the next Emergency Rating, for longer than the time frame of the next Emergency Rating.

C. Actual steady state voltage on a BES Facility is greater than the emergency high voltage limit for time frame identified by the TOP.

D. Actual steady state voltage on a BES Facility is less than the defined emergency low voltage limit for time frame identified by the TOP.

E. Any established stability Limit (non-IROL) is exceeded for longer than the 30 minutes or defined by operating guides.

Terry Harbour - Berkshire Hathaway Energy - MidAmerican Energy Co. - 1,3	
Answer	No
Document Name	
Comment	

MidAmerican Energy Company (MEC) re-iterates our disagreement with the proposed definition of SOL exceedance. We note the SDT's reluctance to incorporate our original comments and suggested changes submitted during the August 2016 commenting period.

- The SDT failed to assess and recognize that the proposed SOL exceedance definition will cause unintended consequences on large spectrum of the Industry's participants.
- The first issue with the SDT's proposed definition of the SOL exceedance is that it would expose TOPs and RCs to unnecessary compliance risk. Significant resources for each TOP's/RC's organization would be required to meet the higher compliance administrative burden.
- The second issue is the definition is driven by SDT's belief that the definition would "trigger implementation of Operating Plan". However, MEC believes the definition could delay implementation of the Operating Plan in real-time due to logging and documentation requirements, as this functionality is not a built-in feature of many SCADA systems in use today. MEC believes that a potential unintended outcome to avoid the administrative burden would be to operate in an unnecessarily conservative operation mode**.** The SDT has downplayed existing NERC standards that already currently require system operator training, tools, and processes to trigger the implementation of Operating Plans, including SCADA operating alarms, RTCA results, principles of reliable operations and high quality operator's training.

The role of NERC adopted definition of SOL exceedance definition, in our opinion, should be to clearly and unambiguously formulate critical operational borderlines of reliable operations, while respecting existing limitations of existing transmission infrastructure and human resources that operate this infrastructure. In other words the *SOL exceedance definition should be focused on defining what is considered to be unacceptable operation rather than what should be good operating practice based recommendable operation*.

Therefore, MEC recommends the SDT defer voting/ballots on this item until such time that the following tasks are completed:

- Perform comparative analysis of existing SOL definitions nation-wide, in order to get an informed insight as to where majority of industry's participants stand on this definition.
- Perform analysis of additional staffing resources and tools that would be needed to implement proposed definition.
- Outline and assess compliance driven administrative burden that the proposed definition would impose on numerous entities in terms of providing an evidence of compliance that they initiated an Operating Plan for each single event of SOL exceedance.
- Evaluate a risk of overwhelming and distracting real-time operations people with a burden of significantly increased communication requirements associated numerous instances of marginally relevant localized SOL exceedances.
- Assess the potential impact of outages with the implementation of the proposed SOL definition. The combination of the proposed SOL definition and operational outages could significantly constrain business in the industry associated with the industry's inability to approve and perform numerous scheduled outages (with many of them mandated by other NERC standards). The conservative definition of SOL exceedance would simply make it impossible for many of these outages to proceed without causing SOL exceedances.

- Assess the impact that the proposed definition would have on efficiency of market operations and associated cost.

MEC *recommends the SDT reconsider adoption of the current SOL exceedance in effect in the MISO Reliability footprint*. This is based on the following advantages of the MISO definition when compared with the SDT's proposed definition. The MISO definition:

- *Is more realistic in recognizing reality of existing transmission infrastructure and human resources allocated to operate such an infrastructure*
- *Would provide for significantly less administrative burden* on numerous Industry's entities related to providing evidences of compliance.
- Would provide *comparably reliable operation* of power systems.
- Is *based on physical limitations of various components of transmission facilities* as opposed to being based on "intention to trigger implementation of Operating Plan".
- Would *prevent potential increased* market operations costs.
- Would provide *more clarity and avoid ambiguity and interpretation issues*.
- Is more efficient for small entities that don't have advanced tools and other resources, including, but not limited to staffing and support personnel.

The current MISO Reliability footprint wide SOL Exceedance occurs if system operating state indicates any of the following:

- *Actual steady state flow on a BES Facility is greater than the Facility's highest Emergency Rating for any time period.*
- *Actual steady state flow on a BES Facility is above the Normal Rating but below the next Emergency Rating for longer than the time frame of the next Emergency Rating.*
- *Actual steady state voltage on a BES Facility is greater than the emergency high voltage limit for time frame identified by the TOP.*
- *Actual steady state voltage on a BES Facility is less than the defined emergency low voltage limit for time frame identified by the TOP.*
- *Any established stability limit (non-IROL) is exceeded for longer than the 30 minutes or defined by Operating Plan.*
- *Projected post-Contingent loading on a BES Facility is greater than the highest Emergency Rating for longer than 30 minutes with NO agreed upon Post Contingency Action Plan that would mitigate the condition if the Contingency were to occur.*
- *Projected post-Contingent voltage on a BES Facility is less than the Emergency low voltage limit for longer than 30 minutes with NO agreed upon Post Contingency Action Plan that would mitigate the condition if the Contingency were to occur.*
- *Rationale for MEC Comments and Recommendation*
- The SDT limited its vision of this subject to the Project 2014-03 Whitepaper. The Whitepaper was product of a small subset of subject matter experts. The original version of the NERC White Paper (from May 2014) was more objective and referenced the use of post-contingent action plans to address projected post-contingent issues. Subsequent versions of the NERC White Paper (revision of January 2015) weren't presented to industry, weren't approved by the Industry. More industry participant input responsible for implementing the real-time SOL exceedance definition is still needed.
- The SDT proposed definition of the SOL exceedance fails to recognize the important difference between actual, pre-contingency SOL exceedance and calculated, post-contingency RISK of SOL exceedance. This attempt to include both of them under the single, generic term

“SOL exceedance” may easily cause an incorrect expectation that TOP/RC control action response to these two types of exceedances should be similar. The actual, pre-contingency SOL Exceedance is a real-time condition exceeding the equipment’s rated capabilities, while the calculated, post-contingency risk of SOL Exceedance requires another event to happen in order to become real and actual exceedance issue.

- Both pre-contingent and post-contingent types of exceedances require and should trigger implementation of a control action from the Operating Plan. However, implementation should be treated *differently in terms of urgency and severity of mitigating control actions*, as they have different repercussions on system reliability.

MEC comments on specific “components” from the SDT’s document:

Component #3 – *The pre -Contingency state indicates: … Actual flow th its* **Normal Ratin**

- Persistent should be removed as ambiguous and not auditable. The SDT determined that any persistent exceedance of a Normal Rating should be regarded as an SOL exceedance, even if the exceedance occurs for an acceptable duration. MEC disagrees with the SDT’s insistence on using Normal Rating and recommend the use of Emergency Rating. The technical rationale for our recommendation is based on the TOP rating methodology which considers all limiting factors for transmission facilities and assesses *no reliability repercussions as long as the flow on facility is returned below normal rating during time that was assigned for the emergency rating*. Transmission operators have used emergency ratings for many years and that fact should be correspondingly recognized in the SOL exceedance definition.

- The SDT’s rationale to use Normal Rating in order to “trigger implementation of Operating Plan” is confusing. TOPs understand the limitations associated with the use of Emergency Rating and their obligation to return the flow below Normal Rating within specified time-frame. Hard-coded SCADA based operational alarms will trigger implementation of Operating Plan. Therefore, it is unnecessary to adopt a conservative definition of SOL exeedance in order to “remind” TOPs and RCs of their well understood obligation to return flow under Normal Rating in specified time-frame.

- Although the SDT stated that the their goal is to improve clarity and eliminate ambiguity they increase ambiguity and open another issue of interpretation by introducing the term **“**persistent exceedance of a Normal Rating”. The time of exceedance has to be clearly specified in this component. Otherwise, how will entities, including Auditors, measure “persistency” of exceedance?

- The proposed, conservative definition could cause undesirable consequences in terms of administrative compliance burden and an unnecessarily increase the cost of market operations while providing marginal benefit to system reliability. TOPs/RCs are already under NERC obligation to protect facilities on a contingency basis, which will consequently protect that facility against real-time flow exceedances.

MEC recommends the following definition superior alternative:

- ***Actual steady state flow on a BES Facility is greater than the Facility’s highest Emergency Rating for any time period.***

- ***Actual steady state flow on a BES Facility is above the Normal Rating but below the next Emergency Rating for longer than the time frame of the next Emergency Rating.***

Component #4 – *The pre -Contingency state indicates: Actual bus voltage is outside normal System Voltage Limits*

- MEC disagrees with the SDT’s insistence on using Normal System Voltage Limits and recommend using Emergency Voltage Limits. Our arguments regarding the Component #4 are similar to our comments concerning the Component #3.

- The technical rationale for our recommendation is based on the fact that TOPs/RCs do operate their systems within normal voltage limits during vast majority of the time. However, there are rare instances when sudden events and changes to operating conditions, or periods during switching long transmission lines, require use of emergency voltage limits. That is why *SOL exceedance definition should be focused on what is* *considered to be unacceptable operation rather than what should be recommended operation*. Again, the proposed, conservative definition would cause undesirable consequences in terms of administrative compliance burden.

MEC recommends the following definition:

- ***Actual steady state voltage on a BES Facility is greater than the emergency high voltage limit for time frame identified by the TOP.***
- ***Actual steady state voltage on a BES Facility is less than the defined emergency low voltage limit for time frame identified by the TOP.***

Component #6 – *The pre Contingency established to prevent the ··· A stability li*

Contingency from resulting in instability is exceeded

- The SDT differentiated between stability limits occurring without contingency and stability limits that are contingency based and conditioned. The SDT rational doesn't justify the existence of two components related to stability limits.
- The physical nature of the stability limits is best addressed within individual Operating Plans. Therefore, there is no need to separate the different natures of stability problems within the definition of a SOL exceedance. This is an unnecessary complication and could be resolved by merging two subcomponents into the one.
- The proposed definition does not recognize time-frame associated with exceedances of established stability limits. If not recognized this can lead to hundreds of meaningless (nuisance) exceedances (for sake of an example, such as those that last less than 1 minute and have magnitude of less than 1%).

We recommend the following definition:

- ***Any established stability limit (non-IROL) is exceeded for longer than the 30 minutes or defined by Operating Plan.***

Component #7 – *The calculated post or Contin above a Facility Rating for which there is not sufficient time to reduce the flow to established acceptable levels should the Contingency occur*

- The SDT provided clarification of their position by pointing out the (Project 2014 e03 White paper) two diagram. The portion highlighted in yellow, according to the SDT's explanation) " is considered an SOL Exceedance because this designation accomplishes the desired outcome by triggering mitigating action through the implementation of an Operating Plan".
- Please note the original version of the NERC White Paper (from May 2014) stated that "Post-contingency flow in this range is not acceptable unless Operating Plan address reliability impact so that it has localized impact". Subsequent versions of the NERC White Paper (revision of January 2015) introduced a statement that "Post-contingency flow in this range is not acceptable". This revision wasn't presented to the industry, and never approved by the Industry.
- The SDT's proposed definition of the post-Contingency flow SOL exceedance fails to recognize the important difference between actual, pre-contingency SOL exceedance and calculated, post-contingency RISK of SOL exceedance. This attempt to include both of them under the single, generic term "SOL exceedance" may easily cause an incorrect expectation that TOP/RC control action response to these two types of exceedances should be similar.
- Both types of exceedances require and should trigger implementation of a control action from Operating Plan, but they should be treated

differently in terms of urgency and severity of mitigating control actions, as they have different repercussions on system reliability.

- The portion of the definition that states, *"…or above a Facility Rating for which there is not sufficient time to reduce the flow to established acceptable levels should the Contingency occur"* is intended to address the operating state highlighted in light blue. This portion of the definition will cause industry implementation and compliance issues. It introduces ambiguity and confusion. Because TOPs/RCs would be faced with hard and sometimes impossible task to determine what is actually "sufficient time" for any specific set of operational circumstances. This time may depend on unit ramp rates along with efficiency and speed of congestion management procedures (such as LMP binding). This could impose significant market operations costs, while providing marginal reliability benefits.

MEC recommends the following definition:

- *Projected post-Contingent loading on a BES Facility is greater than the highest Emergency Rating for longer than 30 minutes with NO agreed upon Post Contingency Action Plan that would mitigate the condition if the Contingency were to occur.*

Rationale for using Post-contingency action plan concept

- The main difference between our proposed definition and the SDT's proposed definition is the concept of post-contingent action plan. *The Post-contingency action plan is the RC's/TOP's agreed upon control action to be used while the normal congestion management processes are attempting to return the projected post contingent flow within longer-term rating.* It's important to note that the Post-contingency action plans are NOT a vehicle to justify continual operation where the projected post contingent flow is above Facility's highest Emergency Rating.

- MEC recommends a Post-contingency action plan developed by the TOP and RC is required to address potential impacts and post-contingent mitigating strategies, including but not limited to load shedding or generator tripping, while normal congestion management actions are being implemented, to ensure potential impact is localized and to prevent equipment damage.

- Therefore, MEC would not consider a SOL exceedance to exist anytime the Projected post-contingency flow is above Facility's highest Emergency Rating, but only for those situations when the Projected post-contingency flow is above the Facility's highest Emergency Rating (Rate C) for longer than 30 minutes without associated post-contingency action plan.

- MEC recognizes that there may be situations when normal congestion management is not effective or has been exhausted, and the projected post-contingent loading on a facility remains greater than the highest available emergency rating. In this situation, load shedding may be the sole remaining option to address the projected post-contingency loading. The TOP and RC may decide to operate in this fashion and not implement load-shedding pre-contingency if the impacts would be localized. In this case the SOL exceedance would be reportable, even though a post-contingent action plan exists, since normal congestion management is no longer taking place.

The SDT's concept insists on the concept "highest Emergency Rating". The MEC alternative definition is based on the concept of "post-contingency action plan". MEC recognizes it might be argued that the TOP has to establish a new Short Emergency rating in contrast to agreeing with its RC on post-contingency action plan. Issuing a new Short Term Emergency rating should be considered as a legitimate alternative. However, there are practical obstacles to issuing higher emergency ratings (or "Load Shed Rating"). The Industry must obtain manufacturer confirmations for using shorter term Emergency Ratings (such as 10-minute ratings) for every single piece of equipment (breakers, switches, wave traps, CTs conductors, all transformers components etc). The majority of manufacturers aren't willing to provide such data. Therefore, for practical reasons, short-term ratings based on manufacturers' data are difficult to corroborate. Consequently, each TOP and RC would need to define criteria within their Operating Plan for using post-contingent action plans. These criteria might be based, for sake of example, on Relay Loadability Limits of transmission facilities.

Comment	
The SPP Standards Review Group recommends that the drafting team removes the term "Operational Planning Analysis (OPA)" from the SOL Exceedance definition. From our perspective, we feel that the SOL Exceedance Definition should be applicable to only an actual SOL Exceedance instead of focusing on a potential exceedance.

IRC is concerned that the use of the term "acceptable levels" in the first and second bullets under the description of the "calculated post-Contingency state" is unclear as to which entity—the responsible entity or the compliance authority—determines what level is "acceptable." Although the IRC believes the responsible entity should be the entity that determines the appropriate level, IRC has no consensus on appropriate substitute language at this time.

Comment	

Great River Energy does not agree with the proposed definition of SOL exceedance for the following reasons.

- The SDT's proposed definition of the SOL exceedance would expose a large number of operating entities, both TOPs and RCs, to increased compliance risk through additional administrative burden with no foreseen benefit to reliability.

- The definition should allow for a maximum time the limit can be violated, similar to the approach currently in place with Interconnection Reliability Operating Limits. This would allow time for the execution of responses either through automated mechanisms or System Operator actions to mitigate the system condition. NERC currently defines Emergency Rating as a limit, which can be exceeded for a finite period, as specified for a facility by its equipment owner. Current practices leverage the use of Emergency Ratings in many operation and planning activities, and shifting to a more stringent definition could create a significant compliance burden.

The proposed definition fails to consider the validity of calculated post-contingent values. Applicable entities will soon be held accountable with the quality of developing Real-time Assessments, as required in NERC Reliability Standards IRO-018-1(i) and TOP-010-1(i). These assessments help identify real actions that must be implemented in order to alleviate potential system problems. Often these problems are identified through N-1 contingencies, although could be identified through multiple level "tower" contingencies accounting for Facilities that are located on the same transmission infrastructure. Violating limits associated with these limits, while concerning, may not pose an immediate threat to system reliability. The definition should narrow the exceedance identification process to only real, pre-contingent values.

- We suggest and recommend *that SDT consider adoption of the SOL exceedance that is currently in effect in MISO Reliability footprint*, based on the following advantages of the MISO definition when compared with the SDT's proposed definition:

- It is much more realistic in recognizing existing transmission infrastructure and human resources allocated to operate such an infrastructure

- It would provide for significantly less administrative compliance burden on numerous Industry's entities as related to providing evidence to meet the current definition.

- It would provide comparable reliability in the operation of the transmission system with a substantial benefit of less administrative burden.

- It is based on the physical limitations of various components of transmission facilities as opposed to being based on "intention to trigger implementation of Operating Plan".

- It provides more clarity and avoids ambiguity and interpretation issues.

- It is much more acceptable to vast majority of Industry participants, especially smaller TOPs

As a reference to the SDT, a MISO Reliability footprint wide SOL Exceedance occurs if system operating state indicates any of the following seven conditions:

- Actual steady state flow on a BES Facility is greater than the Facility's highest Emergency Rating for any time period.
-
- Actual steady state flow on a BES Facility is above the Normal Rating but below the next Emergency Rating for longer than the time frame of

the next Emergency Rating.

- Actual steady state voltage on a BES Facility is less than the defined emergency low voltage limit for time frame identified by the TOP.
- Actual steady state voltage on a BES Facility is greater than the emergency high voltage limit for time frame identified by the TOP.
- Any established stability limit (non-IROL) is exceeded for longer than the 30 minutes or defined by Operating Plan.
- Projected post-Contingent loading on a BES Facility is greater than the highest Emergency Rating for longer than 30 minutes with NO agreed upon Post Contingency Action Plan that would mitigate the condition if the Contingency were to occur.
- Projected post-Contingent voltage on a BES Facility is less than the Emergency low voltage limit for longer than 30 minutes with NO agreed upon Post Contingency Action Plan that would mitigate the condition if the Contingency were to occur.
- Great River Energy would like to emphasize the difference between the above definition and the SDT's proposed definition as it relates to the concept of a post-contingent action plan. The Post-contingency action plan is the RC's/TOP's agreed upon control action to be used while the normal congestion management processes are attempting to return the projected post contingent flow within a longer-term rating for a specified amount of time. An SOL exceedance should not exist if a post contingent action plan has been identified and is in place to address the contingency were it to occur. It should only exist if no plan has been formulated within the specified time frame which for MISO members has been identified as 30 minutes.

Comment

We do not believe it is necessary that NERC define SOL Exceedance. However, if there is going to be a definition we believe a simple definition for Real-time operations is best.

We suggest the following definition:

SOL Exceedance - An operating condition, as determined in Real -time Monitoring, wher

An exceedance can only occur if it happens in Real-time and therefore the SOL Exceedance definition should not incorporate the concept of predicted exceedances. Predicted exceedances, such as those identified through OPAs and RTAs, may or may not occur as they are just that, predicted. Predicted exceedances should not be defined and subject to the stringent set of limitations and requirements that SOL Exceedances should be. Furthermore, how predicted exceedances are identified, assessed, operationally planned for and mitigated should be the responsibility of the Reliability

Coordinator. Therefore, any such definition for predicted exceedances should remain in the respective RC's SOL methodology.

Julie Hall - Entergy - 6, Group Name Entergy/NERC Compliance

Answer	No
Document Name	

Comment

Entergy strongly disagrees with the definition as written.

The "pre-Contingency" state does not include a statement regarding time. If an entity using time dependent emergency ratings it should only be an exceedance if the actual flow through a facility is above the Facility's normal rating for a period of time greater than the timeframe of the emergency rating. The definition of the post-contingency state does take into account emergency ratings but they are essentially useless if by definition the instance after the contingency occurs and now you move into the next pre-contingency state you will immediately have an SOL exceedance.

In addition, the post-contingency state mentions the term "sufficient time" but doesn't describe what "sufficient time" time is. This leaves the definition ambiguous.

Entergy believes you should adopt the MISO definition of SOL exceedance as follow.

- ***Actual steady state flow on a BES Facility is greater than the Facility's highest Emergency Rating for any time period.***
- ***Actual steady state flow on a BES Facility is above the Normal Rating but below the next Emergency Rating for longer than the time frame of the next Emergency Rating.***
- ***Actual steady state voltage on a BES Facility is greater than the emergency high voltage limit for time frame identified by the TOP.***
- ***Actual steady state voltage on a BES Facility is less than the defined emergency low voltage limit for time frame identified by the TOP.***
- ***Any established stability limit (non-IROL) is exceeded for longer than the 30 minutes or defined by Operating Plan.***
- ***Projected post-Contingent loading on a BES Facility is greater than the highest Emergency Rating for longer than 30 minutes with NO agreed upon Post Contingency Action Plan that would mitigate the condition if the Contingency were to occur.***
- ***Projected post-Contingent voltage on a BES Facility is less than the Emergency low voltage limit for longer than 30 minutes with NO agreed upon Post Contingency Action Plan that would mitigate the condition if the Contingency were to occur.***

Daniel Grinkevich - Con Ed - Consolidated Edison Co. of New York - 1,3,5,6

Answer	No
Document Name	

Comment

Typically there are additional Thermal ratings above the "normal" limit that have a time frame associated with them. For example an emergency limit may be a 15 minute rating, i.e. the flow can be at the emergency rating for 15 minutes. Therefore, by design, being above the normal rating is not going to result in damage to the BES elements. Therefore the 1st bullet in the SOL Exceedance definition should be revised to
"Actual flow through a Facility is above the Facility's Rating and the associated allowable time frame is exceeded."

Colby Bellville - Duke Energy - 1,3,5,6 - FRCC,SERC,RF, Group Name Duke Energy

Answer	No
Document Name	

Comment	
Duke Energy requests further clarification on the rationale behind the differences in criteria between pre-Contingency, and post-Contingency. As proposed, 'pre-Contingency' criteria for exceedances are above 'normal' ratings/limits, whereas 'post-Contingency' criteria for exceedances being 'above the highest/lowest' rating/limit. We feel that the rating/limit should be the same for both, and propose that the pre-Contingency criteria should also be for 'above the highest/lowest' rating/limit. Some ambiguity exists with the use of "Normal Rating". It is possible that an entity could interpret the use of "Normal Rating" to include all ratings. We recommend the drafting team consider adding language that explains that a "Normal Rating" is defined by the entity's SOL Methodology. • *"Actual flow through a Facility is above the Facility's Normal Rating (as defined by entity's SOL Methodolgy)"* Also, there appears to be some inconsistency between the text of the SOL Exceedance definition, and the SOL Performance Summary table found on page 11 of the SOL/SOL Exceedance Rationales document. The table implies that an SOL Exceedance can occur within the 1-hr rating range. Was this the drafting team's intent? It is acknowledged that action is needed if the Exceedance occurs within the 1-hr ratings range, but does the drafting team contend that an SOL Exceedance can occur even if you are still in that 1-hr rating. Lastly, The definition does not address temporary conditions. What happens if you have a fault and it drags your bus voltage down long enough to pick up and alarm, and then restores. Would that be a exceedance according to the proposed definition? We recommend that the drafting team include language that outlines how long an SOL may be exceeded in the RTA before a Mitigation Plan should be developed. We suggest that the drafting team insert language recommending that an SOL Exceedance has not occurred until the SOL has been exceeded for a period of 30 minutes or longer.

Comment	
The proposed definition of SOL Exceedance does not consider the concept of timeframes on Facility Ratings. Specifically, the SOL Performance Summary on page 5 of the System Operating Limit Definition and Exceedance Clarification whitepaper from Project 2014-03 indicates that Pre-Contingency flow between a Normal Rating (24 hour rating) and a higher Emergency Rating with an associated timeframe (4 hour in the specific example) is not an SOL exceedance until flow exceeds both the Normal Rating (24 hour rating) and the time limit associated with the higher limit (again, 4 hours in this specific example). The proposed definition of SOL Exceedance would consider Pre-Contingency flow above the Normal Rating (24 hour rating) to be an SOL Exceedance irrespective of any time based higher rating. For the Pre-Contingency state, actual flow through a Facility above its Normal Rating should not be an SOL Exceedance unless the actual flow through the Facility stayed above the Normal Rating for a duration longer than the timeframe associated with the next rating. NERC standard TOP-001-3 R14 states that "Each Transmission Operator shall initiate its Operating Plan to mitigate a SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment". Per the definition of SOL Exceedance TOP's will be required to mitigate flows going above normal rating all of the time even if the facility has a valid higher rating that allows flows to be above Normal Rating for a defined period of time. While the system operators will act to reduce flows to below the normal rating an SOL Exceedance should not be defined to occur until the defined period of time for the next higher rating has been exceeded. Defining an SOL Exceedance to occur whenever the normal rating is exceeded regardless of timeframe creates a compliance burden on real time operations staff that will reduce reliability due to the distractions associated with creating compliance documentation.	

For the post-Contingency state, it should be made clear that monitoring Normal Ratings for contingency analysis is not required. Instead, as depicted in the SOL Performance Summary on page 5 of the System Operating Limit Definition and Exceedance Clarification whitepaper and on page 11 of the NERC Glossary Definitions: System Operating Limit and SOL Exceedance Rationale document, having a long term Emergency Rating of sufficient duration to allow for a reduction in flow to below the Normal Rating would allow for monitoring to Emergency Ratings during contingency analysis. Requiring TOP's to monitor contingency analysis results for post contingent conditions that exceed Normal Ratings will create undue burden on system operators as well as on the contingency analysis programs. In addition, setting the threshold lower than what is currently used may reduce the usage of the transmission system. Due to the significant increase in the volume of reported contingency violations which will need to be sorted through and contemplated. In fact, some contingency analysis tools have a finite number of contingency violations that can be reported and depending on the relative severity of contingent violations, will likely result in not reporting valid post-contingent violations of emergency limits which have a much more significant impact on reliability.

Often times load shed is used as a mitigation plan when flow on a facility is above the highest Emergency Rating however implementing pre-contingent load shed to mitigate an SOL Exceedance may not be prudent all of the time since load shed may occur when the contingency happens. In addition, the impact of SOL Exceedance is local in nature. A TOP should have the ability to weigh the risks/benefits associated with implementing load shed vs risking a localized impact for a postulated post-contingent condition without having to factor in SOL Exceedance compliance considerations. The transmission system is much too dynamic to be overly prescriptive. Specifically, with the proposed definition of SOL Exceedance, standard TOP-001-3 R14/R15 may not explicitly allow for TOP's to not implement pre-contingent load shed if post contingent operation is above the highest Emergency Rating. The Project 2014-03 Whitepaper clearly specified that pre contingency load shed may not be necessary or appropriate. Absent any modifications to TOP-001-3 the proposed SOL Exceedance definition may require pre-contingent load shed actions. If the definition is used as currently proposed then TOP-001-3 should also be revised to add clarification that a post contingent SOL Exceedance is acceptable as long TOP has a viable Operating Plan.

Response

Mike Smith - Manitoba Hydro - 1,3,5,6

Answer	No
Document Name	

Comment

Manitoba Hydro agrees with the SDT that a definition for SOL Exceedance is needed to support the updated standards. We agree with all components of the definition with the exception of components #3 and #4 – exceeding normal facility ratings or normal voltage limits. Should exceeding the normal facility rating or normal voltage be the trigger for all the reporting requirements included in these updated standards. Most TOPs can exceed their normal facility ratings and normal voltage limits without any adverse effects on the system. In fact, these TOPs have emergency facility ratings and emergency voltage limits to give operators the time to take corrective actions in response to an event that would cause these normal ratings and limits to be exceeded. It seems unnecessarily burdensome to ask TOPs and RCs to report and document these events when they pose no risk to reliability. Conversely, exceeding emergency ratings and limits is definitely impactful to the reliability of the BES. It is appropriate to expect a higher threshold of reporting and documentation for these events.

With the proposed definition, SDT putting a huge compliance burden on to TOPs and RCs for no apparent reliability impact. New definition require TOP to notify their RC, every time the real time flow or the voltage goes outside the normal range and make a log entry for compliance purposes.

Manitoba Hydro believes that the SOL Exceedance definition should reflect the more sever conditions than the normal rating. For an example, due to absence of NERC definition for SOL Exceedance, MISO members developed definition for the SOL Exceedance. Like the proposed NERC definition, MISO SOL Exceedance definition also covers the real-time condition and the projected post contingency condition. According to MISO definition, SOL exceedance occurs whenever the real-time flow goes above the highest Emergency rating or the real-time voltage goes outside the emergency voltage

limits. Manitoba Hydro support MISO's approach of managing SOL exceedance.

Michael Cruz-Montes - CenterPoint Energy Houston Electric, LLC - 1 - Texas RE	
Answer	No
Document Name	
Comment	
CenterPoint Energy does not agree with the proposed definition of SOL Exceedance and believes that a definition is not necessary. If you take into consideration the FERC-referenced, NERC SOL Whitepaper coupled with the work the SDT has done to provide the industry with a clear and concise proposed definition to the System Operating Limit (SOL) term, a formalized definition to SOL Exceedance is not warranted. Furthermore, we believe that the proposed definition to SOL Exceedance is problematic and confusing with potential operational and compliance implications. We are concerned that the SDT definition and application of the term "stability limits" differs from the NERC approved glossary definition of "Stability Limits". This term, "Stability limit" is also used in the NERC SOL Whitepaper. CenterPoint energy urges the SDT to have further discussions and considerations towards the use of "stability limits" for proper alignment with the NERC defined term as well as how the term is used in the NERC SOL Whitepaper for clear representation to the industry.

Bob Solomon - Hoosier Energy Rural Electric Cooperative, Inc. - 1	
Answer	No

Document Name	
Comment	

Hoosier Energy strongly disagrees with the proposed definition of SOL exceedance. Hoosir supports the following:

1. The SDT failed to assess and recognize that the proposed SOL exceedance definition will cause **huge unintended consequences on large spectrum of the Industry's participants**.

2. The first major problem with the SDT's proposed definition of the SOL exceedance is **that it would expose a large number of TOPs and RCs to compliance risk unless enormous resources and efforts are added within each TOP's/RC's organization to keep up with (an order of magnitude) higher compliance administrative burden**.

3. The second major problem is that this definition is driven by SDT's belief that the definition would "trigger implementation of Operating Plan". However, we believe the definition would delay implementation of the Operating Plan in real-time due to logging and documentation requirements, as this functionality is not a built-in feature of many SCADA systems in use today. We believe that a potential unintended outcome to avoid the administrative burden is operating **in an unnecessarily conservative operation.** We believe the SDT has ignored a fundamental fact that the implementation of Operating Plan, even in current industry's practice, is already being triggered by existing mechanisms, such as SCADA operating alarms, RTCA results, principles of reliable operations and high quality operator's training.

4. The role of NERC adopted definition of SOL exceedance definition, in our opinion, should be to clearly and unambiguously formulate critical operational borderlines of reliable operations, while **respecting existing limitations of existing transmission infrastructure and human resources that operate this infrastructure**. In other words the *SOL exceedance definition should be focused on defining what is considered to be **unacceptable operation** rather than what should be **good operating practice based recommendable operation***.

Therefore, we strongly **recommend that the SDT defers voting/ballots** on this item until such time that the following tasks are completed:

- **Perform comparative analysis of existing SOL definitions nation-wide**, in order to get an informed insight as to where majority of industry's participants stand on this definition.

- **Perform analysis of additional staffing resources and tools** that would be needed to implement proposed definition.

- **Outline and assess compliance driven administrative burden** that the proposed definition would impose on numerous entities in terms of providing an evidence of compliance that they initiated an Operating Plan for each single event of SOL exceedance.

- **Evaluate a risk of overwhelming and distracting real-time operations people** with a burden of significantly increased communication requirements associated numerous instances of marginally relevant localized SOL exceedances.

- **Assess the impact of significantly constraining business in the industry** associated with the industry's **inability to approve and perform numerous scheduled outages** (with many of them mandated by other NERC standards), as this conservative definition of SOL exceedance would simply make impossible many of these outages to proceed without causing SOL exceedances.

- Assess the impact that the proposed definition would have **on efficiency of market operations and associated cost**.

We re-iterate our ***recommendation that SDT re-considers adoption of the SOL exceedance that is currently in effect in MISO Reliability footprint***, based on the following advantages of the MISO definition when compared with the SDT's proposed definition:

1. It is *much more realistic in recognizing reality of existing transmission infrastructure and human resources allocated to operate such an infrastructure*

2. *It would provide for significantly less administrative burden* on numerous Industry's entities related to providing evidences of compliance.

3. It would provide *comparably reliable operation* of power systems.

4. It is *based on physical limitations of various components of transmission facilities* as opposed to being based on "intention to trigger implementation of Operating Plan".

5. It would *prevent potentially huge increase of cost* of market operations.

6. It provides *more clarity and avoids ambiguity and interpretation issues*.

7. It is *much more acceptable to vast majority of Industry participants* as opposed to relatively small subset of industry participants that can afford use of advanced tools and other resources, including, but not limited to staffing and support personnel.

MISO Reliability footprint wide SOL Exceedance occurs if system operating state indicates any of the following:

- ***Actual steady state flow on a BES Facility is greater than the Facility's highest Emergency Rating for any time period.***
- ***Actual steady state flow on a BES Facility is above the Normal Rating but below the next Emergency Rating for longer than the time frame of the next Emergency Rating.***

Typically there are additional Thermal ratings above the "normal" limit that have a time frame associated with them. For example an emergency limit may be a 15 minute rating, i.e. the flow can be at the emergency rating for 15 minutes. Therefore, by design, being above the normal rating is not going to result in damage to the BES elements. Therefore the 1st bullet in the SOL Exceedance definition should be revised to
"Actual flow through a Facility is above the Facility's Rating and the associated allowable time frame is exceeded.

BPA believes that a TOP should be able to exceed a Normal Rating while utilizing an Emergency Rating (with a time-dependency) without logging an SOL Exceedance or notifying their RC of the actions taken (the action taken was to use an Emergency Rating). Using an Emergency Rating for the appropriate amount of time has no impact to system reliability and is using the "applicable" rating as identified in the NERC SOL Whitepaper.

Given the drafting team's SOL Exceedance proposal, a TOP would have to document their initiation of an Operating Plan and call their RC each time a Normal Rating is exceeded. BPA believes that this is an undue burden on the TOP and their RC and that the use of an Emergency Rating is normal operating procedure, not an SOL Exceedance.

BPA proposes this definition for SOL Exceedance:

An operating condition or analysis result characterized by any of the following, as determined in Real-time Assessments (RTA) or Operational Planning Analysis (OPA):

The pre-Contingency state indicates any of the following:

- *Actual flow through a Facility is above the Facility's highest Emergency Rating, or above an Emergency Rating for longer than the associated time*
- *Actual bus voltage is below the System Voltage Limit*

- *Actual bus voltage is above the highest System Voltage Limit, or the actual bus voltage is above a time-dependent System Voltage Limit for longer than the associated time*
- *A stability limit established to prevent instability without a Contingency is exceeded*
- *A stability limit established to prevent the Contingency from resulting in instability is exceeded*

The calculated post -Contingency state indicates any of the following:

- *Flow through a Facility is above the Facility's highest Emergency Rating, or above a Facility Rating for which there is not sufficient time to reduce the flow to established acceptable levels should the Contingency occur*
- *Bus voltage is outside the highest or lowest System Voltage Limit, or outside a System Voltage Limit for which there is not sufficient time to bring the bus voltage to established acceptable levels should the Contingency occur*
- *Defined stability performance criteria are not met*

The proposed NERC defined term System Voltage Limit is used in the proposed definition of SOL Exceedance. System Voltage Limit is in a separate NERC posting out for comment, but since BPA will be proposing a revision to the definition of System Voltage Limit, BPA has used this revised definition in the comments submitted by BPA on the SOL Exceedance definition. Subsequently, BPA thinks it is relevant to share this revised definition with the drafting team now.

BPA proposes the following revisions to the definition of System Voltage Limit:

"The minimum steady -state voltage (pre-Contingency and post-Contingency) that provide for acceptable System performance. The maximum steady -state voltage ... base performance."

When addressing the post-Contingency bus voltage in the SOL Exceedance, the use of "emergency" is redundant given BPA's revised definition of System Voltage Limit because "Emergency Rating" is included in the revised definition.

Comment	

Glencoe re-iterates our strong disagreement with the proposed definition of SOL exceedance. We express our disappointment with SDT's reluctance to incorporate our original comments and suggested changes that we submitted during the August 2016 commenting period.

The SDT failed to assess and recognize that the proposed SOL exceedance definition will cause **huge unintended consequences on large spectrum of the Industry's participants**.

The first major problem with the SDT's proposed definition of the SOL exceedance is **that it would expose a large number of TOPs and RCs to compliance risk unless enormous resources and efforts are added within each TOP's/RC's organization to keep up with (an order of**

magnitude) higher compliance administrative burden.

The second major problem is that this definition is driven by SDT's belief that the definition would "trigger implementation of Operating Plan". However, we believe the definition would delay implementation of the Operating Plan in real-time due to logging and documentation requirements, as this functionality is not a built-in feature of many SCADA systems in use today. We believe that a potential unintended outcome to avoid the administrative burden is operating **in an unnecessarily conservative operation.** We believe the SDT has ignored a fundamental fact that the implementation of Operating Plan, even in current industry's practice, is already being triggered by existing mechanisms, such as SCADA operating alarms, RTCA results, principles of reliable operations and high quality operator's training.

The role of NERC adopted definition of SOL exceedance definition, in our opinion, should be to clearly and unambiguously formulate critical operational borderlines of reliable operations, while **respecting existing limitations of existing transmission infrastructure and human resources that operate this infrastructure**. In other words the *SOL exceedance definition should be focused on defining what is considered to be **unacceptable operation** rather than what should be **good operating practice based recommendable operation***.

Therefore, we strongly **recommend that the SDT defers voting/ballots** on this item until such time that the following tasks are completed:

Perform comparative analysis of existing SOL definitions nation-wide, in order to get an informed insight as to where majority of industry's participants stand on this definition.

Perform analysis of additional staffing resources and tools that would be needed to implement proposed definition.

Outline and assess compliance driven administrative burden that the proposed definition would impose on numerous entities in terms of providing an evidence of compliance that they initiated an Operating Plan for each single event of SOL exceedance.

Evaluate a risk of overwhelming and distracting real-time operations people with a burden of significantly increased communication requirements associated numerous instances of marginally relevant localized SOL exceedances.

Assess the impact of significantly constraining business in the industry associated with the industry's **inability to approve and perform numerous scheduled outages** (with many of them mandated by other NERC standards), as this conservative definition of SOL exceedance would simply make impossible many of these outages to proceed without causing SOL exceedances.

Assess the impact that the proposed definition would have **on efficiency of market operations and associated cost**.

We re-iterate our ***recommendation that SDT re-considers adoption of the SOL exceedance that is currently in effect in MISO Reliability footprint***, based on the following advantages of the MISO definition when compared with the SDT's proposed definition:

It is *much more realistic in recognizing reality of existing transmission infrastructure and human resources allocated to operate such an infrastructure*

It would provide for significantly less administrative burden on numerous Industry's entities related to providing evidences of compliance.

It would provide *comparably reliable operation* of power systems.

It is *based on physical limitations of various components of transmission facilities* as opposed to being based on "intention to trigger implementation of Operating Plan".

It would *prevent potentially huge increase of cost* of market operations.

·It provides *more clarity and avoids ambiguity and interpretation issues*.

It is *much more acceptable to vast majority of Industry participants* as opposed to relatively small subset of industry participants that can afford use of advanced tools and other resources, including, but not limited to staffing and support personnel.

MISO Reliability footprint wide SOL Exceedance occurs if system operating state indicates any of the following:

Actual steady state flow on a BES Facility is greater than the Facility’s highest Emergency Rating for any time period.

· ***Actual steady state flow on a BES Facility is above the Normal Rating but below the next Emergency Rating for longer than the time frame of the next Emergency Rating.***

Actual steady state voltage on a BES Facility is greater than the emergency high voltage limit for time frame identified by the TOP.

Actual steady state voltage on a BES Facility is less than the defined emergency low voltage limit for time frame identified by the TOP.

Any established stability limit (non-IROL) is exceeded for longer than the 30 minutes or defined by Operating Plan.

The SDT determined that any **persistent** exceedance of a Normal Rating should be regarded as an SOL exceedance, even if the exceedance occurs for an **acceptable duration**. We disagree with SDT’s insistence on using Normal Rating **and re-iterate our recommendation to use Emergency Rating.** The technical rationale for our recommendation is based on the TOP rating methodology which considers all limiting factors for transmission facilities and assesses ***no reliability repercussions as long as the flow on facility is returned below normal rating during time that was assigned for the emergency rating***. In the matter of fact, this is one of main reasons that transmission operators are given an emergency ratings and that fact should be correspondingly recognized in the SOL exceedance definition.

The SDT’s rationale to use Normal Rating in order to “trigger implementation of Operating Plan” is confusing. TOPs are perfectly aware of the limitations associated with the use of Emergency Rating and their obligation to return the flow below Normal Rating within specified time-frame**. Furthermore, hard-coded SCADA based operational alarms will trigger implementation of Operating Plan. Therefore, it is absolutely unnecessary to adopt conservative definition of SOL in order to “remind” TOPs and RCs of their well understood obligation to return flow under Normal Rating in specified time-frame**.

Secondly, although SDT stated that the their goal is to improve clarity and eliminate ambiguity they increase ambiguity and open another issue of interpretation by introducing the term **“persistent** exceedance of a Normal Rating”. The time of exceedance has to be clearly specified in this component. Otherwise, how will entities, including Auditors, measure “persistency” of exceedance?

The proposed, conservative definition would cause undesirable consequences in terms of administrative compliance burden and unnecessary increase of the cost of market operations while providing marginal benefit to system reliability as TOPs/RCs are under obligation to protect facilities on a contingency basis, which will consequently protect that facility against real-time flow exceedances.

We recommend the following definition:

· ***Actual steady state flow on a BES Facility is greater than the Facility’s highest Emergency Rating for any time period.***

· ***Actual steady state flow on a BES Facility is above the Normal Rating but below the next Emergency Rating for longer than the time frame of the next Emergency Rating.***

Component #4 – *The pre* Outside normal System Voltage Limits *Actual bus voltage is*

We disagree with SDT’s insistence on using Normal System Voltage Limits and recommend using Emergency Voltage Limits. Our arguments regarding the Component #4 are similar to our comments concerning the Component #3.

The technical rationale for our recommendation is based on the fact that **TOPs/RCs do operate their systems within normal voltage limits during vast majority of the time**. However, there are rare instances when sudden events and changes to operating conditions, or periods during switching long transmission lines, require use of emergency voltage limits. That is why *SOL exceedance definition should be focused on what is considered to be unacceptable operation rather than what should be recommended operation*. Again, the proposed, conservative definition would cause undesirable consequences in terms of administrative compliance burden.

We recommend the following definition:

Actual steady state voltage on a BES Facility is greater than the emergency high voltage limit for time frame identified by the TOP.

Actual steady state voltage on a BES Facility is less than the defined emergency low voltage limit for time frame identified by the TOP.

Component #5 – *The pre* *-Continge*

Component #6 – *The pre* *ncy state in Stability is exceeded*

The SDT apparently concluded that there is a reason to differentiate between stability limit occurring without contingency and stability limit that is contingency based and conditioned. We do not see reason that would be strong enough in order to justify existence of two components related to stability limits.

We believe that the physical nature of the stability limits is best addressed within individual Operating Plans. Therefore, there is no need to separate different natures of stability problems within definition of SOL exceedance. We believe that this is unnecessary complication and could be resolved by merging two subcomponents into the one.

We also find it inappropriate that **the proposed definition does not recognize time-frame associated with exceedances of established stability limits**. If not recognized this can lead to hundreds of meaningless (nuisance) exceedances (for sake of an example, such as those that last less than 1 minute and have magnitude of less than 1%).

We recommend the following definition:

· ***Any established stability limit (non-IROL) is exceeded for longer than the 30 minutes or defined by Operating Plan.***

Component #7 – *The calculated post* *-Contin* *or above a Facility Rating for which there is not sufficient time to reduce the flow to established acceptable levels should the Contingency occur*

The SDT provided clarification of their position by pointing out the (Project 2014 -03 White Paper) two highlighted items in the diagram. The portion highlighted in yellow, according to the SDT's explanation) " is considered an SOL Exceedance because this designation accomplishes the desired outcome by triggering mitigating action through the implementation of an Operating Plan".

First, we need to draw attention of the SDT that the original version of the NERC White Paper (from May 2014) was stating that "Post-contingency flow in this range is not acceptable **unless Operating Plan address reliability impact so that it has localized impact**". Subsequent version of the NERC White Paper (revision of January 2015) introduced statement that "Post-contingency flow in this range is not acceptable" . **This revision, with a major impact, was never presented to the industry, never approved by the Industry and in our opinion was step in the wrong direction**.

The SDT's proposed definition of the post-Contingency flow SOL exceedance **fails to recognize the important difference between actual, pre-contingency SOL exceedance and calculated, post-contingency RISK of SOL exceedance**. This attempt to include both of them under the single, generic term "SOL exceedance" may easily cause an incorrect expectation that TOP/RC control action response to these two types of exceedances should be similar.

It is perfectly clear and understandable that both of these types of exceedances require and should trigger implementation of a control action from Operating Plan, but they should be treated *differently in terms of urgency and severity of mitigating control actions*, as they have different repercussions on system reliability.

The portion of the definition that states, *"…or above a Facility Rating for which there is not **sufficient time** to reduce the flow to established acceptable levels should the Contingency occur"* is intended to address the operating state highlighted in light blue. **This portion of the definition will be permanent source of major troubles for the industry, from the implementation prospective**. It **introduces ambiguity and confusion, because TOPs/RCs would be faced with hard and sometimes impossible task to determine what actually is "sufficient time" for any specific set of operational circumstances**. This time might be dependent on ramp rates of the units but also on efficiency and speed of congestion management procedures (such as LMP binding). **This may also cause huge cost to market operations, while providing marginal benefits to system's reliability**.

We recommend the following definition:

Projected post-Contingent loading on a BES Facility is greater than the highest Emergency Rating for longer than 30 minutes with NO agreed upon Post Contingency Action Plan that would mitigate the condition if the Contingency were to occur.

Rationale for using Post-contingency action plan concept

The main difference between our proposed definition and the SDT's proposed definition is the **concept of post-contingent action plan**. *The Post-contingency action plan is the RC's/TOP's agreed upon control action to be used* ***while the normal congestion management processes are attempting to return the projected post contingent flow within longer-term rating****.* It is very important to note that the Post-contingency action plans are **NOT** a vehicle to justify continual operation where the projected post contingent flow is above Facility's highest Emergency Rating.

In contrast to this, we think that the Post-contingency action plan developed by TOP and RC is required to address potential impacts and post-contingent mitigating strategies, including but not limited to load shedding or generator tripping, while normal congestion management actions are being implemented, to ensure potential impact is localized and to prevent equipment damage.

Therefore, we would NOT consider SOL exceedance to exist anytime the Projected post-contingency flow is above Facility's highest Emergency Rating, but only for those situations when the Projected post-contingency flow is above the Facility's highest Emergency Rating (Rate C) for longer than 30 minutes **WITHOUT associated post-contingency action plan**.

We recognize that there may be situations in the system when normal congestion management is not effective or has been exhausted, and the projected post-contingent loading on a facility remains greater than the highest available emergency rating. In this situation, load shedding may be the sole remaining option to address the projected post-contingency loading. The TOP and RC may decide to operate in this fashion and not implement load-shedding pre-contingency if the impacts would be localized. In this case the SOL exceedance would be reportable, even though a post-contingent action plan exists, since normal congestion management is no longer taking place.

The SDT's concept insists on the concept "highest Emergency Rating". Our definition is based on the concept of "post-contingency action plan". We do recognize that it might be argued that the TOP has to establish a new Short Emergency rating in contrast to agreeing with its RC on post-contingency action plan. Issuing a new Short Term Emergency rating should be considered as a legitimate alternative, indeed. **The huge practical obstacle to issuing higher emergency rating (or "Load Shed Rating**") that the Industry always faced is that each TOP would have to **get manufacturers' confirmations for using shorter term Emergency Ratings (such as 10-minute ratings**) for every single piece of equipment (breakers, switches, wave traps, CTs conductors, all pieces on transformers etc). Majority of manufacturers would not be even able nor willing to provide such a data. Therefore, **for practical reasons, it is almost impossible to get such a short-term ratings based on manufacturers' data**. Consequently, each TOP and RC would need to define criteria within their Operating Plan for using post-contingent action plans. These criteria might be based, for sake of example, on Relay Loadability Limits of transmission facilities.

Comment

It is felt that an SOL Exceedance has not occurred until both a limit and corresponding time frame have been surpassed, which is supported by the SOL whitepaper. If a Facility has a Normal Rating and corresponding 4-hour Emergency Rating, reliable operation can occur even after surpassing the Normal Rating (but still less than the Emergency Rating) for less than 4 hours. Operating in an allowed reliable state should not be an SOL Exceedance. SOL Exceedances should be to the true binding limitations of the system for purposes of consistency. This does not preclude an operator from taking action, but should not be required if reliable system operation has been determined within this range. This should be true for both pre- and post-contingent discussions as long as mitigation can take place within the allotted timeframe.

As currently written, pre-contingent and post-contingent definitions are inconsistent. A post-contingent Normal Rating exceedance that can be mitigated with its allowable timeframe would immediately become an SOL exceedance if the contingency occurs.

Suggested language as follows:

*A **binding and valid** operating condition or analysis result characterized by any of the following, as determined in Real etime Assessments (RTA) or Operational Planning Analysis (OPA):*

The pre -Contingency state indicates any of the following:

- *Actual flow through a Facility is above the Facility's **respective rating (Normal or Emergency) longer than the allowable time defined by the TOP***
- *Actual bus voltage is outside **acceptable** System Voltage Limits **longer than the allowable time defined by the TOP***
- *A stability limit established to prevent instability without a Contingency is exceeded*
- *A stability limit established to prevent the Contingency from resulting in instability is exceeded*

The calculated post -Contingency state indicates any of the following:

- *Flow through a Facility is above the Facility's highest Emergency Rating, or above a Facility Rating for which **it is known that flow would exceed the rating longer than the respective allowable time defined by the TOP should the contingency occur***
- *Bus voltage is outside the highest or lowest emergency System Voltage Limit, or outside a System Voltage Limit for which **it is known that the voltage would remain outside the limit longer than the respective timeframe defined by the TOP** should the Contingency occur*
- *Defined, non-limit based stability performance criteria are not met as determined by those entities with the capabilities and processes to do so*

*Valid and binding shall ensure that conditions or results flagged are of sufficient accuracy and consistency. Nuisance (i.e., intermittent alarming) conditions or results shall not be considered a binding SOL Exceedance.

Brandon Ware - Colorado Springs Utilities - 1,3,5,6, Group Name Colorado Springs Utilities

Answer	No
Document Name	

Comment

Colorado Springs Utilities finds the Project 2014-03 SDT's rationale for what constitutes an SOL Exceedence to be compelling and reasonable. The proposed definition in question strays from the White Paper produced by that Project (and subsequently adopted as "ERO Enterprise-Endorsed Implementation Guidance") in a significant way - that of being able to fully utilize all applicable thermal ratings and associated time frames in Real-time.

The purpose of SOLs is to "ensure operation within acceptable reliability criteria," and entities establish thermal SOLs, including any so-called "emergency" ratings and their attendant time limits, with those criteria in mind.

From the White Paper, "SOL exceedance occurs when acceptable system performance as described in approved FAC-011-2 is not occurring in Real-time operations as determined by Real-time Assessments. In other words, unacceptable system performance as indicated by Real-time Assessments equates to SOL exceedance." In other, other words; operating, Real-time, with MW flows above a Facility's normal/continuous thermal rating but below a time-limited "emergency" rating for a time not exceeding the applicable time-limit is acceptable system performance and, thus, not an SOL Exceedance. This is straight-forward logic, and conforms with the White Paper you reference.

TOP-001-3, R14, requires, "Each Transmission Operator shall initiate its Operating Plan to mitigate a SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment." Colorado Springs Utilities believes this requirement is met, in spirit and in letter, by an entity implementing an Operating Plan to prevent exceeding the time limit imposed by any specific, applicable thermal SOL. This requirement would also be met, in spirit and in letter, by an entity recognizing that operating slightly above the normal/continuous rating (but below the time-limited "emergency" rating) will only persist for a time less than the applicable time limit due to the forecasted load curve and taking no specific action other than monitor.

Therefore, Colorado Springs Utilites requests changing the first bullet under the "pre-Contingency" list to read:

• Actual flow through a Facility is above the applicable Facility Rating for an unacceptable time duration

Thomas Foltz - AEP - 3,5	
Answer	No
Document Name	
Comment	

While AEP agrees overall with the proposed definition, we are unsure of the need to include the text “Real-Time monitoring.” Unlike Real-time Assessments and Operational Planning Analysis, the phrase “Real-Time monitoring” is not a NERC glossary term. If “Real Time Assessment” is not already encompassing enough, what additional operating conditions or analysis would be brought into scope by including “Real-Time monitoring” in the definition?

AEP seeks clarity on the use of the term “calculated” relative to the post-contingency state. Nowhere in the technical justification, or as phrased in the question above, does it clarify the need to distinguish between calculated or actual post-contingency states.

Idaho Power agrees with the proposed definition, but recommends a wording change to the post-contingency facility rating bullet. Instead of "the Facility's highest Emergency Rating," the definition should state that flows should not exceed "the Facility's highest Emergency Rating for the operating conditions." For example, winter ratings should not be used for summer operating conditions.

We think the "or analysis result" is not necessary considering the reference to RTA and OPA. We appreciate the introduction of time to reduce the flow in the assessment of an operating condition. We suggest to reword "A stability limit established to prevent a (instead of the) Contingency from resulting in instability is exceeded". Also, same comment as for the SOL definition regarding the use of the non-defined term stability limit and the link with the interface concept.

Comments: Texas RE generally agrees with the SDT's approach to separate the definition of System Operating Limits (SOLs) from the definition of an "SOL Exceedance." In particular, Texas RE agrees with the NERC-endorsed implementation guidance that "[i]t is important to distinguish operating practices and strategies from the SOL itself." That is to say, while SOLs are based on an entity's actual set of Facility Ratings, voltage limits, and Stability Limits monitored in pre- and post-contingency states, SOL Exceedances should reflect performance within all applicable limits over the time horizon at issue. The SDT appears to take appropriate steps to clarify that distinction. With these general comments in mind, Texas RE notes one area that could further enhance the new SOL and SOL Exceedance definitions. In particular, both the SOL and SOL Exceedance definitions refer to "stability limits" and do use the existing NERC "Stability Limit" definition. "Stability Limit" is currently defined as: "[t]he maximum power flow possible through some particular point in the system while maintaining stability in the entire system or the part of the system to which the stability limit refers." The SDT should consider using the existing Stability Limit definition or, alternatively, revise the definition to reflect the new SOL and SOL Exceedance definitions. At a minimum, Texas RE requests that the SDT identify the aspects of the existing Stability Limit definition that warrant using the non-defined term.

Without stating in some way the rationale in the definition itself, it could easily be interpreted that some form of action would be required of all entities, not just those that have the capability to perform these types of studies. It is clear that the intent is not requiring real-time stability analysis tools; therefore, a clear distinction must be made to ensure this only applies to certain entities.

Suggested language:

Defined, ***non-limit based*** *stability performance criteria are not met* ***as determined by those entities with the capabilities and processes to do so***

Comment

We consider this portion of the definition as unnecessary, as it would apply to very limited number of TOPs/RCs that use real-time tools for determining defined stability performance. Established stability limits are sufficiently addressed by the third and fourth bullets under pre-Contingency operations (which we recommend to also be merged within one clearly defined stability related bullet. Those entities that use real-time stability tools should use the third and fourth bullets under pre-Contingency operations as well, with understanding that their stability limits might vary in real-time as opposed to be fixed/established.

This portion of the definition as unnecessary, as it would apply to very limited number of TOPs/RCs that use real-time tools for determining defined stability performance. Established stability limits are sufficiently addressed by the third and fourth bullets under pre-Contingency operations (which we recommend to also be merged within one clearly defined stability related bullet. Those entities that use real-time stability tools should use the third and fourth bullets under pre-Contingency operations as well, with understanding that their stability limits might vary in real-time as opposed to be fixed/established.

Including this bullet seems to put additional burden on TOP's and RC's utilizing real time tools to determine if stability criteria are being met. This may inadvertently discourage entities from implementing these types of real time tools that could help to enhance reliability. In addition, the rationale document states that "If the TOP or RC does not utilize Real-time stability tools to determ ngency events and to evaluate that response against defined stability performance criteria, but solely utilizes a more traditional approach for establishing stability limits (i.e., limit "values") to address system instability, then the third bullet in the post-Contingency section of the p Contingency definition would not apply to that TOP or RC, and the fourth bullet under the pre-Contingency section o Stability performance." However the definition itself does not list any exclusions or state that this bullet is "above and beyond". The definition used in a standard should clearly state the applicability and should exclude this bullet if the SDT considers it only applicable to entities with certain tools.

The proposed definition assumes each applicable entity possesses its own on-line stability tools or are actively monitoring its operating parameters to indicate the next Contingency that could result in instability. This may not always be the case. Moreover, what happens if an entity loses the availability of these tools? We believe the addition of this bullet to the definition is unnecessary, as applicable entities will likely take appropriate action to avoid the possible exceedance of a stability limit in the pre -Contingency state.

The proposed definition assumes each applicable entity possesses its own on-line stability tools or are actively monitoring its operating parameters to indicate the next Contingency that could result in instability. Established stability limits are sufficiently addressed by the third and fourth bullets under pre-Contingency operations. Per our recommendation to utilize the MISO definition in question #4, we believe these two bullets could be combined into one clearly defined stability related condition. Those entities that use real-time stability tools should use the third and fourth bullets under pre-	

Contingency operations as well or the single definition, with understanding that their stability limits might vary in real-time as opposed to be fixed/established.

NIPSCO feels the use of "sufficient time" in the definition is vague. Who defines "sufficient time"? Is it the RC or the TO? Again NIPSCO likes the MISO definition as it is more descriptive. It reads as follows: SOL Exceedance Based on Projected Post-Contingent Flows, Determined by a Real-Time Assessment A. Projected post-Contingent loading on a BES Facility is greater than the highest emergency rating for longer than 30 minutes with **NO** agreed upon action plan that would mitigate the condition if the Contingency were to occur. B. Projected post-Contingent voltage on a BES Facility is less than the emergency low voltage limit for longer than 30 minutes with **NO** agreed upon action plan that would mitigate the condition if the Contingency were to occur.

Peak agrees that the definition of SOL Exceedance should include the item "Defined stability performance criteria are not met." However, it should be made clear to auditors that this aspect of the defintion applies only to entities that use real-time tools to determine whether the system is meeting stability performance criteria or not. I.e., if a TOP or RC is not using real-time tools, but is instead using actual predetermined stability limits (limit "values") in accordance with the last two bullets in the pre-Contingency section of the proposed definition of SOL Exceedance, then the bullet in question should not apply to that TOP or RC.

Answer	Yes
Document Name	

Comment
The definition allows TOPs and RCs to recognize that the standards are about maintaining an adequate level of system performance for all customers. Many reliability issues are not adequately captured by traditional SOL values and are best measured by other system parameters. Although ATC agrees that the inclusion of this bullet is acceptable, the term "stability" with this bullet may cause confusion for some entities. Another possible term to use is "Defined system performance criteria are met".

6. The SAR is being revised to authorize the SDT to review the existing body of Reliability Standards and NERC Glossary of terms, and where necessary, modify those standards and definitions to incorporate the new terms and/or definition(s) of SOL Exceedance and System Voltage Limit, as well as the revised definition of System Operating Limit. The SDT has identified the standards and terms they contend would benefit from this incorporation and has included them in separate documents with this posting for your review. Do you agree with the SDT's selections? If not, please explain your response.

The current definition of SOL has been the foundation of the existing suite of Reliability Standards, in addition to operating practices, since 2007. Any change in the definition of SOL and the implementation of the new definitions needs to be carefully coordinated with updates to existing standards to accommodate the revised definition.

IRC has identified the following additional four Reliability Standards that it believes should be considered for updates included in the SDT Spreadsheet:

MOD-001-2 R1.1 The requirement should be changed to acknowledge the new definition

PER-004-2 R2 The VSLs needs to be modified since they were written with the 'most limiting' of ratings to be considered. The proposed definition includes the entire universe of ratings which I don't believe was the intent of the VSLs.

VAR-001-4.1 R1 The requirement should be changed to acknowledge the new definition.

Interconnection Reliability Operating Limit Glossary of Terms Need to replace violated with exceeded.

1. We believe the SDT should expand their review to any reference to the phrase "limit," in the context of System Operating Limits, in the NERC Reliability Standard and NERC Glossary. This includes the addition of glossary terms like Emergency Rating, Flowgate Methodology, Rating, and Reliable Operation. 2. The scope of the SAR should also be expanded to consider the review of applicable requirements that could be retired under various Paragraph 81 criteria.

The SDT should take the opportunity of this revision to ensure that clarity exists when other standards refer to deliverables or language used in the current FAC standards. For example, CIP -002-5.1a criterion 2.6 refers to a list of facilities critical to the derivation of IROL used in FAC-014, but the current FAC-014 does not explain in any way what critical facilities are versus non-critical facilities.

Care should be taken on implementing this definition. Once formal (capitalized) definitions become effective, entities will use that explicitly when complying with NERC standards. For example, confusion can occur if standards incorrectly use “SOL exceedance” or “exceeding an SOL” vs “SOL Exceedance. There must be a way to ensure continuity so that the intent of the requirement is clear.

1. We believe the SDT should have included a request for comments on its proposed definition for System Voltage Limit, since this definition directly ties to the SOL definition. The references to normal and emergency in this definition do not aligned with the proposed SOL and SOL Exceedance definitions. Further guidance on what constitutes "acceptable performance" is also needed. 2. We thank you for this opportunity to provide these comments.

The definitions addressed here achieve the objective of "bring clarity and consistency to the notion of establishing SOLs, exceeding SOLs, and implementing Operating Plans to mitigate SOL exceedances." It should be noted that the consistency in the definition of SOLs and application of SOLs to determine SOL Exceedances does not translate as a consistent, comparative indicator of reliable system performance. The contingencies applied to establish an SOL Exceedance event are bounded only by a floor of three contingencies mandated by FAC-011. OPAs and RTAs determine SOL Exceedances in accordance with the local SOL methodologies. SOL methodologies may or may not significantly expand the applicable contingencies which define SOL Exceedances. Comparing SOL Exceedances from one SOL methodology to the SOL exceedances of another SOL methodology can be a case comparing apples to oranges.

It is premature for industry to vote on FAC standards using the current definition as requested. While it would be nice to decouple the new standard and the revised SOL definitition, the revised definition fundamentally impacts how the FAC standards will be implemented. Therefore, entities must vote on the NERC standard based on the expected revised SOL definition. Where the combination of the revised definition and standard would cause concerns, then industry should vote negative accordingly. The two things cannot be effectvely decoupled.

Comment

1. The proposed definition of SOL Exceedance, if employed, will cause confusion as to what is a violation. For example, if flow on a line goes beyond its post-contingency STE (the highest time-based rating), should it not be considered a violation as opposed to an exceedance despite the fact the contingency has not occurred? This new definition should also identify which exceedances should also be treated as violations in the interest of eliminating confusion as to what is a SOL violation vs. what is an exceedance. Alternatively, having a definition for SOL Violation may provide the required clarity.

2. The proposed definition of System Voltage Limit seems unnecessary and the associated background information causes confusion around voltage Facility Ratings vs. System Voltage limits. System voltage limits are either present to either protect system equipment from damage or to prevent instability of the system. Therefore this defined term is not needed. The background from Q3 of this comments form states, "Facility Ratings and System Voltage Limits are not determined by a "study"; rather they are inputs to the "study". This confuses the term further as a System Voltage Limit definition further as voltage limits which are not Facility Ratings must be studied whenever system configurations are different from what has been previously studied.

3. The proposed definition for SOL must include the glossary term "Stability" definition. Use of lower-case stability with an accompanying explanation is not sufficient to allow industry to be of a common understanding. A common understanding of "Stability" is fundamental in ensuring Interconnected System Reliability. The definition of Stability must be inclusive of what could be deemed instability; this includes thermal violations would cause cascading outages.

Consideration of Comments

Project Name:	2015-09 Establish and Communicate System Operating Limits | SOL and SOL Exceedance Definitions
Comment Period Start Date:	9/29/2017
Comment Period End Date:	10/30/2017
Associated Ballots:	

There were 36 sets of responses, including comments from approximately 92 different people from approximately 74 companies representing 10 of the Industry Segments as shown in the table on the following pages.

All comments submitted can be reviewed in their original format on the project page.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process. If you feel there has been an error or omission, you can contact the Senior Director of Engineering and Standards, Howard Gugel (via email) or at (404) 446-9693.

Questions

1. Given the above, and considering the rationale provided in the supporting document, do you support the SDT's proposal to revise the current SOL definition? (Clarification: this question is not asking of you agree with the proposed definition. That will be addressed in a separate question. This question is focused on the need to modify the SOL definition at all.) Please explain your response.

2. Given the above, and considering the rationale provided in the supporting document, do you support the SDT's proposal to create and implement a definition for SOL Exceedance? (Clarification: this question is not asking of you agree with the proposed definition. That will be addressed in a separate question. This question is focused on the need for having a definition of SOL Exceedance.) Please explain your response.

3. Considering the simplified approach to SOLs described here and the explanations provided in the definitions rationales, do you agree with the proposed SOL definition? Please explain your response and/or provide alternative language.

4. Considering the explanations provided in the definitions rationales, do you agree with the proposed SOL Exceedance definition? Please explain your response and/or provide alternative language.

5. Considering the explanations provided here and further explained in the definitions rationales, do you agree that the proposed SOL Exceedance definition should include this bullet item? Please explain your response and/or provide alternative language.

6. The SAR is being revised to authorize the SDT to review the existing body of Reliability Standards and NERC Glossary of terms, and where necessary, modify those standards and definitions to incorporate the new terms and/or definition(s) of SOL Exceedance and System Voltage Limit, as well as the revised definition of System Operating Limit. The SDT has identified the standards and terms they contend would benefit from this incorporation and has included them in separate documents with this posting for your review. Do you agree with the SDT's selections? If not, please explain your response.

7. If you have any other comments that you haven't already provided in response to the above questions, please provide them here.

1. Given the above, and considering the rationale provided in the supporting document, do you support the SDT's proposal to revise the current SOL definition? (Clarification: this question is not asking of you agree with the proposed definition. That will be addressed in a separate question. This question is focused on the need to modify the SOL definition at all.) Please explain your response.

Answer	Yes
Document Name	
Comment	
CenterPoint Energy Houston Electric, LLC ("CenterPoint Energy") supports the SDT's proposal to revise the current definition of SOL and generally supports the revised definition with the exception of the use of "stability limit" within the definition of SOL. We understand from comments made during an industry webinar that this use of "stability limits" is not the same definition of "Stability Limits" used in the NERC Glossary. We believe this to be confusing to the industry. If the SDT's use of the term does not align with the NERC glossary term, then it needs to be clearly represented for the industry to know and understand the difference. Additionally, the NERC SOL whitepaper also uses a variation of "Stability limit".

Response	

Thank you for your comments. As is stated in the supporting document, "NERC Glossary Definitions: System Operating Limit and SOL Exceedance Rationale", *"the intent of using the "stability limit" term (as opposed to the NERC Glossary term "Stability Limit") is to allow for a number of different types of stability-related limitations or phenomena, including, but not limited to, sub-synchronous resonance (SSR), phase angle limitations, transient voltage limitations on equipment, and weighted short-circuit ratio (WSCR). The Glossary term "Stability Limits" is not appropriate for use in the revised definition because its use is limited to a maximum power flow value. While some entities may use maximum power flow values as a means by which to prevent instability, this approach represents only one particular method and may be too restrictive for some entities. Reliability tools allow entities to monitor and control parameters other than maximum power flow values in order to demonstrate acceptable stability performance."* The revision of the Stability Limit defined term is outside the scope of the SDT at this time. However, if the definition of Stability Limit is modified at some point in the future, the industry should consider modifying the SOL definition to include this term.

Scott Downey - Peak Reliability - 1	
Answer	Yes
Document Name	
Comment	
Peak supports the need for revising the definition of SOL and creating a new definition for SOL Exceedance. Peak believes that the SOL definition needs to be revised and that a clear definition for SOL Exceedance needs to be created and implemented in the body of the NERC Reliability Standards. Doing so would result in improved clarity and consistency and would prevent entities from adopting interpretation of SOL Exceedance that do not provide the level of reliability intended by its use in the TOP and IRO standards. Peak also believes that the key events mentioned in question #1 do not provide a sufficient basis for addressing the clarity and consistency problems associated with the current definition of SOL and the absence of a definition for SOL Exceedance as described in the supporting document "NERC Glossary Definitions: System Operating Limit and SOL Exceedance Rationale."

Answer	No
Document Name	

Comment

The justification for creating an SOL Exceedance definition, as described in the "NERC Glossary Definitions: System Operating Limit and SOL Exceedance Rationale" document, is speculative in nature. Specifically, the SDT expresses the concern that "[o]ne TOP might interpret SOL exceedances to not include the post-Contingency state when identifying SOL exceedance". However, the existing NERC definitions for OPA and RTA coupled with the requirements of the TOP-001-3 and TOP-002-4 standards logically combine to require an entity to evaluate the system for SOL exceedances for the post-Contingency condition. As such, there is insufficient reasoning to create a new definition for SOL Exceedance.

The SDT's concern appears to be with the wording of TOP-001-3 R14. Although ATC believes that there is no conflict or gap, a SAR could be written to improve the TOP-001-3 R14 requirement if the SDT still believes that there is an issue with the language.

Response

Thank you for your comments. Industry response to the draft SOL Exceedance definition indicated numerous significant concerns. Given this response, the SDT concluded that creating a definition of SOL Exceedance which adequately reflects reliable operating principles could create an unnecessary compliance burden if action is not taken to substantially modify the existing TOP and IRO standards. Therefore, the SDT maintained system performance criteria through requirements in FAC-011-4 and FAC-014-3 similar to the approach within the currently effective FAC standards rather than address within a definition for SOL exceedance.

Pamela Hunter - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC, Group Name Southern Company	
Answer	No
Document Name	
Comment	
We do not believe it is necessary that NERC define SOL Exceedance. Operating outside an SOL in Real-time is an exceedance of the limits. An SOL that is predicted to be exceeded using RTA and OPS is a predicted exceedance, or a potential exceedance, but until it actually happens, it is not an exceedance. We believe it is important to keep a Real-time exceedance and an exceedance predicted by RTA or OPA separate from each other.

Answer	No
Document Name	
Comment	

CenterPoint Energy does not support the creation and implementation of a definition for SOL Exceedance. We believe that the proposed term SOL Exceedance could potentially confuse the industry and take away from the clarity provided to the industry with the proposed revisions of the SOL definition. Furthermore, we believe that the proposed revisions to the definition of System Operating Limit (SOL) provide the industry with a clear and concise definition of the term; therefore, the industry understands that an exceedance to an SOL is when the applicable electrical values have gone beyond those established Facility Ratings limits, System Voltage Limits, and stability limits used in the operation of the BES.

Thank you for your response. Industry response to the draft SOL Exceedance definition indicated numerous significant concerns. Given this response, the SDT concluded that creating a definition of SOL Exceedance which adequately reflects reliable operating principles could create an unnecessary compliance burden if action is not taken to substantially modify the existing TOP and IRO standards. Therefore, the SDT maintained system performance criteria through requirements in FAC-011-4 and FAC-014-3 similar to the approach within the currently effective FAC standards rather than address within a definition for SOL exceedance.

Comment	
While very close, it is felt that a tweak to the language can provide clarity in how RTM, RTAs, and OPAs are performed. Consider using: "Facility Ratings, System Voltage Limits, and stability limits more restrictive than Facility Ratings (including margins if required) used in the operation of the BES." This ensures that RTAs and OPAs are not checked against Facility Ratings and then separately stability limits; it should only be the more limiting of the two. Other "studies" are still required to verify if stability limits are more restrictive, but are not needed as part of the RTAs and OPAs.

Comment	

ITC agrees that the proposed SOL definition provides clarity and removes ambiguity. However, because the term "System Voltage Limit" is included in the definition of SOL, the definition of "System Voltage Limit" should be considered in this comment form. Assuming the definition of "System Voltage Limit" stands as currently proposed, ITC would approve of the proposed SOL definition.

Comments: ATC has three comments with the proposed SOL definition:

1. The existing SOL definition contains important language regarding the "applicab[ility]" of the limit used. This clarity is missing from the proposed SOL definition revision. ATC believes the existing definition is better than the proposed definition from this perspective although entities could read “applicable” into the proposed definition as needed.
2. The term SOL is not used in proposed standard FAC-015-1 for the planning horizon. However, the concept does exist in the proposed standard. The proposed SOL definition only calls out the operating horizon and would be improved by recognizing the planning horizon as well. ATC recommends that the proposed SOL definition be edited to address this omission with wording like, “. . . used in the operation and planning of the BES”.
3. Similar to ATC’s response to Question #5 (below), stability limits can be a difficult to understand term to use in the SOL definition, especially since it is undefined. The SOL Exceedance definition tries to aid entities that establish and monitor SOLs by including the terms “stability performance criteria” to cover a wider range of system phenomenon than traditional stability limits (e.g., voltage stability, angular stability, system stability). For question #5, ATC recommends the use of “system performance criteria” to recognize that the underlying issue may not be a traditional stability problem but some other important system performance limit that is being exceeded. The underlying system issue is then represented by a proxy “stability limit” to keep the system within the bounds of acceptable performance. It would seem that this type of clarification would be more reasonably provided in the SOL definition and not the SOL Exceedance definition. Alternatively, the SDT could create a “Stability Limit” definition, which would then be referenced in the SOL definition by using the capitalized term. If a Stability Limit definition is created, the definition would then need to clearly indicate that both traditional stability issues and other system performance criteria issues (such as voltage ride through curves, angle difference from system reference angle, margin from voltage collapse point, system damping attenuation, etc.) can be represented with Stability Limits.

Response

1. The SDT modified the proposed SOL definition to include the phrase “*applicable to specified System configurations*.”
2. The SDT does not believe that the SOL term needs to be included in FAC-015-1, nor does the SDT believe that the SOL term needs to be applicable to the planning horizon. The current planning standard TPL-001-4 and the proposed FAC-015-1 accomplish the intended planning reliability objectives without the use of the SOL term.

3. The SDT agrees with ATC on many points written here. The SDT modified the proposed SOL definition to include the phrase "*applicable to specified System configurations*." Additionally, requirement R4 in proposed FAC-011-4 includes a subpart requirements for the RC's SOL Methodology to specify stability performance criteria and to require that stability limits be established to meet those stability performance criteria. It is quite possible that resulting stability limits would be "proxy limits" that, if operated within, prevents the system from violating those performance criteria in the event of a Contingency. The revision of the Stability Limit defined term is outside the scope of the SDT at this time. However, if the definition of Stability Limit is modified at some point in the future, the industry should consider modifying the SOL definition to include this term.

We agree with the proposed definition, but in practice in order to remain within SOLs in operations is often the use of pre-determined transfer and monitoring of specific interfaces (either thermal, voltage stability, or transient stability). The concept is introduced in the rationale for component #5 and #6 of SOL exceedance, but more rationale regarding how a transfer interface is managed versus the simplified SOL definition would be helpful. Also, the use of "lower case" stability limits rather than the defined term causes some confusion. Why use the defined term for FR and SVL, but not stability limits? What is a stability limit for the purpose of the SOL definition?

Dislikes 0	
Response	
Thank you for your comment. The SDT agrees with the comment. Page 3 of the NERC SOL White Paper states, *"It is important to distinguish operating practices and strategies from the SOL itself. As stated earlier, the SOL is based on the actual set of Facility Ratings, voltage limits, or Stability limits that are to be monitored for the pre- and post-Contingency state. How an entity remains within these SOLs can vary depending on the planning strategies, operating practices, and mechanisms employed by that entity."* This concept was considered when formulating the proposed definition of SOL. Accordingly, if managing flow on an interface is an effective means by which to prevent or mitigate an SOL exceedance, then such actions can be implemented as part of an Operating Plan. Effectively, the Operating Plan is the mechanism for addressing SOL exceedances, and it can include trigger points for operator action based on Real-time Assessments or based on prior analyses. The definition of Operating Plan affords TOPs with the flexibility to address SOL exceedances in the most effective or efficient means necessary as determined by the TOP. As is stated in the supporting document, "NERC Glossary Definitions: System Operating Limit and SOL Exceedance Rationale", *"the intent of using the "stability limit" term (as opposed to the NERC Glossary term "Stability Limit") is to allow for a number of different types of stability-related limitations or phenomena, including, but not limited to, sub-synchronous resonance (SSR), phase angle limitations, transient voltage limitations on equipment, and weighted short-circuit ratio (WSCR). The Glossary term "Stability Limits" is not appropriate for use in the revised definition because its use is limited to a maximum power flow value. While some entities may use maximum power flow values as a means by which to prevent instability, this approach represents only one particular method and may be too restrictive for some entities. Reliability tools allow entities to monitor and control parameters other than maximum power flow values in order to demonstrate acceptable stability*	

performance." The revision of the Stability Limit defined term is outside the scope of the SDT at this time. However, if the definition of Stability Limit is modified at some point in the future, the industry should consider modifying the SOL definition to include this term.

4. Considering the explanations provided in the definitions rationales, do you agree with the proposed SOL Exceedance definition? Please explain your response and/or provide alternative language.

Lauren Price - American Transmission Company, LLC - 1 - MRO,RF	
Answer	No
Document Name	
Comment	

The proposed SOL Exceedance definition is unworkable as written.

The definition has a fundamental flaw as it is attempting to create a one size fits all definition for two very different situations. The two situations are: (1) real-time situations (Real-time Monitoring and Real-time Assessments), and (2) static situations (Operational Planning Analysis). As categories of these situations imply, there are different time components associated with an SOL Exceedance in each situation that are not adequately addressed by the proposed SOL Exceedance definition.

There are three primary concerns with the definition as written and applied towards real-time situations: (1) the pre-Contingency language, (2) the post-Contingency language, and (3) purpose of the definition.

1. The pre-Contingency portion of the definition is not workable because it assumes a static system and does not account for timeframes associated with operating to various SOLs in real-time situations. Specifically, the first two bullets require the use of a "Facility's Normal Rating" and "normal System Voltage Limits", which are not applicable to a system that has just suffered a contingency. As recognized in the post-Contingency language, once a contingency has occurred the actual flow on the system may exceed the Normal Rating and/or the actual voltage may be outside of normal System Voltage Limits. Prior to the contingency occurring, this was not an SOL Exceedance but now that the contingency has occurred it shall be deemed an SOL Exceedance solely because of the definition's pre-Contingency language. The definition does not recognize that the new pre-Contingency state has flows below the "Facility's highest Emergency Rating" but above the Normal Rating. This condition is not an SOL Exceedance because the system is operating as designed and is not experiencing unacceptable system performance. Flows will be able to be returned below the Normal Rating within the applicable timeframe. The TOP should not have to deem this an SOL Exceedance because the SOL has not been exceeded.

2. The post-Contingency portion of the definition is not workable because is assumes a static system whereas there are constantly changing real-time inputs of a possible post-Contingency state. Assessing the post-Contingency state represents only a snapshot in time. However, due to the way contingency analysis tools work, it can be several minutes before another snapshot of the real-time inputs calculates the newly expected post-Contingency state. The definition means an entity has an SOL Exceedance for even a single post-Contingency state result, which may not be valid due to the fluidity of the system, especially in a market. Given the way the STD is intending to use the definition (i.e. as a driver of action to mitigate the issue), the post-Contingency language would need to include reference to a **persistent** post-Contingency state indication.
3. The SDT explains that the purpose of this definition is to drive an action, which is not the purpose of a definition. As stated in the rationale document (p. 9), the SDT believes the proposed definition "accomplishes the intended reliability objective of triggering an appropriate action". NERC definitions should not drive requirements for entities. Rather, this function is accomplished by the requirements within the NERC Standards. A proposed definition should define what an SOL Exceedance is or is not. The proposed definition does not create this level of clarity because the SDT has developed a definition with a particular required action in mind (e.g., see above regarding the "pre-Contingent state" language). A proposal for edits to the definition is given below and these proposed edits will achieve the intended outcome the SDT desires because the edits recognize the time-based nature of limits, which the SDT recognizes in its rationale document (cf. p. 11).

ATC recommends that the SOL Exceedance definition not be created. However, if the definition will be created, ATC recommends that the two separate definitions be created to recognize the difference between real-time and next contingency situations regarding SOL exceedances. If two definitions will not be created, at a minimum, edits must be made to the "pre-Contingency state" language so that the definition does not reference "normal" ratings or voltage limits. This specific language should be changed to refer to "applicable" ratings and "applicable" voltage limits because of the explanation above regarding the definition applying to real-time situations immediately following a contingency (i.e. what was not an SOL exceedance suddenly becomes an SOL exceedance, which is not logical from a definition standpoint).

Proposed definitions for SOL Exceedance in both RTA and OPA would bring clarity to the industry. The proposed definitions are as follows:

SOL Exceedance - Real-time:

An Operating condition or analysis result characterized by any of the following, as determined in Real-time monitoring or Real-time Assessments (RTA):

The pre-Contingency state indicates any of the following:

- Actual flow through a Facility is above the Facility's applicable Rating for a time period longer than deemed acceptable.
- Actual bus voltage is outages applicable System Voltage Limits" for a time period longer than deemed acceptable.
- A stability limit established to prevent instability without a Contingency is exceeded for a time period longer than deemed acceptable.
- A stability limit established to prevent the Contingency from resulting in instability is exceeded for a time period longer than deemed acceptable.

The calculated post-Contingency state indication persists for any of the following:

- Flow through a Facility is above the Facility's highest Emergency Rating, or above a Facility Rating for which there is not sufficient time to reduce the flow to established acceptable levels should the Contingency occur
- Bus voltage is outside the highest or lowest emergency System Voltage Limit, or outside a System Voltage Limit for which there is not sufficient time to bring the bus voltage to established acceptable levels should the Contingency occur
- Defined stability performance criteria are not met

SOL Exceedance - Next Contingency

An Operating condition or analysis result characterized by any of the following, as determined in Operational Planning Analysis (OPA):

The pre-Contingency state indicates any of the following:

- Flow through a Facility is above the Facility's normal Rating
- Bus voltage is outages normal System Voltage Limits
- A stability limit established to prevent instability without a Contingency is exceeded
- A stability limit established to prevent the Contingency from resulting in instability is exceeded

The calculated post-Contingency state indication persists for any of the following:

- Flow through a Facility is above the Facility's highest Emergency Rating, or above a Facility Rating for which there is not sufficient time to reduce the flow to established acceptable levels should the Contingency occur
- Bus voltage is outside the highest or lowest emergency System Voltage Limit, or outside a System Voltage Limit for which there is not sufficient time to bring the bus voltage to established acceptable levels should the Contingency occur
- Defined stability performance criteria are not met"

These changes will allow the definition to work in the pre-Contingency state as envisioned by the SDT while also clarifying that an SOL exceedance after a contingency occurs in real time only exists if the actual flow or the actual voltage (i.e. the new pre-Contingency state) is outside of the applicable limit for an applicable period of time. In addition, these changes provide the needed clarity for post-Contingency situations.

Response	
Thank you for your comments. Industry response to the draft SOL Exceedance definition indicated numerous significant concerns. Given this response, the SDT concluded that creating a definition of SOL Exceedance which adequately reflects reliable operating principles could create an unnecessary compliance burden if action is not taken to substantially modify the existing TOP and IRO standards. Therefore, the SDT maintained system performance criteria through requirements in FAC-011-4 and FAC-014-3 similar to the approach within the currently effective FAC standards rather than address within a definition for SOL exceedance.

NIPSCO is not in agreement that an SOL Exceedance has occurred if the flow is over a rating for an "Acceptable duration" being the time allowed for the next emergency rating. We do agree that an exceedance would occur if outside that "acceptable duration". In the explanation the Standards Develop Team states that "any PERSISTENT exceedance of a Normal Rating should be regarded as an SOL exceedance, even if the exceedance occurs for an acceptable duration." The word "persistent" and the idea that there is NOT an "acceptable duration" for the flow to go over the Normal Rating seem to contradict. Also the SOL Performance Summary on page 11 of the Rationale document states, "Pre-Contingency flow in this range (between normal and first emergency) for longer than 4 hours is not acceptable." How does this fit the explanation? Is 4 hours the acceptable duration? And if it is not acceptable to go beyond the 4 hours then we assume less than 4 hours is acceptable. If so, how can an SOL exceedance be acceptable since by the SDT definition for a flow above normal there is an SOL exceedance? We believe the MISO definition for Pre-Contingency as it relates to Facility Ratings is better. The MISO definition is as follows:

SOL Exceedance Based on Real-Time Flows

A. Actual steady state flow on a BES Facility is greater than the Facility's highest Emergency Rating for any time period.

B. Actual steady state flow on a BES Facility is above the Normal Rating, but below the next Emergency Rating, for longer than the time frame of the next Emergency Rating.

C. Actual steady state voltage on a BES Facility is greater than the emergency high voltage limit for time frame identified by the TOP.

D. Actual steady state voltage on a BES Facility is less than the defined emergency low voltage limit for time frame identified by the TOP.

E. Any established stability Limit (non-IROL) is exceeded for longer than the 30 minutes or defined by operating guides.

Response	

Thank you for your comments. Industry response to the draft SOL Exceedance definition indicated numerous significant concerns. Given this response, the SDT concluded that creating a definition of SOL Exceedance which adequately reflects reliable operating principles could create an unnecessary compliance burden if action is not taken to substantially modify the existing TOP and IRO standards. Therefore, the SDT maintained system performance criteria through requirements in FAC-011-4 and FAC-014-3 similar to the approach within the currently effective FAC standards rather than address within a definition for SOL exceedance.

Terry Harbour - Berkshire Hathaway Energy - MidAmerican Energy Co. - 1,3

Comment

MidAmerican Energy Company (MEC) re-iterates our disagreement with the proposed definition of SOL exceedance. We note the SDT's reluctance to incorporate our original comments and suggested changes submitted during the August 2016 commenting period.

- The SDT failed to assess and recognize that the proposed SOL exceedance definition will cause unintended consequences on large spectrum of the Industry's participants.
- The first issue with the SDT's proposed definition of the SOL exceedance is that it would expose TOPs and RCs to unnecessary compliance risk. Significant resources for each TOP's/RC's organization would be required to meet the higher compliance administrative burden.
- The second issue is the definition is driven by SDT's belief that the definition would "trigger implementation of Operating Plan". However, MEC believes the definition could delay implementation of the Operating Plan in real-time due to logging and documentation requirements, as this functionality is not a built-in feature of many SCADA systems in use today. MEC believes that a potential unintended outcome to avoid the administrative burden would be to operate in an unnecessarily conservative operation

mode. The SDT has downplayed existing NERC standards that already currently require system operator training, tools, and processes to trigger the implementation of Operating Plans, including SCADA operating alarms, RTCA results, principles of reliable operations and high quality operator's training.

The role of NERC adopted definition of SOL exceedance definition, in our opinion, should be to clearly and unambiguously formulate critical operational borderlines of reliable operations, while respecting existing limitations of existing transmission infrastructure and human resources that operate this infrastructure. In other words the *SOL exceedance definition should be focused on defining what is considered to be unacceptable operation rather than what should be good operating practice based recommendable operation*.

Therefore, MEC recommends the SDT defer voting/ballots on this item until such time that the following tasks are completed:

- Perform comparative analysis of existing SOL definitions nation-wide, in order to get an informed insight as to where majority of industry's participants stand on this definition.
- Perform analysis of additional staffing resources and tools that would be needed to implement proposed definition.
- Outline and assess compliance driven administrative burden that the proposed definition would impose on numerous entities in terms of providing an evidence of compliance that they initiated an Operating Plan for each single event of SOL exceedance.
- Evaluate a risk of overwhelming and distracting real-time operations people with a burden of significantly increased communication requirements associated numerous instances of marginally relevant localized SOL exceedances.
- Assess the potential impact of outages with the implementation of the proposed SOL definition. The combination of the proposed SOL definition and operational outages could significantly constrain business in the industry associated with the industry's inability to approve and perform numerous scheduled outages (with many of them mandated by other NERC standards). The conservative definition of SOL exceedance would simply make it impossible for many of these outages to proceed without causing SOL exceedances.
- Assess the impact that the proposed definition would have on efficiency of market operations and associated cost.

MEC *recommends the SDT reconsider adoption of the current SOL exceedance in effect in the MISO Reliability footprint*. This is based on the following advantages of the MISO definition when compared with the SDT's proposed definition. The MISO definition:

- *Is more realistic in recognizing reality of existing transmission infrastructure and human resources allocated to operate such an infrastructure*
- *Would provide for significantly less administrative burden* on numerous Industry's entities related to providing evidences of compliance.
- Would provide *comparably reliable operation* of power systems.
- Is *based on physical limitations of various components of transmission facilities* as opposed to being based on "intention to trigger implementation of Operating Plan".
- Would *prevent potential increased* market operations costs.
- Would provide *more clarity and avoid ambiguity and interpretation issues*.
- Is more efficient for small entities that don't have advanced tools and other resources, including, but not limited to staffing and support personnel.

The current MISO Reliability footprint wide SOL Exceedance occurs if system operating state indicates any of the following:

- *Actual steady state flow on a BES Facility is greater than the Facility's highest Emergency Rating for any time period.*
- *Actual steady state flow on a BES Facility is above the Normal Rating but below the next Emergency Rating for longer than the time frame of the next Emergency Rating.*
- *Actual steady state voltage on a BES Facility is greater than the emergency high voltage limit for time frame identified by the TOP.*

- *Actual steady state voltage on a BES Facility is less than the defined emergency low voltage limit for time frame identified by the TOP.*
- *Any established stability limit (non-IROL) is exceeded for longer than the 30 minutes or defined by Operating Plan.*
- *Projected post-Contingent loading on a BES Facility is greater than the highest Emergency Rating for longer than 30 minutes with NO agreed upon Post Contingency Action Plan that would mitigate the condition if the Contingency were to occur.*
- *Projected post-Contingent voltage on a BES Facility is less than the Emergency low voltage limit for longer than 30 minutes with NO agreed upon Post Contingency Action Plan that would mitigate the condition if the Contingency were to occur.*
- *Rationale for MEC Comments and Recommendation*
- The SDT limited its vision of this subject to the Project 2014-03 Whitepaper**.** The Whitepaper was product of a small subset of subject matter experts. The original version of the NERC White Paper (from May 2014) was more objective and referenced the use of post-contingent action plans to address projected post-contingent issues. Subsequent versions of the NERC White Paper (revision of January 2015) weren't presented to industry, weren't approved by the Industry. More industry participant input responsible for implementing the real-time SOL exceedance definition is still needed.
- The SDT proposed definition of the SOL exceedance fails to recognize the important difference between actual, pre-contingency SOL exceedance and calculated, post-contingency RISK of SOL exceedance. This attempt to include both of them under the single, generic term "SOL exceedance" may easily cause an incorrect expectation that TOP/RC control action response to these two types of exceedances should be similar. The actual, pre-contingency SOL Exceedance is a real-time condition exceeding the equipment's rated capabilities, while the calculated, post-contingency risk of SOL Exceedance requires another event to happen in order to become real and actual exceedance issue.
- Both pre-contingent and post-contingent types of exceedances require and should trigger implementation of a control action from the Operating Plan. However, implementation should be treated *differently in terms of urgency and severity of mitigating control actions*, as they have different repercussions on system reliability.

MEC comments on specific "components" from the SDT's document:

Component #3 – *The pre-Contingency state indicates: … Actual flow through a Facility is above the Facility's **Normal** Rating*

- Persistent should be removed as ambiguous and not auditable. The SDT determined that any persistent exceedance of a Normal Rating should be regarded as an SOL exceedance, even if the exceedance occurs for an acceptable duration. MEC disagrees with the SDT's insistence on using Normal Rating and recommend the use of Emergency Rating. The technical rationale for our recommendation is based on the TOP rating methodology which considers all limiting factors for transmission facilities and assesses *no reliability repercussions as long as the flow on facility is returned below normal rating during time that was assigned for the emergency rating*. Transmission operators have used emergency ratings for many years and that fact should be correspondingly recognized in the SOL exceedance definition.
- The SDT's rationale to use Normal Rating in order to "trigger implementation of Operating Plan" is confusing. TOPs understand the limitations associated with the use of Emergency Rating and their obligation to return the flow below Normal Rating within specified time-frame. Hard-coded SCADA based operational alarms will trigger implementation of Operating Plan. Therefore, it is unnecessary to adopt a conservative definition of SOL exceedance in order to "remind" TOPs and RCs of their well understood obligation to return flow under Normal Rating in specified time-frame.
- Although the SDT stated that the their goal is to improve clarity and eliminate ambiguity they increase ambiguity and open another issue of interpretation by introducing the term **"**persistent exceedance of a Normal Rating". The time of exceedance has to be clearly specified in this component. Otherwise, how will entities, including Auditors, measure "persistency" of exceedance?
- The proposed, conservative definition could cause undesirable consequences in terms of administrative compliance burden and an unnecessarily increase the cost of market operations while providing marginal benefit to system reliability. TOPs/RCs are already under NERC obligation to protect facilities on a contingency basis, which will consequently protect that facility against real-time flow exceedances.

MEC recommends the following definition superior alternative:

- ***Actual steady state flow on a BES Facility is greater than the Facility's highest Emergency Rating for any time period.***

- ***Actual steady state flow on a BES Facility is above the Normal Rating but below the next Emergency Rating for longer than the time frame of the next Emergency Rating.***

Component #4 – *The pre-Contingency state indicates: … Actual bus voltage is outside normal System Voltage Limits*

- MEC disagrees with the SDT’s insistence on using Normal System Voltage Limits and recommend using Emergency Voltage Limits. Our arguments regarding the Component #4 are similar to our comments concerning the Component #3.
- The technical rationale for our recommendation is based on the fact that TOPs/RCs do operate their systems within normal voltage limits during vast majority of the time. However, there are rare instances when sudden events and changes to operating conditions, or periods during switching long transmission lines, require use of emergency voltage limits. That is why *SOL exceedance definition should be focused on what is considered to be unacceptable operation rather than what should be recommended operation*. Again, the proposed, conservative definition would cause undesirable consequences in terms of administrative compliance burden.

MEC recommends the following definition:

- ***Actual steady state voltage on a BES Facility is greater than the emergency high voltage limit for time frame identified by the TOP.***
- ***Actual steady state voltage on a BES Facility is less than the defined emergency low voltage limit for time frame identified by the TOP.***

Component #6 – *The pre-Contingency state indicates: … A stability limit established to prevent the*

Contingency from resulting in instability is exceeded

- The SDT differentiated between stability limits occurring without contingency and stability limits that are contingency based and conditioned. The SDT rational doesn’t justify the existence of two components related to stability limits.

- The physical nature of the stability limits is best addressed within individual Operating Plans. Therefore, there is no need to separate the different natures of stability problems within the definition of a SOL exceedance. This is an unnecessary complication and could be resolved by merging two subcomponents into the one.
- The proposed definition does not recognize time-frame associated with exceedances of established stability limits. If not recognized this can lead to hundreds of meaningless (nuisance) exceedances (for sake of an example, such as those that last less than 1 minute and have magnitude of less than 1%).

We recommend the following definition:

- ***Any established stability limit (non-IROL) is exceeded for longer than the 30 minutes or defined by Operating Plan.***

Component #7 – *The calculated post-Contingency state indicates: … Flow through a Facility is above the Facility's highest Emergency Rating, or above a Facility Rating for which there is not sufficient time to reduce the flow to established acceptable levels should the Contingency occur*

- The SDT provided clarification of their position by pointing out the (Project 2014-03 Whitepaper) two highlighted items in the diagram. The portion highlighted in yellow, according to the SDT's explanation) "is considered an SOL Exceedance because this designation accomplishes the desired outcome by triggering mitigating action through the implementation of an Operating Plan".
- Please note the original version of the NERC White Paper (from May 2014) stated that "Post-contingency flow in this range is not acceptable unless Operating Plan address reliability impact so that it has localized impact". Subsequent versions of the NERC White Paper (revision of January 2015) introduced a statement that "Post-contingency flow in this range is not acceptable". This revision wasn't presented to the industry, and never approved by the Industry.
- The SDT's proposed definition of the post-Contingency flow SOL exceedance fails to recognize the important difference between actual, pre-contingency SOL exceedance and calculated, post-contingency RISK of SOL exceedance. This attempt to include both of them under the single, generic term "SOL exceedance" may easily cause an incorrect expectation that TOP/RC control action response to these two types of exceedances should be similar.

- Both types of exceedances require and should trigger implementation of a control action from Operating Plan, but they should be treated *differently in terms of urgency and severity of mitigating control actions*, as they have different repercussions on system reliability.
- The portion of the definition that states, *"…or above a Facility Rating for which there is not sufficient time to reduce the flow to established acceptable levels should the Contingency occur"* is intended to address the operating state highlighted in light blue. This portion of the definition will cause industry implementation and compliance issues. It introduces ambiguity and confusion. Because TOPs/RCs would be faced with hard and sometimes impossible task to determine what is actually "sufficient time" for any specific set of operational circumstances. This time may depend on unit ramp rates along with efficiency and speed of congestion management procedures (such as LMP binding). This could impose significant market operations costs, while providing marginal reliability benefits.

MEC recommends the following definition:

- *Projected post-Contingent loading on a BES Facility is greater than the highest Emergency Rating for longer than 30 minutes with NO agreed upon Post Contingency Action Plan that would mitigate the condition if the Contingency were to occur.*

Rationale for using Post-contingency action plan concept

- The main difference between our proposed definition and the SDT's proposed definition is the concept of post-contingent action plan. *The Post-contingency action plan is the RC's/TOP's agreed upon control action to be used while the normal congestion management processes are attempting to return the projected post contingent flow within longer-term rating.* It's important to note that the Post-contingency action plans are NOT a vehicle to justify continual operation where the projected post contingent flow is above Facility's highest Emergency Rating.
- MEC recommends a Post-contingency action plan developed by the TOP and RC is required to address potential impacts and post-contingent mitigating strategies, including but not limited to load shedding or generator tripping, while normal congestion management actions are being implemented, to ensure potential impact is localized and to prevent equipment damage.

- Therefore, MEC would not consider a SOL exceedance to exist anytime the Projected post-contingency flow is above Facility's highest Emergency Rating, but only for those situations when the Projected post-contingency flow is above the Facility's highest Emergency Rating (Rate C) for longer than 30 minutes without associated post-contingency action plan.

- MEC recognizes that there may be situations when normal congestion management is not effective or has been exhausted, and the projected post-contingent loading on a facility remains greater than the highest available emergency rating. In this situation, load shedding may be the sole remaining option to address the projected post-contingency loading. The TOP and RC may decide to operate in this fashion and not implement load-shedding pre-contingency if the impacts would be localized. In this case the SOL exceedance would be reportable, even though a post-contingent action plan exists, since normal congestion management is no longer taking place.

The SDT's concept insists on the concept "highest Emergency Rating". The MEC alternative definition is based on the concept of "post-contingency action plan". MEC recognizes it might be argued that the TOP has to establish a new Short Emergency rating in contrast to agreeing with its RC on post-contingency action plan. Issuing a new Short Term Emergency rating should be considered as a legitimate alternative. However, there are practical obstacles to issuing higher emergency ratings (or "Load Shed Rating"). The Industry must obtain manufacturer confirmations for using shorter term Emergency Ratings (such as 10-minute ratings) for every single piece of equipment (breakers, switches, wave traps, CTs conductors, all transformers components etc.). The majority of manufacturers aren't willing to provide such data. Therefore, for practical reasons, short-term ratings based on manufacturers' data are difficult to corroborate. Consequently, each TOP and RC would need to define criteria within their Operating Plan for using post-contingent action plans. These criteria might be based, for sake of example, on Relay Loadability Limits of transmission facilities.

Comment	
The SPP Standards Review Group recommends that the drafting team removes the term "Operational Planning Analysis (OPA)" from the SOL Exceedance definition. From our perspective, we feel that the SOL Exceedance Definition should be applicable to only an actual SOL Exceedance instead of focusing on a potential exceedance.

IRC is concerned that the use of the term "acceptable levels" in the first and second bullets under the description of the "calculated post-Contingency state" is unclear as to which entity—the responsible entity or the compliance authority—determines what level is "acceptable." Although the IRC believes the responsible entity should be the entity that determines the appropriate level, IRC has no consensus on appropriate substitute language at this time.

Michael Brytowski - Great River Energy - 1,3,5,6 - MRO	
Answer	No
Document Name	
Comment	

Great River Energy does not agree with the proposed definition of SOL exceedance for the following reasons.

- The SDT's proposed definition of the SOL exceedance would expose a large number of operating entities, both TOPs and RCs, to increased compliance risk through additional administrative burden with no foreseen benefit to reliability.
- The definition should allow for a maximum time the limit can be violated, similar to the approach currently in place with Interconnection Reliability Operating Limits. This would allow time for the execution of responses either through automated mechanisms or System Operator actions to mitigate the system condition. NERC currently defines Emergency Rating as a limit, which can be exceeded for a finite period, as specified for a facility by its equipment owner. Current practices leverage the use of Emergency Ratings in many operation and planning activities, and shifting to a more stringent definition could create a significant compliance burden.

The proposed definition fails to consider the validity of calculated post-contingent values. Applicable entities will soon be held accountable with the quality of developing Real-time Assessments, as required in NERC Reliability Standards IRO-018-1(i) and TOP-010-1(i). These assessments help identify real actions that must be implemented in order to alleviate potential system problems. Often these problems are identified through N-1 contingencies, although could be identified through multiple level "tower" contingencies accounting for Facilities that are located on the same transmission infrastructure. Violating limits associated with these limits, while concerning, may not pose an immediate threat to system reliability. The definition should narrow the exceedance identification process to only real, pre-contingent values.

- We suggest and recommend *that SDT consider adoption of the SOL exceedance that is currently in effect in MISO Reliability footprint*, based on the following advantages of the MISO definition when compared with the SDT's proposed definition:
- It is much more realistic in recognizing existing transmission infrastructure and human resources allocated to operate such an infrastructure
- It would provide for significantly less administrative compliance burden on numerous Industry's entities as related to providing evidence to meet the current definition.
- It would provide comparable reliability in the operation of the transmission system with a substantial benefit of less administrative burden.
- It is based on the physical limitations of various components of transmission facilities as opposed to being based on "intention to trigger implementation of Operating Plan".
- It provides more clarity and avoids ambiguity and interpretation issues.
- It is much more acceptable to vast majority of Industry participants, especially smaller TOPs

As a reference to the SDT, a MISO Reliability footprint wide SOL Exceedance occurs if system operating state indicates any of the following seven conditions:

- Actual steady state flow on a BES Facility is greater than the Facility's highest Emergency Rating for any time period.
-
- Actual steady state flow on a BES Facility is above the Normal Rating but below the next Emergency Rating for longer than the time frame of the next Emergency Rating.
- Actual steady state voltage on a BES Facility is less than the defined emergency low voltage limit for time frame identified by the TOP.
- Actual steady state voltage on a BES Facility is greater than the emergency high voltage limit for time frame identified by the TOP.
- Any established stability limit (non-IROL) is exceeded for longer than the 30 minutes or defined by Operating Plan.

- Projected post-Contingent loading on a BES Facility is greater than the highest Emergency Rating for longer than 30 minutes with NO agreed upon Post Contingency Action Plan that would mitigate the condition if the Contingency were to occur.
- Projected post-Contingent voltage on a BES Facility is less than the Emergency low voltage limit for longer than 30 minutes with NO agreed upon Post Contingency Action Plan that would mitigate the condition if the Contingency were to occur.
- Great River Energy would like to emphasize the difference between the above definition and the SDT's proposed definition as it relates to the concept of a post-contingent action plan. The Post-contingency action plan is the RC's/TOP's agreed upon control action to be used while the normal congestion management processes are attempting to return the projected post contingent flow within a longer-term rating for a specified amount of time. An SOL exceedance should not exist if a post contingent action plan has been identified and is in place to address the contingency were it to occur. It should only exist if no plan has been formulated within the specified time frame which for MISO members has been identified as 30 minutes.

Comment

We do not believe it is necessary that NERC define SOL Exceedance. However, if there is going to be a definition we believe a simple definition for Real-time operations is best.

We suggest the following definition:

SOL Exceedance - An operating condition, as determined in Real-time Monitoring, where a System Operating Limit is exceeded.

An exceedance can only occur if it happens in Real-time and therefore the SOL Exceedance definition should not incorporate the concept of predicted exceedances. Predicted exceedances, such as those identified through OPAs and RTAs, may or may not occur as they are just that, predicted. Predicted exceedances should not be defined and subject to the stringent set of limitations and requirements that SOL Exceedances should be. Furthermore, how predicted exceedances are identified, assessed, operationally planned for and mitigated should be the responsibility of the Reliability Coordinator. Therefore, any such definition for predicted exceedances should remain in the respective RC's SOL methodology.

Julie Hall - Entergy - 6, Group Name Entergy/NERC Compliance	
Answer	No

Document Name	
Comment	

Entergy strongly disagrees with the definition as written.

The "pre-Contingency" state does not include a statement regarding time. If an entity using time dependent emergency ratings it should only be an exceedance if the actual flow through a facility is above the Facility's normal rating for a period of time greater than the timeframe of the emergency rating. The definition of the post-contingency state does take into account emergency ratings but they are essentially useless if by definition the instance after the contingency occurs and now you move into the next pre-contingency state you will immediately have an SOL exceedance.

In addition, the post-contingency state mentions the term "sufficient time" but doesn't describe what "sufficient time" time is. This leaves the definition ambiguous.

Entergy believes you should adopt the MISO definition of SOL exceedance as follow.

- ***Actual steady state flow on a BES Facility is greater than the Facility's highest Emergency Rating for any time period.***
- ***Actual steady state flow on a BES Facility is above the Normal Rating but below the next Emergency Rating for longer than the time frame of the next Emergency Rating.***
- ***Actual steady state voltage on a BES Facility is greater than the emergency high voltage limit for time frame identified by the TOP.***
- ***Actual steady state voltage on a BES Facility is less than the defined emergency low voltage limit for time frame identified by the TOP.***
- ***Any established stability limit (non-IROL) is exceeded for longer than the 30 minutes or defined by Operating Plan.***
- ***Projected post-Contingent loading on a BES Facility is greater than the highest Emergency Rating for longer than 30 minutes with NO agreed upon Post Contingency Action Plan that would mitigate the condition if the Contingency were to occur.***

• ***Projected post-Contingent voltage on a BES Facility is less than the Emergency low voltage limit for longer than 30 minutes with NO agreed upon Post Contingency Action Plan that would mitigate the condition if the Contingency were to occur.***

Comment	
Typically there are additional Thermal ratings above the "normal" limit that have a time frame associated with them. For example an emergency limit may be a 15 minute rating, i.e. the flow can be at the emergency rating for 15 minutes. Therefore, by design, being above the normal rating is not going to result in damage to the BES elements. Therefore the 1st bullet in the SOL Exceedance definition should be revised to "Actual flow through a Facility is above the Facility's Rating and the associated allowable time frame is exceeded."

Duke Energy requests further clarification on the rationale behind the differences in criteria between pre-Contingency, and post-Contingency. As proposed, 'pre-Contingency' criteria for exceedances are above 'normal' ratings/limits, whereas 'post-Contingency' criteria for exceedances being 'above the highest/lowest' rating/limit. We feel that the rating/limit should be the same for both, and propose that the pre-Contingency criteria should also be for 'above the highest/lowest' rating/limit.

Some ambiguity exists with the use of "Normal Rating". It is possible that an entity could interpret the use of "Normal Rating" to include all ratings. We recommend the drafting team consider adding language that explains that a "Normal Rating" is defined by the entity's SOL Methodology.

- *"Actual flow through a Facility is above the Facility's Normal Rating (as defined by entity's SOL Methodology)"*

Also, there appears to be some inconsistency between the text of the SOL Exceedance definition, and the SOL Performance Summary table found on page 11 of the SOL/SOL Exceedance Rationales document. The table implies that an SOL Exceedance can occur within the 1-hr rating range. Was this the drafting team's intent? It is acknowledged that action is needed if the Exceedance occurs within the 1-hr ratings range, but does the drafting team contend that an SOL Exceedance can occur even if you are still in that 1-hr rating.

Lastly, The definition does not address temporary conditions. What happens if you have a fault and it drags your bus voltage down long enough to pick up and alarm, and then restores. Would that be an exceedance according to the proposed definition? We recommend that the drafting team include language that outlines how long an SOL may be exceeded in the RTA before a Mitigation Plan should be developed. We suggest that the drafting team insert language recommending that an SOL Exceedance has not occurred until the SOL has been exceeded for a period of 30 minutes or longer.

The proposed definition of SOL Exceedance does not consider the concept of timeframes on Facility Ratings. Specifically, the SOL Performance Summary on page 5 of the System Operating Limit Definition and Exceedance Clarification whitepaper from Project 2014-03 indicates that Pre-Contingency flow between a Normal Rating (24 hour rating) and a higher Emergency Rating with an associated timeframe (4 hour in the specific example) is not an SOL exceedance until flow exceeds both the Normal Rating (24 hour rating) and the time limit associated with the higher limit (again, 4 hours in this specific example). The proposed definition of SOL Exceedance would consider Pre-Contingency flow above the Normal Rating (24 hour rating) to be an SOL Exceedance irrespective of any time based higher rating.	

For the Pre-Contingency state, actual flow through a Facility above its Normal Rating should not be an SOL Exceedance unless the actual flow through the Facility stayed above the Normal Rating for a duration longer than the timeframe associated with the next rating. NERC standard TOP-001-3 R14 states that “Each Transmission Operator shall initiate its Operating Plan to mitigate a SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment”. Per the definition of SOL Exceedance TOP’s will be required to mitigate flows going above normal rating all of the time even if the facility has a valid higher rating that allows flows to be above Normal Rating for a defined period of time. While the system operators will act to reduce flows to below the normal rating an SOL Exceedance should not be defined to occur until the defined period of time for the next higher rating has been exceeded. Defining an SOL Exceedance to occur whenever the normal rating is exceeded regardless of timeframe creates a compliance burden on real time operations staff that will reduce reliability due to the distractions associated with creating compliance documentation.

For the post-Contingency state, it should be made clear that monitoring Normal Ratings for contingency analysis is not required. Instead, as depicted in the SOL Performance Summary on page 5 of the System Operating Limit Definition and Exceedance Clarification whitepaper and on page 11 of the NERC Glossary Definitions: System Operating Limit and SOL Exceedance Rationale document, having a long term Emergency Rating of sufficient duration to allow for a reduction in flow to below the Normal Rating would allow for monitoring to Emergency Ratings during contingency analysis. Requiring TOP’s to monitor contingency analysis results for post contingent conditions that exceed Normal Ratings will create undue burden on system operators as well as on the contingency analysis programs. In addition, setting the threshold lower than what is currently used may reduce the usage of the transmission system. Due to the significant increase in the volume of reported contingency violations which will need to be sorted through and contemplated. In fact, some contingency analysis tools have a finite number of contingency violations that can be reported and depending on the relative severity of contingent violations, will likely result in not reporting valid post-contingent violations of emergency limits which have a much more significant impact on reliability.

Often times load shed is used as a mitigation plan when flow on a facility is above the highest Emergency Rating however implementing pre-contingent load shed to mitigate an SOL Exceedance may not be prudent all of the time since load shed may occur when the contingency happens. In addition, the impact of SOL Exceedance is local in nature. A TOP should have the ability to weigh the risks/benefits associated with implementing load shed vs risking a localized impact for a postulated post-contingent condition without having to factor in SOL Exceedance compliance considerations. The transmission system is much too dynamic to be overly prescriptive. Specifically, with the proposed definition of SOL Exceedance, standard TOP-001-3 R14/R15 may not explicitly allow for TOP’s to not implement pre-contingent load shed if post contingent operation is above the highest Emergency Rating. The Project 2014-03 Whitepaper clearly specified that pre contingency load shed may not be necessary or appropriate. Absent any modifications to TOP-001-3 the proposed SOL Exceedance definition

may require pre-contingent load shed actions. If the definition is used as currently proposed then TOP-001-3 should also be revised to add clarification that a post contingent SOL Exceedance is acceptable as long TOP has a viable Operating Plan.

Manitoba Hydro agrees with the SDT that a definition for SOL Exceedance is needed to support the updated standards. We agree with all components of the definition with the exception of components #3 and #4 – exceeding normal facility ratings or normal voltage limits. Should exceeding the normal facility rating or normal voltage be the trigger for all the reporting requirements included in these updated standards. Most TOPs can exceed their normal facility ratings and normal voltage limits without any adverse effects on the system. In fact, these TOPs have emergency facility ratings and emergency voltage limits to give operators the time to take corrective actions in response to an event that would cause these normal ratings and limits to be exceeded. It seems unnecessarily burdensome to ask TOPs and RCs to report and document these events when they pose no risk to reliability. Conversely, exceeding emergency ratings and limits is definitely impactful to the reliability of the BES. It is appropriate to expect a higher threshold of reporting and documentation for these events.	

With the proposed definition, SDT putting a huge compliance burden on to TOPs and RCs for no apparent reliability impact. New definition require TOP to notify their RC, every time the real time flow or the voltage goes outside the normal range and make a log entry for compliance purposes. Manitoba Hydro believes that the SOL Exceedance definition should reflect the more sever conditions than the normal rating. For an example, due to absence of NERC definition for SOL Exceedance, MISO members developed definition for the SOL Exceedance. Like the proposed NERC definition, MISO SOL Exceedance definition also covers the real-time condition and the projected post contingency condition. According to MISO definition, SOL exceedance occurs whenever the real-time flow goes above the highest Emergency rating or the real-time voltage goes outside the emergency voltage limits. Manitoba Hydro support MISO's approach of managing SOL exceedance.

CenterPoint Energy does not agree with the proposed definition of SOL Exceedance and believes that a definition is not necessary. If you take into consideration the FERC-referenced, NERC SOL Whitepaper coupled with the work the SDT has done to provide the industry with a clear and concise proposed definition to the System Operating Limit (SOL) term, a formalized definition to SOL Exceedance is not warranted.	

Furthermore, we believe that the proposed definition to SOL Exceedance is problematic and confusing with potential operational and compliance implications. We are concerned that the SDT definition and application of the term "stability limits" differs from the NERC approved glossary definition of "Stability Limits". This term, "Stability limit" is also used in the NERC SOL Whitepaper. CenterPoint energy urges the SDT to have further discussions and considerations towards the use of "stability limits" for proper alignment with the NERC defined term as well as how the term is used in the NERC SOL Whitepaper for clear representation to the industry.

Comment	

Hoosier Energy strongly disagrees with the proposed definition of SOL exceedance. Hoosir supports the following:

1. The SDT failed to assess and recognize that the proposed SOL exceedance definition will cause **huge unintended consequences on large spectrum of the Industry's participants**.

2. The first major problem with the SDT's proposed definition of the SOL exceedance is **that it would expose a large number of TOPs and RCs to compliance risk unless enormous resources and efforts are added within each TOP's/RC's organization to keep up with (an order of magnitude) higher compliance administrative burden**.

3. The second major problem is that this definition is driven by SDT's belief that the definition would "trigger implementation of Operating Plan". However, we believe the definition would delay implementation of the Operating Plan in real-time due to logging and documentation requirements, as this functionality is not a built-in feature of many SCADA systems in use today. We believe that a potential unintended outcome to avoid the administrative burden is operating **in an unnecessarily conservative operation.** We believe the SDT has ignored a fundamental fact that the implementation of Operating Plan, even in current industry's practice, is already being triggered by existing mechanisms, such as SCADA operating alarms, RTCA results, principles of reliable operations and high quality operator's training.

4. The role of NERC adopted definition of SOL exceedance definition, in our opinion, should be to clearly and unambiguously formulate critical operational borderlines of reliable operations, while **respecting existing limitations of existing transmission infrastructure and**

human resources that operate this infrastructure. In other words the *SOL exceedance definition should be focused on defining what is considered to be* ***unacceptable operation*** *rather than what should be* ***good operating practice based recommendable operation***.

Therefore, we strongly **recommend that the SDT defers voting/ballots** on this item until such time that the following tasks are completed:

- **Perform comparative analysis of existing SOL definitions nation-wide**, in order to get an informed insight as to where majority of industry's participants stand on this definition.

- **Perform analysis of additional staffing resources and tools** that would be needed to implement proposed definition.

- **Outline and assess compliance driven administrative burden** that the proposed definition would impose on numerous entities in terms of providing an evidence of compliance that they initiated an Operating Plan for each single event of SOL exceedance.

- **Evaluate a risk of overwhelming and distracting real-time operations people** with a burden of significantly increased communication requirements associated numerous instances of marginally relevant localized SOL exceedances.

- **Assess the impact of significantly constraining business in the industry** associated with the industry's **inability to approve and perform numerous scheduled outages** (with many of them mandated by other NERC standards), as this conservative definition of SOL exceedance would simply make impossible many of these outages to proceed without causing SOL exceedances.

- Assess the impact that the proposed definition would have **on efficiency of market operations and associated cost**.

We re-iterate our ***recommendation that SDT re-considers adoption of the SOL exceedance that is currently in effect in MISO Reliability footprint***, based on the following advantages of the MISO definition when compared with the SDT's proposed definition:

1. It is *much more realistic in recognizing reality of existing transmission infrastructure and human resources allocated to operate such an infrastructure*
2. *It would provide for significantly less administrative burden* on numerous Industry's entities related to providing evidences of compliance.
3. It would provide *comparably reliable operation* of power systems.
4. It is *based on physical limitations of various components of transmission facilities* as opposed to being based on "intention to trigger implementation of Operating Plan".

5. It would *prevent potentially huge increase of cost* of market operations.

6. It provides *more clarity and avoids ambiguity and interpretation issues*.

7. It is *much more acceptable to vast majority of Industry participants* as opposed to relatively small subset of industry participants that can afford use of advanced tools and other resources, including, but not limited to staffing and support personnel.

MISO Reliability footprint wide SOL Exceedance occurs if system operating state indicates any of the following:

- ***Actual steady state flow on a BES Facility is greater than the Facility's highest Emergency Rating for any time period.***

- ***Actual steady state flow on a BES Facility is above the Normal Rating but below the next Emergency Rating for longer than the time frame of the next Emergency Rating.***

- ***Actual steady state voltage on a BES Facility is greater than the emergency high voltage limit for time frame identified by the TOP.***

- ***Actual steady state voltage on a BES Facility is less than the defined emergency low voltage limit for time frame identified by the TOP.***

- ***Any established stability limit (non-IROL) is exceeded for longer than the 30 minutes or defined by Operating Plan.***

- ***Projected post-Contingent loading on a BES Facility is greater than the highest Emergency Rating for longer than 30 minutes with NO agreed upon Post Contingency Action Plan that would mitigate the condition if the Contingency were to occur.***

- ***Projected post-Contingent voltage on a BES Facility is less than the Emergency low voltage limit for longer than 30 minutes with NO agreed upon Post Contingency Action Plan that would mitigate the condition if the Contingency were to occur.***

Typically there are additional Thermal ratings above the "normal" limit that have a time frame associated with them. For example an emergency limit may be a 15 minute rating, i.e. the flow can be at the emergency rating for 15 minutes. Therefore, by design, being above the normal rating is not going to result in damage to the BES elements. Therefore the 1st bullet in the SOL Exceedance definition should be revised to "Actual flow through a Facility is above the Facility's Rating and the associated allowable time frame is exceeded.

BPA believes that a TOP should be able to exceed a Normal Rating while utilizing an Emergency Rating (with a time-dependency) without logging an SOL Exceedance or notifying their RC of the actions taken (the action taken was to use an Emergency Rating). Using an Emergency Rating for the appropriate amount of time has no impact to system reliability and is using the “applicable” rating as identified in the NERC SOL Whitepaper.

Given the drafting team’s SOL Exceedance proposal, a TOP would have to document their initiation of an Operating Plan and call their RC each time a Normal Rating is exceeded. BPA believes that this is an undue burden on the TOP and their RC and that the use of an Emergency Rating is normal operating procedure, not an SOL Exceedance.

BPA proposes this definition for SOL Exceedance:

An operating condition or analysis result characterized by any of the following, as determined in Real-time monitoring, Real-time Assessments (RTA) or Operational Planning Analysis (OPA):

The pre-Contingency state indicates any of the following:

- *Actual flow through a Facility is above the Facility’s highest Emergency Rating, or above an Emergency Rating for longer than the associated time*
- *Actual bus voltage is below the System Voltage Limit*
- *Actual bus voltage is above the highest System Voltage Limit, or the actual bus voltage is above a time-dependent System Voltage Limit for longer than the associated time*
- *A stability limit established to prevent instability without a Contingency is exceeded*

- *A stability limit established to prevent the Contingency from resulting in instability is exceeded*

The calculated post-Contingency state indicates any of the following:

- *Flow through a Facility is above the Facility's highest Emergency Rating, or above a Facility Rating for which there is not sufficient time to reduce the flow to established acceptable levels should the Contingency occur*
- *Bus voltage is outside the highest or lowest System Voltage Limit, or outside a System Voltage Limit for which there is not sufficient time to bring the bus voltage to established acceptable levels should the Contingency occur*
- *Defined stability performance criteria are not met*

The proposed NERC defined term System Voltage Limit is used in the proposed definition of SOL Exceedance. System Voltage Limit is in a separate NERC posting out for comment, but since BPA will be proposing a revision to the definition of System Voltage Limit, BPA has used this revised definition in the comments submitted by BPA on the SOL Exceedance definition. Subsequently, BPA thinks it is relevant to share this revised definition with the drafting team now.

BPA proposes the following revisions to the definition of System Voltage Limit:

"The minimum steady-state voltages (both pre-Contingency and post-Contingency) that provide for acceptable System performance. The maximum steady-state voltages based on equipment ratings (both Normal Rating and Emergency Rating) that provide for acceptable System performance."

When addressing the post-Contingency bus voltage in the SOL Exceedance, the use of "emergency" is redundant given BPA's revised definition of System Voltage Limit because "Emergency Rating" is included in the revised definition.

Comment	

Glencoe re-iterates our strong disagreement with the proposed definition of SOL exceedance. We express our disappointment with SDT's reluctance to incorporate our original comments and suggested changes that we submitted during the August 2016 commenting period.

The SDT failed to assess and recognize that the proposed SOL exceedance definition will cause **huge unintended consequences on large spectrum of the Industry's participants**.

The first major problem with the SDT's proposed definition of the SOL exceedance is **that it would expose a large number of TOPs and RCs to compliance risk unless enormous resources and efforts are added within each TOP's/RC's organization to keep up with (an order of magnitude) higher compliance administrative burden**.

The second major problem is that this definition is driven by SDT's belief that the definition would "trigger implementation of Operating Plan". However, we believe the definition would delay implementation of the Operating Plan in real-time due to logging and documentation requirements, as this functionality is not a built-in feature of many SCADA systems in use today. We believe that a potential unintended outcome to avoid the administrative burden is operating **in an unnecessarily conservative operation.** We believe the SDT has ignored a fundamental fact that the implementation of Operating Plan, even in current industry's practice, is already being triggered by existing mechanisms, such as SCADA operating alarms, RTCA results, principles of reliable operations and high quality operator's training.

The role of NERC adopted definition of SOL exceedance definition, in our opinion, should be to clearly and unambiguously formulate critical operational borderlines of reliable operations, while **respecting existing limitations of existing transmission infrastructure and human**

resources that operate this infrastructure. In other words the *SOL exceedance definition should be focused on defining what is considered to be* ***unacceptable operation*** *rather than what should be* ***good operating practice based recommendable operation***.

Therefore, we strongly **recommend that the SDT defers voting/ballots** on this item until such time that the following tasks are completed:

Perform comparative analysis of existing SOL definitions nation-wide, in order to get an informed insight as to where majority of industry's participants stand on this definition.

Perform analysis of additional staffing resources and tools that would be needed to implement proposed definition.

Outline and assess compliance driven administrative burden that the proposed definition would impose on numerous entities in terms of providing an evidence of compliance that they initiated an Operating Plan for each single event of SOL exceedance.

Evaluate a risk of overwhelming and distracting real-time operations people with a burden of significantly increased communication requirements associated numerous instances of marginally relevant localized SOL exceedances.

Assess the impact of significantly constraining business in the industry associated with the industry's **inability to approve and perform numerous scheduled outages** (with many of them mandated by other NERC standards), as this conservative definition of SOL exceedance would simply make impossible many of these outages to proceed without causing SOL exceedances.

Assess the impact that the proposed definition would have **on efficiency of market operations and associated cost**.

We re-iterate our ***recommendation that SDT re-considers adoption of the SOL exceedance that is currently in effect in MISO Reliability footprint***, based on the following advantages of the MISO definition when compared with the SDT's proposed definition:

It is *much more realistic in recognizing reality of existing transmission infrastructure and human resources allocated to operate such an infrastructure*

It would provide for significantly less administrative burden on numerous Industry's entities related to providing evidences of compliance.

It would provide *comparably reliable operation* of power systems.

It is *based on physical limitations of various components of transmission facilities* as opposed to being based on "intention to trigger implementation of Operating Plan".

It would *prevent potentially huge increase of cost* of market operations.

·It provides *more clarity and avoids ambiguity and interpretation issues*.

It is *much more acceptable to vast majority of Industry participants* as opposed to relatively small subset of industry participants that can afford use of advanced tools and other resources, including, but not limited to staffing and support personnel.

MISO Reliability footprint wide SOL Exceedance occurs if system operating state indicates any of the following:

Actual steady state flow on a BES Facility is greater than the Facility's highest Emergency Rating for any time period.

· ***Actual steady state flow on a BES Facility is above the Normal Rating but below the next Emergency Rating for longer than the time frame of the next Emergency Rating.***

Actual steady state voltage on a BES Facility is greater than the emergency high voltage limit for time frame identified by the TOP.

Actual steady state voltage on a BES Facility is less than the defined emergency low voltage limit for time frame identified by the TOP.

Any established stability limit (non-IROL) is exceeded for longer than the 30 minutes or defined by Operating Plan.

The SDT determined that any **persistent** exceedance of a Normal Rating should be regarded as an SOL exceedance, even if the exceedance occurs for an **acceptable duration**. We disagree with SDT's insistence on using Normal Rating **and re-iterate our recommendation to use Emergency Rating.** The technical rationale for our recommendation is based on the TOP rating methodology which considers all limiting factors for transmission facilities and assesses ***no reliability repercussions as long as the flow on facility is returned below normal rating during time that was assigned for the emergency rating***. In the matter of fact, this is one of main reasons that transmission operators are given an emergency ratings and that fact should be correspondingly recognized in the SOL exceedance definition.

The SDT's rationale to use Normal Rating in order to "trigger implementation of Operating Plan" is confusing. TOPs are perfectly aware of the limitations associated with the use of Emergency Rating and their obligation to return the flow below Normal Rating within specified time-frame**. Furthermore, hard-coded SCADA based operational alarms will trigger implementation of Operating Plan. Therefore, it is absolutely**

unnecessary to adopt conservative definition of SOL in order to "remind" TOPs and RCs of their well understood obligation to return flow under Normal Rating in specified time-frame.

Secondly, although SDT stated that the their goal is to improve clarity and eliminate ambiguity they increase ambiguity and open another issue of interpretation by introducing the term **"persistent** exceedance of a Normal Rating". The time of exceedance has to be clearly specified in this component. Otherwise, how will entities, including Auditors, measure "persistency" of exceedance?

The proposed, conservative definition would cause undesirable consequences in terms of administrative compliance burden and unnecessary increase of the cost of market operations while providing marginal benefit to system reliability as TOPs/RCs are under obligation to protect facilities on a contingency basis, which will consequently protect that facility against real-time flow exceedances.

We recommend the following definition:

· ***Actual steady state flow on a BES Facility is greater than the Facility's highest Emergency Rating for any time period.***

· ***Actual steady state flow on a BES Facility is above the Normal Rating but below the next Emergency Rating for longer than the time frame of the next Emergency Rating.***

Component #4 – *The pre-Contingency state indicates: … Actual bus voltage is outside normal System Voltage Limits*

We disagree with SDT's insistence on using Normal System Voltage Limits and recommend using Emergency Voltage Limits. Our arguments regarding the Component #4 are similar to our comments concerning the Component #3.

The technical rationale for our recommendation is based on the fact that **TOPs/RCs do operate their systems within normal voltage limits during vast majority of the time**. However, there are rare instances when sudden events and changes to operating conditions, or periods during switching long transmission lines, require use of emergency voltage limits. That is why *SOL exceedance definition should be focused on what is considered to be unacceptable operation rather than what should be recommended operation*. Again, the proposed, conservative definition would cause undesirable consequences in terms of administrative compliance burden.

We recommend the following definition:

Actual steady state voltage on a BES Facility is greater than the emergency high voltage limit for time frame identified by the TOP.

Actual steady state voltage on a BES Facility is less than the defined emergency low voltage limit for time frame identified by the TOP.

Component #5 – *The pre-Contingency state indicates: … A stability limit established to prevent instability without a Contingency is exceeded*

Component #6 – *The pre-Contingency state indicates: … A stability limit established to prevent the Contingency from resulting in instability is exceeded*

The SDT apparently concluded that there is a reason to differentiate between stability limit occurring without contingency and stability limit that is contingency based and conditioned. We do not see reason that would be strong enough in order to justify existence of two components related to stability limits.

We believe that the physical nature of the stability limits is best addressed within individual Operating Plans. Therefore, there is no need to separate different natures of stability problems within definition of SOL exceedance. We believe that this is unnecessary complication and could be resolved by merging two subcomponents into the one.

We also find it inappropriate that **the proposed definition does not recognize time-frame associated with exceedances of established stability limits**. If not recognized this can lead to hundreds of meaningless (nuisance) exceedances (for sake of an example, such as those that last less than 1 minute and have magnitude of less than 1%).

We recommend the following definition:

· ***Any established stability limit (non-IROL) is exceeded for longer than the 30 minutes or defined by Operating Plan.***

Component #7 – *The calculated post-Contingency state indicates: … Flow through a Facility is above the Facility's highest Emergency Rating, or above a Facility Rating for which there is not sufficient time to reduce the flow to established acceptable levels should the Contingency occur*

The SDT provided clarification of their position by pointing out the (Project 2014-03 Whitepaper) two highlighted items in the diagram. The portion highlighted in yellow, according to the SDT's explanation) "is considered an SOL Exceedance because this designation accomplishes the desired outcome by triggering mitigating action through the implementation of an Operating Plan".

First, we need to draw attention of the SDT that the original version of the NERC White Paper (from May 2014) was stating that "Post-contingency flow in this range is not acceptable **unless Operating Plan address reliability impact so that it has localized impact**". Subsequent version of the NERC White Paper (revision of January 2015) introduced statement that "Post-contingency flow in this range is not acceptable".

This revision, with a major impact, was never presented to the industry, never approved by the Industry and in our opinion was step in the wrong direction.

The SDT's proposed definition of the post-Contingency flow SOL exceedance **fails to recognize the important difference between actual, pre-contingency SOL exceedance and calculated, post-contingency RISK of SOL exceedance**. This attempt to include both of them under the single, generic term "SOL exceedance" may easily cause an incorrect expectation that TOP/RC control action response to these two types of exceedances should be similar.

It is perfectly clear and understandable that both of these types of exceedances require and should trigger implementation of a control action from Operating Plan, but they should be treated *differently in terms of urgency and severity of mitigating control actions*, as they have different repercussions on system reliability.

The portion of the definition that states, *"…or above a Facility Rating for which there is not **sufficient time** to reduce the flow to established acceptable levels should the Contingency occur"* is intended to address the operating state highlighted in light blue. **This portion of the definition will be permanent source of major troubles for the industry, from the implementation prospective**. It **introduces ambiguity and confusion, because TOPs/RCs would be faced with hard and sometimes impossible task to determine what actually is "sufficient time" for any specific set of operational circumstances**. This time might be dependent on ramp rates of the units but also on efficiency and speed of congestion management procedures (such as LMP binding). **This may also cause huge cost to market operations, while providing marginal benefits to system's reliability**.

We recommend the following definition:

Projected post-Contingent loading on a BES Facility is greater than the highest Emergency Rating for longer than 30 minutes with NO agreed upon Post Contingency Action Plan that would mitigate the condition if the Contingency were to occur.

Rationale for using Post-contingency action plan concept

The main difference between our proposed definition and the SDT's proposed definition is the **concept of post-contingent action plan**. *The Post-contingency action plan is the RC's/TOP's agreed upon control action to be used* ***while the normal congestion management processes are attempting to return the projected post contingent flow within longer-term rating***. It is very important to note that the Post-contingency action plans are **NOT** a vehicle to justify continual operation where the projected post contingent flow is above Facility's highest Emergency Rating.

In contrast to this, we think that the Post-contingency action plan developed by TOP and RC is required to address potential impacts and post-contingent mitigating strategies, including but not limited to load shedding or generator tripping, while normal congestion management actions are being implemented, to ensure potential impact is localized and to prevent equipment damage.

Therefore, we would NOT consider SOL exceedance to exist anytime the Projected post-contingency flow is above Facility's highest Emergency Rating, but only for those situations when the Projected post-contingency flow is above the Facility's highest Emergency Rating (Rate C) for longer than 30 minutes **WITHOUT associated post-contingency action plan**.

We recognize that there may be situations in the system when normal congestion management is not effective or has been exhausted, and the projected post-contingent loading on a facility remains greater than the highest available emergency rating. In this situation, load shedding may be the sole remaining option to address the projected post-contingency loading. The TOP and RC may decide to operate in this fashion and not implement load-shedding pre-contingency if the impacts would be localized. In this case the SOL exceedance would be reportable, even though a post-contingent action plan exists, since normal congestion management is no longer taking place.

The SDT's concept insists on the concept "highest Emergency Rating". Our definition is based on the concept of "post-contingency action plan". We do recognize that it might be argued that the TOP has to establish a new Short Emergency rating in contrast to agreeing with its RC on post-contingency action plan. Issuing a new Short Term Emergency rating should be considered as a legitimate alternative, indeed. **The huge practical obstacle to issuing higher emergency rating (or "Load Shed Rating**") that the Industry always faced is that each TOP would have to **get manufacturers' confirmations for using shorter term Emergency Ratings (such as 10-minute ratings**) for every single piece of equipment (breakers, switches, wave traps, CTs conductors, all pieces on transformers etc.). Majority of manufacturers would not be even able nor willing to provide such a data. Therefore, **for practical reasons, it is almost impossible to get such a short-term ratings based on manufacturers' data**. Consequently, each TOP and RC would need to define criteria within their Operating Plan for using post-contingent action plans. These criteria might be based, for sake of example, on Relay Loadability Limits of transmission facilities.

Response

Thank you for your comments. Industry response to the draft SOL Exceedance definition indicated numerous significant concerns. Given this response, the SDT concluded that creating a definition of SOL Exceedance which adequately reflects reliable operating principles could create an unnecessary compliance burden if action is not taken to substantially modify the existing TOP and IRO standards. Therefore, the SDT

maintained system performance criteria through requirements in FAC-011-4 and FAC-014-3 similar to the approach within the currently effective FAC standards rather than address within a definition for SOL exceedance.

Kayleigh Wilkerson - Lincoln Electric System - 1,3,5,6	
Answer	No

Comment	

It is felt that an SOL Exceedance has not occurred until both a limit and corresponding time frame have been surpassed, which is supported by the SOL whitepaper. If a Facility has a Normal Rating and corresponding 4-hour Emergency Rating, reliable operation can occur even after surpassing the Normal Rating (but still less than the Emergency Rating) for less than 4 hours. Operating in an allowed reliable state should not be an SOL Exceedance. SOL Exceedances should be to the true binding limitations of the system for purposes of consistency. This does not preclude an operator from taking action, but should not be required if reliable system operation has been determined within this range. This should be true for both pre- and post-contingent discussions as long as mitigation can take place within the allotted timeframe.

As currently written, pre-contingent and post-contingent definitions are inconsistent. A post-contingent Normal Rating exceedance that can be mitigated with its allowable timeframe would immediately become an SOL exceedance if the contingency occurs.

Suggested language as follows:

*A **binding and valid** operating condition or analysis result characterized by any of the following, as determined in Real-time monitoring, Real-time Assessments (RTA) or Operational Planning Analysis (OPA):*

The pre-Contingency state indicates any of the following:

- *Actual flow through a Facility is above the Facility's **respective rating (Normal or Emergency) longer than the allowable time defined by the TOP***
- *Actual bus voltage is outside **acceptable** System Voltage Limits **longer than the allowable time defined by the TOP***

- *A stability limit established to prevent instability without a Contingency is exceeded*
- *A stability limit established to prevent the Contingency from resulting in instability is exceeded*

The calculated post-Contingency state indicates any of the following:

- *Flow through a Facility is above the Facility's highest Emergency Rating, or above a Facility Rating for which **it is known that flow would exceed the rating longer than the respective allowable time defined by the TOP should the contingency occur***
- *Bus voltage is outside the highest or lowest emergency System Voltage Limit, or outside a System Voltage Limit for which **it is known that the voltage would remain outside the limit longer than the respective timeframe defined by the TOP** should the Contingency occur*
- *Defined, non-limit based stability performance criteria are not met as determined by those entities with the capabilities and processes to do so*

*Valid and binding shall ensure that conditions or results flagged are of sufficient accuracy and consistency. Nuisance (i.e., intermittent alarming) conditions or results shall not be considered a binding SOL Exceedance.

Comment	

Colorado Springs Utilities finds the Project 2014-03 SDT's rationale for what constitutes an SOL Exceedance to be compelling and reasonable. The proposed definition in question strays from the White Paper produced by that Project (and subsequently adopted as "ERO Enterprise-Endorsed Implementation Guidance") in a significant way - that of being able to fully utilize all applicable thermal ratings and associated time frames in Real-time. The purpose of SOLs is to "ensure operation within acceptable reliability criteria," and entities establish thermal SOLs, including any so-called "emergency" ratings and their attendant time limits, with those criteria in mind.

From the White Paper, "SOL exceedance occurs when acceptable system performance as described in approved FAC-011-2 is not occurring in Real-time operations as determined by Real-time Assessments. In other words, unacceptable system performance as indicated by Real-time Assessments equates to SOL exceedance." In other, other words; operating, Real-time, with MW flows above a Facility's normal/continuous thermal rating but below a time-limited "emergency" rating for a time not exceeding the applicable time-limit is acceptable system performance and, thus, not an SOL Exceedance. This is straight-forward logic, and conforms with the White Paper you reference.

TOP-001-3, R14, requires, "Each Transmission Operator shall initiate its Operating Plan to mitigate a SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment." Colorado Springs Utilities believes this requirement is met, in spirit and in letter, by an entity implementing an Operating Plan to prevent exceeding the time limit imposed by any specific, applicable thermal SOL. This requirement would also be met, in spirit and in letter, by an entity recognizing that operating slightly above the normal/continuous rating (but below the time-limited "emergency" rating) will only persist for a time less than the applicable time limit due to the forecasted load curve and taking no specific action other than monitor.

Therefore, Colorado Springs Utilities requests changing the first bullet under the "pre-Contingency" list to read:

•	Actual flow through a Facility is above the applicable Facility Rating for an unacceptable time duration

While AEP agrees overall with the proposed definition, we are unsure of the need to include the text “Real-Time monitoring.” Unlike Real-time Assessments and Operational Planning Analysis, the phrase “Real-Time monitoring” is not a NERC glossary term. If “Real Time Assessment” is not already encompassing enough, what additional operating conditions or analysis would be brought into scope by including “Real-Time monitoring” in the definition?

AEP seeks clarity on the use of the term “calculated” relative to the post-contingency state. Nowhere in the technical justification, or as phrased in the question above, does it clarify the need to distinguish between calculated or actual post-contingency states.

Comment	
Idaho Power agrees with the proposed definition, but recommends a wording change to the post-contingency facility rating bullet. Instead of "the Facility's highest Emergency Rating," the definition should state that flows should not exceed "the Facility's highest Emergency Rating for the operating conditions." For example, winter ratings should not be used for summer operating conditions.

We think the "or analysis result" is not necessary considering the reference to RTA and OPA. We appreciate the introduction of time to reduce the flow in the assessment of an operating condition. We suggest to reword "A stability limit established to prevent a (instead of the)	

Contingency from resulting in instability is exceeded". Also, same comment as for the SOL definition regarding the use of the non-defined term stability limit and the link with the interface concept.

Comments: Texas RE generally agrees with the SDT's approach to separate the definition of System Operating Limits (SOLs) from the definition of an "SOL Exceedance." In particular, Texas RE agrees with the NERC-endorsed implementation guidance that "[i]t is important to distinguish operating practices and strategies from the SOL itself." That is to say, while SOLs are based on an entity's actual set of Facility Ratings, voltage limits, and Stability Limits monitored in pre- and post-contingency states, SOL Exceedances should reflect performance within all applicable limits over the time horizon at issue. The SDT appears to take appropriate steps to clarify that distinction.	

With these general comments in mind, Texas RE notes one area that could further enhance the new SOL and SOL Exceedance definitions. In particular, both the SOL and SOL Exceedance definitions refer to "stability limits" and do use the existing NERC "Stability Limit" definition. "Stability Limit" is currently defined as: "[t]he maximum power flow possible through some particular point in the system while maintaining stability in the entire system or the part of the system to which the stability limit refers." The SDT should consider using the existing Stability Limit definition or, alternatively, revise the definition to reflect the new SOL and SOL Exceedance definitions. At a minimum, Texas RE requests that the SDT identify the aspects of the existing Stability Limit definition that warrant using the non-defined term.

Comment	

Question #5 states that “If a TOP or a RC does not use real-time tools in this manner, then this bullet of the proposed SOL Exceedance definition would not apply to that TOP or RC, and the fourth bullet under the pre-Contingency section of the SOL Exceedance definition would govern stability performance.” While we agree with this view, we do not believe it is obvious or apparent when looking solely at the proposed definition only. We believe any such clarity or insight should be added to the definition itself.

While the intention is good, stability performance criteria are more subjective than thermal and voltage criteria. The acceptability of stability performance may vary more than that of thermal and voltage acceptability. This definition may unnecessarily invite the determination of non-compliance.

Colorado Springs Utilities is not so optimistic to believe that, "If a TOP or a RC does not use real-time tools in this manner, then this bullet of the proposed SOL Exceedance definition would not apply to that TOP or RC …" We believe it is the natural tendency of a regulatory body to enforce regulations rather indiscriminately once codified, regardless of the intent of the authors. Colorado Springs Utilities is also bemused by the presumption that entities won't take appropriate responses without a regulatory "trigger."

Without stating in some way the rationale in the definition itself, it could easily be interpreted that some form of action would be required of all entities, not just those that have the capability to perform these types of studies. It is clear that the intent is not requiring real-time stability analysis tools; therefore, a clear distinction must be made to ensure this only applies to certain entities. Suggested language: *Defined,* ***non-limit based*** *stability performance criteria are not met* ***as determined by those entities with the capabilities and processes to do so***

We consider this portion of the definition as unnecessary, as it would apply to very limited number of TOPs/RCs that use real-time tools for determining defined stability performance. Established stability limits are sufficiently addressed by the third and fourth bullets under pre-Contingency operations (which we recommend to also be merged within one clearly defined stability related bullet. Those entities that use real-time stability tools should use the third and fourth bullets under pre-Contingency operations as well, with understanding that their stability limits might vary in real-time as opposed to be fixed/established.

Including this bullet seems to put additional burden on TOP's and RC's utilizing real time tools to determine if stability criteria are being met. This may inadvertently discourage entities from implementing these types of real time tools that could help to enhance reliability. In addition, the rationale document states that "If the TOP or RC does not utilize Real-time stability tools to determine the system's response to Contingency events and to evaluate that response against defined stability performance criteria, but solely utilizes a more traditional approach for establishing stability limits (i.e., limit "values") to address system instability, then the third bullet in the post-Contingency section of the proposed SOL Exceedance definition would not apply to that TOP or RC, and the fourth bullet under the pre-Contingency section of the SOL Exceedance definition would govern stability performance." However the definition itself does not list any exclusions or state that this	

bullet is "above and beyond". The definition used in a standard should clearly state the applicability and should exclude this bullet if the SDT considers it only applicable to entities with certain tools.

The proposed definition assumes each applicable entity possesses its own on-line stability tools or are actively monitoring its operating parameters to indicate the next Contingency that could result in instability. This may not always be the case. Moreover, what happens if an entity loses the availability of these tools? We believe the addition of this bullet to the definition is unnecessary, as applicable entities will likely take appropriate action to avoid the possible exceedance of a stability limit in the pre-Contingency state.

Thank you for your comments. Industry response to the draft SOL Exceedance definition indicated numerous significant concerns. Given this response, the SDT concluded that creating a definition of SOL Exceedance which adequately reflects reliable operating principles could create an unnecessary compliance burden if action is not taken to substantially modify the existing TOP and IRO standards. Therefore, the SDT maintained system performance criteria through requirements in FAC-011-4 and FAC-014-3 similar to the approach within the currently effective FAC standards rather than address within a definition for SOL exceedance.

Our proposed definition covers both established stability limits and stability limits determined using Real-time tools making this distinction unnecessary.

The proposed definition assumes each applicable entity possesses its own on-line stability tools or are actively monitoring its operating parameters to indicate the next Contingency that could result in instability. Established stability limits are sufficiently addressed by the third and fourth bullets under pre-Contingency operations. Per our recommendation to utilize the MISO definition in question #4, we believe these two bullets could be combined into one clearly defined stability related condition. Those entities that use real-time stability tools should use the third and fourth bullets under pre-Contingency operations as well or the single definition, with understanding that their stability limits might vary in real-time as opposed to be fixed/established.

This portion of the definition isn't necessary, as it would apply to very limited number of TOPs/RCs that use real-time tools for determining defined stability performance. Established stability limits are sufficiently addressed by the third and fourth bullets under pre-Contingency operations. Those entities that use real-time stability tools should use the third and fourth bullets under pre-Contingency operations as well, with understanding that their stability limits might vary in real-time as opposed to be fixed/established.

NIPSCO feels the use of “sufficient time” in the definition is vague. Who defines “sufficient time”? Is it the RC or the TO? Again NIPSCO likes the MISO definition as it is more descriptive. It reads as follows:

SOL Exceedance Based on Projected Post-Contingent Flows, Determined by a Real-Time Assessment

A. Projected post-Contingent loading on a BES Facility is greater than the highest emergency rating for longer than 30 minutes with **NO** agreed upon action plan that would mitigate the condition if the Contingency were to occur.

B. Projected post-Contingent voltage on a BES Facility is less than the emergency low voltage limit for longer than 30 minutes with **NO** agreed upon action plan that would mitigate the condition if the Contingency were to occur.

Comment

Peak agrees that the definition of SOL Exceedance should include the item "Defined stability performance criteria are not met." However, it should be made clear to auditors that this aspect of the definition applies only to entities that use real-time tools to determine whether the system is meeting stability performance criteria or not. I.e., if a TOP or RC is not using real-time tools, but is instead using actual predetermined stability limits (limit "values") in accordance with the last two bullets in the pre-Contingency section of the proposed definition of SOL Exceedance, then the bullet in question should not apply to that TOP or RC.

Reclamation recommends, if it is the intent of the third post-Contingency bullet to only apply to those TOPs or RCs that additionally use real-time tools to determine whether defined stability performance criteria are being met, that the bullet explicitly state this applicability criterion so as to provide clarity and avoid confusion.

The definition allows TOPs and RCs to recognize that the standards are about maintaining an adequate level of system performance for all customers. Many reliability issues are not adequately captured by traditional SOL values and are best measured by other system parameters. Although ATC agrees that the inclusion of this bullet is acceptable, the term "stability" with this bullet may cause confusion for some entities. Another possible term to use is "Defined system performance criteria are met".

6. The SAR is being revised to authorize the SDT to review the existing body of Reliability Standards and NERC Glossary of terms, and where necessary, modify those standards and definitions to incorporate the new terms and/or definition(s) of SOL Exceedance and System Voltage Limit, as well as the revised definition of System Operating Limit. The SDT has identified the standards and terms they contend would benefit from this incorporation and has included them in separate documents with this posting for your review. Do you agree with the SDT's selections? If not, please explain your response.

The current definition of SOL has been the foundation of the existing suite of Reliability Standards, in addition to operating practices, since 2007. Any change in the definition of SOL and the implementation of the new definitions needs to be carefully coordinated with updates to existing standards to accommodate the revised definition.

IRC has identified the following additional four Reliability Standards that it believes should be considered for updates included in the SDT Spreadsheet:

MOD-001-2 R1.1 The requirement should be changed to acknowledge the new definition

PER-004-2 R2 The VSLs needs to be modified since they were written with the 'most limiting' of ratings to be considered. The proposed definition includes the entire universe of ratings which I don't believe was the intent of the VSLs.

VAR-001-4.1 R1 The requirement should be changed to acknowledge the new definition.

Interconnection Reliability Operating Limit Glossary of Terms Need to replace violated with exceeded.

1. We believe the SDT should expand their review to any reference to the phrase "limit," in the context of System Operating Limits, in the NERC Reliability Standard and NERC Glossary. This includes the addition of glossary terms like Emergency Rating, Flowgate Methodology, Rating, and Reliable Operation. 2. The scope of the SAR should also be expanded to consider the review of applicable requirements that could be retired under various Paragraph 81 criteria.

The SDT should take the opportunity of this revision to ensure that clarity exists when other standards refer to deliverables or language used in the current FAC standards. For example, CIP-002-5.1a criterion 2.6 refers to a list of facilities critical to the derivation of IROL used in FAC-014, but the current FAC-014 does not explain in any way what critical facilities are versus non-critical facilities.

Care should be taken on implementing this definition. Once formal (capitalized) definitions become effective, entities will use that explicitly when complying with NERC standards. For example, confusion can occur if standards incorrectly use “SOL exceedance” or “exceeding an SOL” vs “SOL Exceedance. There must be a way to ensure continuity so that the intent of the requirement is clear.

1. We believe the SDT should have included a request for comments on its proposed definition for System Voltage Limit, since this definition directly ties to the SOL definition. The references to normal and emergency in this definition do not aligned with the proposed SOL and SOL Exceedance definitions. Further guidance on what constitutes "acceptable performance" is also needed. 2. We thank you for this opportunity to provide these comments.

The definitions addressed here achieve the objective of "bring clarity and consistency to the notion of establishing SOLs, exceeding SOLs, and implementing Operating Plans to mitigate SOL exceedances."

It should be noted that the consistency in the definition of SOLs and application of SOLs to determine SOL Exceedances does not translate as a consistent, comparative indicator of reliable system performance. The contingencies applied to establish an SOL Exceedance event are bounded only by a floor of three contingencies mandated by FAC-011. OPAs and RTAs determine SOL Exceedances in accordance with the local SOL methodologies. SOL methodologies may or may not significantly expand the applicable contingencies which define SOL Exceedances. Comparing SOL Exceedances from one SOL methodology to the SOL exceedances of another SOL methodology can be a case comparing apples to oranges.

Likes 0	
Dislikes 0	

Response

The SDT agrees that the selection of Contingencies has a significant impact on the existence (or non-existence) of stability limits. For example, if the SOL Methodology considers a high number of multiple Contingencies such as breaker failure or common tower multiple Contingencies in its stability assessments, there is a higher likelihood that more stability limits and IROLs will be identified. The SDT recognizes that the selection of Contingencies also has an impact on the number of Facility Rating and System Voltage Limit exceedances that are likely to be observed in OPAs and RTA. Again, the more multiple Contingencies are included, the more exceedances are likely to be observed. However, the SDT believes that SOL exceedance as a phenomenon is not a function of an SOL Methodology.

Industry response to the draft SOL Exceedance definition indicated numerous significant concerns. Given this response, the SDT concluded that creating a definition of SOL Exceedance which adequately reflects reliable operating principles could create an unnecessary compliance burden if action is not taken to substantially modify the existing TOP and IRO standards. Therefore, the SDT maintained system performance criteria through requirements in FAC-011-4 and FAC-014-3 similar to the approach within the currently effective FAC standards rather than address within a definition for SOL exceedance.

The definitions addressed here achieve the objective of "bringing clarity and consistency to the notion of establishing SOLs, exceeding SOLs, and implementing Operating Plans to mitigate SOL exceedances."

It should be noted that the consistency in the definition of SOLs and application of SOLs to determine SOL Exceedances does not translate as a consistent, comparative indicator of reliable system performance. The contingencies applied to establish an SOL Exceedance event are bounded only by a floor of three contingencies mandated by FAC-011. OPAs and RTAs determine SOL Exceedances in accordance with the local SOL methodologies. SOL methodologies may or may not significantly expand the applicable contingencies which define SOL Exceedances. Comparing SOL Exceedances from one SOL methodology to the SOL exceedances of another SOL methodology can be a case comparing apples to oranges. However, this project will result in the application of SOLs in the OPA and RTA being consistent regardless of disparity in the methodologies between different RCs.

Response

The SDT agrees that the selection of Contingencies has a significant impact on the existence (or non-existence) of stability limits. For example, if the SOL Methodology considers a high number of multiple Contingencies such as breaker failure or common tower multiple Contingencies in its stability assessments, there is a higher likelihood that more stability limits and IROLs will be identified. The SDT recognizes that the selection of Contingencies also has an impact on the number of Facility Rating and System Voltage Limit exceedances that are likely to be observed in OPAs and RTA. Again, the more multiple Contingencies are included, the more exceedances are likely to be observed. However, the SDT believes that SOL exceedance as a phenomenon is not a function of an SOL Methodology.

Industry response to the draft SOL Exceedance definition indicated numerous significant concerns. Given this response, the SDT concluded that creating a definition of SOL Exceedance which adequately reflects reliable operating principles could create an unnecessary compliance burden if action is not taken to substantially modify the existing TOP and IRO standards. Therefore, the SDT maintained system performance criteria through requirements in FAC-011-4 and FAC-014-3 similar to the approach within the currently effective FAC standards rather than address within a definition for SOL exceedance.

Comment

It is premature for industry to vote on FAC standards using the current definition as requested. While it would be nice to decouple the new standard and the revised SOL definition, the revised definition fundamentally impacts how the FAC standards will be implemented. Therefore, entities must vote on the NERC standard based on the expected revised SOL definition. Where the combination of the revised definition and standard would cause concerns, then industry should vote negative accordingly. The two things cannot be effectively decoupled.

Response

The SDT believes that the FAC standards work with both the currently effective definition of SOL as well as the proposed definition of SOL.

Comment

1. The proposed definition of SOL Exceedance, if employed, will cause confusion as to what is a violation. For example, if flow on a line goes beyond its post-contingency STE (the highest time-based rating), should it not be considered a violation as opposed to an exceedance despite the fact the contingency has not occurred? This new definition should also identify which exceedances should also be treated as violations in the interest of eliminating confusion as to what is a SOL violation vs. what is an exceedance. Alternatively, having a definition for SOL Violation may provide the required clarity.
2. The proposed definition of System Voltage Limit seems unnecessary and the associated background information causes confusion around voltage Facility Ratings vs. System Voltage limits. System voltage limits are either present to either protect system equipment from damage or to prevent instability of the system. Therefore this defined term is not needed. The background from Q3 of this comments form states, “Facility Ratings and System Voltage Limits are not determined by a “study”; rather they are inputs to the “study”. This confuses the term further as a System Voltage Limit definition further as voltage limits which are not Facility Ratings must be studied whenever system configurations are different from what has been previously studied.
3. The proposed definition for SOL must include the glossary term “Stability” definition. Use of lower-case stability with an accompanying explanation is not sufficient to allow industry to be of a common understanding. A common understanding of “Stability” is fundamental in ensuring Interconnected System Reliability. The definition of Stability must be inclusive of what could be deemed instability; this includes thermal violations would cause cascading outages.

Response	

1. Thank you for your comments.
2. System Voltage Limits are intended to respect equipment voltage ratings and to provide acceptable voltage performance for the System. The acceptable System performance referenced in the proposed definition is intended to convey that the System is expected to perform acceptably from a voltage perspective. The NERC defined term System is *"A combination of generation, transmission, and distribution components."* This term was used in the proposed definition to convey the idea that the System Voltage Limits established by the TOP in accordance with the RC's SOL Methodology are expected to be established in a manner that renders acceptable voltage performance for the System (as defined in the NERC glossary) that resides within the TOP Area. System Voltage Limits, by providing acceptable System performance, are intended to go beyond that of voltage limits based solely off facility/equipment limitations. (i.e., A voltage profile of 0.6 p.u. may not damage equipment; however, it is unacceptable from a System performance perspective.)
3. As is stated in the supporting document, "NERC Glossary Definitions: System Operating Limit and SOL Exceedance Rationale", *"the intent of using the "stability limit" term (as opposed to the NERC Glossary term "Stability Limit") is to allow for a number of different types of stability-related limitations or phenomena, including, but not limited to, sub-synchronous resonance (SSR), phase angle limitations, transient voltage limitations on equipment, and weighted short-circuit ratio (WSCR). The Glossary term "Stability Limits" is not appropriate for use in the revised definition because its use is limited to a maximum power flow value. While some entities may use maximum power flow values as a means by which to prevent instability, this approach represents only one particular method and may be too restrictive for some entities. Reliability tools allow entities to monitor and control parameters other than maximum power flow values in order to demonstrate acceptable stability performance."* The revision of the Stability Limit defined term is outside the scope of the SDT at this time. However, if the definition of Stability Limit is modified at some point in the future, the industry should consider modifying the SOL definition to include this term.

A. Introduction

1. **Title:** **System Operating Limits Methodology for the Planning Horizon**

2. **Number:** FAC-010-3

3. **Purpose:** To ensure that System Operating Limits (SOLs) used in the reliable planning of the Bulk Electric System (BES) are determined based on an established methodology or methodologies.

4. **Applicability**

   4.1. Planning Authority

5. **Effective Date:** See Implementation Plan for the Revised Definition of "Remedial Action Scheme"

B. Requirements

R1. The Planning Authority shall have a documented SOL Methodology for use in developing SOLs within its Planning Authority Area. This SOL Methodology shall:

R1.1. Be applicable for developing SOLs used in the planning horizon.

R1.2. State that SOLs shall not exceed associated Facility Ratings.

R1.3. Include a description of how to identify the subset of SOLs that qualify as IROLs.

R2. The Planning Authority's SOL Methodology shall include a requirement that SOLs provide BES performance consistent with the following:

R2.1. In the pre-contingency state and with all Facilities in service, the BES shall demonstrate transient, dynamic and voltage stability; all Facilities shall be within their Facility Ratings and within their thermal, voltage and stability limits. In the determination of SOLs, the BES condition used shall reflect expected system conditions and shall reflect changes to system topology such as Facility outages.

R2.2. Following the single Contingencies[1] identified in Requirement 2.2.1 through Requirement 2.2.3, the system shall demonstrate transient, dynamic and voltage stability; all Facilities shall be operating within their Facility Ratings and within their thermal, voltage and stability limits; and Cascading or uncontrolled separation shall not occur.

R2.2.1. Single line to ground or three-phase Fault (whichever is more severe), with Normal Clearing, on any Faulted generator, line, transformer, or shunt device.

R2.2.2. Loss of any generator, line, transformer, or shunt device without a Fault.

R2.2.3. Single pole block, with Normal Clearing, in a monopolar or bipolar high voltage direct current system.

R2.3. Starting with all Facilities in service, the system's response to a single Contingency, may include any of the following:

R2.3.1. Planned or controlled interruption of electric supply to radial customers or some local network customers connected to or supplied by the Faulted Facility or by the affected area.

[1] The Contingencies identified in R2.2.1 through R2.2.3 are the minimum contingencies that must be studied but are not necessarily the only Contingencies that should be studied.

R2.3.2. System reconfiguration through manual or automatic control or protection actions.

R2.4. To prepare for the next Contingency, system adjustments may be made, including changes to generation, uses of the transmission system, and the transmission system topology.

R2.5. Starting with all Facilities in service and following any of the multiple Contingencies identified in Reliability Standard TPL-003 the system shall demonstrate transient, dynamic and voltage stability; all Facilities shall be operating within their Facility Ratings and within their thermal, voltage and stability limits; and Cascading or uncontrolled separation shall not occur.

R2.6. In determining the system's response to any of the multiple Contingencies, identified in Reliability Standard TPL-003, in addition to the actions identified in R2.3.1 and R2.3.2, the following shall be acceptable:

R2.6.1. Planned or controlled interruption of electric supply to customers (load shedding), the planned removal from service of certain generators, and/or the curtailment of contracted Firm (non-recallable reserved) electric power Transfers.

R3. The Planning Authority's methodology for determining SOLs, shall include, as a minimum, a description of the following, along with any reliability margins applied for each:

R3.1. Study model (must include at least the entire Planning Authority Area as well as the critical modeling details from other Planning Authority Areas that would impact the Facility or Facilities under study).

R3.2. Selection of applicable Contingencies.

R3.3. Level of detail of system models used to determine SOLs.

R3.4. Allowed uses of Remedial Action Schemes.

R3.5. Anticipated transmission system configuration, generation dispatch and Load level.

R3.6. Criteria for determining when violating a SOL qualifies as an Interconnection Reliability Operating Limit (IROL) and criteria for developing any associated IROL T_v.

R4. The Planning Authority shall issue its SOL Methodology, and any change to that methodology, to all of the following prior to the effectiveness of the change:

R4.1. Each adjacent Planning Authority and each Planning Authority that indicated it has a reliability-related need for the methodology.

R4.2. Each Reliability Coordinator and Transmission Operator that operates any portion of the Planning Authority's Planning Authority Area.

R4.3. Each Transmission Planner that works in the Planning Authority's Planning Authority Area.

R5. If a recipient of the SOL Methodology provides documented technical comments on the methodology, the Planning Authority shall provide a documented response to that recipient within 45 calendar days of receipt of those comments. The response shall indicate whether a change will be made to the SOL Methodology and, if no change will be made to that SOL Methodology, the reason why. (Retirement approved by FERC effective January 21, 2014.)

C. Measures

M1. The Planning Authority's SOL Methodology shall address all of the items listed in Requirement 1 through Requirement 3.

M2. The Planning Authority shall have evidence it issued its SOL Methodology and any changes to that methodology, including the date they were issued, in accordance with Requirement 4.

If the recipient of the SOL Methodology provides documented comments on its technical review of that SOL methodology, the Planning Authority that distributed that SOL Methodology shall have evidence that it provided a written response to that commenter within 45 calendar days of receipt of those comments in accordance with Requirement 5. (Retirement approved by FERC effective January 21, 2014.)

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

Regional Reliability Organization

1.2. Compliance Monitoring Period and Reset Time Frame

Each Planning Authority shall self-certify its compliance to the Compliance Monitor at least once every three years. New Planning Authorities shall demonstrate compliance through an on-site audit conducted by the Compliance Monitor within the first year that it commences operation. The Compliance Monitor shall also conduct an on-site audit once every nine years and an investigation upon complaint to assess performance.

The Performance-Reset Period shall be twelve months from the last non-compliance.

1.3. Data Retention

The Planning Authority shall keep all superseded portions to its SOL Methodology for 12 months beyond the date of the change in that methodology ~~and shall keep all documented comments on its SOL Methodology and associated responses for three years~~. In addition, entities found non-compliant shall keep information related to the non-compliance until found compliant. (Deleted text retired-Retirement approved by FERC effective January 21, 2014.)

The Compliance Monitor shall keep the last audit and all subsequent compliance records.

1.4. Additional Compliance Information

The Planning Authority shall make the following available for inspection during an on-site audit by the Compliance Monitor or within 15 business days of a request as part of an investigation upon complaint:

1.4.1 SOL Methodology.

Documented comments provided by a recipient of the SOL Methodology on its technical review of a SOL Methodology, and the associated responses. (Retirement approved by FERC effective January 21, 2014.)

1.4.2 Superseded portions of its SOL Methodology that had been made within the past 12 months.

1.4.3 Evidence that the SOL Methodology and any changes to the methodology that occurred within the past 12 months were issued to all required entities.

2. Levels of Non-Compliance for Western Interconnection: (To be replaced with VSLs once developed and approved by WECC)

2.1. Level 1: There shall be a level one non-compliance if either of the following conditions exists:

2.1.1 The SOL Methodology did not include a statement indicating that Facility Ratings shall not be exceeded.

2.1.2 No evidence of responses to a recipient's comments on the SOL Methodology. (Retirement approved by FERC effective January 21, 2014.)

2.2. Level 2: The SOL Methodology did not include a requirement to address all of the elements in R2.1 through R2.3 and E1.

2.3. Level 3: There shall be a level three non-compliance if any of the following conditions exists:

2.3.1 The SOL Methodology did not include a statement indicating that Facility Ratings shall not be exceeded and the methodology did not include evaluation of system response to one of the three types of single Contingencies identified in R2.2.

2.3.2 The SOL Methodology did not include a statement indicating that Facility Ratings shall not be exceeded and the methodology did not include evaluation of system response to two of the seven types of multiple Contingencies identified in E1.1.

2.3.3 The System Operating Limits Methodology did not include a statement indicating that Facility Ratings shall not be exceeded and the methodology did not address two of the six required topics in R3.

2.4. Level 4: The SOL Methodology was not issued to all required entities in accordance with R4

3. Violation Severity Levels:

E. Regional Differences

1. The following Interconnection-wide Regional Difference shall be applicable in the Western Interconnection:

1.1. As governed by the requirements of R2.5 and R2.6, starting with all Facilities in service, shall require the evaluation of the following multiple Facility Contingencies when establishing SOLs:

1.1.1 Simultaneous permanent phase to ground Faults on different phases of each of two adjacent transmission circuits on a multiple circuit tower, with Normal Clearing. If multiple circuit towers are used only for station entrance and exit purposes, and if they do not exceed five towers at each station, then this condition is an acceptable risk and therefore can be excluded.

1.1.2 A permanent phase to ground Fault on any generator, transmission circuit, transformer, or bus section with Delayed Fault Clearing except for bus sectionalizing breakers or bus-tie breakers addressed in E1.1.7

1.1.3 Simultaneous permanent loss of both poles of a direct current bipolar Facility without an alternating current Fault.

1.1.4 The failure of a circuit breaker associated with a Remedial Action Scheme to operate when required following: the loss of any element without a Fault; or a permanent phase to ground Fault, with Normal Clearing, on any transmission circuit, transformer or bus section.

1.1.5 A non-three phase Fault with Normal Clearing on common mode Contingency of two adjacent circuits on separate towers unless the event frequency is determined to be less than one in thirty years.

1.1.6 A common mode outage of two generating units connected to the same switchyard, not otherwise addressed by FAC-010.

1.1.7 The loss of multiple bus sections as a result of failure or delayed clearing of a bus tie or bus sectionalizing breaker to clear a permanent Phase to Ground Fault.

1.2. SOLs shall be established such that for multiple Facility Contingencies in E1.1.1 through E1.1.5 operation within the SOL shall provide system performance consistent with the following:

1.2.1 All Facilities are operating within their applicable Post-Contingency thermal, frequency and voltage limits.

1.2.2 Cascading does not occur.

1.2.3 Uncontrolled separation of the system does not occur.

1.2.4 The system demonstrates transient, dynamic and voltage stability.

1.2.5 Depending on system design and expected system impacts, the controlled interruption of electric supply to customers (load shedding), the planned removal from service of certain generators, and/or the curtailment of contracted firm (non-recallable reserved) electric power transfers may be necessary to maintain the overall security of the interconnected transmission systems.

1.2.6 Interruption of firm transfer, Load or system reconfiguration is permitted through manual or automatic control or protection actions.

1.2.7 To prepare for the next Contingency, system adjustments are permitted, including changes to generation, Load and the transmission system topology when determining limits.

1.3. SOLs shall be established such that for multiple Facility Contingencies in E1.1.6 through E1.1.7 operation within the SOL shall provide system performance consistent with the following with respect to impacts on other systems:

1.3.1 Cascading does not occur.

1.4. The Western Interconnection may make changes (performance category adjustments) to the Contingencies required to be studied and/or the required responses to Contingencies for specific facilities based on actual system performance and robust design. Such changes will apply in determining SOLs.

Version History

Version	Date	Action	Change Tracking
1	November 1, 2006	Adopted by Board of Trustees	New
1	November 1, 2006	Fixed typo. Removed the word "each" from the 1st sentence of section D.1.3, Data Retention.	01/11/07
2	June 24, 2008	Adopted by Board of Trustees; FERC Order 705	Revised
2		Changed the effective date to July 1, 2008 Changed "Cascading Outage" to "Cascading" Replaced Levels of Non-compliance with Violation Severity Levels	Revised
2	January 22, 2010	Updated effective date and footer to April 29, 2009 based on the March 20, 2009 FERC Order	Update
2.1	November 5, 2009	Adopted by the Board of Trustees — errata change Section E1.1 modified to reflect the renumbering of requirements R2.4 and R2.5 from FAC-010-1 to R2.5 and R2.6 in FAC-010-2.	Errata
2.1	April 19, 2010	FERC Approved — errata change Section E1.1 modified to reflect the renumbering of requirements R2.4 and R2.5 from FAC-010-1 to R2.5 and R2.6 in FAC-010-2.	Errata
2.1	February 7, 2013	R5 and associated elements approved by NERC Board of Trustees for retirement as part of the Paragraph 81 project (Project 2013-02) pending applicable regulatory approval.	

2.1	November 21, 2013	R5 and associated elements approved by FERC for retirement as part of the Paragraph 81 project (Project 2013-02)	
2.1	February 24, 2014	Updated VSLs based on June 24, 2013 approval.	
3	November 13, 2014	Adopted by the NERC Board of Trustees	Replaced references to Special Protection System and SPS with Remedial Action Scheme and RAS
3	November 19, 2015	FERC Order issued approving FAC-010-3. Docket No. RM15-13-000.

Standards Committee approved Standard Authorization Request (SAR) for posting	08/19/15
SAR posted for comment	08/20/15 – 09/21/15
Draft Reliability Standard posted for Informal Comment Period	07/14/16 – 08/12/16

Anticipated Actions	Date
45-day formal comment period with initial ballot	September 2017 – November 2017
45-day formal comment period with additional ballot	January 2018 – February 2018
10-day final ballot	February 2018
NERC Board adoption	May 2018

A. Introduction

1. **Title:** System Operating Limits Methodology for the Operations Horizon
2. **Number:** FAC-011-4
3. **Purpose:** To ensure that System Operating Limits (SOLs) used in the reliable operation of the Bulk Electric System (BES) are determined based on an established methodology or methodologies.
4. **Applicability:**

   4.1. Functional Entities:

   4.1.1. Reliability Coordinator

5. **Effective Date:** See Implementation Plan for Project 2015-09.

B. Requirements and Measures

R1. Each Reliability Coordinator shall have a methodology for establishing SOLs (i.e., SOL Methodology) within its Reliability Coordinator Area. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M1. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation of its SOL Methodology.

R2. Each Reliability Coordinator shall include in its SOL Methodology the method for Transmission Operators to determine the applicable owner-provided Facility Ratings to be used in operations. The method shall address the use of common Facility Ratings between the Reliability Coordinator and the Transmission Operators in its Reliability Coordinator Area. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M2. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation of its SOL Methodology that addresses the items listed in Requirement R2.

R3. Each Reliability Coordinator shall include in its SOL Methodology the method for Transmission Operators to determine the System Voltage Limits to be used in operations. The method shall: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

3.1. Require that BES buses/stations have an associated System Voltage Limit except for the BES buses/stations that may be excluded as specified in the Reliability Coordinator's SOL Methodology;

3.2. Require that System Voltage Limits respect the Facility voltage Ratings;

3.3. Require that System Voltage Limits are higher than in-service under voltage load shedding (UVLS) relay settings;

3.4. Identify the lowest allowable System Voltage Limit;

3.5. Address the use of common System Voltage Limits between the Reliability Coordinator and the Transmission Operators in its Reliability Coordinator Area;

3.6. Address coordination of System Voltage Limits between adjacent Transmission Operators in its Reliability Coordinator Area; and

3.7. Address coordination of System Voltage Limits between adjacent Reliability Coordinator Areas within an Interconnection.

M3. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation of its SOL Methodology that addresses the items listed in Requirement R3.

R4. Each Reliability Coordinator shall include in its SOL Methodology the method for determining the stability limits to be used in operations. The method shall: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

4.1. Specify stability performance criteria, including any margins applied. The criteria shall include the following:

4.1.1. steady-state voltage stability;

4.1.2. transient voltage response;

4.1.3. angular stability; and

4.1.4. System damping.

4.2. Require that stability limits are established to meet the criteria specified in Part 4.1 for the Contingencies identified in Requirement R5.

4.3. Describe how the Reliability Coordinator establishes stability limits when there is an impact to more than one Transmission Operator in its Reliability Coordinator Area.

4.4. Describe how instability risks are identified, considering levels of transfers, Load and generation dispatch, and System conditions including any changes to System topology such as Facility outages;

4.5. Describe the level of detail that is required for the study model(s); including the extent of the Reliability Coordinator Area, as well as the critical modeling details from other Reliability Coordinator Areas, necessary to determine different types of stability limits.

4.6. Describe the allowed uses of Remedial Action Schemes and other automatic post-Contingency mitigation actions; the planned use of underfrequency load shedding (UFLS) is not allowed in the establishment of stability limits.

M4. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation of its SOL Methodology that addresses the items listed in Requirement R4.

R5. Each Reliability Coordinator shall include in its SOL Methodology the method for identifying the single Contingencies and multiple Contingencies for use in determining stability limits and performing Operational Planning Analysis (OPAs) and Real-time Assessments (RTAs). The method shall include: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

5.1. The following list of single Contingency events for use in determining stability limits and performing OPAs and RTAs:

5.1.1. Loss of any of the following either by single phase to ground or three phase Fault (whichever is more severe) with normal clearing, or without a Fault:

- generator;
- transmission circuit;
- transformer;
- shunt device; or
- single pole block, with Normal Clearing, in a monopolar or bipolar high voltage direct current system.

5.2. Any additional types of single Contingency events identified for use in determining stability limits, or for use in performing OPAs and RTAs.

5.3. Any types of multiple Contingency events identified for use in determining stability limits, or for use in performing OPAs and RTAs.

5.4. The method for considering the Contingency events provided by the Planning Coordinator in accordance with FAC-015-1, Requirement R6 to identify the Contingencies for use in determining stability limits.

M5. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation of its SOL Methodology that addresses the items listed in Requirement R5.

R6. Each Reliability Coordinator shall include in its SOL Methodology: *[Violation Risk Factor: High] [Time Horizon: Operations Planning]*

6.1. A description of how to identify the subset of SOLs that qualify as Interconnection Reliability Operating Limits (IROLs).

6.2. Criteria for determining when violating a SOL qualifies as an IROL and criteria for developing any associated IROL T_v.

M6. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation of its SOL Methodology that addresses the items listed in Requirement R6.

R7. Each Reliability Coordinator shall include in its SOL Methodology the method for Transmission Operators to communicate SOLs it established to its Reliability Coordinator(s). The method shall address the periodicity of SOL communication. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M7. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation of its SOL Methodology that addresses the items listed in Requirement R7.

R8. Each Reliability Coordinator shall provide its SOL Methodology and any changes to the SOL Methodology prior to the effective date of the SOL Methodology, to: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

8.1. Each adjacent Reliability Coordinator within an Interconnection, and each Reliability Coordinator that requests and indicates it has a reliability-related need;

8.2. Each Planning Coordinator and Transmission Planner that is responsible for planning any portion of the Reliability Coordinator Area;

8.3. Each Transmission Operator within its Reliability Coordinator Area.

M8. Acceptable evidence that the Reliability Coordinator provided its SOL Methodology to the entities identified in Requirement R8 may include, but is not limited to, dated electronic or hard copy documentation such as emails with receipts, registered mail receipts, or postings to a secure web site with accompanying notification(s).

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:
"Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention:
The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- The Reliability Coordinator shall keep data or evidence of compliance with Requirements R1 through R8 for the current year plus the previous 12 calendar months. .

1.3. Compliance Monitoring and Enforcement Program
As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	N/A	N/A	N/A	The Reliability Coordinator did not have a SOL Methodology for establishing SOLs within its Reliability Coordinator Area.
R2.	N/A	N/A	The Reliability Coordinator included in its SOL Methodology the method for Transmission Operators to determine the applicable owner-provided Facility Ratings to be used in operations, but the method did not address the use of common Facility Ratings between the Reliability Coordinator and the Transmission Operators in its Reliability Coordinator Area	The Reliability Coordinator did not include in its SOL Methodology the method for Transmission Operators to determine the applicable owner-provided Facility Ratings to be used in operations.

45-day formal comment period with initial ballot	September 2017 – November 2017
45-day formal comment period with additional ballot	January 2018 – February 2018
10-day final ballot	February 2018
NERC Board adoption	May 2018

A. Introduction

1. **Title:** System Operating Limits Methodology for the Operations Horizon

2. **Number:** FAC-011-~~3~~4

3. **Purpose:** -To ensure that System Operating Limits (SOLs) used in the reliable operation of the Bulk Electric System (BES) are determined based on an established methodology or methodologies.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1. Reliability Coordinator

5. **Effective Date:** See Implementation Plan for ~~the Revised Definition of "Remedial Action Scheme".~~Project 2015-09.

B. Requirements and Measures

R1. ~~The~~Each Reliability Coordinator shall have a ~~documented~~ methodology for ~~use in developing~~establishing SOLs (i.e., SOL Methodology) within its Reliability Coordinator Area. ~~This~~*[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M1. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation of its SOL Methodology.

~~**R1.**~~**R2.** Each Reliability Coordinator shall~~:~~ include in its SOL Methodology the method for Transmission Operators to determine the applicable owner-provided Facility Ratings to be used in operations. The method shall address the use of common Facility Ratings between the Reliability Coordinator and the Transmission Operators in its Reliability Coordinator Area. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

~~**1.1.** Be applicable for developing SOLs used in the operations horizon.~~

~~**1.2.** State that SOLs shall not exceed associated Facility Ratings.~~

M2. ~~Include a description of how to identify the subset of SOLs that qualify~~Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation of its SOL Methodology that addresses the items listed in Requirement R2.

R3. Each Reliability Coordinator shall include in its SOL Methodology the method for Transmission Operators to determine the System Voltage Limits to be used in operations. The method shall: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

~~**1.3.**~~ Require that BES buses/stations have an associated System Voltage Limit except for the BES buses/stations that may be excluded as ~~IROLs.~~

3.1. ~~The~~ specified in the Reliability Coordinator's SOL Methodology ~~shall include a requirement that SOLs provide BES~~ ;

3.2. Require that System Voltage Limits respect the Facility voltage Ratings;

3.3. Require that System Voltage Limits are higher than in-service under voltage load shedding (UVLS) relay settings;

3.4. Identify the lowest allowable System Voltage Limit;

3.5. Address the use of common System Voltage Limits between the Reliability Coordinator and the Transmission Operators in its Reliability Coordinator Area;

3.6. Address coordination of System Voltage Limits between adjacent Transmission Operators in its Reliability Coordinator Area; and

3.7. Address coordination of System Voltage Limits between adjacent Reliability Coordinator Areas within an Interconnection.

M3. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation of its SOL Methodology that addresses the items listed in Requirement R3.

R4. Each Reliability Coordinator shall include in its SOL Methodology the method for determining the stability limits to be used in operations. The method shall: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

~~1.4.~~4.1. Specify stability performance ~~consistent with~~ criteria, including any margins applied. The criteria shall include the following:

4.1.1. ~~In the pre-contingency~~ steady-state~~, the BES shall demonstrate~~ voltage stability;

4.1.2. transient~~, dynamic and~~ voltage response;

4.1.3. angular stability; ~~all Facilities shall be within their Facility Ratings and within their thermal, voltage and~~ and

4.1.4. System damping.

4.2. Require that stability limits~~. In~~ are established to meet the ~~determination of SOLs,~~criteria specified in Part 4.1 for the ~~BES condition used shall reflect current or expected system~~Contingencies identified in Requirement R5.

4.3. Describe how the Reliability Coordinator establishes stability limits when there is an impact to more than one Transmission Operator in its Reliability Coordinator Area.

~~1.5.~~4.4. Describe how instability risks are identified, considering levels of transfers, Load and generation dispatch, and System conditions ~~and shall reflect~~ including any changes to ~~system~~System topology such as Facility outages~~. ~~;

~~1.6. Following the single Contingencies[1] identified in Requirement 2.2.1 through Requirement 2.2.3, the system shall demonstrate transient, dynamic and voltage stability; all Facilities shall be operating within their Facility Ratings and within their thermal, voltage and stability limits; and Cascading or uncontrolled separation shall not occur.~~

4.5. ~~Single line to~~ Describe the level of detail that is required for the study model(s); including the extent of the Reliability Coordinator Area, as well as the critical modeling details from other Reliability Coordinator Areas, necessary to determine different types of stability limits.

4.6. Describe the allowed uses of Remedial Action Schemes and other automatic post-Contingency mitigation actions; the planned use of underfrequency load shedding (UFLS) is not allowed in the establishment of stability limits.

M4. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation of its SOL Methodology that addresses the items listed in Requirement R4.

R5. Each Reliability Coordinator shall include in its SOL Methodology the method for identifying the single Contingencies and multiple Contingencies for use in determining stability limits and performing Operational Planning Analysis (OPAs) and Real-time Assessments (RTAs). The method shall include: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

5.1. The following list of single Contingency events for use in determining stability limits and performing OPAs and RTAs:

5.1.1. Loss of any of the following either by single phase to ground or ~~3-~~three phase Fault (whichever is more severe~~),~~) with ~~Normal Clearing, on any Faulted~~ normal clearing, or without a Fault:

- generator~~, line,~~ ;
- transmission circuit;
- transformer~~, or~~ ;
- shunt device~~.~~; or

~~1.6.1. Loss of any generator, line, transformer, or shunt device without a Fault.~~

- ~~Single~~single pole block, with Normal Clearing, in a monopolar or bipolar high voltage direct current system.

~~1.7. In determining the system's response to a~~ Any additional types of single Contingency~~, the following shall be acceptable:~~

~~[1] The Contingencies identified in FAC-011 R2.2.1 through R2.2.3 are the minimum contingencies that must be studied but are not necessarily the only Contingencies that should be studied.~~

~~1.7.1. Planned or controlled interruption of electric supply to radial customers or some local network customers connected to or supplied by the Faulted Facility or by the affected area.~~

~~1.7.2. Interruption of other network customers, (a) only if the system has already been adjusted, or is being adjusted, following at least one prior outage, or (b) if the real-time operating conditions are more adverse than anticipated in the corresponding studies~~

~~1.7.3. System reconfiguration through manual or automatic control or protection actions.~~

~~1.8. To prepare for the next Contingency, system adjustments may be made, including changes to generation, uses of the transmission system, and the transmission system topology.~~

~~R2. The Reliability Coordinator's methodology for determining SOLs, shall include, as a minimum, a description of the following, along with any reliability margins applied for each:~~

~~2.1. Study model (must include at least the entire Reliability Coordinator Area as well as the critical modeling details from other Reliability Coordinator Areas that would impact the Facility or Facilities under study.)~~

~~2.2. Selection of applicable Contingencies~~

5.2. ~~A process for determining which of the~~ events identified for use in determining stability limits ~~associated with the list~~, or for use in performing OPAs and RTAs.

5.3. Any types of multiple ~~contingencies (~~Contingency events identified for use in determining stability limits, or for use in performing OPAs and RTAs.

~~2.3.~~5.4. The method for considering the Contingency events provided by the Planning ~~Authority~~Coordinator in accordance with FAC-~~014~~015-1, Requirement ~~6) are applicable for use in the operating horizon given the actual or expected system conditions.~~ R6 to identify the Contingencies for use in determining stability limits.

~~2.3.1. This process shall address the need to modify these limits, to modify the list of limits, and to modify the list of associated multiple contingencies.~~

~~2.4. Level of detail of system models used to determine SOLs.~~

~~2.5. Allowed uses of Remedial Action Schemes.~~

~~2.6. Anticipated transmission system configuration, generation dispatch and Load level~~

M5. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation of its SOL Methodology that addresses the items listed in Requirement R5.

R6. Each Reliability Coordinator shall include in its SOL Methodology: *[Violation Risk Factor: High] [Time Horizon: Operations Planning]*

6.1. A description of how to identify the subset of SOLs that qualify as Interconnection Reliability Operating Limits (IROLs).

~~2.7.~~6.2. Criteria for determining when violating a SOL qualifies as an ~~Interconnection Reliability Operating Limit (~~IROL~~)~~ and criteria for developing any associated IROL T_v.

M6. ~~The~~ Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation of its SOL Methodology that addresses the items listed in Requirement R6.

R7. Each Reliability Coordinator shall include in its SOL Methodology the method for Transmission Operators to communicate SOLs it established to its Reliability Coordinator(s). The method shall address the periodicity of SOL communication. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M7. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation of its SOL Methodology that addresses the items listed in Requirement R7.

~~R3.~~R8. Each Reliability Coordinator shall ~~issue~~provide its SOL Methodology and any changes to ~~that methodology,~~the SOL Methodology prior to the effective date of the SOL Methodology, to ~~the effectiveness of the Methodology or of a change to the Methodology, to all of the following:~~ : *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

~~3.1.~~8.1. Each adjacent Reliability Coordinator within an Interconnection, and each Reliability Coordinator that ~~indicated~~requests and indicates it has a reliability-related need ~~for the methodology.~~;

8.2. Each Planning ~~Authority~~Coordinator and Transmission Planner that ~~models~~is responsible for planning any portion of the Reliability ~~Coordinator's~~Coordinator Area;

~~3.2.~~8.3. Each Transmission Operator within its Reliability Coordinator Area.

~~3.3.~~ ~~Each Transmission Operator~~ Acceptable evidence that ~~operates in~~ the Reliability Coordinator ~~Area.~~

~~C. Measures~~

~~**M1.** The Reliability Coordinator's SOL Methodology shall address all of the items listed in Requirement 1 through Requirement 3.~~

~~M2.~~M8. ~~The Reliability Coordinator shall have evidence it issued~~provided its SOL Methodology~~, and any changes to that methodology, including the date they were issued, in accordance~~ to the entities identified in Requirement R8 may include, but is not limited to, dated electronic or hard copy documentation such as emails with ~~Requirement 4.~~ receipts, registered mail receipts, or postings to a secure web site with accompanying notification(s).

~~D.~~C. Compliance

1. Compliance Monitoring Process

1.1. Compliance ~~Monitoring Responsibility~~Enforcement Authority:

~~Regional Reliability Organization~~

~~1.2. Compliance Monitoring Period and Reset Time Frame~~

~~Each Reliability Coordinator shall self-certify its compliance to the Compliance Monitor at least once every three years. New Reliability Authorities shall demonstrate compliance through an on-site audit conducted by the Compliance Monitor within the first year that it commences operation. The Compliance Monitor shall also conduct an on-site audit once every nine years and an investigation upon complaint to assess performance.~~

~~The Performance-Reset Period shall be twelve months from the last non-compliance.~~

~~**Data**~~"Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

~~1.3.~~1.2. Evidence Retention:

~~The Reliability Coordinator shall keep all superseded portions to its SOL Methodology for 12 months beyond the date of the change in that methodology. In addition, entities found non-compliant shall keep information related to the non-compliance until found compliant~~

~~The Compliance Monitor shall keep the last audit and all subsequent compliance records.~~

~~1.4. Additional Compliance Information~~

~~The Reliability Coordinator shall make the following available for inspection during an on-site audit~~The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by ~~the~~its Compliance ~~Monitor or within 15~~

~~business days~~Enforcement Authority to retain specific evidence for a longer period of ~~a request~~time as part of an investigation~~ upon complaint:~~.

~~**1.4.1** SOL Methodology.~~

~~**1.4.2** Superseded portions~~The Reliability Coordinator shall keep data or evidence of ~~its SOL Methodology that had been made within the past 12 months.~~

~~**1.4.3** Evidence that the SOL Methodology and any changes to the methodology that occurred within the past 12 months were issued to all required entities.~~

~~**2. Levels of Non-Compliance for Western Interconnection: (To be replaced with VSLs once developed and approved by WECC)**~~

~~**2.1. Level 1:** There shall be a level one non-~~compliance ~~if either of the following conditions exists:~~

~~**2.1.1** The SOL Methodology did not include a statement indicating that Facility Ratings shall not be exceeded.~~

- ~~**Level 2:** The SOL Methodology did not include a requirement to address all of the elements in R3.1, R3.2, R3.4~~with Requirements R1 through ~~R3.7 and E1~~R8 for the current year plus the previous 12 calendar months. .

~~**2.2. Level 3:** There shall be a level three non-compliance if any of the following conditions exists:~~

~~**2.2.1** The SOL Methodology did not include a statement indicating that Facility Ratings shall not be exceeded and the methodology did not include evaluation of system response to one of the three types of single Contingencies identified in R2.2.~~

~~**2.2.2** The SOL Methodology did not include a statement indicating that Facility Ratings shall not be exceeded and the methodology did not include evaluation of system response to two of the seven types of multiple Contingencies identified in E1.1.~~

~~**2.2.3** The System Operating Limits Methodology did not include a statement indicating that Facility Ratings shall not be exceeded and the methodology did not address two of the six required topics in R3.1, R3.2, R3.4 through R3.7.~~

~~**2.3. Level 4:** The SOL Methodology was not issued to all required entities in accordance with R4.~~

1.3. Compliance Monitoring and Enforcement Program

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels~~:~~

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	N/A	N/A	N/A	The Reliability Coordinator did not have a SOL Methodology for establishing SOLs within its Reliability Coordinator Area.
~~R1~~R2.	~~Not applicable.~~ N/A	~~The Reliability Coordinator has a documented SOL Methodology for use in developing SOLs within its Reliability Coordinator Area, but it does not address R1.2~~N/A	The Reliability Coordinator ~~has a documented~~ included in its SOL Methodology the method for Transmission Operators to determine the applicable owner-provided Facility Ratings to be used in operations, but the method did not address the use ~~in developing SOLs within~~of common Facility Ratings between the Reliability Coordinator and the Transmission Operators in its Reliability Coordinator Area~~, but it does not address R1.3.~~	The Reliability Coordinator ~~has a documented~~ did not include in its SOL Methodology the method for ~~use in developing SOLs within its Reliability Coordinator Area, but it does not address R1.1~~Transmission Operators to determine the applicable owner-provided Facility Ratings to be used~~;~~ ~~OR~~ ~~The Reliability Coordinator has no documented SOL Methodology for use~~ in ~~developing SOLs within its Reliability Coordinator Area.~~operations.

				requesting Reliability Coordinator in accordance with Part 8.4, but was late by more than 30 calendar days ~~after the effectiveness of the change~~. OR The Reliability Coordinator failed to provide its new or revised SOL Methodology to a requesting Reliability Coordinator in accordance with Part 8.4.

~~E.~~D. Regional ~~Differences~~Variances

~~3. The following Interconnection-wide Regional Difference shall be applicable in the Western Interconnection:~~

~~3.1. As governed by the requirements of R3.3, starting with all Facilities in service, shall require the evaluation of the following multiple Facility Contingencies when establishing SOLs:~~

~~3.1.1 Simultaneous permanent phase to ground Faults on different phases of each of two adjacent transmission circuits on a multiple circuit tower, with Normal Clearing. If multiple circuit towers are used only for station entrance and exit purposes, and if they do not exceed five towers at each station, then this condition is an acceptable risk and therefore can be excluded.~~

~~3.1.2 A permanent phase to ground Fault on any generator, transmission circuit, transformer, or bus section with Delayed Fault Clearing except for bus sectionalizing breakers or bus-tie breakers addressed in E1.1.7~~

~~3.1.3 Simultaneous permanent loss of both poles of a direct current bipolar Facility without an alternating current Fault.~~

~~3.1.4 The failure of a circuit breaker associated with a Remedial Action Scheme to operate when required following: the loss of any element without a Fault; or a permanent phase to ground Fault, with Normal Clearing, on any transmission circuit, transformer or bus section.~~

~~3.1.5 A non-three phase Fault with Normal Clearing on common mode Contingency of two adjacent circuits on separate towers unless the event frequency is determined to be less than one in thirty years.~~

~~3.1.6 A common mode outage of two generating units connected to the same switchyard, not otherwise addressed by FAC-011.~~

~~3.1.7 The loss of multiple bus sections as a result of failure or delayed clearing of a bus tie or bus sectionalizing breaker to clear a permanent Phase to Ground Fault.~~

~~3.2. SOLs shall be established such that for multiple Facility Contingencies in E1.1.1 through E1.1.5 operation within the SOL shall provide system performance consistent with the following:~~

~~3.2.1 All Facilities are operating within their applicable Post-Contingency thermal, frequency and voltage limits.~~

~~3.2.2 Cascading does not occur.~~

~~3.2.3 Uncontrolled separation of the system does not occur.~~

~~3.2.4 The system demonstrates transient, dynamic and voltage stability.~~

~~3.2.5 Depending on system design and expected system impacts, the controlled interruption of electric supply to customers (load shedding), the planned removal from service of certain generators, and/or the curtailment of contracted firm (non-recallable reserved) electric power transfers may be necessary to maintain the overall security of the interconnected transmission systems.~~

~~3.2.6 Interruption of firm transfer, Load or system reconfiguration is permitted through manual or automatic control or protection actions.~~

~~3.2.7 To prepare for the next Contingency, system adjustments are permitted, including changes to generation, Load and the transmission system topology when determining limits.~~

~~3.3. SOLs shall be established such that for multiple Facility Contingencies in E1.1.6 through E1.1.7 operation within the SOL shall provide system performance consistent with the following with respect to impacts on other systems:~~

~~3.3.1 Cascading does not occur.~~

~~3.4. The Western Interconnection may make changes (performance category adjustments) to the Contingencies required to be studied and/or the required responses to Contingencies for specific facilities based on actual system performance and robust design. Such changes will apply in determining SOLs.~~

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the Board of Trustees.

Description of Current Draft

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	08/19/15
SAR posted for comment	08/20/15 – 09/21/15
Draft Reliability Standard posted for Informal Comment Period	07/14/16 – 08/12/16

Anticipated Actions	Date
45-day formal comment period with ballot	September 2017 – October 2017
45-day formal comment period with additional ballot	January 2018 – February 2018
10-day final ballot	February 2018
NERC Board (Board) adoption	May 2018

A. Introduction

1. **Title:** Establish and Communicate System Operating Limits
2. **Number:** FAC-014-3
3. **Purpose:** To ensure that System Operating Limits (SOLs) used in the reliable operation of the Bulk Electric System (BES) are determined based on an established methodology or methodologies.
4. **Applicability:**

   4.1. Functional Entities:

   4.1.1. Reliability Coordinator

   4.1.2. Transmission Operator

5. **Effective Date:** See Implementation Plan for Project 2015-09.

B. Requirements and Measures

R1. Each Reliability Coordinator shall establish Interconnection Reliability Operating Limits (IROLs) for its Reliability Coordinator Area in accordance with its System Operating Limit Methodology (SOL Methodology). *[Violation Risk Factor: High] [Time Horizon: Operations Planning]*

M1. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation to demonstrate that the Reliability Coordinator established IROLs in accordance with it SOL Methodology.

R2. Each Transmission Operator shall establish System Operating Limits (SOLs) for its portion of the Reliability Coordinator Area in accordance with its Reliability Coordinator’s SOL Methodology. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M2. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation to demonstrate that the Transmission Operator established SOLs in accordance with its Reliability Coordinator’s SOL Methodology.

R3. The Transmission Operator shall provide its SOLs to its Reliability Coordinator in accordance with its Reliability Coordinator’s SOL Methodology. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Same-day Operations, Real-Time Operations]*

M3. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation to demonstrate that the Transmission Operator provided its SOLs in accordance with its Reliability Coordinator’s SOL Methodology.

R4. Each Reliability Coordinator shall establish stability limits to be used in operations when the limit impacts more than one Transmission Operator in its Reliability

Coordinator Area in accordance with its SOL Methodology. *[Violation Risk Factor: High] [Time Horizon: Operations Planning]*

M4. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation to demonstrate that the Reliability Coordinator established stability limits in accordance with Requirement R4.

R5. Each Reliability Coordinator shall provide: *[Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-day Operations, Real-Time Operations]*

5.1. Each Planning Coordinator within its Reliability Coordinator Area, SOLs for its Reliability Coordinator Area (including the subset of SOLs that are IROLs) at least once every twelve calendar months.

5.2. Each impacted Planning Coordinator within its Reliability Coordinator Area, the following information for each established stability limit and each established IROL at least once every twelve calendar months:

5.2.1. The value of the stability limit or IROL;

5.2.2. Identification of the Facilities that are critical to the derivation of the stability limit or IROL;

5.2.3. The associated IROL T_v for any IROL;

5.2.4. The associated Contingency(ies); and

5.2.5. The type of limitation represented by the stability limit or IROL (*e.g.*, voltage collapse, angular stability).

5.3. Each impacted Transmission Operator within its Reliability Coordinator Area, the value of the stability limits established pursuant to Requirement R4 and each IROL established pursuant to Requirement R1, in an agreed upon time frame necessary for inclusion in the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.

5.4. Each impacted Transmission Operator within its Reliability Coordinator Area, the information identified in Requirement R5 Parts 5.2.2 – 5.2.5 for each established stability limit or each IROL, and any updates to that information within an agreed upon time frame necessary for inclusion in the Transmission Operator's Operational Planning Analyses.

5.5. Each requesting Transmission Operator within its Reliability Coordinator Area, requested SOL information for its Reliability Coordinator Area, on a mutually agreed upon schedule.

M5. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation to demonstrate that the Reliability Coordinator provided the information in accordance with Requirement R5.

R6. Each Reliability Coordinator that is impacted by an IROL shall provide Transmission Owners and Generation Owners within its Reliability Coordinator Area a list of

Facilities owned by that entity that are critical to the derivation of the IROL. *[Violation Risk Factor: High] [Time Horizon: Operations Planning]*

M6. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation to demonstrate that the Reliability Coordinator provided the list of Facilities in accordance with Requirement R6.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:
"Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention:
The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- The Reliability Coordinator or Transmission Operator shall keep data or evidence of Requirements R1 through R6 for the current year plus the previous 12 calendar months.

1.3. Compliance Monitoring and Enforcement Program
As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	N/A	N/A	N/A	The Reliability Coordinator did not establish Interconnection Reliability Operating Limits (IROLs) for its Reliability Coordinator Area in accordance with its System Operating Limit Methodology ("SOL Methodology") as established in FAC-011-4.
R2.	N/A	N/A	N/A	The Transmission Operator did not establish SOLs for its portion of the Reliability Coordinator Area in accordance with its Reliability Coordinator's SOL Methodology.
R3.	N/A	N/A	The Transmission Operator provided its SOLs to its Reliability Coordinator, but did not provide its SOLs at the periodicity at which the RC needs such information	The Transmission Operator did not provide its SOLs to its Reliability Coordinator.

			to perform its reliability functions.	
R4.	N/A	N/A	N/A	The Reliability Coordinator did not determine stability limits to be used in operations when the limit impacts more than one Transmission Operator in its Reliability Coordinator Area in accordance with its SOL Methodology.
R5.	The Reliability Coordinator did not provide one of the items listed in Requirement R5, Parts 5.1 through 5.5.	The Reliability Coordinator did not provide two of the items listed in Requirement R5, Parts 5.1 through 5.5.	The Reliability Coordinator did not provide three of the items listed in Requirement R5, Parts 5.1 through 5.5.	The Reliability Coordinator did not provide four or more of the items listed in Requirement R5, Parts 5.1 through 5.5.
R6.	N/A	N/A	N/A	The Reliability Coordinator with an established IROL, or the Reliability Coordinator impacted by a neighboring Reliability Coordinator IROL, did not provide Transmission Owners or Generation Owners within its Reliability Coordinator Area a list of Facilities owned by that entity that are critical to the derivation of the IROL.

NERC Board (Board) adoption	May 2018

A. Introduction

1. **Title:** Establish and Communicate System Operating Limits

2. **Number:** FAC-014-~~2~~3

3. **Purpose:** To ensure that System Operating Limits (SOLs) used in the reliable ~~planning and~~ operation of the Bulk Electric System (BES) are determined based on an established methodology or methodologies.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1. Reliability Coordinator

   ~~1.1. Planning Authority~~

   ~~1.2. Transmission Planner~~

   4.1.2. Transmission Operator

~~2. **Effective Date:** April 29, 2009~~

5. **Effective Date:** See Implementation Plan for Project 2015-09.

B. Requirements and Measures

~~The~~

R1. Each Reliability Coordinator shall ~~ensure that SOLs, including~~ establish Interconnection Reliability Operating Limits (IROLs~~),~~) for its Reliability Coordinator Area ~~are~~in accordance with its System Operating Limit Methodology (SOL Methodology). *[Violation Risk Factor: High] [Time Horizon: Operations Planning]*

M1. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation to demonstrate that the Reliability Coordinator established ~~and that the SOLs (including Interconnection Reliability Operating Limits) are consistent~~IROLs in accordance with ~~its~~it SOL Methodology.

R2. ~~The~~Each Transmission Operator shall establish ~~SOLs (as directed by its Reliability Coordinator~~System Operating Limits (SOLs) for its portion of the Reliability Coordinator Area ~~that are consistent~~in accordance with its Reliability Coordinator's SOL Methodology. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

M2. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation to demonstrate that the Transmission Operator established SOLs in accordance with its Reliability Coordinator's SOL Methodology.

~~**R1.**~~**R3.** The ~~Planning Authority~~Transmission Operator shall ~~establish SOLs, including IROLs, for~~provide its ~~Planning Authority Area that are consistent~~SOLs to its Reliability Coordinator in accordance with its Reliability Coordinator's SOL Methodology. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Same-day Operations, Real-Time Operations]*

M3. ~~The Transmission Planner shall establish SOLs, including IROLs, for its~~Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation to demonstrate that the Transmission ~~Planning Area that are consistent~~Operator provided its SOLs in accordance with its ~~Planning Authority's~~Reliability Coordinator's SOL Methodology.

~~**R1.** The Reliability Coordinator, Planning Authority, and Transmission Planner shall each provide its SOLs and IROLs to those entities that have a reliability-related need for those limits and provide a written request that includes a schedule for delivery of those limits as follows:~~

R4. ~~The~~Each Reliability Coordinator shall ~~provide its SOLs~~establish stability limits to be used in operations when the limit impacts more than one Transmission Operator in its Reliability Coordinator Area in accordance with its SOL Methodology. *[Violation Risk Factor: High] [Time Horizon: Operations Planning]*

M4. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation to demonstrate that the Reliability Coordinator established stability limits in accordance with Requirement R4.

R5. Each Reliability Coordinator shall provide: *[Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-day Operations, Real-Time Operations]*

5.1. Each Planning Coordinator within its Reliability Coordinator Area, SOLs for its Reliability Coordinator Area (including the subset of SOLs that are IROLs) ~~to adjacent Reliability Coordinators and Reliability Coordinators who indicate a reliability-related need for those limits, and to the Transmission Operators, Transmission Planners, Transmission Service Providers and~~ at least once every twelve calendar months.

~~1.1.~~5.2. Each impacted Planning ~~Authorities~~Coordinator within its Reliability Coordinator Area~~. For~~, the following information for each established stability limit and each established IROL~~, the Reliability Coordinator shall provide the following supporting information~~ at least once every twelve calendar months:

5.2.1. The value of the stability limit or IROL;

~~1.1.1.~~5.2.2. Identification ~~and status~~ of the ~~associated Facility (or group of~~ Facilities~~)~~ that ~~is (~~are~~)~~ critical to the derivation of the stability limit or IROL~~.~~;

~~1.1.2.~~5.2.3. The ~~value of the IROL and its~~ associated IROL T_V~~.~~ for any IROL;

~~1.1.3.~~5.2.4. The associated Contingency(ies~~).~~); and

~~1.1.4.~~5.2.5. The type of limitation represented by the stability limit or IROL (*e.g.*, voltage collapse, angular stability).

5.3. ~~The~~Each impacted Transmission Operator ~~shall provide any SOLs it developed~~within its Reliability Coordinator Area, the value of the stability limits established pursuant to ~~its Reliability Coordinator~~Requirement R4 and each IROL established pursuant to Requirement R1, in an agreed upon time frame necessary for inclusion in the Transmission ~~Service Providers that share its portion of the~~ Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.

~~1.2.~~5.4. Each impacted Transmission Operator within its Reliability Coordinator Area, the information identified in Requirement R5 Parts 5.2.2 – 5.2.5 for each established stability limit or each IROL, and any updates to that information within an agreed upon time frame necessary for inclusion in the Transmission Operator's Operational Planning Analyses.

~~**R1.1.** The Planning Authority shall provide its SOLs (including the subset of SOLs that are IROLs) to adjacent Planning Authorities, and to Transmission Planners, Transmission Service Providers, Transmission Operators and Reliability Coordinators that work within its Planning Authority Area.~~

~~**R1.2.** The Transmission Planner shall provide its SOLs (including the subset of SOLs that are IROLs) to its Planning Authority, Reliability Coordinators, Transmission Operators, and Transmission Service Providers that work within its Transmission Planning Area and to adjacent Transmission Planners.~~

~~**R2.** The Planning Authority shall identify the subset of multiple contingencies (if any), from Reliability Standard TPL-003 which result in stability limits.~~

~~**R2.1.** The Planning Authority shall provide this list of multiple contingencies and the associated stability limits to the Reliability Coordinators that monitor the facilities associated with these contingencies and limits.~~

~~**R2.2.** If the Planning Authority does not identify any stability-related multiple contingencies, the Planning Authority shall so notify the~~ Each requesting Transmission Operator within its Reliability Coordinator~~.~~

~~A. Measures~~

5.5. ~~The~~ Area, requested SOL information for its Reliability Coordinator~~, Planning Authority, Transmission Operator, and Transmission Planner shall each be able~~ Area, on a mutually agreed upon schedule.

~~**M4.**~~ Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation to demonstrate that ~~it developed its SOLs (including the subset of SOLs that are IROLs) consistent with the applicable SOL Methodology in accordance with Requirements 1 through 4.~~

~~**M5.** The~~ the Reliability Coordinator~~, Planning Authority, Transmission Operator, and Transmission Planner shall each have evidence that its SOLs (including the subset of SOLs that are IROLs) were supplied in accordance with schedules supplied by the requestors of such SOLs as specified in Requirement 5.~~

~~**M6.**~~**M5.** ~~The Planning Authority shall have evidence it identified a list of multiple contingencies (if any) and their associated stability limits and~~ provided the ~~list and the limits to its Reliability Coordinators~~information in accordance with Requirement ~~6~~R5.

R6. Each Reliability Coordinator that is impacted by an IROL shall provide Transmission Owners and Generation Owners within its Reliability Coordinator Area a list of Facilities owned by that entity that are critical to the derivation of the IROL. *[Violation Risk Factor: High] [Time Horizon: Operations Planning]*

M6. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation to demonstrate that the Reliability Coordinator provided the list of Facilities in accordance with Requirement R6.

C. Compliance

1. Compliance Monitoring Process

~~**2.1. Compliance Monitoring Responsibility**~~

~~Regional Reliability Organization~~

~~**2.2. Compliance Monitoring Period and Reset Time Frame**~~

~~The Reliability Coordinator, Planning Authority, Transmission Operator, and Transmission Planner shall each verify compliance through self-certification submitted to its Compliance Monitor annually. The Compliance Monitor may conduct a targeted audit once in each calendar year (January – December) and an investigation upon a complaint to assess performance.~~

~~The Performance-Reset Period shall be twelve months from the last finding of non-compliance.~~

~~**2.3. Data Retention**~~

~~The Reliability Coordinator, Planning Authority, Transmission Operator, and Transmission Planner shall each keep documentation for 12 months. In addition, entities found non-compliant shall keep information related to non-compliance until found compliant.~~

~~The Compliance Monitor shall keep the last audit and all subsequent compliance records.~~

~~**2.4. Additional Compliance Information**~~

~~The Reliability Coordinator, Planning Authority, Transmission Operator, and Transmission Planner shall each make the following available for inspection during a targeted audit by the Compliance Monitor or within 15 business days of a request as part of an investigation upon complaint:~~

~~**2.4.1** SOL Methodology(ies)~~

~~**2.4.2** SOLs, including the subset of SOLs that are IROLs and the IROLs supporting information~~

~~**2.4.3** Evidence that SOLs were distributed~~

~~**2.4.4** Evidence that a list of stability-related multiple contingencies and their associated limits were distributed~~

~~**2.4.5** Distribution schedules provided by entities that requested SOLs~~

1.1. Compliance Enforcement Authority:

"Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention:

The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- The Reliability Coordinator or Transmission Operator shall keep data or evidence of Requirements R1 through R6 for the current year plus the previous 12 calendar months.

1.3. Compliance Monitoring and Enforcement Program

As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels~~:~~

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	~~There are SOLs, for the Reliability Coordinator Area, but from 1% up to but less than 25% of these SOLs are inconsistent with the Reliability Coordinator's SOL Methodology. (R1)~~N/A	~~There are SOLs, for the Reliability Coordinator Area, but 25% or more, but less than 50% of these SOLs are inconsistent with the Reliability Coordinator's SOL Methodology. A. Introduction

1. **Title:** Coordination of Planning Assessments with the Reliability Coordinator's SOL Methodology

2. **Number:** FAC-015-1

3. **Purpose:** To ensure the Facility Ratings, System steady-state voltage limits, and stability criteria used in Planning Assessments are coordinated with the Reliability Coordinator's System Operating Limits (SOL) Methodology.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1. Planning Coordinator

   4.1.2. Transmission Planner

5. **Effective Date:** See Implementation Plan for Project 2015-09.

B. Requirements and Measures

R1. Each Planning Coordinator, when developing its steady-state modeling data requirements, shall implement a process to ensure that Facility Ratings used in its Planning Assessment of the Near-Term Transmission Planning Horizon are equally limiting or more limiting than those established in accordance with its Reliability Coordinator's SOL Methodology. If the Planning Coordinator uses less limiting Facility Ratings than the Facility Ratings established in accordance with its Reliability Coordinator's SOL Methodology, the Planning Coordinator shall provide a technical justification to its Reliability Coordinator. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M1. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation demonstrating the Planning Coordinator implemented its process in accordance with Requirement R1.

R2. Each Planning Coordinator shall implement a process to ensure that System steady state voltage limits used in its Planning Assessment of the Near-Term Transmission Planning Horizon are equally limiting or more limiting than the System Voltage Limits established in accordance with its Reliability Coordinator's SOL Methodology. If the Planning Coordinator uses less limiting System steady-state voltage limits than the System Voltage Limits established in accordance with its Reliability Coordinator's SOL Methodology, the Planning Coordinator shall provide a technical justification to its Reliability Coordinator. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M2. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation demonstrating the Planning Coordinator implemented its process in accordance with Requirement R2.

R3. Each Planning Coordinator shall implement a process to ensure the stability performance criteria used in its Planning Assessment of the Near-Term Transmission Planning Horizon are equally limiting or more limiting than the stability performance criteria established in its Reliability Coordinator's SOL Methodology. If the Planning Coordinator uses less limiting stability performance criteria than the stability performance criteria specified in its Reliability Coordinator's SOL Methodology, the Planning Coordinator shall provide a technical justification to its Reliability Coordinator. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M3. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation demonstrating the Planning Coordinator implemented its process in accordance with Requirement R3.

R4. Each Planning Coordinator shall provide the Facility Ratings, System steady-state voltage limits, and stability performance criteria for use in its Planning Assessment to its Transmission Planners and to requesting Planning Coordinator's. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M4. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation demonstrating the Planning Coordinator provided its information in accordance with Requirement R4.

R5. Each Transmission Planner shall use Facility Ratings, System steady-state voltage limits, and stability performance criteria in its Planning Assessment that are equally limiting or more limiting than the Facility Ratings, System steady-state voltage limits, and stability criteria provided by its Planning Coordinator. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

M5. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation demonstrating the Transmission Planner used the information provided by its Planning Coordinator in accordance with Requirement R5.

R6. Each Planning Coordinator shall communicate any instability, Cascading or uncontrolled separation identified in either its Planning Assessment of the Near-Term Transmission Planning Horizon or its Transfer Capability assessment to each impacted Reliability Coordinator and Transmission Operator. This communication shall include: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

6.1 The type of instability identified (e.g., voltage collapse, angular instability, transient voltage dip criteria violation);

6.2 The associated stability criteria used as part of determining the instability;

6.3 The associated Contingency(ies) which result(s) in the instability, Cascading or uncontrolled separation;

6.4 Any Remedial Action Scheme action, undervoltage load shedding (UVLS) action, underfrequency load shedding (UFLS) action, interruption of Firm Transmission

Service, or Non-Consequential Load Loss required to address the instability, Cascading or uncontrolled separation; and

6.5 Any Corrective Action Plan associated with the instability, Cascading or uncontrolled separation.

M6. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation demonstrating the Planning Coordinator communicated the information in accordance with Requirement R6.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:
"Compliance Enforcement Authority" means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention:
The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- The Planning Coordinator and Transmission Planner shall keep evidence for Requirements R1 through R6 for the most current year plus the previous three years.

1.3. Compliance Monitoring and Enforcement Program
As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	N/A	The Planning Coordinator used less limiting Facility Ratings than the Facility Ratings established in accordance with its Reliability Coordinator's SOL Methodology, but did not provide its documented technical justification to its Reliability Coordinator.	The Planning Coordinator used less limiting Facility Ratings than the Facility Ratings established in accordance with its Reliability Coordinator's SOL Methodology, but did not document the technical justification.	The Planning Coordinator failed to implement a process to ensure that Facility Ratings used in Planning Assessment are equally limiting or more limiting than those established in its Reliability Coordinator's SOL Methodology.
R2.	N/A	The Planning Coordinator used less limiting System steady-state voltage limits than the System Voltage Limits established in accordance with its Reliability Coordinator's SOL Methodology, but did not provide its documented technical justification to its Reliability Coordinator.	The Planning Coordinator used less limiting System steady-state voltage limits than the System Voltage Limits established in accordance with its Reliability Coordinator's SOL Methodology, but did not document the technical justification. Proposed Definition of "System Voltage Limit"

Term: "System Voltage Limit"

Definition:

The maximum and minimum steady-state voltage limits (both normal and emergency) that provide for acceptable System performance.

Rationale

As noted above, the Project 2015-09 standard drafting team (SDT) also proposes to add the term System Voltage Limit to the NERC Glossary with the following definition:

> *The maximum and minimum steady-state voltage limits (both normal and emergency) that provide for acceptable System performance.*

The SDT identified a need to develop a NERC Glossary definition for the term System Voltage Limit to address confusion within industry as to what constitutes a system voltage limit. As part of its informal comment period on initial drafts of FAC-011-4 and FAC-014-3 (July 14- August 12, 2016), the SDT requested industry comment on whether there is a need to clarify what constitutes system voltage limits through a defined term in the NERC Glossary. The SDT proposed the following definition: "The maximum and minimum steady-state voltages (both Normal and Emergency) that provide for reliable system operations."

The vast majority of commenters indicated support for developing a definition for System Voltage Limits but noted a few concerns with the proposed definition. In response to those comments, the SDT made the following revisions:

- The word "limits" was added to clarify that it is a numeric value.
- The terms "Normal" and "Emergency" were changed to lower case as "Normal" is not defined in the NERC Glossary, and the SDT concluded that the NERC defined term "Emergency" was not appropriate.
- The phrase "reliable system operations" was replaced with "acceptable System performance" because the SDT determined that this language was more reflective of the desired intent behind the definition.
- The SDT used the NERC Glossary term "System" as the definition implies that System Voltage Limits should result in acceptable performance (from a voltage perspective) of the overall System.

The proposed System Voltage Limit definition does not specify whether the Transmission Operator would be required to provide a "System Voltage Limit" for each bus on its system, or if the Transmission Operator would need to provide a single high and low limit that is applicable to its entire system. The SDT intends for the Reliability Coordinator's System Operating Limits (SOL) Methodology to dictate the manner in which

System Voltage Limits should be established. The proposed definition allows Reliability Coordinators to have such flexibility, provided the requirements in proposed FAC-011-4 are met.

Additionally, the System Voltage Limit definition allows for differing time components that may be associated with short term or dynamic ratings. The SDT's intent is to allow the flexibility to establish System Voltage Limits consistent with the Reliability Coordinator's SOL Methodology, provided the requirements in proposed FAC-011-4 are met. The proposed definition specifies that System Voltage Limits must include normal and emergency maximum and minimum limits, and that these limits provide for acceptable System performance (in the context of voltage performance). According to the definition, it is acceptable for a Reliability Coordinator's SOL Methodology to allow for System Voltage Limits to include a normal limit and multiple emergency limits, which may have associated time values similar to the way emergency Facility Ratings are associated with time values. As discussed below, this concept is supported by the proposed definition of SOL Exceedance which states, in relevant par: "Bus voltage is outside the highest or lowest emergency System Voltage Limit, or outside a System Voltage Limit for which there is not sufficient time to bring the bus voltage to defined levels should the Contingency occur

Lastly, the proposed definition of System Voltage Limit does not explicitly distinguish between a voltage limit and a voltage rating. That is because proposed FAC-011-4 requires that System Voltage Limits respect equipment voltage ratings.

Potential Standards for Use of New Term: "System Voltage Limit"

These standard(s) were identified as potential areas that may benefit from the use of the new term. The SDT is in the process of evaluating these standards with respect to incorporating the definition.

- FAC-003-4 Transmission Vegetation Management
- MOD-001-2 Available Transmission System Capability
- PRC-012-2 Remedial Action Schemes
- TPL-001-4 Transmission System Planning Performance Requirements
- TPL-007-1 Transmission System Planned Performance for Geomagnetic Disturbance Events
- VAR-001-4.1 Voltage and Reactive Control

Implementation Plan

Project 2015-09 Establish and Communicate System Operating Limits

Applicable Standard(s)

- Definition of System Voltage Limit (SVL) in the Glossary of Terms Used in NERC Reliability Standards ("NERC Glossary")
- FAC-011-4 System Operating Limits Methodology for the Operations Horizon
- FAC-014-3 Establish and Communicate System Operating Limits
- FAC-015-1 Coordination of Planning Assessments with the Reliability Coordinator's SOL Methodology

Requested Retirement(s)

- FAC-010-3 System Operating Limits Methodology for the Planning Horizon
- FAC-011-3 System Operating Limits Methodology for the Operations Horizon
- FAC-014-2 Establish and Communicate System Operating Limits

[*New/Modified/Retired*] Terms in the NERC Glossary of Terms

Proposed New Definition(s):
System Voltage Limit: The maximum and minimum steady-state voltage limits (both normal and emergency) that provide for acceptable System performance.

Applicable Entities

- Reliability Coordinator
- Planning Coordinator
- Transmission Planner
- Transmission Operator

Effective Date

The effective date for proposed Reliability Standards FAC-011-4, FAC-014-3, and FAC-015-1 and the NERC Glossary term "System Voltage Limit" is provided below:

Where approval by an applicable governmental authority is required, Reliability Standards FAC-011-4, FAC-014-3, and FAC-015-1 and the NERC Glossary term "System Voltage Limit" shall become effective the first day of the first calendar quarter that is twelve (12) calendar months after the effective date of the applicable governmental authority's order approving the standards and term, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, Reliability Standards FAC-011-4, FAC-014-3, and FAC-015-1 and the NERC Glossary term "System Voltage Limit" shall become effective on the first day of the first calendar quarter that is twelve (12) calendar months after the date the standards and term are adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Retirement Date

Currently-Effective NERC Reliability Standards

Reliability Standards FAC-010-3, FAC-011-3, and FAC-014-2 shall be retired immediately prior to the effective date of the proposed Reliability Standards FAC-011-4, FAC-014-3, and FAC-015-1.

Initial Performance of Periodic Requirements

FAC-014-3 Requirement R5, Parts 5.1 and 5.2

The initial performance of FAC-014-3, Requirement R5, Parts 5.1 and 5.2 must be within 12 calendar months of the effective date of FAC-014-3.

Project 2015-09 Establish and Communicate System Operating Limits

Do not use this form for submitting comments. Use the electronic form to submit comments on the **Project 2015-09 Establish and Communicate System Operating Limits** project. The electronic form must be submitted by **8 p.m. Eastern, Monday, November 13, 2017**.

Documents and information about this project are available on the project page. If you have questions, contact either Senior Standards Developer, Darrel Richardson at (609) 613-1848 or Al McMeekin at (404) 446-9675.

Preface

The Reliability Standards that address System Operating Limits (SOLs) – FAC-010, FAC-011, and FAC-014 have remained essentially unchanged since their initial versions. Since that time, many improvements have been made to the body of Reliability Standards, specifically those in the TPL, TOP, and IRO families of standards. The former TPL-001, -002, -003, and -004 Reliability Standards have been replaced with TPL-001-4, all of the TOP standards were replaced with the currently effective TOP-001, TOP-002, and TOP-003, and several IRO standards have been replaced as well. One of the primary objectives of Project 2015-09 is to make changes to the FAC standards to create better alignment with the currently effective TPL, TOP, and IRO standards and the revised definitions of Operational Planning Analysis (OPA) and Real-time Assessments (RTA).

Please provide your responses to the questions listed below along with any detailed comments.

FAC-010-3 System Operating Limits Methodology for the Planning Horizon

Background Information

In 2015, the FAC Standard Periodic Review Team (PRT) completed a review of the FAC-010-3, FAC-011-3, and FAC-014-2 Reliability Standards. The review focused on reconciling these three standards with new and revised TPL, TOP and IRO standards that did not exist at the time that the three FAC standards were drafted and approved. Regarding FAC-010-3, the PRT concluded that the requirements in FAC-010-3, which specify the development of an SOL methodology for the planning horizon, are not necessary inputs to the Bulk-Electric System (BES) planning process.

In May of 2015, the PRT posted a preliminary recommendation to retire FAC-010-3. Industry comments on this recommendation indicated a general agreement with the PRT position.

NERC Project 2015-09 was initiated later in 2015 to address all PRT recommendations through the formation of a standard drafting team (SDT). The SDT further concluded that the requirements in FAC-010-3 are redundant with TPL-001-4 and no longer provide a necessary reliability function. Furthermore, the SOL Methodology for the planning horizon does not serve a purpose within the operations horizon. Therefore, the SDT proposes the retirement of FAC-010-3 in its entirety.

In addition to the proposed retirement of FAC-010-3, the SDT proposal for a new FAC-015-1 Reliability Standard, along with the proposed revisions contained in FAC-011-4 and FAC-014-3, represent an improvement for planning and operations to better coordinate analysis input assumptions and System performance criteria to address the reliability issues that are ultimately faced in Real-time operations. This proposed construct does not make use of an SOL Methodology applicable to the planning horizon as required to the currently effective FAC-010-3 due to its overall redundancy with TPL-001-4.

Questions

1. The SDT is recommending retirement of FAC-010-3 and has provided justification in the “FAC-010/FAC-015 Rationale” and “FAC-010-3 Mapping Document.” Do you agree that the proposed retirement of FAC-010-3 does not create a reliability gap? Please provide supporting rationale.

   ☐ Yes
   ☐ No

   Comments:

FAC-011-4 System Operating Limits Methodology for the Operations Horizon

Background Information

The SDT contends that the requirements in FAC-011-4 improve clarity, reduce redundancy, and create better alignment and continuity with the currently-effective TOP and IRO standards. One of the primary changes in FAC-011-4 is seen in the focus on the establishment of Facility Ratings (FAC-011-4 Requirement R2), System Voltage Limits (FAC-011-4 Requirement R3), and stability limits (FAC-011-4 Requirement R4). The other requirements in FAC-011-4 do not represent a significant departure from the currently-effective FAC-011-3. The SDT's intent is that the Facility Ratings, the System Voltage Limits, the stability limits, and the IROLs that are used in operations are those that are established in accordance with the proposed FAC-011-4, and are those that are monitored and assessed through OPAs and RTAs to ultimately determine whether the System is performing reliably.

Currently effective FAC-011-3 Requirement R2 requires that the "Reliability Coordinator's SOL Methodology shall include a requirement that SOLs provide BES performance consistent with the following…" Sub requirements R2.1 and R2.2 proceed to describe the BES performance that is required for the pre-Contingency state (R2.1) and for the post-Contingency state for single Contingencies (R2.2). The mapping document for Requirement R2 and its sub requirements describes the SDT's assertion that "BES performance" as stated in FAC-011-3, Requirement R2, R2.1 and R2.2 is not determined through SOLs in and of themselves, rather, that "BES performance" is determined through OPAs and RTAs, where SOLs are an input to the OPAs and RTAs. This is a similar construct to the TPL-001-4 wherein Facility Ratings, voltage criteria, and stability criteria are inputs to the Planning Assessment.

Stability limits that are used in OPAs and RTAs are established by developing stability performance criteria and then running studies to determine stability limits that result in System performance within the criteria. These stability limits can be established prior to OPAs and RTAs, or they can be established as part of OPAs and RTAs. The timing of the establishment of stability limits is not as important as the accuracy and applicability of the stability limits. On the other hand, Facility Ratings and System Voltage Limits are direct inputs into the OPAs and RTAs and do not require a "study" such as an OPA or an RTA to establish them. For example, "BES performance" for Facility Ratings is determined through OPAs and RTAs which assess the flow on Facilities in the pre- and post-Contingency states. When unacceptable "BES performance" is identified in an OPA, Transmission Operators (TOPs) and Reliability Coordinators (RCs) are required by the Reliability Standard to develop an Operating Plan to address that unacceptable "BES performance". Similarly, when unacceptable "BES Performance" is identified in the RTA, TOPs and RCs are required to implement an Operating Plan to address the unacceptable "BES performance." In accordance with the NERC SOL Whitepaper (and the proposed definition of SOL Exceedance), unacceptable "BES performance" for either the pre-Contingency state or the post-Contingency state translates to SOL exceedance, which serves to prompt the development (for OPAs) or implementation (for RTAs) of Operating Plans. This is a similar construct to the TPL-001-4 whereby unacceptable system performance prompts the development and implementation of a Corrective Action Plan in the Planning Assessment.

The definitions of OPA and RTA include the analyses of the pre- and post-Contingency states, and include language that addresses the expected conditions (OPA) and actual conditions (RTA) such as Facility outages, load, and generation dispatch. OPAs and RTAs are the assessments for System performance and require the development of Operating Plans (for OPAs) and implementation of Operating Plans (for RTAs) to address any potential (for OPAs) or actual (for RTAs) SOL exceedances identified in the OPA or RTA. As such, the drafting team did not carry forward into FAC-011-4the concepts of FAC-011-3, Requirement R2, R2.1 and R2.2 pertaining to BES performance. The following part of R2.1 “In the determination of SOLs, the BES condition used shall reflect current or expected system conditions and shall reflect changes to system topology such as Facility outages.” has been retained in FAC-011-4, Requirement R4 Part 4.4 for stability limits which may be “determined” or “calculated” prior to the OPA and RTA. The FAC-011-3 mapping document provides a more detailed justification for not carrying Requirement R2, R2.1 and R2.2 forward in its current form.

FAC-011-3, Requirement R2, R2.3 describes an acceptable System response to single Contingencies. Requirement R2, R2.4 contains the statement, “To prepare for the next Contingency, system adjustments may be made, including changes to generation, uses of the transmission system, and the transmission system topology.” Again, these sub requirements of Requirement R2 address the establishment of SOLs that “provide a certain level of BES performance”. Requirement R2, R2.3 and R2.4 were originally written to be congruous with concepts in the TPL standards that existed at that time. Today, these concepts are found in Table 1 of TPL-001-4. The TPL standards have been improved over the last several years, so the language in FAC-011-3 Requirement R2 does not correlate one-to-one with the various items in Table 1 of TPL-001-4:

<table>
<tr><th>FAC-011-3 Requirements</th><th>Corresponding Items in TPL-001-4 Table 1</th></tr>
<tr><td>R2.3.1. Planned or controlled interruption of electric supply to radial customers or some local network customers connected to or supplied by the Faulted Facility or by the affected area.</td><td rowspan="4">1. Items “b, c, and e” under the Steady State & Stability section:
b. Consequential Load Loss as well as generation loss is acceptable as a consequence of any event excluding P0.
c. Simulate the removal of all elements that Protection Systems and other controls are expected to automatically disconnect for each event.
e. Planned System adjustments such as Transmission configuration changes and re-dispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings.</td></tr>
<tr><td>R2.3.2. Interruption of other network customers, (a) only if the system has already been adjusted, or is being adjusted, following at least one prior outage, or
(b) if the real-time operating conditions are more adverse than anticipated in the corresponding studies</td></tr>
<tr><td>R2.3.3. System reconfiguration through manual or automatic control or protection actions.</td></tr>
<tr><td>R2.4. To prepare for the next Contingency, system adjustments may be made, including changes to generation, uses of the transmission system, and the transmission system topology.</td></tr>
</table>

	2. The far right column in Table 1 addresses the allowance of Non-Consequential Load Loss for various Contingency events. For P1 events, Non-Consequential Load Loss is not allowed; however, there is a footnote 12 caveat noted. (See below) 3. For P3 and P6 events (two consecutive single Contingencies with system adjustments between the first -1 event and the second -1 event), Non-Consequential Load Loss is allowed; however, there is a footnote 9 caveat noted (See below)

Footnote 9 – An objective of the planning process should be to minimize the likelihood and magnitude of interruption of Firm Transmission Service following Contingency events. Curtailment of Firm Transmission Service is allowed both as a System adjustment (as identified in the column entitled 'Initial Condition') and a corrective action when achieved through the appropriate re-dispatch of resources obligated to re-dispatch, where it can be demonstrated that Facilities, internal and external to the Transmission Planner's planning region, remain within applicable Facility Ratings and the re-dispatch does not result in any Non- Consequential Load Loss. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources should be considered.

Footnote 12 – An objective of the planning process is to minimize the likelihood and magnitude of Non-Consequential Load Loss following planning events. In limited circumstances, Non-Consequential Load Loss may be needed throughout the planning horizon to ensure that BES performance requirements are met. However, when Non-Consequential Load Loss is utilized under footnote 12 within the Near-Term Transmission Planning Horizon to address BES performance requirements, such interruption is limited to circumstances where the Non-Consequential Load Loss meets the conditions shown in Attachment 1. In no case can the planned Non-Consequential Load Loss under footnote 12 exceed 75 MW for US registered entities. The amount of planned Non-Consequential Load Loss for a non-US Registered Entity should be implemented in a manner that is consistent with, or under the direction of, the applicable governmental authority or its agency in the non-US jurisdiction.

Automatic control actions relevant to the establishment of stability limits are addressed in FAC-011-4, Requirement R4, Part 4.6 which requires the SOL Methodology to describe the allowed uses of Remedial Action Schemes (RAS) and other automatic post-Contingency mitigation actions as part of stability limit establishment. Accordingly, any RAS or automatic mitigation scheme (which includes those that interrupt customers or reconfigure the System) are required to be reflected in the establishment of stability limits.

However, insofar as FAC-011-3, Requirement R2, R2.3 and R2.4 correlate to "how the system is supposed to be operated", the operational decisions related to customer interruption and System reconfiguration are governed by the Operating Plan. The SDT contends that TOPs need to have the flexibility in their Operating Plan(s) to address the wide-ranging operational issues they may encounter, including the interruption of other network customers if the RTA identifies unacceptable System performance. This may be necessary to return the System to an acceptable state of pre and post-Contingency System performance for subsequent RTAs (i.e., N-1 secure state) after a Contingency event occurs. In the SDT's opinion, FAC-011-3, Requirement R2, R2.3.1 would be better addressed by a reliability guideline regarding Consequential Load Loss; however, the SDT notes that recent clarifications to the definition of Bulk Electric System (BES) excluded the Facilities described in Requirement R2, R2.3.1. As such it would be counter-intuitive and confusing to reference such Facilities in a NERC reliability guideline. FAC-011-3, Requirement R2, R2.3.2 (b) has become obsolete since the 30-minute RTA requirements in the IRO and TOP standards have become effective. Since the RTA is conducted at least once every 30 minutes and requires implementation of an Operating Plan for unacceptable system performance, the Real-time conditions will not be "more adverse than anticipated in the corresponding studies". Accordingly, the SDT sees no need for retaining these requirements which may restrict how TOPs are allowed to operate the System (e.g. interruption of customers/load). Such guidance is better suited for a reliability guideline on Operating Plans rather than a NERC Reliability Standard.

Questions

2. Given the background discussion and the justification provided in the mapping document for FAC-011-3, Requirement R2, R2.1 and R2.2, do you agree that BES performance is adequately covered and that no reliability gaps are introduced from the removal of those concepts in a revised FAC-011-4? If not, please explain specifically what aspects of the removal you disagree with and propose alternative language.

   ☐ Yes
   ☐ No

   Comments:

3. Given the background discussion and the justification provided in the mapping document for FAC-011-3, Requirement R2, R2.3 and R2.4, do you agree that BES performance is adequately covered and that no reliability gaps are introduced from the removal of those concepts in a revised FAC-011-4? If not, please explain specifically what aspects of the removal you disagree with and propose alternative language.

   ☐ Yes
   ☐ No

   Comments:

4. Are there any reliability objectives of FAC-011-3, Requirement R2, R2.3 and R2.4 that you maintain need to be preserved in requirements relating to the development of Operating Plans which would reside outside the FAC family of standards? Please explain your response.

   ☐ Yes
   ☐ No

   Comments:

5. In the Final Report on the August 14, 2003 Blackout in the United States and Canada: Causes and Recommendations, the Federal Energy Regulatory Commission (FERC) classified underfrequency load-shedding schemes (UFLS) as a “safety net” and stated that UFLS should not be a tool used by Bulk Electric System operators in the derivation of stability limits. In Order 763, FERC asserted that UFLS “provide last resort system preservation measures.” The SDT agrees with the FERC, and has footnoted Requirement R4, Part 4.6 of proposed FAC-011-4 to state:

   “The planned use of underfrequency load-shedding (UFLS) is not allowed in the establishment of stability limits.”

   With regard to undervoltage load-shedding schemes (UVLS), FERC states in Order 818 (Order) that they are “[not] persuaded by [the] argument that UVLS programs should be considered in operations planning and real-time operations. We understand that [the argument] refers to the consideration of UVLS programs in the derivation of Interconnection Reliability Operating Limits (IROLs) for Category B contingencies as defined in the currently-effective transmission planning standard TPL-002-0b (commonly known as N-1 contingencies under normal system operation).” With this understanding, we disagree […] on the relevance of using UVLS in the derivation of IROLs for N-1 contingencies. The 2003 Canada-United States Blackout Report stated that “[s]afety nets should not be relied upon to establish transfer limits.” This statement is consistent with the performance criteria established in TPL-002-0b and TPL-001-4, which generally prohibit the loss of non-consequential load for certain N-1 Contingencies. We conclude that UVLS programs under PRC-010-1 are examples of such “safety nets” and should not be tools used by bulk electric system operators to calculate operating limits for N-1 contingencies.”

   While the Order clearly addresses the prohibition of using UVLS for calculating SOLs for single (N-1) Contingencies, the Order does not address the use of UVLS for calculating SOLs for Contingencies more severe than single (N-1) Contingencies, for example for N-1-1 operations scenarios or for N-2 Contingencies such as breaker failure Contingencies or common tower Contingencies that may be deemed credible for operations. For this reason, the proposed FAC-011-4, Requirement R4, Part 4.6

does not specifically address the use of UVLS, but allows the RC to describe its allowed use as an "other automatic post-Contingency mitigation action" within its SOL Methodology.

Do you agree that the SDT should allow the use of UVLS in the establishment of stability limits? If not, please explain and provide alternative language.

☐ Yes
☐ No

Comments:

FAC-014-3 Establish and Communicate System Operating Limits

Background Information

FAC-014-2 provides the requirements for the establishment and communication of SOLs by operating and planning entities. The requirements in this standard prescribe the responsibilities for establishing SOLs and list the defined set of entities which receive the established SOLs and other related information. This standard works with FAC-010-3 and FAC-011-3 in a coordinated effort to establish and distribute SOL information.

Given the SDT proposal to retire FAC-010-3 and to adopt FAC-015-1 (whitepaper), there is no longer a need for planning entities (Planning Authorities and Transmission Planners) to establish and distribute SOLs. As a result, the SDT proposes revising the function of FAC-014 in revision three to provide the requirements necessary for operating entities to establish SOLs and to disburse their SOLs, and other related information, to a defined set of entities. With removing the need for planning entities to have an SOL methodology and to establish and communicate SOLs, Requirements R2, R3 and R4 from FAC-014-2 are removed in the SDT's proposed FAC-014-3. Also, Requirement R6, and subparts 6.1 and 6.2, are augmented and included in the SDT's proposed FAC-015-1, Requirement R6. The remaining operations related requirements in FAC-014-2 were kept or altered for improvement in the SDT's proposed FAC-014-3 revision. Questions related to the removal of Requirements R2, R3, and R4 from FAC-014-2 are not included in this comment form. Rather, they are included in the comment forms related to the retirement of FAC-010-3 and the addition of FAC-015-1. Accordingly, please refrain from addressing the removal of these requirements when providing comments for FAC-014-3.

Questions

7. The SDT is proposing to divide existing Requirement R1 of FAC-014-2 into three requirements in FAC-014-3 to clearly indicate which entities have the responsibility for establishing Interconnection Reliability Operating Limits (IROLs) [the RC], System Operating Limits (SOLs) [the TOP] and stability limits that impact more than one TOP in its Reliability Coordinator Area [the RC] into proposed Requirements R1, R2, and R4, respectively. Do you agree with the proposed changes? If not, please explain.

   ☐ Yes
   ☐ No

   Comments:

8. Existing FAC-014-2, Requirement R5, R5.2 requires the Transmission Operator (TOP) to provide its SOLs to its Reliability Coordinator (RC) and Transmission Service Providers (TSPs) that share its portion of the RC Area. The SDT is proposing in Requirement R3 of FAC-014-3 to exclude the TSPs from that communication chain. Other requirements in existing standards (MOD-028-2, Requirement R7, MOD-029-2a, Requirement R4, and MOD-030-3, Requirement R2.6) require the TOP to provide the Total Transfer Capabilities (TTCs), Total Flowgate Capabilities (TFCs), along with supporting information and assumptions to TSPs. Because the TTCs and TFCs already reflect the impact(s) of any SOLs, the SDT deemed retention of the existing language unnecessary. Do you agree with the proposed change? If not, please explain.

   ☐ Yes
   ☐ No

   Comments:

9. The SDT relocated the reliability objectives of existing Requirement R6 of FAC-014-2 into Requirement R6 of proposed Reliability Standard FAC-015-1 such that all Planning Coordinator and Transmission Planner responsibilities will be housed within one standard. Do you agree with the proposed change? If not, please explain.

   ☐ Yes
   ☐ No

   Comments:

10. If you have any other comments **that you haven't already provided** in response to questions 7-9, please provide them here.

   Comments:

FAC-015-1 Coordination of Planning Assessments with the Reliability Coordinator's SOL Methodology

Background

The drafting team contends that the proposed requirements in FAC-015-1 improve coordination of limits and criteria between the planning and operating standards. The primary focus of FAC-015-1 is to coordinate limits and criteria utilized in Planning Assessments with those identified within or established in accordance with the Reliability Coordinator's SOL Methodology. FAC-015 coordinates Facility Ratings, System steady-state voltage limits, and stability performance criteria (i.e. limits and criteria) utilized in Planning Assessments with the Facility Ratings, System Voltage Limits, and stability performance criteria utilized in the operations horizon. The requirements are drafted to provide for a construct where the limits and criteria utilized in Planning Assessments are at least as limiting if not more limiting that those used in operations. Failing to have limit and criteria consistency between planning and operations might result in unacceptable System performance in the operations time horizon for the same conditions that were previously deemed acceptable when assessed in the planning horizon (i.e., planning the System less conservatively than the System is operated) This will minimize the potential for unnecessary corrective actions up to and including load shed that could result from planning the system with limits and criteria less conservative.

The SDT has specifically identified the Planning Assessment of the Near-Term Transmission Planning Horizon as the assessment that carries the requirements as these are the closest assessments before transitioning into the operations horizon. The SDT also arranged the standard such that Requirements R1 – R3 focus on Facility Ratings, System steady-state voltage limits, and stability performance criteria individually. The SDT added the statement "the Planning Coordinator shall provide a technical justification to its Reliability Coordinator" to allow for flexibility in the rare circumstances when less limiting Facility Ratings, System steady-state voltage limits, and stability performance criteria must be utilized (e.g. up-rating a line in a future project). This ensures that the RC will also be aware of these rare circumstances.

Requirement R4 requires provision of the coordinated limits and criteria by the PCs to its TPs. Requirement R5 requires the TP to use limits and criteria that are equally limiting or more limiting than the coordinated Facility Ratings, System steady-state voltage limits, and stability criteria provided by its PC.

Requirement R6 requires the PC to communicate any instability, Cascading, or uncontrolled separation identified in either its Planning Assessment of the Near-Term Transmission Planning Horizon or its Transfer Capability assessment to each impacted RC and TOP. IRO-017-1, Requirement R3 requires PCs and TPs to provide their Planning Assessments to impacted RCs. However, Requirement R2, Part 2.4 and Requirement R4 in TPL-001-4 which outline the Stability analysis portion of the Planning Assessment, do not provide for the level of detail prescribed in FAC-015-1, Requirement R6. Therefore this requirement was drafted to ensure the appropriate details regarding potential instability identified in the Stability portion of the Planning Assessment for the Near-Term Planning Horizon are provided to impacted RCs and TOPs. The information itemized in Requirement R6 is a key consideration for RCs and TOPs in the establishment of stability SOLs and IROLs.

Requirement R6 lists items that a PC is required to provide each impacted RC and TOP. This requirement serves as an enhancement of FAC-014-2, Requirement R6, and the information is intended to be used by impacted RCs and TOPs for their consideration in subsequent development of stability limits, IROLs and associated Operating Plans. Requirement R6, Part 6.4 requires the PC to communicate "any Remedial Action Scheme action, under voltage load shedding (UVLS) action, under frequency load shedding (UFLS) action, interruption of Firm Transmission Service, or Non-Consequential Load Loss required to address the instability, Cascading or uncontrolled separation." This item was included because planners are allowed to invoke these items in accordance with TPL-001-4 to meet the prescribed performance requirements. The drafting team contends it is critical that impacted RCs and TOPs are made aware when the items listed in Requirement R6, Part 6.4 have been invoked to address or avoid instability, Cascading or uncontrolled separation. Otherwise, impacted RCs and TOPs may not have any idea that such risks are present and that they are addressed through the use of the measures listed in Part 6.4. This unawareness can compromise the RC's and TOP's abilities to ensure that stability limits, IROLs, and associated Operating Plans are developed as necessary to address the risks identified by the PCs.

Questions

11. FAC-015-1 is predicated on the principle that Facility Ratings, System steady-state voltage limits, and stability criteria used in Planning Assessments for the Near-Term Transmission Planning Horizon should be more conservative/restrictive/limiting than those found in (or established in accordance with) the RC's SOL Methodology, allowing for justified exceptions. Do you agree with this principle? If not, please explain.

   ☐ Yes
   ☐ No

   Comments:

12. Do you agree that coordination of Facility Ratings, System steady state voltage limits, and stability performance criteria as required in Requirements R1-R3 should be limited to Planning Assessments of the Near-Term Transmission Planning Horizon? If yes, please provide supporting rationale; if no, please explain and provide alternative language.

   ☐ Yes
   ☐ No

   Comments:

13. In Requirements R1 – R3, the SDT is proposing to allow a PC to provide a technical justification to its RC for using less limiting Facility Ratings, System steady-state voltage limits, and stability performance criteria than those specified in its RC's SOL Methodology. Do you agree that this provides adequate flexibility (in the rare circumstances when less limiting Facility Ratings, System steady-state voltage limits, and stability performance criteria must be utilized; e.g., up-rating a line in a future project) without compromising reliability? If yes, please provide supporting rationale; if no, please explain and provide alternative language.

☐ Yes
☐ No

Comments:

14. Do you agree that the information identified in Requirement R6 is necessary for each impacted RC and TOP to properly evaluate instability, Cascading, or uncontrolled separation identified in planning assessments for use in establishing stability limits and IROLs in the operations horizon? If not, please explain and provide alternative language.

☐ Yes
☐ No

Comments:

15. Do you agree that the Planning Assessment of the Near-Term Transmission Planning Horizon and the Transfer Capability assessment, as stipulated in Requirement R6, are the appropriate assessments for identifying any instability, Cascading, or uncontrolled separation in the planning horizon? If yes, please provide supporting rationale; if no, please explain and provide alternative language.

☐ Yes
☐ No

Comments:

Definition: System Voltage Limit

Background Information

The SDT proposes to add the term "System Voltage Limit" to the NERC Glossary with the following definition:

> *The maximum and minimum steady-state voltage limits (both normal and emergency) that provide for acceptable System performance.*

The SDT modified the previously proposed definition based on feedback from the previous informal comment period: "The maximum and minimum steady-state voltages (both Normal and Emergency) that provide for reliable system operations."

The vast majority of commenters indicated support for developing a definition for System Voltage Limits but noted a few concerns with the proposed definition. In response to those comments, the SDT made the following revisions:

- The word "limits" was added to clarify that it is a numeric value.
- The terms "Normal" and "Emergency" were changed to lower case as "Normal" is not defined in the NERC Glossary, and the SDT concluded that the NERC defined term "Emergency" was not appropriate.
- The phrase "reliable system operations" was replaced with "acceptable System performance" because the SDT determined that this language was more reflective of the desired intent behind the definition.
- The SDT used the NERC Glossary term "System" as the definition implies that System Voltage Limits should result in acceptable performance (from a voltage perspective) of the overall System.

Additionally, the System Voltage Limit definition allows for differing time components that may be associated with short term or dynamic ratings. The SDT acknowledges that TPL-001-4 Requirement R5 requires criteria for "post-Contingency voltage deviations". The current proposed changes to FAC-011-4 and the proposed definition of System Voltage Limits does not specifically include "post-Contingency voltage deviations", however the SDT determined the proposed changes to the FAC standards do not prevent an entity from monitoring and operating within "post-Contingency voltage deviations" that may be more limiting than the System Voltage Limits.

According to the definition, it is acceptable for a RC's SOL Methodology to allow for System Voltage Limits to include a normal limit and multiple emergency limits, which may have associated time values similar to the way emergency Facility Ratings are associated with time values. The SDT asserts that the definition as worded allows for the term to be applied in both the operations and planning time horizons.

Questions

17. Do you agree with the proposed definition of System Voltage Limit? If not, please explain and provide alternative language.

☐ Yes
☐ No

Cost Effectiveness

Question

19. The SDT asserts the combination of proposed FAC-011-4, FAC-014-3, and FAC-015-1 provide entities with flexibility to meet the reliability objectives in the project Standards Authorization Request (SAR) in a cost effective manner. Do you agree? If you do not agree, or if you agree but have suggestions for improvement to enable additional cost effective approaches to meet the reliability objectives, please provide your recommendation and, if appropriate, technical justification.

☐ Yes
☐ No

Mapping Document for FAC-010-3

The Project 2015-09 standard drafting team (SDT) is proposing the retirement of the NERC FAC-010-3 Reliability Standard. The SDT further proposes a new paradigm regarding the coordination of the Planning Assessment (TPL-001-4) with the establishment of System Operating Limits (SOLs) used in operations. Along with the retirement of FAC-010-3, this new paradigm consists of a new FAC-015-1 Reliability Standard and revisions to the existing FAC-011-3 and FAC-014-2 Reliability Standards. The SDT proposal for a new FAC-015-1 Reliability Standard, along with the proposed revisions contained in FAC-011-4 and FAC-014-3, represent an improvement for planning and operations to better coordinate analysis input assumptions and System performance criteria to address the reliability issues that are ultimately faced in Real-time operations.

The proposed construct does not make use of an SOL Methodology applicable to the planning horizon as required by the currently-effective FAC-010-3 due to its overall redundancy with TPL-001-4. However, FAC-015-1, Requirements R1 – R3 ensure that Planning Assessments performed for the Near-Term Transmission Planning Horizon, are bounded by modeling data and performance criteria that are equally limiting or more limiting than those established in accordance with the Reliability Coordinator's (RC's) SOL Methodology. FAC-015-1, Requirements R1 – R3 respectively address Facility Ratings System steady state voltage limits, and stability performance criteria used in the development of Planning Assessments. These requirements focus on the three components of SOLs used in operations and facilitate continuity between operations and planning. Implementing the processes required in FAC-015-1 Requirements R1 – R3 provides the Planning Coordinator (PC) with Facility Ratings, System steady-state voltage limits, and stability performance criteria that are equally limiting or more limiting than the Facility Ratings, System Voltage Limits, and stability performance criteria established in accordance with the Reliability Coordinator's SOL Methodology.

FAC-015-1, Requirements R4 and R5 address the communication and use of Facility Ratings, System steady-state voltage limits, and stability performance criteria for use in Planning Assessments between PCs and Transmission Planners (TPs).

FAC-015-1, Requirement R6 requires the PC to communicate any instability, Cascading or uncontrolled separation, along with key supporting information, identified in the Planning Assessments to the RCs and to impacted Transmission Operators (TOPs). This information may be useful to RC and TOPs in the establishment of stability limits and IROLs that will ultimately be used in Real-time operations.

By implementing Requirements R1 – R6 of FAC-015, Facility Ratings, System steady-state voltage limits and stability criteria used in the development of the Planning Assessment are effectively bounded by the Facility Ratings, System Voltage Limits, and stability performance criteria define and established in accordance with the RC's SOL Methodology (FAC-011-4 & FAC-014-3). Furthermore, potentially critical stability information is communicated by planners to operators. The result is an improvement in reliability by ensuring continuity between planning and operations.

The remainder of this document provides a mapping of the existing requirements in FAC-010-3 to the proposed action by the SDT. For easier reference applicable information from Table 1 of TPL-001-4 is included below. References to notes a – j and Planning Events P0 – P7 will be included in the mapping table where appropriate.

TPL-001-4 Table 1 (steady state & stability performance criteria notes for planning events)

Steady State & Stability:

a. The System shall remain stable. Cascading and uncontrolled islanding shall not occur.
b. Consequential Load Loss as well as generation loss is acceptable as a consequence of any event excluding P0.
c. Simulate the removal of all elements that Protection Systems and other controls are expected to automatically disconnect for each event.
d. Simulate Normal Clearing unless otherwise specified.
e. Planned System adjustments such as Transmission configuration changes and re-dispatch of generation are allowed if such adjustments are executable within the time duration applicable to the Facility Ratings.

Steady State Only:

f. Applicable Facility Ratings shall not be exceeded.
g. System steady state voltages and post-Contingency voltage deviations shall be within acceptable limits as established by the Planning Coordinator and the Transmission Planner.
h. Planning event P0 is applicable to steady state only.
i. The response of voltage sensitive Load that is disconnected from the System by end-user equipment associated with an event shall not be used to meet steady state performance requirements.

Stability Only:

j. Transient voltage response shall be within acceptable limits established by the Planning Coordinator and the Transmission Planner.

Category P0 No Contingency
(Initial Condition - Normal System)

Category P1 Single Contingency
(Initial Condition - Normal System)
Loss of one of the following:
1. Generator (3 Ø fault)
2. Transmission Circuit (3 Ø fault)
3. Transformer (3 Ø fault)
4. Shunt Device (3 Ø fault)
5. Single Pole of DC line (SLG fault)

Category P2 Single Contingency
(Initial Condition - Normal System)
1. Opening of a line section w/o a fault
2. Bus Section Fault (SLG fault)
3. Internal Breaker Fault (non-Bus-tie Breaker) (SLG fault)
4. Internal Breaker Fault (Bus-tie Breaker) (SLG fault)

Category P3 Multiple Contingency
(Initial Condition - Loss of generator unit followed by System adjustments)
Loss of one of the following:
1. Generator (3 Ø fault)
2. Transmission Circuit (3 Ø fault)
3. Transformer (3 Ø fault)
4. Shunt Device (3 Ø fault)
5. Single Pole of DC line (SLG fault)

Category P4 Multiple Contingency
(Initial Condition - Normal System)
1. Generator (SLG fault)
2. Transmission Circuit (SLG fault)
3. Transformer (SLG fault)
4. Shunt Device (SLG fault)
5. Bus Section (SLG fault)
6. Loss of multiple elements caused by a stuck breaker (Bus-tie Breaker) attempting to clear a Fault on the associated bus

Category P5 Multiple Contingency
(Initial Condition - Normal System)
Delayed Fault Clearing due to the failure of a non-redundant relay protecting the Faulted element to operate as designed, for one of the following:
Generator (SLG fault)
1. Transmission Circuit (SLG fault)
2. Transformer (SLG fault)
3. Shunt Device (SLG fault)
4. Bus Section (SLG fault)

Category P6 Multiple Contingency
(Initial Condition - Loss of one of the following followed by System adjustments.
1. Transmission Circuit
2. Transformer
3. Shunt Device
4. Single Pole of DC line)

Loss of one of the following:
1. Transmission Circuit (3 Ø fault)
2. Transformer (3 Ø fault)
3. Shunt Device (3 Ø fault)
4. Single Pole of DC line (SLG fault)

Category P7 Multiple Contingency
(Initial Condition - Normal System)
The loss of:
- Any two adjacent (vertically or horizontally) circuits on common structure (SLG fault)
- Loss of a bipolar DC line (SLG fault)

Standard: FAC-010-3 — System Operating Limits Methodology for the Planning Horizon		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
R1. The Planning Authority shall have a documented SOL Methodology for use in developing SOLs within its Planning Authority Area. This SOL Methodology shall:	**FAC-010-3, Requirement R1 is addressed by:** 1. TPL-001-4, Requirements R1, R5, and R6 2. MOD-032-1, Requirement R2 3. FAC-008-3 Requirements R2 and R3 **TPL-001-4, Requirement R1:** **R1.** Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment. The models shall use data consistent with that provided in accordance with the MOD-010 and MOD-012 standards, supplemented by other sources as needed, including items represented in the Corrective Action Plan, and shall represent projected System conditions. This establishes Category P0 as the normal System condition in Table 1. **R1.1** System models shall represent: **R1.1.1.** Existing Facilities **R1.1.2.** Known outage(s) of generation or Transmission	SOLs developed by the PC and TP for use in the planning horizon are addressed in other standards as described below. SOLs used in the Operations Planning, Same-day Operations, and Real-time Operations time horizons are developed in accordance with the RC's methodology as specified in FAC-011-4. The determination of Facility Ratings, System steady-state voltage limits, and stability performance criteria for use in the Long-term Planning time horizon are addressed as follows. It is important to note the new FAC-015-1 Reliability Standard bounds the following items as stated in the introduction of this document. **Facility Ratings** PCs and TPs are required, by TPL-001-4 Requirement R1, to maintain System models and to use data consistent with that which has been provided in accordance with MOD-032-1 (which supersedes the MOD-010 and MOD-012 standards). Facility Ratings are included in this data. These Facility Ratings: • Are determined in accordance with a Generator Owner's (GOs) or TO's Facility Ratings Methodology as required by FAC-008-3 R2 & R3 and

Table 1 with notes a through j specifying the applicable performance criteria.
R2.2.1.	Single line to ground or three-phase Fault (whichever is more severe), with Normal Clearing, on any Faulted generator, line, transformer, or shunt device.	**TPL-001-4 Table1:** **Note: 'd'** **TPL-001-4 Table 1:** Categories P1 & P2 Single Contingency Events **TPL-001-4 Table 1:** **Footnote 2.** Unless specified otherwise, simulate Normal Clearing of faults. Single line to ground (SLG) or three-phase (3Ø) are the fault types that must be evaluated in Stability simulations for the event described. A 3Ø or a double line to ground fault study indicating the criteria are being met is sufficient evidence that a SLG condition would also meet the criteria.	

Standard: FAC-010-3 — System Operating Limits Methodology for the Planning Horizon			
Requirement in Approved Standard		Translation to New Standard or Other Action	Description and Change Justification
R2.2.2.	Loss of any generator, line, transformer, or shunt device without a Fault.	**TPL-001-4 Table1:** Categories P1 & P2 Single Contingency Events	
R2.2.3.	Single pole block, with Normal Clearing, in a monopolar or bipolar high voltage direct current system.	**TPL-001-4 Table1:** Categories P1 & P2 Single Contingency Events	
R2.3.	Starting with all Facilities in service, the system's response to a single Contingency, may include any of the following:	**TPL-001-4 Table 1**	Allowable actions for BES planned performance in response to single contingencies are addressed in approved TPL-001-4 Table 1, including Consequential Load Loss and System Reconfiguration.
R2.3.1.	Planned or controlled interruption of electric supply to radial customers or some local network customers connected to or supplied by the Faulted Facility or by the affected area.	**TPL-001-4 Table1:** **Note: 'b'**	
R2.3.2.	System reconfiguration through manual or automatic control or protection actions.	**TPL-001-4 Table1:** **Note: 'e'**	
R2.4.	To prepare for the next Contingency, system adjustments may be made,	**TPL-001-4 Table1:** **Note: 'e'**	Allowable System adjustments for BES planned performance to prepare for the next

Standard: FAC-010-3 — System Operating Limits Methodology for the Planning Horizon			
Requirement in Approved Standard		**Translation to New Standard or Other Action**	**Description and Change Justification**
	including changes to generation, uses of the transmission system, and the transmission system topology.	**TPL-001-4 Table 1:** Footnote 9**.** An objective of the planning process should be to minimize the likelihood and magnitude of interruption of Firm Transmission Service following Contingency events. Curtailment of Firm Transmission Service is allowed both as a System adjustment (as identified in the column entitled 'Initial Condition') and a corrective action when achieved through the appropriate re-dispatch of resources obligated to re-dispatch, where it can be demonstrated that Facilities, internal and external to the Transmission Planner's planning region, remain within applicable Facility Ratings and the re-dispatch does not result in any Non- Consequential Load Loss. Where limited options for re-dispatch exist, sensitivities associated with the availability of those resources should be considered.	Contingency are addressed TPL-001-4 Table 1 note e and footnote 9.
R2.5.	Starting with all Facilities in service and following any of the multiple Contingencies identified in Reliability Standard TPL-003 the system shall demonstrate transient, dynamic and voltage stability;	**TPL-001-4 Table1:** **Notes: 'a', 'f', 'g' 'j'** **TPL-001-4 Table1:** Categories P3 – P7 Multiple Contingency Events	Multiple contingency BES planned performance is addressed as Category P3 - P7 in TPL-001-4 Table 1. These include the multiple contingency events that start with all Facilities in service (P4, P5 & P7). Notes a through j from Table 1 (above) specify the applicable performance criteria.

Standard: FAC-010-3 — System Operating Limits Methodology for the Planning Horizon		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
all Facilities shall be operating within their Facility Ratings and within their thermal, voltage and stability limits; and Cascading or uncontrolled separation shall not occur.		
R2.6. In determining the system's response to any of the multiple Contingencies, identified in Reliability Standard TPL-003, in addition to the actions identified in R2.3.1 and R2.3.2, the following shall be acceptable:	**TPL-001-4, Requirement R2.7.3** **TPL-001-4 Table 1**	Allowable actions for BES planned performance in response to multiple contingencies are addressed in TPL-001-4 Requirement R2.7.3 and Table 1, including all actions that were acceptable in response to single Contingencies discussed above; and load shedding and curtailment of Firm Transmission Service.
R2.6.1. Planned or controlled interruption of electric supply to customers (load shedding), the planned removal from service of certain generators, and/or the curtailment of contracted Firm (non-recallable reserved) electric power Transfers.	**TPL-001-4, Requirement R2, Part 2.7.3.** **2.7.3.** If situations arise that are beyond the control of the Transmission Planner or Planning Coordinator that prevent the implementation of a Corrective Action Plan in the required timeframe, then the Transmission Planner or Planning Coordinator is permitted to utilize Non-Consequential Load Loss and curtailment of Firm Transmission Service to correct the situation that would normally not be permitted in Table 1, provided that the Transmission Planner or Planning Coordinator documents that they are taking	Table 1 in TPL-001-4 specifies the conditions where service interruption is acceptable.

Standard: FAC-010-3 — System Operating Limits Methodology for the Planning Horizon		
Requirement in Approved Standard	Translation to New Standard or Other Action	Description and Change Justification
	actions to resolve the situation. The Transmission Planner or Planning Coordinator shall document the situation causing the problem, alternatives evaluated, and the use of Non-Consequential Load Loss or curtailment of Firm Transmission Service. **TPL-001-4 Table 1:** Footnote 9 (refer to R2.4 section) Footnote 12. An objective of the planning process is to minimize the likelihood and magnitude of Non-Consequential Load Loss following planning events. In limited circumstances, Non-Consequential Load Loss may be needed throughout the planning horizon to ensure that BES performance requirements are met. However, when Non-Consequential Load Loss is utilized under footnote 12 within the Near-Term Transmission Planning Horizon to address BES performance requirements, such interruption is limited to circumstances where the Non-Consequential Load Loss meets the conditions shown in Attachment 1. In no case can the planned Non-Consequential Load Loss under footnote 12 exceed 75 MW	

Standard: FAC-010-3 — System Operating Limits Methodology for the Planning Horizon		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
	for US registered entities. The amount of planned Non-Consequential Load Loss for a non-US Registered Entity should be implemented in a manner that is consistent with, or under the direction of, the applicable governmental authority or its agency in the non-US jurisdiction.	
R3. The Planning Authority's methodology for determining SOLs, shall include, as a minimum, a description of the following, along with any reliability margins applied for each:		The proposed construct as described in the document introduction does not make use of an SOL Methodology applicable to the planning horizon. The SDT also acknowledges that the June 2013 report from the Independent Experts Review Project identified FAC-010-2.1, Requirements R3 and R4 as "Requirements Recommended for Retirement" in Appendix E of the report (R5 had since been retired). Requirement R3 was identified as "More appropriate as a Guideline. This is a checklist."
R3.1. Study model (must include at least the entire Planning Authority Area as well as the critical modeling details from other Planning Authority Areas that would impact the Facility or Facilities under study).	**TPL-001-4, Requirement R1:** **R1**. (refer to Requirement R2.1 section above)	Study model used for BES planned performance is specified in approved TPL-001-4, Requirement R1.

Standard: FAC-010-3 — System Operating Limits Methodology for the Planning Horizon			
Requirement in Approved Standard		**Translation to New Standard or Other Action**	**Description and Change Justification**
R3.2.	Selection of applicable Contingencies.	**TPL-001-4 Table1:** Categories P1 – P7 Planning Events	Applicable contingencies for BES planned performance are specified in approved TPL-001-4 Table 1.
R3.3.	Level of detail of system models used to determine SOLs.	**TPL-001-4, Requirement R1:** **R1.** (refer to Requirement R1 section above)	Model details for BES planned performance are specified in approved TPL-001-4, Requirement R1.
R3.4.	Allowed uses of Remedial Action Schemes.	**TPL-001-4, Requirement R2, Part 2.7:** **2.7.** For planning events shown in TPL-001-4 Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met. Revisions to the Corrective Action Plan(s) are allowed in subsequent Planning Assessments but the planned System shall continue to meet the performance requirements in Table 1. Corrective Action Plan(s) do not need to be developed solely to meet the performance requirements for a single sensitivity case analyzed in accordance with TPL-001-4, Requirements R2, Parts 2.1.4 and 2.4.3. The Corrective Action Plan(s) shall: **2.7.1.** List System deficiencies and the associated actions needed to	TPL-001-4, Requirement R2.7 requires the development of a Corrective Action Plan to address system deficiencies. The Corrective Action Plan is required to include any automatic tripping or other automated protection that is required to meet the performance criteria in TPL-001-4 Table 1.

Standard: FAC-010-3 — System Operating Limits Methodology for the Planning Horizon		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
	achieve required System performance. Examples of such actions include: • Installation, modification, or removal of Protection Systems or Special Protection Systems • Installation or modification of automatic generation tripping as a response to a single or multiple Contingency to mitigate Stability performance violations. • Installation or modification of manual and automatic generation runback/tripping as a response to a single or multiple Contingency to mitigate steady state performance violations.	
R3.5. Anticipated transmission system configuration, generation dispatch and Load level.	**TPL-001-4, Requirement R1:** **R1.** (refer to Requirement R1 section above)	Anticipated transmission dispatch, generation, and load levels are incorporated into study models used for BES planned performance as specified in TPL-001-4, Requirement R1.

Standard: FAC-010-3 — System Operating Limits Methodology for the Planning Horizon			
Requirement in Approved Standard		**Translation to New Standard or Other Action**	**Description and Change Justification**
R3.6.	Criteria for determining when violating a SOL qualifies as an Interconnection Reliability Operating Limit (IROL) and criteria for developing any associated IROL T_v	See mapping for Requirement R1, Part 1.3	See mapping for Requirement R1.3
R4.	The Planning Authority shall issue its SOL Methodology, and any change to that methodology, to all of the following prior to the effectiveness of the change:		The proposed construct as described in the document introduction does not make use of an SOL Methodology applicable to the planning horizon. The modeling and performance requirements as well as the reliability objectives of FAC-010-3 are redundant with those in TPL-001-4. Furthermore, the Planning Assessment required by TPL-001-4 is distributed, in accordance with TPL-001-4 Requirement R8 and IRO-017 Requirement R3, to all applicable entities listed in FAC-010-3 Requirement R4. The SDT also acknowledges that the June 2013 report from the Independent Experts Review Project identified FAC-010-2.1, Requirements R3 and R4 as "Requirements Recommended for Retirement" in Appendix E of the report (Requirement R5 had since been retired). Requirement R4 was identified as "More appropriate as a Guideline. Description of
R4.1.	Each adjacent Planning Authority and each Planning Authority that indicated it has a reliability-related need for the methodology.	**TPL-001-4, Requirement R8:** **R8.** Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 calendar days of completing its Planning Assessment, and to any functional entity that has a reliability related need and submits a written request for the information within 30 days of such a request.	
R4.2.	Each Reliability Coordinator and Transmission Operator that operates any portion of the Planning Authority's Planning Authority Area.	**TPL-001-4, Requirement R8:** **R8.** (refer to Requirement R4, Part 4.1 section above) **IRO-017-1, Requirement R3:**

Project 2015-09 Establish and Communicate System Operating Limits

Standard FAC-011-3 - System Operating Limits Methodology for the Operations Horizon		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
FAC-011-3, Requirement R1. The Reliability Coordinator shall have a documented methodology for use in developing SOLs (SOL Methodology) within its Reliability Coordinator Area. This SOL Methodology shall:	FAC-011-4, Requirement R1. Each Reliability Coordinator shall have a methodology for establishing SOLs ("SOL Methodology") within its Reliability Coordinator Area.	No change.
FAC-011-3, Requirement R1, R1.1. [This SOL Methodology shall] Be applicable for developing SOLs used in the operations horizon.	This requirement was removed.	The stated purpose of FAC-011-4 is "To ensure that System Operating Limits (SOLs) used in the reliable operation of the Bulk Electric System (BES) are determined based on an established methodology or methodologies." The title of FAC-011-4 is "System Operating Limits Methodology for the Operations Horizon". Therefore, every requirement in FAC-011-4 is intended for developing SOLs used in the operations horizon. Accordingly, there is no reliability-

Standard FAC-011-3 - System Operating Limits Methodology for the Operations Horizon		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
		related need to have a requirement specifying that the Reliability Coordinator's (RC's) SOL Methodology is applicable for developing SOLs used in the operations horizon.
FAC-011-3, Requirement R1, R1.2. [This SOL Methodology shall] State that SOLs shall not exceed associated Facility Ratings.	This requirement is addressed in proposed FAC-011-4 Requirement R2 in conjunction with the definitions for Operational Planning Analysis and Real-time Assessment in the NERC Glossary of Terms. <u>FAC-011-4 Requirement R2</u>: Each Reliability Coordinator shall include in its SOL Methodology the method for Transmission Operators to determine the applicable owner-provided Facility Ratings to be used in operations. The method shall address the use of common Facility Ratings between the Reliability Coordinator and the Transmission Operators in its Reliability Coordinator Area. <u>Operational Planning Analysis</u> is defined in the NERC Glossary of Terms as *"An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for*	Facility Ratings to be used in operations as SOLs is addressed through FAC-011-4, Requirement R2. Facility Ratings that are determined per Requirement R2 are a required input for Operational Planning Analyses (OPA) and Real-time Assessments (RTA) per the definitions, and therefore address the analysis of system performance with respect to Facility Ratings. Facility Rating exceedances are determined through OPAs and RTAs.

Standard FAC-011-3 - System Operating Limits Methodology for the Operations Horizon		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
	next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)" Real-time Assessment is defined in the NERC Glossary of Terms as *"An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through*	

Standard FAC-011-3 - System Operating Limits Methodology for the Operations Horizon		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
	internal systems or through third-party services.)"	
FAC-011-3, Requirement R1, R1.3. [This SOL Methodology shall] Include a description of how to identify the subset of SOLs that qualify as IROLs.	FAC-011-4, Requirement R6 and Part 6.1. R6. Each Reliability Coordinator shall include in its SOL Methodology 6.1. A description of how to identify the subset of SOLs that qualify as IROLs.	The language from the approved standard was maintained in the proposed FAC-011-4.
FAC-011-3, Requirements R2, R2.1 and R2.2. R2. The Reliability Coordinator's SOL Methodology shall include a requirement that SOLs provide BES performance consistent with the following: R2.1 In the pre-contingency state, the BES shall demonstrate transient, dynamic and voltage stability; all Facilities shall be within their Facility Ratings and within their thermal, voltage and stability limits. In the determination of SOLs, the BES condition used shall reflect current or expected system conditions and shall reflect changes to system topology such as Facility outages.	These requirements are addressed in: 1. TOP and IRO requirements for TOPs and RCs to perform OPAs, to develop Operating Plans for SOL exceedances identified in those OPAs, to perform RTAs, and to implement Operating Plans to address SOL exceedances identified in those RTAs. 2. The definition of OPA and RTA 3. FAC-011-4, Requirement R4 addresses the establishment of stability limits and the associated performance requirements. 4. FAC-011-4 Requirement R6 and its Parts relating to IROLs.	"BES performance" as stated in FAC-011-3 Requirement R2 is not determined through SOLs in and of themselves. SOLs are an input into OPAs and RTAs. The OPA and RTA evaluation against those SOLs provide for reliable system performance by ensuring through these analyses/assessments that the system performs reliably in the pre- and post-Contingency states (i.e., that the system is within thermal (Facility Ratings), System Voltage Limits, and stability limits pre- and post-Contingency). If SOL exceedance is occurring, the system is not performing reliably. Per the Transmission Operator (TOP) standards, SOL exceedance triggers the development and

Standard FAC-011-3 - System Operating Limits Methodology for the Operations Horizon		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
R2.2. Following the single Contingencies identified in Requirement R2, R2.2.1 - R2.2.3, the system shall demonstrate transient, dynamic and voltage stability; all Facilities shall be operating within their Facility Ratings and within their thermal, voltage and stability limits; and Cascading or uncontrolled separation shall not occur.	5. The definition of IROL and the TOP and IRO standards that address operation within IROLs. TOP-002-4, Requirement R1: Each Transmission Operator shall have an Operational Planning Analysis that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any of its System Operating Limits (SOLs). TOP-001-4, Requirement R2: Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1. TOP-001-4, Requirement R13: Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. TOP-001-4, Requirement R14: Each Transmission Operator shall initiate its Operating Plan to mitigate a SOL	implementation of an Operating Plan to address that SOL exceedance. The items in approved FAC-011-3, Requirement R2 and its sub-requirements are addressed through the related TOP standards that reference SOL exceedance. 1. Per TOP-002-4, Requirement R1, TOPs have OPAs to identify SOL exceedances. 2. Per TOP-002-4, Requirement R2, TOPs develop Operating Plans for SOL exceedances identified in the OPA. 3. Per TOP-001-3, Requirement R13, TOPs perform RTAs at least once every 30 minutes to identify SOL exceedances. 4. Per TOP-001-3, Requirement R14, TOPs implement Operating Plans to mitigate SOL exceedances. 5. Per IRO-008-2, Requirement R1, RCs perform OPAs to identify SOL and IROL exceedances.

Standard FAC-011-3 - System Operating Limits Methodology for the Operations Horizon		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
	exceedance identified as part of its Real-time monitoring or Real-time Assessment. IRO-008-2, Requirement R1: Each Reliability Coordinator shall perform an Operational Planning Analysis that will allow it to assess whether the planned operations for the next-day will exceed System Operating Limits (SOLs) and Interconnection Operating Reliability Limits (IROLs) within its Wide Area. IRO-008-2, Requirement R2: Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities. IRO-008-2, Requirement R4: Each Reliability Coordinator shall ensure that a Real-time	6. Per IRO-008-2, Requirement R2, RCs develop coordinated Operating Plans for SOL and IROL exceedances identified in its OPA. 7. Per IRO-008-2, Requirement R4, RCs perform RTAs at least once every 30 minutes to identify SOL and IROL exceedances. 8. Per IRO-008-2, Requirement R5, RCs notify TOPs and BAs of SOL or IROL exceedances identified in its RTA. The portion of FAC-011-3, Requirement R2, R2.1 that states *"In the determination of SOLs, the BES condition used shall reflect current or expected system conditions and shall reflect changes to system topology such as Facility outages"* is addressed specifically by FAC-011-4 Requirement R4, Part 4.4 which requires that System conditions including any changes to System topology such as Facility outages are to be included as part of the process for determining stability limits. While stability

Standard FAC-011-3 - System Operating Limits Methodology for the Operations Horizon		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
	Assessment is performed at least once every 30 minutes. IRO-008-2, Requirement R5: Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the results of a Real-time Assessment indicate an actual or expected condition that results in, or could result in, a System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance within its Wide Area. Operational Planning Analysis is defined in the NERC Glossary of Terms as *"An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status*	limits are frequently dependent on system conditions and Facility outages, Facility Ratings and System Voltage Limits are not dependent on system conditions and Facility outages. However, system conditions and topology changes such as Facility outages are critical for determining whether or not Facility Ratings and System Voltage Limits are being exceeded for the pre- or post-Contingency state, which is accomplished through performing OPAs and RTAs that address expected and actual system conditions and Facility outages for the pre- and post-Contingency state. Regarding the stability portions of Requirement R2, R2.1 and R2.2: FAC-011-4, Requirement R4 improve reliability by requiring the RC's SOL Methodology to address several stability-related phenomena and associated performance criteria in its SOL Methodology, as seen in Requirement R4, Part 4.1.

Standard FAC-011-3 - System Operating Limits Methodology for the Operations Horizon		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
	or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)" Real-time Assessment is defined in the NERC Glossary of Terms as *"An evaluation of system conditions using Real-time data to assess existing (pre-Contingency) and potential (post-Contingency) operating conditions. The assessment shall reflect applicable inputs including, but not limited to: load, generation output levels, known Protection System and Special Protection System status or degradation, Transmission outages, generator outages, Interchange, Facility Ratings, and identified phase angle and equipment limitations. (Real-time Assessment may be provided through internal systems or through third-party services.)"*	Requirement R4, Part 4.2 requires the RC's SOL Methodology to require that stability limits be established to meet those performance requirements. Furthermore, Requirement R4, Part 4.6 requires the RC's SOL Methodology to specify how the RC establishes stability limits when there is an impact to more than one TOP in its Reliability Coordinator Area RC's SOL Methodology. Requirement R4 works together with FAC-014-3, Requirement R2 which requires TOPs to establish SOLs in accordance with the RC's SOL Methodology and with FAC-014-3, Requirement R4 which requires the RC to establish stability limits that impact more than one TOP in its RC Area. Instability is also addressed through FAC-011-4, Requirement R6 which requires the RC's SOL Methodology contain a description of how to identify the subset of SOLs that qualify as Interconnection Reliability Operating Limits (IROLs), and through FAC-014-3, Requirement R1 which requires the

Standard FAC-011-3 - System Operating Limits Methodology for the Operations Horizon		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
	FAC-011-4 Requirement R4: Each Reliability Coordinator shall include in its SOL Methodology the method for determining the stability limits to be used in operations. The method shall: 4.1. Specify stability performance criteria, including any margins applied. The criteria shall include the following: 4.1.1. steady-state voltage stability; 4.1.2. transient voltage response; 4.1.3. angular stability; 4.1.4. System damping. 4.2. Require that stability limits are established to meet the criteria specified in Part 4.1 for the Contingencies identified in Requirement R5. 4.3. Describe how the Reliability Coordinator establishes stability limits when there is an impact to more than one Transmission Operator in its Reliability Coordinator Area.	RC to establish IROLs in accordance with its SOL Methodology. IRO-009-2, Requirement R3 requires the RC to act or direct others to act so that the magnitude and duration of an IROL exceedance is mitigated within the IROL's T_v, as identified in the Reliability Coordinator's Real-time monitoring or Real-time Assessment. Additionally, TOP-001-3, Requirement R12 requires that the TOP not operate outside any identified IROL for a continuous duration exceeding its associated IROL T_V.

Standard FAC-011-3 - System Operating Limits Methodology for the Operations Horizon		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
	4.4. Describe how instability risks are identified, considering levels of transfers, Load and generation dispatch, and System conditions including any changes to System topology such as Facility outages; 4.5. Describe the level of detail that is required for the study model(s), including the extent of the Reliability Coordinator Area, as well as the critical modeling details from other Reliability Coordinator Areas, necessary to determine different types of stability limits. 4.6. Describe the allowed uses of Remedial Action Schemes (RAS) and other automatic post-Contingency mitigation actions. IROL is defined in the NERC Glossary of Terms as – *A System Operating Limit that, if violated, could lead to instability, uncontrolled separation, or Cascading outages that adversely impact the reliability of the Bulk Electric System.*	

Standard FAC-011-3 - System Operating Limits Methodology for the Operations Horizon		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
	FAC-011-4, Requirement R6: Each Reliability Coordinator shall include in its SOL Methodology: 6.1. A description of how to identify the subset of SOLs that qualify as IROLs. 6.2. Criteria for determining when violating a SOL qualifies as an Interconnection Reliability Operating Limit (IROL) and criteria for developing any associated IROL T_v. FAC-014-3, Requirement R1: Each Reliability Coordinator shall establish Interconnection Reliability Operating Limits (IROLs) for its Reliability Coordinator Area in accordance with its System Operating Limit Methodology (SOL Methodology). IRO-009-2, Requirement R3: Each Reliability Coordinator shall act or direct others to act so that the magnitude and duration of an	

Standard FAC-011-3 - System Operating Limits Methodology for the Operations Horizon		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
	IROL exceedance is mitigated within the IROL's T_V, as identified in the Reliability Coordinator's Real-time monitoring or Real-time Assessment. TOP-001-3, Requirement R12: Each Transmission Operator shall not operate outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL T_V.	
FAC-011-3, Requirement R2, sub-requirements R2.2.1, R2.2.2, and R2.2.3 R2.2.1. Single line to ground or 3-phase Fault (whichever is more severe), with Normal Clearing, on any Faulted generator, line, transformer, or shunt device. R2.2.2. Loss of any generator, line, transformer, or shunt device without a Fault. R2.2.3. Single pole block, with Normal Clearing, in a monopolar or bipolar high voltage direct current system.	FAC-011-4, Requirement R5, Part 5.1.1 Loss of any of the following either by single phase or three phase Fault to ground with normal clearing, or without a Fault: • generator; • transmission circuit; • transformer; • shunt device; • single pole block, with Normal Clearing, in a monopolar or bipolar high voltage direct current system.	The requirements in approved FAC-011-3 were consolidated into a single requirement in proposed FAC-011-4.

Standard FAC-011-3 - System Operating Limits Methodology for the Operations Horizon		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
FAC-011-3, Requirement R2.3, sub-requirements R2.3.1, R2.3.2, R2.3.3, and Requirement R2.4. R2.3 In determining the system's response to a single Contingency, the following shall be acceptable: R2.3.1. Planned or controlled interruption of electric supply to radial customers or some local network customers connected to or supplied by the Faulted Facility or by the affected area. R2.3.2. Interruption of other network customers, (a) only if the system has already been adjusted, or is being adjusted, following at least one prior outage, or (b) if the real-time operating conditions are more adverse than anticipated in the corresponding studies R2.3.3. System reconfiguration through manual or automatic control or protection actions. R2.4 To prepare for the next Contingency, system adjustments may be made, including changes to generation, uses of the	The reliability issues denoted in FAC-011-3 Requirement R2.3, sub-requirements R2.3.1, R2.3.2, R2.3.3, and R2.4 represent a combination of issues that are relevant to the establishment of SOLs and those that are relevant to "how the system is to be operated." The issues that pertain to the establishment of SOLs are addressed through FAC-011-4 Requirement R4 : R4. Each Reliability Coordinator shall include in its SOL Methodology the method for determining the stability limits to be used in operations. The method shall: 4.1. Specify stability performance criteria, including any margins applied. The criteria shall include the following: 4.1.1. steady-state voltage stability; 4.1.2. transient voltage response; 4.1.3. angular stability; 4.1.4. System damping.	Requirement R2, R2.3 describes an acceptable System response to single Contingencies. These requirements are sub-requirements of Requirement R2, which addresses the establishment of SOLs that "provide a certain level of BES performance". "BES performance" as stated in FAC-011-3, Requirement R2 is not determined through SOLs in and of themselves. SOLs are an input into OPAs and RTAs. The OPA and RTA evaluation against those SOLs provide for reliable system performance by ensuring through these analyses/assessments that the system performs reliably in the pre- and post-Contingency states (i.e., that the system is within thermal (Facility Ratings), System Voltage Limits, and stability limits pre- and post-Contingency). If SOL exceedance is occurring, the system is not performing reliably. Per the TOP and IRO standards, RTAs must be performed at least once every 30 minutes. Accordingly, each new operating state is "studied" at least once every 30 minutes. Additionally, per the TOP

Standard FAC-011-3 - System Operating Limits Methodology for the Operations Horizon		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
transmission system, and the transmission system topology.	4.2. Require that stability limits are established to meet the criteria specified in Part 4.1 for the Contingencies identified in Requirement R5. 4.3. Describe how the Reliability Coordinator establishes stability limits when there is an impact to more than one Transmission Operator in its Reliability Coordinator Area. 4.4. Describe how instability risks are identified, considering levels of transfers, Load and generation dispatch, and System conditions including any changes to System topology such as Facility outages; 4.5. Describe the level of detail that is required for the study model(s), including the extent of the Reliability Coordinator Area, as well as the critical modeling details from other Reliability Coordinator Areas, necessary to determine different types of stability limits. 4.6. Describe the allowed uses of Remedial Action Schemes (RAS) and other	standards, SOL exceedance triggers the development and implementation of an Operating Plan to address that SOL exceedance. Insofar as the issues in FAC-011-3, Requirement R2, R2.3 and R2.4 correlate to the establishment of SOLs, automatic control actions relevant to the establishment of stability limits are addressed in FAC-011-4 Requirement R4, Part 4.6 which requires the SOL Methodology to describe the allowed uses of Remedial Action Schemes (RAS) and other automatic post-Contingency mitigation actions as part of stability limit establishment. Accordingly, any RAS or automatic mitigation scheme (which includes those that interrupt customers or reconfigure the system) are required to be reflected in the establishment of stability limits per Requirement R4, Part 4.6. Furthermore, per Requirement R4, Part 4.4, stability limits are required to take into consideration the configuration of the system, which may include any necessary

Standard FAC-011-3 - System Operating Limits Methodology for the Operations Horizon		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
	automatic post-Contingency mitigation actions. The issues that are more centric to “how the system is to be operated” are more appropriately addressed in the development and implementation of Operating Plans as denoted in the following standards: 1. TOP-002-4, Requirement R2: Each Transmission Operator shall have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1. 2. TOP-002-4, Requirement R3: Each Transmission Operator shall notify entities identified in the Operating Plan(s) cited in Requirement R2 as to their role in those plan(s). 3. TOP-002-4, Requirement R6: Each Transmission Operator shall provide	manual actions taken by the System Operator to configure the system in a manner that supports the use of a given stability limit. However, insofar as FAC-011-3, Requirement R2, R2.3 and R2.4 correlate to “how the system is to be operated”, the operational decisions related to customer interruption and system reconfiguration are governed by the Operating Plan, if such actions are necessary to address SOL exceedance. The need for making system adjustments to prepare for the next Contingency is standard operational practice and does not need to be specified or required by the Reliability standards. Any such actions related to the interruption of customers, reconfiguration of the system, or operational preparations for the next Contingency are expected to be included in an Operating Plan, if such actions are required by System Operators to address SOL exceedances.

Standard FAC-011-3 - System Operating Limits Methodology for the Operations Horizon		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
	its Operating Plan(s) for next-day operations identified in Requirement R2 to its Reliability Coordinator. 4. TOP-012-3, Requirement R14: Each Transmission Operator shall initiate its Operating Plan to mitigate a SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment. 5. IRO-008-2, Requirement R2: Each Reliability Coordinator shall have a coordinated Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) and Interconnection Reliability Operating Limit (IROL) exceedances identified as a result of its Operational Planning Analysis as performed in Requirement R1 while considering the Operating Plans for the next-day provided by its Transmission Operators and Balancing Authorities. 6. IRO-008-2, Requirement R3: Each Reliability Coordinator shall notify	In the current body of TOP and IRO reliability standards, the Operating Plan is the mechanism for addressing SOL exceedances. The mitigation actions that System Operators take to prevent or address SOL exceedances are expected to be contained within the Operating Plan. TOPs need to have the flexibility in their Operating Plan to address the wide-ranging operational issues they may encounter. There is no reliability need for reliability standards to provide such highly prescriptive requirements which specify how TOPs are to operate the system. Because the development and implementation of Operating Plans is addressed in the current body of reliability standards, reliability is not compromised by the removal of FAC-011-3, Requirement R2, R2.3 and R2.4. Any concepts in this section may need to be retained are better suited in a Reliability Guideline (e.g., Reliability Guideline for the development of Operating Plans) rather

Standard FAC-011-3 - System Operating Limits Methodology for the Operations Horizon		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
	impacted entities identified in its Operating Plan(s) cited in Requirement R2 as to their role in such plan(s). 7. IRO-008-2, Requirement R5: Each Reliability Coordinator shall notify impacted Transmission Operators and Balancing Authorities within its Reliability Coordinator Area, and other impacted Reliability Coordinators as indicated in its Operating Plan, when the System Operating Limit (SOL) or Interconnection Reliability Operating Limit (IROL) exceedance identified in Requirement R5 has been prevented or mitigated.	than a NERC Reliability Standard requirement.
FAC-011-3, Requirement R3, R3.1 R3. The Reliability Coordinator's methodology for determining SOLs, shall include, as a minimum, a description of the following, along with any reliability margins applied for each:	FAC-011-4, Requirement R4, Part 4.5 R4. Each Reliability Coordinator shall include in its SOL Methodology the method for determining the stability limits to be used in operations. The method shall: 4.5. Describe the level of detail that is required for the study model(s), including	FAC-011-3, Requirement R3, R3.1 and R3.4 both address the study model. These two requirements are addressed with the single requirement in proposed FAC-011-4, Requirement R4, Part 4.5. Facility Ratings are created and provided through FAC-008 and further examined

Standard FAC-011-3 - System Operating Limits Methodology for the Operations Horizon		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
R3.1 Study model (must include at least the entire Reliability Coordinator Area as well as the critical modeling details from other Reliability Coordinator Areas that would impact the Facility or Facilities under study.)	the extent of the Reliability Coordinator Area, as well as the critical modeling details from other Reliability Coordinator Areas, necessary to determine different types of stability limits.	through FAC-011-4, Requirement R2. System Voltage Limits are created per FAC-011-4, Requirement R3. Neither of these types of SOLs are necessarily a byproduct of a "study" or study model. As a result, no study model reference is needed in FAC-011-4 for Facility Ratings or System Voltage Limits. However, for those RCs or TOPs that determine stability limits, a study model is needed to perform the "study". Therefore, the level of detail of the study model falls under the requirement associated with establishing stability limits (R4). FAC-011-4, Requirement R4, Part 4.5 affords the RC with the flexibility to the extent of the modeling area (including other RC areas) that must be modeled to reflect the varying needs for different types of stability limits (e.g. local single unit stability up to wide-area or inter-area instability). Part 4.5 acknowledges that some types of localized stability issues do not require a model of

Standard FAC-011-3 - System Operating Limits Methodology for the Operations Horizon		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
		the entire RC area to establish certain types of stability limits.
FAC-011-3, Requirement R3, R3.2 R3.2 [The RC's SOL Methodology shall include] Selection of applicable Contingencies	FAC-011-4, Requirement R5 R5. Each Reliability Coordinator shall include in its SOL Methodology the method for identifying the single Contingencies and multiple Contingencies for use in determining stability limits and performing Operational Planning Analyses (OPAs) and Real-time Assessments (RTAs). The method shall include: 5.1. The following list of single Contingency events for use in determining stability limits and performing OPAs and RTAs: 5.1.1. Loss of any of the following, either by single phase to ground or three phase Fault (whichever is more severe) with normal clearing, or without a Fault: • generator; • transmission circuit; • transformer;	All requirements regarding Contingencies are consolidated and addressed in proposed FAC-011-4, Requirement R5.

Standard FAC-011-3 - System Operating Limits Methodology for the Operations Horizon		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
	• shunt device; • single pole block, with Normal Clearing, in a monopolar or bipolar high voltage direct current system. 5.2. Any additional types of single Contingency events identified for use in determining stability limits, or for use in performing OPAs and RTAs. 5.3. Any types of multiple Contingency events identified for use in determining stability limits, or for use in performing OPAs and RTAs. 5.4. The method for considering the Contingency events provided by the Planning Coordinator in accordance with FAC-015-1 Requirement R6 to identify the Contingencies for use in determining stability limits.	
FAC-011-3, Requirement R3, R3.3 and R3.3.1. R3.3 [The RC's SOL Methodology shall include] A process for determining which of the stability limits associated with the list of	FAC-011-4, Requirement R5, Part 5.4 R5. Each Reliability Coordinator shall include in its SOL Methodology the method for identifying the single Contingencies and	FAC-011-4, Requirement R5, Part 5.4 and FAC-015-1 Requirement R6 address the reliability objective in FAC-011-3, Requirement R3, R3.3.1.

Standard FAC-011-3 - System Operating Limits Methodology for the Operations Horizon		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
multiple contingencies (provided by the Planning Authority in accordance with FAC-014, Requirement 6) are applicable for use in the operating horizon given the actual or expected system conditions. R3.3.1. This process shall address the need to modify these limits, to modify the list of limits, and to modify the list of associated multiple contingencies.	multiple Contingencies for use in determining stability limits and performing Operational Planning Analyses (OPAs) and Real-time Assessments (RTAs). The method shall include: 5.4. The method for considering the Contingency events provided by the Planning Coordinator in accordance with FAC-015-1 Requirement R6 to identify the Contingencies for use in determining stability limits. FAC-015-1 Requirement R6: R6. Each Planning Coordinator shall communicate any instability, Cascading or uncontrolled separation identified in either its Planning Assessment of the Near-Term Transmission Planning Horizon or its Transfer Capability assessment to each impacted Reliability Coordinator and Transmission Operator. This communication shall include:	In FAC-015-1, Requirement R6, the Planning Coordinator is required to identify and communicate any instability, Cascading, or uncontrolled separation, as well as the related information contained in the Parts of Requirement R6, to the RC and associated TOPs. Once the RC receives this information, the RC then applies the method required by FAC-011-4, Requirement R5, Part 5.4 for considering those Contingencies for use in determining stability limits. These requirements collectively address the reliability objectives of FAC-011-3, Requirement R3, R3.1.

Standard FAC-011-3 - System Operating Limits Methodology for the Operations Horizon		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
	6.1 The type of instability identified (e.g., voltage collapse, angular instability, transient voltage dip criteria violation); 6.2 The associated stability criteria used as part of determining the instability; 6.3 The associated Contingency(ies) which result(s) in the instability, Cascading or uncontrolled separation; 6.4 Any Remedial Action Scheme action, under voltage load shedding (UVLS) action, under frequency load shedding (UFLS) action, interruption of Firm Transmission Service, or Non-Consequential Load Loss required to address the instability, Cascading or uncontrolled separation; 6.5 Any Corrective Action Plan associated with the instability, Cascading or uncontrolled separation.	
FAC-011-3, Requirement 3, R3.4. R3.4 [The RC's SOL Methodology shall include] Level of detail of system models used to determine SOLs.	FAC-011-4, Requirement R4, Part 4.5 R4. Each Reliability Coordinator shall include in its SOL Methodology the method	Reference the explanation provided for FAC-011-3, Requirement R3, R3.1.

Standard FAC-011-3 - System Operating Limits Methodology for the Operations Horizon		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
	for determining the stability limits to be used in operations. The method shall: 4.5. Describe the level of detail that is required for the study model(s), including the extent of the Reliability Coordinator Area, as well as the critical modeling details from other Reliability Coordinator Areas, necessary to determine different types of stability limits.	
FAC-011-3, Requirement R3, R3.5. R3.5 [The RC's SOL Methodology shall include] Allowed uses of Remedial Action Schemes.	FAC-011-4, Requirement R4, Part 4.6 R4. Each Reliability Coordinator shall include in its SOL Methodology the method for determining the stability limits to be used in operations. The method shall: 4.6. Describe the allowed uses of Remedial Action Schemes (RAS) and other automatic post-Contingency mitigation actions[1]. Footnote 1 states "The planned use of underfrequency load-shedding (UFLS) is not allowed in the establishment of stability limits."	FAC-011-3, Requirement R3, R3.5 was carried over into FAC-011-4, Requirement R4, Part 4.6. The requirement has been clarified by including other automatic mitigation actions that are not a RAS, for example UVLS.

Standard FAC-011-3 - System Operating Limits Methodology for the Operations Horizon		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
FAC-011-3, Requirement R3, R3.6. R3.6 [The RC's SOL Methodology shall include] Anticipated transmission system configuration, generation dispatch and Load level	FAC-011-4, Requirement R4, Part 4.4: R4. Each Reliability Coordinator shall include in its SOL Methodology the method for determining the stability limits to be used in operations. The method shall: 4.4. Describe how instability risks are identified, considering levels of transfers, Load and generation dispatch, and System conditions including any changes to System topology such as Facility outages; TOP-002-4, Requirement R1: Each Transmission Operator shall have an Operational Planning Analysis that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any of its System Operating Limits (SOLs). IRO-008-2, Requirement R1: Each Reliability Coordinator shall perform an Operational Planning Analysis that will allow it to assess whether the planned operations for the next-day will exceed System Operating Limits (SOLs) and Interconnection Operating	The requirements in FAC-011-3, Requirement R3, R3.6 are addressed in proposed FAC-011-4, Requirement R4, Part 4.4. Part 4.4 was included as a Part to Requirement R4 because the information is relevant to the establishment of stability limits. Facility Ratings are created and provided through FAC-008 and further examined through FAC-011-4, Requirement R2, and System Voltage Limits are created through FAC-011-4, Requirement R3. Neither of these types of SOLs are necessarily a byproduct of a "study" or study model that requires inclusion of the items in FAC-011-3, Requirement R3, R3.6. Additionally, TOP-002-4, Requirement R1 and IRO-008-2, Requirement R1 require the TOP and the RC respectively to have/perform an OPA. Per the definition of OPA, the OPA shall reflect applicable inputs which include the

Standard FAC-011-3 - System Operating Limits Methodology for the Operations Horizon		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
	Reliability Limits (IROLs) within its Wide Area. Operational Planning Analysis is defined in the NERC Glossary of Terms as *"An evaluation of projected system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for next-day operations. The evaluation shall reflect applicable inputs including, but not limited to, load forecasts; generation output levels; Interchange; known Protection System and Special Protection System status or degradation; Transmission outages; generator outages; Facility Ratings; and identified phase angle and equipment limitations. (Operational Planning Analysis may be provided through internal systems or through third-party services.)"*	items required by FAC-011-3, Requirement R3, R3.6. Accordingly, when stability limits include the information required in Requirement R4, and the TOPs and RCs perform their required OPAs, the information in FAC-011-3, Requirement R3, R3.6 is inherently addressed.
FAC-011-3, Requirement R3, R3.7. R3.7 [The RC's SOL Methodology shall include] Criteria for determining when violating a SOL qualifies as an Interconnection Reliability	FAC-011-4, Requirement R6, Part 6.2 R6.2 Criteria for determining when violating a SOL qualifies as an Interconnection Reliability Operating Limit (IROL) and	The reliability objective of FAC-011-3, Requirement R3, R3.7 was carried over into FAC-011-4, Requirement R6, Part 6.2.

Standard FAC-011-3 - System Operating Limits Methodology for the Operations Horizon		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
Operating Limit (IROL) and criteria for developing any associated IROL T_V.	criteria for developing any associated IROL T_V.	
FAC-011-3, Requirement R4 and Requirement R4.1: R4. The Reliability Coordinator shall issue its SOL Methodology and any changes to that methodology, prior to the effectiveness of the Methodology or of a change to the Methodology, to all of the following: R4.1. Each adjacent Reliability Coordinator and each Reliability Coordinator that indicated it has a reliability-related need for the methodology.	FAC-011-4, Requirement R8, Parts 8.1 and 8.4: R8. Each Reliability Coordinator shall provide its new or revised SOL Methodology to: 8.1. Each adjacent Reliability Coordinator within its Interconnection prior to the effective date of the SOL Methodology; 8.4. Each requesting Reliability Coordinator that indicates a reliability-related need and is not considered adjacent in Part 8.1, within 30 calendar days of receiving the request.	The reliability objective of FAC-011-3, Requirement R4 was carried over to FAC-011-4, Requirement R8, Parts 8.1 and 8.4 Clarifications were made in Part 8.1 that adjacent RCs include those within an Interconnection. This was added to clarify the intent of adjacent RCs for the purposes of communicating SOL Methodologies. These adjacent RCs are required to receive the SOL Methodology prior to the effective date of the Methodology because they can be directly impacted by it. Non-adjacent RCs, which are addressed in Part 8.4, do not require communication of the SOL Methodology prior to its effective date because these RCs are less likely to be directly impacted; however, provisions are made with Part 8.4 for non-adjacent RCs to obtain the SOL Methodology within 30 days of the request if they indicate a reliability-related need for it.

Standard FAC-011-3 - System Operating Limits Methodology for the Operations Horizon		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
FAC-011-3, Requirement R4, R4.2 R4.2 [communicate the SOL Methodology to] Each Planning Authority and Transmission Planner that models any portion of the Reliability Coordinator's Reliability Coordinator Area.	FAC-011-4, Requirement R8, Part 8.2 R8. Each Reliability Coordinator shall provide its new or revised SOL Methodology to: 8.2. Each Planning Coordinator and Transmission Planner responsible for planning any portion of the Reliability Coordinator Area prior to the effective date of the SOL Methodology;	The language was changed to better reflect the intent of the requirement. The requirement is intended to addresses PCs and TPs that are responsible for planning within the RC Area.
FAC-011-3, Requirement R4, R4.3 R4.3 [communicate the SOL Methodology to] Each Transmission Operator that operates in the Reliability Coordinator Area.	FAC-011-4, Requirement R8, Part 8.3 R8. Each Reliability Coordinator shall provide its new or revised SOL Methodology to: 8.3. Each Transmission Operator within its Reliability Coordinator Area prior to the effective date of the SOL Methodology;	The reliability objective of FAC-011-3, Requirement R4, R4.3 was carried over to FAC-011-4, Requirement R8, Part 8.3.

Mapping Document for FAC-014-2

Project 2015-09 Establish and Communicate System Operating Limits

Standard: FAC-014-2 Establish and Communicate System Operating Limits		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
<u>FAC-014-2, Requirement R1</u> R1. The Reliability Coordinator shall ensure that SOLs, including Interconnection Reliability Operating Limits (IROLs), for its Reliability Coordinator Area are established and that the SOLs (including Interconnection Reliability Operating Limits) are consistent with its SOL Methodology.	<u>Requirements R1, R2, and R4 of FAC-014-3</u> R1. Each Reliability Coordinator shall establish Interconnection Reliability Operating Limits (IROLs) for its Reliability Coordinator Area in accordance with its System Operating Limit Methodology (SOL Methodology). R2. Each Transmission Operator shall establish System Operating Limits (SOLs) for its portion of the Reliability Coordinator Area in accordance with its Reliability Coordinator's SOL Methodology. R4. Each Reliability Coordinator shall establish stability limits to be used in operations when the limit impacts more than one Transmission Operator in its Reliability Coordinator Area in accordance with its SOL Methodology.	Requirements R1, R2, and R4 of FAC-014-3 ensure that SOLs are established in accordance with the Reliability Coordinator's (RC's) SOL Methodology. Requirement R1 was changed to address an issue with the existing language in FAC-014-2, Requirement R1. With the original language, the RC is responsible for ensuring that SOLs established by the Transmission Operator (TOP) per FAC-014-2, Requirement R2 are consistent with the RC's SOL Methodology. This creates a situation where the RC is responsible for "ensuring" the actions of the TOP. Accordingly, if the TOP does not establish SOLs per its RC's SOL Methodology, then 1) the TOP is in violation of Requirement R2, and 2) the RC by default is in violation of Requirement R1 because the RC did

Standard: FAC-014-2 Establish and Communicate System Operating Limits		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
		not ensure that the TOP's SOL was consistent with its SOL Methodology. The proposed revision addresses this issue and clarifies the appropriate responsibilities of the respective functional entities. Additionally, this requirement carries forward the obligation of the RC to establish IROLs for its RC Area. The RC maintains primary responsibility for establishment of IROLs because these limits have the potential to impact a Wide-area. FAC-011-4 requirement R4 further addresses the RC responsibilities (beyond IROL establishment) for stability limit establishment where more than one TOP is impacted.
<u>FAC-014-2, Requirement R2</u> R2. The Transmission Operator shall establish SOLs (as directed by its Reliability Coordinator) for its portion of the Reliability	<u>FAC-014-3, Requirement R2</u> R2. Each Transmission Operator shall establish System Operating Limits (SOLs) for its portion of the Reliability Coordinator Area in accordance with its Reliability Coordinator's SOL Methodology.	The language from the existing FAC-014-2, Requirement R2 that states the TOP, "(as directed by its Reliability Coordinator)" was removed because it causes confusion and may be incorrectly understood to mean that the TOPs are

Standard: FAC-014-2 Establish and Communicate System Operating Limits		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
Coordinator Area that are consistent with its Reliability Coordinator's SOL Methodology.		only required to establish SOLs if they have been "directed to by their RC." This is not the intended meaning of the requirement, thus, the drafting team has removed the unnecessary and potentially confusing language. The proposed language makes clear that the TOP is the entity responsible for establishing SOLs, and that these SOLs must be established in accordance with the RC's SOL Methodology.
FAC-014-2, Requirements R3 and R4 R3. The Planning Authority shall establish SOLs, including IROLs, for its Planning Authority Area that are consistent with its SOL Methodology. R4. The Transmission Planner shall establish SOLs, including IROLs, for its Transmission Planning Area that are consistent with its Planning Authority's SOL Methodology.	1. FAC-011-4, Requirement R8, Part 8.2 2. FAC-015-1, Requirements R 1 – R6 FAC-011-4, Requirement R8, Part 8.2: R8. Each Reliability Coordinator shall provide its new or revised SOL Methodology to: 8.2. Each Planning Coordinator and Transmission Planner responsible for planning any portion of the Reliability Coordinator Area prior to the effective date of the SOL Methodology;	The PCs and TOPs responsible for planning any portion of the RC's Area are made aware of the RC's SOL Methodology through FAC-011-4, Requirement R8, Part 8.2. By having the RC's SOL Methodology, PCs and TPs who plan any portion of the System in the RC Area have knowledge of the methods and criteria for establishing SOLs, including the stability performance criteria used for establishing stability limits in the operations horizon. New Reliability Standard FAC-015-1 along with the changes made to FAC-011-4 and FAC-014-3 represent an improvement for

NERC

Standard: FAC-014-2 Establish and Communicate System Operating Limits		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
	FAC-015-1: R1. Each Planning Coordinator, when developing its steady-state modeling data requirements, shall implement a process to ensure that Facility Ratings used in its Planning Assessment of the Near-Term Transmission Planning Horizon are equally limiting or more limiting than those established in accordance with its Reliability Coordinator's SOL Methodology. If the Planning Coordinator uses less limiting Facility Ratings than the Facility Ratings established in accordance with its Reliability Coordinator's SOL Methodology, the Planning Coordinator shall provide a technical justification to its Reliability Coordinator. R2. Each Planning Coordinator shall implement a process to ensure that System steady state voltage limits used in its Planning Assessment of the Near-Term Transmission Planning Horizon are equally limiting or more limiting than the System Voltage Limits established in accordance with its Reliability Coordinator's SOL Methodology. If the Planning Coordinator uses less limiting System steady-state voltage limits than the System Voltage Limits established in accordance with its	planning and operations to better work together to address the reliability issues that are ultimately faced in Real-time operations. FAC-015-1, Requirements R1 – R3 ensures that Planning Assessments performed for the Near-Term Transmission Planning Horizon (required by TPL-001-4), are bounded by modeling data and performance criteria that are equally limiting or more limiting than those established in accordance with the RC's SOL Methodology. FAC-015-1, Requirement R1 addresses Facility Ratings used in Planning Assessments, Requirement R2 addresses the System steady state voltage limits used in Planning Assessments, and Requirement R3 addresses the stability performance criteria used in Planning Assessments. These requirements address the three components of SOLs used in operations and facilitates continuity between operations and planning.

Standard: FAC-014-2 Establish and Communicate System Operating Limits		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
	Reliability Coordinator's SOL Methodology, the Planning Coordinator shall provide a technical justification to its Reliability Coordinator. R3. Each Planning Coordinator shall implement a process to ensure the stability performance criteria used in its Planning Assessment of the Near-Term Transmission Planning Horizon are equally limiting or more limiting than the stability performance criteria established in its Reliability Coordinator's SOL Methodology. If the Planning Coordinator uses less limiting stability performance criteria than the stability performance criteria specified in its Reliability Coordinator's SOL Methodology, the Planning Coordinator shall provide a technical justification to its Reliability Coordinator. R4. Each Planning Coordinator shall provide the Facility Ratings, System steady-state voltage limits, and stability performance criteria for use in its Planning Assessment to its Transmission Planners and to requesting Planning Coordinators. R5. Each Transmission Planner shall use Facility Ratings, System steady-state voltage limits, and stability performance criteria in its Planning Assessment that are equally limiting or more	Implementing the processes required in FAC-015-1, Requirements R1 – R3 provides the PC with Facility Ratings, System steady-state voltage limits, and stability performance criteria that are equally limiting or more limiting than those established in accordance with the RC's SOL Methodology. FAC-015-1, Requirement R4 requires the PC to provide those Facility Ratings, System steady-state voltage limits, and stability performance criteria for use in its Planning Assessment to its TPs and to requesting PCs. FAC-015-1, Requirement R5 requires the TP to use the Facility Ratings, System steady-state voltage limits, and stability performance criteria in its Planning Assessment that are equally limiting or more limiting than the Facility Ratings, System steady-state voltage limits, and stability criteria provided by its PC. By implementing Requirements R1 – R5 of FAC-015-1, equally limiting or more limiting Facility Ratings, System steady-

Standard: FAC-014-2 Establish and Communicate System Operating Limits		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
	limiting than the Facility Ratings, System steady-state voltage limits, and stability criteria provided by its Planning Coordinator. R6. Each Planning Coordinator shall communicate any instability, Cascading or uncontrolled separation identified in either its Planning Assessment of the Near-Term Transmission Planning Horizon or its Transfer Capability assessment to each impacted Reliability Coordinator and Transmission Operator. This communication shall include: 6.1 The type of instability identified (e.g., voltage collapse, angular instability, transient voltage dip criteria violation); 6.2 The associated stability criteria used as part of determining the instability; 6.3 The associated Contingency(ies) which result(s) in the instability, Cascading or uncontrolled separation; 6.4 Any Remedial Action Scheme action, under voltage load shedding (UVLS) action, under frequency load shedding (UFLS) action, interruption of Firm Transmission Service, or Non-	state voltage limits and stability criteria that are established in accordance with the RC's SOL Methodology are ultimately implemented in the Planning Assessments performed by the PCs and TPs, thus improving reliability by ensuring continuity between planning and operations. FAC-015-1, Requirement R6 requires the PC to communicate any instability, Cascading or uncontrolled separation identified in the Planning Assessments to the RC and to impacted TOPs. The subparts of Requirement R6 require the communication of key information that can be useful to the RC and TOP to establish stability limits and IROLs that will ultimately be used in real-time operations.

Standard: FAC-014-2 Establish and Communicate System Operating Limits		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
	Consequential Load Loss required to address the instability, Cascading or uncontrolled separation; 6.5 Any Corrective Action Plan associated with the instability, Cascading or uncontrolled separation.	
FAC-014-2, Requirement R5, R5.1 R5. The Reliability Coordinator, Planning Authority and Transmission Planner shall each provide its SOLs and IROLs to those entities that have a reliability-related need for those limits and provide a written request that includes a schedule for delivery of those limits as follows: R5.1. The Reliability Coordinator shall provide its SOLs (including the subset of SOLs that are IROLs) to adjacent Reliability Coordinators and Reliability Coordinators who indicate a reliability-related need for those limits, and to the Transmission Operators, Transmission Planners, Transmission Service Providers and Planning Authorities within its Reliability Coordinator Area. For each IROL, the Reliability Coordinator shall provide the following supporting information:	The communication of SOL and IROL information from the Reliability Coordinator is addressed by: 1. FAC-014-3, Requirement R5 (addresses communication from the Reliability Coordinator to other entities) 2. IRO-014-3, Requirement R1 (addresses communication between Reliability Coordinators to support reliable operations) FAC-014-3, Requirement R5: R5. Each Reliability Coordinator shall provide: 5.1. Each Planning Coordinator within its Reliability Coordinator Area, SOLs for its Reliability Coordinator Area (including the subset of SOLs that are IROLs) at least once every twelve calendar months. 5.2. Each impacted Planning Coordinator within its Reliability Coordinator Area, the following	Reference the description above for Requirement R3 which describes a different set of roles and responsibilities for the PC and TP as defined in FAC-015-1. While the existing requirements in FAC-014-2, Requirement R5 are preserved in FAC-014-3, Requirement R5, FAC-014-3, Requirement R5 more specifically address the communications requirements for the RC. Each recipient of the RC communications is addressed in a separate subpart because each recipient has a slightly different need. This approach represents an improvement over the former approach. IRO-014-3, Requirement R1 and subparts addresses RC communication of critical operational information to adjacent RCs,

Standard: FAC-014-2 Establish and Communicate System Operating Limits		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
R5.1.1. Identification and status of the associated Facility (or group of Facilities) that is (are) critical to the derivation of the IROL. R5.1.2. The value of the IROL and its associated Tv. R5.1.3. The associated Contingency(ies). R5.1.4. The type of limitation represented by the IROL (e.g., voltage collapse, angular stability).	information for each established stability limit and each established IROL at least once every twelve calendar months: 5.2.1. The value of the stability limit or IROL; 5.2.2. Identification of the Facilities that are critical to the derivation of the stability limit or IROL; 5.2.3. The associated IROL Tv for any IROL; 5.2.4. The associated Contingency(ies); and 5.2.5. The type of limitation represented by the stability limit or IROL (e.g., voltage collapse, angular stability). 5.3. Each impacted Transmission Operator within its Reliability Coordinator Area, the value of the stability limits established pursuant to Requirement R4 and each IROL established pursuant to Requirement R1, in an agreed upon time frame necessary for inclusion in the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments. 5.4. Each impacted Transmission Operator within its Reliability Coordinator Area, the	which addresses RC-to-RC communication and coordinated operations issues.

and Reliability Coordinators that work within its Planning Authority Area. R5.4 The Transmission Planner shall provide its SOLs (including the subset of SOLs that are IROLs) to its Planning Authority, Reliability Coordinators, Transmission Operators, and Transmission Service Providers that work within its Transmission Planning Area and to adjacent Transmission Planners.	R1. Each Planning Coordinator, when developing its steady-state modeling data requirements, shall implement a process to ensure that Facility Ratings used in its Planning Assessment of the Near-Term Transmission Planning Horizon are equally limiting or more limiting than those established in accordance with its Reliability Coordinator's SOL Methodology. If the Planning Coordinator uses less limiting Facility Ratings than the Facility Ratings established in accordance with its Reliability Coordinator's SOL Methodology, the Planning Coordinator shall provide a technical justification to its Reliability Coordinator. R2. Each Planning Coordinator shall implement a process to ensure that System steady state voltage limits used in its Planning Assessment of the Near-Term Transmission Planning Horizon are equally limiting or more limiting than the System Voltage Limits established in accordance with its Reliability Coordinator's SOL Methodology. If the Planning Coordinator uses less limiting System steady-state voltage limits than the System Voltage Limits established in accordance with its Reliability Coordinator's SOL Methodology, the	provides the PC with Facility Ratings, System steady-state voltage limits, and stability performance criteria that are equally limiting or more limiting than those established in accordance with the RC's SOL Methodology. FAC-015-1, Requirement R4 addresses the PC's role for providing the Facility Ratings, System steady-state voltage limits and stability performance criteria derived from Requirements R1 – R3 to the TPs and to requesting PCs for their use in performing Planning Assessments. FAC-015-1, Requirement R5 requires the TP to use the Facility Ratings, System steady-state voltage limits, and stability performance criteria in its Planning Assessment that are equally limiting or more limiting than the Facility Ratings, System steady-state voltage limits, and stability criteria provided by its PC. FAC-015-1, Requirements R1 – R5 result in PC and TPs using Facility Ratings, System steady state voltage limits, and stability performance criteria in their

Standard: FAC-014-2 Establish and Communicate System Operating Limits		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
	Planning Coordinator shall provide a technical justification to its Reliability Coordinator. R3. Each Planning Coordinator shall implement a process to ensure the stability performance criteria used in its Planning Assessment of the Near-Term Transmission Planning Horizon are equally limiting or more limiting than the stability performance criteria established in its Reliability Coordinator's SOL Methodology. If the Planning Coordinator uses less limiting stability performance criteria than the stability performance criteria specified in its Reliability Coordinator's SOL Methodology, the Planning Coordinator shall provide a technical justification to its Reliability Coordinator. R4. Each Planning Coordinator shall provide the Facility Ratings, System steady-state voltage limits, and stability performance criteria for use in its Planning Assessment to its Transmission Planners and to requesting Planning Coordinators. R5. Each Transmission Planner shall use Facility Ratings, System steady-state voltage limits, and stability performance criteria in its Planning Assessment that are equally limiting or more limiting than the Facility Ratings, System steady-	Planning Assessments that are equally limiting or more limiting than the Facility Ratings, System Voltage Limits, and stability performance criteria established in accordance with the RC's SOL Methodology. FAC-015-1, Requirement R6 requires the PC to communicate any instability, Cascading or uncontrolled separation identified in the Planning Assessments to the RC and to impacted TOPs. The subparts of Requirement R6 require the communication of key information that can be useful to the RC and TOP to establish stability limits and IROLs that will ultimately be used in real-time operations. The TSP was removed from the SOL communication chain. The TSP does not need SOLs from the PCs or TPs; rather, TSPs need TTC and TFC from the TOPs as required in Requirement R7 of MOD-028-2, Requirement R4 of MOD-029-2a, and Requirement R2.6 of MOD-030-3. The

Standard: FAC-014-2 Establish and Communicate System Operating Limits		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
	state voltage limits, and stability criteria provided by its Planning Coordinator. R6. Each Planning Coordinator shall communicate any instability, Cascading or uncontrolled separation identified in either its Planning Assessment of the Near-Term Transmission Planning Horizon or its Transfer Capability assessment to each impacted Reliability Coordinator and Transmission Operator. This communication shall include: 6.1 The type of instability identified (e.g., voltage collapse, angular instability, transient voltage dip criteria violation); 6.2 The associated stability criteria used as part of determining the instability; 6.3 The associated Contingency(ies) which result(s) in the instability, Cascading or uncontrolled separation; 6.4 Any Remedial Action Scheme action, under voltage load shedding (UVLS) action, under frequency load shedding (UFLS) action, interruption of Firm Transmission Service, or Non-Consequential Load Loss required to address the instability, Cascading or uncontrolled separation;	TTCs and TFCs provided to the TSPs already reflect the impact of any SOLs. TPL-001-4, Requirement R8 requires each PC and TP to distribute its Planning Assessment results to adjacent PCs and adjacent TPs within 90 calendar days of completing its Planning Assessment, and to any functional entity that has a reliability related need and submits a written request for the information within 30 days of such a request. With this requirement, any functional entity with a reliability-related need for a PC's or TP's Planning Assessment can obtain that Planning Assessment. Requesting entities are then made aware of any system performance issues identified by these Planning Assessments.

Standard: FAC-014-2 Establish and Communicate System Operating Limits		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
	6.5 Any Corrective Action Plan associated with the instability, Cascading or uncontrolled separation. <u>MOD-028-2, Requirement R7:</u> R7. The Transmission Operator shall provide the Transmission Service Provider of that ATC Path with the most current value for TTC for that ATC Path no more than: R7.1. One calendar day after its determination for TTCs used in hourly and daily ATC calculations. R7.2. Seven calendar days after its determination for TTCs used in monthly ATC calculations. <u>MOD-029-2a, Requirement R4:</u> R4. Within seven calendar days of the finalization of the study report, the Transmission Operator shall make available to the Transmission Service Provider of the ATC Path, the most current value for TTC and the TTC study report documenting the assumptions used and steps taken in determining the current value for TTC for that ATC Path.	

Standard: FAC-014-2 Establish and Communicate System Operating Limits		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
	MOD-030-3, Requirement R2.6: [The TOP shall…] R2.6. Provide the Transmission Service Provider with the TFCs within seven calendar days of their establishment. TPL-001-4, Requirement R8: R8. Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 calendar days of completing its Planning Assessment, and to any functional entity that has a reliability related need and submits a written request for the information within 30 days of such a request. 8.1. If a recipient of the Planning Assessment results provides documented comments on the results, the respective Planning Coordinator or Transmission Planner shall provide a documented response to that recipient within 90 calendar days of receipt of those comments.	
FAC-014-2, Requirement R6 R6. The Planning Authority shall identify the subset of multiple contingencies (if any),	FAC-015-1, Requirement R6 R6. Each Planning Coordinator shall communicate any instability, Cascading or	FAC-015-1, Requirement R6 cover the content of FAC-014-2, Requirement R6 and improves upon it as follows:

Standard: FAC-014-2 Establish and Communicate System Operating Limits		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
from Reliability Standard TPL-003 which result in stability limits. R6.1 The Planning Authority shall provide this list of multiple contingencies and the associated stability limits to the Reliability Coordinators that monitor the facilities associated with these contingencies and limits. R6.2 If the Planning Authority does not identify any stability-related multiple contingencies, the Planning Authority shall so notify the Reliability Coordinator.	uncontrolled separation identified in either its Planning Assessment of the Near-Term Transmission Planning Horizon or its Transfer Capability assessment to each affected Reliability Coordinator and Transmission Operator. This communication shall include: 6.1 The type of the instability identified (e.g., voltage collapse, angular instability, transient voltage dip criteria violation); 6.2 The associated stability criteria used as part of determining the instability; 6.3 The associated Contingency(ies) which result(s) in the instability, Cascading or uncontrolled separation; 6.4 Any Remedial Action Scheme action, under voltage load shedding (UVLS) action, under frequency load shedding (UFLS) action, interruption of Firm Transmission Service, or Non-Consequential Load Loss required to address the instability, Cascading or uncontrolled separation; 6.5 Any Corrective Action Plan associated with the instability, Cascading or uncontrolled separation.	• FAC-015-1, Requirement R6 addresses not only the identification of multiple contingencies that result in stability limits, but also address the key information RCs need to establish stability limits and IROLs used in operations. Unlike FAC-014-2, Requirement R6, FAC-015-1, Requirement R6 ensures the type of instability, relevant stability criteria, and mitigation assumptions used by the PC are communicated to the appropriate RC. • Additionally, FAC-015-1, Requirement R6 includes all planning events (single and multiple contingencies) that result in instability, Cascading, or uncontrolled separation. • FAC-014-2, Requirement R6, R6.2 is addressed by FAC-015-1, Requirement R6 because all instances of instability identified by the PC are to be communicated

Standard: FAC-014-2 Establish and Communicate System Operating Limits		
Requirement in Approved Standard	**Translation to New Standard or Other Action**	**Description and Change Justification**
		to the RC in accordance with FAC-015-1, Requirement R6. In addition, FAC-014-2, Requirement R6, R6.2 is administrative in nature, given that the existing FAC-014-2, Requirement R6, R6.1 and proposed FAC-015-1, Requirement R6 both require communication of a defined set of stability related data. The absence of any communication of stability related data inherently implies the PC has not identified any instability and therefore has nothing to communicate.

Violation Risk Factor and Violation Severity Level Justifications

FAC-011-4 System Operating Limits Methodology for the Operations Horizon

This document provides the standard drafting team's (SDT's) justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in Reliability Standard FAC-011-4 System Operating Limits (SOL) Methodology for the Operations Horizon. Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the Electric Reliability Organizations Sanction Guidelines. The SDT applied the following NERC criteria and FERC Guidelines when developing the VRFs and VSLs for the requirements.

NERC Criteria for Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

FERC Guidelines for Violation Risk Factors

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

FERC seeks to ensure that VRFs assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard
FERC expects a rational connection between the sub-Requirement VRF assignments and the main Requirement VRF assignment.

Guideline (3) – Consistency among Reliability Standards
FERC expects the assignment of VRFs corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular VRF level conforms to NERC's definition of that risk level.

Guideline (5) – Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC Criteria for Violation Severity Levels

VSLs define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

VSLs should be based on NERC's overarching criteria shown in the table below:

Lower VSL	Moderate VSL	High VSL	Severe VSL
The performance or product measured almost meets the full intent of the requirement.	The performance or product measured meets the majority of the intent of the requirement.	The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.	The performance or product measured does not substantively meet the intent of the requirement.

FERC Order of Violation Severity Levels

The FERC VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

Guideline (1) – Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline (2) – Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.
Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline (3) – Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline (4) – Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VRF Justifications for FAC-011-4 Requirement R1	
Proposed VRF	**Medium**
FERC VRF G1 Discussion Guideline 1- Consistency with Blackout Report	The VRF is consistent with the conclusions of the final Blackout Report.
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	The requirement has no sub-requirements so a single VRF was assigned.
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	A VRF of medium for this requirement is consistent with approved Reliability Standard FAC-013-2, Requirement R1.
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	Not having a methodology for establishing SOLs has the potential unintended consequence of creating inconsistencies in establishing SOLs which could directly affect the electrical state or the capability of the Bulk Electric System (BES), or the ability to effectively monitor and control the BES. However, violation of this requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to BES instability, separation, or cascading failures, nor to hinder restoration to a normal condition.
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-	The requirement contains one objective, therefore a single VRF is assigned.

mingle More than One Obligation	

VSLs for FAC-011-4, Requirement R1			
Lower	**Moderate**	**High**	**Severe**
N/A	N/A	N/A	The Reliability Coordinator did not have a SOL Methodology for establishing SOLs within its Reliability Coordinator Area.

VSL Justifications for FAC-011-4, Requirement R1	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The requirement does not have elements or quantities to evaluate degrees of compliance. The requirement is binary and therefore a VSL of Severe is assigned for non-compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties <u>Guideline 2a</u>: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent <u>Guideline 2b</u>: Violation Severity Level Assignments that Contain Ambiguous Language	The requirement does not have elements or quantities to evaluate degrees of compliance. The requirement is binary and therefore a VSL of Severe is assigned for non-compliance. The requirement is clear and does not contain any ambiguous language.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL is worded consistently with the corresponding requirement.

FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The proposed VSL is not based on a cumulative number of violations.

VRF Justifications for FAC-011-4 Requirement R2	
Proposed VRF	**Medium**
FERC VRF G1 Discussion Guideline 1- Consistency with Blackout Report	The VRF is consistent with the conclusions of the final Blackout Report.
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	The requirement has no sub-requirements so a single VRF was assigned.
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	A VRF of medium for this requirement is consistent with approved Reliability Standard FAC-008-3, Requirements R2 and R3.
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	The establishment of improper Facility Ratings could directly affect the electrical state or the capability of the BES, or the ability to effectively monitor and control the BES. However, violation of this requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to BES instability, separation, or cascading failures, nor to hinder restoration to a normal condition.
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation	The requirement contains one objective, therefore a single VRF is assigned.

VSLs for FAC-011-4, Requirement R2			
Lower	**Moderate**	**High**	**Severe**
N/A	N/A	The Reliability Coordinator included in its SOL Methodology the method for Transmission Operators to determine the applicable owner-provided Facility Ratings to be used in operations but the method did not address the use of common Facility Ratings between the Reliability Coordinator and the Transmission Operators in its Reliability Coordinator Area.	The Reliability Coordinator did not include in its SOL Methodology the method for Transmission Operators to determine the applicable owner-provided Facility Ratings to be used in operations.

VSL Justifications for FAC-011-4, Requirement R2	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The requirement maps to the previously approved Requirement R1 sub-requirement R1.2. Therefore, the proposed VSLs do not have the unintended consequence of lowering compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL is worded consistently with the corresponding requirement.

FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The proposed VSL is not based on a cumulative number of violations.

VRF Justifications for FAC-011-4 Requirement R3	
Proposed VRF	**Medium**
FERC VRF G1 Discussion Guideline 1- Consistency with Blackout Report	The VRF is consistent with the conclusions of the final Blackout Report.
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	This Guideline is no longer applicable since sub-requirements (Parts) utilize the same VRF assigned to the main requirement.
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	A VRF of medium for this requirement is consistent with approved Reliability Standard FAC-008-3, Requirements R2 and R3 which requires development of a methodology to determine certain ratings/limits.
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	The establishment of incorrect System Voltage Limits could directly affect the electrical state or the capability of the BES, or the ability to effectively monitor and control the BES. However, violation of this requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to BES instability, separation, or cascading failures, nor to hinder restoration to a normal condition.
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation	The requirement contains one objective, therefore a single VRF is assigned.

VSLs for FAC-011-4, Requirement R3			
Lower	**Moderate**	**High**	**Severe**
The Reliability Coordinator failed to incorporate one of the Parts of Requirement R3 into its SOL Methodology.	The Reliability Coordinator failed to incorporate two of the Parts of Requirement R3 into its SOL Methodology.	The Reliability Coordinator failed to incorporate three of the Parts of Requirement R3 into its SOL Methodology.	The Reliability Coordinator failed to incorporate four or more of the Parts of Requirement R3 into its SOL Methodology.

VSL Justifications for FAC-011-4, Requirement R3	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The requirement maps to the previously approved Requirement R1 and Requirement R2. Therefore, the proposed VSLs do not have the unintended consequence of lowering compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties <u>Guideline 2a</u>: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent <u>Guideline 2b</u>: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL is worded consistently with the corresponding requirement.

FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The proposed VSL is not based on a cumulative number of violations.

VRF Justifications for FAC-011-4 Requirement R4	
Proposed VRF	**Medium**
FERC VRF G1 Discussion Guideline 1- Consistency with Blackout Report	The VRF is consistent with the conclusions of the final Blackout Report.
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	This Guideline is no longer applicable since sub-requirements (Parts) utilize the same VRF assigned to the main requirement.
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	A VRF of medium for this requirement is consistent with approved Reliability Standard FAC-008-3, Requirements R2 and R3 which requires development of a methodology to determine certain ratings/limits.
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	The establishment of incorrect stability limits could directly affect the electrical state or the capability of the BES, or the ability to effectively monitor and control the BES. However, violation of this requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to BES instability, separation, or cascading failures, nor to hinder restoration to a normal condition.
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation	The requirement contains one objective, therefore a single VRF is assigned.

VSLs for FAC-011-4, Requirement R4			
Lower	**Moderate**	**High**	**Severe**
The Reliability Coordinator failed to incorporate one of the Parts of Requirement R4 into its SOL Methodology.	The Reliability Coordinator failed to incorporate two of the Parts of Requirement R4 into its SOL Methodology.	The Reliability Coordinator failed to incorporate three of the Parts of Requirement R4 into its SOL Methodology.	The Reliability Coordinator failed to incorporate four or more of the Parts of Requirement R4 into its SOL Methodology.

VSL Justifications for FAC-011-4, Requirement R4	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The requirement maps to the previously approved Requirement R1 and Requirement R2. Therefore, the proposed VSLs do not have the unintended consequence of lowering compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties <u>Guideline 2a</u>: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent <u>Guideline 2b</u>: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL is worded consistently with the corresponding requirement.

FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The proposed VSL is not based on a cumulative number of violations.

VRF Justifications for FAC-011-4 Requirement R5	
Proposed VRF	**Medium**
FERC VRF G1 Discussion Guideline 1- Consistency with Blackout Report	The VRF is consistent with the conclusions of the final Blackout Report.
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	This Guideline is no longer applicable since sub-requirements (Parts) utilize the same VRF assigned to the main requirement.
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	A VRF of medium for this requirement is consistent with approved Reliability Standard TPL-001-4, Requirement R3, Part 3.4, which requires development of a list of contingencies to be evaluated for System performance.
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	Incorrectly identifying the single Contingencies and multiple Contingencies for use in determining stability limits and performing Operational Planning Analyses (OPAs) and Real-time Assessments (RTAs) could directly affect the electrical state or the capability of the BES, or the ability to effectively monitor and control the BES. However, violation of this requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to BES instability, separation, or cascading failures, nor to hinder restoration to a normal condition.
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation	The requirement contains one objective, therefore a single VRF is assigned.

VSLs for FAC-011-4, Requirement R5			
Lower	**Moderate**	**High**	**Severe**
N/A	The Reliability Coordinator failed to incorporate one of the Parts 5.2, 5.3 or 5.4 of Requirement R5 into its SOL Methodology.	The Reliability Coordinator failed to incorporate two of the Parts 5.2, 5.3, or 5.4 of Requirement R5 into its SOL Methodology.	The Reliability Coordinator failed to incorporate Part 5.1 of Requirement R5 into its SOL Methodology. OR The Reliability Coordinator failed to incorporate Parts 5.2, 5.3, and 5.4 of Requirement R5 into its SOL Methodology.

VSL Justifications for FAC-011-4, Requirement R5	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The requirement maps to the previously approved Requirement R3, sub-requirements R3.2, R3.3, and R3.3.1. Therefore, the proposed VSLs do not have the unintended consequence of lowering compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties <u>Guideline 2a</u>: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent <u>Guideline 2b</u>: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL is worded consistently with the corresponding requirement.

FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The proposed VSL is not based on a cumulative number of violations.

VRF Justifications for FAC-011-4 Requirement R6	
Proposed VRF	**High**
FERC VRF G1 Discussion Guideline 1- Consistency with Blackout Report	The VRF is consistent with the conclusions of the final Blackout Report.
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	This Guideline is no longer applicable since sub-requirements (Parts) utilize the same VRF assigned to the main requirement.
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	A VRF of High for this requirement is consistent with approved Reliability Standard FAC-014-2, Requirements R1, R3, and R4 which requires development of Interconnection Reliability Operating Limits (IROLs) to be consistent with a methodology.
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	Failing to correctly identify an IROL could directly cause or contribute to BES instability, separation, or a cascading sequence of failures, or could place the BES at an unacceptable risk of instability, separation, or cascading failures.
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation	The requirement contains one objective, therefore a single VRF is assigned.

VSLs for FAC-011-4, Requirement R6			
Lower	**Moderate**	**High**	**Severe**
N/A	N/A	The Reliability Coordinator failed to include Part 6.1 (a description of how to identify the subset of SOLs that qualify as IROLs) in its SOL Methodology. OR The Reliability Coordinator failed to include Part 6.2 (a criteria for determining when violating a SOL qualifies as an IROL) in its SOL Methodology. OR The Reliability Coordinator failed to include Part 6.2 (criteria for developing any associated IROL T_v) in its SOL Methodology.	The Reliability Coordinator failed to include Parts 6.1 and 6.2 in its SOL Methodology.

VSL Justifications for FAC-011-4, Requirement R6	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The requirement maps to the previously approved Requirement R1, sub-requirement R1.3 and Requirement R3, sub-requirement R3.7. Therefore, the proposed VSLs do not have the unintended consequence of lowering compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties <u>Guideline 2a</u>: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent <u>Guideline 2b</u>: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL is worded consistently with the corresponding requirement.

FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The proposed VSL is not based on a cumulative number of violations.

VRF Justifications for FAC-011-4 Requirement R7	
Proposed VRF	**Medium**
FERC VRF G1 Discussion Guideline 1- Consistency with Blackout Report	The VRF is consistent with the conclusions of the final Blackout Report.
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	The requirement has no sub-requirements (Parts) so a single VRF was assigned.
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	A VRF of medium for this requirement is consistent with approved other standards in the BAL, COM, EOP, IRO, and TOP families that require notification to other entities for situational awareness of the BES.
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	Failure to communicate identified SOLs could directly affect the electrical state or the capability of the BES, or the ability to effectively monitor and control the BES. However, violation of this requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to BES instability, separation, or cascading failures, nor to hinder restoration to a normal condition.
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation	The requirement contains one objective, therefore a single VRF is assigned.

VSLs for FAC-011-4, Requirement R7			
Lower	**Moderate**	**High**	**Severe**
N/A	N/A	The Reliability Coordinator did not include in its SOL Methodology the periodicity of SOL communications for Transmission Operators to communicate SOLs the Transmission Operator established.	The Reliability Coordinator did not include in its SOL Methodology the method for Transmission Operators to communicate SOLs it established or the periodicity of SOL communication.

VSL Justifications for FAC-011-4, Requirement R7	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The requirement does not have elements or quantities to evaluate degrees of compliance. The proposed VSLs do not lower the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL is worded consistently with the corresponding requirement.

FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The proposed VSL is not based on a cumulative number of violations.

VRF Justifications for FAC-011-4 Requirement R8	
Proposed VRF	**Lower**
FERC VRF G1 Discussion Guideline 1- Consistency with Blackout Report	The VRF is consistent with the conclusions of the final Blackout Report.
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	This Guideline is no longer applicable since sub-requirements (Parts) utilize the same VRF assigned to the main requirement.
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	A VRF of lower for this requirement is consistent with approved Reliability Standard FAC-010-3, Requirement R4, FAC-011-3, Requirement R4, and FAC-013-2, Requirement R2 which requires notification of a new or revised methodology to other entities.
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	Failing to provide its SOL methodology to entities within and adjacent to its Reliability Coordinator Area could affect the electrical state or the capability of the BES, or the ability to effectively monitor and control the BES. However, violation of this requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to BES instability, separation, or cascading failures, nor to hinder restoration to a normal condition.
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation	The requirement contains one objective, therefore a single VRF is assigned.

VSLs for FAC-011-4, Requirement R8			
Lower	**Moderate**	**High**	**Severe**
The Reliability Coordinator provided its new or revised SOL Methodology to a requesting Reliability Coordinator in accordance with Part 8.4 but was late by less than or equal to 10 calendar days.	The Reliability Coordinator provided its new or revised SOL Methodology to a requesting Reliability Coordinator in accordance with Part 8.4, but was late by more than 10 calendar days but less than or equal to 20 calendar days.	The Reliability Coordinator failed to provide its new or revised SOL Methodology to one of the parties specified in Parts 8.1 through 8.3. OR The Reliability Coordinator provided its new or revised SOL Methodology to a requesting Reliability Coordinator in accordance with Part 8.4, but was late by more than 20 calendar days but less than or equal to 30 calendar days.	The Reliability Coordinator failed to provide its new or revised SOL Methodology to two or more of the parties specified in Parts 8.1 through 8.3. OR The Reliability Coordinator failed to provide its new or revised SOL Methodology to one or more of the parties specified in Parts 8.1 through 8.3 prior to the effective date of the SOL Methodology. OR The Reliability Coordinator provided its new or revised SOL Methodology to a requesting Reliability Coordinator in accordance with Part 8.4, but was late by more than 30 calendar days. OR The Reliability Coordinator failed to provide its new or revised SOL Methodology to a requesting Reliability

			Coordinator in accordance with Part 8.4.

VSL Justifications for FAC-011-4, Requirement R8	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The VSLs map to the currently-effective FAC-011-3 Requirement R4. The proposed VSLs do not lower the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL is worded consistently with the corresponding requirement.

FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The proposed VSL is not based on a cumulative number of violations.

Violation Risk Factor and Violation Severity Level Justifications

FAC-014-3 Establish and Communicate System Operating Limits

This document provides the standard drafting team's (SDT's) justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in Reliability Standard FAC-014-3 Establish and Communicate System Operating Limits (SOLs). Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the Electric Reliability Organizations Sanction Guidelines. The SDT applied the following NERC criteria and FERC Guidelines when developing the VRFs and VSLs for the requirements.

NERC Criteria for Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

FERC Guidelines for Violation Risk Factors

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

FERC seeks to ensure that VRFs assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard

FERC expects a rational connection between the sub-Requirement VRF assignments and the main Requirement VRF assignment.

Guideline (3) – Consistency among Reliability Standards

FERC expects the assignment of VRFs corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular VRF level conforms to NERC's definition of that risk level.

Guideline (5) – Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC Criteria for Violation Severity Levels

VSLs define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

VSLs should be based on NERC's overarching criteria shown in the table below:

Lower VSL	Moderate VSL	High VSL	Severe VSL
The performance or product measured almost meets the full intent of the requirement.	The performance or product measured meets the majority of the intent of the requirement.	The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.	The performance or product measured does not substantively meet the intent of the requirement.

FERC Order of Violation Severity Levels

The FERC VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

Guideline (1) – Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline (2) – Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.

Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline (3) – Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline (4) – Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

VRF Justifications for FAC-014-3 Requirement R1	
Proposed VRF	**High**
FERC VRF G1 Discussion Guideline 1- Consistency with Blackout Report	The VRF is consistent with the conclusions of the final Blackout Report.
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	The requirement has no sub-requirements so a single VRF was assigned.
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	A VRF of high for this requirement is consistent with approved Reliability Standard TPL-001-4 which requires development of operating conditions through the use of system models.
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	Failing to correctly identify an IROL could directly cause or contribute to Bulk Electric System (BES) instability, separation, or a cascading sequence of failures, or could place the BES at an unacceptable risk of instability, separation, or cascading failures.
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation	The requirement contains one objective, therefore a single VRF is assigned.

VSLs for FAC-014-3, Requirement R1			
Lower	**Moderate**	**High**	**Severe**
N/A	N/A	N/A	The Reliability Coordinator did not establish Interconnection Reliability Operating Limits (IROLs) for its Reliability Coordinator Area in accordance with its System Operating Limit Methodology ("SOL Methodology") as established in FAC-011-4.

VSL Justifications for FAC-014-3, Requirement R1	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The requirement does not have elements or quantities to evaluate degrees of compliance. The requirement is binary and therefore a VSL of Severe is assigned for non-compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The requirement does not have elements or quantities to evaluate degrees of compliance. The requirement is binary and therefore a VSL of Severe is assigned for non-compliance. The requirement is clear and does not contain any ambiguous language.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL is worded consistently with the corresponding requirement.

FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The proposed VSL is not based on a cumulative number of violations.

VRF Justifications for FAC-014-3 Requirement R2	
Proposed VRF	**Medium**

This reliability objective of Requirement R2 from approved Reliability Standard FAC-014-2 is now Requirement R2 of proposed Reliability Standard FAC-014-3. Therefore, the existing VRF of medium was maintained for consistency.

VSLs for FAC-014-3, Requirement R2			
Lower	**Moderate**	**High**	**Severe**
N/A	N/A	N/A	The Transmission Operator did not establish SOLs for its portion of the Reliability Coordinator Area in accordance with its Reliability Coordinator's SOL Methodology.

VSL Justifications for FAC-014-3, Requirement R2	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The requirement does not have elements or quantities to evaluate degrees of compliance. The requirement is binary and therefore a VSL of Severe is assigned for non-compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties <u>Guideline 2a</u>: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent <u>Guideline 2b</u>: Violation Severity Level Assignments that Contain Ambiguous Language	The requirement does not have elements or quantities to evaluate degrees of compliance. The requirement is binary and therefore a VSL of Severe is assigned for non-compliance. The requirement is clear and does not contain any ambiguous language.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL is worded consistently with the corresponding requirement.

FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The proposed VSL is not based on a cumulative number of violations.

VRF Justifications for FAC-014-3 Requirement R3	
Proposed VRF	**Medium**

This reliability objective of Requirement R5, R5.2 from approved Reliability Standard FAC-014-2 is now Requirement R3 of proposed Reliability Standard FAC-014-3. Therefore, the existing VRF of medium was maintained for consistency.

VSLs for FAC-014-3, Requirement R3			
Lower	**Moderate**	**High**	**Severe**
N/A	N/A	The Transmission Operator provided its SOLs to its Reliability Coordinator, but did not provide its SOLs at the periodicity at which the RC needs such information to perform its reliability functions.	The Transmission Operator did not provide its SOLs to its Reliability Coordinator.

VSL Justifications for FAC-014-3, Requirement R3	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The requirement maps to the previously approved Requirement R5, R5.2 of FAC-014-2. Therefore, the proposed VSLs do not have the unintended consequence of lowering compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL is worded consistently with the corresponding requirement.

FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The proposed VSL is not based on a cumulative number of violations.

VRF Justifications for FAC-014-3 Requirement R4	
Proposed VRF	**High**
FERC VRF G1 Discussion Guideline 1- Consistency with Blackout Report	The VRF is consistent with the conclusions of the final Blackout Report.
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	The requirement has no sub-requirements so a single VRF was assigned.
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	A VRF of high for this requirement is consistent with approved Reliability Standard TPL-001-4 which requires development of operating conditions through the use of system models.
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	The establishment of incorrect stability limits could directly cause or contribute to BES instability, separation, or a cascading sequence of failures, or could place the BES at an unacceptable risk of instability, separation, or cascading failures.
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation	The requirement contains one objective, therefore a single VRF is assigned.

VSLs for FAC-014-3, Requirement R4			
Lower	**Moderate**	**High**	**Severe**
N/A	N/A	N/A	The Reliability Coordinator did not determine stability limits to be used in operations when the limit impacts more than one Transmission Operator in its Reliability Coordinator Area in accordance with its SOL Methodology.

VSL Justifications for FAC-014-3, Requirement R4	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The requirement does not have elements or quantities to evaluate degrees of compliance. The requirement is binary and therefore a VSL of Severe is assigned for non-compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The requirement does not have elements or quantities to evaluate degrees of compliance. The requirement is binary and therefore a VSL of Severe is assigned for non-compliance. The requirement is clear and does not contain any ambiguous language.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL is worded consistently with the corresponding requirement.

FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The proposed VSL is not based on a cumulative number of violations.

VRF Justifications for FAC-014-3 Requirement R5	
Proposed VRF	**High**

This reliability objective of Requirement R5 and Requirement R5, R5.1 from approved Reliability Standard FAC-014-2 is now Requirement R5 of proposed Reliability Standard FAC-014-3. Therefore, the existing VRF of high was maintained for consistency.

VSLs for FAC-014-3, Requirement R5			
Lower	**Moderate**	**High**	**Severe**
The Reliability Coordinator did not provide one of the items listed in Requirement R5 Parts 5.1 through 5.5.	The Reliability Coordinator did not provide two of the items listed in Requirement R5 Parts 5.1 through 5.5.	The Reliability Coordinator did not provide three of the items listed in Requirement R5 Parts 5.1 through 5.5.	The Reliability Coordinator did not provide four or more of the items listed in Parts 5.1 through 5.5.

VSL Justifications for FAC-014-3, Requirement R5	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The requirement maps to the previously approved Requirement R5, sub-requirement R5.1. Therefore, the proposed VSLs do not have the unintended consequence of lowering compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties <u>Guideline 2a</u>: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent <u>Guideline 2b</u>: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL is worded consistently with the corresponding requirement.

FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The proposed VSL is not based on a cumulative number of violations.

VRF Justifications for FAC-014-3 Requirement R6	
Proposed VRF	**High**

This reliability objective of Requirement R5, R5.1 from approved Reliability Standard FAC-014-2 is now Requirement R6 of proposed Reliability Standard FAC-014-3. Therefore, the existing VRF of high was maintained for consistency.

VSLs for FAC-014-3, Requirement R6			
Lower	**Moderate**	**High**	**Severe**
N/A	N/A	N/A	The Reliability Coordinator with an established IROL, or the Reliability Coordinator impacted by a neighboring Reliability Coordinator IROL, did not provide Transmission Owners or Generation Owners within its Reliability Coordinator Area a list of Facilities owned by that entity that are critical to the derivation of the IROL.

VSL Justifications for FAC-014-3, Requirement R6	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The requirement does not have elements or quantities to evaluate degrees of compliance. The requirement is binary and therefore a VSL of Severe is assigned for non-compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The requirement does not have elements or quantities to evaluate degrees of compliance. The requirement is binary and therefore a VSL of Severe is assigned for non-compliance. The requirement is clear and does not contain any ambiguous language.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL is worded consistently with the corresponding requirement.

FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The proposed VSL is not based on a cumulative number of violations.

Violation Risk Factor and Violation Severity Level Justifications

FAC-015-1 System Coordination of Planning Assessments with the Reliability Coordinator’s SOL Methodology

This document provides the standard drafting team’s (SDT’s) justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in Reliability Standard FAC-015-1 System Coordination of Planning Assessments with the Reliability Coordinator’s System Operating Limits (SOL) Methodology. Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the Electric Reliability Organizations Sanction Guidelines. The SDT applied the following NERC criteria and FERC Guidelines when developing the VRFs and VSLs for the requirements.

NERC Criteria for Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

FERC Guidelines for Violation Risk Factors

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

FERC seeks to ensure that VRFs assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard

FERC expects a rational connection between the sub-Requirement VRF assignments and the main Requirement VRF assignment.

Guideline (3) – Consistency among Reliability Standards

FERC expects the assignment of VRFs corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular VRF level conforms to NERC's definition of that risk level.

Guideline (5) – Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC Criteria for Violation Severity Levels

VSLs define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

VSLs should be based on NERC's overarching criteria shown in the table below:

Lower VSL	Moderate VSL	High VSL	Severe VSL
The performance or product measured almost meets the full intent of the requirement.	The performance or product measured meets the majority of the intent of the requirement.	The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.	The performance or product measured does not substantively meet the intent of the requirement.

FERC Order of Violation Severity Levels

The FERC VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

Guideline (1) – Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline (2) – Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.

Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline (3) – Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline (4) – Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VRF Justifications for FAC-015-1 Requirement R1	
Proposed VRF	**Medium**

This reliability objective of Requirement R3 from approved Reliability Standard FAC-014-2 is now Requirement R1 of proposed Reliability Standard FAC-015-1. Therefore, the existing VRF of medium was maintained for consistency.

VSLs for FAC-015-1, Requirement R1			
Lower	**Moderate**	**High**	**Severe**
N/A	The Planning Coordinator used less limiting Facility Ratings than the Facility Ratings established in accordance with its Reliability Coordinator's SOL Methodology, but did not provide its documented technical justification to its Reliability Coordinator.	The Planning Coordinator used less limiting Facility Ratings than the Facility Ratings established in accordance with its Reliability Coordinator's SOL Methodology, but did not document the technical justification.	The Planning Coordinator failed to implement a process to ensure that Facility Ratings used in Planning Assessment are equally limiting or more limiting than those established in its Reliability Coordinator's SOL Methodology.

VSL Justifications for FAC-015-1, Requirement R1	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The requirement maps to the previously approved Requirement R3 of FAC-014-2. Therefore, the proposed VSLs do not have the unintended consequence of lowering compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL is worded consistently with the corresponding requirement.

FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The proposed VSL is not based on a cumulative number of violations.

VRF Justifications for FAC-015-1 Requirement R2	
Proposed VRF	**Medium**

This reliability objective of Requirement R3 from approved Reliability Standard FAC-014-2 is now Requirement R2 of proposed Reliability Standard FAC-015-1. Therefore, the existing VRF of medium was maintained for consistency.

VSLs for FAC-015-1, Requirement R2			
Lower	**Moderate**	**High**	**Severe**
N/A	The Planning Coordinator used less limiting System steady-state voltage limits than the System Voltage Limits established in accordance with its Reliability Coordinator's SOL Methodology, but did not provide its documented technical justification to its Reliability Coordinator.	The Planning Coordinator used less limiting System steady-state voltage limits than the System Voltage Limits established in accordance with its Reliability Coordinator's SOL Methodology, but did not document the technical justification.	The Planning Coordinator failed to implement a process to ensure that System steady-state voltage limits used in Planning Assessments are equally limiting or more limiting than the System Voltage Limits established in accordance with its Reliability Coordinator's SOL Methodology.

VSL Justifications for FAC-015-1, Requirement R2	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The requirement maps to the previously approved Requirement R3 of FAC-014-2. Therefore, the proposed VSLs do not have the unintended consequence of lowering compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties <u>Guideline 2a</u>: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent <u>Guideline 2b</u>: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL is worded consistently with the corresponding requirement.

FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The proposed VSL is not based on a cumulative number of violations.

VRF Justifications for FAC-015-1 Requirement R3	
Proposed VRF	**Medium**

This reliability objective of Requirement R3 from approved Reliability Standard FAC-014-2 is now Requirement R3 of proposed Reliability Standard FAC-015-1. Therefore, the existing VRF of medium was maintained for consistency.

VSLs for FAC-015-1, Requirement R3			
Lower	**Moderate**	**High**	**Severe**
N/A	The Planning Coordinator used less limiting stability performance criteria than the stability performance criteria established in its Reliability Coordinator's SOL Methodology, but did not provide its documented technical justification to its Reliability Coordinator.	The Planning Coordinator used less limiting stability performance criteria than the stability performance criteria established in its Reliability Coordinator's SOL Methodology, but did not document the technical justification.	The Planning Coordinator failed to implement a process to ensure that stability performance criteria used in planning assessments are equally limiting or more limiting than those used in operations established in its Reliability Coordinator's SOL Methodology.

VSL Justifications for FAC-015-1, Requirement R3	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The requirement maps to the previously approved Requirement R3 of FAC-014-2. Therefore, the proposed VSLs do not have the unintended consequence of lowering compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL is worded consistently with the corresponding requirement.

FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The proposed VSL is not based on a cumulative number of violations.

VRF Justifications for FAC-015-1 Requirement R4	
Proposed VRF	**Medium**

This reliability objective of Requirement R5, R5.3 from approved Reliability Standard FAC-014-2 is now Requirement R4 of proposed Reliability Standard FAC-015-1. Therefore, the existing VRF of medium was maintained for consistency.

VSLs for FAC-015-1, Requirement R4			
Lower	**Moderate**	**High**	**Severe**
N/A	N/A	The Planning Coordinator failed to provide the Facility Ratings, System steady-state voltage limits, and stability performance criteria to all of its Transmission Planners. OR The Planning Coordinator failed to provide one element of the required information.	The Planning Coordinator failed to provide the Facility Ratings, System steady-state voltage limits, and stability performance criteria to all of its Transmission Planners. OR The Planning Coordinator failed to provide two or more elements of the required information.

VSL Justifications for FAC-015-1, Requirement R4	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The requirement maps to the previously approved Requirement R5, R5.3 of FAC-014-2. Therefore, the proposed VSLs do not have the unintended consequence of lowering compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties <u>Guideline 2a</u>: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent <u>Guideline 2b</u>: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL is worded consistently with the corresponding requirement.

FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The proposed VSL is not based on a cumulative number of violations.

VRF Justifications for FAC-015-1 Requirement R5	
Proposed VRF	**Medium**

This reliability objective of Requirement R4 from approved Reliability Standard FAC-014-2 is now Requirement R5 of proposed Reliability Standard FAC-015-1. Therefore, the existing VRF of medium was maintained for consistency.

VSLs for FAC-015-1, Requirement R5			
Lower	**Moderate**	**High**	**Severe**
N/A	N/A	N/A	The Transmission Planner failed to use Facility Ratings, System steady-stability voltage limits, and stability performance criteria that were equally or more limiting than those provided by its Planning Coordinator.

VSL Justifications for FAC-015-1, Requirement R5	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The requirement maps to the previously approved Requirement R4 of FAC-014-2. Therefore, the proposed VSLs do not have the unintended consequence of lowering compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties <u>Guideline 2a</u>: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent <u>Guideline 2b</u>: Violation Severity Level Assignments that Contain Ambiguous Language	The requirement does not have elements or quantities to evaluate degrees of compliance. The requirement is binary and therefore a VSL of Severe is assigned for non-compliance. The requirement is clear and does not contain any ambiguous language.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL is worded consistently with the corresponding requirement.

FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The proposed VSL is not based on a cumulative number of violations.

VRF Justifications for FAC-015-1 Requirement R6	
Proposed VRF	Medium

This reliability objective of Requirement R5, R5.3 and Requirement R6 from approved Reliability Standard FAC-014-2 is now Requirement R6 of proposed Reliability Standard FAC-015-1. Therefore, the existing VRF of medium was maintained for consistency.

VSLs for FAC-015-1, Requirement R6			
Lower	**Moderate**	**High**	**Severe**
The Planning Coordinator communicated the identified instability, Cascading, or uncontrolled separation to each impacted Reliability Coordinator and Transmission Operator but the communication did not contain one of the elements listed in Requirement R6, Parts 6.1 – 6.5.	The Planning Coordinator communicated the identified instability, Cascading, or uncontrolled separation to each impacted Reliability Coordinator and Transmission Operator but the communication did not contain two of the elements listed in Requirement R6, Parts 6.1 – 6.5.	The Planning Coordinator communicated the identified instability, Cascading, or uncontrolled separation to each impacted Reliability Coordinator and Transmission Operator but the communication did not contain three elements listed in Requirement R6, Parts 6.1 – 6.5.	The Planning Coordinator communicated the identified instability, Cascading, or uncontrolled separation to each impacted Reliability Coordinator and Transmission Operator but the communication did not contain four or more of the elements listed in Requirement R6, Parts 6.1 – 6.5. OR The Planning Coordinator failed to communicate any identified instability, Cascading, or uncontrolled separation to each impacted Reliability Coordinator and Transmission Operator.

VSL Justifications for FAC-015-1, Requirement R6	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The requirement maps to the previously approved Requirement R5, R5.3 and R6 of FAC-014-2. Therefore, the proposed VSLs do not have the unintended consequence of lowering compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties <u>Guideline 2a</u>: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent <u>Guideline 2b</u>: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSL is worded consistently with the corresponding requirement.

FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	The proposed VSL is not based on a cumulative number of violations.

Rationales for FAC-010-3 (Retirement) and FAC-015-1

September 2017

Background

The Facilities Design, Connections, and Maintenance (FAC) group of Reliability Standards provide for, among other things, the important reliability objective of establishing and communicating System Operating Limits (SOLs) and Interconnection Reliability Operating Limits (IROLs) that help ensure reliable operation of the Bulk Electric System (BES). Specifically, under currently-effective Reliability Standard FAC-010-3, each Planning Authority must have a documented methodology for establishing SOLs (including IROLs) used in the planning horizon. Currently-effective Reliability Standard FAC-011-3 requires each Reliability Coordinator (RC) to have a documented methodology for establishing SOLs (including IROLs) within its Reliability Coordinator Area for the operations horizon. Further, under currently-effective Reliability Standard FAC-014-2, Transmission Operators (TOPs) must establish and communicate SOLs consistent with the RC's methodology and RCs must determine and communicate which of those SOLs are deemed as IROLs. Likewise, FAC-014-2 requires Planning Coordinators (PCs) and Transmission Planners (TPs) to establish and communicate SOLs and IROLs used in the planning horizon consistent with the PC's SOL Methodology.

The FAC-010, FAC-011, and FAC-014 Reliability Standards, however, have remained essentially unchanged since they were initially developed and became effective in 2008. Since that time there have been many improvements to other mandatory NERC Reliability Standards that work in concert with those FAC Reliability Standards, namely, those in the Transmission Planning (TPL), Transmission Operations (TOP), and Interconnection Reliability Operations and Coordination (IRO) groups of Reliability Standards. Specifically, the retired versions TPL-001, 002, 003, and 004 Reliability standards have been replaced with currently-effective TPL-001-4, all of the TOP standards have been replaced with the currently-effective TOP-001-3, TOP-002-4, and TOP-003-3, and all of the IRO standards have been modified. The FAC Reliability Standards that address SOLs and IROLs are inextricably linked to many of these TPL, TOP, and IRO Reliability Standards, as they all address in some manner the foundational reliability concept of reliable system performance as it relates to SOLs and IROLs. While the changes to the TPL, TOP, and IRO standards have been significant and have evolved as industry practices and needs have changed, there have been no consequential substantive changes to the related FAC Reliability Standards. One of the primary objectives of Project 2015-09 is to make changes to the SOL/IROL-related FAC standards to create better alignment with the currently-effective TPL, TOP, and IRO Reliability Standards.

The Project 2015-09 standard drafting team (SDT) is proposing to make a significant improvement to the SOL/IROL-related FAC standards by minimizing redundancy, allowing for better continuity from the establishment to communication of SOLs, and improving the efficiency and effectiveness of the tasks performed by planners and operators to achieve the ultimate reliability objective of reliable system performance in operations. As discussed in this whitepaper, one of the fundamental changes proposed by the SDT is to retire the FAC-010-3 Reliability Standard, eliminating the requirement for PCs to have a methodology for establishing SOLs for use in the planning horizon, as well as the corresponding requirements in the FAC-014 Reliability Standard related to the establishment and communication of planning horizon SOLs and IROLs. As discussed further below, the SDT concluded that, with the changes in TPL-001-4, the establishment of planning horizon SOLs were unnecessary and not useful for ensuring reliable planning or reliable operations. Rather, the SDT concluded, the reliability need was for the limits and criteria used in the TPL-001-4 Planning Assessments to be equally limiting or more limiting than those established in accordance with or identified within its RC's SOL Methodology. The SDT developed proposed FAC-015-1 to ensure the coordination of the limits and criteria used in the Planning Assessment with the RC's SOL Methodology.

Under the current construct, PCs and RCs may have significantly different SOL Methodologies as the currently-effective Reliability Standards (FAC-010-3, FAC-011-3 & FAC-014-2) do not have any link requiring coordination between the methodologies. Furthermore, the nature of the current construct does not address continuity between planning and operations and may potentially result in a system not adequately planned for operational needs. The SDT's proposed changes help address the potential for inconsistencies between the PC's SOL Methodology and the RC's SOL Methodology.

Additionally, because of the evolution of the TPL standards, there are many redundancies in the responsibilities for PCs and Transmission Planners (TPs) between those in FAC-010/FAC-014 and those in TPL-001-4. In fact, planners are under no obligation to use (and many do not use) the PC's SOL Methodology for their Planning Assessments. Under Reliability Standard TPL-001-4, the SOLs established for the planning horizon pursuant to the FAC-010 and FAC-014 Reliability Standards are not necessary for reliable planning.

The SDT's proposal addresses both of these issues by providing for better continuity between planning and operations and by eliminating any redundancies that exist. To accomplish these objectives, the SDT is proposing a new construct. Under the proposed construct, the terms "SOL" and "IROL" are only applicable to the operations horizon and, in turn, only the RC would have an obligation to develop an SOL Methodology. RCs and TOPs would continue to have the responsibility under the FAC-014 Reliability Standard for establishing SOLs and IROLs consistent with the RCs' SOL Methodology. Planners, however, would no longer have an obligation to have an SOL Methodology applicable for the planning horizon, nor would planners be required to establish SOLs and IROLs for use in the planning horizon. Instead, planners would continue to perform Planning Assessments in accordance with TPL-001-4, and work with operating entities per the proposed new standard FAC-015-1 to ensure continuity between planning and operations. Specifically, under proposed FAC-015-1, planners are responsible for ensuring that the Facility Ratings, System (steady-state) voltage limits, and stability performance criteria used in their planning assessments for the Near-Term Transmission Planning Horizon are equally limiting or more limiting than the Facility Ratings, System Voltage Limits, and stability performance criteria as determined in accordance with the RC's SOL Methodology.

This whitepaper demonstrates that the proposed construct would improve reliability by eliminating redundancies and by providing better continuity between planning and operations. The primary principles of the proposed approach include:

- Clarifying that SOLs are established only for the *operations horizon,* which aligns with the *"Operating"* term in System *"Operating"* Limits. Additionally, IROLs are better identified by the RC in the operations time horizon.

- The existing FAC-010-3 and related requirements in FAC-014-2 are addressed by TPL-001-4 and proposed FAC-015-1such that the retirement of FAC-010 and related requirements in FAC-014-2 would not create any reliability gaps.

- The addition of FAC-015-1 consolidates PC and TP requirements related to coordination of limits and criteria utilized in the planning horizon with those used in the operations horizon into one standard. This reduces the risk of multiple varying methodologies/processes, clarifies the usage of such limits and criteria (TPL-001-4, FAC-010-3, FAC-013-2) and eliminates any redundancy with such limits and criteria.

- Clarity and efficiency of communication of limits and criteria between planning and operating entities is improved with FAC-015-1.

System Operating Limits in the Planning Horizon

There are two different time frames in which the system is analyzed to ensure reliable operation: the planning horizon and the operations horizon. The time frame covered by the PC's SOL methodology developed pursuant to FAC-010-3 is for the *planning horizon*. The planning horizon covers the period from one year and beyond, while the operations horizon covers real-time (now) to one year. Between those two time horizons, the topology of the system could be quite different based on the addition of new projects, changes in generation, planned or forced outages of elements, and different uses of the system (power transfers), and weather.

Under the currently-effective FAC Reliability Standards, planners must establish SOLs for use in the planning horizon and operators must establish SOLs for use in operations. The initial intent for requiring planners to establish SOLs for use in the planning horizon was to develop a consistent set of limits to be used by the TPs while *planning* for the reliability of the transmission system. To ensure this consistency, the PC develops the SOL Methodology to be used by its TPs and thus provide for an overall, coherent transmission plan for a PC area.

The purpose of requiring the establishment of SOLs for the operations horizon is to identify limits that if operated within, will result in the system being *operated* reliably. TOPs must establish SOLs in the operations horizon that account for real-time characteristics (generation, load, topology and transfers) of their system. To ensure the consistent use of limits within a RC area, the RC is obligated to develop the SOL methodology to be used by its TOPs. The RC's methodology includes how Facility Ratings, System Voltage Limits, and stability performance criteria will be used to establish limits for use in assessments that determine whether the system is being reliably *operated*. Additionally, the RC's methodology prescribes what tests (Contingencies) must be used during the reliability assessment of the system during operations.

One of the key aspects of the proposed new construct is to eliminate the use of the SOL term as applied to the planning horizon. The SDT views SOLs as limits that are used in operations, hence the use of the term

"Operating" in System "Operating" Limits. The components of SOLs include the use of Facility Ratings, System Voltage Limits, and stability limits. These SOLs are based on specifications and criteria identified in the RC's SOL Methodology. While planners also use Facility Ratings provided by Facility Owners, System steady state voltage limits (TPL-001-4 Requirement R5), and stability performance criteria (TPL-001-4 Requirement R6) for its Planning Assessments, these are not referred to as SOLs.

The SDT determined that there is limited value in requiring PCs and TPs to establish SOLs for use in the planning horizon. Rather, the SDT believes that the reliability objective is to ensure that there is continuity between the limits and criteria used in the Planning Assessments with the limits and criteria (i.e., SOLs) that are used in operations. This adds further clarity that it is the RCs and TOPs – not the PCs and TPs – who determine the SOLs and IROLs that are used in operations. However, the RCs and TOPs may use the information provided by PCs and TPs, especially with regard to risks for System instability, Cascading, and uncontrolled separation, when developing the SOLs and IROLs used in operations. Proposed FAC-015-1 Requirement R6 retains this concept, which is currently in FAC-014-2 Requirement R6, and appropriately points to the TPL-001-4 Reliability Standard rather than FAC-010.

Another key difference in the proposed new construct is seen in the PC's and TP's role in addressing instability and the establishment of IROLs. Under the current construct, PCs and TPs are responsible for identifying stability SOLs and IROLs in accordance with the PCs Methodology. As stated above, there is little value in the establishment of SOLs and IROLs (by current definitions a "value" such as MW, Mvar, etc.) for use in the planning horizon; however, there is great value identifying more severe System risks in the planning horizon and communicating those risks to the impacted entities who operate those systems. PCs and TPs are currently responsible for identifying more severe System impacts such as Cascading, voltage instability, or uncontrolled islanding in accordance with TPL-001-4 Requirements R3.4, R3.5, R4.4, and R4.5. The new FAC-015-1 requires continuity in the criteria used and requires that the PC and TP communicate these risks of System instability, Cascading or uncontrolled separation identified in its Planning Assessment to impacted RCs and impacted TOPs. The entities that operate those systems can then use that information, if applicable and appropriate, to assist in establishing stability limits and IROLs that will ultimately be used in operations.

SOLs in the planning horizon are developed starting with a model that has all facilities in service and has different system conditions (different transfers, weather assumptions, load levels) than those in the operations time horizon. The results from the planning horizon SOL methodology application can therefore be quite different and either do not correspond to SOLs (different limiting elements) in the operations time horizon or have very different limiting results (voltage limit violations versus System instability). Therefore, there is little or no value to using planning horizon SOLs during operations horizon conditions.

The use of the word "Operating" within the term "System Operating Limit" when establishing limits in the planning horizon has created confusion as to which value is referred to when referencing "SOL". Is it the "planning horizon SOL" or the "operations horizon SOL"? Retiring FAC-010-3 and eliminating references to SOLs and IROLs in the planning horizon will eliminate this confusion.

Retirement of FAC-010-3

Background

The purpose of FAC-010-3 (System Operating Limits Methodology for the Planning Horizon) is to ensure that SOLs used in the reliable planning of the (BES are determined based on an established methodology or methodologies. This standard only requires a PC to have a documented SOL Methodology. FAC-014-2 Requirements R3, R4, R4.3 and R5.4 require its use. Retirement of FAC-010-3 would consequently necessitate retirement of the associated requirements in FAC-014-2.

Comprehensive Requirements of TPL-001-4

The requirements in the TPL-001-4 standard require a comprehensive Planning Assessment and includes the establishment of limits and criteria (Facility ratings, System steady-state voltage limits, and stability performance criteria) and the *methodology* used by the planners (TPL-001-4, Requirement R6) to identify System instability (Cascading, voltage instability, or uncontrolled islanding) for the planning horizon. TPL-001-4 requires that a summary of the results of the assessment (TPL-001-4, Requirement R2) and a list of critical Contingencies that are expected to produce the most severe System impacts (TPL-001-4, Requirement R4.5) be included in the Planning Assessment. Further, TPL-001-4, Requirement R8 requires that the Planning Assessment, which includes all of information listed above, be distributed to any functional entity that has a reliability related need, for which the RC qualifies.

With the introduction of TPL-001-4 in 2013, FAC-010-3 became redundant as TPL-001-4 *is an established methodology* used in the reliable planning of the BES. This comprehensive methodology describes how the transmission system should be studied, addresses the establishment of performance criteria, prescribes the outages that must be analyzed, identifies the outages that do not meet the performance requirements, and requires determination of the corrective actions that should be taken to ensure future system reliability. This established methodology meets and exceeds performance requirements identified in FAC-010-3 SOL methodology. The comprehensive nature of TPL-001-4 is seen in the following excerpts from the TPL-001-4 requirements, which correspond to FAC-010-3:

<u>Modeling</u>:

TPL-001-4, Requirement R1 – "Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment."

<u>Criteria/Methodology</u>:

TPL-001-4, Requirement R5 – "Each Transmission Planner and Planning Coordinator shall have criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System. For transient voltage response, the criteria shall at a minimum, specify a low voltage level and a maximum length of time that transient voltages may remain below that level."

TPL-001-4, Requirement R6 – "Each Transmission Planner and Planning Coordinator shall define and document, within their Planning Assessment, the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding."

<u>Analyzed Events</u>:

TPL-001-4, Table 1 – "Steady State & Stability Performance Planning Events"

<u>Reporting</u>:

TPL-001-4, Requirement R2 – "Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES."

TPL-001-4, Requirement R8 – "Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 calendar days of completing its Planning Assessment, and to any functional entity that has a reliability related need and submits a written request for the information within 30 days of such a request."

Corrective Action:

TPL-001-4, R2.7: "For the planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met."

Prior Review of FAC-010

The June 2013 report from the Independent Experts Review Project identified FAC-010-2.1 Requirements R3, R4, and R5 as “Requirements Recommended for Retirement” in Appendix E of the report. Requirement R5 was retired effective January 21, 2014 as part of NERC’s P81 project. The Independent Expert Review team consisted of five independent industry experts and a sixth participant from FERC. The relevant table entries are shown below.

FAC-010-2.1	R3.	More appropriate as a Guideline. This is a checklist.
FAC-010-2.1	R4.	More appropriate as a Guideline. Description of appropriate coordination does not rise to a Standard.
FAC-010-2.1	R5.	P81 Phase 1.

In addition, the Periodic Review Team under the NERC Project 2015-03 recommended retirement of FAC-010-3. Industry comments received and reviewed during the PRT efforts indicate significant support for the retirement of FAC-010-3 due to its redundancy.

Creation of FAC-015-1

Rationale for FAC-015-1

As noted above, the SDT identified consistency of the limits and criteria used in the planning and operations time horizons as an area in the Reliability Standards that could be improved. To that end, the SDT developed FAC-015-1 to require that the planners use limits and criteria in their Planning Assessments that are as limiting, if not more limiting, than the limits and criteria developed in accordance with the RC’s SOL Methodology.

The Perceived “Gap”

The perceived *gap* stems from the concern about the potential use of limits and criteria in the planning horizon that is less conservative than that used in the operations time horizon. For example, if planners used less conservative thermal limits when planning the System to meet all-facilities-in-service, peak load conditions, then operations would potentially face Facility Rating exceedances, which may require corrective actions up to and including Load shed to operate within Facility Ratings. Failing to have limit and criteria consistency between planning and operations may result in unacceptable System performance in the operations time horizon for the same conditions that were previously deemed acceptable when assessed in the planning horizon (i.e. planning the System less conservatively than the System is operated).

There is currently no mechanism to require consistency between the limits and criteria used in the two time horizons. By requiring a direct link of coordination between the limits and criteria in the SOL Methodology in the operations horizon with the limits and criteria used in Planning Assessments, which are used for the reliable planning of the BES, reliability and consistency is improved. By retiring FAC-010-3 the coordination is directly linked and a risk for a third and potentially disparate “methodology” around limits and criteria is also removed.

Development of FAC-015-1

Despite the comprehensive requirements in TPL-001-4 and to address the perceived gap, the SDT developed FAC-015-1 with the title “Coordination of Planning Assessments with the RC’s SOL Methodology” and the purpose “to ensure the Facility Ratings, System steady-state voltage limits, and stability criteria used in Planning Assessments are coordinated with the RC’s SOL Methodology.” FAC-015-1 will require the PC to implement processes that ensure that the Facility Ratings, voltage limits, and stability performance criteria used in its planning assessment are equal or more limiting than the Facility Ratings, System Voltage Limits, and stability performance criteria specified in the RC’s SOL Methodology.

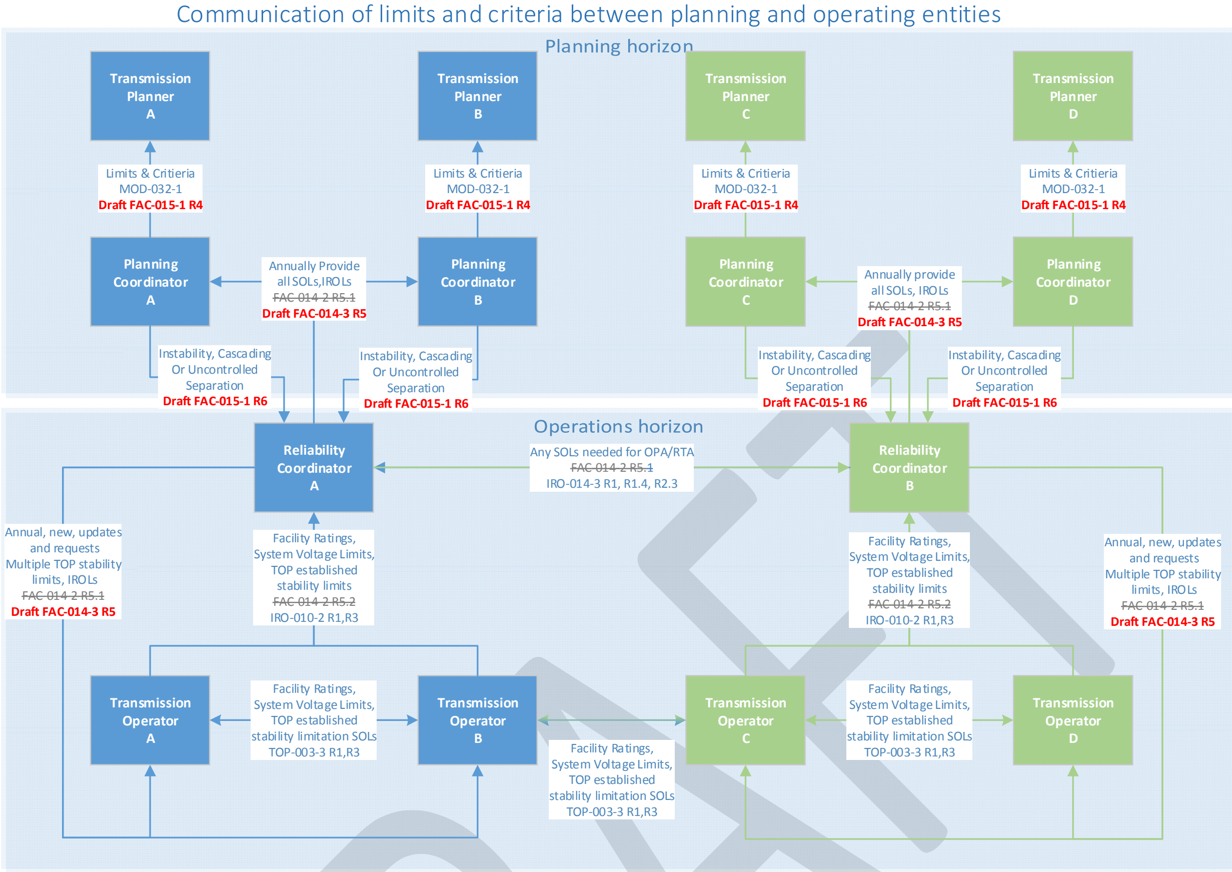
Improved Communication of Limits and Criteria Between Planning and Operating Entities

Reliability Standard FAC-014-2 Requirements R5 and R6 address communication of limits and criteria between the planning (PCs and TPs) and operating entities (RCs and TOPs). The requirements lack some clarity with respect to timing of the communication. In proposed FAC-014-3, the SDT revised Requirements R5 and R6 to simplify and streamline the PC’s and TP’s responsibilities for communication of limits and criteria. Proposed FAC-015-1 coordinates with proposed FAC-014-3 by identifying the necessary communication of limits and criteria between the planning and operating entities that utilize such limits and criteria. These two standards also recognize existing requirements that already address some of the necessary communication (e.g. IRO-010-2, TOP-003-3, and IRO-014-3).

The SDT is improving clarity and efficiency of communications by establishing a single point of contact between the RC and the PC for communication of SOLs from the operations horizon to the planning horizon. The PC, which is more familiar with and interacts regularly with TPs, is the entity responsible for communicating the SOLs to impacted Transmission Planners. This removes communications directly from the RC to the TPs and keeps the PC in the direct path of all SOLs from the operations time horizon. The requirements for FAC-015-1 can be thus met during times of annual preparation for its annual Planning Assessments.

The figure below shows examples of how the communication of SOLs would work given the proposed FAC-014-3 and FAC-015-1. The figure details what is communicated, direction of the communication (i.e. from whom to whom), and the respective NERC Reliability Standard Requirements that require or contain a provision for such communication. Requirements that are struck through and grayed out represent currently-effective requirements that are proposed to be replaced and/or not be retained (due to redundancy with the other referenced requirements) in FAC-014-3. Requirements that are bold and red text are proposed requirements that support or replace existing requirements for the noted communication path and content.

Communication of limits and criteria between planning and operating entities



FAC-015 single standard for PCs and TPs

Currently, planning entities (PCs and TPs) have requirements in FAC-010-3 and FAC-014-2. With FAC-010-3 and FAC-014-2 Requirements R3, R4, R5.3 and R5.4 being effectively replaced by proposed FAC-015-1, the communication of stability related information identified in FAC-014-2 Requirement R6 from the PC to the RC remained. The SDT has opted to relocate the content addressed in FAC-014-2 Requirement R6 into newly proposed FAC-015-1 Requirement R6 rather than keep in FAC-014. This relocation allowed for all PC and TP requirements related to coordination of limits utilized between planning and operations time horizons to be in a single standard.

Rationales for FAC-010-3 (Retirement) and FAC-015-1

September 2017

Background

The Facilities Design, Connections, and Maintenance (FAC) group of Reliability Standards provide for, among other things, the important reliability objective of establishing and communicating System Operating Limits (SOLs) and Interconnection Reliability Operating Limits (IROLs) that help ensure reliable operation of the Bulk Electric System (BES). Specifically, under currently-effective Reliability Standard FAC-010-3, each Planning Authority must have a documented methodology for establishing SOLs (including IROLs) used in the planning horizon. Currently-effective Reliability Standard FAC-011-3 requires each Reliability Coordinator (RC) to have a documented methodology for establishing SOLs (including IROLs) within its Reliability Coordinator Area for the operations horizon. Further, under currently-effective Reliability Standard FAC-014-2, Transmission Operators (TOPs) must establish and communicate SOLs consistent with the RC's methodology and RCs must determine and communicate which of those SOLs are deemed as IROLs. Likewise, FAC-014-2 requires Planning Coordinators (PCs) and Transmission Planners (TPs) to establish and communicate SOLs and IROLs used in the planning horizon consistent with the PC's SOL Methodology.

The FAC-010, FAC-011, and FAC-014 Reliability Standards, however, have remained essentially unchanged since they were initially developed and became effective in 2008. Since that time there have been many improvements to other mandatory NERC Reliability Standards that work in concert with those FAC Reliability Standards, namely, those in the Transmission Planning (TPL), Transmission Operations (TOP), and Interconnection Reliability Operations and Coordination (IRO) groups of Reliability Standards. Specifically, the retired versions TPL-001, 002, 003, and 004 Reliability standards have been replaced with currently-effective TPL-001-4, all of the TOP standards have been replaced with the currently-effective TOP-001-3, TOP-002-4, and TOP-003-3, and all of the IRO standards have been modified. The FAC Reliability Standards that address SOLs and IROLs are inextricably linked to many of these TPL, TOP, and IRO Reliability Standards, as they all address in some manner the foundational reliability concept of reliable system performance as it relates to SOLs and IROLs. While the changes to the TPL, TOP, and IRO standards have been significant and have evolved as industry practices and needs have changed, there have been no consequential substantive changes to the related FAC Reliability Standards. One of the primary objectives of Project 2015-09 is to make changes to the SOL/IROL-related FAC standards to create better alignment with the currently-effective TPL, TOP, and IRO Reliability Standards.

The Project 2015-09 standard drafting team (SDT) is proposing to make a significant improvement to the SOL/IROL-related FAC standards by minimizing redundancy, allowing for better continuity from the establishment to communication of SOLs, and improving the efficiency and effectiveness of the tasks performed by planners and operators to achieve the ultimate reliability objective of reliable system performance in operations. As discussed in this whitepaper, one of the fundamental changes proposed by the SDT is to retire the FAC-010-3 Reliability Standard, eliminating the requirement for PCs to have a methodology for establishing SOLs for use in the planning horizon, as well as the corresponding requirements in the FAC-014 Reliability Standard related to the establishment and communication of planning horizon SOLs and IROLs. As discussed further below, the SDT concluded that, with the changes in TPL-001-4, the establishment of planning horizon SOLs were unnecessary and not useful for ensuring reliable planning or reliable operations. Rather, the SDT concluded, the reliability need was for the limits and criteria used in the TPL-001-4 Planning Assessments to be equally limiting or more limiting than those established in accordance with or identified within its RC's SOL Methodology. The SDT developed proposed FAC-015-1 to ensure the coordination of the limits and criteria used in the Planning Assessment with the RC's SOL Methodology.

Under the current construct, PCs and RCs may have significantly different SOL Methodologies as the currently-effective Reliability Standards (FAC-010-3, FAC-011-3 & FAC-014-2) do not have any link requiring coordination between the methodologies. Furthermore, the nature of the current construct does not address continuity between planning and operations and may potentially result in a system not adequately planned for operational needs. The SDT's proposed changes help address the potential for inconsistencies between the PC's SOL Methodology and the RC's SOL Methodology.

Additionally, because of the evolution of the TPL standards, there are many redundancies in the responsibilities for PCs and Transmission Planners (TPs) between those in FAC-010/FAC-014 and those in TPL-001-4. In fact, planners are under no obligation to use (and many do not use) the PC's SOL Methodology for their Planning Assessments. Under Reliability Standard TPL-001-4, the SOLs established for the planning horizon pursuant to the FAC-010 and FAC-014 Reliability Standards are not necessary for reliable planning.

The SDT's proposal addresses both of these issues by providing for better continuity between planning and operations and by eliminating any redundancies that exist. To accomplish these objectives, the SDT is proposing a new construct. Under the proposed construct, the terms "SOL" and "IROL" are only applicable to the operations horizon and, in turn, only the RC would have an obligation to develop an SOL Methodology. RCs and TOPs would continue to have the responsibility under the FAC-014 Reliability Standard for establishing SOLs and IROLs consistent with the RCs' SOL Methodology. Planners, however, would no longer have an obligation to have an SOL Methodology applicable for the planning horizon, nor would planners be required to establish SOLs and IROLs for use in the planning horizon. Instead, planners would continue to perform Planning Assessments in accordance with TPL-001-4, and work with operating entities per the proposed new standard FAC-015-1 to ensure continuity between planning and operations. Specifically, under proposed FAC-015-1, planners are responsible for ensuring that the Facility Ratings, System (steady-state) voltage limits, and stability performance criteria used in their planning assessments for the Near-Term Transmission Planning Horizon are equally limiting or more limiting than the Facility Ratings, System Voltage Limits, and stability performance criteria as determined in accordance with the RC's SOL Methodology.

This whitepaper demonstrates that the proposed construct would improve reliability by eliminating redundancies and by providing better continuity between planning and operations. The primary principles of the proposed approach include:

- Clarifying that SOLs are established only for the *operations horizon,* which aligns with the *"Operating"* term in System *"Operating"* Limits. Additionally, IROLs are better identified by the RC in the operations time horizon.

- The existing FAC-010-3 and related requirements in FAC-014-2 are addressed by TPL-001-4 and proposed FAC-015-1such that the retirement of FAC-010 and related requirements in FAC-014-2 would not create any reliability gaps.

- The addition of FAC-015-1 consolidates PC and TP requirements related to coordination of limits and criteria utilized in the planning horizon with those used in the operations horizon into one standard. This reduces the risk of multiple varying methodologies/processes, clarifies the usage of such limits and criteria (TPL-001-4, FAC-010-3, FAC-013-2) and eliminates any redundancy with such limits and criteria.

- Clarity and efficiency of communication of limits and criteria between planning and operating entities is improved with FAC-015-1.

System Operating Limits in the Planning Horizon

There are two different time frames in which the system is analyzed to ensure reliable operation: the planning horizon and the operations horizon. The time frame covered by the PC's SOL methodology developed pursuant to FAC-010-3 is for the *planning horizon*. The planning horizon covers the period from one year and beyond, while the operations horizon covers real-time (now) to one year. Between those two time horizons, the topology of the system could be quite different based on the addition of new projects, changes in generation, planned or forced outages of elements, and different uses of the system (power transfers), and weather.

Under the currently-effective FAC Reliability Standards, planners must establish SOLs for use in the planning horizon and operators must establish SOLs for use in operations. The initial intent for requiring planners to establish SOLs for use in the planning horizon was to develop a consistent set of limits to be used by the TPs while *planning* for the reliability of the transmission system. To ensure this consistency, the PC develops the SOL Methodology to be used by its TPs and thus provide for an overall, coherent transmission plan for a PC area.

The purpose of requiring the establishment of SOLs for the operations horizon is to identify limits that if operated within, will result in the system being *operated* reliably. TOPs must establish SOLs in the operations horizon that account for real-time characteristics (generation, load, topology and transfers) of their system. To ensure the consistent use of limits within a RC area, the RC is obligated to develop the SOL methodology to be used by its TOPs. The RC's methodology includes how Facility Ratings, System Voltage Limits, and stability performance criteria will be used to establish limits for use in assessments that determine whether the system is being reliably *operated*. Additionally, the RC's methodology prescribes what tests (Contingencies) must be used during the reliability assessment of the system during operations.

One of the key aspects of the proposed new construct is to eliminate the use of the SOL term as applied to the planning horizon. The SDT views SOLs as limits that are used in operations, hence the use of the term

"Operating" in System "Operating" Limits. The components of SOLs include the use of Facility Ratings, System Voltage Limits, and stability limits. These SOLs are based on specifications and criteria identified in the RC's SOL Methodology. While planners also use Facility Ratings provided by Facility Owners, System steady state voltage limits (TPL-001-4 Requirement R5), and stability performance criteria (TPL-001-4 Requirement R6) for its Planning Assessments, these are not referred to as SOLs.

The SDT determined that there is limited value in requiring PCs and TPs to establish SOLs for use in the planning horizon. Rather, the SDT believes that the reliability objective is to ensure that there is continuity between the limits and criteria used in the Planning Assessments with the limits and criteria (i.e., SOLs) that are used in operations. This adds further clarity that it is the RCs and TOPs – not the PCs and TPs – who determine the SOLs and IROLs that are used in operations. However, the RCs and TOPs may use the information provided by PCs and TPs, especially with regard to risks for System instability, Cascading, and uncontrolled separation, when developing the SOLs and IROLs used in operations. Proposed FAC-015-1 Requirement R6 retains this concept, which is currently in FAC-014-2 Requirement R6, and appropriately points to the TPL-001-4 Reliability Standard rather than FAC-010.

Another key difference in the proposed new construct is seen in the PC's and TP's role in addressing instability and the establishment of IROLs. Under the current construct, PCs and TPs are responsible for identifying stability SOLs and IROLs in accordance with the PCs Methodology. As stated above, there is little value in the establishment of SOLs and IROLs (by current definitions a "value" such as MW, Mvar, etc.) for use in the planning horizon; however, there is great value identifying more severe System risks in the planning horizon and communicating those risks to the impacted entities who operate those systems. PCs and TPs are currently responsible for identifying more severe System impacts such as Cascading, voltage instability, or uncontrolled islanding in accordance with TPL-001-4 Requirements R3.4, R3.5, R4.4, and R4.5. The new FAC-015-1 requires continuity in the criteria used and requires that the PC and TP communicate these risks of System instability, Cascading or uncontrolled separation identified in its Planning Assessment to impacted RCs and impacted TOPs. The entities that operate those systems can then use that information, if applicable and appropriate, to assist in establishing stability limits and IROLs that will ultimately be used in operations.

SOLs in the planning horizon are developed starting with a model that has all facilities in service and has different system conditions (different transfers, weather assumptions, load levels) than those in the operations time horizon. The results from the planning horizon SOL methodology application can therefore be quite different and either do not correspond to SOLs (different limiting elements) in the operations time horizon or have very different limiting results (voltage limit violations versus System instability). Therefore, there is little or no value to using planning horizon SOLs during operations horizon conditions.

The use of the word "Operating" within the term "System Operating Limit" when establishing limits in the planning horizon has created confusion as to which value is referred to when referencing "SOL". Is it the "planning horizon SOL" or the "operations horizon SOL"? Retiring FAC-010-3 and eliminating references to SOLs and IROLs in the planning horizon will eliminate this confusion.

Retirement of FAC-010-3

Background

The purpose of FAC-010-3 (System Operating Limits Methodology for the Planning Horizon) is to ensure that SOLs used in the reliable planning of the (BES are determined based on an established methodology or methodologies. This standard only requires a PC to have a documented SOL Methodology. FAC-014-2 Requirements R3, R4, R4.3 and R5.4 require its use. Retirement of FAC-010-3 would consequently necessitate retirement of the associated requirements in FAC-014-2.

Comprehensive Requirements of TPL-001-4

The requirements in the TPL-001-4 standard require a comprehensive Planning Assessment and includes the establishment of limits and criteria (Facility ratings, System steady-state voltage limits, and stability performance criteria) and the *methodology* used by the planners (TPL-001-4, Requirement R6) to identify System instability (Cascading, voltage instability, or uncontrolled islanding) for the planning horizon. TPL-001-4 requires that a summary of the results of the assessment (TPL-001-4, Requirement R2) and a list of critical Contingencies that are expected to produce the most severe System impacts (TPL-001-4, Requirement R4.5) be included in the Planning Assessment. Further, TPL-001-4, Requirement R8 requires that the Planning Assessment, which includes all of information listed above, be distributed to any functional entity that has a reliability related need, for which the RC qualifies.

With the introduction of TPL-001-4 in 2013, FAC-010-3 became redundant as TPL-001-4 *is an established methodology* used in the reliable planning of the BES. This comprehensive methodology describes how the transmission system should be studied, addresses the establishment of performance criteria, prescribes the outages that must be analyzed, identifies the outages that do not meet the performance requirements, and requires determination of the corrective actions that should be taken to ensure future system reliability. This established methodology meets and exceeds performance requirements identified in FAC-010-3 SOL methodology. The comprehensive nature of TPL-001-4 is seen in the following excerpts from the TPL-001-4 requirements, which correspond to FAC-010-3:

<u>Modeling</u>:

TPL-001-4, Requirement R1 – “Each Transmission Planner and Planning Coordinator shall maintain System models within its respective area for performing the studies needed to complete its Planning Assessment.”

<u>Criteria/Methodology</u>:

TPL-001-4, Requirement R5 – “Each Transmission Planner and Planning Coordinator shall have criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System. For transient voltage response, the criteria shall at a minimum, specify a low voltage level and a maximum length of time that transient voltages may remain below that level.”

TPL-001-4, Requirement R6 – “Each Transmission Planner and Planning Coordinator shall define and document, within their Planning Assessment, the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding.”

<u>Analyzed Events</u>:

TPL-001-4, Table 1 – “Steady State & Stability Performance Planning Events”

<u>Reporting</u>:

TPL-001-4, Requirement R2 – "Each Transmission Planner and Planning Coordinator shall prepare an annual Planning Assessment of its portion of the BES."

TPL-001-4, Requirement R8 – "Each Planning Coordinator and Transmission Planner shall distribute its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners within 90 calendar days of completing its Planning Assessment, and to any functional entity that has a reliability related need and submits a written request for the information within 30 days of such a request."

Corrective Action:

TPL-001-4, R2.7: "For the planning events shown in Table 1, when the analysis indicates an inability of the System to meet the performance requirements in Table 1, the Planning Assessment shall include Corrective Action Plan(s) addressing how the performance requirements will be met."

Prior Review of FAC-010

The June 2013 report from the Independent Experts Review Project identified FAC-010-2.1 Requirements R3, R4, and R5 as "Requirements Recommended for Retirement" in Appendix E of the report. Requirement R5 was retired effective January 21, 2014 as part of NERC's P81 project. The Independent Expert Review team consisted of five independent industry experts and a sixth participant from FERC. The relevant table entries are shown below.

FAC-010-2.1	R3.	More appropriate as a Guideline. This is a checklist.
FAC-010-2.1	R4.	More appropriate as a Guideline. Description of appropriate coordination does not rise to a Standard.
FAC-010-2.1	R5.	P81 Phase 1.

In addition, the Periodic Review Team under the NERC Project 2015-03 recommended retirement of FAC-010-3. Industry comments received and reviewed during the PRT efforts indicate significant support for the retirement of FAC-010-3 due to its redundancy.

Creation of FAC-015-1

Rationale for FAC-015-1

As noted above, the SDT identified consistency of the limits and criteria used in the planning and operations time horizons as an area in the Reliability Standards that could be improved. To that end, the SDT developed FAC-015-1 to require that the planners use limits and criteria in their Planning Assessments that are as limiting, if not more limiting, than the limits and criteria developed in accordance with the RC's SOL Methodology.

The Perceived "Gap"

The perceived *gap* stems from the concern about the potential use of limits and criteria in the planning horizon that is less conservative than that used in the operations time horizon. For example, if planners used less conservative thermal limits when planning the System to meet all-facilities-in-service, peak load conditions, then operations would potentially face Facility Rating exceedances, which may require corrective actions up to and including Load shed to operate within Facility Ratings. Failing to have limit and criteria consistency between planning and operations may result in unacceptable System performance in the operations time horizon for the same conditions that were previously deemed acceptable when assessed in the planning horizon (i.e. planning the System less conservatively than the System is operated).

There is currently no mechanism to require consistency between the limits and criteria used in the two time horizons. By requiring a direct link of coordination between the limits and criteria in the SOL Methodology in the operations horizon with the limits and criteria used in Planning Assessments, which are used for the reliable planning of the BES, reliability and consistency is improved. By retiring FAC-010-3 the coordination is directly linked and a risk for a third and potentially disparate "methodology" around limits and criteria is also removed.

Development of FAC-015-1

Despite the comprehensive requirements in TPL-001-4 and to address the perceived gap, the SDT developed FAC-015-1 with the title “Coordination of Planning Assessments with the RC’s SOL Methodology” and the purpose “to ensure the Facility Ratings, System steady-state voltage limits, and stability criteria used in Planning Assessments are coordinated with the RC’s SOL Methodology.” FAC-015-1 will require the PC to implement processes that ensure that the Facility Ratings, voltage limits, and stability performance criteria used in its planning assessment are equal or more limiting than the Facility Ratings, System Voltage Limits, and stability performance criteria specified in the RC’s SOL Methodology.

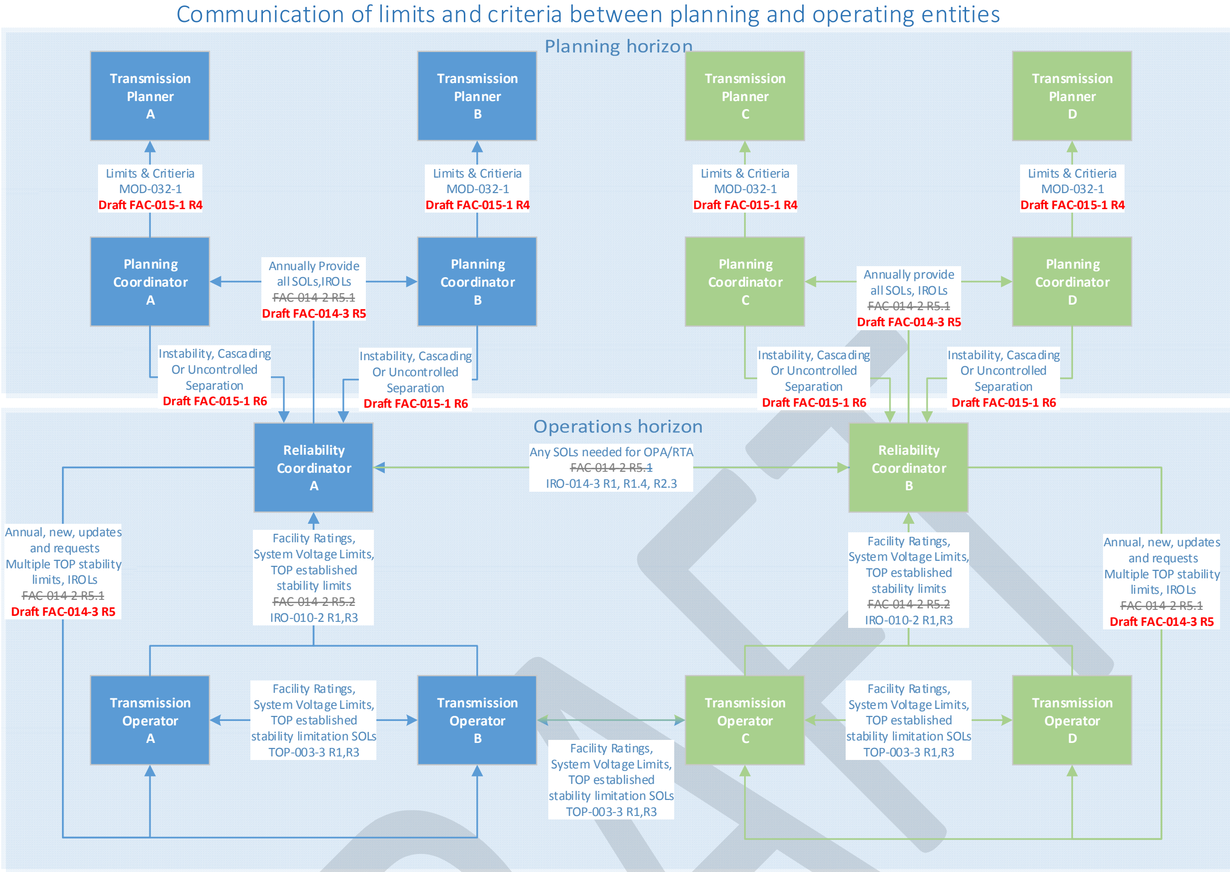
Improved Communication of Limits and Criteria Between Planning and Operating Entities

Reliability Standard FAC-014-2 Requirements R5 and R6 address communication of limits and criteria between the planning (PCs and TPs) and operating entities (RCs and TOPs). The requirements lack some clarity with respect to timing of the communication. In proposed FAC-014-3, the SDT revised Requirements R5 and R6 to simplify and streamline the PC’s and TP’s responsibilities for communication of limits and criteria. Proposed FAC-015-1 coordinates with proposed FAC-014-3 by identifying the necessary communication of limits and criteria between the planning and operating entities that utilize such limits and criteria. These two standards also recognize existing requirements that already address some of the necessary communication (e.g. IRO-010-2, TOP-003-3, and IRO-014-3).

The SDT is improving clarity and efficiency of communications by establishing a single point of contact between the RC and the PC for communication of SOLs from the operations horizon to the planning horizon. The PC, which is more familiar with and interacts regularly with TPs, is the entity responsible for communicating the SOLs to impacted Transmission Planners. This removes communications directly from the RC to the TPs and keeps the PC in the direct path of all SOLs from the operations time horizon. The requirements for FAC-015-1 can be thus met during times of annual preparation for its annual Planning Assessments.

The figure below shows examples of how the communication of SOLs would work given the proposed FAC-014-3 and FAC-015-1. The figure details what is communicated, direction of the communication (i.e. from whom to whom), and the respective NERC Reliability Standard Requirements that require or contain a provision for such communication. Requirements that are struck through and grayed out represent currently-effective requirements that are proposed to be replaced and/or not be retained (due to redundancy with the other referenced requirements) in FAC-014-3. Requirements that are bold and red text are proposed requirements that support or replace existing requirements for the noted communication path and content.

Communication of limits and criteria between planning and operating entities



FAC-015 single standard for PCs and TPs

Currently, planning entities (PCs and TPs) have requirements in FAC-010-3 and FAC-014-2. With FAC-010-3 and FAC-014-2 Requirements R3, R4, R5.3 and R5.4 being effectively replaced by proposed FAC-015-1, the communication of stability related information identified in FAC-014-2 Requirement R6 from the PC to the RC remained. The SDT has opted to relocate the content addressed in FAC-014-2 Requirement R6 into newly proposed FAC-015-1 Requirement R6 rather than keep in FAC-014. This relocation allowed for all PC and TP requirements related to coordination of limits utilized between planning and operations time horizons to be in a single standard.

Rationale for FAC-011-4

September 2017

Requirement R1

Each Reliability Coordinator shall have a methodology for establishing SOL (i.e., SOL Methodology) within its Reliability Coordinator Area.

Rationale R1

The three subparts in Requirement R1 in currently-effective Reliability Standard FAC-011-3 are either not necessary for reliability, or they are addressed through other mechanisms in FAC-011-4 and therefore are not included as part of Requirement R1.

Requirement R1.1 in currently-effective FAC-011-3 requires that the SOL Methodology shall be applicable for developing SOLs used in the operations horizon. The revised Requirement R1 is applicable to the Operations Planning Time Horizon. Accordingly, there is no reliability-related need to have a requirement specifying that the Reliability Coordinator's (RC's) SOL Methodology is applicable for developing SOLs used in the operations horizon. Additionally, the purpose of the standard references SOLs used in the reliable operation of the BES.

Requirement R1.2 in currently-effective FAC-011-3 requires that the SOL Methodology state that SOLs shall not exceed associated Facility Ratings. Facility Ratings to be used in operations as System Operating Limits (SOLs) are addressed through FAC-011-4 Requirement R2 and therefore is not addressed as a subpart of R1.

Requirement R1.3 in currently-effective FAC-011-3 requires that the SOL Methodology include a description of how to identify the subset of SOLs that qualify as Interconnection Reliability Operating Limits (IROLs). This language is preserved in Requirement R6.

Requirement R2

Each Reliability Coordinator shall include in its SOL Methodology the method for Transmission Operators to determine the applicable owner-provided Facility Ratings to be used in operations. The method shall address the use of common Facility Ratings between the Reliability Coordinator and the Transmission Operators in its Reliability Coordinator Area.

Rationale R2

The reliability objectives of Requirement R2 are 1) to ensure that the owner-provided Facility Ratings that are selected for use in operations are determined in accordance with the RC's SOL Methodology, and 2) to ensure the consistent use of applicable Facility Ratings between RCs and their Transmission Operators (TOP). For example, if a Transmission Owner (TO) provides three levels of Facility Ratings pursuant to Reliability Standard FAC-008-3, and another TO provides five levels of ratings, the RC will establish the method for the TOPs to determine which of those Facility Ratings will be utilized in common with the TOP and the RC for monitoring and assessments.

The intent of Requirement R2 is not to change, limit, or modify Facility Ratings determined by the equipment owner. The equipment owner is still responsible for determining the Facility Ratings per FAC-008. The intent is to use those owner-provided Facility Ratings in a consistent manner between the TOP and RC during operations.

Requirement R3

Each Reliability Coordinator shall include in its SOL Methodology the method for Transmission Operators to determine the System Voltage Limits to be used in operations. The method shall:

3.1 Require that BES buses/stations have an associated System Voltage Limit except for the BES buses/stations that may be excluded as specified in the Reliability Coordinator's SOL Methodology;

3.2 Require that System Voltage Limits respect the Facility voltage Ratings;

3.3 Require that System Voltage Limits are higher than in-service undervoltage load shedding (UVLS) relay settings;

3.4 Identify the lowest allowable System Voltage Limit;

3.5 Require the use of common System Voltage Limits between the Reliability Coordinator and the Transmission Operators in its Reliability Coordinator Area;

3.6 Require coordination of System Voltage Limits between adjacent Transmission Operators in its Reliability Coordinator Area;

3.7 Require coordination of System Voltage Limits between adjacent Reliability Coordinator Areas within an Interconnection.

Rationale R3

System Voltage Limits (SVLs) are intended to provide reliable pre- and post-contingency System performance for operations within a Reliability Coordinator Area and across neighboring Reliability Coordinator Areas. The proposed definition of System Voltage Limits includes normal and emergency voltage limits, and can also include time-based voltage limits, depending on what the RC requires. It is expected that the RC would require a set of System Voltage Limits to cover the entire BES system within its Reliability Coordinator Area for facility-based voltage limits, voltage instability, voltage collapse and misactuation of relay elements.

Both high and low limits are required. High limits tend to be associated with equipment/facility limitations. Low limits are often used to prevent phenomena associated with low voltages such as system instability, voltage collapse, and potential misactuation of relay elements. Identifying the set of "System Voltage Limits", both high and low, assures that all voltage limits associated with a particular bus or station, or the equipment connected to it, have been considered and the most limiting are used.

While all BES buses/stations have equipment related voltage ratings, there may be reasons that certain buses/stations do not require a System Voltage limit. Part 3.1 allows RCs to identify certain buses/stations that may be excluded from having an associated System Voltage Limit. These exempt buses/stations should be identified in the RC's SOL Methodology with appropriate reasoning. The identification of such buses/stations could be documented by citing the type of buses/stations (based on voltage level or area of the System) as opposed to a more detailed list of individual buses/stations which are exempt.

Buses or stations may not require System Voltage Limits when the voltage at the station has no material impact on System performance and associated SOLs. For example, System Voltage Limits at neighboring/nearby stations may be sufficient to protect the facilities from high voltage, and the System from instability, voltage collapse, and misactuation of relay elements.

Parts 3.5-3.7 identifies the RC as the entity responsible for developing the overall method for TOPs and RCs to determine and coordinate System Voltage Limits in their areas and neighboring areas.

Part 3.2 provides that in establishing System Voltage Limits, the SOL Methodology shall respect any Facility voltage Ratings established by the Generation Owner or TO under FAC-008. Recognizing that voltage limits are difficult to reflect by facility, the System Voltage Limits provided for stations/buses should reflect any Facility voltage Ratings for facilities that terminate at or are adjacent to the stations/buses with System Voltage Limits.

FERC Order No. 818 issued November 19, 2015, states that UVLS should not be triggered for an N-1 Contingency. As such, under Part 3.3, the SOL Methodology shall ensure System Voltage Limits are set above all UVLS settings to avoid UVLS operation following N-1 Contingencies.

Requirement R4

Each Reliability Coordinator shall include in its SOL Methodology the method for determining the stability limits to be used in operations. The method shall:

4.1 Specify stability performance criteria, including any margins applied. The criteria shall include the following:

4.1.1 steady-state voltage stability;

4.1.2 transient voltage response;

4.1.3 angular stability;

4.1.4 System damping;

4.2 Require that stability limits are established to meet the criteria specified in Part 4.1 for the Contingencies identified in Requirement R5;

4.3 Describe how the Reliability Coordinator establishes stability limits when there is an impact to more than one Transmission Operator in its Reliability Coordinator Area;

4.4 Describe how instability risks are identified, considering levels of transfers, Load and generation dispatch, and System conditions including any changes to System topology such as Facility outages;

4.5 Describe the level of detail that is required for the study model(s), including the extent of the Reliability Coordinator Area, as well as the critical modeling details from other Reliability Coordinator Areas, necessary to determine different types of stability limits.

4.6 Describe the allowed uses of Remedial Action Schemes (RAS) and other automatic post-Contingency mitigation actions[1].

Rationale R4

Reliability Standard FAC-011-3 currently requires the System to demonstrate transient, dynamic and voltage stability for both pre- and post-contingent states, but does not provide specifics. By requiring specific stability criteria within the SOL Methodology, the standard is improved and provides greater clarity and uniformity on practices across the industry. The set of commonly used stability criteria specified in Requirement R4 Part 4.1 is based upon information provided by standard drafting team members and observers, including many RCs and TOPs. Industry input from areas with significant experience managing stability issues led to the inclusion of system damping.

Also included in Part 4.1 is language requiring the SOL Methodology to include descriptions of how margins are applied. This language was added to explicitly capture the practices in use by RCs for off-line or on-line calculated stability limits, including any margin used in the application of the stability limits. It is left to the RC what type of margin to use (a percentage of the limit or a fixed MW value, for example), if it uses one at all.

Requirement R4 Part 4.2 provides the link to the Contingencies which must be respected in operations, which are unchanged from the current standard. In response to industry comments, Contingency specifications were moved to a separate requirement.

Requirement R4 Part 4.3 was introduced to preclude ambiguity in the resolution of stability limits when multiple TOPs within an RC's footprint are impacted. For example, this requirement may be met by providing language in the SOL Methodology describing which TOP (or identifying that the RC) has the responsibility to determine stability SOLs impacting multiple TOPs, and could also determine how to choose between stability limits derived by multiple TOPs for the same stability limit exceedance.

Requirement R4 Parts 4.4, 4.5 and 4.6 require that the SOL Methodology provide a description of the key parameters that must be considered and monitored when performing analyses to determine the stability limits. The intent of these parts is to help ensure that the SOL Methodology provides guidance such that the process/method used by the RC to determine stability limits may be repeated, successfully, by anyone reading the SOL Methodology. For example, the SOL Methodology could state that stability limits will be determined for any combination of all facilities in and single facility out

[1] The planned use of underfrequency load shedding (UFLS) is not allowed in the establishment of stability limits.

conditions, for all valid transfer conditions for the highest allowable thermal transfer condition (i.e. winter ratings), plus a flow margin of 10%, to account for potential emergency transfer conditions. This level of detail would allow TOPs and other entities to consistently duplicate results from study to study. Part 4.5 combines FAC-011-3 Requirements R3.1 and R3.4 into a single part while providing flexibility to the extent of the Reliability Coordinator Area (including other Reliability Coordinator Areas) that must be modeled to reflect the varying needs for different types of stability limits (e.g. local single unit stability up to wide area or inter area instability). By recognizing that some types of localized stability issues do not require entire Reliability Coordinator Area modeling to establish a stability limit, this revision aligns with and promotes the ability to monitor these localized areas with real time stability analysis tools.

Requirement 4 Part 4.4 is specifically intended to address the need for the SOL Methodology to identify the method for ensuring stability limits are “valid” (i.e. provide stable operations pre- and post-Contingency) for the Operational Planning Analysis (OPA) and Real-time Assessments (RTA) for which they will be used. Since stability limits may vary based on the system topology, load, generation dispatch, etc., and the current definitions for OPA and RTA include “An evaluation of … system conditions to assess anticipated (pre-Contingency) and potential (post-Contingency) conditions for ….operations”, the stability limits used in OPA/RTA should be “valid” for those system conditions.

As described within PRC-006-2 in alignment with FERC Order No. 763, underfrequency load shedding (UFLS) are designed “to arrest declining frequency, assist recovery of frequency following underfrequency events and provide last resort system preservation measures.” In the establishment of stability limits under Requirement R4 Part 4.6, UFLS programs are expressly prohibited from being considered as an acceptable post-Contingency mitigation action in order to preserve the intended availability of UFLS as a “last resort system preservation measure”.

Requirement R5

Each Reliability Coordinator shall include in its SOL Methodology the method for identifying the single Contingencies and multiple Contingencies for use in determining stability limits and performing Operational Planning Analyses (OPAs) and Real-time Assessments (RTAs). The method shall include:

5.1 The following list of single Contingency events for use in determining stability limits and performing OPAs and RTAs:

5.1.1 Loss of any of the following either by single phase to ground or three phase Fault (whichever is more severe) with normal clearing, or without a Fault:

- generator;
- transmission circuit;
- transformer;
- shunt device;
- single pole block, with Normal Clearing, in a monopolar or bipolar high voltage direct current system.

5.2 Any additional types of single Contingency events identified for use in determining stability limits, or for use in performing OPAs and RTAs.

5.3. Any types of multiple Contingency events identified for use in determining stability limits, or for use in performing OPAs and RTAs.

5.4 The method for considering the Contingency events provided by the Planning Coordinator in accordance with FAC-015-1 Requirement R6 to identify the Contingencies for use in determining stability limits.

Rationale R5

Requirement R5 combines both the requirements for single Contingencies (formerly in Requirement R2.2 of FAC-011-3) and for multiple Contingencies (formerly in Requirement R3.3 of FAC-011-3) for ease of interpretation.

Furthermore, Requirement R5 continues to maintain the flexibility that existed in Requirement R2.2 and Requirement R3.3 for each RC to determine which additional single and multiple Contingencies to respect given the uniqueness of their system. Through both the feedback received as a result of the July 2016 informal posting and the May 2016 technical conference it was evident that both the drafting team and industry agree that sufficient flexibility is required for each RC to determine its own methodology for addressing Contingencies other than single Contingencies.

Requirement R5 mandates that the RC specify which types of Contingencies (both single and multiple) are used for determining stability limits as well as those used in checking for all types of SOL exceedances in OPAs and RTAs (thermal, voltage and stability limits). The SOL Methodology is the best place to communicate which Contingencies the RC is respecting in their footprint such that all TOPs and any neighboring RCs understand one another's internal and interconnection-related reliability objectives.

Requirement R5 Part 5.1.1 identifies the types of single Contingency events that at a minimum must be used for stability limit analysis and for performing OPAs and RTAs. However, other types of single Contingency events such as inadvertent breaker operation and bus faults may be considered if the probability of such an event is relevant. The method for determining those Contingencies must also be identified in the RC's methodology as per Requirement R5 Part 5.2.

Requirement R5 Parts 5. 1 through 5.4 require that differences in Contingency events for determining stability limits, those used for OPAs and those used for RTAs, be specified in the RC's methodology. It is important to distinguish between Contingencies used for determining stability limits and those that are actually applied in OPAs and RTAs as only specific system conditions may actually warrant their use in the days leading up to real-time operations. For example, multiple Contingencies at heightened risk under specific weather or system conditions may not need to be respected (and thus monitored) the majority of the time when these conditions are not present.

Requirement R5 Part 5.4 compliments the proposed Requirement R6 in FAC-015-1 by ensuring the RC's methodology describes how the Contingency event information from the Planning Coordinator is used in deriving stability limits used in operations.

Requirement R6

Each Reliability Coordinator shall include in its SOL Methodology:

6.1 A description of how to identify the subset of SOLs that qualify as IROLs.

6.2 Criteria for determining when violating a SOL qualifies as an Interconnection Reliability Operating Limit (IROL) and criteria for developing any associated IROL T_v.

Rationale R6

The two IROL related requirements in FAC-011-3 were preserved under Requirement R6.

Requirement R7

Each Reliability Coordinator shall include in its SOL Methodology the method and periodicity for Transmission Operators to communicate SOLs it established to its RC(s).

Rationale R7

Requirement R7 serves as a companion to FAC-014-3 Requirement R3 which states, *"The Transmission Operator shall provide its SOLs to its Reliability Coordinator in accordance with its Reliability Coordinator's SOL Methodology."*

The language in Requirement R7 is written to provide clarity that the TOP is responsible for communicating only those SOLs that it established for its own Transmission Operator Area. The TOP is not responsible for communicating SOLs established by other TOPs that it uses in its analyses.

While it is possible to address communication of SOLs through TOP-003-3 and IRO-010-2, the standard drafting team determined that the communication of SOLs was of such importance to the reliability of the BES that it should be addressed specifically in the RC's SOL Methodology and in FAC-014-3. Additionally, the aforementioned Reliability Standards address the data specifically necessary for performing OPA, Real-time monitoring, and RTA. SOL information may be necessary for other uses beyond these analyses, for example in outage coordination assessments.

Requirement R8

Each Reliability Coordinator shall provide its new or revised SOL Methodology to:

8.1 Each adjacent Reliability Coordinator within its Interconnection prior to the effective date of the SOL Methodology;

8.2 Each Planning Coordinator and Transmission Planner responsible for planning any portion of the Reliability Coordinator Area prior to the effective date of the SOL Methodology;

8.3 Each Transmission Operator within its Reliability Coordinator Area prior to the effective date of the SOL Methodology;

8.4 Each requesting Reliability Coordinator that indicates a reliability-related need and is not considered adjacent in Part 8.1, within 30 calendar days of receiving the request.

Rationale R8

Requirement R8 preserves the reliability objective of providing the SOL Methodology to the appropriate entities from Requirement R4 of FAC-011-3. Requirement R8 Part 8.1 mandates that an RC provide its SOL Methodology to each adjacent RC within its Interconnection. In Requirement R8 Part 8.2, PC, not Planning Authority, was used to be consistent with the Functional Model as well as to be consistent with TPL-001. Requirement R8 Part 8.2 also uses "responsible for planning" instead of "models any portion of" to identify those PCs and TPs who have a reliability-related need rather than a PC/TP who simply has acquired a model that contains a portion of the Reliability Coordinator Area, but does not plan for that area. Requirement R8 Part 8.4 differs from Requirement R8 Parts 8.1 through 8.3 in that it mandates that an RC provide its SOL Methodology to any requesting RC that indicates a reliability-related need within 30 calendar days of such request rather than prior to the effective date of the SOL Methodology.

Rationales for FAC-014-3

September 2017

Requirement R1

Each Reliability Coordinator shall establish Interconnection Reliability Operating Limits (IROLs) for its Reliability Coordinator Area in accordance with its System Operating Limit methodology (SOL Methodology).

Rationale R1

Reliability Standard FAC-014-2 Requirement R1 requires that the Reliability Coordinator (RC) ensure that System Operating Limits (SOLs), including Interconnection Reliability Operating Limits (IROLs), for its RC Area are established and that the SOLs (including IROLs) are consistent with its SOL Methodology.

Furthermore, Requirement R2 of FAC-014-2 requires the Transmission Operator (TOP) to establish SOLs consistent with its RC's SOL Methodology.

Under this structure the RC is responsible for ensuring that SOLs established by the TOP, per Requirement R2, are consistent with the RC's SOL Methodology. This creates a situation where the RC is responsible for "ensuring" the actions of the TOP.

Accordingly, if the TOP does not establish SOLs per its RC's SOL Methodology, then 1) the TOP is in violation of Requirement R2, and 2) the RC by default is in violation of Requirement R1 because the RC did not ensure that the TOP's SOL was consistent with its SOL Methodology.

The proposed revision addresses this issue and clarifies the appropriate responsibilities of the respective functional entities. Additionally, this requirement carries forward the obligation of the RC to establish IROLs for its RC Area. The RC maintains primary responsibility for establishment of IROLs because these limits have the potential to impact a Wide-area.

Requirement R2

Each Transmission Operator shall establish System Operating Limits (SOL) for its portion of the Reliability Coordinator Area in accordance with its Reliability Coordinator's SOL Methodology.

Rationale R2

Requirement R2 preserves the intent of Requirement R2 of FAC-014-2.

The standard drafting team (SDT) removed language from the existing FAC-014-2 Requirement R2 that states the TOP "shall establish SOLs (as directed by its Reliability Coordinator)" because it causes confusion and may be incorrectly understood to mean that the TOPs are only required to establish SOLs if they have been "directed to by their RC." This is not the intended meaning of the requirement, thus, the SDT has removed the unnecessary and potentially confusing language. The proposed language makes clear that the TOP is the entity responsible for establishing SOLs, and that these SOLs must be established in accordance with the RC's SOL Methodology.

Requirement R3

The Transmission Operator shall provide its SOLs to its Reliability Coordinator in accordance with its Reliability Coordinator's SOL Methodology.

Rationale R3

Requirement R3 requires TOPs to provide the SOLs it established (under requirement R2) to the RC in accordance with the RC's SOL Methodology. This requirement is a companion requirement to FAC-011-4 Requirement R7, which states: "Each Reliability Coordinator shall include in its SOL Methodology the method for Transmission Operators to communicate SOLs it established to its RC(s). The method shall address the periodicity of SOL communication." These two requirements work together to ensure that SOLs established by the TOP in accordance with the RC's SOL Methodology are communicated to the RC in a timely manner.

The SDT recognizes that the provision of SOL information from the TOP to the RC may also be addressed via IRO-010-2, but the proposed requirement may also be utilized for SOL information other than what is utilized for Operational Planning Analysis (OPA)/ Real-time Assessment (RTA)/ Real-time monitoring. In such instances, the timing requirements should be coordinated between the RC's SOL methodology and the data specification document.

Requirement R4

Each Reliability Coordinator shall establish stability limits to be used in operations when the limit impacts more than one Transmission Operator in its Reliability Coordinator Area in accordance with its SOL Methodology.

Rationale R4

Requirement R4 requires that the RC establish stability limits to be used in operations when the limit impacts more than one TOP in its RC Area. This ensures that the RC who has wide-area responsibility will identify such stability limits and prevent any gaps in identification and monitoring of stability limits that impacts more than one TOP in its RC Area. TOPs are still required to identify stability limits that are within its TOP area (including Generator Operator areas interconnected to its TOP area).

Requirement R5

Each Reliability Coordinator shall provide:

5.1. Each Planning Coordinator within its Reliability Coordinator Area, SOLs for its Reliability Coordinator Area (including the subset of SOLs that are IROLs) at least once every twelve calendar months.

5.2. Each impacted Planning Coordinator within its Reliability Coordinator Area,, the following information for each established stability limit and each established IROL at least once every twelve calendar months:

5.2.1. The value of the stability limit or IROL;

5.2.2. Identification of the Facilities that are critical to the derivation of the stability limit or IROL;

5.2.3. The associated IROL T_v for any IROL;

5.2.4. The associated Contingency(ies); and,

5.2.5. The type of limitation represented by the stability limit or IROL (e.g., voltage collapse, angular stability).

5.3. Each impacted Transmission Operator within its Reliability Coordinator Area, the value of the stability limits established pursuant to Requirement R4 and each IROL established pursuant to Requirement R1, in an agreed upon time frame necessary for inclusion in the Transmission Operator's Operational Planning Analysis, Real-time monitoring, and Real-time Assessments.

5.4. Each impacted Transmission Operator within its Reliability Coordinator Area, the information identified in Requirement R5 Parts 5.2.2 – 5.2.5 for each established stability limit or each IROL, and any updates to that information within an agreed upon time frame necessary for inclusion in the Transmission Operator's Operational Planning Analyses.

5.5. Each requesting Transmission Operator within its Reliability Coordinator Area, requested SOL information for its Reliability Coordinator Area, on a mutually agreed upon schedule.

Rationale R5

Requirement R5 requires the RC to provide SOLs (including the subset that are IROLs) and any updates to those SOLs to Planning Coordinators (PCs) and Transmission Operators (TOP)s. This is an improvement over Requirement R5 in FAC-014-2 because it provides additional clarity on when the RC is responsible for performing these tasks. FAC-014-2 Requirement R5 includes the triggering clause of when entities "provide a written request that includes a schedule for delivery of those limits", while Requirement R5 of FAC-014-3 clearly identifies the RC's responsibilities with or without a request. This also removes confusion associated with FAC-010 in terms of SOLs existing in the planning horizon. All requirements in pertaining to SOLs in the planning horizon have thus been removed.

The requirement addresses varying needs in terms of both the content and the frequency at which the information is provided. This requirement also complements existing NERC requirements that provide a construct for communication of SOLs and SOL-related information (e.g. TOP-003-3, IRO-010-2, IRO-014-3) to prevent redundancies in requirements. TOP-to-TOP SOL information communication is addressed in TOP-003-3. RC-to-RC SOL information communication is addressed in IRO-014-3. TOP-to-RC information communication is addressed in Requirement R3 and may be addressed in IRO-010-2.

Requirement R5 Part 5.1 requires the RC to provide the PCs in its RC Area all SOLs and relevant SOL information at least once every 12 calendar months. This provides the PC the relevant information necessary for its assessments and its Transmission Planner's (TP's) assessments. MOD-032-1 and FAC-015-1 requirements provides the mechanism for SOLs to be communicated between the PCs and its TPs. It is expected that PCs do not need more frequent updates as most of their assessments are performed on an annual cycle. Transmission Service Providers were not retained as an entity that would have a reliability related need for stability limit and IROL related information. Nothing prohibits an RC from sharing such information outside of a NERC Reliability Standard for other non-reliability related purposes.

Requirement R5 Part 5.2 requires the RC to provide the impacted PCs additional specific information (consistent with FAC-014-2 R5.1.1 - R5.1.4) for stability limits and IROLs at least once every 12 calendar months. It is expected that PCs do not need more frequent updates as most of their assessments (and their respective TPs assessments) are performed on an annual cycle.

Requirement R5 Part 5.3 requires the RC to provide the impacted TOPs within its RC Area the value of the stability limits established in Requirement R4 and IROLs established in Requirement R1 in the Real-time Operations time horizon. This recognizes that the actual numerical "limit" (whether a new limit or modification of an existing one) may change based on varying system topology and thus those limit values must be provided in a timeframe designed to meet the impacted TOP's needs for their OPA, Real-time monitoring, and RTA.

Requirement R5 Part 5.4 requires the RC to provide the impacted TOPs additional specific information (consistent with FAC-014-2 R5.1.1-5.1.4) for stability limits and IROLs within Same-day or Operations Planning time horizon. This additional information is essential for the TOP's OPA; however, it can be communicated within a longer-term agreed upon time frame outside the Real-time Operations time horizon.

Additionally, Requirement R5 Part 5.5 requires that if a TOP requests any SOL information beyond what impacts that TOP, the RC must provide this SOL information as well. Both Requirement R5 Parts 5.4 and 5.5 require that the related information be provided in a mutually agreed upon schedule to ensure the TOP's needs are met (e.g. OPA, RTA, etc.) and the RC's ability to meet those needs are taken into consideration.

Requirement R6

Each Reliability Coordinator that is impacted by an IROL shall provide Transmission Owners and Generation Owners within its Reliability Coordinator Area a list of Facilities owned by that entity that are critical to the derivation of the IROL.

Rationale R6

Requirement R6 addresses FERC Order No. 777 directive for the communication of IROL information to Transmission Owners (TOs) (P6 and P41). FERC Order No. 777 states:

> *"As discussed below, we also direct NERC to develop a means to assure that IROLs are communicated to transmission owners." (P 6) "NERC should establish a clearly defined communication structure to assure that IROLs and changes to IROL status are timely communicated to transmission owners...One way to achieve this objective...is to modify FAC-014 to require the provision of IROLs to transmission owners. However, we leave it to NERC to determine the most appropriate means for communicating IROL status to transmission owners." (P 41)*

Requirement R5 Parts 5.2.1 through 5.2.5 requires that IROL information – including the Facilities critical to the derivation of the IROL – be communicated to the TOPs. SDT determined that while TOs and Generator Owners (GOs) need to be made aware of their Facilities that are critical to the derivation of the IROL, the TOs and GOs do not need to know the other IROL information specified in Requirement R5 Part 5.2.1 and Parts 5.2.3 through 5.2.5. These items may contain operationally sensitive information that should be limited to the TOPs that operate the equipment. Therefore, the SDT separated the communication to the TOs and GOs into a stand-alone Requirement R6.

The language "Each Reliability Coordinator that is impacted by an IROL" was used to cover scenarios where an IROL in one Reliability Coordinator Area contains Facilities that reside in a neighboring Reliability Coordinator's Area that are critical to the derivation of the IROL. Therefore, any Facilities that are critical to the derivation of an IROL will be communicated from the responsible RC to the appropriate TOs and GOs.

Rationale for FAC-015-1

September 2017

Requirement R1

Each Planning Coordinator, when developing its steady-state modeling data requirements, shall implement a process to ensure that Facility Ratings used in its Planning Assessment of the Near-Term Transmission Planning Horizon are equally limiting or more limiting than those established in accordance with its Reliability Coordinator's SOL Methodology. If the Planning Coordinator uses less limiting Facility Ratings than the Facility Ratings established in accordance with its Reliability Coordinator's SOL methodology, the Planning Coordinator shall provide a technical justification to its Reliability Coordinator.

Rationale R1

Requirement R1 was drafted to ensure the appropriate use of applicable Facility Ratings in planning models. Analysis of these models determines System needs, potential future transmission expansion and other Corrective Action Plans for reliable System operations. Therefore, it is imperative that the System is planned in such a way to support the successful operation of facilities when they are placed in service.

Requirement R1 provides a mechanism for the coordination of Facility Ratings in planning models to those established in accordance with the Reliability Coordinator's (RC's) System Operating Limit (SOL) Methodology. Since the analysis of planning models determines what facilities are constructed or modified, Facility Ratings used in these analyses should be equally limiting or more limiting than those established in accordance with the RC's SOL Methodology. Otherwise, operators could be unduly limited by thermal constraints that were not identified in preceding planning studies.

Reliability Standard MOD-032 requires the modeling data in a Planning Coordinator (PC) area be coordinated between the PC and applicable Transmission Planners (TPs). It is the opinion of the standard drafting team (SDT) that the resulting coordination is the appropriate means to ensure Facility Ratings included in planning models are equally limiting or more limiting than the Facility Ratings established in accordance with the RC's SOL Methodology, since Planning Assessments and Corrective Action Plans are developed based on analysis of these models (TPL-001).

The Near-Term Planning Horizon is specified because planning assumptions tend to be more certain earlier in the Planning Horizon. Additionally, construction activities or other Corrective Action Plans are more likely to be finalized in this period.

The intent of Requirement R1 is not to change, limit, or modify Facility Ratings determined by the equipment owner per FAC-008. The intent is to utilize those owner-provided Facility Ratings such that the System is planned to support the reliable operation of that System. This is accomplished by requiring the PC to use Facility Ratings that are equally limiting or more limiting than those established in accordance with the RC's SOL Methodology. If less limiting Facility Ratings are used by the PC, a technical justification is required to be documented and provided to the RC. This does not give the RC authority over the PC in the development of the Planning Assessment. It does, however, facilitate communication between planning and operating entities so that analysis of the System by these entities are coordinated.

Requirement R2

Each Planning Coordinator shall implement a process to ensure that System steady state voltage limits used in its Planning Assessment of the Near-Term Transmission Planning Horizon are equally limiting or more limiting than the System Voltage Limits established in accordance with its Reliability Coordinator's SOL Methodology. If the Planning Coordinator uses less limiting System steady-state voltage limits than the System Voltage Limits established in accordance with its Reliability Coordinator's SOL methodology, the Planning Coordinator shall provide a technical justification to its Reliability Coordinator.

Rationale R2

The purpose of TPL-001 is to "…develop a Bulk Electric System (BES) that will operate reliably over a broad spectrum of System conditions and following a wide range of probable Contingencies." Because the Planning Assessment (including the Corrective Action Plan) is the primary output of TPL-001, planning criteria used in developing the Planning Assessment should support the eventual operation of BES Facilities.

Requirement R2 was drafted to ensure the use of appropriate System steady-state voltage limits when performing studies in support of developing the Planning Assessment. These studies determine System needs, potential future transmission expansion and other Corrective Action Plans for reliable System operation. Therefore, it is imperative that the System is planned in such a way to support the successful operation of facilities when they are placed in service.

Since the analysis of planning models determines what Facilities are constructed or modified, the application of System steady-state voltage limits used in studies that support the development of the Planning Assessment should be equally limiting or more limiting than those established in accordance with the RC's SOL Methodology. Otherwise, operators could be unduly limited by voltage constraints that were not identified in preceding planning studies. Requirement R2 provides a mechanism for the coordination of System steady-state voltage limits evaluated in planning studies with the System Voltage Limits established in accordance with the RC's SOL Methodology.

The Near-Term Transmission Planning Horizon is specified because planning assumptions tend to be more certain earlier in the planning horizon. Additionally, construction activities or other Corrective Action Plans are more likely to be finalized in this period.
The intent of Requirement R2 is to supplement Requirement R5 of TPL-001-4 which states, "Each Transmission Planner and Planning Coordinator shall have criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System. For transient voltage response, the criteria shall at a minimum, specify a low voltage level

and a maximum length of time that transient voltages may remain below that level." When determining the criteria for System steady-state voltage limits in accordance with TPL-001-4 Requirement R2, the PC is required to implement the process described in FAC-015-1 Requirement R2.

Requirement R2 requires the PC to use System steady-state voltage limits that are equally limiting or more limiting than the System Voltage Limits established in accordance with the RC's SOL methodology. If less limiting System steady-state voltage limits are used by the PC, a technical justification is required to be documented and provided to the RC. This does not give the RC authority over the PC in the development of the Planning Assessment. It does, however, facilitate communication between planning and operating entities so that analysis of the System by these entities are coordinated.

Requirement R3

Each Planning Coordinator shall implement a process to ensure the stability performance criteria used in its Planning Assessment of the Near-Term Transmission Planning Horizon are equally limiting or more limiting than the stability performance criteria established in its Reliability Coordinator's SOL methodology. If the Planning Coordinator uses less limiting stability performance criteria than the stability performance criteria specified in its Reliability Coordinator's SOL methodology, the Planning Coordinator shall provide a technical justification to its Reliability Coordinator.

Rationale R3

The purpose of TPL-001-4 is to "…develop a Bulk Electric System (BES) that will operate reliably over a broad spectrum of System conditions and following a wide range of probably Contingencies." Because the Planning Assessment (including the Corrective Action Plan) is the primary output of TPL-001-4, planning criteria used in developing the Planning Assessment should support the eventual operation of BES facilities.

Requirement R3 was drafted to ensure the use of appropriate stability performance criteria when performing studies in support of developing the Planning Assessment. These studies determine System needs, potential future transmission expansion and other Corrective Action Plans for reliable System operation. Therefore, it is imperative that the System is planned in such a way to support the successful operation of facilities when they are placed in service.

Since the analysis of planning models determines what facilities are constructed or modified, the application of stability performance criteria used in studies that support the development of the Planning Assessment should be equally limiting or more limiting than the criteria specified in the RCs SOL Methodology. Otherwise, operators could be unduly limited by stability constraints that were not identified in preceding planning studies. Requirement R3 provides a mechanism for the coordination of stability performance criteria evaluated in planning studies with the Reliability Coordinator's SOL Methodology.

The Near-Term Planning Horizon is specified because planning assumptions tend to be more certain earlier in the Planning Horizon. Additionally, construction activities or other Corrective Action Plans are more likely to be finalized in this period.

The intent of Requirement R3 is to address the stability performance criteria used by PCs and TPs when performing the required stability analysis per TPL-001. When the PC performs the relevant stability analyses in accordance with TPL-001, they are required to implement the process in FAC-015-1 Requirement R3, which requires the PC to use stability performance criteria that are equally limiting or more limiting than the criteria established in accordance with the RC's SOL Methodology. If less limiting stability performance criteria are used by the PC, a technical justification is required to be documented and provided to the RC. This does not give the RC authority over the PC in the development of the Planning Assessment. It does, however, facilitate communication between planning and operating entities so that analysis of the System by these entities are coordinated.

Requirement R4

Each Planning Coordinator shall provide the Facility Ratings, System steady-state voltage limits, and stability performance criteria for use in its Planning Assessment to its Transmission Planners and to requesting Planning Coordinators.

Requirement R5

Each Transmission Planner shall use Facility Ratings, System steady-state voltage limits, and stability performance criteria in its Planning Assessment that are equally limiting or more limiting than the Facility Ratings, System steady-state voltage limits, and stability criteria provided by its Planning Coordinator.

Rationale R4 and R5

Requirements R4 and R5 provide for the explicit coordination between PCs and TPs of Facility Ratings, System steady-state voltage limits, and stability performance criteria used to develop Planning Assessments of the PC area. Additionally, Requirement R4 provides a mechanism for other PCs to obtain this same information, as needed. Requirement R5 also allows the TP to use more conservative Facility Ratings, System steady-state voltage limits, and stability performance criteria than those the PC provides where the TP deems appropriate

These requirements supplement TPL-001-4 Requirements R1, R5, and R6 by ensuring Facility Ratings, System steady-state voltage limits, and stability performance criteria are consistently applied in Planning Assessments of the PC area.

Requirement R6

Each Planning Coordinator shall communicate any instability, Cascading or uncontrolled separation identified in either its Planning Assessment of the Near-Term Transmission Planning Horizon or its

Transfer Capability assessment to each impacted Reliability Coordinator and Transmission Operator. This communication shall include:

6.1 The type of instability identified (e.g., voltage collapse, angular instability, transient voltage dip criteria violation);

6.2 The associated stability criteria used as part of determining the instability;

6.3 The associated Contingency(ies) which result(s) in the instability, Cascading or uncontrolled separation;

6.4 Any Remedial Action Scheme action, under voltage load shedding (UVLS) action, under frequency load shedding (UFLS) action, interruption of Firm Transmission Service, or Non-Consequential Load Loss required to address the instability, Cascading or uncontrolled separation;

6.5 Any Corrective Action Plan associated with the instability, Cascading or uncontrolled separation.

Rationale R6

IRO-017-1 Requirement R3 requires PCs and TPs to provide their Planning Assessments to impacted RCs. However, Requirement R2 Part 2.4 and Requirement R4 in TPL-001-4, which outline the Stability analysis portion of the Planning Assessment, do not provide for the level of detail prescribed in FAC-015-1 Requirement R6. Therefore this requirement was drafted to ensure the appropriate details regarding potential instability identified in the Stability portion of the Planning Assessment for the Near-Term Transmission Planning Horizon are provided to impacted RC and Transmission Operators (TOPs).

The information itemized in Requirement R6 is a key consideration for RC and TOPs in the establishment of SOLs. Of particular importance is the identification of potential risks of instability, Cascading conditions and uncontrolled separation that warrant establishment of an IROL by the RC. The details required by Requirement R6 will supplement the severe System conditions identified Requirements R4 Parts 4.4 & 4.5 of TPL-001-4.

Standards Impacted by the Retirement of FAC-010-3

Project 2015-09 Establish and Communicate System Operating Limits

STD	Standard Reference	Comment / Proposed Action
BAL standards		No Action Required
CIP standards		
CIP-002-5.1a	Attachment 1: 2.6. Generation at a single plant location or Transmission Facilities at a single station or substation location that are identified by its Reliability Coordinator, Planning Coordinator, or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.	This reference directly refers to the Planning Coordinator (PC), Transmission Planner (TP), and Reliability Coordinator (RC) and certain facilities that have been identified by these entities as being critical to the derivation of an IROL. After retirement of FAC-10-3, PCs and TPs will no longer be required to establish IROLs using FAC-010-3; however, IROLs will continue to be required to be established by the RC. Similar to Requirement R2, Part 2.6 of Attachment 1 of CIP-002-5.1a, FAC-014-3, Requirement R6, requires the Facilities (generation and/or transmission) identified by the RC as critical to the derivation of the IROL to be communicated to the Generator Owners (GO) and Transmission Owners (TOs). FAC-014-3 Requirement R6 specifically states, “Each Reliability Coordinator that is impacted by an IROL shall provide Transmission Owners and Generation Owners within its Reliability Coordinator Area a

		list of Facilities owned by that entity that are critical to the derivation of the IROL." While Requirement R2, Part 2.6 of Attachment 1 of CIP-002-5.1a could benefit from a revision to eliminate the PC and TP in response to the retirement of FAC-010-3, no reliability gap is created if FAC-010-3 is retired prior to the revision of Requirement R2, Part 2.6 of Attachment 1 given the above requirements for the RC. Consideration should also be given to modify Requirement R2, Part 2.6 of Attachment 1 of CIP-002-5.1a to focus on identification of Facilities – not the identification of IROLs as the limits themselves are immaterial to the goal. Accordingly, it may be appropriate for the Facilities identified as applicable to the CIP standard include due consideration for those planning events that result in System instability, Cascading, or uncontrolled separation as identified in the PC and TP's Planning Assessment for the Near-Term Transmission Planning Horizon. **Recommendations:** Revise Requirement R2, Part 2.6 of Attachment 1 in response to the retirement of FAC-010-3 to eliminate PC and TP responsibility for identification of Facilities critical to the derivation of IROLs. A future team should determine the appropriate Facilities for application of the CIP standard and include due consideration for those planning events that result in System instability, Cascading, or uncontrolled separation as identified in the PC and TP's

		Planning Assessment for the Near-Term Transmission Planning Horizon.
CIP-014-2	Applicability 4.1.1.3 Transmission Facilities at a single station or substation location that are identified by its Reliability Coordinator, Planning Coordinator, or Transmission Planner as critical to the derivation of Interconnection Reliability Operating Limits (IROLs) and their associated contingencies.	This reference directly refers to the PC and TP (and RC) and certain facilities that have been identified by these entities as being critical to the derivation of an IROL. Similar to 4.1.1.3 of the Applicability section of CIP-014-2, FAC-014-3, Requirement R6 requires the Facilities (generation and/or transmission) identified by the RC as critical to the derivation of the IROL to be communicated to the GOs and TOs. FAC-014-3 Requirement R6 specifically states, “Each Reliability Coordinator that is impacted by an IROL shall provide Transmission Owners and Generation Owners within its Reliability Coordinator Area a list of Facilities owned by that entity that are critical to the derivation of the IROL.” While 4.1.1.3 of the Applicability section of CIP-014-2 could benefit from a revision to eliminate the PC and TP in response to the retirement of FAC-010-3, no reliability gap is created if FAC-010-3 is retired prior to the revision of Requirement R2, Part 2.6 of Attachment 1 given the above requirements for the RC. Consideration should also be given to modifying 4.1.1.3 of the Applicability section of CIP-014-2 to focus on identification of Facilities – not the identification of IROLs as the limits themselves are immaterial to the goal. Accordingly, it may be appropriate for the Facilities identified as applicable to the CIP standard include due consideration for those planning events that result in System instability, Cascading, or uncontrolled separation as identified in

		the PC and TP's Planning Assessment for the Near-Term Transmission Planning Horizon. **Recommendations:** Revise 4.1.1.3 of the Applicability section of CIP-014-2 in response to the retirement of FAC-010-3 to eliminate the PC and TP responsibility for identification of Facilities critical to the derivation of IROLs. A future team should determine the appropriate Facilities for application of the CIP standard and include due consideration for those planning events that result in System instability, Cascading, or uncontrolled separation as identified in the PC and TP's Planning Assessment for the Near-Term Transmission Planning Horizon.
COM standards		No Action Required
EOP standards		No Action Required
FAC standards		
FAC-003-4	**Introduction:** **4.2.2.** Each overhead transmission line operated below 200kV identified as an element of an IROL under NERC Standard FAC-014 by the Planning Coordinator. **4.3.1.2.** Operated below 200kV identified as an element of an IROL under NERC Standard FAC-014 by the Planning Coordinator; or …	The Applicability section of the Introduction specifies "applicable lines" and includes overhead transmission lines (< 200 kV) identified as an element of an IROL by the PC. Requirements R1 and R2 reference "applicable lines" and IROLs as well. "Applicable lines" are specified for the identification of overhead transmission lines that require the levels of vegetation management required by the standard. All overhead transmission lines that operate at 200 kV and above are included as "applicable

	Requirements **R1.** Each applicable Transmission Owner and applicable Generator Owner shall manage vegetation to prevent encroachments into the Minimum Vegetation Clearance Distance (MVCD) of its applicable line(s) which are either an element of an IROL, or an element of a Major WECC Transfer Path; operating within their Rating and all Rated Electrical Operating Conditions of the types shown below… **R2.** Each applicable Transmission Owner and applicable Generator Owner shall manage vegetation to prevent encroachments into the MVCD of its applicable line(s) which are not either an element of an IROL, or an element of a Major WECC Transfer Path.	lines” (4.2.1). Qualifications are then being made to include < 200 kV transmission lines (4.2.2 & 4.2.3) that have a high enough level of criticality to require the same vegetative management requirements as higher voltage transmission lines. The actual limit is not the focus, but rather, the identification of transmission lines that, when compromised, present the risk of potentially severe consequences and therefore should be subject to stricter vegetation management. The retirement of FAC-010 does not create a reliability gap here. The language in Parts 4.2.2 and 4.3.1.2 of FAC-003-4 specifically addresses IROLs determined in the planning horizon pursuant to FAC-014; however, IROLs are required to be established by the RC, and the Facilities critical to the derivation of the IROL are communicated to the GOs and TOs through FAC-014-3, Requirement R6 which states, “Each Reliability Coordinator that is impacted by an IROL shall provide Transmission Owners and Generation Owners within its Reliability Coordinator Area a list of Facilities owned by that entity that are critical to the derivation of the IROL.” FAC-003-4 is applicable to GOs and TOs. Accordingly, these entities are made aware of IROLs and the facilities critical to the derivation of those IROLs from the RC as per FAC-014-3 Requirement R6 above. While Parts 4.2.2 and 4.3.1.2 of the Applicability section of FAC-003-4 would benefit from a revision in response to the retirement of FAC-010, no reliability gap is created if FAC-010-3 is retired

		prior to the revision of these subparts given the above requirements for the RC. **Recommendations:** Revise 4.2.2 and 4.3.1.2 of the Applicability section of FAC-003-4 in response to the retirement of FAC-010-3 to eliminate references to the PC determining IROLs. A future team should determine the appropriateness for the elements identified as applicable to 4.2.2 and 4.3.1.2 of the Applicability section of FAC-003-4 include due consideration for those planning events that result in System instability, Cascading, or uncontrolled separation as identified in the PC and TP's Planning Assessment for the Near-Term Transmission Planning Horizon.
FAC-013-2	**Requirements** **R1.2.** A statement that the assessment shall respect known System Operating Limits (SOLs).	R 1.2 is not specific to Planning Horizon SOLs but the applicability of the overall standard is for PCs. The retirement of FAC-010-3 does not create a reliability gap here as SOLs will continue to be established by TOPs and communicated to PCs through FAC-014-3 Requirement R5. The PC can then use the SOL information to satisfy Requirement R1, R1.2. Requirement R1.2 does not specify whether the SOLs are sourced from the RC or by the PC. **Recommendations:** Consideration should also be given to clarify FAC-013-2 Requirement R1.2 to eliminate the use of the SOL term as applied to the Planning Coordinators Transfer Capability assessment.

		Possible solutions include changing the language of Requirement R1, R1.2 to reference the performance requirements per Table 1 of TPL-001-4, or revising the language to replace SOL with "Facility Ratings, System steady-state voltage limits, and the Transmission Planners' stability criteria." A future team should consider eliminating the use of the SOL term as applied to the Planning Coordinators Transfer Capability assessment as described above.
FAC-014-2	Requirements R3 – R5	Under Revision
INT standards		No Action Required
IRO standards		No Action Required
MOD standards		No Action Required
NUC standards		No Action Required
PER standards		No Action Required
PRC standards		
PRC-002-2	**Requirements:** **R5.** Each Responsible Entity shall: **5.1.** Identify BES Elements for which dynamic Disturbance recording (DDR) data is required, including the following: **5.1.2.** Any one BES Element that is part of a stability (angular or voltage) related System Operating Limit (SOL).	Direct language around SOL and IROL does not specify PC SOL methodology and therefore does not preclude the RC's methodology from determining the applicable limits. However, the time horizon for the requirement is "long-term planning." Additionally, the SOLs referred to are stability based only. The retirement of FAC-010-3 does not create a reliability gap here. IROLs and stability-related SOLs are communicated to the GOs

	5.1.4. One or more BES Elements that are part of an Interconnection Reliability Operating Limit (IROL).	and TOs through FAC-014-3, Requirement R6 which states, "Each Reliability Coordinator that is impacted by an IROL shall provide Transmission Owners and Generation Owners within its Reliability Coordinator Area a list of Facilities owned by that entity that are critical to the derivation of the IROL." The Applicability section of PRC-002-2 describes the Responsibly Entities: 4.1.1 Eastern Interconnection – Planning Coordinator 4.1.2 ERCOT Interconnection – Planning Coordinator or Reliability Coordinator 4.1.3 Western Interconnection – Reliability Coordinator 4.1.4 Quebec Interconnection – Planning Coordinator or Reliability Coordinator Regardless of the designation of the Responsible Entity in a given Interconnection, either is able to provide the GOs and TOs the information in Requirement R5, Parts 5.1.2 and 5.1.4. The information is ultimately sourced from the RC, but FAC-014-3, Requirement R5, Parts 5.1, 5.2, and subparts requires the RC to communicate the relevant information to the PC, who, in turn, can communicate the information to the applicable GO and TO as required by PRC-002-2, Requirement R5, Parts 5.1.2 and 5.1.4. FAC-014-3 R5. Each Reliability Coordinator shall provide:

		5.1. Each Planning Coordinator within its RC Area, SOLs for its RC Area (including the subset of SOLs that are IROLs) at least once every twelve calendar months. 5.2. Each impacted Planning Coordinator the following information for each established stability limit and each established IROL at least once every twelve calendar months: 5.2.1. The value of the stability limit or IROL; 5.2.2. Identification of the Facilities that are critical to the derivation of the stability limit or IROL; 5.2.3. The associated IROL Tv for any IROL; 5.2.4. The associated Contingency(ies); and, 5.2.5. The type of limitation represented by the stability limit or IROL (e.g., voltage collapse, angular stability). While subparts 5.1.2 and 5.1.4 of PRC-002-2 would benefit from a revision in response to the retirement of FAC-010, the need for such a revision does not rise to the level of creating a reliability gap if FAC-010 is retired prior to the time these requirements can be changed. **Recommendations:** It is recommended that this standard be modified at some point in the future to update the designation of the Responsible Entities defined in the Standard. In the absence of this change, however, the currently defined Responsible Entities are capable of providing the necessary information through the mechanisms described above.
PRC-023-4	**Attachment B** - Criteria Section:	Direct reference to FAC-010 made in this attachment.

	If any of the following criteria apply to a circuit, the applicable entity must comply with the standard for that circuit… B2. The circuit is a monitored Facility of an Interconnection Reliability Operating Limit (IROL), where the IROL was determined in the planning horizon pursuant to FAC-010.	Attachment B sets the applicability of facilities operated below 200 kV (similar to FAC-003). These items reference PRC-023-4, Requirement R6, to which Attachment B is applicable. The language in part B2 of Attachment B of PRC-023-4 specifically addresses IROLs determined in the planning horizon pursuant to FAC-010-3; however, IROLs are established by the RC, and the Facilities critical to the derivation of the IROL are communicated to the GOs and TOs through FAC-014-3, Requirement R6 which states, "Each Reliability Coordinator that is impacted by an IROL shall provide Transmission Owners and Generation Owners within its Reliability Coordinator Area a list of Facilities owned by that entity that are critical to the derivation of the IROL." Accordingly, the GO and the TO are able to use the IROL information provided by the Reliability Coordinator. While part B2 of Attachment B for PRC-023-4 would benefit from a revision in response to the retirement of FAC-010, no reliability gap is created if FAC-010-3 is retired prior to the revision of these subparts given the above requirements for the RC. **Recommendations:** Revise Attachment B of PRC-023-4 in response to the retirement of FAC-010-3 to eliminate the references to FAC-10, PC's determining IROLs and IROLs in the Planning Horizon for identification of circuits as a monitored Facility of an Interconnection Reliability Operating Limit (IROL).

		A future team should consider the appropriateness for the circuits identified as applicable to Attachment B of PRC-023-4 to include due consideration for those planning events that result in System instability, Cascading, or uncontrolled separation as identified in the PC and TP's Planning Assessment for the Near-Term Transmission Planning Horizon.
PRC-026-1	R1. Each Planning Coordinator shall, at least once each calendar year, provide notification of each generator, transformer, and transmission line BES Element in its area that meets one or more of the following criteria, if any, to the respective Generator Owner and Transmission Owner: Criteria: 1. Generator(s) where an angular stability constraint exists that is addressed by a System Operating Limit (SOL) or a Remedial Action Scheme (RAS) and those Elements terminating at the Transmission station associated with the generator(s). 2. An Element that is monitored as part of an SOL identified by the Planning Coordinator's methodology[1] based on an angular stability constraint. *{[1] NERC Reliability Standard FAC-014-2 – Establish and Communicate System Operating Limits, Requirement R3.}*	Direct reference is made to the PC's SOL Methodology. Footnote 1 on page 3 of 84 references FAC-014-2, R3. Similar to the reference identified in Requirement R5, Part 5.1.2 of PRC-002-2, Requirement R1 of PRC-026-1 references the identification of facilities that are sensitive to angular stability constraints. Stability-related SOLs are communicated to the Planning Coordinator through FAC-014-3, Requirement R5, Parts 5.1 and, 5.2: R5. Each Reliability Coordinator shall provide: 5.1. Each Planning Coordinator within its RC Area, SOLs for its RC Area (including the subset of SOLs that are IROLs) at least once every twelve calendar months. 5.2. Each impacted Planning Coordinator the following information for each established stability limit and each established IROL at least once every twelve calendar months: 5.2.1. The value of the stability limit or IROL; 5.2.2. Identification of the Facilities that are critical to the derivation of the stability limit or IROL; 5.2.3. The associated IROL Tv for any IROL;

		5.2.4. The associated Contingency(ies); and, 5.2.5. The type of limitation represented by the stability limit or IROL (e.g., voltage collapse, angular stability). With this information, the PC can communicate the necessary SOL information to the applicable GO and TO as required by PRC-026-1, Requirement R1. While Criteria 1 and 2 of PRC-026-1 would benefit from a revision in response to the retirement of FAC-010, no reliability gap is created if FAC-010-3 is retired prior to the revision of these criteria given the above requirement for the RC. **Recommendations:** Revise PRC-026-1, Requirement R1 in response to the retirement of FAC-010-3 to eliminate the term, “Planning Coordinator’s Methodology” which references FAC-10 and remove the reference to SOLs identified by the PC. A future team should consider that the PRC-026 R1 criteria reference Elements associated with angular stability as identified in the PC or TP’s Planning Assessment for the Near-Term Transmission Planning Horizon.

[1] NERC developed this Reliability Standard Audit Worksheet (RSAW) language in order to facilitate NERC's and the Regional Entities' assessment of a registered entity's compliance with this Reliability Standard. The NERC RSAW language is written to specific versions of each NERC Reliability Standard. Entities using this RSAW should choose the version of the RSAW applicable to the Reliability Standard being assessed. While the information included in this RSAW provides some of the methodology that NERC has elected to use to assess compliance with the requirements of the Reliability Standard, this document should not be treated as a substitute for the Reliability Standard or viewed as additional Reliability Standard requirements. In all cases, the Regional Entity should rely on the language contained in the Reliability Standard itself, and not on the language contained in this RSAW, to determine compliance with the Reliability Standard. NERC's Reliability Standards can be found on NERC's website. Additionally, NERC Reliability Standards are updated frequently, and this RSAW may not necessarily be updated with the same frequency. Therefore, it is imperative that entities treat this RSAW as a reference document only, and not as a substitute or replacement for the Reliability Standard. It is the responsibility of the registered entity to verify its compliance with the latest approved version of the Reliability Standards, by the applicable governmental authority, relevant to its registration status.

The RSAW may provide a non-exclusive list, for informational purposes only, of examples of the types of evidence a registered entity may produce or may be asked to produce to demonstrate compliance with the Reliability Standard. A registered entity's adherence to the examples contained within this RSAW does not necessarily constitute compliance with the applicable Reliability Standard, and NERC and the Regional Entity using this RSAW reserve the right to request additional evidence from the registered entity that is not included in this RSAW. This RSAW may include excerpts from FERC Orders and other regulatory references which are provided for ease of reference only, and this document does not necessarily include all applicable Order provisions. In the event of a discrepancy between FERC Orders, and the language included in this document, FERC Orders shall prevail.

[2] Compliance Assessment Date(s): The date(s) the actual compliance assessment (on-site audit, off-site spot check, etc.) occurs.

Compliance Assessment Approach Specific to FAC-011-4, R3
This section to be completed by the Compliance Enforcement Authority

	Verify the entity's SOL Methodology includes the method for Transmission Operators to determine the System Voltage Limits to be used in operations.
	Verify the method for Transmission Operators to determine the System Voltage Limits to be used in operations:
	(3.1) Requires that BES buses/stations have an associated System Voltage Limit except for the BES buses/stations that may be excluded as specified in the Reliability Coordinator's SOL Methodology
	(3.2) Requires that System Voltage Limits respect the Facility voltage Ratings;
	(3.3) Require that System Voltage Limits are higher than in-service under voltage load shedding (UVLS) relay settings
	(3.4) Identifies the lowest allowable System Voltage Limit;
	(3.5) Addresses the use of common System Voltage Limits between the Reliability Coordinator and the Transmission Operators in its Reliability Coordinator Area;
	(3.6) Addresses coordination of System Voltage Limits between adjacent Transmission Operators in its Reliability Coordinator Area; and
	(3.7) Address coordination of System Voltage Limits between adjacent Reliability Coordinator Areas within an Interconnection.
Note to Auditor:	

Auditor Notes:

____

R4 Supporting Evidence and Documentation

R4. Each Reliability Coordinator shall include in its SOL Methodology the method for determining the stability limits to be used in operations. The method shall:

4.1. Specify stability performance criteria, including any margins applied. The criteria shall include the following:

4.1.1. steady-state voltage stability;

4.1.2. transient voltage response;

4.1.3. angular stability; and

4.1.4. System damping.

4.2. Require that stability limits are established to meet the criteria specified in Part 4.1 for the Contingencies identified in Requirement R5.

4.3. Describe how the Reliability Coordinator establishes stability limits when there is an impact to more than one Transmission Operator in its Reliability Coordinator Area.

4.4. Describe how instability risks are identified, considering levels of transfers, Load and generation dispatch, and System conditions including any changes to System topology such as Facility outages;

4.5. Describe the level of detail that is required for the study model(s); including the extent of the Reliability Coordinator Area, as well as the critical modeling details from other Reliability Coordinator Areas, necessary to determine different types of stability limits.

4.6. Describe the allowed uses of Remedial Action Schemes and other automatic post-Contingency mitigation actions; the planned use of underfrequency load shedding (UFLS) is not allowed in the establishment of stability limits.

M4. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation of its SOL Methodology that addresses the items listed in Requirement R4.

Registered Entity Response (Required):
Compliance Narrative:
Provide a brief explanation, in your own words, of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[i]:

Provide the following evidence, or other evidence to demonstrate compliance.
Methodology for establishing SOLs (i.e., SOL Methodology) within the entity's Reliability Coordinator Area.

Registered Entity Evidence (Required):

The following information is requested for each document submitted as evidence. Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.					
File Name	**Document Title**	**Revision or Version**	**Document Date**	**Relevant Page(s)**	**Description of Applicability of Document**

				or Section(s)	

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to FAC-011-4, R4

This section to be completed by the Compliance Enforcement Authority

	Verify the entity's SOL Methodology includes the method for determining the stability limits to be used in operations.
	Verify the method for determining the stability limits to be used in operations:
	(4.1) Specifies stability performance criteria, including any margins applied, and includes:
	(4.1.1) steady-state voltage stability;
	(4.1.2) transient voltage response;
	(4.1.3) angular stability; and
	(4.1.4) System damping.
	(4.2) Requires that stability limits are established to meet the criteria specified in Part 4.1 for the Contingencies identified in Requirement R5.
	(4.3) Describes how the Reliability Coordinator establishes stability limits when there is an impact to more than one Transmission Operator in its Reliability Coordinator Area.
	(4.4) Describes how instability risks are identified, considering levels of transfers, Load and generation dispatch, and System conditions including any changes to System topology such as Facility outages;
	(4.5) Describes the level of detail that is required for the study model(s); including the extent of the Reliability Coordinator Area, as well as the critical modeling details from other Reliability Coordinator Areas, necessary to determine different types of stability limits.
	(4.6) Describes the allowed uses of Remedial Action Schemes and other automatic post-Contingency mitigation actions; the planned use of underfrequency load shedding (UFLS) is not allowed in the establishment of stability limits.
Note to Auditor:	

Auditor Notes:

R5 Supporting Evidence and Documentation

R5. Each Reliability Coordinator shall include in its SOL Methodology the method for identifying the single Contingencies and multiple Contingencies for use in determining stability limits and performing Operational Planning Analysis (OPAs) and Real-time Assessments (RTAs). The method shall include:

5.1. The following list of single Contingency events for use in determining stability limits and performing OPAs and RTAs:

5.1.1. Loss of any of the following either by single phase to ground or three phase Fault (whichever is more severe) with normal clearing, or without a Fault:

- generator;
- transmission circuit;
- transformer;
- shunt device; or
- single pole block, with Normal Clearing, in a monopolar or bipolar high voltage direct current system.

5.2. Any additional types of single Contingency events identified for use in determining stability limits, or for use in performing OPAs and RTAs.

5.3. Any types of multiple Contingency events identified for use in determining stability limits, or for use in performing OPAs and RTAs.

5.4. The method for considering the Contingency events provided by the Planning Coordinator in accordance with FAC-015-1, Requirement R6 to identify the Contingencies for use in determining stability limits.

M5. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation of its SOL Methodology that addresses the items listed in Requirement R5.

Registered Entity Response (Required):
Compliance Narrative:
Provide a brief explanation, in your own words, of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested [i]:

Provide the following evidence, or other evidence to demonstrate compliance.
Methodology for establishing SOLs (i.e., SOL Methodology) within the entity's Reliability Coordinator Area.

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to FAC-011-4, R7
This section to be completed by the Compliance Enforcement Authority

	Verify the entity's SOL Methodology includes the method for Transmission Operators to communicate SOLs it established to its Reliability Coordinator(s).
	Verify the method for Transmission Operators to communicate SOLs it established to its Reliability Coordinator(s) addresses the periodicity of SOL communication.
Note to Auditor:	

Auditor Notes:

R8 Supporting Evidence and Documentation

R8. Each Reliability Coordinator shall provide its SOL Methodology and any changes to the SOL Methodology prior to the effective date of the SOL Methodology, to:

8.1. Each adjacent Reliability Coordinator within an Interconnection, and each Reliability Coordinator that requests and indicates it has a reliability-related need;

8.2. Each Planning Coordinator and Transmission Planner that is responsible for planning any portion of the Reliability Coordinator Area;

8.3. Each Transmission Operator within its Reliability Coordinator Area.

M8. Acceptable evidence that the Reliability Coordinator provided its SOL Methodology to the entities identified in Requirement R8 may include, but is not limited to, dated electronic or hard copy documentation such as emails with receipts, registered mail receipts, or postings to a secure web site with accompanying notification(s).

Registered Entity Response (Required):
Question: Has the entity made any changes to its SOL Methodology during the audit period? ☐ Yes ☐ No
If Yes, provide a list of changes including the date the change became effective. If No, explain how the entity made this determination.
[Note: A separate spreadsheet or other document may be used. If so, provide the document reference below.]

Question: Has the entity received a request for its SOL Methodology from a Reliability Coordinator that indicated it has a reliability-related need for the SOL Methodology? ☐ Yes ☐ No
If Yes, provide a list of requests received. If No, explain how the entity made this determination.
[Note: A separate spreadsheet or other document may be used. If so, provide the document reference below.]

Registered Entity Response (Required):
Compliance Narrative:
Provide a brief explanation, in your own words, of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[i]:

Provide the following evidence, or other evidence to demonstrate compliance.
Methodology for establishing SOLs (i.e., SOL Methodology) within the entity's Reliability Coordinator Area.
Evidence the SOL Methodology and any changes to the SOL Methodology were provided to each adjacent Reliability Coordinator within an Interconnection, and each Reliability Coordinator that requests and indicates it has a reliability-related need.
Evidence the SOL Methodology and any changes to the SOL Methodology were provided to each Planning Coordinator and Transmission Planner that is responsible for planning any portion of the Reliability Coordinator Area.

Evidence the SOL Methodology and any changes to the SOL Methodology were provided to each Transmission Operator within the entity's Reliability Coordinator Area.

Registered Entity Evidence (Required):

The following information is requested for each document submitted as evidence. Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

File Name	Document Title	Revision or Version	Document Date	Relevant Page(s) or Section(s)	Description of Applicability of Document

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to FAC-011-4, R8

This section to be completed by the Compliance Enforcement Authority

	(8.1) Verify that, prior to the effective date of the SOL Methodology, the entity provided its SOL Methodology to each adjacent Reliability Coordinator within an Interconnection, and each Reliability Coordinator that requests and indicates it has a reliability-related need.
	(8.1) For all, or a sample of, changes made to the entity's SOL Methodology, verify entity provided its SOL Methodology to each adjacent Reliability Coordinator within an Interconnection, and each Reliability Coordinator that requests and indicates it has a reliability-related need, prior to the effective date of the updated SOL Methodology.
	(8.2) Verify that, prior to the effective date of the SOL Methodology, the entity provided its SOL Methodology to each Planning Coordinator and Transmission Planner that is responsible for planning any portion of the Reliability Coordinator Area
	(8.2) For all, or a sample of, changes made to the entity's SOL Methodology, verify entity provided its SOL Methodology to each Planning Coordinator and Transmission Planner that is responsible for planning any portion of the Reliability Coordinator Area, prior to the effective date of the updated SOL Methodology.
	(8.3) Verify that, prior to the effective date of the SOL Methodology, the entity provided its SOL Methodology to each Transmission Operator within its Reliability Coordinator Area.
	(8.3) For all, or a sample of, changes made to the entity's SOL Methodology, verify entity provided its SOL Methodology to each Transmission Operator within its Reliability Coordinator Area., prior to the effective date of the updated SOL Methodology.
Note to Auditor:	

Auditor Notes:

Additional Information:

Reliability Standard

The RSAW developer should provide the following information without hyperlinks. Update the information below as appropriate.

The full text of FAC-011-4-N may be found on the NERC Web Site (www.nerc.com) under "Program Areas & Departments", "Reliability Standards."

In addition to the Reliability Standard, there is an applicable Implementation Plan available on the NERC Web Site.

In addition to the Reliability Standard, there is background information available on the NERC Web Site.

Capitalized terms in the Reliability Standard refer to terms in the NERC Glossary, which may be found on the NERC Web Site.

Sampling Methodology [If developer deems reference applicable]

Sampling is essential for auditing compliance with NERC Reliability Standards since it is not always possible or practical to test 100% of either the equipment, documentation, or both, associated with the full suite of enforceable standards. The Sampling Methodology Guidelines and Criteria (see NERC website), or sample guidelines, provided by the Electric Reliability Organization help to establish a minimum sample set for monitoring and enforcement uses in audits of NERC Reliability Standards.

Regulatory Language [Developer to ensure RSAW has been provided to NERC Legal for links to appropriate Regulatory Language – See example below]

E.g. FERC Order No. 742 paragraph 34: "Based on NERC's…….

E.g. FERC Order No. 742 Paragraph 55, Commission Determination: "We affirm NERC's…….

Selected Glossary Terms [If developer deems applicable]

The following Glossary terms are provided for convenience only. Please refer to the NERC web site for the current enforceable terms.

Revision History for RSAW

Version	Date	Reviewers	Revision Description
1	XX/XX/XXXX	RSAW Working Group	New Document

Revision History for RSAW Template

Version	Date	Reviewers	Revision Description
0.9	11/6/2013	RSAW Working Group	Initial Draft
1.0	11/20/2013	CMFG	First Review
1.1	12/1/2014	RSAW TF, CMFG	Minor text changes
1.2	2/17/2014	Jerry Hedrick	Removed Internal Controls approach for additional consideration
1.3	4/9/2014	CIP-014-1 RSAW DT; RSAW TF	Changed the footnote on Evidence Requested to an Endnote. Moved example language from multiple areas to Developer's Guide.
3.0	1/20/2017		Deleted IA, LSE, PSE columns from Applicability; changed PA column to PA/PC. Updated page footer with new template version.

[i] Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

[1] NERC developed this Reliability Standard Audit Worksheet (RSAW) language in order to facilitate NERC's and the Regional Entities' assessment of a registered entity's compliance with this Reliability Standard. The NERC RSAW language is written to specific versions of each NERC Reliability Standard. Entities using this RSAW should choose the version of the RSAW applicable to the Reliability Standard being assessed. While the information included in this RSAW provides some of the methodology that NERC has elected to use to assess compliance with the requirements of the Reliability Standard, this document should not be treated as a substitute for the Reliability Standard or viewed as additional Reliability Standard requirements. In all cases, the Regional Entity should rely on the language contained in the Reliability Standard itself, and not on the language contained in this RSAW, to determine compliance with the Reliability Standard. NERC's Reliability Standards can be found on NERC's website. Additionally, NERC Reliability Standards are updated frequently, and this RSAW may not necessarily be updated with the same frequency. Therefore, it is imperative that entities treat this RSAW as a reference document only, and not as a substitute or replacement for the Reliability Standard. It is the responsibility of the registered entity to verify its compliance with the latest approved version of the Reliability Standards, by the applicable governmental authority, relevant to its registration status.

The RSAW may provide a non-exclusive list, for informational purposes only, of examples of the types of evidence a registered entity may produce or may be asked to produce to demonstrate compliance with the Reliability Standard. A registered entity's adherence to the examples contained within this RSAW does not necessarily constitute compliance with the applicable Reliability Standard, and NERC and the Regional Entity using this RSAW reserve the right to request additional evidence from the registered entity that is not included in this RSAW. This RSAW may include excerpts from FERC Orders and other regulatory references which are provided for ease of reference only, and this document does not necessarily include all applicable Order provisions. In the event of a discrepancy between FERC Orders, and the language included in this document, FERC Orders shall prevail.

[2] Compliance Assessment Date(s): The date(s) the actual compliance assessment (on-site audit, off-site spot check, etc.) occurs.

	Verify the entity established stability limits to be used in operations when the limit impacts more than one Transmission Operator in its Reliability Coordinator Area in accordance with entity's SOL Methodology.
Note to Auditor:	

Auditor Notes:

R5 Supporting Evidence and Documentation

R5. Each Reliability Coordinator shall provide:

5.1. Each Planning Coordinator within its Reliability Coordinator Area, SOLs for its Reliability Coordinator Area (including the subset of SOLs that are IROLs) at least once every twelve calendar months.

5.2. Each impacted Planning Coordinator within its Reliability Coordinator Area, the following information for each established stability limit and each established IROL at least once every twelve calendar months:

5.2.1 The value of the stability limit or IROL;

5.2.2. Identification of the Facilities that are critical to the derivation of the stability limit or IROL;

5.2.3. The associated IROL T_v for any IROL;

5.2.4. The associated Contingency(ies); and

5.2.5. The type of limitation represented by the stability limit or IROL (e.g., voltage collapse, angular stability).

5.3. Each impacted Transmission Operator within its Reliability Coordinator Area, the value of the stability limits established pursuant to Requirement R4 and each IROL established pursuant to Requirement R1, in an agreed upon time frame necessary for inclusion in the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments.

5.4. Each impacted Transmission Operator within its Reliability Coordinator Area, the information identified in Requirement R5 Parts 5.2.2 - 5.2.5 for each established stability limit or each IROL, and any updates to that information within an agreed upon time frame necessary for inclusion in the Transmission Operator's Operational Planning Analyses.

5.5. Each requesting Transmission Operator within its Reliability Coordinator Area, requested SOL information for its Reliability Coordinator Area, on a mutually agreed upon schedule.

M5. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation to demonstrate that the Reliability Coordinator provided the information in accordance with Requirement R5.

Registered Entity Response (Required):
Compliance Narrative:
Provide a brief explanation, in your own words, of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested [i]:

Provide the following evidence, or other evidence to demonstrate compliance.
Evidence the entity provided SOLs for Reliability Coordinator Area (including the subset of SOLs that are IROLs) to each Planning Coordinator within its Reliability Coordinator Area at least once every twelve calendar months.
Evidence the entity provided the information specified in Parts 5.2.1 – 5.2.5 for each established stability limit and each established IROL to each impacted Planning Coordinator within its Reliability Coordinator Area at least once every twelve calendar months.
Evidence the entity provided the value of the stability limits established pursuant to Requirement R4 and each

IROL established pursuant to Requirement R1, in an agreed upon time frame necessary for inclusion in the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-time Assessments, to each impacted Transmission Operator within its Reliability Coordinator Area.
Evidence the entity provided the information identified in Requirement R5 Parts 5.2.2 - 5.2.5 for each established stability limit or each IROL, and any updates to that information within an agreed upon time frame necessary for inclusion in the Transmission Operator's Operational Planning Analyses, to each impacted Transmission Operator within its Reliability Coordinator Area.
Evidence the entity provided requested SOL information for its Reliability Coordinator Area, on a mutually agreed upon schedule, to each requesting Transmission Operator within its Reliability Coordinator Area.

Registered Entity Evidence (Required):

The following information is requested for each document submitted as evidence. Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to FAC-014-3, R5

This section to be completed by the Compliance Enforcement Authority

	(5.1) Verify the entity provided SOLs for its Reliability Coordinator Area (including the subset of SOLs that are IROLs) to each Planning Coordinator within its Reliability Coordinator Area at least once every twelve calendar months.
	(5.2) Verify the entity provided the following information for each established stability limit and each established IROL to each impacted Planning Coordinator within its Reliability Coordinator Area at least once every twelve calendar months:
	(5.2.1) The value of the stability limit or IROL
	(5.2.2) Identification of the Facilities that are critical to the derivation of the stability limit or IROL;
	(5.2.3) The associated IROL T_v for any IROL;
	(5.2.4) The associated Contingency(ies); and
	(5.2.5) The type of limitation represented by the stability limit or IROL (e.g., voltage collapse, angular stability).
	(5.3) Verify the entity provided the value of the stability limits established pursuant to Requirement R4 and each IROL established pursuant to Requirement R1, in an agreed upon time frame necessary for inclusion in the Transmission Operator's Operational Planning Analyses, Real-time monitoring, and Real-

	time Assessments, to each impacted Transmission Operator within its Reliability Coordinator Area.
	(5.4) Verify the entity provided the information identified in Requirement R5 Parts 5.2.2 - 5.2.5 for each established stability limit or each IROL, and any updates to that information within an agreed upon time frame necessary for inclusion in the Transmission Operator's Operational Planning Analyses, to each impacted Transmission Operator within its Reliability Coordinator Area.
	(5.5) Verify the entity provided each requesting Transmission Operator within its Reliability Coordinator Area, requested SOL information for its Reliability Coordinator Area, on a mutually agreed upon schedule.
Note to Auditor:	

Auditor Notes:

R6 Supporting Evidence and Documentation

R6. Each Reliability Coordinator that is impacted by an IROL shall provide Transmission Owners and Generation Owners within its Reliability Coordinator Area a list of Facilities owned by that entity that are critical to the derivation of the IROL.

M6. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation to demonstrate that the Reliability Coordinator provided the list of Facilities in accordance with Requirement R6.

Registered Entity Response (Required):
Question: Is the entity impacted by IROL(s)? ☐ Yes ☐ No
If Yes, provide a list of IROL(s) for which the entity is impacted. If No, explain how the entity made this determination.
[Note: A separate spreadsheet or other document may be used. If so, provide the document reference below.]

Registered Entity Response (Required):
Compliance Narrative:
Provide a brief explanation, in your own words, of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested [i]:

Provide the following evidence, or other evidence to demonstrate compliance.
A list of Facilities that are critical to the derivation of each IROL, including identification of the Transmission Owner or Generator Owner that owns each Facility.
Evidence the entity provided Transmission Owners and Generation Owners within its Reliability Coordinator Area a list of Facilities owned by that entity that are critical to the derivation of the IROL.

Registered Entity Evidence (Required):

The following information is requested for each document submitted as evidence. Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

File Name	Document Title	Revision or Version	Document Date	Relevant Page(s) or Section(s)	Description of Applicability of Document

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to FAC-014-3, R6

This section to be completed by the Compliance Enforcement Authority

	For all, or sample of, Facilities that are critical to the derivation of an IROL, verify the entity provided Transmission Owners and Generation Owners within its Reliability Coordinator Area a list of Facilities owned by that entity that are critical to the derivation of the IROL.

Additional Information:

Reliability Standard

The RSAW developer should provide the following information without hyperlinks. Update the information below as appropriate.
The full text of STD-0XX-N may be found on the NERC Web Site (www.nerc.com) under "Program Areas & Departments", "Reliability Standards."

In addition to the Reliability Standard, there is an applicable Implementation Plan available on the NERC Web Site.

In addition to the Reliability Standard, there is background information available on the NERC Web Site.

Capitalized terms in the Reliability Standard refer to terms in the NERC Glossary, which may be found on the NERC Web Site.

Sampling Methodology [If developer deems reference applicable]
Sampling is essential for auditing compliance with NERC Reliability Standards since it is not always possible or practical to test 100% of either the equipment, documentation, or both, associated with the full suite of enforceable standards. The Sampling Methodology Guidelines and Criteria (see NERC website), or sample guidelines, provided by the Electric Reliability Organization help to establish a minimum sample set for monitoring and enforcement uses in audits of NERC Reliability Standards.

Regulatory Language [Developer to ensure RSAW has been provided to NERC Legal for links to appropriate Regulatory Language – See example below]

E.g. FERC Order No. 742 paragraph 34: "Based on NERC's…….

E.g. FERC Order No. 742 Paragraph 55, Commission Determination: "We affirm NERC's…….

Selected Glossary Terms [If developer deems applicable]
The following Glossary terms are provided for convenience only. Please refer to the NERC web site for the current enforceable terms.

Revision History for RSAW

Version	Date	Reviewers	Revision Description
1	10/10/2017	NERC Compliance Assurance, RSAW Task Force	New Document

[i] Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

Text entry area with white background:	Auditor-supplied information

[1] NERC developed this Reliability Standard Audit Worksheet (RSAW) language in order to facilitate NERC's and the Regional Entities' assessment of a registered entity's compliance with this Reliability Standard. The NERC RSAW language is written to specific versions of each NERC Reliability Standard. Entities using this RSAW should choose the version of the RSAW applicable to the Reliability Standard being assessed. While the information included in this RSAW provides some of the methodology that NERC has elected to use to assess compliance with the requirements of the Reliability Standard, this document should not be treated as a substitute for the Reliability Standard or viewed as additional Reliability Standard requirements. In all cases, the Regional Entity should rely on the language contained in the Reliability Standard itself, and not on the language contained in this RSAW, to determine compliance with the Reliability Standard. NERC's Reliability Standards can be found on NERC's website. Additionally, NERC Reliability Standards are updated frequently, and this RSAW may not necessarily be updated with the same frequency. Therefore, it is imperative that entities treat this RSAW as a reference document only, and not as a substitute or replacement for the Reliability Standard. It is the responsibility of the registered entity to verify its compliance with the latest approved version of the Reliability Standards, by the applicable governmental authority, relevant to its registration status.

The RSAW may provide a non-exclusive list, for informational purposes only, of examples of the types of evidence a registered entity may produce or may be asked to produce to demonstrate compliance with the Reliability Standard. A registered entity's adherence to the examples contained within this RSAW does not necessarily constitute compliance with the applicable Reliability Standard, and NERC and the Regional Entity using this RSAW reserve the right to request additional evidence from the registered entity that is not included in this RSAW. This RSAW may include excerpts from FERC Orders and other regulatory references which are provided for ease of reference only, and this document does not necessarily include all applicable Order provisions. In the event of a discrepancy between FERC Orders, and the language included in this document, FERC Orders shall prevail.

[2] Compliance Assessment Date(s): The date(s) the actual compliance assessment (on-site audit, off-site spot check, etc.) occurs.

Registered Entity Response (Required; Insert additional rows if needed):

SME Name	Title	Organization	Requirement(s)

R1 Supporting Evidence and Documentation

R1. Each Planning Coordinator, when developing its steady-state modeling data requirements, shall implement a process to ensure that Facility Ratings used in its Planning Assessment of the Near-Term Transmission Planning Horizon are equally limiting or more limiting than those established in accordance with its Reliability Coordinator's SOL Methodology. If the Planning Coordinator uses less limiting Facility Ratings than the Facility Ratings established in accordance with its Reliability Coordinator's SOL Methodology, the Planning Coordinator shall provide a technical justification to its Reliability Coordinator.

M1. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation demonstrating the Planning Coordinator implemented its process in accordance with Requirement R1.

Registered Entity Response (Required):
Question: Does the entity use less limiting Facility Ratings than the Facility Ratings established in accordance with its Reliability Coordinator's SOL Methodology? ☐ Yes ☐ No
If Yes, provide evidence the entity provided a technical justification to its Reliability Coordinator. If No, explain how the entity made this determination.
[Note: A separate spreadsheet or other document may be used. If so, provide the document reference below.]

Registered Entity Response (Required):
Compliance Narrative:
Provide a brief explanation, in your own words, of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested[i]:

Provide the following evidence, or other evidence to demonstrate compliance.
Evidence the entity, when developing its steady-state modeling data requirements, implemented a process to ensure that Facility Ratings used in its Planning Assessment of the Near-Term Transmission Planning Horizon are equally limiting or more limiting than those established in accordance with its Reliability Coordinator's SOL Methodology.
Reliability Coordinator's SOL Methodology.

Registered Entity Evidence (Required):

The following information is requested for each document submitted as evidence. Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.					
File Name	**Document Title**	**Revision or Version**	**Document Date**	**Relevant Page(s) or Section(s)**	**Description of Applicability of Document**

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to FAC-015-1, R1

This section to be completed by the Compliance Enforcement Authority

	Verify the entity, when developing its steady-state modeling data requirements, implemented a process to ensure that Facility Ratings used in its Planning Assessment of the Near-Term Transmission Planning Horizon are equally limiting or more limiting than those established in accordance with its Reliability Coordinator's SOL Methodology.
	Verify the entity provided a technical justification to its Reliability Coordinator if the entity uses less limiting Facility Ratings than the Facility Ratings established in accordance with its Reliability Coordinator's SOL Methodology.
Note to Auditor:	

Auditor Notes:

R2 Supporting Evidence and Documentation

R2. Each Planning Coordinator shall implement a process to ensure that System steady state voltage limits used in its Planning Assessment of the Near-Term Transmission Planning Horizon are equally limiting or more limiting than the System Voltage Limits established in accordance with its Reliability Coordinator's SOL Methodology. If the Planning Coordinator uses less limiting System steady-state voltage limits than the System Voltage Limits established in accordance with its Reliability Coordinator's SOL Methodology, the Planning Coordinator shall provide a technical justification to its Reliability Coordinator.

M2. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation demonstrating the Planning Coordinator implemented its process in accordance with Requirement R2.

Registered Entity Response (Required):
Question: Does the entity use less limiting System steady-state voltage limits than the System Voltage Limits established in accordance with its Reliability Coordinator's SOL Methodology?☐ Yes ☐ No
If Yes, provide evidence the entity provided a technical justification to its Reliability Coordinator. If No, explain how the entity made this determination.
[Note: A separate spreadsheet or other document may be used. If so, provide the document reference below.]

Registered Entity Response (Required):
Compliance Narrative:
Provide a brief explanation, in your own words, of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested [i]:

Provide the following evidence, or other evidence to demonstrate compliance.
Evidence the entity implemented a process to ensure that System steady state voltage limits used in its Planning Assessment of the Near-Term Transmission Planning Horizon are equally limiting or more limiting than the System Voltage Limits established in accordance with its Reliability Coordinator's SOL Methodology.
Reliability Coordinator's SOL Methodology

Registered Entity Evidence (Required):

The following information is requested for each document submitted as evidence. Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

File Name	Document Title	Revision or Version	Document Date	Relevant Page(s) or Section(s)	Description of Applicability of Document

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to FAC-015-1, R2

This section to be completed by the Compliance Enforcement Authority

	Verify the entity implemented a process to ensure that System steady state voltage limits used in its Planning Assessment of the Near-Term Transmission Planning Horizon are equally limiting or more limiting than the System Voltage Limits established in accordance with its Reliability Coordinator's SOL Methodology.
	Verify the entity provided a technical justification to its Reliability Coordinator if the entity uses less limiting System steady-state voltage limits than the System Voltage Limits established in accordance with its Reliability Coordinator's SOL Methodology.
Note to Auditor:	

Auditor Notes:

R3 Supporting Evidence and Documentation

R3. Each Planning Coordinator shall implement a process to ensure the stability performance criteria used in its Planning Assessment of the Near-Term Transmission Planning Horizon are equally limiting or more limiting than the stability performance criteria established in its Reliability Coordinator's SOL Methodology. If the Planning Coordinator uses less limiting stability performance criteria than the stability performance criteria specified in its Reliability Coordinator's SOL Methodology, the Planning Coordinator shall provide a technical justification to its Reliability Coordinator.

M3. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation demonstrating the Planning Coordinator implemented its process in accordance with Requirement R3.

Registered Entity Response (Required):
Question: Does the entity use less limiting stability performance criteria than the stability performance criteria specified in its Reliability Coordinator's SOL Methodology? ☐ Yes ☐ No
If Yes, provide evidence the entity provided a technical justification to its Reliability Coordinator. If No, explain how the entity made this determination.
[Note: A separate spreadsheet or other document may be used. If so, provide the document reference below.]

Registered Entity Response (Required):
Compliance Narrative:
Provide a brief explanation, in your own words, of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested [i]:

Provide the following evidence, or other evidence to demonstrate compliance.
Evidence the entity implemented a process to ensure the stability performance criteria used in its Planning Assessment of the Near-Term Transmission Planning Horizon are equally limiting or more limiting than the stability performance criteria established in its Reliability Coordinator's SOL Methodology.
Reliability Coordinator's SOL Methodology

Registered Entity Evidence (Required):

The following information is requested for each document submitted as evidence. Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

File Name	Document Title	Revision or Version	Document Date	Relevant Page(s) or Section(s)	Description of Applicability of Document

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to FAC-015-1, R3

This section to be completed by the Compliance Enforcement Authority

	Verify the entity implemented a process to ensure the stability performance criteria used in its Planning Assessment of the Near-Term Transmission Planning Horizon are equally limiting or more limiting than the stability performance criteria established in its Reliability Coordinator's SOL Methodology.
	Verify the entity provided a technical justification to its Reliability Coordinator if the entity uses less limiting stability performance criteria than the stability performance criteria specified in its Reliability Coordinator's SOL Methodology.
Note to Auditor:	

Auditor Notes:

R4 Supporting Evidence and Documentation

R4. Each Planning Coordinator shall provide the Facility Ratings, System steady-state voltage limits, and stability performance criteria for use in its Planning Assessment to its Transmission Planners and to requesting Planning Coordinator's.

M4. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation demonstrating the Planning Coordinator provided its information in accordance with Requirement R4.

Registered Entity Response (Required):
Question: Has the entity received a request from a Planning Coordinator for Facility Ratings, System steady-state voltage limits, and stability performance criteria for use in its Planning Assessment? ☐ Yes ☐ No
If Yes, provide a list of requests received. If No, explain how the entity made this determination.
[Note: A separate spreadsheet or other document may be used. If so, provide the document reference below.]

Registered Entity Response (Required):
Compliance Narrative:
Provide a brief explanation, in your own words, of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested [i]**:**

Provide the following evidence, or other evidence to demonstrate compliance.
Evidence the entity provided Facility Ratings, System steady-state voltage limits, and stability performance criteria for use in its Planning Assessment to its Transmission Planners and to requesting Planning Coordinators.

Registered Entity Evidence (Required):

The following information is requested for each document submitted as evidence. Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.					
File Name	**Document Title**	**Revision or Version**	**Document Date**	**Relevant Page(s) or Section(s)**	**Description of Applicability of Document**

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to FAC-015-1, R4

This section to be completed by the Compliance Enforcement Authority

	Verify the entity provided Facility Ratings, System steady-state voltage limits, and stability performance criteria for use in its Planning Assessment to its Transmission Planners and to requesting Planning Coordinators.
Note to Auditor:	

Auditor Notes:

R5 Supporting Evidence and Documentation

R5. Each Transmission Planner shall use Facility Ratings, System steady-state voltage limits, and stability performance criteria in its Planning Assessment that are equally limiting or more limiting than the Facility Ratings, System steady-state voltage limits, and stability criteria provided by its Planning Coordinator.

M5. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation demonstrating the Transmission Planner used the information provided by its Planning Coordinator in accordance with Requirement R5.

Registered Entity Response (Required):
Compliance Narrative:
Provide a brief explanation, in your own words, of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested [i]:

Provide the following evidence, or other evidence to demonstrate compliance.
Evidence the entity used Facility Ratings, System steady-state voltage limits, and stability performance criteria in its Planning Assessment that are equally limiting or more limiting than the Facility Ratings, System steady-state voltage limits, and stability criteria provided by its Planning Coordinator.

Registered Entity Evidence (Required):

The following information is requested for each document submitted as evidence. Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.

File Name	Document Title	Revision or Version	Document Date	Relevant Page(s) or Section(s)	Description of Applicability of Document

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to FAC-015-1, R5
This section to be completed by the Compliance Enforcement Authority

	Verify the entity used Facility Ratings, System steady-state voltage limits, and stability performance criteria in its Planning Assessment that are equally limiting or more limiting than the Facility Ratings, System steady-state voltage limits, and stability criteria provided by its Planning Coordinator.

Note to Auditor:

Auditor Notes:

R6 Supporting Evidence and Documentation

R6. Each Planning Coordinator shall communicate any instability, Cascading or uncontrolled separation identified in either its Planning Assessment of the Near-Term Transmission Planning Horizon or its Transfer Capability assessment to each impacted Reliability Coordinator and Transmission Operator. This communication shall include:

6.1. The type of instability identified (e.g., voltage collapse, angular instability, transient voltage dip criteria violation);

6.2. The associated stability criteria used as part of determining the instability;

6.3. The associated Contingency(ies) which result(s) in the instability, Cascading or uncontrolled separation;

6.4. Any Remedial Action Scheme action, undervoltage load shedding (UVLS) action, underfrequency load shedding (UFLS) action, interruption of Firm Transmission Service, or Non-Consequential Load Loss required to address the instability, Cascading or uncontrolled separation; and

6.5. Any Corrective Action Plan associated with the instability, Cascading or uncontrolled separation.

M6. Acceptable evidence may include, but is not limited to, dated electronic or hard copy documentation demonstrating the Planning Coordinator communicated the information in accordance with Requirement R6.

Registered Entity Response (Required):
Question: Has the entity identified instability, Cascading or uncontrolled separation in either its Planning Assessment of the Near-Term Transmission Planning Horizon or its Transfer Capability assessment?
☐ Yes ☐ No
If Yes, provide a list of instances of instability, Cascading or uncontrolled separation identified in either the Planning Assessment of the Near-Term Transmission Planning Horizon or the Transfer Capability assessment. If No, explain how the entity made this determination.
[Note: A separate spreadsheet or other document may be used. If so, provide the document reference below.]

Registered Entity Response (Required):
Compliance Narrative:
Provide a brief explanation, in your own words, of how you comply with this Requirement. References to supplied evidence, including links to the appropriate page, are recommended.

Evidence Requested [i]:

Provide the following evidence, or other evidence to demonstrate compliance.
Evidence the entity communicated any instability, Cascading or uncontrolled separation identified in either its Planning Assessment of the Near-Term Transmission Planning Horizon or its Transfer Capability assessment to each impacted Reliability Coordinator and Transmission Operator.
Evidence communication to each impacted Reliability Coordinator and Transmission Operator included each item specified in Parts 6.1 – 6.5.

The entity's most recent Planning Assessment of the Near-Term Transmission Planning Horizon.
The entity's most recent Transfer Capability assessment.

Registered Entity Evidence (Required):

The following information is requested for each document submitted as evidence. Also, evidence submitted should be highlighted and bookmarked, as appropriate, to identify the exact location where evidence of compliance may be found.					
File Name	**Document Title**	**Revision or Version**	**Document Date**	**Relevant Page(s) or Section(s)**	**Description of Applicability of Document**

Audit Team Evidence Reviewed (This section to be completed by the Compliance Enforcement Authority):

Compliance Assessment Approach Specific to FAC-015-1, R6

This section to be completed by the Compliance Enforcement Authority

	For each instance of instability, Cascading or uncontrolled separation identified in either the entity's Planning Assessment of the Near-Term Transmission Planning Horizon or the entity's Transfer Capability assessment, verify the entity communicated the instability, Cascading or uncontrolled separation to each impacted Reliability Coordinator and Transmission Operator.
	For all, or a sample of, communication from the entity to impacted Reliability Coordinators and Transmission Operators, verify the communication included:
	(6.1) The type of instability identified (e.g., voltage collapse, angular instability, transient voltage dip criteria violation);
	(6.2) The associated stability criteria used as part of determining the instability;
	(6.3) The associated Contingency(ies) which result(s) in the instability, Cascading or uncontrolled separation;
	(6.4) Any Remedial Action Scheme action, undervoltage load shedding (UVLS) action, underfrequency load shedding (UFLS) action, interruption of Firm Transmission Service, or Non-Consequential Load Loss required to address the instability, Cascading or uncontrolled separation; and
	(6.5) Any Corrective Action Plan associated with the instability, Cascading or uncontrolled separation.
Note to Auditor: Planning Coordinators are required to prepare a Planning Assessment of the Near-Term Transmission Planning Horizon in TPL-001-4 R2, and conduct a Transfer Capability assessment in FAC-013 R2.	

Auditor Notes:

Additional Information:

Reliability Standard

The RSAW developer should provide the following information without hyperlinks. Update the information below as appropriate.
The full text of STD-0XX-N may be found on the NERC Web Site (www.nerc.com) under “Program Areas & Departments”, “Reliability Standards.”

In addition to the Reliability Standard, there is an applicable Implementation Plan available on the NERC Web Site.

In addition to the Reliability Standard, there is background information available on the NERC Web Site.

Capitalized terms in the Reliability Standard refer to terms in the NERC Glossary, which may be found on the NERC Web Site.

Sampling Methodology [If developer deems reference applicable]
Sampling is essential for auditing compliance with NERC Reliability Standards since it is not always possible or practical to test 100% of either the equipment, documentation, or both, associated with the full suite of enforceable standards. The Sampling Methodology Guidelines and Criteria (see NERC website), or sample guidelines, provided by the Electric Reliability Organization help to establish a minimum sample set for monitoring and enforcement uses in audits of NERC Reliability Standards.

Regulatory Language [Developer to ensure RSAW has been provided to NERC Legal for links to appropriate Regulatory Language – See example below]

E.g. FERC Order No. 742 paragraph 34: “Based on NERC’s…….

E.g. FERC Order No. 742 Paragraph 55, Commission Determination: “We affirm NERC’s…….

Selected Glossary Terms [If developer deems applicable]
The following Glossary terms are provided for convenience only. Please refer to the NERC web site for the current enforceable terms.

Revision History for RSAW

Version	Date	Reviewers	Revision Description

[i] Items in the Evidence Requested section are suggested evidence that may, but will not necessarily, demonstrate compliance. These items are not mandatory and other forms and types of evidence may be submitted at the entity's discretion.

Standards Announcement

Project 2015-09
Establish and Communicate System Operating Limits
FAC-011-4, FAC-014-3 and FAC-015-1

Draft Reliability Standard Audit Worksheets (RSAWs) Posted for Industry Comment through November 13, 2017

Now Available

Draft RSAWs are posted on the project page for industry comment through **8 p.m. Eastern**, **Monday, November 13, 2017** for the following standards:

- **FAC-011-4 - System Operating Limits Methodology for the Operations Horizon**
- **FAC-014-3 – Establish and Communicate System Operating Limit**
- **FAC-015-1 - Coordination of Planning Assessments with the Reliability Coordinator's SOL Methodology**

Submit feedback regarding the draft RSAWs to RSAWfeedback@nerc.net.

For more information or assistance, contact Senior Standards Developer, Darrel Richardson at (609) 613-1848 or Al McMeekin at (404) 446-9675.

RELIABILITY CORPORATION

Standards Announcement

Project 2015-09
Establish and Communicate System Operating Limits

Formal Comment Period Open through November 13, 2017
Ballot Pools Forming through October 30, 2017

Now Available

A 45-day formal comment period is open through **8 p.m. Eastern, Monday, November 13, 2017** for:

1. **FAC-010-3** – System Operating Limits Methodology for the Planning Horizon (retirement)
2. **FAC-011-4** – System Operating Limits Methodology for the Operations Horizon
3. **FAC-014-3** – Establish and Communicate System Operating Limit
4. **FAC-015-1** – Coordination of Planning Assessments with the Reliability Coordinator's SOL Methodology
5. **Implementation Plan**
6. **Proposed definition of System Voltage Limit**

Commenting

Use the Standards Balloting & Commenting System (SBS) to submit comments. If you experience any difficulties navigating the SBS, contact Nasheema Santos. An unofficial Word version of the comment form is posted on the project page.

Join the Ballot Pools

Ballot pools are being formed through **8 p.m. Eastern, Monday, October 30, 2017.** Registered Ballot Body members can join the ballot pools here.

If you are having difficulty accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out, contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern).

- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

Initial ballots for the standards, implementation plan, proposed definition and non-binding polls of the associated Violation Risk Factors and Violation Severity Levels will be conducted **November 3-13, 2017**.

For more information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer, Darrel Richardson (via email), or at (609) 613-1848.

There were 56 sets of responses, including comments from approximately 166 different people from approximately 106 companies representing 10 of the Industry Segments as shown in the table on the following pages.

Questions

1. The SDT is recommending retirement of FAC-010-3 and has provided justification in the "FAC-010/FAC-015 Rationale" and "FAC-010-3 Mapping Document." Do you agree that the proposed retirement of FAC-010-3 does not create a reliability gap? Please provide supporting rationale.

2. Given the background discussion and the justification provided in the mapping document for FAC-011-3, Requirement R2, R2.1 and R2.2, do you agree that BES performance is adequately covered and that no reliability gaps are introduced from the removal of those concepts in a revised FAC-011-4? If not, please explain specifically what aspects of the removal you disagree with and propose alternative language.

3. Given the background discussion and the justification provided in the mapping document for FAC-011-3, Requirement R2, R2.3 and R2.4, do you agree that BES performance is adequately covered and that no reliability gaps are introduced from the removal of those concepts in a revised FAC-011-4? If not, please explain specifically what aspects of the removal you disagree with and propose alternative language.

4. Are there any reliability objectives of FAC-011-3, Requirement R2, R2.3 and R2.4 that you maintain need to be preserved in requirements relating to the development of Operating Plans which would reside outside the FAC family of standards? Please explain your response.

5. Do you agree that the SDT should allow the use of UVLS in the establishment of stability limits? If not, please explain and provide alternative language.

6. If you have any other comments that you haven't already provided in response to questions 2-5, please provide them here.

7. The SDT is proposing to divide existing Requirement R1 of FAC-014-2 into three requirements in FAC-014-3 to clearly indicate which entities have the responsibility for establishing Interconnection Reliability Operating Limits (IROLs) [the RC], System Operating Limits (SOLs) [the TOP] and stability limits that impact more than one TOP in its Reliability Coordinator Area [the RC] into proposed Requirements R1, R2, and R4, respectively. Do you agree with the proposed changes? If not, please explain.

8. Existing FAC-014-2, Requirement R5, R5.2 requires the Transmission Operator (TOP) to provide its SOLs to its Reliability Coordinator (RC) and Transmission Service Providers (TSPs) that share its portion of the RC Area. The SDT is proposing in Requirement R3 of FAC-014-3 to exclude the TSPs from that communication chain. Other requirements in existing standards (MOD-028-2, Requirement R7, MOD-029-2a, Requirement R4, and MOD-030-3, Requirement R2.6) require the TOP to provide the Total Transfer Capabilities (TTCs), Total Flowgate Capabilities (TFCs), along with supporting information and assumptions to TSPs. Because the TTCs and TFCs already reflect the impact(s) of any SOLs, the SDT deemed retention of the existing language unnecessary. Do you agree with the proposed change? If not, please explain.

9. The SDT relocated the reliability objectives of existing Requirement R6 of FAC-014-2 into Requirement R6 of proposed Reliability Standard FAC-015-1 such that all Planning Coordinator and Transmission Planner responsibilities will be housed within one standard. Do you agree with the proposed change? If not, please explain.

10. If you have any other comments that you haven't already provided in response to questions 7-9, please provide them here.

11. FAC-015-1 is predicated on the principle that Facility Ratings, System steady-state voltage limits, and stability criteria used in Planning Assessments for the Near-Term Transmission Planning Horizon should be more conservative/restrictive/limiting than those found in (or established in accordance with) the RC's SOL Methodology, allowing for justified exceptions. Do you agree with this principle? If not, please explain.

12. Do you agree that coordination of Facility Ratings, System steady state voltage limits, and stability performance criteria as required in Requirements R1-R3 should be limited to Planning Assessments of the Near-Term Transmission Planning Horizon? If yes, please provide supporting rationale; if no, please explain and provide alternative language.

13. In Requirements R1 – R3, the SDT is proposing to allow a PC to provide a technical justification to its RC for using less limiting Facility Ratings, System steady-state voltage limits, and stability performance criteria than those specified in its RC's SOL Methodology. Do you agree that this provides adequate flexibility (in the rare circumstances when less limiting Facility Ratings, System steady-state voltage limits, and stability performance criteria must be utilized; e.g., up-rating a line in a future project) without compromising reliability? If yes, please provide supporting rationale; if no, please explain and provide alternative language.

14. Do you agree that the information identified in Requirement R6 is necessary for each impacted RC and TOP to properly evaluate instability, Cascading, or uncontrolled separation identified in planning assessments for use in establishing stability limits and IROLs in the operations horizon? If not, please explain and provide alternative language.

15. Do you agree that the Planning Assessment of the Near-Term Transmission Planning Horizon and the Transfer Capability assessment, as stipulated in Requirement R6, are the appropriate assessments for identifying any instability, Cascading, or uncontrolled separation in the planning horizon? If yes, please provide supporting rationale; if no, please explain and provide alternative language.

16. If you have any other comments that you haven't already provided in response to questions 11-15, please provide them here.

17. Do you agree with the proposed definition of System Voltage Limit? If not, please explain and provide alternative language.

18. Do you agree with the Implementation Plan? If not, please provide the basis for your disagreement and an alternate proposal.

19. The SDT asserts the combination of proposed FAC-011-4, FAC-014-3, and FAC-015-1 provide entities with flexibility to meet the reliability objectives in the project Standards Authorization Request (SAR) in a cost effective manner. Do you agree? If you do not agree, or if you agree but have suggestions for improvement to enable additional cost effective approaches to meet the reliability objectives, please provide your recommendation and, if appropriate, technical justification.

1. The SDT is recommending retirement of FAC-010-3 and has provided justification in the "FAC-010/FAC-015 Rationale" and "FAC-010-3 Mapping Document." Do you agree that the proposed retirement of FAC-010-3 does not create a reliability gap? Please provide supporting rationale.

Richard Vine - California ISO - 2	
Answer	No
Document Name	
Comment	
FAC-010-3 contains regional differences (e.g. common corridor 500 kV outages, no cascading for loss of two PV units) that the California ISO plans the WECC system to that provide for a more resilient system. With the exception of this Question and Question 15, the California ISO supports the comments of the ISO/RTO Council Standards Review Committee. However, the California ISO has provided numerous additional comments in the sections below related to the new proposed FAC-015-1 standard.

SCE agrees with the drafting team that the new TPL-001-4 ensures the reliable planning of the transmission system and addresses each of the reliability components of FAC-010-3. The mapping document adequately and exhaustively demonstrates where the components of FAC-010 are addressed in other standards or are no longer relevant under the new SOL/IROL construct.

Yes, I agree that it is unnecessary to have a planning SOL methodology. The TPL requirements along with changes to FAC-011, FAC-014 and the new requirements discussed in the FAC-015 (which I think should be covered in the TPL standard, but my comments on that are covered in the FAC-015 section) adequately define what ratings/limits should be used to plan the system. **Note:** While we agree with the retirement of FAC-010, we will be voting "No" because of our problems with FAC-015. These changes to FAC-010, FAC-011, FAC-014 and FAC-015 form an integrated whole, so approving the changes to some standards and not others could create a reliability gap.

FAC-010 has always had minimal reliability value as it was restating what was already occurring as part of the TPL standards. Manitoba Hydro agrees the FAC-010-3 is completely redundant with TPL-001-4.

Scott Downey - Peak Reliability - 1	

Answer	Yes
Document Name	

Comment

Peak agrees that the retirement of FAC-010 does not create a reliability gap. The SDT did a thorough job in their assessment of FAC-010 in the mapping document. As is pointed out in the supporting documentation, there is an abundance of redundancies between FAC-010 (and the associated requirements in FAC-014) and TPL-001-4. Peak supports the retirement of FAC-010 and the addition of FAC-015 as described in the supporting documentation.

System Operating Limits in the planning horizon in the Eastern Interconnection are generally the applicable steady-state ratings of the facilities, which are included in the powerflow models and are tested in a wide range of contingency analyses as required by standard TPL-001-4. Voltage limits are generally published in transmission planning criteria documents.

2. Given the background discussion and the justification provided in the mapping document for FAC-011-3, Requirement R2, R2.1 and R2.2, do you agree that BES performance is adequately covered and that no reliability gaps are introduced from the removal of those concepts in a revised FAC-011-4? If not, please explain specifically what aspects of the removal you disagree with and propose alternative language.

Leonard Kula - Independent Electricity System Operator - 2

Answer	No
Document Name	

Comment

Interpretation of Facility Ratings, System Voltage Limits and Stability limits are confusing and can be easily misinterpreted.   In the background information above, SDT states that 'For example, "BES performance" for Facility Ratings is determined through OPAs and RTAs which assess the flow on Facilities in the pre- and post-Contingency states…'   As it can be seen Facility Ratings can be interpreted as Thermal ratings only. Facility Ratings should include both Thermal ratings and voltage ratings of the equipment.

Comment

Commentary and Support: In the existing FAC-011-3 paradigm, System Operating Limits (SOLs) are essentially the means used to limit the system so that the Bulk Electric System (BES) has acceptable performance both pre-contingency and post-contingency. Although not a term used in FAC-011-3, the concept of 'Reliable Operation' from the NERC Glossary of Terms is helpful in describing the objective:

Reliable Operation: "Operating the elements of the [Bulk-Power System] within equipment and electric system thermal, voltage, and stability limits…"

In the new, proposed FAC-011-4 paradigm, the focus is removed from SOLs as the tool to ensure secure system operations, and instead moves to assessing whether expected operating conditions are within acceptable performance pre- and post-contingency. If studies indicate otherwise, entities and the RC implement and utilize Operating Plans to keep the system within acceptable performance.

Conceptually, FAC-011-3 and FAC-011-4 are very similar. One uses SOLs to keep the system within acceptable performance; the other uses Operating Plans when unacceptable performance is identified. Therefore, the reliability objectives are maintained, although the terminology and approach has now changed.

In the description of the proposed FAC-011-4, SOLs now play a role similar to Facility Ratings, Voltage Criteria, and Stability Criteria; SOLs are now part of the criteria to assess acceptable BES performance via OPAs and RTAs.

Comment 1: CHPD would like to see an approach where the assessment of the system is started with Facility Ratings and performance criteria, and SOLs, if required, be used as an operational tool to support operating within those Facility Ratings and performance criteria, along with generation re-dispatch, topology re-configuration, etc.

Comment 2: Regarding the contingencies transferred from FAC-011-3 to FAC-011-4 to align with the TPL contingencies, there are two discontinuities worth mentioning.

In the old FAC-011-3, R2.2.2. listed “Loss of any generator, line, transformer, or shunt device without a Fault”.

The new FAC-011-4 description is now “…or without a Fault: generator; transmission circuit; transformer; shunt device; or single pole block, with Normal Clearing, in a monopolar or bipolar high voltage direct current system.”

In TPL-001-4, the analogous no-fault contingency is a category P2.1, and is described in TPL-001-4 Table 1 as “Opening of a line section w/o a fault”.

In summary, the new FAC-011-4 adds the single pole block to the list of no-fault outages. This probably has minor impact, but CHPD is unsure why it is being added. The second change, which is maintained, is of greater mention – there has been a discontinuity between the TPL requirements for no-fault (line section w/o a fault) and both the old and new FAC-011 standards (generator, line (old) / transmission circuit (new) transformer, shunt device (or single pole block). This could mean that these non-fault events aren’t planned for through TPL, but are expected to be operated to through the FAC standard. CHPD requests this be examined by the Standard Drafting Team to see if a better alignment between TPL and FAC can be arranged. Additionally, the difference between the old FAC-011-3 ‘line’ and the new FAC-011-4 ‘transmission circuit’ could be clarified if these are intended to be the same thing, or if differences are intended (and if so, what are those differences).

Terri Pyle - OGE Energy - Oklahoma Gas and Electric Co. - 1

Answer	No
Document Name	

Comment

With regard to the proposed Requirement R2, OGE believes that the proposed language could be mistakenly interpreted as giving the Reliability Coordinator the discretion to impose unacceptable Facility Ratings to Transmission Operators. We would ask that the drafting team provides more clarity on the intent for this requirement.

Pamela Hunter - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC, Group Name Southern Company

Answer	No

Document Name	
Comment	

We do not agree with the proposed definition of SOL Exceedance. In our proposed definition below, we excluded the criteria for which contingencies should be assessed. We do not believe that the state of the system (pre or post contingency) should be included in the definition of SOL Exceedance, but should be left outside that definition. We believe that an RC's SOL methodology should define the conditions in which an SOL should not be exceeded.

Southern's Proposed definition:

SOL Exceedance - An operating condition, as determined in Real -time Monitoring, wher

An exceedance can only occur if it happens in Real-time and therefore the SOL Exceedance definition should not incorporate the concept of predicted exceedances. Predicted exceedances, such as those identified through OPAs and RTAs, may or may not occur as they are just that, predicted. Predicted exceedances should not be defined and subject to the stringent set of limitations and requirements that SOL Exceedances should be. Furthermore, how predicted exceedances are identified, assessed, operationally planned for and mitigated should be the responsibility of the Reliability Coordinator. Therefore, any such definition for predicted exceedances should remain in the respective RC's SOL methodology.

The language in Requirement 2: “for Transmission Operators to determine the applicable owner -provided Facility Ratings used in operations.” needs work. Suggested language: “for Transmission Operators to determine SOLs based upon the Transmission Owner-provided Facility Ratings.”

Comment	
Peak agrees that no reliability gap is introduced with the removal of the requirements R2, R2.1, and R2.2. Peak agrees with the justifications set forth in the FAC-011 mapping document for these requirements. Peak also believes that the removal of requirements R2, R2.1 and R2.2 would be strengthened by adoption of the proposed definition of SOL Exceedance.

Comment	
NIPSCO is concerned that the requirement does not provide adequate assurance that the RC will respect the ratings established by the TO or the TO's FAC-008 methodology. As written, the language is vague and could be interpreted as allowing an RC to determine the ratings that a TOP must use (including normal and emergency ratings and seasonal changeover dates) without respecting the TO's authority to establish such Facility Ratings.

3. Given the background discussion and the justification provided in the mapping document for FAC-011-3, Requirement R2, R2.3 and R2.4, do you agree that BES performance is adequately covered and that no reliability gaps are introduced from the removal of those concepts in a revised FAC-011-4? If not, please explain specifically what aspects of the removal you disagree with and propose alternative language.

Neil Swearingen - Salt River Project - 1,3,5,6 - WECC	
Answer	No
Document Name	
Comment	
SRP recommends retaining the clarifying language of 2.3 and 2.4. Having the options explicitly stated within the standard ensures consistency throughout each RC area in the way TOPs respond to Contingencies. Having those clear, well-defined options spelled out within the RC's SOL Methodology enhances reliability by setting consistent expectations of what actions neighboring or overlapping TOPs may be performing. Furthermore, it is valuable to house the language within a standard dealing with the Operations Planning Horizon, to avoid a potential misconception that the described options are only permissible when planning the system in the Near-term or Long-term Planning Horizons.

Comment 1: CHPD is concerned about the ‘permitted uses’ language of RAS and other schemes, to be contained in the RC’s methodology. In the TPL / Planning process, an entity may determine and build a scheme under a certain set of assumptions (how the system was planned / designed / built). The entity may determine this scheme is acceptable to their own operations. The RC may then prohibit the use of this non-RAS in the RC’s SOL methodology, rendering the scheme useless for actual operations. CHPD has witnessed this concern with one of its neighbor’s automatic schemes and feels that the prohibition of the scheme’s use for operations has not always been in the best interest of system reliability. CHPD also recognizes the Planning Coordinator and Reliability Coordinator will be performing additional coordination through the new PRC-012-2, whose purpose is stated as “To ensure that Remedial Action Schemes (RAS) do not introduce unintentional or unacceptable reliability risks to the Bulk Electric System

(BES).” The requirement here in FAC-011 may be duplicative of those objectives found in the new PRC-012-2.

In FAC-011-3, only allowed uses of Remedial Action Schemes was listed under the RC’s methodology requirements. In FAC-011-4, the addition of ‘other automatic post-Contingency mitigation actions’ adds significant scope to the methodology. CHPD wants the Standard Drafting Team to ensure that the concept of ‘operated as designed’ is maintained in the use of these other automatic post-Contingency mitigation actions.

Comment 2: In the discussion about UFLS being not permitted in R4.6 (and by omittance, UVLS being permitted) CHPD identifies that there seems to be confusion, or at least the potential for confusion, about the FERC order and acceptable use or non-use of these schemes. The first point is that there is a difference between a UFLS or UVLS program. From the NERC glossary of terms:

Undervoltage Load Shedding Program: An automatic load shedding program, consisting of distributed relays and controls, used to mitigate undervoltage conditions impacting the Bulk Electric System (BES), leading to voltage instability, voltage collapse, or Cascading. Centrally controlled undervoltage-based load shedding is not included.

Underfrequency Load Shedding Program is not described in the NERC glossary of terms, but is described in the purpose description for PRC-006:

To establish design and documentation requirements for automatic underfrequency load shedding (UFLS) programs to arrest declining frequency, assist recovery of frequency following underfrequency events and provide last resort system preservation measures

A UFLS or UVLS program is a coordinated use of UFLS or UVLS relays at multiple locations and are essentially used to prevent described conditions that are essentially the events of an IROL. The FERC order 818 states regarding UVLS programs:

“We conclude that UVLS **programs** (emphasis added) under PRC-010-1 are examples of such “safety nets” and should not be tools used by bulk electric system operators to calculate operating limits for N-1 contingencies.”

Again, in the “Final Report on the August 14, 2003 Blackout in the United States and Canada: Causes and Recommendations”, on page 109 in the discussion about UFLS as a safety net, it simply states:

Safety nets should not be relied upon to establish transfer limits

CHPD would like clarification here in the proposed FAC-011-4 whether the references to UFLS (and UVLS) are meant to be to the UFLS (PRC-006) and UVLS (PRC-010) Programs or is it a reference to something else.

Comment

Peak agrees that BES performance is adequately covered and that no reliability gap is introduced with the removal of the requirements R2, R2.3 and its subparts, and R2.4. Peak agrees with the justifications set forth in the FAC-011 mapping document for these requirements. Peak believes that the "rules" set forth in the current FAC-011-3 R2, R2.3 and its subparts, and R2.4 have relevance in the TPL standards, but not in the TOP or IRO standards. When planners plan the system, they are constructing a system that meets the performance requirements set forth in TPL-001-4. This system is then provided to operators to operate. Rules such as those reflected in Table 1 of TPL-001-4 and the footnotes of Table 1 are important for identifying Corrective Action Plans associated with determining how the system is to be built; however, Peak believes the "rules" as reflected in FAC-011-3 R2, R2.3 and its subparts, and R2.4 are not necessary for operating the system. Operators encounter many operating scenarios that were not addressed or anticipated in the TPL Planning Assessments, and very often these conditions are more severe than those assessed in the Planning Assessments. Peak agrees with the SDT's assertion that operators need the flexibility to operate the system to address SOL exceedances without being confined to such "rules" regarding non-consequential load loss, interruption of firm transmission, and requirements associated with preparations for the next Contingency. All of these items are expected to be addressed as needed in associated Operating Plans. Accordingly, operators do not need to be confined to these "rules" set forth in current FAC-011-3 R2, R2.3 and its subparts, and R2.4.

Duke Energy would like to point out to the SDT, a potential typo in the FAC-011-3 Mapping Document. When referencing the translation of R2 and its sub-requirements to a New Standard or Other Action, the SDT appears to reference a TOP-012-3 standard R14. We believe that this was in error, and that perhaps the drafting team meant to reference TOP-001-3 instead.

We think the removal of BES performance from R2 is relevant, but that the performance requirements associated with determination of stability limits associated with SOLs are vague compared to the TPL assessments. Is the SDT intent to let full flexibility to the RC with regards to stability performance requirements per requirement 4.1? For example, is a unit pulling out of synchronism something up to the RC to demonstrate as acceptable for the purpose of determining SOLs/IROLs for a given interface?

4. Are there any reliability objectives of FAC-011-3, Requirement R2, R2.3 and R2.4 that you maintain need to be preserved in requirements relating to the development of Operating Plans which would reside outside the FAC family of standards? Please explain your response.	
Janis Weddle - Public Utility District No. 1 of Chelan County - 6, Group Name Chelan PUD	
Answer	No
Document Name	
Comment	
As a practice, reliability objectives should be maintained in standards. Documentation and examples supporting those objectives (white papers, guidelines, etc.) can reside outside the standard. Regarding Operating Plans, the definition found in the NERC glossary of terms is sufficient for CHPD. Regarding R2, R2.3 and R2.4 as it deals with the response of the system to events, any other reliability objectives should be contained in the standard to ensure these items have the scrutiny, review, and due process related to these items. CHPD has mentioned some concerns in its responses to item #3, but has nothing in addition to those to add here.

National Grid supports the NPCC RSC Group comments. Additional comment for consideration: Typically there are additional Thermal ratings above the "normal" limit that have a time frame associated with them. For example an emergency limit may be a 15 minute rating, i.e. the flow can be at the emergency rating for 15 minutes. Therefore, by design, being above the normal rating is not going to result in damage to the BES elements. Therefore the 1st bullet in the SOL Exceedance definition could be revised to state "Actual flow through a Facility is above the Facility's Rating and the associated allowable time frame is exceeded".

We think actions allowed in real-time operations should not be part of FAC-011, but captured by TOP/IRO standards. We think there is ambiguity and a lack of consistency in the industry around allowed system adjustments and preparation for the next contingency (old R2.4) with refers indirectly to N-1 situations. Although it is clear that FAC-011 requires, at a minimum, to consider a set of single contingencies to address stability limits, it is not clear at all what are the minimum requirements applicable if the contingency was to occur… and how "preparing for the next contingency" is addressed by the current standards.

5. Do you agree that the SDT should allow the use of UVLS in the establishment of stability limits? If not, please explain and provide alternative language.

Aaron Cavanaugh - Bonneville Power Administration - 1,3,5,6 - WECC

Answer	No
Document Name	

Comment

It is unclear in 4.6 (and the entirety of R4) if "stability limits" refers to either or both of the following (1) bulk transfer across the BES (transfer limit stability studies) or (2) load areas (local area limit stability studies). BPA believes that it is important to distinguish between transfer limit stability studies and local area limit stability studies. We recommend that the SDT add language to R4 to clarify that R4 applies to only transfer limit stability studies. BPA believes that the SDT should not allow UVLS in transfer limit stability studies, unless it is part of a designated RAS. We understand that FERC is describing transfer limit stability studies in Order 818. BPA therefore does not think that relying on UVLS, except where included in RAS, to increase transfer limits is appropriate. However, BPA believes that the SDT should allow UVLS in local area limit stability studies when failure of the UVLS would not result in cascading. If UVLS is not allowed in local area limit stability studies, the TOP may be forced to perform pre-contingency load shed.

Proposed: Planned use of UFLS or UVLS in establishment of stability limits is not allowed unless either of the following conditions is true:

- Pre-contingency load shedding would be required in order to meet BES performance criteria
- Load shedding is already included as part of an approved Remedial Action Scheme

UVLS is a safety net. It should not be used as an acceptable tool to preserve acceptable system performance for credible contingencies unless it is part of a RAS. This is directly implied in FERC order 818. The wording should be: "R4.6 Describe…; neither the planned use of underfrequency load shedding (UFLS) or undervoltage load shedding (UVLS) is allowed in the establishment of stability limits."

Wendy Center - U.S. Bureau of Reclamation - 5	
Answer	No
Document Name	
Comment	
Reclamation has concerns with possible misinterpretation of FAC-011-4 R4.2 and R5 as it implies Real-Time Assessments will include Stability. Reclamation also does not agree with the identified single Contingency and multiple Contingencies for use in determining stability limits because the TOP will inform the RC which Contingencies are credible.

These comments are duplicated from comments made on question #3 above. CHPD would note that the language stated in the NERC summary from the 2003 report uses the term 'transfer limits', whereas in this SOL revision document it is described as 'stability limits'. These two terms have different meanings, and the reference in the SOL document should be reviewed.	

In the discussion about UFLS being not permitted in R4.6 (and by omittance, UVLS being permitted) CHPD identifies that there seems to be confusion, or at least the potential for confusion, about the FERC order and acceptable use or non-use of these schemes. The first point is that there is a difference between a UFLS or UVLS program. From the NERC glossary of terms:

Undervoltage Load Shedding Program: An automatic load shedding program, consisting of distributed relays and controls, used to mitigate undervoltage conditions impacting the Bulk Electric System (BES), leading to voltage instability, voltage collapse, or Cascading. Centrally controlled undervoltage-based load shedding is not included.

Underfrequency Load Shedding Program is not described in the NERC glossary of terms, but is described in the purpose description for PRC-006:

To establish design and documentation requirements for automatic underfrequency load shedding (UFLS) programs to arrest declining frequency, assist recovery of frequency following underfrequency events and provide last resort system preservation measures

A UFLS or UVLS program is a coordinated use of UFLS or UVLS relays at multiple locations and are essentially used to prevent described conditions that are essentially the events of an IROL. The FERC order 818 states regarding UVLS programs:

"We conclude that UVLS **programs** (emphasis added) under PRC-010-1 are examples of such "safety nets" and should not be tools used by bulk electric system operators to calculate operating limits for N-1 contingencies."

Again, in the "Final Report on the August 14, 2003 Blackout in the United States and Canada: Causes and Recommendations", on page 109 in the discussion about UFLS as a safety net, it simply states:

Safety nets should not be relied upon to establish transfer limits

CHPD would like clarification here in the proposed FAC-011-4 whether the references to UFLS (and UVLS) are meant to be to the UFLS (PRC-006) and UVLS (PRC-010) Programs or is it a reference to something else.

Comment	

We agree with FERC, Undervoltage load-shedding schemes (UVLS) are a “safety net” and should not be a tool used by Bulk Electric System operators in the derivation of stability limits. In some areas single contingencies include bus faults, stuck breakers and tower-contingencies.

Note: ERCOT does not support this response.

Not sure how the SDT like entities to vote. The SDT rationale indicated that their understanding of FERC Order 818 prohibited the use UVLS in the establishment of stability limits for N-1 contingency. Hence, if the SDT understanding of the FERC order is correct that FERC doesn’t allow use of UVLS in the establishment of stability limits for N-1 contingency then it would also mean that using UVLS is also prohibited for N-2 contingencies. Indicating a “Yes” to Question 5 is contradicted to FERC Order 818. Indicating a “No” to Question 5 is in alignment with the SDT understanding of FERC Order 818.

Xcel Energy agrees with the allowed use of UVLS assuming that its meaning is not restrictred to the defined term UVLS Program and is used as an umbrella term that also includes local UVLS schemes. We would disagree if UVLS was intended to be synonymous with UVLS Program, since it would imply that use of local UVLS is not allowed. This illustrates the need to clarify what is the intended scope of UVLS in this standard.

Consistency is necessary between the mitigating actions permitted to maintain acceptable performance after N-1-1 and N-2 Contingencies in the Planning Assessment and Real-time Operations. The use of equal more limiting parameters prescribed in FAC-015-1 R1-R3 would be undermined by the prohibition of UVLS in response to more severe Contingencies when calculating SOLs.

Response

Scott Downey - Peak Reliability - 1	
Answer	Yes
Document Name	
Comment	

Peak agrees that UVLS should be allowed for use to prevent adverse reliability impacts for Contingencies more severe than single P1 Contingencies and that such allowances should be addressed in the RC's SOL Methodology. However, Peak is concerned that the use of UVLS, RAS, and other automatic post-Contingency mitigation schemes are confined to the development of stability limits. Peak believes that the allowed use of RAS or other automatic post-Contingency mitigation actions should be extended beyond the establishment of stability limits to also apply to the development of Operating Plans in general. Because the current FAC-011-3 intermingles "how to operate the system" with SOL establishment, it can be argued that the current FAC-011-3 already allows the RC's SOL Methodology to extended beyond the establishment of stability limits to also apply to the development of Operating Plans. While Peak is supportive of the SDT's attempt to focus FAC-011-4 more on establishing Facility Ratings, System Voltage Limits, and stability limits used in operations and removing the aspects of FAC-011-3 that relate more to "how to operate the system", it seems the SDT inadvertently introduced an inconsistency by limiting the use of RAS (or automatic actions) for deriving stability limits only. Peak believes the RC should have the ability to determine the use of RAS and other automatic post-Contingency mitigation actions across the board – not just for stability limit establishment. This issue, however, does not seem appropriate to be addressed in the FAC family of standards.

Given that FERC Order 818 clearly addresses the prohibition of using UVLS for calculating SOLs for single N-1 Contingencies, the SDT should consider a footnote within FAC-011-4 Part 4.6 that recognizes the FERC Order 818's prohibition on the use of UVLS in the determination of N-1 stability limits.

Comment	
FMPA appreciates the SDTs efforts to provide the background and historical context of UVLS and the derivation of IROLS. Unfortunately the background information provided is confusing and does not make clear what the SDT is trying convey. The rational appears to try and draw a line between UFLS and UVLS when in fact they perform the same function, but for different quantities. The use of UFLS is allowed in certain PC studied events and we see no reason why UFLS shouldn't be used where appropriate. We agree that UVLS should be considered in the establishment of stability limits; however we also believe UFLS should be allowed under certain scenarios as it is in the planning horizon.

Comment	
We agree with the allowed use of UVLS under certain conditions, but we strongly disagree with the way the SDT has addressed the allowed use of UFLS and UVLS in the new FAC-011. Since R5 gives some flexibility to the RC to choose its method for considering various types of contingencies (N-1, N-2, etc.) for both OPA/RTA and stability limits, the acceptable actions in R4.6 should not be limited as they can vary a lot depending on the types of contingencies considered. For example, a RC considering only the minimum single contingencies from R5.1 may not be allowed to use UFLS and UVLS actions for N-1… but another RC may choose to establish stability limits and limit transfers accordingly to address more stringent and rare multiple contingencies for which additional means like the action of UFLS/UVLS may be allowed (if that same RC would choose not to plan a stability limit for those contingencies, it would be acceptable to use UFLS/UVLS as a safety net?). Similarly, the reference to UVLS in SVL requirement R2 is not adequate, as SVL may comprise multiple levels, some for acceptable for single contingencies (without UVLS), some with some UVLS actions allowed for multiple contingencies. We think that the consequence of the action (e.g. the use of non-consequential load loss as in TPL) should be used throughout the standards to allow the use of actions for specific contingencies (rather than referring to RAS, UFLS or UVLS).

In the case of non-IROL SOLs we agree. However, it was noted that according to the background information above and in FAC-11-4, the use of UVLS is only considered in the context of establishing stability limits as per Requirement R4 Part 4.6.

The use of UVLS should also be acceptable to respect Facility Ratings and System Voltage Limits.

ERCOT asserts it is not appropriate to use UVLS for the purpose of increasing transfer capability for stability limits for N-1 Contingencies. However, it may be appropriate to use UVLS to determine the post-contingency impact in regards to establishment of an IROL vs. an SOL. It may also be appropriate to use UVLS in determining whether or not pre-contingency load shedding is warranted.

ERCOT suggests rewording proposed R2 to clarify that the SOL methodology establishes a method for determining which of the Facility Ratings provided by the owner should be used in operations, and not a method for establishing Facility Ratings. Please see the suggested language below.

"R2. Each Reliability Coordinator shall include in its SOL Methodology the method for Transmission Operators to determine ***which of the*** applicable owner provided Facility Ratings ***are*** to be used in operations. The method shall address the use of common Facility Ratings between the Reliability Coordinator and the Transmission Operators in its Reliability Coordinator Area.

With respect to R3.5, the meaning of the phrase "Address the use of" is unclear. The meaning of this phrase could be interpreted several different ways. ERCOT understands that the intent of the SDT is to ensure that, under the SOL methodology, the RC and its TOPs have a method to determine how the common set of System Voltage Limits between the RC and TOPs are to be used in operations, without becoming overly prescriptive in the requirement language. ERCOT suggests rewording proposed R3.5 to "Address how the Reliability Coordinator and its Transmission Operators use common System Voltage Limits in the Reliability Coordinator Area;"

ERCOT notes that parts 4.1.1.-4.1.4. of R4 list the *minimum* stability performance criteria that should be used in the method to determine stability limits in operations. To add clarity, ERCOT suggests adding a new part 4.1.5 that reads ***"other stability performance criteria as required by the RC's SOL Methodology."***

****Please refer to the attached comment form for redlined language.

Requirement R7 of the proposed FAC-011-4 standard requires the RC to define the method and periodicity a TOP must communicate their SOLs back to the RC. In comparison, parts 5.3-5.5 of requirement R5 of FAC-014-3 identify such communications must occur on a mutually agreed upon time frame. We believe Requirement R7 should be changed to a mutually agreeable timeframe that reflects the frequency a Transmission Operator will

conduct its Operational Planning Analyses and Real-time Assessments.

ATC has the following concerns with the proposed FAC-011-4 standard.

- R3.1: Requirement R3.1 contains the term "stations" and uses an unconventional designation of "buses/stations".
    - The NERC BES definition does not require entities to identify BES stations, which would make it problematic to use the requirement as written.
    - Additionally, "buses/stations" is an unclear designation where entities may understand that System Voltage Limits shall be created for all Facilities in a station, including both BES and non-BES Facilities in that station. We do not believe this is the intent of the SDT so this should be clarified.
    - Consider modifying R3.1 language to state "Require that BES buses have an associated System Voltage Limit except for the BES buses that may be excluded as specified in the [RC]'s SOL methodology."
- R3.2: Clarify R3.2, similar to R2 language, that "respect[ing] the Facility voltage Ratings" means determining the "applicable owner-provided Facility" voltage "Ratings to be used in operations". FAC-008-3 R2 and R3, in conjunction with the NERC "Facility Ratings" definition, requires the Generator Owners and Transmission Owners, respectively, to have voltage ratings for Facilities.

- R4.5 and a New R5.5: Requirements R4.2, R4.4, R4.5 and R5 become applicable to all TOPs through proposed FAC-014-3 R2.

    - Given the language of R4.4, which requires "instability risks" to be "identified", ATC believes the standard overreaches at R5 when it includes stability analysis within OPAs and RTAs as determined by the RC. TOP-001-3 R13 and R14 and TOP-002-4 R1 already require the TOP study SOLs in RTAs and OPAs, and inclusion of OPAs and RTAs in R5 is redundant with TOP-001-3 and TOP-002-4. The TOPs are the local experts on the stability of their systems and the R5 requirement language should not force additional stability analysis beyond TOP-001-3 and TOP-002-4 in the OPA and RTA on to a TOP if stability is not an issue for its system. ATC recommends striking “and performing Operational Planning Analysis (OPAs) and Real -time Asses

      A proposed revision to R5 to address this concern is the addition of a new requirement R5.5, which would read:

      "R5.5 The applicability of the identified single Contingency and multiple Contingencies to its TOPs for use in determining stability limits."

    - Similarly, given the applicability of the model requirements stated in R4.5 to the TOPs performing stability studies under the RC SOL methodology, through FAC-014-3 R2, clarify is needed that a TOP does not need to have a model of similar scale or scope as the RC will use. Per TOP-003-3, TOPs determine what data is needed to perform their OPAs and RTAs and the scope of this data is likely a subset of the RC's data, whether covered by IRO-010-2 or proposed FAC-011-4 R4.5. The revision should make it clear that the breadth of the RC's model does not necessarily need to be replicated by the TOP.

      A proposed revision to R4.5 to address this concern would be the addition of the following language to the current proposed R4.5 language:

      "… necessary to determine different types of stability limits, including applicability of the model detail to studies performed by its TOPs"

- New R4.x: The RC SOL methodology should include how "impacted" PCs and TOPs will be identified for stability SOLs. The "impacted" language appears in FAC-014-3 R4 and R5 and clarity is needed for all parties.

- R7: The second sentence of R7 should be struck as it is a redundant requirement to IRO-010-2 R1. SOL communication should be a part of the RC's data specification, which already contains a requirement regarding periodicity of communication.

R8: The requirement should contain a minimum notice provision to TOPs, such as "30 days prior to implementation". The current language would permit an RC to issue a revision the day prior to a material change in its SOL methodology, possibly impacting a TOP's compliance under FAC-014.

This standard in its current form allows a single entity the ability to dictate operating and effectively planning criteria. PNM believes that the development of the SOL methodology should be a joint effort including RCs, TOPs, and PAs.

Propose revised R1 language: Each Reliability Coordinator, in conjunction with each of its Transmission Operations and Planning Coordinators, shall develop a methodology for establishing SOLs (i.e., SOL Methodology) within its Reliability Coordinator Area.

PNM believes that R2 gives the RC the ability to dictate how an entity uses its own Facility Ratings effectively modifying FAC-008. There is no point for an entity to establish a Facility rating that cannot be used when operating the system. PNM recommends removal of R2 and revision of FAC-008-3 to address any concerns regarding a lack of common facility ratings methodology.

PNM questions the reliability basis for R3.3. PNM believes that there may be legit reasons to have the UVLS settings higher than the limits for certain critical contingencies. FERC order No. 818 specifies not using UVLS for N-1; however, this requirement doesn't have that qualifier. If the SDT feels this concept should be included in the standard the requirement should move under R4.6 and shall clearly specify that it is only applicable to single contingencies.

PNM finds no difference between R6.1 and R6.2.

Comment

1. FAC-11-4, Requirement R3.3 should be clear that it's only pre-contingency System Voltage Limits which should be above in-service UVLS scheme settings. When depending on these schemes, a post-contingency System Voltage Limit may fall below a UVLS set point.

2. FAC-11-4 Requirement R3 Part R3.4 should either be revised or removed. Identifying the lowest allowable System Voltage Limit does not make sense from the context of minimum voltage SVLs (it should be the highest SVL identified). Perhaps "lowest" could be replaced by "most restrictive".

3. Where FAC-11-4 Requirement R3 Part 3.7 requires coordination between adjacent RCs for SVLs the FAC-11-4 Requirement R2 and R4 are

silent on this with respect to Facility Ratings and stability limits. The RC should also be coordinating Facility Rating and Stability SOL actions with RCs within an Interconnection where applicable and this should be spelled out in FAC-11-4.

4. FAC-11-4 Requirement R4.1.2 should not force Reliability Coordinators into adopting transient voltage response criteria as part of their SOL Methodology. There are effective alternative means to guard against coincidental load loss and inadvertent tripping such as employing a relay margin criterion instead. Please remove or modify the requirement to recognize viable alternatives exist.

5. FAC-11-4 Requirement R4.1.2 should not force Reliability Coordinators into adopting transient voltage response criteria as part of their SOL Methodology. Transient voltage criterion results should be communicated to the Reliability Coordinator as outlined in FAC-15-1 Requirement R6 for consideration.

6. FAC-11-4 Requirement R4.1.3 introduces the term "angular stability". Why is System damping considered separately? Angular stability consists of Transient Stability and Small Signal Stability, System damping would be part of Small Signal Stability.

7. FAC-11-4 Requirement R4.4 appears to ask for so much detail in the SOL Methodology (FAC-11-4 Rationale indicates enough information should be provided to duplicate the study) that it would be extremely onerous to satisfy given that the assumptions made for each operating zone of our RC area are vastly different given the common conditions and risks that exist. Detailed assumptions around instability risks, transfer levels, dispatch and system conditions are better left in study documentation pertaining to each specific zone. (Also see 5 below. We believe that there is value in sharing SOLs and associated study reports based on need/request.)

Additionally, the phrase "instability risks are identified" is misleading and does not really contribute to the objective of the requirement/standard. We assess that the intent of R4 is to present the method for determining stability limit, not to identify risks although they are the driver for developing stability limit. If the intent of that phrase is to present the stability concerns and/or the way to address such concerns through SOL determination, then we offer the following revised wording:

"Describe how stability limits are determined, considering levels of transfers, Load and generation dispatch, and the applicable System conditions including any changes to System topology such as Facility outages;"

8. FAC-11-4 Requirement R4.5 asks for a description of the critical details from other Reliability Coordinator areas necessary to determine stability limits. This is in conflict with FAC-14-3 R5 which no longer enforces that Reliability Coordinators *provide its SOLs and IROLs to those entities with a reliability need.* IRO-014-3 speaks to required information for Operating Plans, Procedures and Processes but does not address the need for critical details required for developing SOLs.

Furthermore, obtaining these critical details from other Reliability Coordinators and verifying their impact to SOLs through study can require a great deal of time and effort. It is recommended that more than 12 months be given in order to comply with this requirement. An appropriate time would be in the order of 24 – 36 months.

Obtaining these critical details would also be made much easier and the information would be much more valuable if all Reliability Coordinators (RC) were aligned in respecting the same set of contingencies and performance criterion for IROLs. For example, if an RC finds an instability issue due to a multiple contingency in a neighboring RC's footprint there's no requirement in FAC-11 and FAC-14 that supports forcing the neighbor to respect that contingency in the interest of interconnected system reliably as multiple contingencies are still left up to the RC's discretion.

9. FAC-11-4 Requirement R5.2 leaves the door open for any potential contingency to be considered credible and will create an unnecessary burden in attempting to show compliance. Listing other specific single contingencies that could be deemed credible would improve this requirement.

An alternative to listing additional specific contingencies would be to revert to the existing language in FAC-11-3 Requirement R2.2 which specifies, at a minimum, which contingencies must be respected.

10. FAC-11-4 Requirement R6.2 is redundant with Requirement R6.1 in that a criterion is what is used to identify SOLs that are IROLs. Consider revising to combine the two sub-requirements to remove unnecessary duplication and confusion.

11. FAC-11-4 Requirement R8 requires RCs to provision of their SOL Methodology to other entities. Given that the changes to the FAC-11-4 standard require substantial documentation work on the part of many RCs, more time should be given for compliance. At least 36 months is recommended. Furthermore, given there will be changes coming to the IROL requirements in this very same standard maybe the compliance period should be extended to the compliance deadline associated with that version of the FAC-11 standard to avoid the burden of duplicating a great deal of work.

Response

Allie Gavin - Allie Gavin On Behalf of: Michael Moltane, International Transmission Company Holdings Corporation, 1; - Allie Gavin

Answer	
Document Name	

Comment

FAC-011-4 Requirement R2 specifically states that the RC "shall include in its SOL Methodology the method for Transmission Operators to determine the applicable owner-provided Facility Ratings to be used in operations". It goes on to identify that the method "shall address the use of common Facility Ratings between the Reliability Coordinator and the Transmission Operators in its Reliability Coordinator Area". This requirement needs to be bounded such that the RC is not specifying in its methodology how a Transmission Operator and thus a Transmission Owner is required to rate its transmission facilities, up to and including the use of real time ratings. This would determine the amount of risk a Transmission Owner is subject to for its facilities. The standard should only specify the end objective and not the process to achieve that objective.

FAC-011-4 Requirement R3.2 introduces the concept of "Facility voltage Ratings". This is not a defined term and leaves room for interpretation. There is no standard that requires TO's to provide Facility Ratings for voltage. Before TOP's are required to operate to Facility Ratings for voltage there should be a requirement for TO's to provide Facility Ratings for voltage.

FAC-011-4 Requirement R4 seems to be somewhat duplicative of TPL-001-4 requirements R5 and R6. Consideration should be given to coordination of these requirements.

FAC-011-4 Requirement R5 includes language that requires the RC's SOL Methodology to include "the method for identifying the single Contingencies and multiple Contingencies for use in determining stability limits and performing Operational Planning Analysis (OPA's) and Real-time Assessments (RTA's)". Use of SOL's in OPA's and RTA's is covered in TOP-001 and TOP-002. The concept of requiring how SOL's should be used in OPA's and RTA's should be removed from this requirement.

FAC-011-4 R7 is redundant with IRO-010-2 R1. As the SDT notes in its preface to FAC-011-4, SOLs are inputs to OPA and RTAs. As such, R1 of IRO-010-2 already requires the RC to maintain a documented specification of the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring and Real-time Assessments. This requirement included requirements for periodicity of providing the data. As such, R7 of proposed FAC-011-4 is redundant and should be deleted from the proposed standard.

Comment

FAC-011 R3.1

We do not agree with Part 3.1 as written since it implies that all BES (i.e. each and every) buses/stations within an RC or TOP area need to have a SVL. To meet this requirement, an RC/TOP will need to determine and list a large number of System Voltage Limits (SVLs), many of which have no impact on the BES voltage performance and hence serve little or no value to the determination of SOLs and/or IROLs.

The proposed definition of SVL is:

The maximum and minimum steady -state voltage limits (both normal and emergency) that provide for acceptable System performance.

With this definition, we interpret that there may be more than one SVL within an RC or TOP area, and that the identified SVLs are the limiting parameters with which to assess acceptable voltage performance on an RC or TOP system and their interconnected systems. An RC or TOP may identify a handful of buses/stations within their areas to be requiring the stipulation of SVLs, while deeming it unnecessary to stipulate SVLs on other buses/stations as acceptable voltage performance can be assessed/assured by observing the stipulated SVLs.

We therefore suggest Part 3.1 be reworded as follows:

R3.1. Require the identification of the critical BES buses/stations and associated System Voltage Limits with which to assess acceptable System performance

FAC-011 R3.2

This part is not required. Observing the more restrictive of the two – SVLs and Facility voltage Ratings, is the general practice for any RCs and TOPs. If the SDT wish to spell out this requirement explicitly, we propose the following wording:

3.2 Require that the more restrictive of the System Voltage Limits and the Facility voltage Ratings at the same bus/station be respected.

FAC-011 R3.4

This part is not required since all applicable SVLs (may be more than one) identified in the proposed Part 3.1 will be observed in the determination of SOLs. Identifying the lowest allowable SVL serves little or no purpose, or can be insufficient, in the determination of SOLs.

We suggest deleting Part 3.4

FAC-011 R3.5,6,7

The overall intent of these parts is to ensure the methodology specifies the use of common SVLs by those entities that need to determine SOLs around those buses/stations for which SVLs are identified. This can be achieved by combining them into the following proposed part:

3.5. Address the use of common System Voltage Limits by all entities in the Reliability Coordinator Area and the process to coordinate the determination of System Voltage Limits between neighboring Reliability Coordinators and Transmission Operators.

FAC-011 R4.4

The phrase “instability risks are identified” is misleading and does not really contribute to the objective of the requirement/standard. We assess that the intent of R4 is to present the method for determining stability limit, not to identify risks although they are the driver for developing stability limit. If the intent of that phrase is to present the stability concerns and/or the way to address such concerns through SOL determination, then we offer the following revised wording:

4.4 Describe how stability limits are determined, considering levels of transfers, Load and generation dispatch, and the applicable System conditions including any changes to System topology such as Facility outages;

FAC-011 R5

We interpret R5 to require identification of relevant single Contingencies AND multiple Contingencies for use in determining stability limits, and in performing Operational Planning Analysis (OPAs) and Real time Assessments (RTAs), and any Planning Coordinator identified contingency events for use in determining stability limits. As such, and considering the umbrella wording in R5 and that Parts 5.1 to 5.3 essentially cover all contingency events, we do not see the need for Parts 5.1, 5.2 and 5.3. To add clarity, we propose R5 be revised, to include Part 5.4, as follows:

R5 Each Reliability Coordinator shall include in its SOL Methodology the method for identifying the single Contingencies and multiple Contingencies for use in determining stability limits, and in performing Operational Plans Analyses (OPAs) and Real time Assessments (RT the method for considering the Contingency events provided by the Planning Coordinator in accordance with FAC 015 1, Requirement R6 to identify the Contingencies for use in determining stability limits.

Comment

1- We support the harmonization and approach to the new standards for the establishment of SOLs. However, we do have an important concern regarding the way the use of UVLS and UFLS in the establishment of stability limits was incorporated in the FAC-011-4 requirements. Although the requirements give good flexibility to the RC in identifying the set of contingencies applicable for SOL determination, they also impose performance requirements (SVLs and limited use of UFLS/UVLS) that do not make any distinction between the mandatory single contingencies and the complimentary multiple contingencies. Since the RC has flexibility to identify the relevant contingencies beyond the minimum requirements from R5.1.1, it should also have flexibility in the performance requirements for the allowed use of mitigation actions.

2- We think the level of description in sub-requirements R3.X for System Voltage Limits is a burden without added benefit to reliability. Why so much details for SVL and not for Facility Ratings? R3.5-3.7 are not needed. If coordination is an issue, it should be addressed in a single requirement for the whole standard. R3.2 is redundant with the application of FR in R2. R3.3 is an issue that should be addressed with the allowed used of UVLS under certain circumstances, not captured by SVL requirements. Different SVLs may be used for different contingencies, not just N-1. R3.4 is redundant with SVL definition.

3- R4.2 is a redundant cross-reference with 4.1 and R5 and does not bring any benefit to the remaining of the standard. R4.3 also is redundant since the RC has to describe how stability limits are established per R4 whether or not multiple TOPs are involved.

4- Concerning the selection of contingencies, it is understood that the RC has full flexibility to determine the appropriate multiple contingencies for its System, correct? If that is the case, the proposed standard should allow the same flexibility for the performance requirements associated with those contingencies, namely the use of UVLS and UFLS.

5- Although we appreciate the standard's flexibility regarding the stability performance requirements in R4.1, there seems to be a lack of guidelines and minimum expected performance as in TPL (no mention of Cascading, instability, etc.).

Response

Janis Weddle - Public Utility District No. 1 of Chelan County - 6, Group Name Chelan PUD

Answer	
Document Name	

Comment

Comment 1: It is a common concept in industry that the system should be operated as it is planned. The TPL-001-4 standard is one of the main regulatory drivers to the planning of the system, while the FAC standards regarding SOLs are important to the operation. While not possible to align the two standards entirely, there are some features of the TPL standard which may have merit for the FAC-011 standard revision which have not been addressed in the draft of the proposed revision of FAC-011-4. These include:

1. Voltage Criteria (TPL-001-4 R5)
2. Instability Criteria (TPL-001-4 R6)
3. Division of responsibilities (TPL-001-4 R7)

The Voltage criteria is present in both FAC-011-3 and TPL-001-4. While TPL-001-4 voltage criteria requirement includes steady state, post-contingency deviation, and transient voltage response, the proposed FAC-011-3 criteria has additional performance metrics. This presents a risk where the system may not be operated as it was planned, because the criteria proposed in FAC-014-3 could be more conservative than the criteria required by TPL-001-4. The Standard Drafting Team should take this opportunity to consider aligning the operational criteria in the proposed FAC-011-3 with that of TPL-001-4. CHPD recognizes that due to the variety of unknowns encountered in real-time, operational criteria should have more flexibility than system planning.

Comment 2: CHPD is also concerned by the requirements in R3.6. and R3.7. regarding coordination of these system limits. This is not well addressed in the Standard Drafting Material as to the intent and scope of the proposed coordination. If the expectation is simply to share, post, or distribute limits, then that would be a helpful clarification. If the expectation is to conduct additional coordination studies involving multiple parties and the RC, then it is clearly a greater body of work and should be addressed further and clarified by the Standard Drafting Team as to the nature of these expectations.

CHPD is in favor of the removal of R3.6. and R3.7. altogether, because the coordination of these is already essentially performed through the use of the OPA and RTA.

Comment 3: The continued use of margins in FAC-011-4 (also found in FAC-011-3) is another instance of mis-alignment between TPL-001-4 and FAC-011-3. CHPD recognizes that there is value to include an assessment of margin in the operational realm, but is also aware that this is a difference in the way the system is planned vs. operated, and in some instances may result in the system being operated to support a particular margin that wasn't necessarily planned through TPL-001-4 or other planning standards. CHPD recognizes that due to the variety of unknowns encountered in real-time, operational criteria should have more flexibility than system planning.

Comment 4: Regarding the voltage criteria proposed in FAC-011-4 R4, there are a number of concerns.

1. The use of the term 'steady-state voltage stability' in 4.1.1. is confusing. Steady state analysis is different than stability analysis. Please clarify this term. If this is the feature described in the 2003 blackout report, this would be the assessment of reactive power support.
2. Angular stability criteria is a new metric to the FAC-011 standard; this concept is discussed to some extent in the 2003 blackout report as well. It is assumed that this is the analog to the FAC-011-3 requirement R1.2.4 "The system demonstrates *transient*, *dynamic*, and voltage stability" (emphasis added). CHPD would prefer the transient and dynamic language from FAC-011-3 to be maintained, rather than 'angular'. The system damping criteria in 4.1.4. and the transient voltage response in 4.1.2 could be also included as part of the angular (transient/dynamic) criteria, and does not need to be specifically enumerated.

If the Standard Drafting Team feels prescriptive requirements are required over performance based requirements, CHPD believes that this requirement could be simplified to something similar to "The Reliability Coordinator shall have voltage reactive margin criteria" and "The

Reliability Coordinator shall have stability criteria for a) transient voltage response, and b) system damping"

Comment 5: CHPD would also like to see a requirement for a definition of System Instability in the RC SOL methodology, analogous to the TPL-001-4 R6:

TPL-001-4 R6: "Each Transmission Planner and Planning Coordinator shall define and document, within their Planning Assessment, the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding."

CHPD finds the text of TPL-001-4 R6 adequate to incorporate into the proposed FAC-011-4, with the Transmission Planner and Planning Coordinator references updated to Reliability Coordinator. This is particularly important since the Reliability Coordinator is to identify IROLs, which are these types of system phenomena.

Comment 6: Requirement in FAC-011-3 R3.4 – "Identify the lowest allowable System Voltage Limit;" seems duplicative or redundant to the proposed definition of System Voltage Limit – "The maximum and ***minimum*** steady
System performance."

The System Voltage Limit, in itself, should be the minimum allowable system voltage.

Comment 7: There is no mention of steady state thermal performance in the requirements for the Reliability Coordinator SOL methodology, nor language stating that SOLs shall not exceed associated Facility Ratings for thermal ratings (as found in the old FAC-010-3 R1.2). CHPD strongly encourages the Standards Drafting Team to add language supporting the operation within thermal limits to the proposed FAC-011-4 document, possibly in the vicinity of R4, which discusses stability and voltage criteria.

Comment

It is unclear by the wording of R4 whether Transmission Operators determine stability limits or the RC. Based on R2 and R3, it is clear that the Transmission Operators develop Facility Ratings and System Voltage Limits based on the RC methodology. Based on R7, it says SOLs are communicated to the RC. One can assume this includes the stability limits as well, but R4 could be spelled out as a TOP task to develop stability limits (unless the door is intentionally being left open for the RC to determine stability limits in parallel to the TOP). It should be the TOP developing all of the

SOLs and communicating them to the RC. The RC should only drive the methodology and determine which of the provided SOLs qualify as IROLs.

Answer	
Document Name	

Comment

FMPA recommends a feedback loop be introduced to FAC-011-4 for the RC's SOL methodology, such as found in FAC-008-3 R5. This will provide for better coordination between the PC and the RC, improve the effectiveness of the RC's Stability assessment, and allow consideration of best Stability analysis practices within the RC's footprint.

It is not clear what the phrase "for use in performing OPAs and RTAs" as used in R5 is intending. Are just the RC's OPAs and RTAs required to use this list of contingencies, or are all entities performing OPAs and RTAs within the RC footprint required to use this list? It does not make sense for every TOP to use the same extensive list of contingencies, since they may not have a need to model the System beyond their immediate TOP area.

Additionally, as currently worded R5 requires Stability analysis to be run on all contingencies that qualify as P1 events under TPL-001-4, which would result in a tremendous amount of work, but very little beneficial insight. The ability to apply engineering judgement to select those events that are expected to result in more severe System impacts is needed.

FMPA sees the use of the term "normal clearing" (lowercase, but note that the capitalized, defined term is used in the bulleted list) in 5.1.1 as problematic. Breaker failure schemes meet both the definition of Delayed Fault Clearing and the definition of Normal Clearing as they are currently written. Is it the SDT's intent to require breaker failure be included when determining stability limits? If not, FMPA recommends changing "with normal clearing" to "without Delayed Fault Clearing".

Comment

The SPP Standard Review Group has a concern in reference to the drafting team intents for Requirement R2. From our perspective, this proposed language may suggest that the RC will receive the authority to tell the Transmission Owner how to determine their Facility Ratings. We would ask that the drafting team provides more clarity on the intent for this Requirement.

The SPP Standard Review Group has a concern that the drafting team has potentially created a new term by adding the term “voltage” between Facility Ratings. We recommend that the drafting team uses the proposed phrase “voltage Facility Ratings**. "**

The SPP Standards Review Group has a concern that the drafting team may have caused confusion by not including the actual FAC-011-3 Standard in the posted material. From our perspective, this creates an inconsistency and disconnection on what the drafting teams intents are for this project. For future reference, we would suggest the drafting team include all pertinent documentation to help provide clarity and demonstrate consistency on what their intents and goals are for the project.

The SPP Standards Review Group has a concern pertaining to the language in Requirement 6 Subpart 6.2. There is a confusion on which term “violating” or “Exceedance” should be used in the Subpart language. From our perspective, the drafting team has put a lot of emphasis on the term “Exceedance” as they have developed a definition for the term “SOL Exceedance” and we feel that the term “Exceedance” should be referenced in the language to promote consistency with the intents of the drafting team.

Comment

The language in Requirement R3 Part 3.2 that refers to “Facility voltage Ratings” is problematic. Splitting a NERC-defined term (Facility Ratings) with voltage isn’t a good practice. Suggested language: “the maximum and minimum voltage Facility Ratings”.

WAPA has a concern regarding the wording for **FAC-011-4 R4** and **R5** and the linkage between**.**

As written R4 implies **required** Stability assessments in all OPAs and RTAs.

R4. Each Reliability Coordinator shall include in its SOL Methodology the method for determining the stability limits to be used in operations. The method shall:

{C}**4.1.** ….

{C}**4.2.** Require that stability limits are established to meet the criteria specified in Part 4.1 for the Contingencies identified in Requirement R5.

R5. Each Reliability Coordinator shall include in its SOL Methodology the method for

identifying the single Contingencies and multiple Contingencies for use in determining stability limits and performing Operational Planning Analysis (OPAs) and Real -time Assessments (RTAs). The method shall include:

WAPA understands that was not the intent of the SDT and suggests this minor modification:

4.2. Require that ***identified*** stability limits meet the criteria specified in Part 4.1 for the Contingencies identified in Requirement R5 ***for OPAs and RTAs***. **(Or)**

4.2. Require that stability limits are established to meet the criteria specified in Part 4.1 for the Contingencies identified in Requirement R5. And remove stability from the body of R5 and add a R5.5 (as initially suggested by the MRO-NSRF with WAPA's modification)

A proposed revision to R5 to address this concern is the addition of a new requirement R5.5, which would read: "R5.5 The applicability of the identified single Contingency and multiple Contingencies **as agreed to by** its TOPs for use in determining stability limits."

Lastly, it appears "additional" is missing from Requirement 5.3

5.3. Any ***additional*** types of multiple Contingency events identified for use in determining

stability limits, or for use in performing OPAs and RTAs.

Without it, R5.3 is redundant to the body of R5.

Scott Downey - Peak Reliability - 1	
Answer	
Document Name	
Comment	
Peak believes that requirement R5 should contain a subpart that requires the RC's SOL Methodology to include a description of the performance requirements for Contingencies more severe than the single Contingencies listed in part 5.1.1. In operations, the operating criteria for single Contingencies is often more stringent than that of more severe Contingencies such as breaker failure Contingencies or common structure Contingencies. Accordingly, some RC's only examine these more sever Contingencies for instability, Cascading, or uncontrolled separation, and they may not screen such severe Contingencies for thermal or voltage exceedances as described in the proposed definition of SOL Exceedance. The SDT could include a subpart 5.5 which states, "The minimum performance requirements for Contingencies more severe than those described in subpart 5.1.1."

Comment	

With regard to the proposed Requirement R2, CenterPoint Energy believes that the proposed language could be mistakenly interpreted as giving the Reliability Coordinator the discretion to impose unacceptable Facility Ratings to Transmission Operators. CenterPoint suggests the following language for the proposed Requirement R2:

“Each Reliability Coordinator shall include in its SOL Methodology a mutually agreeable method for Transmission Operators to determine the applicable owner provided Facility Ratings to be used in operations.”

With regard to the proposed Requirement R6.2, the existing legacy language uses the word “violating” in reference to an exceedance of an SOL that qualifies as an IROL. CenterPoint Energy recommends the SDT revise the wording so that there is no negative connotation to the context of the proposed requirement.

CenterPoint Energy suggests the following language for the proposed Requirement R6.2:

“R6.2 Criteria for determining when an SOL exceedance qualifies as an IROL and criteria for developing any associated IROL TV.”

R4.6 specifically does not allow the use of UFLS in the establishment of stability limits, which is acceptable for all single contingencies and multiple contingencies as define by P1-P7 events in Table 1 of TPL-001-4. However, R5.4 requires consideration of contingency events by the PC in R6 of FAC-015-1. It could be that the Planning Assessment identified Cascading following an extreme event even with UFLS included. It's unclear whether the RC will consider this a valid stability limit or not. There should be limits placed on the scope of R6 of FAC-015-1 to P1-P7 events to allow the exclusion in R4.6 to remain.

Comment

The intent of Proposed R2 needs more clarification as to which entities are using the same rating, for example: RC & TOP? or RC & all TOPs for the same facility? Is the intent to have all TOP's under the same RC using the same ratings methodology?

The intent of Proposed R5.4 is unclear. We believe the Planning Coordinator should provide the established stability limit and the method by which the RC should assess the system against established stability limits. Maybe an example would help the understanding.

Proposed R8.1 needs to define under what circumstances a nonadjacent Reliability Coordinator would have a reliability-related need for the Reliability Coordinator's SOL Methodology.

Cynthia Kneisl - Midwest Reliability Organization - 1,2,3,4,5,6 - MRO, Group Name MRO NSRF

Answer	
Document Name	

Comment

The first sentence of FAC-011-4 R2 should be clarified as follows: “Each Reliability Coordinator shall include in its SOL Methodology the method for Transmission Operators to determine which owner-provided Facility Ratings are applicable th d in operations.” The proposed clarification makes it more obvious that the SOL Methodology only determines which owner-provided ratings are applicable for use in operations.

FAC-011-4 R3.1: Requirement R3.1 contains the term "stations" and uses an unconventional designation of "buses/stations."

- The NERC BES definition does not require entities to identify BES stations, which would make it problematic to use the requirement as written.
- Additionally, "buses/stations" is an unclear designation where entities may understand that System Voltage Limits shall be created for all Facilities in a station, including both BES and non-BES Facilities in that station. We do not believe this is the intent of the SDT so this should be clarified.
- Consider modifying R3.1 language to state "Require that BES buses have an associated System Voltage Limit except for the BES buses that may be excluded as specified in the RC's SOL methodology."

R4.5 and a new R5.5: Requirements R4.2, R4.4, R4.5, and R5 become applicable to all TOPs through proposed FAC-014-3 R2.

- Given the language of R4.4, which requires "instability risks" to be "identified," ATC believes the standard overreaches at R5 when it includes stability analysis within OPAs and RTAs as determined by the RC. TOP-001-3 R13 and R14 and TOP-002-4 R1 already require the TOP study SOLs in RTAs and OPAs, and inclusion of OPAs and RTAs in R5 is redundant with TOP-001-3 and TOP-002-4. The TOPs are the local experts on the stability of their systems and the R5 requirement language should not force additional stability analysis beyond TOP-001-3 and TOP-002-4 in the OPA and RTA on to a TOP if stability is not an issue for its system. ATC recommends striking “and performing Operational Planning Analysis (OPAs) and Real-time Assessments (RTAs)” from R5.

A proposed revision to R5 to address this concern is the addition of a new requirement R5.5, which would read: "R5.5 The applicability of the identified single Contingency and multiple Contingencies to its TOPs for use in determining stability limits."

Similarly, given the applicability of the model requirements stated in R4.5 to the TOPs performing stability studies under the RC SOL methodology, through FAC-014-3 R2, clarity is needed that a TOP does not need to have a model of similar scale or scope as the RC will use. Per TOP-003-3, TOPs determine what data is needed to perform their OPAs and RTAs and the scope of this data is likely a subset of the RC's data, whether covered by IRO-010-2 or proposed FAC-011-4 R4.5. The revision should make it clear that the breadth of the RC's model does not necessarily need to be replicated by the TOP.

A proposed revision to R4.5 to address this concern would be the addition of the following language to the current proposed R4.5 language: "… necessary to determine different types of stability limits, including applicability of the model detail to studies performed by its TOPs."

FAC-011-4 R3.2: the term used is “Facility voltage Ratings.” The defined term is “Facility Ratings.” Remove voltage or reword to say “Facility Ratings for voltage."

FAC-011-4 R6.2: The term "violating" relates to previous Standard. Suggest: "Criteria for determining when violating an SOL qualifies as an IROL and criteria for developing any associated IROL Tv."

FAC-011-4 R7 is redundant with IRO-010-2 R1. As the SDT notes in its preface to FAC-011-4, SOLs are inputs to OPA and RTAs. As such, R1 of IRO-010-2 already requires the RC to maintain a documented specification of the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring and Real-time Assessments. This requirement included requirements for periodicity of providing the data. As such, R7 of proposed FAC-011-4 is redundant and should be deleted from the proposed standard.

FAC-011-4 R8 does not specify how far in advance of the effective date of the SOL Methodology the RC must provide its SOL Methodology to other entities. With other standard requirements that Transmission Operators develop their SOLs in accordance with the RCs SOL Methodology, changes that would require a new determination of SOLs based upon the new methodology could take some time to develop. It is recommended that the RC provide its methodology at least 30 days prior to the effective date to give entities an opportunity to evaluate changes to the methodology and implement any changes necessary to their SOLs prior to the effective date of the new SOL Methodology. Without sufficient time a registered entity could find themselves in violation of standard requirements due to lack of time to make changes to SOLs according to the new methodology.

LES is concerned that Requirement R2 does not provide adequate assurance that the Reliability Coordinator will respect the Facility Ratings established by the TO, or the TO's FAC-008 methodology. As written, the language is vague and appears to allow the RC to determine the Facility Ratings and voltage ratings that a TO must use. Additionally, based on the NERC definition of Facility Rating, there is a potential conflict between System Voltage Limits and Facility Ratings as both can utilize voltage ratings. At minimum, consideration should be given to potential inconsistencies that may develop between FAC-011-4, FAC-008-3 and the definition of Facility Rating as a result of the project.

FAC-011-3 R2 and R3 add an additional translation layer on top of FAC-008 which already defines the determination of Facility Ratings. Could this additional translation allow for the RC to impose ratings and risk that the TO owning the facility is not willing to accept? An example is forcing the use of

dynamic ratings. The language in R3.3 that requires the System Voltage Limit to be higher than the UVLS setting nullifies the ability to use local UVLS schemes. There exist local UVLS schemes that have been planned to operate at the emergency low voltage limit to protect local load and meet TPL requirements for prior outage (N-1-1) conditions. Effectively disallowing the use of local UVLS schemes to achieve acceptable system performance was likely not the intent. We suggest modifying the R3.3 language to address this unintended consequence. Requiring the operating limit to be more restrictive does not align with FAC-015 philosophy where the planning limits should be more restrictive.

Amy Casuscelli - Amy Casuscelli On Behalf of: Michael Ibold, Xcel Energy, Inc., 3, 1, 5; - Amy Casuscelli

Answer	No
Document Name	

Comment

Xcel Energy feels that R2 should be expanded so that the RC has a role for SOLs that impact more than one TOP, similar to R4. The alternative would be for R4 to be expanded beyond "stability limit" to be more general SOL that impacts more than one TOP. An example would be an interface/path/flowgate that is thermal limited below its Facility Rating due to other thermal (or voltage) limited transmission facilities in multiple TOPs. This concern would likely be addressed if the revised SOL definition is approved and is effective simultaneously with the FAC standards - we recognize that the revised SOL definition makes it clear that the MW limit for an interface/path/flowgate is an SOL only if it is a stability limit.

Comment

The NSRF is not convinced the RC's have the experience necessary to determine stability limits where the limits impact more than one TOP. Although it may make sense to designate the RC as responsible, historically this has been done by TOPs cooperating with each other to determine the limits. The concern is the RCs may not understand the nuances associated with all of their footprint.

Janis Weddle - Public Utility District No. 1 of Chelan County - 6, Group Name Chelan PUD

Answer	No
Document Name	

Comment

This is a helpful proposed clarification. However, in the definition of IROL from the NERC glossary an IROL is:

"A System Operating Limit that, if violated, could lead to instability, uncontrolled separation, or Cascading outages that adversely impact the reliability of the Bulk Electric System."

Therefore, one must calculate what the SOL is first, before determining whether the SOL is an IROL. If the RC is not required to calculate SOLs, how will it be able to determine whether or not the SOLs are IROLs? CHPD would propose that both TOPs and the RC calculate SOLs, but only the RC has the duty to determine which SOLs are IROLs. This would be consistent with the current FAC-014-2 approach and ensure that the RC is calculating SOLs so it can identify which SOLs are IROLs. If the RC is not calculating SOLs, there is the potential risk that the RC could miss an SOL which should be classified as an IROL.

Document Name	

Comment
Peak agrees with the suggested approach. One point of clarification. Proposed requirement R4 states, “Each Reliability Coordinator shall establish stability limits to be used in operations when the limit impacts more than one Transmission Operator in its Reliability Coordinator Area in accordance with its SOL Methodology.” Peak interprets this language to allow the RC the flexibility to either calculate this type of stability limit itself (i.e., the RC performs the calculation), or to utilize a TOP-calculated stability limit as the “established” stability limit, provided that the RC and the impacted TOPs accept its use. Please confirm that Peak’s interpretation is accurate.

Provided that the RC is limited in its ability to usurp the Transmission Owners rights in determining how Facility Ratings are determined, which are major components in SOL determination, than this proposal is acceptable. If the RC is not limited, then this is not acceptable as the RC should not be given the latitude to determine the amount of risk a Transmission Owner will accept through setting their methodology in determining an SOL, specifically a Facility Rating. The standard should only specify the end objective and not the process to achieve that objective.

8. Existing FAC-014-2, Requirement R5, R5.2 requires the Transmission Operator (TOP) to provide its SOLs to its Reliability Coordinator (RC) and Transmission Service Providers (TSPs) that share its portion of the RC Area. The SDT is proposing in Requirement R3 of FAC-014-3 to exclude the TSPs from that communication chain. Other requirements in existing standards (MOD-028-2, Requirement R7, MOD-029-2a, Requirement R4, and MOD-030-3, Requirement R2.6) require the TOP to provide the Total Transfer Capabilities (TTCs), Total Flowgate Capabilities (TFCs), along with supporting information and assumptions to TSPs. Because the TTCs and TFCs already reflect the impact(s) of any SOLs, the SDT deemed retention of the existing language unnecessary. Do you agree with the proposed change? If not, please explain.

NPPD agrees with removing TSPs from the notification requirements. The remainder of the requirement is also redundant with IRO-010-2 R1. As SOLs are a necessary input for OPA and RTA, the communication of them is required in the RC's data specification. As a result, including them here is redundant and unnecessary. Yes, the RC needs to know about changes to SOLs. The mechanism to notify them already exists in the data specification required by IRO-010-2 R1.

9. The SDT relocated the reliability objectives of existing Requirement R6 of FAC-014-2 into Requirement R6 of proposed Reliability Standard FAC-015-1 such that all Planning Coordinator and Transmission Planner responsibilities will be housed within one standard. Do you agree with the proposed change? If not, please explain.

Aaron Cavanaugh - Bonneville Power Administration - 1,3,5,6 - WECC	
Answer	No
Document Name	
Comment	
BPA does not see the need for a new planning standard. The objective could be better accomplished by moving the requirement to existing planning standards. The annual system assessment is required to be provided to the RC per NERC standard IRO-017-1. The RC is in a better position to communicate with affected TOPs in the RC area if instability or uncontrolled islanding is identified in the system assessment.

Mike Smith - Manitoba Hydro - 1, Group Name Manitoba Hydro	
Answer	No
Document Name	
Comment	
Manitoba Hydro agrees that the Planning Coordinator responsibilities do not need to be in FAC-014-2. Manitoba Hydro would prefer if the responsibilities are related to FAC-013 or TPL-001 that the requirements be housed in one of those standards rather than create a new standard.

SCE finds the new SOL/IROL construct to be clearer and more useful. As the drafting team points out, Operations Time Horizon SOLs are not necessarily included in Planning Assessments required by TPL-001-4. SCE supports the reliability objectives established by FAC-015-1 and the relocation of these objectives from the in-effect FAC-014 to the proposed FAC-015.

Comment

ATC has the following additional comments on proposed FAC-014-3:

- R3: The SDT should strike requirement R3 since the content of this requirement is already covered by NERC standard IRO-010-2 R1 (i.e. this information or data is needed by the RC to perform its OPA and RTA as covered by R1.1).

R4 and R5.2 through R5.4: The term "impacts" and "impacted" are used without definition. See ATC's comments to question #6 above about the need for a new sub-requirement under R4 of FAC-011-4 to ensure how impacted parties are identified is addressed in the RC's SOL methodology.

1. We believe it will be more efficient for RCs to make their SOLs available to impacted entities through automated mechanisms, such as an on-line database portal, rather than providing the information as proposed. The proposed expectation would require direct communication between the RC and the impacted entities that would be documented through electronic communications or voice recordings. This would be a compliance burden on all entities involved. Moreover, this approach could introduce a natural latency when the RC provides the SOL

information to external entities. This latency could impact a PC or TP who could have partially completed a Planning Assessment, only to find that the SOL data they used is outdated and that the assessment will need to be restarted. By pushing this information to an on-line portal, impacted entities can then pull the most current data set for monitoring and assessment purposes. We believe this change would convert the requirement to a more risk-based performance approach that shifts the focus of risk to the availability of the automated mechanisms.

2. We observe that part 5.4 is the only portion of this requirement that expects the RC to provide updated information to external entities. We ask the SDT to clarify this discrepancy in the other external entities identified in the requirement.
3. The proposed standard appears to miss the possible coordination between RC and an adjacent RC, particularly in the instance that an impacted TOP from an adjacent Reliability Coordinator Area would need information related to SOLs. There currently is no obligation listed under Requirement 5 that captures this instance.
4. We ask the SDT to move the IROL-related critical information to Requirement R1 where the RC is obligated to establish the IROL. The references listed under Requirement R5 are confusing, as they only pertain to the PC.
5. For part 5.4, we believe the RC should provide the value of the stability limit or IROL, as identified in part 5.2.1, to an impacted TOP within its Reliability Coordinator Area.
6. We believe Requirements R1 and R6 should be combined, as there is no expected timeframe identified when a RC is required to provide a list of generation or transmission Facilities that are critical to the derivation of the IROL. Transmission Owners ad Generation Owners could have compliance implications if the information is not provided in a timely fashion. The provision of this information should be done as soon as the IROL is established.

Comments: ERCOT provides the following additional feedback:

FAC-014:

ERCOT suggests the following clarification to R4 to simplify the language and to avoid the possible interpretation that the RC's authority (or duty) to establish stability limits that impact multiple TOPs would only be triggered in the event one or more TOPs has preliminarily established such a stability limit pursuant to its obligation under R2:

R4. Each Reliability Coordinator shall establish ***any*** stability limit to be used in operations ***in accordance with its SOL Methodology if that*** limit impacts more than one Transmission Operator ***in that*** Reliability Coordinator Area.

****Please refer to the attached comment form for redlined language.

1. FAC-14-3 Requirement R5 no longer enforces that Reliability Coordinators *provide its SOLs and IROLs to those entities with a reliability need.* IRO-014-3 speaks to required information for Operating Plans, Procedures and Processes but does not address the need for critical details required for developing SOLs such as study reports and other related operating documentation. This information is necessary in order to satisfy requirements in FAC, TOP and IRO standards where there's potential impact to neighboring RC areas.

Furthermore, obtaining these critical details from other Reliability Coordinators and verifying their impact to SOLs through study can require a great deal of time and effort. It is recommended that more than 12 months be given in order to comply with this requirement. An appropriate time would be in the order of 24 – 36 months.

2. FAC-14-2 Requirement R6 had been the one requirement tying identification of multiple contingencies in the Planning Horizon to those that must be considered in Operations. This requirement had ensured that if instability as a result of a multiple contingency was identified in the Planning Assessment then that contingency should be deemed credible. It was the best vehicle to use to influence another RC/TOP area within the Interconnection to recognize a multiple contingency within its area if shown to impact other areas. In the interest of both assistance in respecting an IROL and operating a more reliable interconnected system some language to this effect should remain in FAC-14-3. The language should be expanded to reflect that multiples may be identified in the Operations Horizon as well through studies performed in deriving SOLs including those performed for OPA and RTA. Restricting the language to the planning horizon is insufficient as the planning horizon covers a more limited scope of system configurations realized in operations.

The use of the existing wording from FAC-014-2 “Facilities that are critical to the derivation of the IROL” causes a lot of confusion as to the mean of the word “critical”. The corresponding list of Facilities is referenced by other standards (e.g. CIP-002) with a major impact on compliance to those standards. With lack of clarity and guidelines on the intent regarding the “critical Facilities” that should be included per this requirement. The addition of “stability limits” causes even more confusion, as it is now understood that Facilities impacting SOLs stability limits not considered IROLs should be included on that list. The SDT should rework the purpose and rationale behind those requirements.

Comment 1: The use of the term 'stability limit' in the proposed FAC-014-3 R4, R5.2 and R5.3 is ambiguous. In the definition of 'Reliable Operation' in the NERC glossary of terms, it lists:

"Operating the elements of the [Bulk-Power System] within equipment and electric system thermal, voltage, and stability limits… "

And from Final Report on the August 14, 2003 Blackout in the United States and Canada: Causes and Recommendations, page 8:

There are two types of stability limits: (1) Voltage stability limits… (2) Power (angle) stability limits…

Clearly there are multiple meanings of stability limits. CHPD requests the Standard Drafting Team to use additional language to clarify which 'stability limits' are meant here. The definition of Stability Limit, as a capitalized term in the NERC glossary of terms, unfortunately defines the Capitalized term 'Stability Limit' by the lowercase term 'stability limit', so of itself is not very useful as to identifying whether this is a thermal, voltage, or transient / dynamic type of phenomenon.

Comment 2: CHPD would recommend the following language to be used in the proposed FAC-014-3 R5.1. and 5.2 in place of, or in addition to the 'once every twelve calendar months' language. 'or within 30 calendar days (or a later date if specified by the requester)' to be consistent with the construct found in FAC-008-3 R8.2. Given the importance of SOLs (FAC-014-3 R5.1) and IROLs (FAC-014-3 R5.2), utilities may need ratings in a much more operationally appropriate timeframe than 12 calendar months.

Comment 3: In FAC-014-3 R5.5, the RC is required to provide SOLs for its RC area. However, the RC is not actually required to calculate SOLs (only IROLs). Therefore, any SOLs the RC has would be provided by the respective Transmission Operators in the RC area, as specified under FAC-014-3 R3. The Standards Drafting Team may consider revising R5.5. to have Transmission Operators provide SOLs to other Transmission Operators, rather than the RC providing these SOLs.

Comment 4: It would be useful to the PC for FAC-014-3 R5.2 to also include a sub-requirement for the RC to provide the PC with a description of the conditions where the IROL has been observed or was expected to be observed. For example, 'in Winter with heavy south to north transfers', etc. This way, the Planning Coordinator can better test its models to assess whether it can duplicate these conditions in the planning horizon.

Comment 5: The language in FAC-014-3 R6 'Each Reliability Coordinator that is impacted by an IROL…" is unclear by the meaning of 'that is impacted by an IROL'. It is thought that this probably could be removed from the requirement and the function of the requirement would be unaffected.

Comment 6: The requirement for the Transmission Operator to provide SOLs in R3 is likely duplicative to requirements in IRO-010-2, R1. This requirement (IRO-010-2 R1) gives the Reliability Coordinator the authority to request this data. We are already providing these to the RC under IRO-010-2 R3, which requires us to provide this data in accordance with IRO-010-2 R1.

Terri Pyle - OGE Energy - Oklahoma Gas and Electric Co. - 1

Answer	
Document Name	

Comment

OGE agrees with the proposed changes in FAC-014-3. However, we disagree with the current proposed definition of SOL Exceedance. As indicated by multiple entities during the SOL/SOL Exceedance comment period, an exceedance can only occur if it happens in Real-time and therefore the SOL Exceedance definition should not incorporate the concept of predicted exceedances. It is inappropriate to approve a NERC standard without a clear understanding of how the definitions will impact the standard. OGE remains concerned with unintended impacts of separating the standard and the proposed SOL & SOL Exceedance definitions.

Comment

Even though ReliabilityFirst agrees with the changes in the standard, ReliabilityFirst provides the following comments for consideration related to the Violation Severity Levels sections:

1. Violation Severity Levels

    i. Requirement 3 VSL

        a. The VSL for Requirement R3 is in disconnect with the language in Requirement R3. The VSL for Requirement R3 references "the periodicity at which the

        RC needs such information" and Requirement R3 simply talks about "in accordance to the Reliability Coordinator's SOL Methodology." Requirement R7 in FAC-011-1 only notes, "The method shall address the periodicity of SOL communication." ReliabilityFirst recommends structuring the VSLs as follows (this is an example of the "lower VSL"):

            1. The Transmission Operator provided its SOLs to its Reliability Coordinator, but was late by less than or equal to 10 calendar days.

    ii. Requirement R6 VSL

        a. The first part of the VSL for Requirement R6 ("The Reliability Coordinator with an established IROL, or the Reliability Coordinator impacted by a neighboring Reliability Coordinator IROL") does not match the language of Requirement R6. ReliabilityFirst recommends the beginning of the VSL state:

            1. Reliability Coordinator that is impacted by an IROL did not provide…

The IROLs and SOLs calculated in FAC-014-3 are computed per the RC's SOL Methodology required per R1 in FAC-011-4. The longest time horizon for computing these is an Operational Planning Analysis, which addresses next-day operations. The SDT has not explained why RCs must provide SOLs and IROLs to PCs (R5.1) and other information (see R5.2) and least once every 12 months. Remember, the longest time frame for this information is next-day operations. However, requiring RCs to communicate their SOL Methodology to PCs and TPs per R8.2 in FAC-011-4 has some reliability benefit in that it communicates an operator's tools to planners.

In FAC-014-3, R4 as worded, entities that establish stability limits in advance of real-time (as allowed) may not have a mechanism to respond with mitigation plans or active ‘tools’ to respond when the RC communicates a newly emerged limit in near real-time. SRP recommends requiring the RC to guide mitigation when stability limits are changed in near real-time.

11. FAC-015-1 is predicated on the principle that Facility Ratings, System steady-state voltage limits, and stability criteria used in Planning Assessments for the Near-Term Transmission Planning Horizon should be more conservative/restrictive/limiting than those found in (or established in accordance with) the RC's SOL Methodology, allowing for justified exceptions. Do you agree with this principle? If not, please explain.

Ginette Lacasse - Seattle City Light - 1,3,4,5,6 - WECC, Group Name Seattle City Light Ballot Body

Answer	No
Document Name	

Comment

Assuming that the question should say "equal to or more conservative" rather than just "more conservative" than the Facility Ratings used by the RC/TOP, we agree with the principle, but find the language too confusing and disagree with the implementation.

The phrase in R1 "If the Planning Coordinator uses less limiting Facility Ratings than the Facility Ratings established in accordance with its Reliability Coordinator's SOL Methodology…" is confusing since Facility Ratings are established by the TO in accordance with FAC-008, not by the RC or TOP in accordance with the SOL Methodology. If the intent is to ensure that, for example, the PC/TP does not plan to 15-minute emergency ratings if the TOP uses only 30-minute emergency ratings in operations, then it should make that more explicit. The requirements seem to imply that there could be more than one set of Facility Ratings for a given Facility (not true) and that Facility Ratings are established in accordance with the RC SOL Methodology (also not true).

In addition, all of the requirements in FAC-015 are related to what limits should be used in planning assessments, therefore the requirements should be included in the TPL standard. Having a separate standard defining the limits that should be used in TPL studies adds unnecessary complication.

Mike Smith - Manitoba Hydro - 1, Group Name Manitoba Hydro

Answer	No
Document Name	

Comment

In general, the Facility Ratings established by the Transmission Owner, system steady-state voltage limits and stability criteria should be the same as the RC for facilities located within the Planning Coordinator area with some minor exceptions. The RC's SOL methodology may be less conservative in some cases, for example contingency selection. The RC will be mainly focusing on single contingencies while the PC will focus on single and multiple contingencies. However, the RC's methodology may be less conservative in terms of transmission service (i.e. considers non-firm use). In that case the RC may identify a stability limit whereas the PC did not.

Duke Energy does not agree with the principle that Facility Ratings, System steady-state voltage limits, and stability criteria used in Planning Assessments for the Near-Term Transmission Planning Horizon should be more conservative than those found in the RC's SOL Methodology. With this language, the drafting team is implying that it is not appropriate for Planners to plan and Operators to operate from the same or equal ratings without justification. We believe that it can be appropriate for Planning and Operations to use the same/equal ratings, and should not require justification to do so. We recommend the drafting team consider modifying the existing language to reflect that the use of the same/equal rating can be appropriate and not require justification.

Day-to-day operations of the system may require a more conservative/restrictive/limiting Facility Ratings, System steady-state voltage limits, and stability criteria as the system can be operated beyond planning criteria (ex. beyond N-1/-1). Some operating margin is added into facility ratings, system steady state voltage limits, and stability criteria as System Operators are operating the system 24 hours for 365 days in a year which provides the Operators with unique operating challenges – various conditions (outages, generation commitment, contingencies that are beyond planning criteria) – that are beyond what's studied in TPL-001 Planning Assessment. System Operators may have, for example, pre-contingency low/high 'proxy' voltage limits for a particular substation as real time voltage collapse (knee of the curve) calculations are not performed for each operating state. System Operators also have at their disposal Dynamic Feeder Ratings which vary the capability of a feeder; which could be higher of lower than what's assumed in the TPL-001 Planning Assessment.

The definition of System Operating Limit states: "The value (such as MW, Mvar, amperes, frequency or volts) that satisfies the most limiting of the prescribed operating criteria for a specified system configuration to ensure operation within acceptable reliability criteria." FAC-015 would introduce operating criteria for multitude of operating system configurations into TPL-001 Planning Assessment.

Comment 1: Facility Ratings should be provided by the Transmission Owner and Generation Owner to both the Planning Coordinator and Reliability Coordinator. Facility Ratings are what they are – from our experience, the trouble comes in with assumptions about ambient conditions.

In CHPD’s experience, the greatest challenge between planning and operations is that we utilize dynamic ambient-temperature based ratings. In real-time, there is a very wide band of potential transmission line ratings based on the ambient temperature, just as there are a wide range of ambient temperature conditions throughout the day. Therefore, in real-time operations we use many ratings throughout the day.

In long term system planning and operations planning, it is clearly inappropriate to run all the studies through all ratings sets. Our practice is to use what we as a utility have felt is appropriate for the expected ambient conditions, in coordination with our neighbors.

Similarly, while it is recognized that there are differences between the planning and operational voltage criteria, CHPD has not experienced great difficulty in operating its system, even with the different planning and operational criteria.

CHPD feels that there isn't a need to create prescriptive requirements in order to accomplish this reliability objective. It is the Planning Coordinator's responsibility to adequately plan the system for growth, capacity, and integration of service in the Planning Horizon; it is the Reliability Coordinator's responsibility to plan and operate the system in the Operations Horizon. Given these different responsibilities, we feel it is not appropriate for one entity to determine another entity's criteria since each performs a different system function in a different system timeframe. **Comment 2:** The term 'System Operating Limit (SOL)' from FAC-014-2 has now been replaced with 'Facility Ratings' in FAC-015-1. While System Operating Limits (SOLs) are the result of *studies* assessing the performance of Facility ratings and performance criteria against expected system conditions and events, Facility Ratings are ***not*** the result of studies and assessments – they 'are what they are'. Furthermore, under FAC-008, the Transmission Owner and Generator Owner is already required (under FAC-008 R6-R8) to make its Facility Ratings available to the Reliability Coordinator and Planning Coordinator. Under FAC-015-1 R4, the Planning Coordinator is now being required to provide Facility Ratings. While this was in the spirit of what was previously in FAC-014-2 with 'SOL' replaced with 'Facility Ratings', this change is now requiring the Planning Coordinator to provide something that is the responsibility of the Transmission Owner under FAC-008 to provide. CHPD recommends removal of this requirement because its objective is carried in FAC-008.

FMPA agrees in principle, but as mentioned above, there should be a feedback loop. More information about how to coordinate the planning horizon events with the operations horizon events would be useful, and a table describing the various time horizons, contingencies, and allowable actions, such as Table 1 of TPL-001-4, may help add clarity.

ITC agrees with the general concept that more or at least as conservative SOL's should be utilized in the Planning Assessments as those considered in real time operations. The SDT should clarify how exceptions would be justified and who would have the authority to justify them. There will be instances where lower Facility Ratings will be identified in real time as Facility Ratings are continually reviewed by TO's. This will create situations when more limiting SOL's may be used in real time operations that those that were used in the latest or even current Planning Assessments. There will also be projects considered in future Planning models that may increase Facility Ratings or other SOL's. It should be made clear that this would be acceptable.

The standard should only specify the end objective and not the process to achieve that objective. Each system has a defined Planning Criteria that is published and readily available to the RC. This Criteria has defined voltage limits and stability criteria that have been identified that work with the Facility Ratings for that system. By utilizing an RC based methodology, you will be forced to go to either a least common denominator criteria or not be able to take in to account specific issues inherent in a system. Having to justify each exception for every rating change due to a project, rating correction, use of seasonal ratings in operations is not prudent for either the PC or the TP.

ITC does not believe FAC-015-1 is necessary to achieve the required outcome. Simple modifications to TPL-001-4 may allow for the same desired outcome.

We agree with the concept that system performance criteria used in the Planning Assessments should be more restrictive or at least line up with system performance criteria used in the Operating Horizon. But, system performance criteria used in the Operating Horizon cannot be more restrictive than those used in the Planning Horizon. The proposed standard, as written, allows the RC to establish criteria without consultation with the TP and the PC. In our opinion, this is a recipe for failure.

Furthermore, we see nothing in the NERC Functional Model that would allow the PC and RC to develop or establish system performance criteria as part of their defined roles, or to establish performance criteria that could be more restrictive than the criteria provided by the Transmission Owners and Transmission Planners. Standard TPL-001-4 dictates system performance requirements. PC and RC cannot arbitrarily decide to come up with new, more restrictive system performance criteria.

We are also concerned that requirements R1 through R3 allow for no input from the Transmission Planners regarding the development of any performance criteria established by the Planning Coordinator. Requirement R4 then requires the PC to simply hand-down its criteria to the Transmission Planner without any input as to whether the criteria are reasonable or whether meeting the criteria is feasible. At a minimum, requirements R1 through R3 need to recognize that the development of any PC based system performance criteria has to be a collaborative effort between the PC and the TPs and the Transmission Owners. Any tightening of performance criteria will likely require capital investment and we need to hear from the Planning Coordinators as to why the planned system needs to meet the new, more stringent reliability requirements.

Requirements R1 through R3 require the Planning Coordinator to provide a technical justification to the Reliability Coordinator for using less limiting ratings, voltage limits, or performance criteria. We can see that some equipment ratings can change from year to year, and perhaps the corrective action plans should also be provided for those parts of the system that have been or are planned to be upgraded. However, we disagree with the approach proposed by the SDT for the voltage limits and stability criteria, and instead believe that the drafting team needs to have the Reliability Coordinator provide a technical basis to the Planning Coordinator and the Transmission Planners regarding why more limiting ratings and performance criteria should be required in planning assessments. As any tightening of ratings and performance criteria will likely require capital investments, we need to hear from the Reliability Coordinators as to why the system as provided/planned needs to meet the new, more stringent reliability requirements.

Planning Assessments for the Near-Term Transmission Planning Horizon utilize base case models built meeting requirements in MOD-032. These base case models incorporate future additions and upgrade projects that may be put in place to resolve existing SOLs. Assessing the continuing need for Corrective Action Plans, as required by TPL-001, would address the need to study the existing SOLs, however, to properly evaluate other future projects, assumptions must be made that existing Corrective Action Plans will be implemented. This means, for example, that studies performed for year 5 should assume that Corrective Action Plans identified for Year 2 have already been implemented, which means an existing SOL may have already been upgraded when studying Year 5.

Comment

PNMR believes that allowing a justified exception will still result in a gap between planning and operations and considers this standard, as written, as an additional administrative burden on the PA. Instead of allowing for exceptions, PNMR suggests that the RC, TOP, and PA should jointly develop system performance criteria.

PNMR suggests that R1 be revised to provide clarity on what is less conservative/restrictive/limiting. Is it the intention of the SDT that the Planning Coordinator would have to provide a technical justification to the RC for using less limiting Facility ratings based on a Corrective Action Plan? For example, Facility A has a rating of 100 MVA. A previous Planning Assessment identified an overload of Facility A. To mitigate the overload the Corrective Action Plan is to increase the rating of Facility A to 200 MVA. TPL-001-4 R1.1.3 requires the Planning Coordinator to include this planned change to the existing Facility in the System model used for the Planning Assessment. Does this situation result in the Planning Coordinator using a less limiting Facility Rating than established in accordance with the RC's SOL Methodology? PNMR strongly believes that the Planning Coordinators should not have to provide technical justification to their RC for simply following the TPL-001 standard.

Comment

The proposed Standard places the onus on the PC to provide the criteria to be used by the Transmission Planner in completing Planning Assessments. In SPP, the SOLs have historically been defined as permanent and temporary flowgate ratings and operating guides. Based on that methodology, it is difficult, if not possible, for planners to identify all situations that potentially may cause an operating guide that would lower a rating; and, as such, the planner may not study each SOL in their Planning Assessment.

While we agree with the principle, BPA does not see a need for a new standard. The objective could be better accomplished by including the requirements to existing standards or modifying existing standards. Planning assessments modeling data including facility ratings are based on MOD-032-1 data requirement. If it is desired to coordinate modeling data with RC SOL methodology, RC SOL methodology should align with the MOD-032-1 requirement instead of drafting a new requirement.

Comment

- We agree with the principle, but we disagree with the implementation.
- We agree with the following comment from Seattle City Light:
    - *The phrase in R1 "If the Planning Coordinator uses less limiting Facility Ratings than the Facility Ratings established in accordance with its Reliability Coordinator's SOL Methodology…" is confusing since Facility Ratings are established by the TO in accordance with FAC-008, not by the RC or TOP in accordance with the SOL Methodology. If the intent is to ensure that, for example, the PC/TP does not plan to 15-minute emergency ratings if the TOP uses only 30-minute emergency ratings in operations, then it should make that more explicit. The requirements seem to imply that there could be more than one set of Facility Ratings for a given Facility (not true) and that Facility Ratings are established in accordance with the RC SOL Methodology (also not true).*
    - Proposed alternative language for R1: In planning assessments and operations, facility continuous ratings shall be used for the pre-contingency state and facility ____ hour/minute ratings shall be used for the post-contingency state.
    - As stated in the purpose section of FAC 008 a Facility Rating is essential for the determination of System Operating Limits. We disagree with the notion that Facility Ratings are SOLs. While Facility ratings are based on characteristics of the Facility in accordance with FAC 008, SOLs are system limits developed using steady state and stability simulations based on a defined set of performance criteria such as those defined in the currently effective FAC-010 and FAC-011 standards.
    - The required coordination between planning and operations can better be addressed by the regional reliability organization like WECC which has an open and established process for developing regional criteria. Reliability coordinators' SOL methodologies are developed without input from planning coordinators.
    - Given the objective is to ensure coordination between planning and operations, the RC must be assigned a responsibility in the standard. For example, if the standard entails comparing planning models with operations models, then the RC must have the responsibility to provide the operations models and the obligation to timely respond to questions the PC may have in the course of the comparison in order to resolve any discrepancy in facility ratings, etc.
    - Requirement R1 of TPL 001-4 requires the planning coordinator to use modelling data provided in accordance with MOD 10 and MOD 12 (which are now replaced with MOD 32). As such using modelling information such as facility ratings obtained from the reliability

coordinator's SOL methodology can be inconsistent with TPL 001-4.

- The ratings and limits used in planning do not have to be more conservative than those used in operations. Equally conservative ratings and limits can be sufficient. For example, a 0.9 p.u. low voltage limit can applicable in both planning and operations.
- CAISO PC proposes Requirements R1 to R5 be replaced with something like:
  - Planning Coordinators(PCs), Transmission Planners (TPs), Reliability Coordinators (RCs) and Transmission Operators (TOPs) within a Regional Reliability Organization (RRO) area shall collaborate in developing and implementing consistent applicable Facility Ratings duration criteria, System steady-state voltage limits, and stability criteria for use in planning assessments and operations.

Coordination for SOLs should be incorporated into base planning models required by MOD-032, the same as Facility Ratings are incorporated into these base models (as required by MOD-032). TPL-001 requirements would then stay the same, as these studies should be based upon models built as required by MOD-032. FAC-015 Requirement R1 may be more appropriately incorporated into the FAC-008 facility rating as part of the MLSE calculation for individual facilities. For groups of facilities, identification of a limiting flow-gate may be more appropriate. If this is not feasible, then the requirement should be incorporated into the modeling requirements of MOD-032.

We expect the FR and limits used in the TPL assessments to be very similar if not identical in most cases between the near-term and long-term horizons. Since most major transmission projects are identified in the long-term horizon and take several years to be completed, it would make no sense for the PC/TP to use less limiting criteria for the long-term horizon than the near-term horizon or the RC's SOL Methodology. We suggest removing the reference to Near-term horizon and simply referring to the Planning Assessment as in R4.

There will also be projects considered in future Planning models that may increase Facility Ratings or other SOL's. It should be made clear that this would be acceptable. *Per FAC-008-3, Facility Ratings are calculated by the TO and communicated to the TP and TOP (typically all within the same organization) and to the PC and RC. These ratings are used throughout both the Near-Term and Long-Term Planning Assessments unless a planned project causes them to change or a project that is under construction goes in service. Coordination occurs today and should be allowed to continue without strict dictates on exactly how each organization will perform their work. The standard should only specify the end objective and not the process to achieve that objective.*

We question what the value of R1-R3 is and if the requirements are even needed. R1-R3 are really dealing with TPL-001-4 and there shouldn't be three additional requirements in FAC-015-1 to deal with the uncommon occurrence of a PC using less limiting Facility Ratings, System steady-state voltage limits, or stability performance criteria. It certainly shouldn't require a technical justification, it should only require coordination

Comment

The TPL-001-4 study requires MOD data to be used in TPL-001-4 R1. This includes the rating of transformers and transmission lines. Voltage limits (including the stability performance of the voltage) is addressed in TPL-001-4 R6 and are the required criteria for the Planning Assessment. These requirements are applicable to both the Near-Term Transmission Planning Horizon and the Long-Term Planning Horizon. Specifying the time horizon in FAC-015-1 should not be done because it does not modify the time frame requirement found in TPL-001-4 for when these thermal and voltage limits should be used. CHPD feels this language should be removed from FAC-015-1 R1-R3.

The NSRF believes there is insufficient technical reason to exclude the Long-Term Transmission Planning Horizon from Requirements R1-R3. The use of different Facility Ratings, System steady state voltage limits, and stability performance criteria between the Near-Term and Long-Term Transmission Planning Horizons has the potential to be problematic. To ensure consistency with Reliability Standard TPL-001-4, which includes both the Near-Term and Long-Term Planning Horizons in the Planning Assessment, recommend the following change to R1-R3:

Each Planning Coordinator… used in its annual Planning Assessment are equally limiting…

We do not see any reason why the method used to establish Ratings/Limits would be different in the near-term and longer-term horizons. The time horizon necessary to fund, plan and construct facilities is much longer than 1 to 2 years. Unacceptable system performance needs to be identified five to ten years in the future to allow for building facilities to solve these issues. As for alternative language, we would just strike the words "of the Near-Term Transmission Planning Horizon" from the requirements.

We think that It is unnecessary and less worthwhile to include the Long-Term Planning Horizon (6 - 10 years in the future) because the future system assumptions (load, generation, transfers, etc.) are more uncertain and speculative than the Near-Term Planning Horizon. So, the results would be less useful and subject to change than the Near-Term Planning Horizon results.

We agreed with the SDT that Planning Assessments in scope for these requirements should be limited to the Near-Term Transmission Planning Horizon. PCs are already required to share their results with their RCs, per NERC Reliability Standards IRO-017-1. Sharing similar results from Planning Assessments that are analyzed over a longer time period may not readily benefit the RC looking to develop Operating Plans that alleviate SOL Exceedances.

With the exception of planned facility upgrades, we are unaware of why facility ratings, steady-state voltage limits, and stability performance criteria would be different in the Long-Term vs. Near-Term Planning Horizons and would need to be coordinated with the Reliability Coordinator. Therefore, for the Eastern Interconnection, limiting the coordination from the Near-Term Planning Horizon with the Operating Horizon to a discussion of changed facility ratings should be adequate to maintain reliability.

Once these facilities move into the Near-Term horizon, 5 years provides sufficient time to identify thermal constraints in the same manner as they would be seen operationally and develop appropriate Corrective Actions. The Near Term horizon is more than enough time to identify constraints and prepare any needed operational strategies for scenarios that may be candidates to be declared an IROL by the RC.

Limiting to the Near-Term assessment is fine. However, the Manitoba Hydro Planning Coordinator does not typically change the limits/criteria/ratings between the Near-Term and Long Term horizons. The exception would be Facility Ratings where a modification occurred (Corrective Action Plan installed) or possibly a facility rating methodology changed.

The Facility Ratings, voltage limits, and stability criteria (SOLs) should be limited to Near-Term Transmission Planning Horizon. The system conditions and uncertainty beyond Near-Term Transmission Planning Horizon are better suited for large capital projects which require extensive licensing. Unnecessary engineering and licensing may occur if more restrictive SOLs are required for Long Term Transmission Planning.

AZPS agrees that it should be limited to Planning Assessments of the Near-Term Transmission Planning Horizon and further recommends that it should be limited to only studies for years 1 to 2. The Near-Term transmission planning horizon covers years 1 to 5 and is much longer than the operating horizon. Requiring SOL methodology limitations to be used for years 1 – 5 of the Near-Term Planning Horizon could be problematic and is unnecessary.

While we agree with the principle since the near term planning horizon is more aligned with operations horizon, BPA does not see a need for a new standard. The objective could be better accomplished by including the requirements in existing standards or modifying existing standards. R1 is covered in MOD-032-1. R2 and R3 are already addressed in TPL-001-04.

13. In Requirements R1 – R3, the SDT is proposing to allow a PC to provide a technical justification to its RC for using less limiting Facility Ratings, System steady-state voltage limits, and stability performance criteria than those specified in its RC's SOL Methodology. Do you agree that this provides adequate flexibility (in the rare circumstances when less limiting Facility Ratings, System steady-state voltage limits, and stability performance criteria must be utilized; e.g., up-rating a line in a future project) without compromising reliability? If yes, please provide supporting rationale; if no, please explain and provide alternative language.

Ginette Lacasse - Seattle City Light - 1,3,4,5,6 - WECC, Group Name Seattle City Light Ballot Body

Answer	No

Comment

: It makes sense to require PC/TPs to use the same "type" of Facility Ratings and Voltage Limits as the RC/TOP (i.e. if the TOP is operating to 20-minute emergency ratings, the TP/PC shouldn't be planning to 60-minute emergency ratings). If that is the intent, then this requirement should be be included in the TPL-001 standard rather than in this separate FAC-015 standard. The language I would put in the TPL standard would look something like: "Each Transmission Planner and Planning Coordinator shall use the same or a more conservative category of Facility Rating (i.e. using the same emergency rating duration, or using only normal ratings) as used by the TOP/RC in operations."

The language of the proposed requirements implies that the RC will be the arbiter of which planned projects can be included in planning cases, which does not make sense. If the intent is make sure the RC is aware of these planned projects, the language should be changed (perhaps in a separate

requirement) to something like: "the PC/TP shall inform its associated RC of any planned projects that result in changes to Facility Ratings, System Voltage Limits or Stability Limits used in the planning horizon." If the drafting team sees a need to set the terms under which a project can be included in a TPL planning case, that should be included in the TPL-001 standard, not decided on a case-by-case basis by the RC.

In the case of Stability Criteria, TPL-001-4 and WECC-CRT-3.1 provide pretty explicit criteria for planning assessments. If these are not consistent with the RC requirements, that should be addressed within those standards. The TP/PC should not need to comply with two different sets of stability criteria.

Comment

R1: The Facility Ratings are coordinated through the MOD-032-1 model development process. Modeling differences from year to year are documented but not between each series of models. The RC is regularly updating Facility Ratings to perform operational and real time studies. The Planning Models are made annually with assumptions made on in-service dates. A particular RC model could easily be out-of-sync with a particular PC model on certain pieces of equipment, however there should be no reliability gap as a result. If the Facility Ratings used by the RC are different from the Year 1 planning model, perhaps the RC should provide a technical justification to the PC instead? This seems to be a lot of work for minimal if any reliability gain.

R2: The PC has documented steady state voltage criteria as required by TPL-001-4 R5. The Transmission Operator fundamentally sets the steady state voltage limits on each BES bus as per NERC NERC FAC-014-3 R2 and NERC FAC-011-4 R3.1. It makes more sense for the PC to coordinate with the

Transmission Operator(s) within the PC area to ensure that limits/criteria are coordinated and exceptions noted. This would be an easy task that it is already performed in Manitoba. The PC criteria is documented in the Transmission System Interconnection Requirements document (created to be compliant with FAC-001) and exceptions developed by the Transmission Operator are noted in a referenced Normal Operating Procedure.

R3: The PC has documented steady stability criteria as required by TPL-001-4 R4 and R5. The The Transmission Operator sets the stability criteria as per NERC FAC-014-3 R2 and NERC FAC-011-4 R4.1. It makes more sense for the PC to coordinate with the Transmission Operator(s) within the PC area to ensure that limits/criteria are coordinated and exceptions noted. This would be an easy task that it is already performed in Manitoba. The PC criteria is documented in the Transmission System Interconnection Requirements document (created to be compliant with FAC-001).

Manitoba Recommends removing R1 and having the coordination in R2 and R3 occur between the PC and relevant Transmission Operator(s) that are responsible for the PC area if needed. Alternatively, the criteria developed by the PC under TPL-001 could be shared with the Transmission Operator.

Suggest adding the phrase “at the same assumed ambient temperature(s)” after the term “Near-Term Transmission Horizon” in the first sentence of R1. The purpose is to make clear that the use of dynamic ratings based on ambient conditions in Operations for thermal ratings can be utilized and that the correlation of the Planning Coordinators Facility Ratings and the Facility Ratings associated with the Reliability Coordinator can be at a discrete small set of ambient temperatures.

Although the NSRF agrees there may be cases where this flexibility is necessary, there is no criterion to determine what acceptable technical justification is. Nor does the standard identify who it is that determines that the technical justification is acceptable. This leaves ambiguity in the proposed requirements. The requirements need to clearly spell out which entity is responsible for determining when it is appropriate for less limiting criteria to be used in planning evaluations. As it is the real-time operators who will have to operate the system as designed, we believe the RC should have the final say as to whether the justification is appropriate or not.

While CHPD appreciates the nod to flexibility by allowing the Planning Coordinator to use different criteria, with justification to the Reliability Coordinator, CHPD disagrees with the statement that this will be a rare circumstance. As stated above, CHPD feels a better tool would be for the Reliability Coordinator and Planning Coordinator to exchange methodologies and ratings assumptions / practices, and to have the ability to comment to each other with technical concerns. Alternative language for R1-R3 could be something to the effect:

R1. The Reliability Coordinator shall provide its methodology, performance criteria, and ratings assumptions to each Planning Coordinator in the Reliability Coordinator's area

1. Each Calendar Year
2. 90 days prior to a change

R2. The Planning Coordinator shall provide its methodology, performance criteria, and ratings assumptions to each Reliability Coordinator in the Planning Coordinator's area

1. Each Calendar Year
2. 90 days prior to a change

R3. If the (Planning Coordinator or Reliability Coordinator) receive technical comments in writing from the (Reliability Coordinator or Planning Coordinator), the (Planning Coordinator or Reliability Coordinator) shall respond to those comments within 30 days.

This would place too much burden on both the PC and TP. Per FAC-008-3, Facility Ratings are calculated by the TO and communicated to the TP and TOP (typically all within the same organization) and to the PC and RC. These same ratings are used throughout both the Near-Term and Long-Term Planning Assessments unless a planned project causes them to change or a project that is under construction goes in service. Coordination occurs today and should be allowed to continue without strict dictates on exactly how each organization will perform their work. The standard should only specify the end objective and not the process to achieve that objective.

Comment

With the exception of planned facility upgrades, we are unaware of why any technical justification would be required by the PC to the RC. Conversely to what is stated in the question, we do not believe that facility upgrades are rare circumstances and compromise reliability.

Furthermore, we see nothing in the NERC Functional Model that would allow the PC and RC to develop or establish system performance criteria as part of their defined roles, or to establish performance criteria that could be more restrictive than the criteria provided by the Transmission Owners and Transmission Planners. Standard TPL-001-4 dictates system performance requirements. PC and RC cannot arbitrarily decide to come up with new, more restrictive system performance criteria.

We are also concerned that requirements R1 through R3 allow for no input from the Transmission Planners regarding the development of any performance criteria established by the Planning Coordinator. Requirement R4 then requires the PC to simply hand-down its criteria to the Transmission Planner without any input as to whether the criteria are reasonable or whether meeting the criteria is feasible. At a minimum, requirements R1 through R3 need to recognize that the development of any PC based system performance criteria has to be a collaborative effort between the PC and the TPs and the Transmission Owners. Any tightening of performance criteria will likely require capital investment and we need to hear from the Planning Coordinators as to why the planned system needs to meet the new, more stringent reliability requirements.

Requirements R1 through R3 require the Planning Coordinator to provide a technical justification to the Reliability Coordinator for using less limiting ratings, voltage limits, or performance criteria. We can see that some equipment ratings can change from year to year, and perhaps the corrective action plans should also be provided for those parts of the system that have been or are planned to be upgraded. However, we disagree with the approach proposed by the SDT for the voltage limits and stability criteria, and instead believe that the drafting team needs to have the Reliability Coordinator provide a technical basis to the Planning Coordinator and the Transmission Planners regarding why more limiting ratings and performance criteria should be required in planning assessments. As any tightening of ratings and performance criteria will likely require capital investments, we need to hear from the Reliability Coordinators as to why the system as provided/planned needs to meet the new, more stringent reliability requirements.

- For the reasons noted in the response to Question 11, the ISO does not agree with the implementation of FAC-015. However, if it is implemented, we support allowing a PC to provide a technical justification to its RC for using less limiting Facility Ratings, System steady-state voltage limits, and stability performance criteria than those specified in its RC's SOL Methodology.
- We request the term "Facility Ratings" in the requirement and throughout the standard be replaced with something like "applicable Facility Ratings duration criteria".
- "In the case of Stability Criteria, TPL-001-4 and TPL-001-WECC-CRT-3.1 provide pretty explicit criteria for planning assessments. If these are not consistent with the RC requirements, that should be addressed within those standards. The TP/PC should not need to comply with two different sets of stability criteria."

In most situations, proposed R1-R3 provides adequate flexibility without compromising reliability; however, it raises a question: If the RC needs to lower an SOL below the Facility Rating in real-time due to clearance issues, how does the PC monitor SOLs to determine if an SOL has gone lower than the Facility Rating, necessitating technical justification?

In the event planned transmission system upgrades exist, the PC would often need to use less limiting Facility Ratings for those facilities. The SDT should consider including a firm exclusion of transmission system upgrades for FAC-015-1 R1 to avoid unnecessary documentation for a frequent and commonly understood justification. ERCOT suggests the following revision to achieve this purpose: Each Planning Coordinator, when developing its steady -state modeling data requirement to ensure that, ***for all Facilities other than those with planned transmission upgrades***, Facility Ratings used in its Planning Assessment of the Near -Term Horizon are equally limiting or more limiting than those established in accordance with its Reliability Coordinator's SOL Methodology. ****Please refer to the attached comment form for redlined language.

PCs are already required to provide the results of their Planning Assessments to impacted RCs, per NERC Reliability Standards IRO-017-1. The inclusion of technical justifications for using less limiting SOLs would then be included in addition to these results. We caution the SDT that the target audience of a RC's SOL Methodology are TOPs, not PCs. TOPs use this methodology to determine applicable owner -provid System Voltage Limits, and stability limits that can be used in operations. We feel this creates a process gap that should be addressed by requiring the RC to include, in its SOL Methodology, a method for PCs to determine applicable owner ltage Limits in their Planning Assessments.

Reclamation supports the use of less limiting Facility Ratings, System steady-state voltage limits, and stability performance criteria than those specified in the RC's SOL Methodology when appropriate.

Response	

Scott Downey - Peak Reliability - 1

Answer	Yes
Document Name	
Comment	

There may be circumstances where there is a technically justifiable reason for using less limiting Facility Ratings, System steady-state voltage limits, and stability criteria than those established in accordance with (or described in) the RC's SOL Methodology. However, if the RC does not agree with the technical justification provided by the PC, the RC should have the authority to refute the justification which would then require that the stipulations in the RC's SOL Methodology would prevail.

However, the SDT should include the Transmission Planner as an entity that can also provide lower facility ratings and limits as they are required under TPL to establish those limits for facilities in their purview.

Note: ERCOT does not support this response.

14. Do you agree that the information identified in Requirement R6 is necessary for each impacted RC and TOP to properly evaluate instability, Cascading, or uncontrolled separation identified in planning assessments for use in establishing stability limits and IROLs in the operations horizon? If not, please explain and provide alternative language.

Lauren Price - American Transmission Company, LLC - 1 - MRO,RF	
Answer	No
Document Name	
Comment	
We disagree that Near-Term Transmission Planning Horizon and Transfer Capability Assessments will necessarily be useful for establishing stability limits and IROLs in the operating horizon because the basis for planning horizon assessments [transmission planning system models (e.g. firm loads, firm transfers, and generation dispatch) and applicable contingencies] are quite different from the basis for operating horizon assessments. It also seems that the burden on the PCs to prepare the required information packages for potentially impacted RCs and TOPs will not be commensurate with the limited benefit that it may provide to RCs and TOPS. It would be more reasonable, clear cut, and pose less compliance risk to require PCs to simply provide their Near-Term Transmission Planning Horizon and Transfer Capability Assessments to the RCs and TOPS within and adjacent to their area. The RCs and TOPs would then decide from themselves whether any information in these documents may be interest or impact them.

FAC-15-1 Requirement R6 is a step in the right direction. However, FAC-15-1 should address that Planning Assessments and Operations studies for derivation of SOLs and IROLs are not of the same scope in terms of number of facilities considered out of service. Therefore simply enforcing that the performance criterion used in the Planning Assessment be more restrictive than that used in Operations does not materially improve the operability of planned facilities. The scope of the studies in the Operations Horizon should be increased to bridge this gap through Requirements in FAC-11-4 and FAC-14-3.

This would place too much additional compliance burden on the PC. If the RCs and TOPs believe that this information is important for them to obtain, a SAR should be opened to add this to the TPL-001 standard or at least the IRO-017 standard verses creating another new standard that requires the PC to provide additional information from the TPL standard to the RC and the TOP.

Because UFLS and UVLS relays are permitted to trip load beyond P2.1 contingencies in the Planning Assessment and will trip as needed to help stabilize the simulation, it is not possible for FAC-015-1 R6.4 to be achieved because the simulation will not reach the point of instability, Cascading, or uncontrolled separation with the relay action present in the simulation. In order to make this determination (whether there would have been instability, Cascading, or uncontrolled separation if they had not tripped), an entity would have to run a second set of simulations blocking all UFLS and UVLS relays from tripping. The system performance could then be assessed and the information in FAC-015-1 R6.4 related to UFLS and UVLS relays could then be provided. As these additional simulations would represent additional burden to the work performed under TPL-001-4, CHPD feels that the proposed FAC-015-1 R6.4 should have the items related to UVLS and UFLS removed from the criteria. If this is a reliability objective, it should be addressed under the TPL-001-4 standard.

The use of the term "instability, Cascading, or uncontrolled separation" as stated in R6 may not be clear to all that the purpose is for the Planning Coordinator to alert the RC to scenarios that have the potential to be categorized as IROLs in the Operations arena based on the RC's SOL methodology. Suggest rewording R6 to: "Each Planning Coordinator shall communicate scenarios that demonstrated IROL type conditions such as instability, Cascading, or…….." However, it should be made clear that the RC would make the determination if it would be considered an IROL based on the RC's SOL methodology

R6 is better located in TPL-001-4 or FAC-013-2. The current language states that "any" instability, Cascading or uncontrolled separation should be communicated. Does the RC need or want to know about extreme disturbances or only P1-P7 events? It makes more sense to share the Planning Assessment and Transfer Capability assessments to the RC as part of the relevant standards.

This requirement is already included in other planning standards, such as TPL-001-4 and IRO-017-1. The objective could be better accomplished by modifying or including specific details of the requirement in existing planning standards.

IRO-017-1 requires the TPs and PCs to provide the system assessment to their RC. Any identified instability would be included in the system assessment. The RC is in the best position to inform the TOP in the RC area. TPL-001-4 also requires the PCs and TPs to share the system assessment to adjacent TPs and PCs.

Scott Downey - Peak Reliability - 1

Answer	Yes
Document Name	

Comment

Peak is especially supportive of subpart 6.4 which requires communication of “Any Remedial Action Scheme action, undervoltage load shedding (UVLS) action, underfrequency load shedding (UFLS) action, interruption of Firm Transmission Service, or Non Consequential Load Loss required to address the instability, Cascading or uncontrolled separation;” This information is critical for the RC understanding the risks that have been identified and the measures that were taken in the Planning Assessments to address the risk. If this information is not provided, the RC has no way of knowing or understanding what kinds of risks for instability, Cascading, or uncontrolled separation that were identified and successfully mitigated via the measures listed in subpart 6.4. This unawareness can have significant adverse reliability consequences if the associated automatic schemes are rendered unavailable in operations. It is critical that the RC understand the risks that were identified and the means by which those risks were mitigated in the Planning Assessment so that these risks can be addressed in operations through the development of Operating Plans.

Cynthia Kneisl - Midwest Reliability Organization - 1,2,3,4,5,6 - MRO, Group Name MRO NSRF

Answer	Yes
Document Name	

Comment

In addition to the communication of information to impacted RCs and TOPs, the NSRF believes consideration should be given to including impacted Transmission Planners as well. Although the information is needed primarily by the RCs and TOPs, there is not currently a mechanism to communicate the information back to the impacted TPs for continued awareness. To ensure all parties remain aware of potential issues identified in the assessments, LES recommends the following change to R6:

R6. Each Planning Coordinator, **in coordination with each impacted Transmission Planner**, shall communicate any instability, Cascading or uncontrolled separation identified in either its Planning Assessment of the Near Transfer Capability Transmission Plann assessment to each impacted Reliability Coordinator and Transmission Operator.

As required by TPL 001-4, planning coordinators implement corrective action plans for any instability, Cascading, or uncontrolled separation identified in planning assessments due to planning events involving single or multiple contingencies. Providing this information to RC may be useful if the corrective action plan is establishing an SOL. On the other hand, providing this information to RC may not be useful if the corrective action plan is transmission development.

Development of SOLs and IROLs is the appropriate assessment for identifying any instability, Cascading, or uncontrolled separation in the planning horizon that is not mitigated by corrective action plans such as transmission development. TPL001-4 planning assessments require the PC to model peak load and firm transmission services but do not require stressing the system to identify its limits. Transfer Capability assessment is only applicable to tie lines.

As the Near-Term Transmission Planning Horizon is the closest to operating horizons, these are the most relevant results to pass on to those responsible for operating the system.

The assessments applicable to R6 should be reflective of those assessments required by the NERC Reliability Standards. Both Planning Assessments and Transfer Capability assessments are required by the standards. Furthermore, it is possible that when performing Transfer Capability assessments, the first limitation encountered could be a stability limit (i.e., as power is transferred across an interface, a stability limitation is reached before any thermal or steady-state voltage limitation is reached). Because this is an operational possibility, Peak believes that Transfer Capability assessments should be included in R6. Peak also believes Transfer Capability assessments should be included in R1 through R3.

Planning Assessment of the Near-Term Transmission Planning Horizon and the Transfer Capability assessment, as stipulated in Requirement R6, are the appropriate assessments for identifying any instability, Cascading, or uncontrolled separation in the planning horizon. However, due to BES system topology differences between the Planning Horizon (usually all facility in-service) and Operations Horizon (N-1 or N-1 out of service due to planned or forced) then instability, Cascading, or uncontrolled separation MAY NOT be identified in the Planning Assessment during the Near-Term Transmission Planning Horizon and the Transfer Capability assessment. In the Operations Horizon, the Operating Planning Analyses (OPA) could and may still identify instability, Cascading, or uncontrolled separation due to latest BES modeling to real-time. Also, the requirement for communicating Facility Rating appears to be redundant to the FAC-008 Reliability Standard.

We think that it is unnecessary and less worthwhile to include the Long-Term Planning Horizon (6 - 10 years in the future) because the future system assumptions (load, generation, transfers, etc.) are more uncertain and speculative than the Near-Term Planning Horizon. So, the results would be less useful and subject to change than the Near-Term Planning Horizon results.

ERCOT Comments:

Requirements R1, R2, and R3 contain similar language that generally requires the PC's Planning Assessments to use limits that are "equally limiting or more limiting" than the limits established pursuant to the RC's methodology. Each of these requirements also includes a second sentence that appears to allow the PC to use a less limiting value when the PC has a legitimate technical justification for doing so. This second sentence technically contradicts the first sentence. ERCOT proposes additional revisions to clarify that the second sentence operates as an exception to the first sentence.

Also, Requirements R1, R2, and R3 do not specify whether the technical justification provided by the PC must be acceptable to (or accepted by) the RC. In the event of a disagreement between the PC and RC, ERCOT suggests that the rule should be clear as to which entity's determination prevails. ERCOT presumes the RC's determination should prevail in such an event since the RC has ultimate responsibility for overseeing the SOL methodology under proposed FAC-011, Requirement R1. Allowing the PC what amounts to unilateral discretion in establishing limits would undermine the principle that the RC's SOL methodology should generally govern, as reflected in the first sentence of Requirements R1, R2, and R3 in FAC-015. ERCOT therefore recommends revisions to the last sentence of each of these three requirements.

The following revisions reflect both of the changes described above:

R1. Each Planning Coordinator, when developing its steady -state r
Ratings used in its Planning Assessment of the Near -Term Transmission Plar than those established
in accordance with its Reliability Coordinator's SOL Methodology, ***except that*** the Planning Coordinator ***may*** use less limiting Facility Ratings than the Facility Ratings established in accordance with its Reliability Coordinator's SOL methodology ***if***, the Planning Coordinator ***provides*** a technical justification ***that is accepted by*** its Reliability Coordinator.

R2. Each Planning Coordinator shall implement a process to ensure that System steady state voltage limits used in its Planning Assessment of the
Near -Term Transmission Plar ccordance with its
Reliability Coordinator's SOL Methodology, ***except that*** the Planning Coordinator ***may use*** less limiting System steady -sta
System Voltage Limits established in accordance with its Reliability Coordinator's SOL Methodology if the Planning Coordinator ***provides*** a technical justification t***hat is accepted by*** its Reliability Coordinator.

R3. Each Planning Coordinator shall implement a process to ensure the stability performance criteria used in its Planning Assessment of the
Near -Term Transmission Plannin specified in its Reliability
Coordinator's SOL Methodology, ***except that*** the Planning Coordinator ***may use*** less limiting stability performance criteria than the stability performance criteria specified in its Reliability Coordinator's SOL Methodology if the Planning Coordinator ***provides*** a technical justification t***hat is accepted by its*** Reliability Coordinator.

****Please refer to the attached comment form for redlined language.

Comment

National Grid supports the NPCC RSC Group comments.

Additional comments for consideration:

There is potential area of concern as to why the TP is not included in the PC's communication of any instability, Cascading or uncontrolled separation identified in either its Planning Assessment of the Near-Term Transmission Planning Horizon or its Transfer Capability assessment FAC-015-1, Requirement R6.

Due to lack of consistent definitions/terminology related to definitions of stability concepts regarding both transient stability and small signal-stability (as related to angle stability) as well as voltage stability, the requirement to implement a process related to the stability performance criteria in Requirement R3 (et.al.) is not clearly defined. We suggest revising by using language related to Requirement R4 and R5 in NERC Reliability Standard TPL-001-4, which states that each TP and PC shall have "criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System" and "criteria for acceptable System steady state voltage limits, post-Contingency voltage deviations, and the transient voltage response for its System."

This comment is regarding to R4 of FAC-015-1. R4 stated that "Each Planning Coordinator shall provide the Facility Ratings, System steady-state voltage limits, and stability performance criteria for use in its Planning Assessment to its Transmission Planners and to requesting Planning Coordinator's". Entities understand that there will need to be two-ways communication between Planning Coordinator (PC) and Transmission Planner (TP). With that said, TPs are much closer to the source of 'Facility Ratings and System steady-state voltage limits'. It would make better sense for TP to provide 'Facility Ratings and System steady-state voltage limits' to PC and consistent to the current practice of TOPs providing 'Facility Ratings and System steady-state voltage limits' to the RC. The R4 as proposed is as having the RC providing 'Facility Ratings and System steady-state voltage limits' to TOPs. As proposed R4, the PC will need to request the 'Facility Ratings and System steady-state voltage limits' from the TP and/or TPs and then the PC will just provide back to the TP/TPs. As drafted, R4 is an effort that involved extra man power and time with no benefit.

FAC-15-1 is a step in the right direction. However, FAC-15-1 should address that Planning Assessments and Operations studies for derivation of SOLs and IROLs are not of the same scope in terms of number of facilities considered out of service. Therefore simply enforcing the performance criterion used in the Planning Assessment be more restrictive than that used in Operations does not materially improve the operability of planned facilities. The scope of the studies in the Operations Horizon should be increased to bridge this gap through Requirements in FAC-11-4 and FAC-14-3.

Comment	

PNMR seeks clarification on the use of single contingency criteria. FAC-011-4 defines a single contingency as a TPL-001 P1 event. In TPL-001 categories P1 and P2 are labeled single contingency. If the RC defines criteria for single and multiple contingency based on FAC-011-4, will the criteria for the single contingency be used for both P1 and P2 events of TPL-001 even though the contingency definition of P2 does not match the single contingency definition in FAC-011-4?

PNMR believes that FAC-015 has requirements that should be part of the TPL-001 Planning Assessment. Instead of creating a separate standard, PNMR recommends that TPL-001 should be revised to include the new requirements.

The work identified in FAC-015 would be better positioned in the TPL-001 standard. A SAR should be drafted to open the TPL-001 standard to include those required items from this proposed new standard rather than creating a new standard. Coordination of criteria could then be determined between the TP and PC as identified in the TPL-001 standard R7 rather than by this new standard by parties familiar with the information in the local regions.

More clarification is needed related to the identification of Facility Ratings. As the Transmission Owners are already obligated to provide planning and operating ratings under FAC-008-3 and MOD-032-1, the burden of establishing a technical justification for potentially different ratings used in planning and operations should be placed upon Functional Entities who own facilities (such as Transmission or Generation). The drafting team should clarify that asset owners typically provide multiple ratings for a given asset based on various conditions and the intent of this standard is to ensure how the RC and PC pick those ratings is consistent.

Note: ERCOT does not support this response.

It appears that one of the objectives here is for the Planning Coordinator to make the Reliability Coordinator aware of system issues identified in the Planning Assessments that could impact the Operations timeframe. CHPD recommends that the TPL-001-4 standard, R8, be modified to add the Reliability Coordinator to the distribution of the Planning Assessment by the Planning Coordinator and Transmission Planner to adjacent Planning Coordinators and Transmission Planners. TPL-001-4 R8 allows the Reliability Coordinator to request this document already, but it would make sense to add the Reliability Coordinator (and possibly Transmission Operator) to the mandatory Planning Assessment distribution in order to pass on the issues observed in the assessment of planned operations for the planning horizon.

It seems to us that proposed standard FAC-015 is missing a requirement (R7) for the Transmission Planners to communicate any instability, Cascading, or uncontrolled separation in either its Planning Assessment information to its TOP, PC, and RC (similar to R6). This requirement would be a slight expansion of IRO-017-1 R3 and consideration should be given to moving this requirement to the new FAC-015-1 standard to keep all TP applicable items together.

Anthony Jablonski - ReliabilityFirst - 10

Answer	
Document Name	

Comment

Even though ReliabilityFirst agrees with the changes in the standard, ReliabilityFirst provides the following comments for consideration related to the Violation Severity Levels sections:

1. Violation Severity Levels
   i. Requirement R4 VSL
      a. The second part of the High and Severe VSL is confusing as it references “information” while Requirement R4 references “criteria”. ReliabilityFirst recommends the following for consideration:
         1. The Planning Coordinator failed to provide one element of the required criteria (i.e., Facility Ratings, System steady -st Coordinator’s.
      b. The language of the first part of the High and Severe VSL are completely the same. Since there is no reference in any of the VLSs related to providing criteria to the requesting Planning Coordinators, ReliabilityFirst believes the first part of the Severe VSL should state “… to its requesting Planning Coordinators” instead of “… to all of its Transmission Planners.”

Comment	
Peak believes that the Transmission Planner should be included along with the Planning Coordinator for communicating any instability, Cascading, or uncontrolled separation in FAC-015-1 requirement R6. Both Planning Coordinators and Transmission Planners perform Planning Assessments for the Near-Term Transmission Planning Horizon, therefore, it is possible that either entity could identify instability, Cascading, or uncontrolled separation in their Planning Assessments. The revised language could read, “Each Planning Coordinator and Transmission Planner shall communicate any instability, Cascading or uncontrolled separation identified in either its Planning Assessment of the Near Term Transmission Planning Horizon or its Transfer Capability assessment to each impacted Reliability Coordinator and Transmission Operator. Transmission Planners are not required to perform Transfer Capability Assessments, so any revised language might need to account for that.

Comment

The stated purpose of FAC-015-1 is:

"To ensure the Facility Ratings, System steady-state voltage limits, and stability [performance] criteria used in Planning Assessments are coordinated with the Reliability Coordinator's System Operating Limits (SOL) Methodology."

LSPT does not disagree with this purpose. It requires two-way communications between the RC and its TOPs and the PC and its TPs. However, LSPT proposes a more efficient way to meet this purpose.

Alternate FAC-015-000 Proposal

There are 15 Reliability Coordinators (per the NERC Compliance Registry) in the NERC footprint and they are listed below. Except for VACAR South and Peak Reliability, the rest are also registered as Planning Coordinators. In total, NERC has 78 Planning Coordinators are registered.

Reliability Coordinators in NERC (as of 9/29/2017)

1. Midcontinent Independent System Operator, Inc.
2. Saskatchewan Power Corporation
3. Southwest Power Pool
4. Hydro-Quebec TransEnergie
5. ISO-NE
6. New Brunswick Power Corporation
7. New York Independent System Operator
8. Ontario IESO
9. PJM Interconnection, LLC
10. Florida Reliability Coordinating Council, Inc.
11. Southern Company Services, Inc. - Trans
12. Tennessee Valley Authority
13. VACAR South
14. Electric Reliability Council of Texas, Inc.
15. Peak Reliability

As an alternative to the present FAC-015-1, LSPT suggests requiring each Reliability Coordinator to facilitate collaborative discussions with its Transmission Operators that use its SOL Methodology and with the Planning Coordinators and Transmission Planners in its Reliability Coordinator Area. Those discussions would be bounded by stated purpose of the proposed FAC-015-1 standard. The results of such discussions would be documented to identify any reliability-related gaps between operations and planning and vice versa regarding the purpose of the standard. For any identified gaps, the RC would be required to develop and implement a Corrective Action Plan. Progress on CAPs would be required to be collectively reviewed periodically (LSPT suggests this be no more than annually).

This is a far more efficient approach to address the standard’s purpose.

Comments on FAC-015-1 as proposed

LSPT is pleased that the retirement of FAC-010-3 eliminated the unnecessary requirement for PCs to develop an SOL Methodology and use that methodology to develop SOLs and IROLs for the planning horizon. Although FAC-015-1 carried over language from the proposed retired FAC-010-3 and proposed revised FAC-014-2, LSPT does not agree with the requirements that FAC-015-1 would impose upon PCs and their associated TPs.

Per R1 through R5 in FAC-015-1, the Planning Assessment in R6 must either use the Facility Ratings, System steady -s performance criteria from the RC’s SOL Methodology *or* provide a technical justification to the RC if the PC’s values differ from the RC’s values. The RC is not subject to the standard, and as written, no method is proposed to resolve technical differences between the RC and PC.

There are many good reasons for differences between a Planning Assessment and an Operational Planning Assessment. For example, some RC’s use a defined set of Normal and Emergency Facility Ratings based upon various ambient temperatures, including daytime and nighttime rating reflecting solar impacts. These ratings cover conditions that will be experienced by operators. Planner’s typically use some of the RC’s ratings as its ‘seasonal ratings’ that, when combined with the temperature impacts of load, stress the System. Each is correct in its application.

The end product in R6 is a Planning Assessment in the Near-Term Planning Horizon along with Corrective Action Plans for any deficiencies. This is well beyond FAC-015-1’s stated purpose. In addition, it is largely duplicative or in TPL-001-4 requirements (see R2.7 in TPL-001-4), except that the implementation of TPL-001-4 would use planning and not operating assumptions.

- The R6 phrase “or its Transfer Capability assessment” would not be produced in TPL-001-4. The SDT did not provide any rationale for this language.

- FAC-015-1 does not state whether the PC and TP are required to use the SOL Methodology’s Contingency List or its planning Contingency list per TPL-001-4.

In summary, FAC-015-1 places significant requirements on PCs and their TPs, and these requirements are not required to meet the standard’s purpose. The main rationale for the FAC-015-1 requirements appears to be that they came from standards being retired (FAC-010-3) or revised (FAC-014-2). The SDT should justify the requirements on their own merits independent of previous standards.

R4 – would prefer to see something about requesting Planning Coordinators with a reliability need instead of any Planning Coordinator that requests.

R6 – could consider including what is provided to impacted RCs in the IRO-017 or TPL-001 standard. This seems to have requirements for the

Planning Assessment scattered over 3 standards.

R6 – would have preferred use of the term “IROL like conditions” instead of words copied from the IROL definition.

One area of coordination that is missing is having the PC review stability limits or IROLs determined by the Transmission Operator and/or Reliability Coordinator, especially in cases where the limit was not determined by the PC – possibly because the PC only considered firm uses as per TPL-001-4 R1.1.5 or Transfer Capability assessment methodology (FAC-013-2 R1) did not stress the same area as the operating assessments. The PC may want to consider the identified stability limit for future confirmation in a Planning Assessment or Transfer Capability Assessment. The criteria for the selection of transfers to be assessed (FAC-013-2 R1.1) could be based on review of information provided to the PC from the RC/Transmission Operator. It is preferable to modify FAC-013-2 to address this issue rather than include in FAC-015.

Note: While we agree with the retirement of FAC-010, and revisions to FAC-011 and 014 we will be voting “No” because of our concerns with FAC-015. These changes to FAC-010, FAC-011, FAC-014 and FAC-015 form an integrated whole, so approving the changes to some standards and not others could create a reliability gap.

Comment	
The NSRF remains concerned with the proposed definition of “System Voltage Limit” as the phrase “reliable system operations” was replaced with “acceptable System performance.” Acceptable System performance should rely on, among other factors, the definition of SOL Exceedance which is in a separate ballot and ballot period. It is inappropriate to approve a NERC standard without a clear understanding of how the definitions will impact the standard. The NSRF remains concerned with unintended impacts of separating the standard and the proposed SOL definition. The NSRF also has this concern with the following question.

Thank you for the opportunity to comment on this new standard. However, BPA does not see the need to create new planning standards to accomplish the goals. Most of the requirements are either partially or fully included in other planning standards. The objectives could be better accomplished by adding or modifying existing planning standards.

Comment	
Within the definition itself, is the word “limits” the best choice for supposedly indicating that it is a numerical value? Instead, might this be more appropriate? “*The maximum and minimum steady-state *voltage* ~~limits~~ (both normal and emergency) that provide for acceptable System performance.*”

BPA recommends including separate definitions for minimum steady -state voltage and maximum -state Minimum steady voltage limits ensure acceptable power system performance while maximum steady -state voltage limits ensure ratings are not exceeded. The approaches for determining and responding to exceedances are different for each type of voltage limit (minimum and maximum). BPA therefore proposes the following revisions to the definition of System Voltage Limit: “The minimum steady -state voltage (both pre-Contingency and post-Contingency) that provide for acceptable System performance. The maximum steady -state voltages based ... performance.”

As currently written, the words maximum and minimum introduce confusion as they seem to imply only one upper limit and one lower limit required by the definition. To improve clarity, LES recommends the following change: The steady-state voltage limits, **including both normal and emergency with applicable allowable timeframes**, that provide for acceptable System performance.

Michael Cruz-Montes - CenterPoint Energy Houston Electric, LLC - 1 - Texas RE	
Answer	No
Document Name	
Comment	
CenterPoint Energy generally agrees with the proposed definition; however, we believe that the phrase, “acceptable System performance” could be subjective. System Voltage Limits should always respect, both in normal and emergency conditions, SOLs and IROLs, both of which are defined and measurable. CenterPoint suggests the following definition of System Voltage Limit for the SDT to consider: “The maximum and minimum steady -state voltage limits (both nor of the BES.” As a point of reference, the NERC glossary defines Reliable Operation as: “Operating the elements of the [Bulk-Power System] within equipment and electric system thermal, voltage, and stability limits so that instability, uncontrolled separation, or cascading failures of such system will not occur as a	

result of a sudden disturbance, including a cybersecurity incident, or unanticipated failure of system elements.”

Typically there are additional Thermal ratings above the "normal" limit that have a time frame associated with them. For example an emergency limit may be a 15 minute rating, i.e. the flow can be at the emergency rating for 15 minutes. Therefore, by design, being above the normal rating is not going to result in damage to the BES elements. Therefore the 1st bullet in the SOL Exceedance definition should be revised to "Actual flow through a Facility is above the Facility’s Rating and the associated allowable time frame is exceeded.

Comment	
The existing constructs (Facility Ratings, voltage performance criteria, voltage stability/reactive margin) should be adequate to address high voltage conditions (typically through Facility Ratings) and low voltage (typically through voltage performance criteria and voltage stability/reactive margin). CHPD feels that introducing another voltage-limit term will only serve to confuse the meanings of these other terms. Additionally, CHPD feels it would have a greater reliability for NERC to develop a system voltage whitepaper to discuss various voltage Facility Ratings methods and the reliability concerns that should be addressed with low and high voltage performance criteria, as well as revisiting transient and reactive margin concepts. A whitepaper would help clarify expectations, bring useful dialogue and improve industry knowledge in this area, whereas a third defined term describing voltage will not likely bring the desired clarity. CHPD does not recommend the creation of the term ‘System Voltage Limit’.

Comment	
This is a significant paradigm shift for industry, affecting personnel from both operations and planning on how SOLs are handled and used within assessments. Time is needed to coordinate activities, particularly between RCs and PCs on how information is dispersed to TOPs and TPs, respectively. Additional time will also be needed for training that will include a larger audience than just operating personnel identified for Reliability Standard PER-005-2. Moreover, depending on the significance of a compliance burden introduced by these standards, registered entities will need time to procure additional staff and resources for their established compliance programs. We believe an implementation period no less than 24 months is appropriate.

The 12 month implementation plan is only sufficient to put in place the required processes necessary to facilitate the requirements as stated in the new and revised standards. In order to then allow for a cycle of the TPL-001 standard to also be accommodated to facilitate this new SOL process another	

12 months would need to be added into the implementation plan to allow for this work specifically.

The new term System Voltage Limit and requirements in FAC-011-4 R3 will require methodology development and coordination between the RC and TOPs to address common limits as well as coordination. Once complete, the studies will need to be performed based on these new concepts, which may take more than 12 months. Also, the language in FAC-011-4 R2 is a change which will result in the need to address common limits as well as coordination.

19. The SDT asserts the combination of proposed FAC-011-4, FAC-014-3, and FAC-015-1 provide entities with flexibility to meet the reliability objectives in the project Standards Authorization Request (SAR) in a cost effective manner. Do you agree? If you do not agree, or if you agree but have suggestions for improvement to enable additional cost effective approaches to meet the reliability objectives, please provide your recommendation and, if appropriate, technical justification.

Comment	
Reclamation has concerns with possible misinterpretation of FAC-011-4 R4.2 and R5 as it implies Real-Time Assessments will include Stability. Reclamation also does not agree with the identified single Contingency and multiple Contingencies for use in determining stability limits because the TOP will inform the RC which Contingencies are credible.

As proposed, we perceive this Standard as requiring additional resources for stability studies and compliance documentation such that it will add cost to our business. Furthermore, the proposed Standard will not change the way we increase reliability or operate the system.

Changes proposed to FAC-011-4 and FAC-014-3 as well as the retirement of FAC-010-3 are reasonable. The development of FAC-015 seems to be burdensome, especially the Facility Rating comparison exercise. Some of the proposed changes fit better into existing standards TPL-001 and FAC-013.

Only consistency in requirements and criteria would help to increase "cost effectiveness" in our environment where legal/regulatory approval processes

impede the effort in maintaining system reliability.

The method that the set of standards has been put together forces everyone into a defined process rather than defining the objective of the standard and allowing every group to identify their own cost effective method of accomplishing the objective. The organization of the requirements especially with those found in FAC-015 should have been incorporated in other already existing standards (TPL-001 or IRO-017). This new proposed standard is not cost effective and sets up organizations for compliance risks due to developing a third standard with obligations tied to the TPL-001 standard that should have just been added to this standard.

We do not see any flexibility to meet the objectives. For standard FAC-015-1, we have offered alternative ideas that the PC and RC should be providing technical justification for developing more stringent system performance requirements than the system is presently planned. We believe that if the draft language remains unchanged, depending on the imposed requirement by the PC or RC, significant dollars may need to be expended to meet the new, more stringent requirements.

Comment	

PNMR believes that the proposed FAC-011 and FAC-015 allow one entity, the RC, to change long standing system performance criteria used by entities for the operation and planning of the system which could result in the need to implement numerous system changes to meet the RC's criteria.

Lauren Price - American Transmission Company, LLC - 1 - MRO,RF

Answer	No
Document Name	
Comment	

ATC is concerned with the application of the RC SOL methodology to the TOP through FAC-014-3 with respect to the requirements regarding stability limits and stability analysis in FAC-011-4 R4 and R5. The current proposal may require a significant increase in stability analyses, whether in OPAs and RTAs, that are not warranted in a local TOPs system but is mandated because a TOP must follow an RC's one-size-fits-all metholodgy.

Brian Van Gheem - ACES Power Marketing - 6 - NA - Not Applicable, Group Name ACES Standards Collaborators

Answer	No
Document Name	
Comment	

1. The proposed standards require direct communication between the RC and the impacted entities that would be documented through electronic communications or voice recordings. This approach is cumbersome and inefficient. We believe the standards should instead allow entities to use more automated mechanisms for exchanging SOL information.
2. We thank you for this opportunity to provide these comments.

Comment	
FMPA believes the overall approach can be a cost effective manner to meet the reliability objectives, provided that the scope of activities for each involved functional entity is made abundantly clear so that unnecessary or duplicative work is not required. We believe additional changes, as suggested above, are needed to reach that point.

Some of the proposed requirements, (for examples: Requirement R3, Parts 3.1 in FAC-011-4), could result in unnecessary cost for the responsible entities without any reliability benefits. We urge the SDT to consider adopting our proposed wording changes to achieve a more cost-effective approach to meeting the reliability objectives.

There were 56 sets of responses, including comments from approximately 166 different people from approximately 106 companies representing 10 of the Industry Segments as shown in the table on the following pages.

All comments submitted can be reviewed in their original format on the project page.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process. If you feel there has been an error or omission, you can contact the Senior Director of Engineering and Standards, Howard Gugel (via email) or at (404) 446-9693.

Questions

1. The SDT is recommending retirement of FAC-010-3 and has provided justification in the “FAC-010/FAC-015 Rationale” and “FAC-010-3 Mapping Document.” Do you agree that the proposed retirement of FAC-010-3 does not create a reliability gap? Please provide supporting rationale.

2. Given the background discussion and the justification provided in the mapping document for FAC-011-3, Requirement R2, R2.1 and R2.2, do you agree that BES performance is adequately covered and that no reliability gaps are introduced from the removal of those concepts in a revised FAC-011-4? If not, please explain specifically what aspects of the removal you disagree with and propose alternative language.

3. Given the background discussion and the justification provided in the mapping document for FAC-011-3, Requirement R2, R2.3 and R2.4, do you agree that BES performance is adequately covered and that no reliability gaps are introduced from the removal of those concepts in a revised FAC-011-4? If not, please explain specifically what aspects of the removal you disagree with and propose alternative language.

4. Are there any reliability objectives of FAC-011-3, Requirement R2, R2.3 and R2.4 that you maintain need to be preserved in requirements relating to the development of Operating Plans which would reside outside the FAC family of standards? Please explain your response.

5. Do you agree that the SDT should allow the use of UVLS in the establishment of stability limits? If not, please explain and provide alternative language.

6. If you have any other comments that you haven’t already provided in response to questions 2-5, please provide them here.

7. The SDT is proposing to divide existing Requirement R1 of FAC-014-2 into three requirements in FAC-014-3 to clearly indicate which entities have the responsibility for establishing Interconnection Reliability Operating Limits (IROLs) [the RC], System Operating Limits

(SOLs) [the TOP] and stability limits that impact more than one TOP in its Reliability Coordinator Area [the RC] into proposed Requirements R1, R2, and R4, respectively. Do you agree with the proposed changes? If not, please explain.

8. Existing FAC-014-2, Requirement R5, R5.2 requires the Transmission Operator (TOP) to provide its SOLs to its Reliability Coordinator (RC) and Transmission Service Providers (TSPs) that share its portion of the RC Area. The SDT is proposing in Requirement R3 of FAC-014-3 to exclude the TSPs from that communication chain. Other requirements in existing standards (MOD-028-2, Requirement R7, MOD-029-2a, Requirement R4, and MOD-030-3, Requirement R2.6) require the TOP to provide the Total Transfer Capabilities (TTCs), Total Flowgate Capabilities (TFCs), along with supporting information and assumptions to TSPs. Because the TTCs and TFCs already reflect the impact(s) of any SOLs, the SDT deemed retention of the existing language unnecessary. Do you agree with the proposed change? If not, please explain.

9. The SDT relocated the reliability objectives of existing Requirement R6 of FAC-014-2 into Requirement R6 of proposed Reliability Standard FAC-015-1 such that all Planning Coordinator and Transmission Planner responsibilities will be housed within one standard. Do you agree with the proposed change? If not, please explain.

10. If you have any other comments that you haven’t already provided in response to questions 7-9, please provide them here.

11. FAC-015-1 is predicated on the principle that Facility Ratings, System steady-state voltage limits, and stability criteria used in Planning Assessments for the Near-Term Transmission Planning Horizon should be more conservative/restrictive/limiting than those found in (or established in accordance with) the RC’s SOL Methodology, allowing for justified exceptions. Do you agree with this principle? If not, please explain.

12. Do you agree that coordination of Facility Ratings, System steady state voltage limits, and stability performance criteria as required in Requirements R1-R3 should be limited to Planning Assessments of the Near-Term Transmission Planning Horizon? If yes, please provide supporting rationale; if no, please explain and provide alternative language.

13. In Requirements R1 – R3, the SDT is proposing to allow a PC to provide a technical justification to its RC for using less limiting Facility Ratings, System steady-state voltage limits, and stability performance criteria than those specified in its RC's SOL Methodology. Do you agree that this provides adequate flexibility (in the rare circumstances when less limiting Facility Ratings, System steady-state voltage limits, and stability performance criteria must be utilized; e.g., up-rating a line in a future project) without compromising reliability? If yes, please provide supporting rationale; if no, please explain and provide alternative language.

14. Do you agree that the information identified in Requirement R6 is necessary for each impacted RC and TOP to properly evaluate instability, Cascading, or uncontrolled separation identified in planning assessments for use in establishing stability limits and IROLs in the operations horizon? If not, please explain and provide alternative language.

15. Do you agree that the Planning Assessment of the Near-Term Transmission Planning Horizon and the Transfer Capability assessment, as stipulated in Requirement R6, are the appropriate assessments for identifying any instability, Cascading, or uncontrolled separation in the planning horizon? If yes, please provide supporting rationale; if no, please explain and provide alternative language.

16. If you have any other comments that you haven't already provided in response to questions 11-15, please provide them here.

17. Do you agree with the proposed definition of System Voltage Limit? If not, please explain and provide alternative language.

18. Do you agree with the Implementation Plan? If not, please provide the basis for your disagreement and an alternate proposal.

19. The SDT asserts the combination of proposed FAC-011-4, FAC-014-3, and FAC-015-1 provide entities with flexibility to meet the reliability objectives in the project Standards Authorization Request (SAR) in a cost effective manner. Do you agree? If you do not agree, or if you agree but have suggestions for improvement to enable additional cost effective approaches to meet the reliability objectives, please provide your recommendation and, if appropriate, technical justification.

The Industry Segments are:

1 — Transmission Owners

2 — RTOs, ISOs

3 — Load-serving Entities

4 — Transmission-dependent Utilities

5 — Electric Generators

6 — Electricity Brokers, Aggregators, and Marketers

7 — Large Electricity End Users

8 — Small Electricity End Users

9 — Federal, State, Provincial Regulatory or other Government Entities

10 — Regional Reliability Organizations, Regional Entities

1. The SDT is recommending retirement of FAC-010-3 and has provided justification in the "FAC-010/FAC-015 Rationale" and "FAC-010-3 Mapping Document." Do you agree that the proposed retirement of FAC-010-3 does not create a reliability gap? Please provide supporting rationale.

Richard Vine - California ISO - 2	
Answer	No
Document Name	
Comment	
FAC-010-3 contains regional differences (e.g. common corridor 500 kV outages, no cascading for loss of two PV units) that the California ISO plans the WECC system to that provide for a more resilient system. With the exception of this Question and Question 15, the California ISO supports the comments of the ISO/RTO Council Standards Review Committee. However, the California ISO has provided numerous additional comments in the sections below related to the new proposed FAC-015-1 standard.	
Likes 0	
Dislikes 0	
Response	
The Contingencies and performance criteria contained in the Regional Differences section (E) are consistent with and can be addressed through studies that support TPL-001 compliance. This supports the SDT's contention that FAC-010 is redundant with not as comprehensive as TPL-001.	
Robert Blackney - Edison Electric Institute - 1,3,5,6 - WECC	
Answer	Yes

Document Name	
Comment	
SCE agrees with the drafting team that the new TPL-001-4 ensures the reliable planning of the transmission system and addresses each of the reliability components of FAC-010-3. The mapping document adequately and exhaustively demonstrates where the components of FAC-010 are addressed in other standards or are no longer relevant under the new SOL/IROL construct.

Comment
Yes, I agree that it is unnecessary to have a planning SOL methodology. The TPL requirements along with changes to FAC-011, FAC-014 and the new requirements discussed in the FAC-015 (which I think should be covered in the TPL standard, but my comments on that are covered in the FAC-015 section) adequately define what ratings/limits should be used to plan the system. **Note:** While we agree with the retirement of FAC-010, we will be voting "No" because of our problems with FAC-015. These changes to FAC-010, FAC-011, FAC-014 and FAC-015 form an integrated whole, so approving the changes to some standards and not others could create a reliability gap.

Scott Downey - Peak Reliability - 1	
Answer	Yes
Document Name	
Comment	
Peak agrees that the retirement of FAC-010 does not create a reliability gap. The SDT did a thorough job in their assessment of FAC-010 in the mapping document. As is pointed out in the supporting documentation, there is an abundance of redundancies between FAC-010 (and the associated requirements in FAC-014) and TPL-001-4. Peak supports the retirement of FAC-010 and the addition of FAC-015 as described in the supporting documentation.

System Operating Limits in the planning horizon in the Eastern Interconnection are generally the applicable steady-state ratings of the facilities, which are included in the powerflow models and are tested in a wide range of contingency analyses as required by standard TPL-001-4. Voltage limits are generally published in transmission planning criteria documents.	
Likes 0	
Dislikes 0	
Response	
There are considerable variations between different entities within the Eastern Interconnection and all other Interconnections in what is considered a planning SOL. This lack of consistency can be problematic when determining what limits to respect and it also speaks to the limited value the standard has.

2. Given the background discussion and the justification provided in the mapping document for FAC-011-3, Requirement R2, R2.1 and R2.2, do you agree that BES performance is adequately covered and that no reliability gaps are introduced from the removal of those concepts in a revised FAC-011-4? If not, please explain specifically what aspects of the removal you disagree with and propose alternative language.

Leonard Kula - Independent Electricity System Operator - 2	
Answer	No
Document Name	
Comment	
Interpretation of Facility Ratings, System Voltage Limits and Stability limits are confusing and can be easily misinterpreted. In the background information above, SDT states that 'For example, "BES performance" for Facility Ratings is determined through OPAs and RTAs which assess the flow on Facilities in the pre- and post-Contingency states…' As it can be seen Facility Ratings can be interpreted as Thermal ratings only. Facility Ratings should include both Thermal ratings and voltage ratings of the equipment.	
Likes 0	
Dislikes 0	
Response	
The SDT agrees with your point, and allows facility owners to include in the voltage limits considered when System Voltage Limits are developed any Facility Rating based voltage limits for the facilities in question. This has been noted in the rationale document.	
Janis Weddle - Public Utility District No. 1 of Chelan County - 6, Group Name Chelan PUD	
Answer	No

Comment	

Commentary and Support: In the existing FAC-011-3 paradigm, System Operating Limits (SOLs) are essentially the means used to limit the system so that the Bulk Electric System (BES) has acceptable performance both pre-contingency and post-contingency. Although not a term used in FAC-011-3, the concept of 'Reliable Operation' from the NERC Glossary of Terms is helpful in describing the objective:

Reliable Operation: "Operating the elements of the [Bulk-Power System] within equipment and electric system thermal, voltage, and stability limits…"

In the new, proposed FAC-011-4 paradigm, the focus is removed from SOLs as the tool to ensure secure system operations, and instead moves to assessing whether expected operating conditions are within acceptable performance pre- and post-contingency. If studies indicate otherwise, entities and the RC implement and utilize Operating Plans to keep the system within acceptable performance.

Conceptually, FAC-011-3 and FAC-011-4 are very similar. One uses SOLs to keep the system within acceptable performance; the other uses Operating Plans when unacceptable performance is identified. Therefore, the reliability objectives are maintained, although the terminology and approach has now changed.

In the description of the proposed FAC-011-4, SOLs now play a role similar to Facility Ratings, Voltage Criteria, and Stability Criteria; SOLs are now part of the criteria to assess acceptable BES performance via OPAs and RTAs.

Comment 1: CHPD would like to see an approach where the assessment of the system is started with Facility Ratings and performance criteria, and SOLs, if required, be used as an operational tool to support operating within those Facility Ratings and performance criteria, along with generation re-dispatch, topology re-configuration, etc.

Comment 2: Regarding the contingencies transferred from FAC-011-3 to FAC-011-4 to align with the TPL contingencies, there are two discontinuities worth mentioning.

In the old FAC-011-3, R2.2.2. listed "Loss of any generator, line, transformer, or shunt device without a Fault".

The new FAC-011-4 description is now "…or without a Fault: generator; transmission circuit; transformer; shunt device; or single pole block, with Normal Clearing, in a monopolar or bipolar high voltage direct current system."

In TPL-001-4, the analogous no-fault contingency is a category P2.1, and is described in TPL-001-4 Table 1 as "Opening of a line section w/o a fault".

In summary, the new FAC-011-4 adds the single pole block to the list of no-fault outages. This probably has minor impact, but CHPD is unsure why it is being added. The second change, which is maintained, is of greater mention – there has been a discontinuity between the TPL requirements for no-fault (line section w/o a fault) and both the old and new FAC-011 standards (generator, line (old) / transmission circuit (new) transformer, shunt device (or single pole block). This could mean that these non-fault events aren't planned for through TPL, but are expected to be operated to through the FAC standard. CHPD requests this be examined by the Standard Drafting Team to see if a better alignment between TPL and FAC can be arranged. Additionally, the difference between the old FAC-011-3 'line' and the new FAC-011-4 'transmission circuit' could be clarified if these are intended to be the same thing, or if differences are intended (and if so, what are those differences).

Response	
The SDT did not create the concept of the use of SOLs when performing OPAs, real time monitoring and real time assessments. That was established with the current set of TOP standards, which became effective in April of 2017. The SDT is attempting, with the proposed changes, to bring the FAC standards, and the proposed definitions, into conformance with the existing practices in the current TOP standards. In addition, the SDT attempted, with this revision, to simplify and shorten portions of the existing standard. The language your later comments references was one of the revisions for contingencies created in the interest of efficiency. The SDT did not intend to add contingencies, and agreed that the consequences of no fault and fault induced loss of facilities are likely to be similar, with the fault induced variety usually the more severe. The no fault clause was added in the case that an entity rationalized that subject equipment could "not fault". A no fault loss case would then still be examined. The inclusion of these types of events was not to force examination of the added no fault cases when the responsible entity determined that a fault-induced version of the contingency was more sever. With that determination, the SDT reviewed your observation and determined that no further revision is warranted.	
Terri Pyle - OGE Energy - Oklahoma Gas and Electric Co. - 1	
Answer	No
Document Name	
Comment	

With regard to the proposed Requirement R2, OGE believes that the proposed language could be mistakenly interpreted as giving the Reliability Coordinator the discretion to impose unacceptable Facility Ratings to Transmission Operators. We would ask that the drafting team provides more clarity on the intent for this requirement.

Likes 0	
Dislikes 0	

Response

The SDT agrees with your comment and has included revisions in the proposed standards to make more explicit the fact that the RCs will only use ratings from those supplied by the transmission asset owners.

Pamela Hunter - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC, Group Name Southern Company

Answer	No
Document Name	

Comment

We do not agree with the proposed definition of SOL Exceedance. In our proposed definition below, we excluded the criteria for which contingencies should be assessed. We do not believe that the state of the system (pre or post contingency) should be included in the definition of SOL Exceedance, but should be left outside that definition. We believe that an RC's SOL methodology should define the conditions in which an SOL should not be exceeded.

Southern's Proposed definition:

SOL Exceedance - An operating condition, as determined in Real-time Monitoring, where a System Operating Limit is exceeded.

An exceedance can only occur if it happens in Real-time and therefore the SOL Exceedance definition should not incorporate the concept of predicted exceedances. Predicted exceedances, such as those identified through OPAs and RTAs, may or may not occur as they are just that, predicted. Predicted exceedances should not be defined and subject to the stringent set of limitations and requirements that SOL Exceedances should be. Furthermore, how predicted exceedances are identified, assessed, operationally planned for and mitigated should be

the responsibility of the Reliability Coordinator. Therefore, any such definition for predicted exceedances should remain in the respective RC's SOL methodology.	
Likes 0	
Dislikes 0	
Response	
The SDT is removing the proposed SOL Exceedance definition from its proposed FAC standards changes due to industry comments. Instead, we are including performance criteria in the proposed FAC 011-4 standard. The performance criteria specify acceptable pre and post contingent system performance, just as the current FAC-011-3 standard does.

Answer	
Document Name	
Comment	
NIPSCO is concerned that the requirement does not provide adequate assurance that the RC will respect the ratings established by the TO or the TO's FAC-008 methodology. As written, the language is vague and could be interpreted as allowing an RC to determine the ratings that a TOP must use (including normal and emergency ratings and seasonal changeover dates) without respecting the TO's authority to establish such Facility Ratings.	
Likes 0	
Dislikes 0	
Response	
The SDT agrees with your comment and has included revisions in the proposed standards to make more explicit the fact that the RCs will only use ratings from those supplied by the transmission asset owners.	

3. Given the background discussion and the justification provided in the mapping document for FAC-011-3, Requirement R2, R2.3 and R2.4, do you agree that BES performance is adequately covered and that no reliability gaps are introduced from the removal of those concepts in a revised FAC-011-4? If not, please explain specifically what aspects of the removal you disagree with and propose alternative language.

Neil Swearingen - Salt River Project - 1,3,5,6 - WECC	
Answer	No
Document Name	
Comment	

SRP recommends retaining the clarifying language of 2.3 and 2.4. Having the options explicitly stated within the standard ensures consistency throughout each RC area in the way TOPs respond to Contingencies. Having those clear, well-defined options spelled out within the RC's SOL Methodology enhances reliability by setting consistent expectations of what actions neighboring or overlapping TOPs may be performing. Furthermore, it is valuable to house the language within a standard dealing with the Operations Planning Horizon, to avoid a potential misconception that the described options are only permissible when planning the system in the Near-term or Long-term Planning Horizons.

Likes 0	
Dislikes 0	

Response

The SDT discussed at length retention of the language or the concepts captured in the language. The end result of those efforts was a new proposed requirement in FAC-014-3, R8, that states:

In addressing any potential or actual SOL exceedances, each Reliability Coordinator and Transmission Operator shall allow for Non-Consequential Load Loss within their Operating Plan only if all other means of System adjustments have been exhausted to prevent: [Violation Risk Factor: High] [Time Horizon: Operations Planning]

- *equipment damage, or*
- *instability, Cascading, uncontrolled separation*

We believe this requirement better describes the criteria under which Non-Consequential Load can be shed when operating the system.

Terri Pyle - OGE Energy - Oklahoma Gas and Electric Co. - 1	
Answer	No
Document Name	
Comment	
With regard to the proposed Requirement R2, OGE believes that the proposed language could be mistakenly interpreted as giving the Reliability Coordinator the discretion to impose unacceptable Facility Ratings to Transmission Operators. We would ask that the drafting team provides more clarity on the intent for this requirement.

Comment 1: CHPD is concerned about the 'permitted uses' language of RAS and other schemes, to be contained in the RC's methodology. In the TPL / Planning process, an entity may determine and build a scheme under a certain set of assumptions (how the system was planned / designed / built). The entity may determine this scheme is acceptable to their own operations. The RC may then prohibit the use of this non-RAS in the RC's SOL methodology, rendering the scheme useless for actual operations. CHPD has witnessed this concern with one of its neighbor's automatic schemes and feels that the prohibition of the scheme's use for operations has not always been in the best interest of system reliability. CHPD also recognizes the Planning Coordinator and Reliability Coordinator will be performing additional coordination through the new PRC-012-2, whose purpose is stated as "To ensure that Remedial Action Schemes (RAS) do not introduce unintentional or unacceptable reliability risks to the Bulk Electric System

(BES)." The requirement here in FAC-011 may be duplicative of those objectives found in the new PRC-012-2.

In FAC-011-3, only allowed uses of Remedial Action Schemes was listed under the RC's methodology requirements. In FAC-011-4, the addition of 'other automatic post-Contingency mitigation actions' adds significant scope to the methodology. CHPD wants the Standard Drafting Team to ensure that the concept of 'operated as designed' is maintained in the use of these other automatic post-Contingency mitigation actions.

Comment 2: In the discussion about UFLS being not permitted in R4.6 (and by omittance, UVLS being permitted) CHPD identifies that there seems to be confusion, or at least the potential for confusion, about the FERC order and acceptable use or non-use of these schemes. The first point is that there is a difference between a UFLS or UVLS program. From the NERC glossary of terms:

Undervoltage Load Shedding Program: An automatic load shedding program, consisting of distributed relays and controls, used to mitigate undervoltage conditions impacting the Bulk Electric System (BES), leading to voltage instability, voltage collapse, or Cascading. Centrally controlled undervoltage-based load shedding is not included.

Underfrequency Load Shedding Program is not described in the NERC glossary of terms, but is described in the purpose description for PRC-006: To establish design and documentation requirements for automatic underfrequency load shedding (UFLS) programs to arrest declining frequency, assist recovery of frequency following underfrequency events and provide last resort system preservation measures A UFLS or UVLS program is a coordinated use of UFLS or UVLS relays at multiple locations and are essentially used to prevent described conditions that are essentially the events of an IROL. The FERC order 818 states regarding UVLS programs: “We conclude that UVLS **programs** (emphasis added) under PRC-010-1 are examples of such “safety nets” and should not be tools used by bulk electric system operators to calculate operating limits for N-1 contingencies.” Again, in the “Final Report on the August 14, 2003 Blackout in the United States and Canada: Causes and Recommendations”, on page 109 in the discussion about UFLS as a safety net, it simply states: Safety nets should not be relied upon to establish transfer limits CHPD would like clarification here in the proposed FAC-011-4 whether the references to UFLS (and UVLS) are meant to be to the UFLS (PRC-006) and UVLS (PRC-010) Programs or is it a reference to something else.

Response
The SDT reviewed your comment and gave careful consideration to your concern regarding "operate as designed". However, given our understanding that the RC is the highest operating authority, the SDT believes it is appropriate for the RC to document, in its SOL methodology, how RAS and other automatic schemes will be treated when determining stability limits. For example, an automatic under voltage load shed scheme could actuate during a stability simulation, which in turn could impact stability limits. The RC, in its SOL methodology, should be establishing the use practice for RAS that is then consistently used by all entities that determine stability limits. The SDT believes that if the RC has found that a RAS performs, based upon real-world experience, in some fashion other than as designed, then the RC has the responsibility to document how that RAS should be used when performing OPAs and RTAs.

The SDT has reviewed your comment with regard to UFLS and UVLS Programs and have included language revisions in FAC-011-4, Part 4.7, which were intended to provide clarity regarding allowed use of these schemes / programs.

Scott Downey - Peak Reliability - 1	
Answer	Yes
Document Name	
Comment	
Peak agrees that BES performance is adequately covered and that no reliability gap is introduced with the removal of the requirements R2, R2.3 and its subparts, and R2.4. Peak agrees with the justifications set forth in the FAC-011 mapping document for these requirements. Peak believes that the “rules” set forth in the current FAC-011-3 R2, R2.3 and its subparts, and R2.4 have relevance in the TPL standards, but not in the TOP or IRO standards. When planners plan the system, they are constructing a system that meets the performance requirements set forth in TPL-001-4. This system is then provided to operators to operate. Rules such as those reflected in Table 1 of TPL-001-4 and the footnotes of Table 1 are important for identifying Corrective Action Plans associated with determining how the system is to be built; however, Peak believes the “rules” as reflected in FAC-011-3 R2, R2.3 and its subparts, and R2.4 are not necessary for operating the system. Operators encounter many operating scenarios that were not addressed or anticipated in the TPL Planning Assessments, and very often these conditions are more severe than those assessed in the Planning Assessments. Peak agrees with the SDT’s assertion that operators need the flexibility to operate the	

system to address SOL exceedances without being confined to such "rules" regarding non-consequential load loss, interruption of firm transmission, and requirements associated with preparations for the next Contingency. All of these items are expected to be addressed as needed in associated Operating Plans. Accordingly, operators do not need to be confined to these "rules" set forth in current FAC-011-3 R2, R2.3 and its subparts, and R2.4.

Duke Energy would like to point out to the SDT, a potential typo in the FAC-011-3 Mapping Document. When referencing the translation of R2 and its sub-requirements to a New Standard or Other Action, the SDT appears to reference a TOP-012-3 standard R14. We believe that this was in error, and that perhaps the drafting team meant to reference TOP-001-3 instead.

Comment	

We think the removal of BES performance from R2 is relevant, but that the performance requirements associated with determination of stability limits associated with SOLs are vague compared to the TPL assessments. Is the SDT intent to let full flexibility to the RC with regards to stability performance requirements per requirement 4.1? For example, is a unit pulling out of synchronism something up to the RC to demonstrate as acceptable for the purpose of determining SOLs/IROLs for a given interface?	
Likes 0	
Dislikes 0	
Response	
The SDT believes that since the RC is the highest operating authority, it has the right and responsibility to determine how stability assessments for determination of limits are to be performed. They have the flexibility to base those practices on anything, and could choose to do so based upon prevailing planning practice in the area, if appropriate and they chose to. With your specific example, it is the RC's responsibility to write into its SOL methodology how it wants unit stability treated. That treatment should account for existing standards and definitions, and, in this instance, not allow for a potential IROL (due to instability, Cascading or uncontrolled separation), for example.

4. Are there any reliability objectives of FAC-011-3, Requirement R2, R2.3 and R2.4 that you maintain need to be preserved in requirements relating to the development of Operating Plans which would reside outside the FAC family of standards? Please explain your response.	
Janis Weddle - Public Utility District No. 1 of Chelan County - 6, Group Name Chelan PUD	
Answer	No
Document Name	
Comment	
As a practice, reliability objectives should be maintained in standards. Documentation and examples supporting those objectives (white papers, guidelines, etc.) can reside outside the standard. Regarding Operating Plans, the definition found in the NERC glossary of terms is sufficient for CHPD. Regarding R2, R2.3 and R2.4 as it deals with the response of the system to events, any other reliability objectives should be contained in the standard to ensure these items have the scrutiny, review, and due process related to these items. CHPD has mentioned some concerns in its responses to item #3, but has nothing in addition to those to add here.

Answer	Yes
Document Name	
Comment	
National Grid supports the NPCC RSC Group comments. Additional comment for consideration: Typically there are additional Thermal ratings above the "normal" limit that have a time frame associated with them. For example an emergency limit may be a 15 minute rating, i.e. the flow can be at the emergency rating for 15 minutes. Therefore, by design, being above the normal rating is not going to result in damage to the BES elements. Therefore the 1st bullet in the SOL Exceedance definition could be revised to state "Actual flow through a Facility is above the Facility's Rating and the associated allowable time frame is exceeded".

Response	

Thank you for your comments. Due to industry concern on the proposed SOL Exceedance definition, the SDT has modified FAC-011-4 to include a new proposed requirement R6 that preserves system performance criteria similar to current FAC-011-3 R2.1 and R2.2 and not proposing a new SOL exceedance definition.

Comment	
We think actions allowed in real-time operations should not be part of FAC-011, but captured by TOP/IRO standards. We think there is ambiguity and a lack of consistency in the industry around allowed system adjustments and preparation for the next contingency (old R2.4) with refers indirectly to N-1-1 situations. Although it is clear that FAC-011 requires, at a minimum, to consider a set of single contingencies to address stability limits, it is not clear at all what are the minimum requirements applicable if the contingency was to occur… and how “preparing for the next contingency” is addressed by the current standards.

Dislikes 0	
Response	
Thank you for your comments. Due to the majority of industry supporting the SDT’s position that FAC-011-3, Requirement R2, R2.3 and R2.4 do not need to be preserved in FAC-011 or other standards, the SDT is proposing to not specifically preserve as the intended reliability objectives are either unnecessary or addressed with the new IRO/TOP standard revisions. The SDT agrees that if clarity is needed, it would need to be addressed in the IRO/TOP standards and not in FAC-011.

5. Do you agree that the SDT should allow the use of UVLS in the establishment of stability limits? If not, please explain and provide alternative language.	
Aaron Cavanaugh - Bonneville Power Administration - 1,3,5,6 - WECC	
Answer	No
Document Name	
Comment	
It is unclear in 4.6 (and the entirety of R4) if "stability limits" refers to either or both of the following (1) bulk transfer across the BES (transfer limit stability studies) or (2) load areas (local area limit stability studies). BPA believes that it is important to distinguish between transfer limit stability studies and local area limit stability studies. We recommend that the SDT add language to R4 to clarify that R4 applies to only transfer limit stability studies. BPA believes that the SDT should not allow UVLS in transfer limit stability studies, unless it is part of a designated RAS. We understand that FERC is describing transfer limit stability studies in Order 818. BPA therefore does not think that relying on UVLS, except where included in RAS, to increase transfer limits is appropriate. However, BPA believes that the SDT should allow UVLS in local area limit stability studies when failure of the UVLS would not result in cascading. If UVLS is not allowed in local area limit stability studies, the TOP may be forced to perform pre-contingency load shed. Proposed: Planned use of UFLS or UVLS in establishment of stability limits is not allowed unless either of the following conditions is true: Pre-contingency load shedding would be required in order to meet BES performance criteria Load shedding is already included as part of an approved Remedial Action Scheme

The SDT believes that FERC order 818 directive is to never allow planned use of UFLS programs in the establishment of stability limited with no exception allowed the planned use of UVLS, it is important to note that the SDT believes that UVLS Program is different than the UVLS.	

The Technical guideline in PRC-010 shows an example of UVLS system that would not fall under the definition of UVLS Program. For this reason, the SDT has modified R4.7 to ensure prohibition of UVLS Program under normal operation, but allow the RC methodology to specify if and when utilization of localized UVLS in operating horizon is acceptable.

Michael Cruz-Montes - CenterPoint Energy Houston Electric, LLC - 1 - Texas RE	
Answer	No
Document Name	
Comment	
CenterPoint Energy Houston Electric, LLC ("CenterPoint Energy") does not agree that the SDT should allow the use of UVLS in the establishment of stability limits. CenterPoint Energy believes that UVLS, like UFLS, is a "safety net" that is deployed as a preservation measure to maintain the reliability of the BES. UVLS should not be relied upon to establish limits in a planning environment, regardless of horizon.

These comments are duplicated from comments made on question #3 above. CHPD would note that the language stated in the NERC summary from the 2003 report uses the term ‘transfer limits’, whereas in this SOL revision document it is described as ‘stability limits’. These two terms have different meanings, and the reference in the SOL document should be reviewed.

In the discussion about UFLS being not permitted in R4.6 (and by omittance, UVLS being permitted) CHPD identifies that there seems to be confusion, or at least the potential for confusion, about the FERC order and acceptable use or non-use of these schemes. The first point is that there is a difference between a UFLS or UVLS program. From the NERC glossary of terms:

Undervoltage Load Shedding Program: An automatic load shedding program, consisting of distributed relays and controls, used to mitigate undervoltage conditions impacting the Bulk Electric System (BES), leading to voltage instability, voltage collapse, or Cascading. Centrally controlled undervoltage-based load shedding is not included.

Underfrequency Load Shedding Program is not described in the NERC glossary of terms, but is described in the purpose description for PRC-006:

To establish design and documentation requirements for automatic underfrequency load shedding (UFLS) programs to arrest declining frequency, assist recovery of frequency following underfrequency events and provide last resort system preservation measures

A UFLS or UVLS program is a coordinated use of UFLS or UVLS relays at multiple locations and are essentially used to prevent described conditions that are essentially the events of an IROL. The FERC order 818 states regarding UVLS programs:

“We conclude that UVLS **programs** (emphasis added) under PRC-010-1 are examples of such “safety nets” and should not be tools used by bulk electric system operators to calculate operating limits for N-1 contingencies.”

Again, in the “Final Report on the August 14, 2003 Blackout in the United States and Canada: Causes and Recommendations”, on page 109 in the discussion about UFLS as a safety net, it simply states:

Safety nets should not be relied upon to establish transfer limits

CHPD would like clarification here in the proposed FAC-011-4 whether the references to UFLS (and UVLS) are meant to be to the UFLS (PRC-006) and UVLS (PRC-010) Programs or is it a reference to something else.

We agree with FERC, Undervoltage load-shedding schemes (UVLS) are a "safety net" and should not be a tool used by Bulk Electric System operators in the derivation of stability limits. In some areas single contingencies include bus faults, stuck breakers and tower-contingencies. Note: ERCOT does not support this response.

Not sure how the SDT like entities to vote. The SDT rationale indicated that their understanding of FERC Order 818 prohibited the use UVLS in the establishment of stability limits for N-1 contingency. Hence, if the SDT understanding of the FERC order is correct that FERC doesn't allow use of UVLS in the establishment of stability limits for N-1 contingency then it would also mean that using UVLS is also prohibited for N-2 contingencies. Indicating a "Yes" to Question 5 is contradicted to FERC Order 818. Indicating a "No" to Question 5 is in alignment with the SDT understanding of FERC Order 818.

Amy Casuscelli - Amy Casuscelli On Behalf of: Michael Ibold, Xcel Energy, Inc., 3, 1, 5; - Amy Casuscelli	
Answer	Yes
Document Name	
Comment	
Xcel Energy agrees with the allowed use of UVLS assuming that its meaning is not restricted to the defined term UVLS Program and is used as an umbrella term that also includes local UVLS schemes. We would disagree if UVLS was intended to be synonymous with UVLS Program, since it would imply that use of local UVLS is not allowed. This illustrates the need to clarify what is the intended scope of UVLS in this standard.

The SDT believes that it is best and more appropriate to allow each RC to document in its methodology when planned use of UVLS is allowed in the establishment of a stability limit. For this reason, the SDT has modified R4.7 to ensure prohibition of UVLS Program under normal operation, but allow the RC methodology to specify if and when utilization of localized UVLS in operating horizon is acceptable.	
Neil Swearingen - Salt River Project - 1,3,5,6 - WECC	
Answer	Yes
Document Name	
Comment	
Consistency is necessary between the mitigating actions permitted to maintain acceptable performance after N-1-1 and N-2 Contingencies in the Planning Assessment and Real-time Operations. The use of equal more limiting parameters prescribed in FAC-015-1 R1-R3 would be undermined by the prohibition of UVLS in response to more severe Contingencies when calculating SOLs.

Scott Downey - Peak Reliability - 1	
Answer	Yes
Document Name	
Comment	

Peak agrees that UVLS should be allowed for use to prevent adverse reliability impacts for Contingencies more severe than single P1 Contingencies and that such allowances should be addressed in the RC's SOL Methodology. However, Peak is concerned that the use of UVLS, RAS, and other automatic post-Contingency mitigation schemes are confined to the development of stability limits. Peak believes that the allowed use of RAS or other automatic post-Contingency mitigation actions should be extended beyond the establishment of stability limits to also apply to the development of Operating Plans in general. Because the current FAC-011-3 intermingles "how to operate the system" with SOL establishment, it can be argued that the current FAC-011-3 already allows the RC's SOL Methodology to extended beyond the establishment of stability limits to also apply to the development of Operating Plans. While Peak is supportive of the SDT's attempt to focus FAC-011-4 more on establishing Facility Ratings, System Voltage Limits, and stability limits used in operations and removing the aspects of FAC-011-3 that relate more to "how to operate the system", it seems the SDT inadvertently introduced an inconsistency by limiting the use of RAS (or automatic actions) for deriving stability limits only. Peak believes the RC should have the ability to determine the use of RAS and other automatic post-Contingency mitigation actions across the board – not just for stability limit establishment. This issue, however, does not seem appropriate to be addressed in the FAC family of standards.

FMPA appreciates the SDTs efforts to provide the background and historical context of UVLS and the derivation of IROLS. Unfortunately the background information provided is confusing and does not make clear what the SDT is trying convey. The rational appears to try and draw a line between UFLS and UVLS when in fact they perform the same function, but for different quantities. The use of UFLS is allowed in certain PC studied events and we see no reason why UFLS shouldn't be used where appropriate. We agree that UVLS should be considered in the establishment of stability limits; however we also believe UFLS should be allowed under certain scenarios as it is in the planning horizon.

Response	
The SDT believes that FERC order 818 does explicitly prevent the utilization of UFLS and UVLS Program for any planned normal operations, the FERC order itself is silent in the utilization of UVLS that is not part of a UVLS Program. For this reason, the SDT has modified R4.7 to ensure prohibition of UVLS Programs under normal operation, but allow the RC methodology to specify if and when utilization of localized UVLS in operating horizon is acceptable.	
David Jendras - Ameren - Ameren Services - 3	
Answer	Yes

Comment	

UVLS is allowed to maintain system performance for some contingency events as described in Table 1 of standard TPL-001-4. The RC allowed use of UVLS should not conflict with standard TPL-001-4.

Comment	
We agree with the allowed use of UVLS under certain conditions, but we strongly disagree with the way the SDT has addressed the allowed use of UFLS and UVLS in the new FAC-011. Since R5 gives some flexibility to the RC to choose its method for considering various types of contingencies (N-1, N-2, etc.) for both OPA/RTA and stability limits, the acceptable actions in R4.6 should not be limited as they can vary a lot depending on the types of contingencies considered. For example, a RC considering only the minimum single contingencies from R5.1 may not be allowed to use UFLS and UVLS actions for N-1… but another RC may choose to establish stability limits and limit transfers accordingly to address more stringent and rare multiple contingencies for which additional means like the action of UFLS/UVLS may be allowed (if that same RC would choose not to plan a stability limit for those contingencies, it would be acceptable to use UFLS/UVLS as a safety net?). Similarly, the reference to UVLS in SVL requirement R2 is not adequate, as SVL may comprise multiple levels, some for acceptable for single contingencies (without UVLS), some with some UVLS actions allowed for multiple contingencies. We think that the consequence of the action (e.g. the use of non-consequential load loss as in TPL) should be used throughout the standards to allow the use of actions for specific contingencies (rather than referring to RAS, UFLS or UVLS).

Response	
The SDT is not contemplating allowance of UFLS. The SDT believes that it is best and more appropriate to allow each RC to document in its methodology when planned use of UVLS is allowed in the establishment of stability limit because UVLS is more localized in nature. It is important to note that the intent is to address UVLS and not UVLS Program as described in PRC-010 technical guideline.

Comment	
In the case of non-IROL SOLs we agree. However, it was noted that according to the background information above and in FAC-11-4, the use of UVLS is only considered in the context of establishing stability limits as per Requirement R4 Part 4.6. The use of UVLS should also be acceptable to respect Facility Ratings and System Voltage Limits.

The establishment of stability limits must take into account automatic actions, including RAS and UVLS, since the loss of load can negatively impact system and unit stability performance. The SDT is correct in including this language in the proposed revisions.

ERCOT asserts it is not appropriate to use UVLS for the purpose of increasing transfer capability for stability limits for N-1 Contingencies. However, it may be appropriate to use UVLS to determine the post-contingency impact in regards to establishment of an IROL vs. an SOL. It may also be appropriate to use UVLS in determining whether or not pre-contingency load shedding is warranted.

With regards to the planned use of UVLS, it is important to note that the SDT believes that UVLS program is different than the UVLS. The Technical guideline in PRC-010 shows an example of UVLS system that would not fall under the definition of UVLS Program. For this reason, the SDT has modified R4.7 to ensure prohibition of UVLS Programs under normal operation, but allow the RC methodology to specify if and when utilization of localized UVLS in operating horizon is acceptable.

ERCOT suggests rewording proposed R2 to clarify that the SOL methodology establishes a method for determining which of the Facility Ratings provided by the owner should be used in operations, and not a method for establishing Facility Ratings. Please see the suggested language below.

"R2. Each Reliability Coordinator shall include in its SOL Methodology the method for Transmission Operators to determine ***which of the*** applicable owner-provided Facility Ratings ***are*** to be used in operations. The method shall address the use of common Facility Ratings between the Reliability Coordinator and the Transmission Operators in its Reliability Coordinator Area.

With respect to R3.5, the meaning of the phrase "Address the use of" is unclear. The meaning of this phrase could be interpreted several different ways. ERCOT understands that the intent of the SDT is to ensure that, under the SOL methodology, the RC and its TOPs have a method to determine how the common set of System Voltage Limits between the RC and TOPs are to be used in operations, without becoming overly prescriptive in the requirement language. ERCOT suggests rewording proposed R3.5 to "Address how the Reliability Coordinator and its Transmission Operators use common System Voltage Limits in the Reliability Coordinator Area;"

ERCOT notes that parts 4.1.1.-4.1.4. of R4 list the *minimum* stability performance criteria that should be used in the method to determine stability limits in operations. To add clarity, ERCOT suggests adding a new part 4.1.5 that reads ***"other stability performance criteria as required by the RC's SOL Methodology."***

****Please refer to the attached comment form for redlined language.

Thank you for your comments. With regards to your suggestion for FAC-011-4 R2, the SDT agrees that the RC does not establish or dictate facility ratings for operations. Rather, the responsibility of the RC is to choose which of the applicable owner provided facility ratings are used to avoid conflicts between the RC and its TOPs during system operation. The SDT has chosen to modify the language in R2 to better reflect this. With regards to your suggestions regarding use of a common set of Facility Ratings and/or System Voltage Limits, the SDT has adjusted the proposed language in FAC-011-4 R2 and R3.5 to clarify the intent of the requirement. The TOP and its RC should be using a common set of Facility Ratings and System Voltage Limits. gives the RC The SDT feels that the current "at a minimum" language around R4.1 for stability performance criteria is sufficient to allow the RC to specify other stability performance criteria in the RC SOL Methodology if the RC chooses to do so. The SDT felt adding the language as suggested in your comment may give entities the impression that requirement is implying additional stability performance criterion must be included

Requirement R7 of the proposed FAC-011-4 standard requires the RC to define the method and periodicity a TOP must communicate their SOLs back to the RC. In comparison, parts 5.3-5.5 of requirement R5 of FAC-014-3 identify such communications must occur on a mutually agreed upon time frame. We believe Requirement R7 should be changed to a mutually agreeable timeframe that reflects the frequency a Transmission Operator will conduct its Operational Planning Analyses and Real-time Assessments.

Response	

Thank you for your comment. The SDT feels that it would be ideal for the TOP and RC to mutually agree on a timeframe for the TOP to provide SOLs to its RC. However, given that the RC has the authority to determine the timeframe at which it requires the TOP to provide its SOLs from its TOP, the SDT prefers the current language.

ATC has the following concerns with the proposed FAC-011-4 standard. R3.1: Requirement R3.1 contains the term "stations" and uses an unconventional designation of "buses/stations". The NERC BES definition does not require entities to identify BES stations, which would make it problematic to use the requirement as written.	

Additionally, "buses/stations" is an unclear designation where entities may understand that System Voltage Limits shall be created for all Facilities in a station, including both BES and non-BES Facilities in that station. We do not believe this is the intent of the SDT so this should be clarified.

Consider modifying R3.1 language to state "Require that BES buses have an associated System Voltage Limit except for the BES buses that may be excluded as specified in the [RC]'s SOL methodology."

R3.2: Clarify R3.2, similar to R2 language, that "respect[ing] the Facility voltage Ratings" means determining the "applicable owner-provided Facility" voltage "Ratings to be used in operations". FAC-008-3 R2 and R3, in conjunction with the NERC "Facility Ratings" definition, requires the Generator Owners and Transmission Owners, respectively, to have voltage ratings for Facilities.

R4.5 and a New R5.5: Requirements R4.2, R4.4, R4.5 and R5 become applicable to all TOPs through proposed FAC-014-3 R2.

Given the language of R4.4, which requires "instability risks" to be "identified", ATC believes the standard overreaches at R5 when it includes stability analysis within OPAs and RTAs as determined by the RC. TOP-001-3 R13 and R14 and TOP-002-4 R1 already require the TOP study SOLs in RTAs and OPAs, and inclusion of OPAs and RTAs in R5 is redundant with TOP-001-3 and TOP-002-4. The TOPs are the local experts on the stability of their systems and the R5 requirement language should not force additional stability analysis beyond TOP-001-3 and TOP-002-4 in the OPA and RTA on to a TOP if stability is not an issue for its system. ATC recommends striking “and performing Operational Planning Analysis (OPAs) and Real-time Assessments (RTAs).” from R5.

A proposed revision to R5 to address this concern is the addition of a new requirement R5.5, which would read:

"R5.5 The applicability of the identified single Contingency and multiple Contingencies to its TOPs for use in determining stability limits."

Similarly, given the applicability of the model requirements stated in R4.5 to the TOPs performing stability studies under the RC SOL methodology, through FAC-014-3 R2, clarify is needed that a TOP does not need to have a model of similar scale or scope as the RC will use. Per TOP-003-3, TOPs determine what data is needed to perform their OPAs and RTAs and the scope of this data is likely a subset of the RC's data, whether covered by IRO-010-2 or proposed FAC-011-4 R4.5. The revision should make it clear that the breadth of the RC's model does not necessarily need to be replicated by the TOP.

A proposed revision to R4.5 to address this concern would be the addition of the following language to the current proposed R4.5 language:

"… necessary to determine different types of stability limits, including applicability of the model detail to studies performed by its TOPs"

New R4.x: The RC SOL methodology should include how "impacted" PCs and TOPs will be identified for stability SOLs. The "impacted" language appears in FAC-014-3 R4 and R5 and clarity is needed for all parties.

R7: The second sentence of R7 should be struck as it is a redundant requirement to IRO-010-2 R1. SOL communication should be a part of the RC's data specification, which already contains a requirement regarding periodicity of communication.

R8: The requirement should contain a minimum notice provision to TOPs, such as "30 days prior to implementation". The current language would permit an RC to issue a revision the day prior to a material change in its SOL methodology, possibly impacting a TOP's compliance under FAC-014.

Response

Thank you for your comments.

With regards to your suggestion for FAC-011-4 R3.1, the SDT has chosen to keep the reference to “buses/stations” as proposed. The SDT feels that it is necessary to clearly identify both stations and buses to ensure those who monitor station based limits (more often referenced by system operators) and those who are monitoring bus based limits (more typically referenced in power flow study groups) relate to this requirement.

With regards to your suggestion related to proposed FAC-011-R3, subpart 3.2, the SDT has attempted to remove confusion regarding the use of the term “voltage ratings” by adopting the phrase “voltage-based Facility Ratings” instead.

In response to the comment on FAC-11-4 R4.5, the SDT feels the language in the requirement R4.5 is clear as stated and works well with requirement R2 in FAC-014-3. The extent of an RC's area that needs to be modelled as part of TOP stability studies may vary depending on how widespread the stability phenomenon is, how large their footprint is within the RC's area, and what responsibility they've agreed to with their RC in performing those studies. Therefore, this type of clarification is better left to the RC's SOL Methodology rather than prescribed in the FAC-11-4 R4.5requirement. Furthermore, it was not the SDT's intent to imply a stability assessment must be run in all OPA and RTAs. Rather, it was intended that stability assessments must be performed considering, at a minimum, those contingencies in R5.1. Separately, and as indicated in R5, the SDT intended all contingencies specified in R5.1 to be run, at a minimum, as part of OPA and RTA, which may or may not include a stability assessment (if proven unnecessary due to prior studies). Though the SDT recommends the TOP and RC come to a mutual decision on the contingency set used in OPA and RTA and for stability assessments, the ultimate authority must rest with the RC and these decisions should be reflected in the RC's methodology. Regarding your comment on FAC-11-4 R7, the SDT feels that it is important to include the periodicity in the SOL Methodology for provision of SOL data. IRO-10-2 R1 speaks to periodicity of receipt of data necessary for OPA and RTA which is not entirely redundant. Given the importance of timely provision of SOLs from the TOP to RC, the SDT feels that providing this guidance in R7 in addition to IRO-10-2 is beneficial. The SDT agrees with your proposal for requirement R8 in FAC-011-4, such that a period of at least 30 days be given to those entities in receipt of the RC's methodology, to complete any implementation as a result of changes to the RC's methodology. The proposed requirement R8 has been updated to reflect this change.

Comment	

This standard in its current form allows a single entity the ability to dictate operating and effectively planning criteria. PNM believes that the development of the SOL methodology should be a joint effort including RCs, TOPs, and PAs.

Propose revised R1 language: Each Reliability Coordinator, in conjunction with each of its Transmission Operations and Planning Coordinators, shall develop a methodology for establishing SOLs (i.e., SOL Methodology) within its Reliability Coordinator Area.

PNM believes that R2 gives the RC the ability to dictate how an entity uses its own Facility Ratings effectively modifying FAC-008. There is no point for an entity to establish a Facility rating that cannot be used when operating the system. PNM recommends removal of R2 and revision of FAC-008-3 to address any concerns regarding a lack of common facility ratings methodology.

PNM questions the reliability basis for R3.3. PNM believes that there may be legit reasons to have the UVLS settings higher than the limits for certain critical contingencies. FERC order No. 818 specifies not using UVLS for N-1; however, this requirement doesn't have that qualifier. If the SDT feels this concept should be included in the standard the requirement should move under R4.6 and shall clearly specify that it is only applicable to single contingencies.

PNM finds no difference between R6.1 and R6.2.

Thank you for your comments.
With regards to your suggestion for FAC-11-4 R1, the SDT agrees with principal of the RC developing its SOL methodology in conjunction with those who are impacted by it. However, the RC needs to have the final authority in order carry out its responsibilities.
With regards to your suggestion for FAC-011-4 R2, the SDT agrees that the RC does not establish or dictate facility ratings for operations. Rather, the responsibility of the RC is to choose which of the applicable owner provided facility ratings are used to avoid conflicts between the RC and its TOPs during system operation. The SDT has chosen to modify the language in R2 to better reflect this.
With regards to your suggestion for FAC-011-4 R3.3, the SDT has modified the proposed language to make it clear that System Voltage Limits should be greater than or equal to UVLS scheme and/or program set points. This requirement is important to ensure that RCs and TOPs are aware of what their UVLS set points are and operate in the interest of avoiding load shed where possible.

FAC-11-4 requirements R6.1 and R6.2 have identical wording to existing requirements R1.3 and R3.7 from current standard, FAC-011-3. FAC-11-3 IROL requirement related issues will be examined for revision following the MEITFs efforts. Thank you for noting this.

Leonard Kula - Independent Electricity System Operator - 2

Answer	
Document Name	

Comment

FAC-11-4, Requirement R3.3 should be clear that it's only pre-contingency System Voltage Limits which should be above in-service UVLS scheme settings. When depending on these schemes, a post-contingency System Voltage Limit may fall below a UVLS set point.

FAC-11-4 Requirement R3 Part R3.4 should either be revised or removed. Identifying the lowest allowable System Voltage Limit does not make sense from the context of minimum voltage SVLs (it should be the highest SVL identified). Perhaps "lowest" could be replaced by "most restrictive".

Where FAC-11-4 Requirement R3 Part 3.7 requires coordination between adjacent RCs for SVLs the FAC-11-4 Requirement R2 and R4 are silent on this with respect to Facility Ratings and stability limits. The RC should also be coordinating Facility Rating and Stability SOL actions with RCs within an Interconnection where applicable and this should be spelled out in FAC-11-4.

FAC-11-4 Requirement R4.1.2 should not force Reliability Coordinators into adopting transient voltage response criteria as part of their SOL Methodology. There are effective alternative means to guard against coincidental load loss and inadvertent tripping such as employing a relay margin criterion instead. Please remove or modify the requirement to recognize viable alternatives exist.

FAC-11-4 Requirement R4.1.2 should not force Reliability Coordinators into adopting transient voltage response criteria as part of their SOL Methodology. Transient voltage criterion results should be communicated to the Reliability Coordinator as outlined in FAC-15-1 Requirement R6 for consideration.

FAC-11-4 Requirement R4.1.3 introduces the term “angular stability”. Why is System damping considered separately? Angular stability consists of Transient Stability and Small Signal Stability, System damping would be part of Small Signal Stability.

FAC-11-4 Requirement R4.4 appears to ask for so much detail in the SOL Methodology (FAC-11-4 Rationale indicates enough information should be provided to duplicate the study) that it would be extremely onerous to satisfy given that the assumptions made for each operating zone of our RC area are vastly different given the common conditions and risks that exist. Detailed assumptions around instability risks, transfer levels, dispatch and system conditions are better left in study documentation pertaining to each specific zone. (Also see 5 below. We believe that there is value in sharing SOLs and associated study reports based on need/request.)

Additionally, the phrase “instability risks are identified” is misleading and does not really contribute to the objective of the requirement/standard. We assess that the intent of R4 is to present the method for determining stability limit, not to identify risks although they are the driver for developing stability limit. If the intent of that phrase is to present the stability concerns and/or the way to address such concerns through SOL determination, then we offer the following revised wording:

“Describe how stability limits are determined, considering levels of transfers, Load and generation dispatch, and the applicable System conditions including any changes to System topology such as Facility outages;”

FAC-11-4 Requirement R4.5 asks for a description of the critical details from other Reliability Coordinator areas necessary to determine stability limits. This is in conflict with FAC-14-3 R5 which no longer enforces that Reliability Coordinators *provide its SOLs and IROLs to*

those entities with a reliability need. IRO-014-3 speaks to required information for Operating Plans, Procedures and Processes but does not address the need for critical details required for developing SOLs. Furthermore, obtaining these critical details from other Reliability Coordinators and verifying their impact to SOLs through study can require a great deal of time and effort. It is recommended that more than 12 months be given in order to comply with this requirement. An appropriate time would be in the order of 24 – 36 months. Obtaining these critical details would also be made much easier and the information would be much more valuable if all Reliability Coordinators (RC) were aligned in respecting the same set of contingencies and performance criterion for IROLs. For example, if an RC finds an instability issue due to a multiple contingency in a neighboring RC's footprint there's no requirement in FAC-11 and FAC-14 that supports forcing the neighbor to respect that contingency in the interest of interconnected system reliably as multiple contingencies are still left up to the RC's discretion. FAC-11-4 Requirement R5.2 leaves the door open for any potential contingency to be considered credible and will create an unnecessary burden in attempting to show compliance. Listing other specific single contingencies that could be deemed credible would improve this requirement. An alternative to listing additional specific contingencies would be to revert to the existing language in FAC-11-3 Requirement R2.2 which specifies, at a minimum, which contingencies must be respected. FAC-11-4 Requirement R6.2 is redundant with Requirement R6.1 in that a criterion is what is used to identify SOLs that are IROLs. Consider revising to combine the two sub-requirements to remove unnecessary duplication and confusion. FAC-11-4 Requirement R8 requires RCs to provision of their SOL Methodology to other entities. Given that the changes to the FAC-11-4 standard require substantial documentation work on the part of many RCs, more time should be given for compliance. At least 36 months is recommended. Furthermore, given there will be changes coming to the IROL requirements in this very same standard maybe the compliance period should be extended to the compliance deadline associated with that version of the FAC-11 standard to avoid the burden of duplicating a great deal of work.

Response
Thank you for your comments. With regards to your suggestion for FAC-011-4 R3.3, the SDT has modified the proposed language to make it clear that System Voltage Limits should be greater than or equal to UVLS scheme and/or program set points. This requirement is important to ensure that RCs and TOPs are aware of what their UVLS set points are and operate in the interest of avoiding load shed where possible. With regards to your suggestion for FAC-011-4 R3.4, the SDT believes the proposed language is adequate. The intent of this requirement is to have the RC establish the lowest allowable System Voltage Limit for their RC area such that TOPs do not establish System Voltage Limits below that threshold. Ensuring coordinated setting of System Voltage Limits with other TOPs is essential for Reliable Operation in the RC's footprint. With regards to your suggestions regarding use of a common set of Facility Ratings and/or System Voltage Limits, the SDT has adjusted the proposed language in FAC-011-4 R2 and R3.5 to clarify the intent of the requirement. The TOP and its RC should be using a common set of Facility Ratings and System Voltage Limits. In response to your suggestion on forcing adoption of a transient voltage response criterion as per FAC-11-4 R4.1.2, the team feels strongly that one should be adopted by all RCs as it helps ensure reliability as facilities are able to stay connected during a fault if not directly connected to the faulted equipment. Though other methods may be used to approximate this, the SDT felt this is the most accurate industry-common approach to achieving this performance. The SDT agrees with the suggested wording to replace "instability risks are identified" in FAC-11-4 R4.4 for improved clarity and has made the revision. Thank you. The term "angular stability" in FAC-11-4 R4.1.3 was used to ensure transient voltage response and system damping criteria could be called out specifically to ensure industry would understand a criteria for system damping is required in the RC's methodology. In response to the comment regarding FAC-11-4 R4.5, the SDT believes description of details around studies performed in other RC areas is (or should be more specifically) addressed in the IRO-014 standard discussing RC-to-RC communication.

Requirement 5.2 of FAC-11-4 was designed to give the RC the authority to include additional contingencies, given their risk to the system as part of stability assessments, OPAs and/or RTAs. Though the SDT recommends the TOP and RC (and perhaps other entities) make this determination together, the RC has the ultimate authority on the matter. The SDT believes this an important requirement to maintain.

FAC-11-4 requirements R6.1 and R6.2 have identical wording to existing requirements R1.3 and R3.7 from current standard, FAC-011-3. FAC-11-3 IROL requirement related issues will be examined for revision following the MEITFs efforts. Thank you for noting this.

The SDT recognizes the need for more time to be given to entities to comply with the changes to the FAC-011-4 standard and recommends a period of 18 months from the time of applicability.

Comment	

FAC-011-4 Requirement R2 specifically states that the RC "shall include in its SOL Methodology the method for Transmission Operators to determine the applicable owner-provided Facility Ratings to be used in operations". It goes on to identify that the method "shall address the use of common Facility Ratings between the Reliability Coordinator and the Transmission Operators in its Reliability Coordinator Area". This requirement needs to be bounded such that the RC is not specifying in its methodology how a Transmission Operator and thus a Transmission Owner is required to rate its transmission facilities, up to and including the use of real time ratings. This would determine the amount of risk a Transmission Owner is subject to for its facilities. The standard should only specify the end objective and not the process to achieve that objective.

FAC-011-4 Requirement R3.2 introduces the concept of "Facility voltage Ratings". This is not a defined term and leaves room for interpretation. There is no standard that requires TO's to provide Facility Ratings for voltage. Before TOP's are required to operate to Facility Ratings for voltage there should be a requirement for TO's to provide Facility Ratings for voltage.

FAC-011-4 Requirement R4 seems to be somewhat duplicative of TPL-001-4 requirements R5 and R6. Consideration should be given to coordination of these requirements.

FAC-011-4 Requirement R5 includes language that requires the RC's SOL Methodology to include "the method for identifying the single Contingencies and multiple Contingencies for use in determining stability limits and performing Operational Planning Analysis (OPA's) and Real-time Assessments (RTA's)". Use of SOL's in OPA's and RTA's is covered in TOP-001 and TOP-002. The concept of requiring how SOL's should be used in OPA's and RTA's should be removed from this requirement. FAC-011-4 R7 is redundant with IRO-010-2 R1. As the SDT notes in its preface to FAC-011-4, SOLs are inputs to OPA and RTAs. As such, R1 of IRO-010-2 already requires the RC to maintain a documented specification of the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring and Real-time Assessments. This requirement included requirements for periodicity of providing the data. As such, R7 of proposed FAC-011-4 is redundant and should be deleted from the proposed standard.

Response
With regards to your suggestion for FAC-011-4 R2, the SDT agrees that the RC does not establish or dictate facility ratings for operations. Rather, the responsibility of the RC is to choose which of the applicable owner provided facility ratings are used to avoid conflicts between the RC and its TOPs during system operation. The SDT has chosen to modify the language in R2 to better reflect this. In response to your comment for FAC-011-4 R5, the intent of the requirement to have "the method for identifying contingencies for use….." was to be different from the TOP requirement to describe how SOL's should be used. The method for identifying contingencies for use in OPA/RTAs is specific to how to come up with which contingencies should be selected to determine SOLs; whereas, it's understood that "how SOLs are used…" is about the selection of the SOLs themselves as inputs to the OPA/RTA. Regarding your comment on FAC-11-4 R7, the SDT feels that it is important to include the periodicity in the SOL Methodology for provision of SOL data. IRO-10-2 R1 speaks to periodicity of receipt of data necessary for OPA and RTA which is not entirely redundant. Given the importance of timely provision of SOLs from the TOP to RC, the SDT feels that providing this guidance in R7 in addition to IRO-10-2 is beneficial.

FAC-011 R3.1

We do not agree with Part 3.1 as written since it implies that all BES (i.e. each and every) buses/stations within an RC or TOP area need to have a SVL. To meet this requirement, an RC/TOP will need to determine and list a large number of System Voltage Limits (SVLs), many of which have no impact on the BES voltage performance and hence serve little or no value to the determination of SOLs and/or IROLs.

The proposed definition of SVL is:

The maximum and minimum steady-state voltage limits (both normal and emergency) that provide for acceptable System performance.

With this definition, we interpret that there may be more than one SVL within an RC or TOP area, and that the identified SVLs are the limiting parameters with which to assess acceptable voltage performance on an RC or TOP system and their interconnected systems. An RC or TOP may identify a handful of buses/stations within their areas to be requiring the stipulation of SVLs, while deeming it unnecessary to stipulate SVLs on other buses/stations as acceptable voltage performance can be assessed/assured by observing the stipulated SVLs.

We therefore suggest Part 3.1 be reworded as follows:

R3.1. Require the identification of the critical BES buses/stations and associated System Voltage Limits with which to assess acceptable System performance

FAC-011 R3.2

This part is not required. Observing the more restrictive of the two – SVLs and Facility voltage Ratings, is the general practice for any RCs and TOPs. If the SDT wish to spell out this requirement explicitly, we propose the following wording:

3.2 Require that the more restrictive of the System Voltage Limits and the Facility voltage Ratings at the same bus/station be respected.

FAC-011 R3.4

This part is not required since all applicable SVLs (may be more than one) identified in the proposed Part 3.1 will be observed in the determination of SOLs. Identifying the lowest allowable SVL serves little or no purpose, or can be insufficient, in the determination of SOLs.

We suggest deleting Part 3.4

FAC-011 R3.5,6,7

The overall intent of these parts is to ensure the methodology specifies the use of common SVLs by those entities that need to determine SOLs around those buses/stations for which SVLs are identified. This can be achieved by combining them into the following proposed part:

3.5. Address the use of common System Voltage Limits by all entities in the Reliability Coordinator Area and the process to coordinate the determination of System Voltage Limits between neighboring Reliability Coordinators and Transmission Operators.

FAC-011 R4.4

The phrase "instability risks are identified" is misleading and does not really contribute to the objective of the requirement/standard. We assess that the intent of R4 is to present the method for determining stability limit, not to identify risks although they are the driver for developing stability limit. If the intent of that phrase is to present the stability concerns and/or the way to address such concerns through SOL determination, then we offer the following revised wording:

4.4 Describe how stability limits are determined, considering levels of transfers, Load and generation dispatch, and the applicable System conditions including any changes to System topology such as Facility outages;

FAC-011 R5

We interpret R5 to require identification of relevant single Contingencies AND multiple Contingencies for use in determining stability limits, and in performing Operational Planning Analysis (OPAs) and Real-time Assessments (RTAs), and any Planning Coordinator identified contingency events for use in determining stability limits. As such, and considering the umbrella wording in R5 and that Parts 5.1 to 5.3 essentially cover all contingency events, we do not see the need for Parts 5.1, 5.2 and 5.3. To add clarity, we propose R5 be revised, to include Part 5.4, as follows:

R5 Each Reliability Coordinator shall include in its SOL Methodology the method for identifying the single Contingencies and multiple Contingencies for use in determining stability limits, and in performing Operational Plans Analyses (OPAs) and Real-time Assessments (RTAs), and the method for considering the Contingency events provided by the Planning Coordinator in accordance with FAC-015-1, Requirement R6 to identify the Contingencies for use in determining stability limits.

Note: ERCOT does not support the response to Q6

Response

With regards to your suggestion for FAC-011-4 R3.1, the SDT has chosen to keep the reference to “buses/stations” as proposed. The SDT feels that it is necessary to clearly identify both stations and buses to ensure those who monitor station based limits (more often referenced by system operators) and those who are monitoring bus based limits (more typically referenced in power flow study groups) relate to this requirement. In addition, the term “System” is capitalized in the definition such that only BES equipment should have an associated System Voltage Limit unless an exclusion in made. The SDT contends the proposed language in FAC-011-4 R3.1 allows for the flexibility in setting System Voltage Limits you’ve suggested in your comments and proposed revision.

With regards to your suggestion related to proposed FAC-011-R3, subpart 3.2, the SDT has attempted to remove confusion regarding the use of the term “voltage ratings” by adopting the phrase “voltage based Facility Ratings” instead.

With regards to your suggestion for FAC-011-4 R3.4, the SDT believes the proposed language is adequate. The intent of this requirement is to have the RC establish the lowest allowable System Voltage Limit for their RC area such that TOPs do not establish System Voltage Limits below that threshold. Ensuring coordinated setting of System Voltage Limits with other TOPs is essential for Reliable Operation in the RC’s footprint.

With regards to your suggestions regarding use of a common set of Facility Ratings and/or System Voltage Limits, the SDT has adjusted the proposed language in FAC-011-4 R2 and R3.5 to clarify the intent of the requirement. The TOP and its RC should be using a common set of Facility Ratings and System Voltage Limits. The SDT agrees with the suggested wording to replace "instability risks are identified" in FAC-11-4 R4.4 for improved clarity and has made the revision. Thank you. In response to your suggestion for FAC-11-4 R5 rewording to consider an umbrella requirement for single and multiple contingencies, the SDT feels that it's important to distinguish the minimum set and types of contingencies that must be respected. This ensures clarity on specifically which contingencies must be a part of stability assessments, OPAs and RTAs. Therefore, the current language has been maintained in R5.1 with some small adjustments to the remaining subparts.

Comment	

1- We support the harmonization and approach to the new standards for the establishment of SOLs. However, we do have an important concern regarding the way the use of UVLS and UFLS in the establishment of stability limits was incorporated in the FAC-011-4 requirements. Although the requirements give good flexibility to the RC in identifying the set of contingencies applicable for SOL determination, they also impose performance requirements (SVLs and limited use of UFLS/UVLS) that do not make any distinction between the mandatory single contingencies and the complimentary multiple contingencies. Since the RC has flexibility to identify the relevant contingencies beyond the minimum requirements from R5.1.1, it should also have flexibility in the performance requirements for the allowed use of mitigation actions.

2- We think the level of description in sub-requirements R3.X for System Voltage Limits is a burden without added benefit to reliability. Why so much details for SVL and not for Facility Ratings? R3.5-3.7 are not needed. If coordination is an issue, it should be addressed in a single requirement for the whole standard. R3.2 is redundant with the application of FR in R2. R3.3 is an issue that should be addressed with the allowed used of UVLS under certain circumstances, not captured by SVL requirements. Different SVLs may be used for different contingencies, not just N-1. R3.4 is redundant with SVL definition.

3- R4.2 is a redundant cross-reference with 4.1 and R5 and does not bring any benefit to the remaining of the standard. R4.3 also is redundant since the RC has to describe how stability limits are established per R4 whether or not multiple TOPs are involved.

4- Concerning the selection of contingencies, it is understood that the RC has full flexibility to determine the appropriate multiple contingencies for its System, correct? If that is the case, the proposed standard should allow the same flexibility for the performance requirements associated with those contingencies, namely the use of UVLS and UFLS.

5- Although we appreciate the standard’s flexibility regarding the stability performance requirements in R4.1, there seems to be a lack of guidelines and minimum expected performance as in TPL (no mention of Cascading, instability, etc.).

Response	

Thank you for your comments. With regards to your suggestion for FAC-011-4 R3.3, the SDT has modified the proposed language to make it clear that System Voltage Limits should be greater than or equal to UVLS scheme and/or program set points. This requirement is important to ensure that RCs and TOPs are aware of what their UVLS set points are and operate in the interest of avoiding load shed where possible. With regards to your suggestions regarding use of a common set of Facility Ratings and/or System Voltage Limits, the SDT has adjusted the proposed language in FAC-011-4 R2 and R3.5 to clarify the intent of the requirement. The TOP and its RC should be using a common set of Facility Ratings and System Voltage Limits.

Comment	

Comment 1: It is a common concept in industry that the system should be operated as it is planned. The TPL-001-4 standard is one of the main regulatory drivers to the planning of the system, while the FAC standards regarding SOLs are important to the operation. While not possible to align the two standards entirely, there are some features of the TPL standard which may have merit for the FAC-011 standard revision which have not been addressed in the draft of the proposed revision of FAC-011-4. These include:

Voltage Criteria (TPL-001-4 R5)

Instability Criteria (TPL-001-4 R6)

Division of responsibilities (TPL-001-4 R7)

The Voltage criteria is present in both FAC-011-3 and TPL-001-4. While TPL-001-4 voltage criteria requirement includes steady state, post-contingency deviation, and transient voltage response, the proposed FAC-011-3 criteria has additional performance metrics. This presents a risk where the system may not be operated as it was planned, because the criteria proposed in FAC-014-3 could be more conservative than the criteria required by TPL-001-4. The Standard Drafting Team should take this opportunity to consider aligning the operational criteria in the proposed FAC-011-3 with that of TPL-001-4. CHPD recognizes that due to the variety of unknowns encountered in real-time, operational criteria should have more flexibility than system planning.

Comment 2: CHPD is also concerned by the requirements in R3.6. and R3.7. regarding coordination of these system limits. This is not well addressed in the Standard Drafting Material as to the intent and scope of the proposed coordination. If the expectation is simply to share, post, or distribute limits, then that would be a helpful clarification. If the expectation is to conduct additional coordination studies involving multiple parties and the RC, then it is clearly a greater body of work and should be addressed further and clarified by the Standard Drafting Team as to the nature of these expectations.

CHPD is in favor of the removal of R3.6. and R3.7. altogether, because the coordination of these is already essentially performed through the use of the OPA and RTA.

Comment 3: The continued use of margins in FAC-011-4 (also found in FAC-011-3) is another instance of mis-alignment between TPL-001-4 and FAC-011-3. CHPD recognizes that there is value to include an assessment of margin in the operational realm, but is also aware that this is a difference in the way the system is planned vs. operated, and in some instances may result in the system being operated to support a particular margin that wasn't necessarily planned through TPL-001-4 or other planning standards. CHPD recognizes that due to the variety of unknowns encountered in real-time, operational criteria should have more flexibility than system planning.

Comment 4: Regarding the voltage criteria proposed in FAC-011-4 R4, there are a number of concerns.

The use of the term 'steady-state voltage stability' in 4.1.1. is confusing. Steady state analysis is different than stability analysis. Please clarify this term. If this is the feature described in the 2003 blackout report, this would be the assessment of reactive power support.

Angular stability criteria is a new metric to the FAC-011 standard; this concept is discussed to some extent in the 2003 blackout report as well. It is assumed that this is the analog to the FAC-011-3 requirement R1.2.4 "The system demonstrates *transient*, *dynamic*, and voltage stability" (emphasis added). CHPD would prefer the transient and dynamic language from FAC-011-3 to be maintained, rather than 'angular'. The system damping criteria in 4.1.4. and the transient voltage response in 4.1.2 could be also included as part of the angular (transient/dynamic) criteria, and does not need to be specifically enumerated.

If the Standard Drafting Team feels prescriptive requirements are required over performance based requirements, CHPD believes that this requirement could be simplified to something similar to "The Reliability Coordinator shall have voltage reactive margin criteria" and "The Reliability Coordinator shall have stability criteria for a) transient voltage response, and b) system damping"

Comment 5: CHPD would also like to see a requirement for a definition of System Instability in the RC SOL methodology, analogous to the TPL-001-4 R6:

TPL-001-4 R6: "Each Transmission Planner and Planning Coordinator shall define and document, within their Planning Assessment, the criteria or methodology used in the analysis to identify System instability for conditions such as Cascading, voltage instability, or uncontrolled islanding."

CHPD finds the text of TPL-001-4 R6 adequate to incorporate into the proposed FAC-011-4, with the Transmission Planner and Planning Coordinator references updated to Reliability Coordinator. This is particularly important since the Reliability Coordinator is to identify IROLs, which are these types of system phenomena.

Comment 6: Requirement in FAC-011-3 R3.4 – "Identify the lowest allowable System Voltage Limit;" seems duplicative or redundant to the proposed definition of System Voltage Limit – "The maximum and ***minimum*** steady-state voltage limits (both normal and emergency) that provide for acceptable System performance."

The System Voltage Limit, in itself, should be the minimum allowable system voltage.

Comment 7: There is no mention of steady state thermal performance in the requirements for the Reliability Coordinator SOL methodology, nor language stating that SOLs shall not exceed associated Facility Ratings for thermal ratings (as found in the old FAC-010-3 R1.2). CHPD strongly encourages the Standards Drafting Team to add language supporting the operation within thermal limits to the proposed FAC-011-4 document, possibly in the vicinity of R4, which discusses stability and voltage criteria.

Response

Thank you for your comments.

With regards to your suggestion for FAC-011-4 R3.4, the SDT believes the proposed language is adequate. The intent of this requirement is to have the RC establish the lowest allowable System Voltage Limit for their RC area such that TOPs do not establish System Voltage Limits below that threshold. Ensuring coordinated setting of System Voltage Limits with other TOPs is essential for Reliable Operation in the RC's footprint.

With regards to your suggestions regarding use of a common set of Facility Ratings and/or System Voltage Limits, the SDT has adjusted the proposed language in FAC-011-4 R2 and R3.5 to clarify the intent of the requirement. The TOP and its RC should be using a common set of Facility Ratings and System Voltage Limits. In response to your comment regarding the use of the term "steady-state voltage instability" in FAC-11-4 R4.1.1, the SDT felt it was important to distinguish between voltage stability criteria applied in steady-state analysis vs. voltage stability criteria applications in dynamics, namely "transient voltage response" to ensure both criteria are included in the RC's SOL Methodology. The SDT felt steady-state voltage stability was a commonly used term in industry to describe the use of steady-state analysis conducted in the interest of determining voltage based stability limits that are, as you've stated, the result of a lack of reactive power support. Similarly, the term "angular stability" was used to ensure transient voltage response and system damping criteria could be called out specifically.

Comment	
It is unclear by the wording of R4 whether Transmission Operators determine stability limits or the RC. Based on R2 and R3, it is clear that the Transmission Operators develop Facility Ratings and System Voltage Limits based on the RC methodology. Based on R7, it says SOLs are communicated to the RC. One can assume this includes the stability limits as well, but R4 could be spelled out as a TOP task to develop stability limits (unless the door is intentionally being left open for the RC to determine stability limits in parallel to the TOP). It should be the TOP developing all of the SOLs and communicating them to the RC. The RC should only drive the methodology and determine which of the provided SOLs qualify as IROLs.

FMPA recommends a feedback loop be introduced to FAC-011-4 for the RC's SOL methodology, such as found in FAC-008-3 R5. This will provide for better coordination between the PC and the RC, improve the effectiveness of the RC's Stability assessment, and allow consideration of best Stability analysis practices within the RC's footprint.

It is not clear what the phrase "for use in performing OPAs and RTAs" as used in R5 is intending. Are just the RC's OPAs and RTAs required to use this list of contingencies, or are all entities performing OPAs and RTAs within the RC footprint required to use this list? It does not make sense for every TOP to use the same extensive list of contingencies, since they may not have a need to model the System beyond their immediate TOP area.

Additionally, as currently worded R5 requires Stability analysis to be run on all contingencies that qualify as P1 events under TPL-001-4, which would result in a tremendous amount of work, but very little beneficial insight. The ability to apply engineering judgement to select those events that are expected to result in more severe System impacts is needed.

FMPA sees the use of the term "normal clearing" (lowercase, but note that the capitalized, defined term is used in the bulleted list) in 5.1.1 as problematic. Breaker failure schemes meet both the definition of Delayed Fault Clearing and the definition of Normal Clearing as they are currently written. Is it the SDT's intent to require breaker failure be included when determining stability limits? If not, FMPA recommends changing "with normal clearing" to "without Delayed Fault Clearing".

Response	

Thank you for your comments.

The intent of the requirements around contingencies FAC-11-4 R5 is to have the method for prescribing how the contingency list(s) used in stability assessments, OPAs and RTAs. These lists could all be different depending on how widespread a stability phenomenon is, how large their footprint is within the RC's area, and what responsibility they've agreed to with their RC in performing those studies etc.

Furthermore, it was not the SDT's intent to imply a stability assessment must be run in all OPA and RTAs. Rather, it was intended that stability assessments must be performed considering, at a minimum, those contingencies in R5.1. Separately, and as indicated in R5, the SDT intended all contingencies specified in R5.1 to be run, at a minimum, as part of OPA and RTA, which may or may not include a stability assessment (if proven unnecessary due to prior studies). Though the SDT recommends the TOP and RC come to a mutual decision on the contingency set used in OPA and RTA and for stability assessments, the ultimate authority must rest with the RC and these decisions should be reflected in the RC's methodology.

Comment

The SPP Standard Review Group has a concern in reference to the drafting team intents for Requirement R2. From our perspective, this proposed language may suggest that the RC will receive the authority to tell the Transmission Owner how to determine their Facility Ratings. We would ask that the drafting team provides more clarity on the intent for this Requirement.

The SPP Standard Review Group has a concern that the drafting team has potentially created a new term by adding the term "voltage" between Facility Ratings. We recommend that the drafting team uses the proposed phrase "voltage Facility Ratings**."**

The SPP Standards Review Group has a concern that the drafting team may have caused confusion by not including the actual FAC-011-3 Standard in the posted material. From our perspective, this creates an inconsistency and disconnection on what the drafting teams intents

are for this project. For future reference, we would suggest the drafting team include all pertinent documentation to help provide clarity and demonstrate consistency on what their intents and goals are for the project. The SPP Standards Review Group has a concern pertaining to the language in Requirement 6 Subpart 6.2. There is a confusion on which term “violating” or “Exceedance” should be used in the Subpart language. From our perspective, the drafting team has put a lot of emphasis on the term “Exceedance” as they have developed a definition for the term “SOL Exceedance” and we feel that the term “Exceedance” should be referenced in the language to promote consistency with the intents of the drafting team.

Comment	
The language in Requirement R3 Part 3.2 that refers to “Facility voltage Ratings” is problematic. Splitting a NERC-defined term (Facility Ratings) with voltage isn’t a good practice. Suggested language: “the maximum and minimum voltage Facility Ratings”.	

WAPA has a concern regarding the wording for **FAC-011-4 R4** and **R5** and the linkage between**.**

As written R4 implies **required** Stability assessments in all OPAs and RTAs.

R4. Each Reliability Coordinator shall include in its SOL Methodology the method for determining the stability limits to be used in operations. The method shall:

{C}**4.1.** ….

{C}**4.2.** Require that stability limits are established to meet the criteria specified in Part 4.1 for the Contingencies identified in Requirement R5.

R5. Each Reliability Coordinator shall include in its SOL Methodology the method for

identifying the single Contingencies and multiple Contingencies for use in determining stability limits and performing Operational Planning Analysis (OPAs) and Real-time Assessments (RTAs). The method shall include:

WAPA understands that was not the intent of the SDT and suggests this minor modification:

4.2. Require that ***identified*** stability limits meet the criteria specified in Part 4.1 for the Contingencies identified in Requirement R5 ***for OPAs and RTAs***. **(Or)**

4.2. Require that stability limits are established to meet the criteria specified in Part 4.1 for the Contingencies identified in Requirement R5. And remove stability from the body of R5 and add a R5.5 (as initially suggested by the MRO-NSRF with WAPA's modification)

A proposed revision to R5 to address this concern is the addition of a new requirement R5.5, which would read: "R5.5 The applicability of the identified single Contingency and multiple Contingencies **as agreed to by** its TOPs for use in determining stability limits."

Lastly, it appears "additional" is missing from Requirement 5.3

5.3. Any ***additional*** types of multiple Contingency events identified for use in determining

stability limits, or for use in performing OPAs and RTAs. Without it, R5.3 is redundant to the body of R5.

With regards to your suggestion for FAC-011-4 R2, the SDT agrees that the RC does not establish or dictate facility ratings for operations. Rather, the responsibility of the RC is to choose which of the applicable owner provided facility ratings are used to avoid conflicts between the RC and its TOPs during system operation. The SDT has chosen to modify the language in R2 to better reflect this.	
Scott Downey - Peak Reliability - 1	
Answer	
Document Name	
Comment	
Peak believes that requirement R5 should contain a subpart that requires the RC's SOL Methodology to include a description of the performance requirements for Contingencies more severe than the single Contingencies listed in part 5.1.1. In operations, the operating criteria for single Contingencies is often more stringent than that of more severe Contingencies such as breaker failure Contingencies or common structure Contingencies. Accordingly, some RC's only examine these more sever Contingencies for instability, Cascading, or uncontrolled separation, and they may not screen such severe Contingencies for thermal or voltage exceedances as described in the proposed definition of SOL Exceedance. The SDT could include a subpart 5.5 which states, "The minimum performance requirements for Contingencies more severe than those described in subpart 5.1.1."	
Likes 0	
Dislikes 0	
Response	
Thank you for your comment. Performance requirements for single and multiple contingencies are identified through imposing the requirements in FAC-11-4 R2, R3 R4 in conjunction with the proposed SOL Exceedance definition. These requirements give the RC the latitude to impose a different set of	

requirements for more severe contingencies if they so choose. Creating a requirement for minimum performance of more severe contingencies may increase reliable operation to some degree but could also tie the hands of some entities that may not have the infrastructure to operate and reliably server customers to respect such severe contingencies which are usually much less likely to occur.

With regard to the proposed Requirement R2, CenterPoint Energy believes that the proposed language could be mistakenly interpreted as giving the Reliability Coordinator the discretion to impose unacceptable Facility Ratings to Transmission Operators. CenterPoint suggests the following language for the proposed Requirement R2:

“Each Reliability Coordinator shall include in its SOL Methodology a mutually agreeable method for Transmission Operators to determine the applicable owner-provided Facility Ratings to be used in operations.”

With regard to the proposed Requirement R6.2, the existing legacy language uses the word “violating” in reference to an exceedance of an SOL that qualifies as an IROL. CenterPoint Energy recommends the SDT revise the wording so that there is no negative connotation to the context of the proposed requirement.

CenterPoint Energy suggests the following language for the proposed Requirement R6.2:

“R6.2 Criteria for determining when an SOL exceedance qualifies as an IROL and criteria for developing any associated IROL TV.”

Not directly related to questions 2-5, the NERC SAR related to Project 2015-09 identified the need "to address the issues identified in the FAC PRRs related to the application of the IROL term." The proposed FAC-011-4 does not appear to have addressed the consistent application of IROL and simply maintains the language from FAC-011-3.

SRP appreciates the efforts of the SDT and supports how the proposed changes generally reduce redundancy and provide clarity in communications. The SDT has also made improvements in further linking the planning and operational limits. SRP also has some recommendations for the SDT: In FAC-011-4 R1, SRP recommends retaining the phrase "documented methodology". In FAC-011-4 4.4, SRP recommends requiring a process for acknowledgement of new/changing stability limits by operational personnel.

R4.6 specifically does not allow the use of UFLS in the establishment of stability limits, which is acceptable for all single contingencies and multiple contingencies as define by P1-P7 events in Table 1 of TPL-001-4. However, R5.4 requires consideration of contingency events by the PC in R6 of FAC-015-1. It could be that the Planning Assessment identified Cascading following an extreme event even with UFLS included. It's	

unclear whether the RC will consider this a valid stability limit or not. There should be limits placed on the scope of R6 of FAC-015-1 to P1-P7 events to allow the exclusion in R4.6 to remain.	
Likes 0	
Dislikes 0	
Response	
Thank you for your comment. The SDT feels that this decision is up to the RC given that this contingency is extreme and beyond those required to be respected as per the proposed FAC-011-4 requirements. There are times when, unexpectedly, extreme events may become a relevant risk to system reliability and warrant SOLs be put in place to respect them. For this reason the SDT feels that the requirement should not preclude the RC from recognizing extreme events relying on safety nets such as UFLS.

The intent of Proposed R2 needs more clarification as to which entities are using the same rating, for example: RC & TOP? or RC & all TOPs for the same facility? Is the intent to have all TOP's under the same RC using the same ratings methodology? The intent of Proposed R5.4 is unclear. We believe the Planning Coordinator should provide the established stability limit and the method by which the RC should assess the system against established stability limits. Maybe an example would help the understanding. Proposed R8.1 needs to define under what circumstances a nonadjacent Reliability Coordinator would have a reliability-related need for the Reliability Coordinator's SOL Methodology.

Response	

Thank you for your comments. The SDT agrees with your suggestion and FAC-011-4 R2 has been modified accordingly. With regards to your comment on FAC-11-4 R5.4, the intent of this requirement is to have the RC's methodology describe how to identify which of the contingency events provided by the Planning Coordinator (PC) will be considered to determine stability limits in Operations. Unless the PC is the entity responsible for determining stability limits using performance criterion used in Operations, the RC or TOP will need to study the particular contingency using performance criterion for Operations to create a System Operating Limits (SOL) suitable for use in OPAs and RTAs. With regards to your comment on FAC-011-4 requirement R8.1, the SDT feels this language should be maintained. RCs may require SOL Methodology updates from non-adjacent RCs where the impact of contingency events may reach across another RC's footprint into their footprint or conditions in non-adjacent footprints may impact transfer limits in a non-adjacent RC's area.

The first sentence of FAC-011-4 R2 should be clarified as follows: “Each Reliability Coordinator shall include in its SOL Methodology the method for Transmission Operators to determine which owner-provided Facility Ratings are applicable that are to be used in operations.” The proposed clarification makes it more obvious that the SOL Methodology only determines which owner-provided ratings are applicable for use in operations.

FAC-011-4 R3.1: Requirement R3.1 contains the term "stations" and uses an unconventional designation of "buses/stations."

- The NERC BES definition does not require entities to identify BES stations, which would make it problematic to use the requirement as written.
- Additionally, "buses/stations" is an unclear designation where entities may understand that System Voltage Limits shall be created for all Facilities in a station, including both BES and non-BES Facilities in that station. We do not believe this is the intent of the SDT so this should be clarified.
- Consider modifying R3.1 language to state "Require that BES buses have an associated System Voltage Limit except for the BES buses that may be excluded as specified in the RC's SOL methodology."

R4.5 and a new R5.5: Requirements R4.2, R4.4, R4.5, and R5 become applicable to all TOPs through proposed FAC-014-3 R2.

- Given the language of R4.4, which requires "instability risks" to be "identified," ATC believes the standard overreaches at R5 when it includes stability analysis within OPAs and RTAs as determined by the RC. TOP-001-3 R13 and R14 and TOP-002-4 R1 already require the TOP study SOLs in RTAs and OPAs, and inclusion of OPAs and RTAs in R5 is redundant with TOP-001-3 and TOP-002-4. The TOPs are the local experts on the stability of their systems and the R5 requirement language should not force additional stability analysis beyond TOP-001-3 and TOP-002-4 in the OPA and RTA on to a TOP if stability is not an issue for its system. ATC recommends striking “and performing Operational Planning Analysis (OPAs) and Real-time Assessments (RTAs)” from R5.

A proposed revision to R5 to address this concern is the addition of a new requirement R5.5, which would read: "R5.5 The applicability of the identified single Contingency and multiple Contingencies to its TOPs for use in determining stability limits."

Similarly, given the applicability of the model requirements stated in R4.5 to the TOPs performing stability studies under the RC SOL methodology, through FAC-014-3 R2, clarity is needed that a TOP does not need to have a model of similar scale or scope as the RC will use. Per TOP-003-3, TOPs determine what data is needed to perform their OPAs and RTAs and the scope of this data is likely a subset of the RC's data, whether covered by IRO-010-2 or proposed FAC-011-4 R4.5. The revision should make it clear that the breadth of the RC's model does not necessarily need to be replicated by the TOP.

A proposed revision to R4.5 to address this concern would be the addition of the following language to the current proposed R4.5 language: "… necessary to determine different types of stability limits, including applicability of the model detail to studies performed by its TOPs."

FAC-011-4 R3.2: the term used is "Facility voltage Ratings." The defined term is "Facility Ratings." Remove voltage or reword to say "Facility Ratings for voltage."

FAC-011-4 R6.2: The term "violating" relates to previous Standard. Suggest: "Criteria for determining when violating an SOL qualifies as an IROL and criteria for developing any associated IROL Tv."

FAC-011-4 R7 is redundant with IRO-010-2 R1. As the SDT notes in its preface to FAC-011-4, SOLs are inputs to OPA and RTAs. As such, R1 of IRO-010-2 already requires the RC to maintain a documented specification of the data necessary for it to perform its Operational Planning Analyses, Real-time monitoring and Real-time Assessments. This requirement included requirements for periodicity of providing the data. As such, R7 of proposed FAC-011-4 is redundant and should be deleted from the proposed standard.

FAC-011-4 R8 does not specify how far in advance of the effective date of the SOL Methodology the RC must provide its SOL Methodology to other entities. With other standard requirements that Transmission Operators develop their SOLs in accordance with the RCs SOL Methodology, changes that would require a new determination of SOLs based upon the new methodology could take some time to develop. It is recommended that the RC provide its methodology at least 30 days prior to the effective date to give entities an opportunity to evaluate changes to the methodology and implement any changes necessary to their SOLs prior to the effective date of the new SOL Methodology. Without sufficient time a registered entity could find themselves in violation of standard requirements due to lack of time to make changes to SOLs according to the new methodology.

Thank you for your comments.
With regards to your suggestion for FAC-011-4 R2, the SDT agrees that the RC does not establish or dictate facility ratings for operations. Rather, the responsibility of the RC is to choose which of the applicable owner provided facility ratings are used to avoid conflicts between the RC and its TOPs during system operation. The SDT has chosen to modify the language in R2 to better reflect this.

With regards to your suggestion related to proposed FAC-011-R3, subpart 3.2, the SDT has attempted to remove confusion regarding the use of the term “voltage ratings” by adopting the phrase “voltage-based Facility Ratings” instead.

With regards to your suggestion for FAC-011-4 R3.1, the SDT has chosen to keep the reference to “buses/stations” as proposed. The SDT feels that it is necessary to clearly identify both stations and buses to ensure those who monitor station based limits (more often referenced by system operators) and those who are monitoring bus based limits (more typically referenced in power flow study groups) relate to this requirement.

In response to the comment on FAC-11-4 R4.5, the SDT feels the language in the requirement R4.5 is clear as stated and works well with requirement R2 in FAC-014-3. The extent of an RC’s area that needs to be modelled as part of TOP stability studies may vary depending on how widespread the stability phenomenon is, how large their footprint is within the RC’s area, and what responsibility they’ve agreed to with their RC in performing those studies. Therefore, this type of clarification is better left to the RC’s SOL Methodology rather than prescribed in the FAC-11-4 R4.5requirement.

Furthermore, it was not the SDT’s intent to imply a stability assessment must be run in all OPA and RTAs. Rather, it was intended that stability assessments must be performed considering, at a minimum, those contingencies in R5.1. Separately, and as indicated in R5, the SDT intended all contingencies specified in R5.1 to be run, at a minimum, as part of OPA and RTA, which may or may not include a stability assessment (if proven unnecessary due to prior studies). Though the SDT recommends the TOP and RC come to a mutual decision on the contingency set used in OPA and RTA and for stability assessments, the ultimate authority must rest with the RC and these decisions should be reflected in the RC’s methodology.

FAC-11-4 requirements R6.1 and R6.2 have identical wording to existing requirements R1.3 and R3.7 from current standard, FAC-011-3. FAC-11-3 IROL requirement related issues will be examined for revision following the MEITFs efforts. Thank you for noting this.

The SDT agrees with your proposal for requirement R8 in FAC-011-4, such that a period of at least 30 days be given to those entities in receipt of the RC's methodology, to complete any implementation as a result of changes to the RC's methodology. The proposed requirement R8 has been updated to reflect this change.

LES is concerned that Requirement R2 does not provide adequate assurance that the Reliability Coordinator will respect the Facility Ratings established by the TO, or the TO's FAC-008 methodology. As written, the language is vague and appears to allow the RC to determine the Facility Ratings and voltage ratings that a TO must use. Additionally, based on the NERC definition of Facility Rating, there is a potential conflict between System Voltage Limits and Facility Ratings as both can utilize voltage ratings. At minimum, consideration should be given to potential inconsistencies that may develop between FAC-011-4, FAC-008-3 and the definition of Facility Rating as a result of the project.

FAC-011-3 R2 and R3 add an additional translation layer on top of FAC-008 which already defines the determination of Facility Ratings. Could this additional translation allow for the RC to impose ratings and risk that the TO owning the facility is not willing to accept? An example is forcing the use of dynamic ratings. The language in R3.3 that requires the System Voltage Limit to be higher than the UVLS setting nullifies the ability to use local UVLS schemes. There exist local UVLS schemes that have been planned to operate at the emergency low voltage limit to protect local load and meet TPL requirements for prior outage (N-1-1) conditions. Effectively disallowing the use of local UVLS schemes to achieve acceptable system performance was likely not the intent. We suggest modifying the R3.3 language to address this unintended consequence. Requiring the operating limit to be more restrictive does not align with FAC-015 philosophy where the planning limits should be more restrictive.

Comment

BPA supports R1 and R2. However, BPA does not agree with breaking out R4. It should be the impacted TOPs’ responsibility to coordinate, establish and agree upon the stability limits, not the RC’s.

Likes 0	
Dislikes 0	

Response

The RC is the highest level of authority in the operating horizon, as such, the RC should have the highest purview and wide-area understanding of the stability limit that impacts more than one TOP. The SDT believes that stability limits that impact more than one TOP should be supervised by the RC who has the wide-area responsibility.

A stability limit that impacts multiple TOPs could be found by the RC, it could be a discussion initiated by a TOP, or it could be the RC reviewing the TOP Stability limits and finding a common one. The proposed language is not specific on the method the RC uses to establish this limit, it could be via the RC’s own study work, it could be the result of combined RC and TOP work, or it could be a verbatim adoption of the TOPs work.

The requirement places the ultimate responsibility on the RC to establish the limit, but by design does not specify how those limits are found or how the RC establishes them.

Comment	
Xcel Energy feels that R2 should be expanded so that the RC has a role for SOLs that impact more than one TOP, similar to R4. The alternative would be for R4 to be expanded beyond "stability limit" to be more general SOL that impacts more than one TOP. An example would be an interface/path/flowgate that is thermal limited below its Facility Rating due to other thermal (or voltage) limited transmission facilities in multiple TOPs. This concern would likely be addressed if the revised SOL definition is approved and is effective simultaneously with the FAC standards - we recognize that the revised SOL definition makes it clear that the MW limit for an interface/path/flowgate is an SOL only if it is a stability limit.	
Likes 0	
Dislikes 0	
Response	
The SOL whitepaper approved by NERC noted that the SOL is based on the actual set of Facility Ratings, System Voltage Limits and stability limits that are to be monitored for the pre- and post-Contingency state. How an entity remains within these SOLs can vary depending on the planning strategies, operating practices and mechanisms employed by that entity. An example would be the utilization of interface/path/flowgate that is thermal limited below its Facility Rating due to other thermal (or voltage) limited transmission facilities in multiple TOPs. The SDT believes R2 is sufficient and does not need to be expanded. This approach will provide sufficient flexibility without creating potential confusion on who has the responsibility to establish SOL.	

Cynthia Kneisl - Midwest Reliability Organization - 1,2,3,4,5,6 - MRO, Group Name MRO NSRF	
Answer	No
Document Name	
Comment	
The NSRF is not convinced the RC's have the experience necessary to determine stability limits where the limits impact more than one TOP. Although it may make sense to designate the RC as responsible, historically this has been done by TOPs cooperating with each other to determine the limits. The concern is the RCs may not understand the nuances associated with all of their footprint.

This is a helpful proposed clarification. However, in the definition of IROL from the NERC glossary an IROL is: "A System Operating Limit that, if violated, could lead to instability, uncontrolled separation, or Cascading outages that adversely impact the reliability of the Bulk Electric System." Therefore, one must calculate what the SOL is first, before determining whether the SOL is an IROL. If the RC is not required to calculate SOLs, how will it be able to determine whether or not the SOLs are IROLs? CHPD would propose that both TOPs and the RC calculate SOLs, but only the RC has the duty to determine which SOLs are IROLs. This would be consistent with the current FAC-014-2 approach and ensure that the RC is calculating SOLs so it can identify which SOLs are IROLs. If the RC is not calculating SOLs, there is the potential risk that the RC could miss an SOL which should be classified as an IROL.	
Likes 0	
Dislikes 0	
Response	
All IROLs are SOLs. This requirement requires RC to establish IROLs. The RC methodology may utilize the two step process whereby an SOL is established first. The current requirement allows flexibility on how the RC establishes the IROL. The SDT believes that there does not need to be a "two steps" process.

Comment	
FMPA appreciates the desire to clearly indicate which entities have the responsibility for establishing SOLs and IROLs, but believes additional clarity in FAC-014-3 is needed. First, it is not clear who has the responsibility to run the stability studies, or how often to run them. Another concern is that IROLs, SOLs, and stability limits are not mutually exclusive. Are TOPs precluded from identifying IROLs?	
Likes 0	
Dislikes 0	
Response	
The SDT believes the ultimate responsibility to establish IROLs belongs to the RC. The potential instability, uncontrolled separation, or Cascading outages could be found by the RC or could be a discussion initiated by a TOP. The proposed language is not specific on the method the RC uses to establish this limit, it could be via the RC's own study work, it could be the result of combined RC and TOP work, or it could be a verbatim adoption of the TOPs work. Requirement places the ultimate responsibility on the RC to establish and declare the IROL. This is important because there are other IRO Reliability Standard requirements that need to be coordinated by the RC.

Answer	No
Document Name	
Comment	
We agree with R1 and R2, but we don't see the need to specifically require the RC to establish stability limits per R4 when more than one TOP is impacted. This should be addressed through the determination of SOL/IROLs per R1 and R2 in FAC-014 and the requirement that the methodology from FAC-011 include the method for determining stability limits. There is an unnecessary redundancy.

The RC is the highest level of authority in the operating horizon, as such, the RC should have the highest purview and wide-area understanding of the stability limit that impacts more than one TOP. The SDT believes that stability limits that impact more than one TOP should be supervised by the RC who has the wide-area responsibility.

A stability limit that impacts multiple TOPs could be found by the RC, it could be a discussion initiated by a TOP, or it could be the RC reviewing the TOP Stability limits and finding a common one. The proposed language is not specific on the method the RC uses to establish this limit, it could be via the RC's own study work, it could be the result of combined RC and TOP work, or it could be a verbatim adoption of the TOPs work.

The requirement places the ultimate responsibility on the RC to establish the limit, but by design does not specify how those limits are found or how the RC establishes them.

Leonard Kula - Independent Electricity System Operator - 2	
Answer	No
Document Name	
Comment	

Without stating requirements for performance criteria and assessment methodology for what SOLs qualify as an IROL, the roles of each entity in this matter remains unclear.

Likes 0	
Dislikes 0	
Response	

The requirements related to IROL are kept consistent with the current process. These requirements present clear role regardless the performance criteria. The requirement places the responsibility to TOP to establish SOL and places the responsibility to RC to establish IROL and stability limits that involve multiple TOPs.

Laurie Williams - PNM Resources - Public Service Company of New Mexico - 1	
Answer	No

PNMR agrees with R1 and R2 but proposes the following language for R4: Each Reliability Coordinator, in conjunction with the impacted Transmission Operators, shall establish stability limits to be used in operations when the limit impacts more than one Transmission Operator in its Reliability Coordinator Area in accordance with its SOL Methodology.

Comment	
ATC believes these changes are acceptable if the SDT adds a new requirement R4.x to FAC-011-4 as explained above in our comments to question #6 where we recommend a new requirement that requires the RC to identify how they will determine "impact[ed]" entities.

While AEP does not object to R1 as proposed, we believe that Transmission Operators should be afforded opportunity to provide input into the process, even if not specifically designated within the standard.	
Likes 0	
Dislikes 0	
Response	
The proposed language is not specific on the method the RC uses to establish limit, it could be via the RC's own study work, it could be the result of combined RC and TOP work, or it could be a verbatim adoption of the TOPs work. The requirement places the ultimate responsibility on the RC to establish limit, but by design does not specify how those limits are found or how the RC establishes them. The current language allows this without taking away flexibility and potential confusion on the responsibility.	
Scott Downey - Peak Reliability - 1	
Answer	Yes
Document Name	
Comment	
Peak agrees with the suggested approach. One point of clarification. Proposed requirement R4 states, "Each Reliability Coordinator shall establish stability limits to be used in operations when the limit impacts more than one Transmission Operator in its Reliability Coordinator	

Area in accordance with its SOL Methodology." Peak interprets this language to allow the RC the flexibility to either calculate this type of stability limit itself (i.e., the RC performs the calculation), or to utilize a TOP-calculated stability limit as the "established" stability limit, provided that the RC and the impacted TOPs accept its use. Please confirm that Peak's interpretation is accurate.

Colby Bellville - Duke Energy - 1,3,5,6 - FRCC,SERC,RF, Group Name Duke Energy	
Answer	Yes
Document Name	
Comment	

While Duke Energy agrees with the proposal of dividing the existing R1 into three requirements, we request the SDT to consider whether there is a reliability gap in allowing only the RC to establish IROLs. We recommend the drafting team consider the following:

R2. Each Transmission Operator shall establish SOLs (including the subset of SOLs that are IROLs) for its portion of the Reliability Coordinator Area consistent with its Reliability Coordinator's SOL Methodology.

Likes 0	
Dislikes 0	

Response

The SDT believes the ultimate responsibility to establish IROL belong to the RC. The SDT does not preclude RC involvement in helping establish SOLs especially where the RC's expertise may benefit the TOP.

The potential instability, uncontrolled separation, or Cascading outages could be found by the RC or could be a discussion initiated by a TOP. The proposed language is not specific on the method the RC uses to establish this limit, it could be via the RC's own study work, it could be the result of combined RC and TOP work, or it could be a verbatim adoption of the TOPs work.

The requirement places the ultimate responsibility on the RC to establish and declare the IROL. This is important because there are other IRO Reliability Standard requirements that need to be coordinated by the RC.

No modification was made to R2.

Allie Gavin - Allie Gavin On Behalf of: Michael Moltane, International Transmission Company Holdings Corporation, 1; - Allie Gavin	
Answer	Yes

Document Name	
Comment	
Provided that the RC is limited in its ability to usurp the Transmission Owners rights in determining how Facility Ratings are determined, which are major components in SOL determination, than this proposal is acceptable. If the RC is not limited, then this is not acceptable as the RC should not be given the latitude to determine the amount of risk a Transmission Owner will accept through setting their methodology in determining an SOL, specifically a Facility Rating. The standard should only specify the end objective and not the process to achieve that objective.

8. Existing FAC-014-2, Requirement R5, R5.2 requires the Transmission Operator (TOP) to provide its SOLs to its Reliability Coordinator (RC) and Transmission Service Providers (TSPs) that share its portion of the RC Area. The SDT is proposing in Requirement R3 of FAC-014-3 to exclude the TSPs from that communication chain. Other requirements in existing standards (MOD-028-2, Requirement R7, MOD-029-2a, Requirement R4, and MOD-030-3, Requirement R2.6) require the TOP to provide the Total Transfer Capabilities (TTCs), Total Flowgate Capabilities (TFCs), along with supporting information and assumptions to TSPs. Because the TTCs and TFCs already reflect the impact(s) of any SOLs, the SDT deemed retention of the existing language unnecessary. Do you agree with the proposed change? If not, please explain.

NPPD agrees with removing TSPs from the notification requirements. The remainder of the requirement is also redundant with IRO-010-2 R1. As SOLs are a necessary input for OPA and RTA, the communication of them is required in the RC's data specification. As a result, including them here is redundant and unnecessary. Yes, the RC needs to know about changes to SOLs. The mechanism to notify them already exists in the data specification required by IRO-010-2 R1.	
Likes 0	
Dislikes 0	
Response:	
The team agrees that the information could be asked for by the RC under the IRO standards however we believe it is sufficiently important that it should be called out in its own requirement within the body of the SOL standards.

9. The SDT relocated the reliability objectives of existing Requirement R6 of FAC-014-2 into Requirement R6 of proposed Reliability Standard FAC-015-1 such that all Planning Coordinator and Transmission Planner responsibilities will be housed within one standard. Do you agree with the proposed change? If not, please explain.

Aaron Cavanaugh - Bonneville Power Administration - 1,3,5,6 - WECC	
Answer	No
Document Name	
Comment	
BPA does not see the need for a new planning standard. The objective could be better accomplished by moving the requirement to existing planning standards. The annual system assessment is required to be provided to the RC per NERC standard IRO-017-1. The RC is in a better position to communicate with affected TOPs in the RC area if instability or uncontrolled islanding is identified in the system assessment.

The drafting team believes that these requirements could be incorporated into a future revision of TPL 001 and FAC 013, however as a stop gap the team has proposed FAC 015 since that level of revision to the TPL 001 and FAC 013 would best be a separate SAR effort.	
Mike Smith - Manitoba Hydro - 1, Group Name Manitoba Hydro	
Answer	No
Document Name	
Comment	

Manitoba Hydro agrees that the Planning Coordinator responsibilities do not need to be in FAC-014-2. Manitoba Hydro would prefer if the responsibilities are related to FAC-013 or TPL-001 that the requirements be housed in one of those standards rather than create a new standard.

The drafting team agrees that these requirements should be incorporated into a future revision of TPL 001 and FAC 013, however as a stop gap the team has proposed FAC 015 since that level of revision to the TPL 001 and FAC 013 would best be a separate SAR effort.

Comment	

SCE finds the new SOL/IROL construct to be clearer and more useful. As the drafting team points out, Operations Time Horizon SOLs are not necessarily included in Planning Assessments required by TPL-001-4. SCE supports the reliability objectives established by FAC-015-1 and the relocation of these objectives from the in-effect FAC-014 to the proposed FAC-015.

ATC has the following additional comments on proposed FAC-014-3: R3: The SDT should strike requirement R3 since the content of this requirement is already covered by NERC standard IRO-010-2 R1 (i.e. this information or data is needed by the RC to perform its OPA and RTA as covered by R1.1). R4 and R5.2 through R5.4: The term "impacts" and "impacted" are used without definition. See ATC's comments to question #6 above about the need for a new sub-requirement under R4 of FAC-011-4 to ensure how impacted parties are identified is addressed in the RC's SOL methodology.

Response	
The team believes there is some overlap with the TOP 003 and IRO 010 standards, but also believes the communications identified in FAC 14 are important enough to be called out explicitly rather than covered under the more general TOP/IRO requirements. Also TOP 003 does not currently require the RC to provide data to the TOP and only addresses TOP to TOP communication. The terms "impacts" and "impacted" are used in other standards. There is certainly room for an RC to further clarify how they determine if an entity is "impacted" however the team does not believe it's necessary to be more specific within the NERC standard.

We believe it will be more efficient for RCs to make their SOLs available to impacted entities through automated mechanisms, such as an on-line database portal, rather than providing the information as proposed. The proposed expectation would require direct communication between the RC and the impacted entities that would be documented through electronic communications or voice recordings. This would be a compliance burden on all entities involved. Moreover, this approach could introduce a natural latency when the RC provides the SOL information to external entities. This latency could impact a PC or TP who could have partially completed a Planning Assessment, only to find that the SOL data they used is outdated and that the assessment will need to be restarted. By pushing this information to an on-line portal, impacted entities can then pull the most current data set for monitoring and assessment purposes. We believe this change would convert the requirement to a more risk-based performance approach that shifts the focus of risk to the availability of the automated mechanisms.

We observe that part 5.4 is the only portion of this requirement that expects the RC to provide updated information to external entities. We ask the SDT to clarify this discrepancy in the other external entities identified in the requirement.

The proposed standard appears to miss the possible coordination between RC and an adjacent RC, particularly in the instance that an impacted TOP from an adjacent Reliability Coordinator Area would need information related to SOLs. There currently is no obligation listed under Requirement 5 that captures this instance.

We ask the SDT to move the IROL-related critical information to Requirement R1 where the RC is obligated to establish the IROL. The references listed under Requirement R5 are confusing, as they only pertain to the PC. For part 5.4, we believe the RC should provide the value of the stability limit or IROL, as identified in part 5.2.1, to an impacted TOP within its Reliability Coordinator Area. We believe Requirements R1 and R6 should be combined, as there is no expected timeframe identified when a RC is required to provide a list of generation or transmission Facilities that are critical to the derivation of the IROL. Transmission Owners ad Generation Owners could have compliance implications if the information is not provided in a timely fashion. The provision of this information should be done as soon as the IROL is established.

Response	
o (Data Sharing) the team agrees and have modified the measure for R5 (and R6) of FAC 014 to better reflect that an online sharing of data would be acceptable. o (Part 5.4 updated information to other entities): Every part under R5 requires that information is provided on a schedule, and every time that information is provided it will have the current values. Part 5.2 requires that the PC receive the full list of information from the RC on an annual basis, receiving not only new values but also updated values and unchanged values. Part 5.4 specifies that the RC provides the data in 5.2.2-5.2.5 when it is first established, and thereafter provides only changes to the information on the agreed to time frame. So the PC and the TOP are both receiving the same information. The PC receives a full set of information each year. The TOP receives the full set of information once, and then only receives the changes to that data thereafter. Of course part 5.4 does not preclude the RC from sending the full set of information each transmittal, rather than just the changes. o *(RC to adjacent RC)* The drafting team believes that the specific case of SOL and IROL communication between RC's can occur under IRO-10-2 and does not need to be addressed in the FAC 014 standard. o *(IROL information to R1) The list of information under part 5.2 is for both Stability Limits and IROL. The list is referenced again in part 5.4 as needing to be sent to the TOP, and for brevity is not repeated under part 5.4. If the list were moved under R1 then it would apply to only IROL and not stability limits.*	

- (5.4 value of limit): Part 5.3 requires the sharing of the Stability and IROL limit values with the Transmission Operator and is a separate part from 5.4 to better accommodate different methods and time frames for providing the limits vs providing the additional information. This is based on the assumption that the limits may change more frequently than the underlying support information.
- (R1/R6 combine) The current requirement specifies that the Reliability Coordinator must communicate this information. This presumes that to show compliance the Reliability Coordinator will not only provide the information when first developed, but would also respond to any inquiries with either complete information or a confirmation on a lack of facilities. The drafting team did not believe it was necessary to establish a time frame for either new entries to be shared or for the reliability Coordinator to respond to a request. A transmission or generator owner who has not received information on a critical facility from their RC has no critical facilities until informed.

Comments: ERCOT provides the following additional feedback:

FAC-014:

ERCOT suggests the following clarification to R4 to simplify the language and to avoid the possible interpretation that the RC's authority (or duty) to establish stability limits that impact multiple TOPs would only be triggered in the event one or more TOPs has preliminarily established such a stability limit pursuant to its obligation under R2:

R4. Each Reliability Coordinator shall establish ***any*** stability limit to be used in operations ***in accordance with its SOL Methodology if that*** limit impacts more than one Transmission Operator ***in that*** Reliability Coordinator Area.

****Please refer to the attached comment form for redlined language.

Likes 0	

Dislikes 0	
Response	

The team reviewed the existing language and appreciates your feedback. The team believes the existing language is clear that the RC establishes the stability limit to be used in operations that impacts more than one Transmission Operator. The RC, the TOP or both may be the ones that actually do the calculation or identify that more than one Transmission Operator is impacted, but the RC would ultimately be responsible for establishing the limit based on their work or the work of others.

Leonard Kula - Independent Electricity System Operator - 2

FAC-14-3 Requirement R5 no longer enforces that Reliability Coordinators *provide its SOLs and IROLs to those entities with a reliability need.* IRO-014-3 speaks to required information for Operating Plans, Procedures and Processes but does not address the need for critical details required for developing SOLs such as study reports and other related operating documentation. This information is necessary in order to satisfy requirements in FAC, TOP and IRO standards where there's potential impact to neighboring RC areas.

Furthermore, obtaining these critical details from other Reliability Coordinators and verifying their impact to SOLs through study can require a great deal of time and effort. It is recommended that more than 12 months be given in order to comply with this requirement. An appropriate time would be in the order of 24 – 36 months.

FAC-14-2 Requirement R6 had been the one requirement tying identification of multiple contingencies in the Planning Horizon to those that must be considered in Operations. This requirement had ensured that if instability as a result of a multiple contingency was identified in the Planning Assessment then that contingency should be deemed credible. It was the best vehicle to use to influence another RC/TOP area within the Interconnection to recognize a multiple contingency within its area if shown to impact other areas. In the interest of both assistance in respecting an IROL and operating a more reliable interconnected system some language to this effect should remain in FAC-14-3. The language should be expanded to reflect that multiples may be identified in the Operations Horizon as well through studies performed in deriving SOLs including those performed for OPA and RTA. Restricting the language to the planning horizon is insufficient as the planning horizon covers a more limited scope of system configurations realized in operations.

Response	

FAC-14-3 Requirement R5 requires that the RC provide its SOLS and IROLS to the TP, PC and TOP within its area. R5 does not extend to a neighboring RC because that RC can request the information as part of the IRO requirements.

The drafting team has modified the implementation plan out to 18 months, which the team believes is long enough to adapt to the changes within the standard.

The Drafting team agrees that FAC-14-2 Requirement R6 is important and it was moved to FAC 15 and expanded upon to include a wider range of events. FAC 11 R5.2 and 5.3 now address multiple contingency events within the operating horizon with R5 requiring that the RC consider any items found by the Planning Coordinator under FAC 15.

The use of the existing wording from FAC-014-2 “Facilities that are critical to the derivation of the IROL” causes a lot of confusion as to the mean of the word “critical”. The corresponding list of Facilities is referenced by other standards (e.g. CIP-002) with a major impact on compliance to those standards. With lack of clarity and guidelines on the intent regarding the “critical Facilities” that should be included per this requirement. The addition of “stability limits” causes even more confusion, as it is now understood that Facilities impacting SOLs stability limits not considered IROLs should be included on that list. The SDT should rework the purpose and rationale behind those requirements.

This wording is consistent across multiple standards. The drafting team agrees that it may not be the ideal phrasing, but believes this change would best be handled by a team dedicated to changing this language across all effected standard simultaneously.

Requirement R5.5 is redundant with TOP-003-3 R1. This is input data necessary to perform OPA and RTA and so the communication of that data is already covered under this requirement. To include it in FAC-014-2 would be redundant and unnecessary.

R4 - Developing stability limits should be the responsibility of the TOP, not the RC. TOPs should have greater familiarity with the studies and model details that are used to develop stability limits. The RC should only be involved where there is a discrepancy or question involving multiple TOPs having differing limits.	
Likes 0	
Dislikes 0	
Response	

The team has modified the wording in R4 and in the Rationale related to R4 to further clarify that the RC is responsible for setting the ultimate stability limit that impacts more than one TOP, however that does not mean the RC has to do the calculation. The RC may just be selecting one of the two TOP's calculations to use – if they aren't identical.

Comment 1: The use of the term 'stability limit' in the proposed FAC-014-3 R4, R5.2 and R5.3 is ambiguous. In the definition of 'Reliable Operation' in the NERC glossary of terms, it lists:

"Operating the elements of the [Bulk-Power System] within equipment and electric system thermal, voltage, and stability limits… "

And from Final Report on the August 14, 2003 Blackout in the United States and Canada: Causes and Recommendations, page 8:

There are two types of stability limits: (1) Voltage stability limits… (2) Power (angle) stability limits…

Clearly there are multiple meanings of stability limits. CHPD requests the Standard Drafting Team to use additional language to clarify which 'stability limits' are meant here. The definition of Stability Limit, as a capitalized term in the NERC glossary of terms, unfortunately defines the Capitalized term 'Stability Limit' by the lowercase term 'stability limit', so of itself is not very useful as to identifying whether this is a thermal, voltage, or transient / dynamic type of phenomenon.

Comment 2: CHPD would recommend the following language to be used in the proposed FAC-014-3 R5.1. and 5.2 in place of, or in addition to the 'once every twelve calendar months' language. 'or within 30 calendar days (or a later date if specified by the requester)' to be consistent with the construct found in FAC-008-3 R8.2. Given the importance of SOLs (FAC-014-3 R5.1) and IROLs (FAC-014-3 R5.2), utilities may need ratings in a much more operationally appropriate timeframe than 12 calendar months.

Comment 3: In FAC-014-3 R5.5, the RC is required to provide SOLs for its RC area. However, the RC is not actually required to calculate SOLs (only IROLs). Therefore, any SOLs the RC has would be provided by the respective Transmission Operators in the RC area, as specified under

FAC-014-3 R3. The Standards Drafting Team may consider revising R5.5. to have Transmission Operators provide SOLs to other Transmission Operators, rather than the RC providing these SOLs. **Comment 4:** It would be useful to the PC for FAC-014-3 R5.2 to also include a sub-requirement for the RC to provide the PC with a description of the conditions where the IROL has been observed or was expected to be observed. For example, ‘in Winter with heavy south to north transfers’, etc. This way, the Planning Coordinator can better test its models to assess whether it can duplicate these conditions in the planning horizon. **Comment 5:** The language in FAC-014-3 R6 ‘Each Reliability Coordinator that is impacted by an IROL…” is unclear by the meaning of ‘that is impacted by an IROL’. It is thought that this probably could be removed from the requirement and the function of the requirement would be unaffected. **Comment 6:** The requirement for the Transmission Operator to provide SOLs in R3 is likely duplicative to requirements in IRO-010-2, R1. This requirement (IRO-010-2 R1) gives the Reliability Coordinator the authority to request this data. We are already providing these to the RC under IRO-010-2 R3, which requires us to provide this data in accordance with IRO-010-2 R1.

Response	
(Stability Limit term usage) The Drafting team attempted within the standard and the associated rationales to provide guidance on what they meant by the term stability limit, please review those and let us know if that meets your need. In addition the MEITF will be further refining this concept within their work which may drive further changes to the standard in the future. (Annual not often enough) The Planning Coordinators activities are generally on an annual basis (TPL 001, FAC 013), and focused on distant years, therefore providing the SOL and IROL information on the minimum of annual basis supports that activity. The studies take substantial amounts of time to perform and because of that it is not uncommon for a small percentage of the information used in the study to have changed before the study is complete. Some information changes can be accommodated in the flow of the study, but others cannot and are captured on the next cycle of the study. Also nothing in the standard precludes the Planning Coordinator from requesting this information from the RC outside of the formal annual provision of the data, and thereby insure the Planning Coordinator is starting their study with the most recent set of information.	

(RC providing SOLs) The standard does not preclude a TOP from requesting SOL information from another TOP, and the TOP could arguably request that information from another TOP under TOP 003. From a FAC 14 perspective the team believed the RC was a reasonable clearing house for SOL data if a TOP wanted to formally request it under FAC 14. (Provide additional information with IROL or Stability Limit) The drafting team agrees and added a new requirement part to require the RC to provide this additional information system condition information with a stability limit or IROL> (Impacted RC) The situation where a Reliability Coordinator has established an IROL is clear, the Reliability Coordinator provides the related facilities. However a Transmission Owners Reliability Coordinator may not have an IROL that impacts the Transmission Owners facilities, but a neighboring Reliability Coordinator does. The Transmission Owners Reliability Coordinator is now an "impacted" Reliability Coordinator because while the IROL is not theirs, it does impact facilities within their area. The Transmission Owner's Reliability Coordinator is responsible for communication from between the Reliability Coordinators and between the Reliability Coordinator and its Transmission Owners. (Duplicative with IRO Standards) The team agrees that SOL information may arguably be requested under the IRO standards but felt that the communication of this information was sufficiently important to warrant its own requirement within the SOL standards.

Comment	
OGE agrees with the proposed changes in FAC-014-3. However, we disagree with the current proposed definition of SOL Exceedance. As indicated by multiple entities during the SOL/SOL Exceedance comment period, an exceedance can only occur if it happens in Real-time and therefore the SOL Exceedance definition should not incorporate the concept of predicted exceedances. It is inappropriate to approve a NERC standard without a clear understanding of how the definitions will impact the standard. OGE remains concerned with unintended impacts of separating the standard and the proposed SOL & SOL Exceedance definitions.	
Likes 0

Response	
Thank you for your comments, taking these concerns into account the drafting team has withdrawn the proposed definition and incorporated language in to FAC 11 and FAC 14 to address what the expected system performance requirements are, and by extension what would constitute an SOL exceedance in real time monitoring, Real Time Assessments and Operational Planning Assessments.

Even though ReliabilityFirst agrees with the changes in the standard, ReliabilityFirst provides the following comments for consideration related to the Violation Severity Levels sections: Violation Severity Levels	

Requirement 3 VSL The VSL for Requirement R3 is in disconnect with the language in Requirement R3. The VSL for Requirement R3 references "the periodicity at which the RC needs such information" and Requirement R3 simply talks about "in accordance to the Reliability Coordinator's SOL Methodology." Requirement R7 in FAC-011-1 only notes, "The method shall address the periodicity of SOL communication." ReliabilityFirst recommends structuring the VSLs as follows (this is an example of the "lower VSL"): The Transmission Operator provided its SOLs to its Reliability Coordinator, but was late by less than or equal to 10 calendar days. Requirement R6 VSL The first part of the VSL for Requirement R6 ("The Reliability Coordinator with an established IROL, or the Reliability Coordinator impacted by a neighboring Reliability Coordinator IROL") does not match the language of Requirement R6. ReliabilityFirst recommends the beginning of the VSL state: Reliability Coordinator that is impacted by an IROL did not provide…

Comment	

OGE agrees with the proposed changes in FAC-014-3. However, we disagree with the current proposed definition of SOL Exceedance. As indicated by multiple entities during the SOL/SOL Exceedance comment period, an exceedance can only occur if it happens in Real-time and therefore the SOL Exceedance definition should not incorporate the concept of predicted exceedances. It is inappropriate to approve a NERC standard without a clear understanding of how the definitions will impact the standard. OGE remains concerned with unintended impacts of separating the standard and the proposed SOL & SOL Exceedance definitions.

Comment	
The IROLs and SOLs calculated in FAC-014-3 are computed per the RC's SOL Methodology required per R1 in FAC-011-4. The longest time horizon for computing these is an Operational Planning Analysis, which addresses next-day operations. The SDT has not explained why RCs must provide SOLs and IROLs to PCs (R5.1) and other information (see R5.2) and least once every 12 months. Remember, the longest time frame for this information is next-day operations. However, requiring RCs to communicate their SOL Methodology to PCs and TPs per R8.2 in FAC-011-4 has some reliability benefit in that it communicates an operator's tools to planners.

Dislikes 0	
Response	

Under the proposed standard the RC develops SOL and IROL values. While the values are primarily used within the standards for the current and next day (OPA) analysis, that does not make them useless beyond the next day. Most of the SOL and IROL values can be relatively static. For example a line rating changes by expected ambient temperature but otherwise does not change day to day or year to year unless the line is modified. The same is true for a voltage limit and many stability limits. Those that aren't relatively static values can be translated by the Planning Coordinator into their time frame, if applicable. Communicating the values to the Planning Coordinator and Transmission Planner is necessary because FAC 015 requires them to use those limits (or more limiting criteria) in their Planning Assessments to insure that the system is planned the way it is operated.

In FAC-014-3, R4 as worded, entities that establish stability limits in advance of real-time (as allowed) may not have a mechanism to respond with mitigation plans or active 'tools' to respond when the RC communicates a newly emerged limit in near real-time. SRP recommends requiring the RC to guide mitigation when stability limits are changed in near real-time.	
Likes 0	
Dislikes 0	
Response	
Mitigation is within the TOP and IRO standard operating plans and not within the team scope. If a limit changes it is imperative that the TOP and RC work together to find a new operating plan to meet that revised limit, not introduce delays in instituting a limit.

The text “in accordance with” is subjective, and could be interpreted inconsistently across RE footprints as well as within RE footprints. For example, would the language from FAC-015-1 “equally limiting or more limiting than” be considered “in accordance with?”	
Likes 0	
Dislikes 0	
Response	
Thank you for your comment. In reviewing FAC 14 R1, R2 and R3, the drafting team considers “in accordance with” sufficiently clear that the TOP must follow with the Reliability Coordinators SOL Methodology. More clear than “consistent with” and more broad then equally limiting or more limiting.	

11. FAC-015-1 is predicated on the principle that Facility Ratings, System steady-state voltage limits, and stability criteria used in Planning Assessments for the Near-Term Transmission Planning Horizon should be more conservative/restrictive/limiting than those found in (or established in accordance with) the RC's SOL Methodology, allowing for justified exceptions. Do you agree with this principle? If not, please explain.
Ginette Lacasse - Seattle City Light - 1,3,4,5,6 - WECC, Group Name Seattle City Light Ballot Body

Answer	No
Document Name	

Comment
Assuming that the question should say "equal to or more conservative" rather than just "more conservative" than the Facility Ratings used by the RC/TOP, we agree with the principle, but find the language too confusing and disagree with the implementation. The phrase in R1 "If the Planning Coordinator uses less limiting Facility Ratings than the Facility Ratings established in accordance with its Reliability Coordinator's SOL Methodology…" is confusing since Facility Ratings are established by the TO in accordance with FAC-008, not by the RC or TOP in accordance with the SOL Methodology. If the intent is to ensure that, for example, the PC/TP does not plan to 15-minute emergency ratings if the TOP uses only 30-minute emergency ratings in operations, then it should make that more explicit. The requirements seem to imply that there could be more than one set of Facility Ratings for a given Facility (not true) and that Facility Ratings are established in accordance with the RC SOL Methodology (also not true). In addition, all of the requirements in FAC-015 are related to what limits should be used in planning assessments, therefore the requirements should be included in the TPL standard. Having a separate standard defining the limits that should be used in TPL studies adds unnecessary complication.

Likes 0	
Dislikes 0	

Response
You are correct. The wording in the question should be "equally or more conservative/restrictive/limiting." Additionally, your statement regarding the use of emergency ratings correctly captures the SDT's intent. The rationale for Requirement R1 states, "The intent of Requirement R1 is not to change, limit, or modify Facility Ratings determined by the equipment owner per FAC-008. The intent is to utilize those owner-provided Facility Ratings such that the System is planned to support the

reliable operation of that System." In order to ensure the requirement is adequately clear, the SDT is editing the requirement to include the descriptor "owner-provided" to the reference for Facility Ratings. The "established in accordance with" wording in the requirements is not intended to imply the RC usurps the owner-provided Facility Ratings. Rather, the intent was to reference the subset of owner-provided Facility Ratings the RC includes in its methodology. The SDT is considering alternate language to add clarity around this concept. FAC-015-1 provides for a level of coordination between planning and operating entities that is currently absent in the body of NERC Reliability Standards. It may be appropriate to include some or all of the requirements of FAC-015 into other existing standards. However, the SAR for this project currently does not allow for the modification of other standards such as TPL-001.

In general, the Facility Ratings established by the Transmission Owner, system steady-state voltage limits and stability criteria should be the same as the RC for facilities located within the Planning Coordinator area with some minor exceptions. The RC's SOL methodology may be less conservative in some cases, for example contingency selection. The RC will be mainly focusing on single contingencies while the PC will focus on single and multiple contingencies. However, the RC's methodology may be less conservative in terms of transmission service (i.e. considers non-firm use). In that case the RC may identify a stability limit whereas the PC did not.

Comment	
Duke Energy does not agree with the principle that Facility Ratings, System steady-state voltage limits, and stability criteria used in Planning Assessments for the Near-Term Transmission Planning Horizon should be more conservative than those found in the RC's SOL Methodology. With this language, the drafting team is implying that it is not appropriate for Planners to plan and Operators to operate from the same or equal ratings without justification. We believe that it can be appropriate for Planning and Operations to use the same/equal ratings, and should not require justification to do so. We recommend the drafting team consider modifying the existing language to reflect that the use of the same/equal rating can be appropriate and not require justification.

Comment	
Day-to-day operations of the system may require a more conservative/restrictive/limiting Facility Ratings, System steady-state voltage limits, and stability criteria as the system can be operated beyond planning criteria (ex. beyond N-1/-1). Some operating margin is added into facility ratings, system steady state voltage limits, and stability criteria as System Operators are operating the system 24 hours for 365 days in a year which provides the Operators with unique operating challenges – various conditions (outages, generation commitment, contingencies that are beyond planning criteria) – that are beyond what's studied in TPL-001 Planning Assessment. System Operators may have, for example, pre-contingency low/high 'proxy' voltage limits for a particular substation as real time voltage collapse (knee of the curve) calculations are not performed for each operating state. System Operators also have at their disposal Dynamic Feeder Ratings which vary the capability of a feeder; which could be higher of lower than what's assumed in the TPL-001 Planning Assessment.	

The definition of System Operating Limit states: "The value (such as MW, Mvar, amperes, frequency or volts) that satisfies the most limiting of the prescribed operating criteria for a specified system configuration to ensure operation within acceptable reliability criteria." FAC-015 would introduce operating criteria for multitude of operating system configurations into TPL-001 Planning Assessment.	
Likes 0	
Dislikes 0	
Response	
The SDT is revising the language in Requirements R1 – R3 and the associated rationale to add clarity regarding allowable exceptions. FAC-015-1 does not require additional simulations of System configurations beyond what is already required by TPL-001. It does require planners to use Facility Ratings and System voltage/stability performance criteria that are consistent with what is used in the operation of the applicable System or document any exceptions.	
Julie Hall - Entergy – 6

Comment 1: Facility Ratings should be provided by the Transmission Owner and Generation Owner to both the Planning Coordinator and Reliability Coordinator. Facility Ratings are what they are – from our experience, the trouble comes in with assumptions about ambient conditions.

In CHPD's experience, the greatest challenge between planning and operations is that we utilize dynamic ambient-temperature based ratings. In real-time, there is a very wide band of potential transmission line ratings based on the ambient temperature, just as there are a wide range of ambient temperature conditions throughout the day. Therefore, in real-time operations we use many ratings throughout the day.

In long term system planning and operations planning, it is clearly inappropriate to run all the studies through all ratings sets. Our practice is to use what we as a utility have felt is appropriate for the expected ambient conditions, in coordination with our neighbors.

Similarly, while it is recognized that there are differences between the planning and operational voltage criteria, CHPD has not experienced great difficulty in operating its system, even with the different planning and operational criteria.

CHPD feels that there isn't a need to create prescriptive requirements in order to accomplish this reliability objective. It is the Planning Coordinator's responsibility to adequately plan the system for growth, capacity, and integration of service in the Planning Horizon; it is the Reliability Coordinator's responsibility to plan and operate the system in the Operations Horizon. Given these different responsibilities, we feel it is not appropriate for one entity to determine another entity's criteria since each performs a different system function in a different system timeframe.

Comment 2: The term 'System Operating Limit (SOL)' from FAC-014-2 has now been replaced with 'Facility Ratings' in FAC-015-1. While System Operating Limits (SOLs) are the result of *studies* assessing the performance of Facility ratings and performance criteria against

expected system conditions and events, Facility Ratings are ***not*** the result of studies and assessments – they 'are what they are'. Furthermore, under FAC-008, the Transmission Owner and Generator Owner is already required (under FAC-008 R6-R8) to make its Facility Ratings available to the Reliability Coordinator and Planning Coordinator. Under FAC-015-1 R4, the Planning Coordinator is now being required to provide Facility Ratings. While this was in the spirit of what was previously in FAC-014-2 with 'SOL' replaced with 'Facility Ratings', this change is now requiring the Planning Coordinator to provide something that is the responsibility of the Transmission Owner under FAC-008 to provide. CHPD recommends removal of this requirement because its objective is carried in FAC-008.

Comment 1 The rationale for Requirement R1 states, "The intent of Requirement R1 is not to change, limit, or modify Facility Ratings determined by the equipment owner per FAC-008. The intent is to utilize those owner-provided Facility Ratings such that the System is planned to support the reliable operation of that System." In order to ensure the requirement is adequately clear, the SDT is editing the requirement to include the descriptor "owner-provided" to the reference for Facility Ratings. The point on ambient assumptions with regards to Facility Ratings is well taken. The SDT is modifying Requirement R1 and the associated rationale to clarify the allowable exceptions. The primary intent of Requirement R1 is to address the potential scenario of planning entities using less limiting Emergency Ratings (time-dependent) than those used in the operation of the System. The point on voltage criteria is well taken as well. In the operational and real-time horizons, operators will typically maintain voltage as close to nominal/desired levels as possible and will likely have guidelines stating as much. The System Voltage Limit, however, is the absolute highest/lowest level the operator can stand without taking pre-contingency action such as load shed. If the applicable planning entities still maintain an acceptable voltage range outside of these System Voltage Limits, a technical rationale will need to be documented and communicated consistent with the requirement. FAC-015-1 provides for a level of coordination between planning and operating entities that is currently absent in the body of NERC Reliability Standards. Based on feedback from KEY STAKEHOLDERS, this level of coordination is necessary and needs to be captured in either in the proposed FAC-015 or a modification to existing standards. Comment 2 The rationale for Requirement R1 states, "The intent of Requirement R1 is not to change, limit, or modify Facility Ratings determined by the equipment owner per FAC-008. The intent is to utilize those owner-provided Facility Ratings such that the System is planned to support the	

reliable operation of that System." In order to ensure the requirement is adequately clear, the SDT is editing the requirement to include the descriptor "owner-provided" to the reference for Facility Ratings.
The SDT is proposing a new construct as described in its whitepaper, Rationales for FAC-010-3 (Retirement) and FAC-015-1, which is included as supporting documentation in the NERC ballot. This construct, along with the SDT's draft SOL definition revision, make use of the concept that SOLs are Facility Ratings, System Voltage Limits, and stability performance criteria used in operations. This is to remove ambiguity with the concept of SOLs that has led to a lack of consistency and confusion in the term's application across industry and to eliminate the notion that operating limits exist in long-term planning. The SDT, therefore, did not replace SOL with Facility Rating as you stated in the above comment, but it removed the notion of SOLs in the planning horizon.

Comment	
FMPA agrees in principle, but as mentioned above, there should be a feedback loop. More information about how to coordinate the planning horizon events with the operations horizon events would be useful, and a table describing the various time horizons, contingencies, and allowable actions, such as Table 1 of TPL-001-4, may help add clarity.

ITC agrees with the general concept that more or at least as conservative SOL's should be utilized in the Planning Assessments as those considered in real time operations. The SDT should clarify how exceptions would be justified and who would have the authority to justify them. There will be instances where lower Facility Ratings will be identified in real time as Facility Ratings are continually reviewed by TO's. This will create situations when more limiting SOL's may be used in real time operations that those that were used in the latest or even current Planning Assessments. There will also be projects considered in future Planning models that may increase Facility Ratings or other SOL's. It should be made clear that this would be acceptable. The standard should only specify the end objective and not the process to achieve that objective. Each system has a defined Planning Criteria that is published and readily available to the RC. This Criteria has defined voltage limits and stability criteria that have been identified that work with the Facility Ratings for that system. By utilizing an RC based methodology, you will be forced to go to either a least common denominator criteria or not be able to take in to account specific issues inherent in a system. Having to justify each exception for every rating change due to a project, rating correction, use of seasonal ratings in operations is not prudent for either the PC or the TP.	

ITC does not believe FAC-015-1 is necessary to achieve the required outcome. Simple modifications to TPL-001-4 may allow for the same desired outcome.

The SDT is revising the language in Requirement R1 and the associated rationale to add clarity regarding allowable exceptions. FAC-015-1 provides for a level of coordination between planning and operating entities that is currently absent in the body of NERC Reliability Standards. Based on feedback from KEY STAKEHOLDERS, this level of coordination is necessary and needs to be captured in either in the proposed FAC-015 or a modification to existing standards. Currently, the SAR for this project does not allow the modification of other standards such as TPL-001.

We agree with the concept that system performance criteria used in the Planning Assessments should be more restrictive or at least line up with system performance criteria used in the Operating Horizon. But, system performance criteria used in the Operating Horizon cannot be more restrictive than those used in the Planning Horizon. The proposed standard, as written, allows the RC to establish criteria without consultation with the TP and the PC. In our opinion, this is a recipe for failure. Furthermore, we see nothing in the NERC Functional Model that would allow the PC and RC to develop or establish system performance criteria as part of their defined roles, or to establish performance criteria that could be more restrictive than the criteria provided by the Transmission Owners and Transmission Planners. Standard TPL-001-4 dictates system performance requirements. PC and RC cannot arbitrarily decide to come up with new, more restrictive system performance criteria. We are also concerned that requirements R1 through R3 allow for no input from the Transmission Planners regarding the development of any performance criteria established by the Planning Coordinator. Requirement R4 then requires the PC to simply hand-down its criteria to the Transmission Planner without any input as to whether the criteria are reasonable or whether meeting the criteria is feasible. At a minimum,	

requirements R1 through R3 need to recognize that the development of any PC based system performance criteria has to be a collaborative effort between the PC and the TPs and the Transmission Owners. Any tightening of performance criteria will likely require capital investment and we need to hear from the Planning Coordinators as to why the planned system needs to meet the new, more stringent reliability requirements. Requirements R1 through R3 require the Planning Coordinator to provide a technical justification to the Reliability Coordinator for using less limiting ratings, voltage limits, or performance criteria. We can see that some equipment ratings can change from year to year, and perhaps the corrective action plans should also be provided for those parts of the system that have been or are planned to be upgraded. However, we disagree with the approach proposed by the SDT for the voltage limits and stability criteria, and instead believe that the drafting team needs to have the Reliability Coordinator provide a technical basis to the Planning Coordinator and the Transmission Planners regarding why more limiting ratings and performance criteria should be required in planning assessments. As any tightening of ratings and performance criteria will likely require capital investments, we need to hear from the Reliability Coordinators as to why the system as provided/planned needs to meet the new, more stringent reliability requirements.

FAC-015-1 is not intended to allow the RC to dictate criteria on planning entities who are not under the authority of the RC. The intent is to ensure the system is planned in a manner that is conducive to the reliable operation of that system. If planning entities use less limiting criteria, the standard does require documentation as to why less limiting criteria were used but does not give the RC authority to accept or reject that documentation. The PC to TP communication does not imply the process of determining performance criteria or modeling assumptions is not a joint effort by the PC and the TP. The rationale for R1 even speaks to the joint effort required by MOD-032-1 as being the appropriate mechanism for the coordination of Facility Ratings in planning models. The SDT is revising the language in the requirements to add clarity regarding exceptions to R1 – R3 and to simplify the language around the PC/TP communication path.

Planning Assessments for the Near-Term Transmission Planning Horizon utilize base case models built meeting requirements in MOD-032. These base case models incorporate future additions and upgrade projects that may be put in place to resolve existing SOLs. Assessing the continuing need for Corrective Action Plans, as required by TPL-001, would address the need to study the existing SOLs, however, to properly evaluate other future projects, assumptions must be made that existing Corrective Action Plans will be implemented. This means, for example, that studies performed for year 5 should assume that Corrective Action Plans identified for Year 2 have already been implemented, which means an existing SOL may have already been upgraded when studying Year 5.

Comment	
PNMR believes that allowing a justified exception will still result in a gap between planning and operations and considers this standard, as written, as an additional administrative burden on the PA. Instead of allowing for exceptions, PNMR suggests that the RC, TOP, and PA should jointly develop system performance criteria. PNMR suggests that R1 be revised to provide clarity on what is less conservative/restrictive/limiting. Is it the intention of the SDT that the Planning Coordinator would have to provide a technical justification to the RC for using less limiting Facility ratings based on a Corrective Action Plan? For example, Facility A has a rating of 100 MVA. A previous Planning Assessment identified an overload of Facility A. To mitigate the overload the Corrective Action Plan is to increase the rating of Facility A to 200 MVA. TPL-001-4 R1.1.3 requires the Planning Coordinator to include this planned change to the existing Facility in the System model used for the Planning Assessment. Does this situation result in the Planning Coordinator using a less limiting Facility Rating than established in accordance with the RC's SOL Methodology? PNMR strongly believes that the Planning Coordinators should not have to provide technical justification to their RC for simply following the TPL-001 standard.

Response	
The potential for "gaps" between planning and operations exist today. The addition of FAC-015 will, at a minimum, facilitate recognition of these "gaps" where they exist. The SDT did not take the route of requiring the PC to jointly develop criteria with TOPs and RCs due to the fact that the PC is not under the jurisdiction of the RC and the RC is not under the jurisdiction of the PC. Therefore, there would be no entity that had the authority to effectively force a set a common criteria on the other should joint efforts fail. The SDT is revising the language in Requirement R1 and the associated rationale to add clarity regarding allowable exceptions including rating changes that are the result of a CAP.

The proposed Standard places the onus on the PC to provide the criteria to be used by the Transmission Planner in completing Planning Assessments. In SPP, the SOLs have historically been defined as permanent and temporary flowgate ratings and operating guides. Based on that methodology, it is difficult, if not possible, for planners to identify all situations that potentially may cause an operating guide that would lower a rating; and, as such, the planner may not study each SOL in their Planning Assessment.

The SDT is proposing a new construct as described in its whitepaper, Rationales for FAC-010-3 (Retirement) and FAC-015-1, which is included as supporting documentation in the NERC ballot. This construct, along with the SDT's draft SOL definition revision, make use of the concept that SOLs are Facility Ratings, System Voltage Limits, and stability performance criteria used in operations. This is to remove ambiguity with the concept of SOLs that has led to a lack of consistency and confusion in the term's application across industry and to eliminate the notion that operating limits exist in long-term planning. However, the primary elements of SOLs (Facility Ratings, voltage/stability limits) should be coordinated in planning models/studies such that they support how that system is actually operated.

While we agree with the principle, BPA does not see a need for a new standard. The objective could be better accomplished by including the requirements to existing standards or modifying existing standards.	

Planning assessments modeling data including facility ratings are based on MOD-032-1 data requirement. If it is desired to coordinate modeling data with RC SOL methodology, RC SOL methodology should align with the MOD-032-1 requirement instead of drafting a new requirement.

SRP agrees with the principle, but has a concern with the wording of R1. -R1 refers to Facility Ratings as being established in accordance with the Reliability Coordinator’s SOL Methodology, though Facility Ratings are established by a TO or GO in accordance with their FAC-008-3 Facility Ratings methodology. Perhaps the requirement should read “…the Facility Ratings used to establish SOLs in accordance with the RC’s SOL Methodology...”

We agree with the principle, but we disagree with the implementation. We agree with the following comment from Seattle City Light: *The phrase in R1 "If the Planning Coordinator uses less limiting Facility Ratings than the Facility Ratings established in accordance with its Reliability Coordinator's SOL Methodology…" is confusing since Facility Ratings are established by the TO in accordance with FAC-008, not by the RC or TOP in accordance with the SOL Methodology. If the intent is to ensure that, for example, the PC/TP does not plan to 15-minute emergency ratings if the TOP uses only 30-minute emergency ratings in operations, then it should make that more explicit. The requirements seem to imply that there could be more than one set of Facility Ratings for a given Facility (not true) and that Facility Ratings are established in accordance with the RC SOL Methodology (also not true).*	

Proposed alternative language for R1: In planning assessments and operations, facility continuous ratings shall be used for the pre-contingency state and facility ____ hour/minute ratings shall be used for the post-contingency state. As stated in the purpose section of FAC 008 a Facility Rating is essential for the determination of System Operating Limits. We disagree with the notion that Facility Ratings are SOLs. While Facility ratings are based on characteristics of the Facility in accordance with FAC 008, SOLs are system limits developed using steady state and stability simulations based on a defined set of performance criteria such as those defined in the currently effective FAC-010 and FAC-011 standards. The required coordination between planning and operations can better be addressed by the regional reliability organization like WECC which has an open and established process for developing regional criteria. Reliability coordinators' SOL methodologies are developed without input from planning coordinators. Given the objective is to ensure coordination between planning and operations, the RC must be assigned a responsibility in the standard. For example, if the standard entails comparing planning models with operations models, then the RC must have the responsibility to provide the operations models and the obligation to timely respond to questions the PC may have in the course of the comparison in order to resolve any discrepancy in facility ratings, etc. Requirement R1 of TPL 001-4 requires the planning coordinator to use modelling data provided in accordance with MOD 10 and MOD 12 (which are now replaced with MOD 32). As such using modelling information such as facility ratings obtained from the reliability coordinator's SOL methodology can be inconsistent with TPL 001-4. The ratings and limits used in planning do not have to be more conservative than those used in operations. Equally conservative ratings and limits can be sufficient. For example, a 0.9 p.u. low voltage limit can applicable in both planning and operations. CAISO PC proposes Requirements R1 to R5 be replaced with something like: Planning Coordinators (PCs), Transmission Planners (TPs), Reliability Coordinators (RCs) and Transmission Operators (TOPs) within a Regional Reliability Organization (RRO) area shall collaborate in developing and implementing consistent applicable Facility Ratings duration criteria, System steady-state voltage limits, and stability criteria for use in planning assessments and operations.

The rationale for Requirement R1 states, "The intent of Requirement R1 is not to change, limit, or modify Facility Ratings determined by the equipment owner per FAC-008. The intent is to utilize those owner-provided Facility Ratings such that the System is planned to support the reliable operation of that System." In order to ensure the requirement is adequately clear, the SDT is editing the requirement to include the descriptor "owner-provided" to the reference for Facility Ratings.	

It is the opinion of the SDT that the notion that SOLs are based on a set of criteria is problematic and is one of the sources of confusion regarding the use of this term throughout the industry. Clarifying that SOLs are Facility Ratings and voltage/stability limits/criteria used in operations is a fundamental concept that is necessary to remove this ambiguity. The rationale for R1 speaks to the modeling requirements of MOD-032-1 as being the appropriate mechanism for the coordination of Facility Ratings in planning models. The requirements of FAC-015 do not usurp this, however their intent is to add bounds to the Facility Ratings such that they align with how the system is actually operated. Exceptions should be documented appropriately but the RC cannot dictate modeling data to planning entities based on the NERC Functional Model. The actual wording in Requirements R1 – R3 of FAC-015-1 is consistent with what is expressed in this comment. The wording in the question should be “equally or more conservative/restrictive/limiting.” The SDT did not take the route of requiring the planning entities to jointly develop criteria with operating entities due to the fact that planning entities are not under the jurisdiction of the operating entities and operating entities are not under the jurisdiction of planning entities. Therefore, there would be no entity that had the authority to effectively force a set a common criteria on the other should joint efforts fail.

Based upon NPCC's comment, this is the SDT's response: The SDT wanted to only compare the Facility Ratings, System steady state voltage limits, and stability performance criteria for use in Planning Assessments of the Near-Term Transmission Planning Horizon due to its best comparability to the Operations Horizon. In addition, the SDT recognized that the Long-Term Planning Horizon may include more differences in Facility Ratings (due to changes in facilities to mitigate issues found in past Planning Assessments), and only wanted Planning Coordinators and Transmission Planners to have to provide a technical rationale for those differences within the Near-Term Planning Horizon only. Nothing in the SDT's choice precludes a Planning Coordinator or Transmission Planner from using consistent Facility Ratings, System steady state voltage limits, and stability performance criteria for use in Planning Assessments across all Planning Horizons.

Coordination for SOLs should be incorporated into base planning models required by MOD-032, the same as Facility Ratings are incorporated into these base models (as required by MOD-032). TPL-001 requirements would then stay the same, as these studies should be based upon models built as required by MOD-032. FAC-015 Requirement R1 may be more appropriately incorporated into the FAC-008 facility rating as part of the MLSE calculation for individual facilities. For groups of facilities, identification of a limiting flow-gate may be more appropriate. If this is not feasible, then the requirement should be incorporated into the modeling requirements of MOD-032.

We expect the FR and limits used in the TPL assessments to be very similar if not identical in most cases between the near-term and long-term horizons. Since most major transmission projects are identified in the long-term horizon and take several years to be completed, it would make no sense for the PC/TP to use less limiting criteria for the long-term horizon than the near-term horizon or the RC's SOL Methodology. We suggest removing the reference to Near-term horizon and simply referring to the Planning Assessment as in R4.

Response	
The SDT appreciates the comment from the SPP Standards Review Group. The SDT had to choose a set of Planning Assessments for comparison and, for simplicity's sake, chose the Near-Term Planning Horizon. The SDT recognizes that, with regard to proposed Requirement R1, there is likely to be differences to be documented between Planning and Operations with regard to Facility Ratings. Those differences will have to be communicated to the Reliability Coordinator at some point, so the SDT views the choice of providing that information from the 5 year model versus 2 year model as not significant. The SDT, while allowing for System steady-state voltage limits differences in Requirement R2, did not expect many to exist among cases examined in the Near and Long Term Planning Horizons. If such differences exist, then there should be a technical reason for the difference so that understanding, at a minimum, would occur and potentially resolution, if appropriate. The Planning Coordinator or Transmission Planner would provide the technical rationale; at most the Reliability Coordinator reviews the rationale but does not approve or reject it.

The same concepts that apply to the Near-Term Transmission Planning Horizon should apply to the Long-Term Planning Horizon. ITC agrees with the general concept that more or at least as conservative SOL's should be utilized in the Planning Assessments as those considered in real time operations. The SDT should clarify how exceptions would be justified and who would have the authority to justify them. There will be instances where lower Facility Ratings will be identified in real time as Facility Ratings are continually reviewed by TO's. This will create situations when more limiting SOL's may be used in real time operations that those that were used in the latest or even current Planning Assessments. There will also be projects considered in future Planning models that may increase Facility Ratings or other SOL's. It should be made clear that this would be acceptable. Per FAC-008-3, Facility Ratings are calculated by the TO and communicated to the TP and TOP (typically all within the same organization) and to the PC and RC. These ratings are used throughout both the Near-Term and Long-Term Planning Assessments unless a planned project causes them to change or a project that is under construction goes in service. Coordination occurs today and should be allowed to continue without strict dictates on exactly how each organization will perform their work. The standard should only specify the end objective and not the process to achieve that objective.	

Likes 0	
Dislikes 0	

Response

The proposed FAC-015-1 does not specify the process by which these activities are accomplished. The proposed standard merely requires that a process exists and some minimal information be provided as part of the effort. If an entity already has a process to accomplish the described effort, then meeting the proposed standard should pose little to no concern. The standard has been proposed, in part, for those entities that have no existing process, and with the retirement of FAC-010-3. The SDT expects most differences to simply be differences in Facility Ratings due to Planning Coordinators or Transmission Planners having identified the need to upgrade a Facility to resolve an issue found in past Planning Assessments. Nothing in the SDT's choice precludes a Planning Coordinator or Transmission Planner from using consistent Facility Ratings, System steady state voltage limits, and stability performance criteria for use in Planning Assessments across all Planning Horizons.

Comment

We question what the value of R1-R3 is and if the requirements are even needed. R1-R3 are really dealing with TPL-001-4 and there shouldn't be three additional requirements in FAC-015-1 to deal with the uncommon occurrence of a PC using less limiting Facility Ratings, System steady-state voltage limits, or stability performance criteria. It certainly shouldn't require a technical justification, it should only require coordination

Response

The SDT understands your perspective with regard to the proposed standard. During our discourse over it, the very point you note was discussed. What our collective dialogue uncovered was the fact that no standard requires this data, used in both Operations and Planning, to be coordinated. In addition, our discussions uncovered current examples where the coordination does not occur as well as it might otherwise. Finally, with the retirement of FAC-010-3, the opportunity to compare, explicitly, SOLs in the Planning Horizon and Operations Horizon is removed. For these reasons, and the need to have coordination between the Reliability Coordinator and the Planning Coordinator and Transmission Planners, the SDT determined there was a need for the proposed standard FAC-015-1.

Comment	
The TPL-001-4 study requires MOD data to be used in TPL-001-4 R1. This includes the rating of transformers and transmission lines. Voltage limits (including the stability performance of the voltage) is addressed in TPL-001-4 R6 and are the required criteria for the Planning Assessment. These requirements are applicable to both the Near-Term Transmission Planning Horizon and the Long-Term Planning Horizon. Specifying the time horizon in FAC-015-1 should not be done because it does not modify the time frame requirement found in TPL-001-4 for when these thermal and voltage limits should be used. CHPD feels this language should be removed from FAC-015-1 R1-R3.

NERC TPL-001 Planning Assessment should have Facility Ratings, System steady state voltage limits, and stability performance criteria established for both Near-Term and Long-Term Transmission Planning Horizon, however these should be defined separately from RC's SOL Methodology.	
Likes 0	
Dislikes 0	
Response	
The proposed FAC-015-1 standard continues to allow the Facility Ratings, System steady state voltage limits, and stability performance criteria established for the NERC TPL-001-4 Planning Assessments to be established independently from those used by the RC using its SOL methodology. What the proposed standard does do, however, is require the implementation of a process to result in Facility Ratings, System steady state voltage limits, and stability performance criteria that are equal or more limiting to those used in Operations, or the difference is explained. The expectation is that System steady state voltage limits and stability performance criteria should be the same in the Near-Term and Long-Term Transmission Planning Horizons, as well as in any Operations Horizon. If they are not, there should be a technical reason for the difference. The same holds true for Facility Ratings; they would expect to be the same among all Horizons for the same facility, but if there were a change in the facility (due to a planned change as a need identified in a Planning Assessment), then there would be a technical reason for the difference.

Scott Downey - Peak Reliability - 1	
Answer	No
Document Name	
Comment	
Peak believes that requirements R1 through R3 should also apply to other NERC required assessments such as the Transfer Capability assessments required by FAC-013-2. It is important for reliability that these Transfer Capability assessments abide by the same principles as the Planning Assessments for the Near-Term Transmission Planning Horizon. Otherwise the Transfer Capability assessments could use a different set of Facility Ratings, System Voltage Limits, and stability criteria than those established in accordance with the RC's SOL Methodology, which propagates the problems that are being addressed by FAC-015-1 Requirements R1 through R3.

Response	
The SDT appreciates your comment. The SDT believes that the Facility Ratings, System steady state voltage limits, and stability performance criteria developed for Planning Assessments for NERC standard TPL-001-4 should be identical to those used for other Planning Assessments, including those required by FAC-013-2. The SDT wants to keep the proposed standard as simple as possible, and chose not to include other sets of Facility Ratings, System steady state voltage limits, and stability performance criteria due to our belief that one set should be common among all planning analyses.

We do not see any reason why the method used to establish Ratings/Limits would be different in the near-term and longer-term horizons. The time horizon necessary to fund, plan and construct facilities is much longer than 1 to 2 years. Unacceptable system performance needs to be identified five to ten years in the future to allow for building facilities to solve these issues. As for alternative language, we would just strike the words “of the Near-Term Transmission Planning Horizon” from the requirements.

We think that It is unnecessary and less worthwhile to include the Long-Term Planning Horizon (6 - 10 years in the future) because the future system assumptions (load, generation, transfers, etc.) are more uncertain and speculative than the Near-Term Planning Horizon. So, the results would be less useful and subject to change than the Near-Term Planning Horizon results.

We agreed with the SDT that Planning Assessments in scope for these requirements should be limited to the Near-Term Transmission Planning Horizon. PCs are already required to share their results with their RCs, per NERC Reliability Standards IRO-017-1. Sharing similar results from Planning Assessments that are analyzed over a longer time period may not readily benefit the RC looking to develop Operating Plans that alleviate SOL Exceedances.

With the exception of planned facility upgrades, we are unaware of why facility ratings, steady-state voltage limits, and stability performance criteria would be different in the Long-Term vs. Near-Term Planning Horizons and would need to be coordinated with the Reliability Coordinator. Therefore, for the Eastern Interconnection, limiting the coordination from the Near-Term Planning Horizon with the Operating Horizon to a discussion of changed facility ratings should be adequate to maintain reliability.

Once these facilities move into the Near-Term horizon, 5 years provides sufficient time to identify thermal constraints in the same manner as they would be seen operationally and develop appropriate Corrective Actions. The Near Term horizon is more than enough time to identify constraints and prepare any needed operational strategies for scenarios that may be candidates to be declared an IROL by the RC.

Limiting to the Near-Term assessment is fine. However, the Manitoba Hydro Planning Coordinator does not typically change the limits/criteria/ratings between the Near-Term and Long Term horizons. The exception would be Facility Ratings where a modification occurred (Corrective Action Plan installed) or possibly a facility rating methodology changed.

AZPS agrees that it should be limited to Planning Assessments of the Near-Term Transmission Planning Horizon and further recommends that it should be limited to only studies for years 1 to 2. The Near-Term transmission planning horizon covers years 1 to 5 and is much longer than the operating horizon. Requiring SOL methodology limitations to be used for years 1 – 5 of the Near-Term Planning Horizon could be problematic and is unnecessary.

Response

Nothing in the SDT's choice (of a comparison using the Near-Term Planning Horizon) precludes a Planning Coordinator or Transmission Planner from using consistent Facility Ratings, System steady state voltage limits, and stability performance criteria for use in Planning Assessments across all Planning Horizons. The SDT wanted to only compare the Facility Ratings, System steady state voltage limits, and stability performance criteria for use in Planning Assessments of the Near-Term Transmission Planning Horizon due to its best comparability to the Operations Horizon. In addition, the SDT recognized that the Long-Term Planning Horizon may include more differences in Facility Ratings (due to changes in facilities to mitigate issues found in past Planning Assessments), and only wanted Planning Coordinators and Transmission Planners to have to provide a technical rationale for those differences within the Near-Term Planning Horizon only.

The expectation is that System steady state voltage limits and stability performance criteria should be the same in the Near-Term and Long-Term Transmission Planning Horizons, as well as in any Operations Horizon. If they are not, there should be a technical reason for the difference. The same holds true for Facility Ratings; they would expect to be the same among all Horizons for the same facility, but if there were a change in the facility (due to a planned change as a need identified in a Planning Assessment), then there would be a technical reason for the difference.

13. In Requirements R1 – R3, the SDT is proposing to allow a PC to provide a technical justification to its RC for using less limiting Facility Ratings, System steady-state voltage limits, and stability performance criteria than those specified in its RC's SOL Methodology. Do you agree that this provides adequate flexibility (in the rare circumstances when less limiting Facility Ratings, System steady-state voltage limits, and stability performance criteria must be utilized; e.g., up-rating a line in a future project) without compromising reliability? If yes, please provide supporting rationale; if no, please explain and provide alternative language.

: It makes sense to require PC/TPs to use the same "type" of Facility Ratings and Voltage Limits as the RC/TOP (i.e. if the TOP is operating to 20-minute emergency ratings, the TP/PC shouldn't be planning to 60-minute emergency ratings). If that is the intent, then this requirement should be included in the TPL-001 standard rather than in this separate FAC-015 standard. The language I would put in the TPL standard would look something like: "Each Transmission Planner and Planning Coordinator shall use the same or a more conservative category of Facility Rating (i.e. using the same emergency rating duration, or using only normal ratings) as used by the TOP/RC in operations."

The language of the proposed requirements implies that the RC will be the arbiter of which planned projects can be included in planning cases, which does not make sense. If the intent is make sure the RC is aware of these planned projects, the language should be changed (perhaps in a separate

requirement) to something like: "the PC/TP shall inform its associated RC of any planned projects that result in changes to Facility Ratings, System Voltage Limits or Stability Limits used in the planning horizon." If the drafting team sees a need to set the terms under which a project can be included in a TPL planning case, that should be included in the TPL-001 standard, not decided on a case-by-case basis by the RC.

In the case of Stability Criteria, TPL-001-4 and WECC-CRT-3.1 provide pretty explicit criteria for planning assessments. If these are not consistent with the RC requirements, that should be addressed within those standards. The TP/PC should not need to comply with two different sets of stability criteria.

Response

Regarding the example you cited in your first paragraph, planning to a 60-minute Emergency Rating by a PC/TP would be an example of those entities using a more limiting rating that the RC/TOP who is operating to a (higher) 20-minute Emergency Rating. Your point about "same type" of ratings is well taken and the SDT agrees.

The intent of FAC-015-1 is not to allow the RC to dictate what projects go into planning cases. It is intended to provide for the coordination of Facility ratings and voltage/stability limits between planning and operations.

FAC-015-1 provides for a level of coordination between planning and operating entities that is currently absent in the body of NERC Reliability Standards. It may be appropriate to include some or all of the requirements of FAC-015 into other existing standards. However, the SAR for this project currently does not allow for the modification of other standards such as TPL.

R1: The Facility Ratings are coordinated through the MOD-032-1 model development process. Modeling differences from year to year are documented but not between each series of models. The RC is regularly updating Facility Ratings to perform operational and real time studies. The Planning Models are made annually with assumptions made on in-service dates. A particular RC model could easily be out-of-sync with a particular PC model on certain pieces of equipment, however there should be no reliability gap as a result. If the Facility Ratings used by the RC are different from the Year 1 planning model, perhaps the RC should provide a technical justification to the PC instead? This seems to be a lot of work for minimal if any reliability gain.

R2: The PC has documented steady state voltage criteria as required by TPL-001-4 R5. The Transmission Operator fundamentally sets the steady state voltage limits on each BES bus as per NERC FAC-014-3 R2 and NERC FAC-011-4 R3.1. It makes more sense for the PC to coordinate with the Transmission Operator(s) within the PC area to ensure that limits/criteria are coordinated and exceptions noted. This would be an

easy task that it is already performed in Manitoba. The PC criteria is documented in the Transmission System Interconnection Requirements document (created to be compliant with FAC-001) and exceptions developed by the Transmission Operator are noted in a referenced Normal Operating Procedure. R3: The PC has documented steady stability criteria as required by TPL-001-4 R4 and R5. The Transmission Operator sets the stability criteria as per NERC FAC-014-3 R2 and NERC FAC-011-4 R4.1. It makes more sense for the PC to coordinate with the Transmission Operator(s) within the PC area to ensure that limits/criteria are coordinated and exceptions noted. This would be an easy task that it is already performed in Manitoba. The PC criteria is documented in the Transmission System Interconnection Requirements document (created to be compliant with FAC-001). Manitoba Recommends removing R1 and having the coordination in R2 and R3 occur between the PC and relevant Transmission Operator(s) that are responsible for the PC area if needed. Alternatively, the criteria developed by the PC under TPL-001 could be shared with the Transmission Operator.

The SDT agrees that MOD-032 provides the process for coordinating Facility Ratings in planning models. The rationale for R1 cites this as well. Additionally, the SDT is considering language revisions to add clarity on Facility Ratings assumptions. The RC sets the SOL criteria the TOP must adhere to. The SDT believes the coordination between planning assumptions and operation assumptions should include the RC's SOL Methodology.

Suggest adding the phrase "at the same assumed ambient temperature(s)" after the term "Near-Term Transmission Horizon" in the first sentence of R1. The purpose is to make clear that the use of dynamic ratings based on ambient conditions in Operations for thermal ratings can be utilized and that the correlation of the Planning Coordinators Facility Ratings and the Facility Ratings associated with the Reliability Coordinator can be at a discrete small set of ambient temperatures.

It makes sense to require PC/TPs to use the same "type" of Facility Ratings and Voltage Limits as the RC/TOP (i.e. if the TOP is operating to 20-minute emergency ratings, the TP/PC shouldn't be planning to 60-minute emergency ratings). If that is the intent, then this requirement should be included in the TPL-001 standard rather than in this separate FAC-015 standard. The language I would put in the TPL standard would look something like: "Each Transmission Planner and Planning Coordinator shall use the same or a more conservative category of Facility Rating (i.e. using the same emergency rating duration, or using only normal ratings) as used by the TOP/RC in operations."

The language of the proposed requirements implies that the RC will be the arbiter of which planned projects can be included in planning cases, which does not make sense. If the intent is make sure the RC is aware of these planned projects, the language should be changed (perhaps in a separate requirement) to something like: "the PC/TP shall inform its associated RC of any planned projects that result in changes to Facility Ratings, System Voltage Limits or Stability Limits used in the planning horizon." If the drafting team sees a need to set the terms under which a project can be included in a TPL planning case, that should be included in the TPL-001 standard, not decided on a case-by-case basis by the RC.

In the case of Stability Criteria, TPL-001-4 and WECC-CRT-3.1 provide pretty explicit criteria for planning assessments. If these are not consistent with the RC requirements, that should be addressed within those standards. The TP/PC should not need to comply with two different sets of stability criteria.

Comment	
Although the NSRF agrees there may be cases where this flexibility is necessary, there is no criterion to determine what acceptable technical justification is. Nor does the standard identify who it is that determines that the technical justification is acceptable. This leaves ambiguity in the proposed requirements. The requirements need to clearly spell out which entity is responsible for determining when it is appropriate for less limiting criteria to be used in planning evaluations. As it is the real-time operators who will have to operate the system as designed, we believe the RC should have the final say as to whether the justification is appropriate or not.

R1-R3 should provide Transmission Planner and not only Planning Coordinator the opportunity to provide a technical justification for 'different' Facility Ratings, System steady state voltage limits, and stability performance criteria to its Reliability Coordinator. The alternative language should have an addition of "Transmission Planner or" as follows: "[…]If the **Transmission Planner or** Planning Coordinator uses less limiting System steady-state voltage limits than the System Voltage Limits established in accordance with its Reliability Coordinator's SOL Methodology, the Planning Coordinator shall provide a technical justification to its Reliability Coordinator."

While CHPD appreciates the nod to flexibility by allowing the Planning Coordinator to use different criteria, with justification to the Reliability Coordinator, CHPD disagrees with the statement that this will be a rare circumstance. As stated above, CHPD feels a better tool would be for the Reliability Coordinator and Planning Coordinator to exchange methodologies and ratings assumptions / practices, and to have the ability to comment to each other with technical concerns. Alternative language for R1-R3 could be something to the effect:

R1. The Reliability Coordinator shall provide its methodology, performance criteria, and ratings assumptions to each Planning Coordinator in the Reliability Coordinator's area

Each Calendar Year

90 days prior to a change

R2. The Planning Coordinator shall provide its methodology, performance criteria, and ratings assumptions to each Reliability Coordinator in the Planning Coordinator's area Each Calendar Year 90 days prior to a change R3. If the (Planning Coordinator or Reliability Coordinator) receive technical comments in writing from the (Reliability Coordinator or Planning Coordinator), the (Planning Coordinator or Reliability Coordinator) shall respond to those comments within 30 days.

This would place too much burden on both the PC and TP. Per FAC-008-3, Facility Ratings are calculated by the TO and communicated to the TP and TOP (typically all within the same organization) and to the PC and RC. These same ratings are used throughout both the Near-Term and Long-Term Planning Assessments unless a planned project causes them to change or a project that is under construction goes in service. Coordination occurs today and should be allowed to continue without strict dictates on exactly how each organization will perform their work. The standard should only specify the end objective and not the process to achieve that objective.

Response	
The rationale for Requirement R1 states, "The intent of Requirement R1 is not to change, limit, or modify Facility Ratings determined by the equipment owner per FAC-008. The intent is to utilize those owner-provided Facility Ratings such that the System is planned to support the reliable operation of that System." In order to ensure the requirement is adequately clear, the SDT is editing the requirement to include the descriptor "owner-provided" to the reference for Facility Ratings. FAC-015-1 does not require additional simulations beyond what is already required by TPL-001. It does require planners to use Facility Ratings and System voltage/stability performance criteria that are consistent with what is used in the operation of the applicable System or document any exceptions.	

Additionally, FAC-015-1 provides for a level of coordination between planning and operating entities that is currently absent in the body of NERC Reliability Standards. Based on feedback from KEY STAKEHOLDERS, this level of coordination is necessary and needs to be captured in either in the proposed FAC-015 or a modification to existing standards.

With the exception of planned facility upgrades, we are unaware of why any technical justification would be required by the PC to the RC. Conversely to what is stated in the question, we do not believe that facility upgrades are rare circumstances and compromise reliability.

Furthermore, we see nothing in the NERC Functional Model that would allow the PC and RC to develop or establish system performance criteria as part of their defined roles, or to establish performance criteria that could be more restrictive than the criteria provided by the Transmission Owners and Transmission Planners. Standard TPL-001-4 dictates system performance requirements. PC and RC cannot arbitrarily decide to come up with new, more restrictive system performance criteria.

We are also concerned that requirements R1 through R3 allow for no input from the Transmission Planners regarding the development of any performance criteria established by the Planning Coordinator. Requirement R4 then requires the PC to simply hand-down its criteria to the Transmission Planner without any input as to whether the criteria are reasonable or whether meeting the criteria is feasible. At a minimum, requirements R1 through R3 need to recognize that the development of any PC based system performance criteria has to be a collaborative effort between the PC and the TPs and the Transmission Owners. Any tightening of performance criteria will likely require capital investment and we need to hear from the Planning Coordinators as to why the planned system needs to meet the new, more stringent reliability requirements.

Requirements R1 through R3 require the Planning Coordinator to provide a technical justification to the Reliability Coordinator for using less limiting ratings, voltage limits, or performance criteria. We can see that some equipment ratings can change from year to year, and perhaps the corrective action plans should also be provided for those parts of the system that have been or are planned to be upgraded. However, we disagree with the approach proposed by the SDT for the voltage limits and stability criteria, and instead believe that the drafting team needs to have the Reliability Coordinator provide a technical basis to the Planning Coordinator and the Transmission Planners regarding why more

limiting ratings and performance criteria should be required in planning assessments. As any tightening of ratings and performance criteria will likely require capital investments, we need to hear from the Reliability Coordinators as to why the system as provided/planned needs to meet the new, more stringent reliability requirements.

Response	
In the initial posting of FAC-015-1, the intent was that a "technical justification" would be required, for example, in instances where a PC planned to a 15 minute Emergency Rating when the RC's methodology only allowed the for a 30 minute Emergency Rating to be used in the operation of the System. This would result in planning studies that used less restrictive Facility Ratings than what is used to operate that system. FAC-015-1 is not intended to allow the RC to dictate criteria on planning entities who are not under the authority of the RC. The intent is to ensure the system is planned in a manner that is conducive to the reliable operation of that system. If planning entities use less limiting criteria, the standard does require documentation as to why less limiting criteria were used but does not give the RC authority to accept or reject that documentation. The PC to TP communication does not imply the process of determining performance criteria or modeling assumptions is not a joint effort by the PC and the TP. The rationale for R1 even speaks to the joint effort required by MOD-032-1 as being the appropriate mechanism for the coordination of Facility Ratings in planning models. The SDT is revising the language in the requirements to add clarity regarding exceptions to R1 – R3 and to simplify the language around the PC/TP communication path.

For the reasons noted in the response to Question 11, the ISO does not agree with the implementation of FAC-015. However, if it is implemented, we support allowing a PC to provide a technical justification to its RC for using less limiting Facility Ratings, System steady-state voltage limits, and stability performance criteria than those specified in its RC's SOL Methodology.

We request the term "Facility Ratings" in the requirement and throughout the standard be replaced with something like "applicable Facility Ratings duration criteria".

"In the case of Stability Criteria, TPL-001-4 and TPL-001-WECC-CRT-3.1 provide pretty explicit criteria for planning assessments. If these are not consistent with the RC requirements, that should be addressed within those standards. The TP/PC should not need to comply with two different sets of stability criteria."

PNMR believes that allowing a justified exception will still result in a gap between planning and operations and considers this standard, as written, as an additional administrative burden on the PA. Instead of allowing for exceptions, PNMR suggests that the RC, TOP, and PA should jointly develop system performance criteria.

Likes 0	
Dislikes 0	

Response

The potential for "gaps" between planning and operations exist today. The addition of FAC-015 will, at a minimum, facilitate recognition of these "gaps" where they exist. The SDT did not take the route of requiring the PC to jointly develop criteria with TOPs and RCs due to the fact that the PC is not under the jurisdiction of the RC and the RC is not under the jurisdiction of the PC. Therefore, there would be no entity that had the authority to effectively force a set a common criteria on the other should joint efforts fail.

In most situations, proposed R1-R3 provides adequate flexibility without compromising reliability; however, it raises a question:

If the RC needs to lower an SOL below the Facility Rating in real-time due to clearance issues, how does the PC monitor SOLs to determine if an SOL has gone lower than the Facility Rating, necessitating technical justification?

Likes 0	
Dislikes 0	

Response

When issues occur in real-time such as the given example, it is not the PC's responsibility to monitor these types of events. However, if a de-rate is expected to go on indefinitely, planning models should be updated with the lower Facility Rating as it is a change to an existing Facility that must be modeled as required by TPL-001-4, Requirement R1.1.3.

Comment	
In the event planned transmission system upgrades exist, the PC would often need to use less limiting Facility Ratings for those facilities. The SDT should consider including a firm exclusion of transmission system upgrades for FAC-015-1 R1 to avoid unnecessary documentation for a frequent and commonly understood justification. ERCOT suggests the following revision to achieve this purpose: Each Planning Coordinator, when developing its steady-state modeling data requirements, shall implement a process to ensure that, ***for all Facilities other than those with planned transmission upgrades***, Facility Ratings used in its Planning Assessment of the Near-Term Transmission Planning Horizon are equally limiting or more limiting than those established in accordance with its Reliability Coordinator's SOL Methodology. ****Please refer to the attached comment form for redlined language.

PCs are already required to provide the results of their Planning Assessments to impacted RCs, per NERC Reliability Standards IRO-017-1. The inclusion of technical justifications for using less limiting SOLs would then be included in addition to these results. We caution the SDT that the target audience of a RC's SOL Methodology are TOPs, not PCs. TOPs use this methodology to determine applicable owner-provided Facility Ratings, System Voltage Limits, and stability limits that can be used in operations. We feel this creates a process gap that should be addressed by requiring the RC to include, in its SOL Methodology, a method for PCs to determine applicable owner-provided Facility Ratings and System Voltage Limits in their Planning Assessments.	
Likes 0	
Dislikes 0

The SDT understands the intent of the RC's SOL Methodology and the target audience. As such, the RC including a method for PC's to determine applicable owner-provided Facility Ratings and System Voltage Limits would not be appropriate additions to this methodology since the RC has no jurisdiction over a PC per the NERC Functional Model. The SDT agrees that one method for communicating the technical justification would be to document it in the Planning Assessment.

14. Do you agree that the information identified in Requirement R6 is necessary for each impacted RC and TOP to properly evaluate instability, Cascading, or uncontrolled separation identified in planning assessments for use in establishing stability limits and IROLs in the operations horizon? If not, please explain and provide alternative language.

Lauren Price - American Transmission Company, LLC - 1 - MRO,RF	
Answer	No
Document Name	
Comment	

We disagree that Near-Term Transmission Planning Horizon and Transfer Capability Assessments will necessarily be useful for establishing stability limits and IROLs in the operating horizon because the basis for planning horizon assessments [transmission planning system models (e.g. firm loads, firm transfers, and generation dispatch) and applicable contingencies] are quite different from the basis for operating horizon assessments. It also seems that the burden on the PCs to prepare the required information packages for potentially impacted RCs and TOPs will not be commensurate with the limited benefit that it may provide to RCs and TOPS. It would be more reasonable, clear cut, and pose less compliance risk to require PCs to simply provide their Near-Term Transmission Planning Horizon and Transfer Capability Assessments to the RCs and TOPS within and adjacent to their area. The RCs and TOPs would then decide from themselves whether any information in these documents may be interest or impact them.	
Likes 0	
Dislikes 0	
Response	
The SDT discussed these issues at length when developing the language. It was the consensus of the SDT that the information provided through FAC-15-01, R6 (now R4 in the revised FAC-015) is potentially of great operational value to RCs and TOPs. Since the focus of the requirement is on those instances of instability, Cascading or uncontrolled separation identified in either its Planning Assessment of the Near-Term Transmission Planning Horizon or its Transfer Capability assessment, those types of system performance are serious enough to warrant the provision of the information as described in the requirement. The SDT noted that current Near-Term Transmission Planning Horizon or its Transfer Capability assessments do not necessarily provide the desired information in an easy to find fashion. The SDT further determined that the serious potential consequence of these types of system performance warranted the addition of the requirement such that the RCs and TOPs could easily determine if there was a potential that the instances found in planning analyses could occur while operating the system. The SDT does not agree that the value of the information is not commensurate with the preparation effort to collect and provide the information. Given the potential reliability benefit (identification and preclusion of IROLs), we do not believe consideration of compliance risk is appropriate for consideration here given the limited effort involved.

FAC-15-1 Requirement R6 is a step in the right direction. However, FAC-15-1 should address that Planning Assessments and Operations studies for derivation of SOLs and IROLs are not of the same scope in terms of number of facilities considered out of service. Therefore simply enforcing that the performance criterion used in the Planning Assessment be more restrictive than that used in Operations does not materially improve the operability of planned facilities. The scope of the studies in the Operations Horizon should be increased to bridge this gap through Requirements in FAC-11-4 and FAC-14-3.	
Likes 0	
Dislikes 0	
Response	
The revised FAC-011-4 standard addresses, at length, the SOL methodology. The revised R4 requires definition of multiple criteria for determination of stability limits. The SDT believes there is no need to further address studies in Planning or Operations, but rather focus on the information that can be gleaned from existing Planning analyses. One of your statements is factually incorrect; FAC-015-1 does not require the performance criteria used in Planning studies to be more restrictive; it has to be equal or more restrictive than that used in Operations, or a technical justification why is it not has to be provided. Given this, there is room for explained differences in Planning and Operations criteria. The SDT recognized that the scope of planning and operating stability studies can be, and are often, different. The scope of the requirement focused on conveying potentially critical information to the RC and TOP in an efficient manner. The SDT believes it is the responsibility of the RC to describe in its SOL methodology the breadth of work required to perform stability studies, and the SDT does not presume to know what expanded scope of stability work should be included by every RC and their TOPs.	
Allie Gavin - Allie Gavin On Behalf of: Michael Moltane, International Transmission Company Holdings Corporation, 1; - Allie Gavin	
Answer	No
Document Name	

Comment	
This would place too much additional compliance burden on the PC. If the RCs and TOPs believe that this information is important for them to obtain, a SAR should be opened to add this to the TPL-001 standard or at least the IRO-017 standard verses creating another new standard that requires the PC to provide additional information from the TPL standard to the RC and the TOP.	
Likes 0	
Dislikes 0	
Response	
The existing standard already has the PC providing information to the RCs for those multiple contingencies that result in stability limits (FAC-011-3, requirement 6 and its subparts). The SDT discussed the value of the information provided through this requirement and believed that the information was inadequate for the needs of the RC, especially in light of FERC's renewed focus on IROLs. The SDT determined that the information sought in the proposed R6 was the minimum the RCs and TOPs need to quickly determine if there are any contingencies, single or multiple, that result in system instability, Cascading or uncontrolled separation. This information should already exist in the Near-Term Transmission Planning Horizon or its Transfer Capability assessments. Since this information would then be used to determine IROLs, which are determined using the RC's SOL methodology, the SDT believed this information was appropriate for inclusion within an FAC standard and could not wait to addition of a SAR and potential inclusion in another standard.	
Janis Weddle - Public Utility District No. 1 of Chelan County - 6, Group Name Chelan PUD	
Answer	No
Document Name	
Comment	
Because UFLS and UVLS relays are permitted to trip load beyond P2.1 contingencies in the Planning Assessment and will trip as needed to help stabilize the simulation, it is not possible for FAC-015-1 R6.4 to be achieved because the simulation will not reach the point of instability, Cascading, or uncontrolled separation with the relay action present in the simulation. In order to make this determination (whether there would have been instability, Cascading, or uncontrolled separation if they had not tripped), an entity would have to run a second set of simulations blocking all UFLS and UVLS relays from tripping. The system performance could then be assessed and the information in FAC-015-1 R6.4 related to UFLS and UVLS relays could then be provided. As these additional simulations would represent additional burden to the	

work performed under TPL-001-4, CHPD feels that the proposed FAC-015-1 R6.4 should have the items related to UVLS and UFLS removed from the criteria. If this is a reliability objective, it should be addressed under the TPL-001-4 standard.	
Likes 0	
Dislikes 0	
Response	
While the SDT agrees that the explicit modeling of the actions of the UFLS and UVLS relays may preclude clear identification of instances of instability, Cascading and uncontrolled separation in stability assessments, the SDT does not believe all planning entities include such models in all of the stability models. Furthermore, an RC, per FAC-011-4, Part 4.7, state explicitly that under-frequency load shedding (UFLS) and Under-voltage Load Shedding Programs are not allowed in the establishment of stability limits. This requirement is based upon long-standing FERC rulings stating that these programs are Given that, then those dynamic models and resulting studies without explicit UFLS and UVLS modeling could provide the necessary information requested in R6 (now R4 in the revised standard). In addition, for those entities that do model UFLS and UVLS, they could construe requirement FAC-011-4, R4.6 to indicate that any actuation of UFLS or UVLS for normal criteria contingencies respected by the RC or TOP as being an indication of potential instability, Cascading or uncontrolled separation. As such the SDT is not requiring any additional simulations on the part of planning entities. Finally, the TPL-001-4 standard is not the only standard with a reliability objective, so it is not the only potential home for a requirement such as FAC-015-1, R6 (now R4).

Thank you for your feedback. The SDT recognizes that assessments and analyses in Planning and Operations may have differences. The concern noted, with the removal of FAC-010, and the underlying reasons why the FAC-010 and FAC-011 standards first came into being, was to have a system planned that could then be operated. The SDT, with observer participation, further noted that if fundamentally different assumptions were used (for thermal, voltage or stability limits / criteria) between planners and operators, then they might be poor correlation between issues found and resolved by planners, and those found and requiring action by operators. With the removal of FAC-010, the value to reviewing consistency between limits and criteria used in planning and operating the system became obvious. The SDT recognizes that neither the PC nor RC has jurisdiction over the other entity for their industry responsibilities (planning and operating, respectively). However, it is the RC, as the ultimate operating authority, that needs to know that the limits it uses to operate the system (based upon thermal ratings, voltage limits and stability criteria) and how they compare against limits used when the system is planned.

The use of the term "instability, Cascading, or uncontrolled separation" as stated in R6 may not be clear to all that the purpose is for the Planning Coordinator to alert the RC to scenarios that have the potential to be categorized as IROLs in the Operations arena based on the RC's SOL methodology. Suggest rewording R6 to: "Each Planning Coordinator shall communicate scenarios that demonstrated IROL type conditions such as instability, Cascading, or……." However, it should be made clear that the RC would make the determination if it would be considered an IROL based on the RC's SOL methodology	
Likes 0	
Dislikes 0	
Response	
The SDT purposefully chose the terms included in the proposed standard so that the PC would focus on their assessment and determination of which results met the "instability, Cascading or uncontrolled separation" characterization without having to use any SOL methodology. The RC has the responsibility to review the information provided, and utilize the information as it sees fit, which would include application of their SOL methodology as applicable.

Answer	No
Document Name	
Comment	
R6 is better located in TPL-001-4 or FAC-013-2. The current language states that "any" instability, Cascading or uncontrolled separation should be communicated. Does the RC need or want to know about extreme disturbances or only P1-P7 events? It makes more sense to share the Planning Assessment and Transfer Capability assessments to the RC as part of the relevant standards.	
Likes 0	
Dislikes 0	

Response	
The SDT's scope and the initiating SAR do not include revisions to either TPL-001-4 or FAC-013-2. The SDT does agree that a later drafting group could take requirement R6 (now R4 in the revised FAC-015-1) and place it in TPL-001-4. It should be noted, though, that the entirety of the requirement is required, including explicit communication from the PC to the RC of the requested information. The SDT discussed at length the information conveyed today in planning assessments and agreed that while the requested information may be in all planning assessments, it is commonly not easily found and not included in the level of detail noted in requirement 6. The RC does want to know about any PC stability simulation result that has as an outcome of instability, Cascading or uncontrolled separation.	
Aaron Cavanaugh - Bonneville Power Administration - 1,3,5,6 - WECC	
Answer	No
Document Name	
Comment	
This requirement is already included in other planning standards, such as TPL-001-4 and IRO-017-1. The objective could be better accomplished by modifying or including specific details of the requirement in existing planning standards. IRO-017-1 requires the TPs and PCs to provide the system assessment to their RC. Any identified instability would be included in the system assessment. The RC is in the best position to inform the TOP in the RC area. TPL-001-4 also requires the PCs and TPs to share the system assessment to adjacent TPs and PCs.

The SDT discussed at length the information conveyed today in planning assessments and agreed that while the requested information **may** be in all planning assessments, *it is not necessarily* in all planning assessments, is not easily found if present, and not included in the level of detail noted in requirement 6. The SDT arrived at the specifics captured in requirement 6 (now R4 in the revised FAC-015-1) after lengthy discussion and debate with regard to its merits. A later SDT may choose to lift this requirement, in its entirety, and place it in TPL-001-4.

Answer	Yes
Document Name	
Comment	
Duke Energy request further clarification from the drafting team on the types of events that require communication from the PC to the RC and TOP in R6. The current language states that the PC shall communicate to the RC and TOP of “any” instances of instability, Cascading or uncontrolled separation identified in either its Planning Assessment of the Near-Term Transmission Planning Horizon or its Transfer Capability assessment. Does this include “extreme events” as well?	
Likes 0	
Dislikes 0	
Response	
The SDT discussed this issue and determined that the RC does want to know about any PC stability simulation result that has an outcome of instability, Cascading or uncontrolled separation. If the PC performed extreme event simulations that demonstrated one of those three	

results, the RC would want to know, so that if, in the unlikely condition that system were close to one of those end states, the RC would have the benefit of the information for developing an operating plan to preclude the potential instability outcome.

Scott Downey - Peak Reliability - 1	
Answer	Yes
Document Name	
Comment	
Peak is especially supportive of subpart 6.4 which requires communication of “Any Remedial Action Scheme action, undervoltage load shedding (UVLS) action, underfrequency load shedding (UFLS) action, interruption of Firm Transmission Service, or Non-Consequential Load Loss required to address the instability, Cascading or uncontrolled separation;” This information is critical for the RC understanding the risks that have been identified and the measures that were taken in the Planning Assessments to address the risk. If this information is not provided, the RC has no way of knowing or understanding what kinds of risks for instability, Cascading, or uncontrolled separation that were identified and successfully mitigated via the measures listed in subpart 6.4. This unawareness can have significant adverse reliability consequences if the associated automatic schemes are rendered unavailable in operations. It is critical that the RC understand the risks that	

were identified and the means by which those risks were mitigated in the Planning Assessment so that these risks can be addressed in operations through the development of Operating Plans.

As required by TPL 001-4, planning coordinators implement corrective action plans for any instability, Cascading, or uncontrolled separation identified in planning assessments due to planning events involving single or multiple contingencies. Providing this information to RC may be useful if the corrective action plan is establishing an SOL. On the other hand, providing this information to RC may not be useful if the corrective action plan is transmission development.	
Likes 0	
Dislikes 0	
Response	
The SDT understands your concern and comment and included a revision to the proposed standard to have the PC also document any correction action proposed to resolve instances of instability, Cascading or uncontrolled separation found. The requirement is now found as R4, with a new Part 4.6 included to address your comment.	

15. Do you agree that the Planning Assessment of the Near-Term Transmission Planning Horizon and the Transfer Capability assessment, as stipulated in Requirement R6, are the appropriate assessments for identifying any instability, Cascading, or uncontrolled separation in the planning horizon? If yes, please provide supporting rationale; if no, please explain and provide alternative language.

Pamela Hunter - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC, Group Name Southern Company

Answer	No

Response

In the original posted draft of FAC-015-1, Requirement R6 is not limited to IROL-like conditions, but rather applies to all instability risks identified in the Near-Term Transmission Planning Horizon portion of the Planning Assessment. The intent of R6 is to provide a mechanism to ensure instability risks, as well as the appropriate details regarding the instability risk, are properly communicated from planning to operations as previously required by FAC-014-2 Requirement R6. Unlike FAC-014-6 Requirement R6, FAC-015 applies to any instability and not just the risks that are the result of multiple contingency Planning Events.

The SDT, through its proposals for FAC-015-1, FAC-014-3, FAC-011-4, FAC-010-3 (retirement), are eliminating the notion of Planning Horizon SOLs. Therefore, in this construct, the RC's SOL Methodology is the only methodology where SOLs and IROLs are established.

FAC-013 (TTC) is not required to have stability criteria, instability criteria, document UFLS or UVLS relay operation, or include Corrective action plans. It is recommended that the reference to the Transfer Capability assessment be removed from the proposed FAC-015-1 R6.

Response	
The SDT recognizes that the FAC-013 TCA will vary depending on the entity performing the assessment. Those entities that do not identify stability-related constraints in their TCA would have nothing to report.

Development of SOLs and IROLs is the appropriate assessment for identifying any instability, Cascading, or uncontrolled separation in the planning horizon that is not mitigated by corrective action plans such as transmission development. TPL001-4 planning assessments require the PC to model peak load and firm transmission services but do not require stressing the system to identify its limits. Transfer Capability assessment is only applicable to tie lines.

Response	
The SDT is proposing a new construct where SOLs and IROLs are established in accordance with the RC's SOL methodology only. In this methodology, the types of studies and applicable performance criteria to assess potential instability will be documented. TPL-001-4 also requires sensitivities to be assessed per R2.4.3.	

The Transfer Capability Assessment is performed differently depending on the entity that performs the assessment. It only applying to tie lines is incorrect.

Comment	
Planning assessments in TPL-001-4 are the appropriate assessments to identify system instability and cascading outages in the planning horizon. However, BPA does not see a need for a new standard. The objective is already addressed by TPL-001-4.

FAC-015-1 provides for a level of coordination between planning and operating entities that is currently absent in the body of NERC Reliability Standards. It may be appropriate to include some or all of the requirements of FAC-015 into other existing standards. However, the SAR for this project currently does not allow for the modification of other standards such as TPL-001. Additionally, FAC-015-1 R6 is more prescriptive in identifying the details related to potential instability than R4 of TPL-001-4.

Based on the requirements of the new TPL-001-4, the Planning Assessment must identify any Near-Term Transmission Planning Horizon instability, Cascading or uncontrolled separation. The proposed FAC-015-1 R6 correctly references the reliability objective accomplished by TPL-001-4.

FAC-015 R6 supplements TPL-001 R4 in that it specifies a more prescriptive list of details regarding potential instabilities that are not explicitly stated in TPL-001 R4.

Reclamation supports the Planning Assessment of the Near-Term Transmission Planning Horizon and the Transfer Capability assessment, as stipulated in Requirement R6, because these items properly identify potential risks.

These assessments look at extreme disturbances or non-firm transfers and would be the appropriate studies in the Planning Horizon that would be able to identify instability, Cascading or uncontrolled separation if these concerns existed.

As the Near-Term Transmission Planning Horizon is the closest to operating horizons, these are the most relevant results to pass on to those responsible for operating the system.

The assessments applicable to R6 should be reflective of those assessments required by the NERC Reliability Standards. Both Planning Assessments and Transfer Capability assessments are required by the standards. Furthermore, it is possible that when performing Transfer Capability assessments, the first limitation encountered could be a stability limit (i.e., as power is transferred across an interface, a stability limitation is reached before any thermal or steady-state voltage limitation is reached). Because this is an operational possibility, Peak believes that Transfer Capability assessments should be included in R6. Peak also believes Transfer Capability assessments should be included in R1 through R3.

Thank you for the comment. The SDT did not include the TCA in R1 – R3 due to the fact that FAC-013 does not have prescriptive requirements outlining the types of planning events to assess and the minimum performance criteria necessary for compliance as TPL-001 does.

The PC also needs to send the results of its Planning Assessment or Transfer Capability Assessment to its Transmission Planners. This activity should happen before the results are sent to the RC and TOP.
