Exhibit A-1

Proposed Reliability Standard IRO-002-7
A. Introduction

1. Title: Reliability Coordination – Monitoring and Analysis

2. Number: IRO-002-7

3. Purpose: To provide System Operators with the capabilities necessary to monitor and analyze data needed to perform their reliability functions.

4. Applicability:

   4.1. Functional Entities:

   4.1.1. Reliability Coordinators

5. Effective Date: See Implementation Plan

B. Requirements and Measures

R1. Reserved.

M1. Reserved.

R2. Each Reliability Coordinator shall have data exchange capabilities, with redundant and diversely routed data exchange infrastructure within the Reliability Coordinator’s primary Control Center, for the exchange of Real-time data with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for performing its Real-time monitoring and Real-time Assessments. [Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-time Operations]

M2. Each Reliability Coordinator shall have, and provide upon request, evidence that could include, but is not limited to, system specifications, system diagrams, or other documentation that lists its data exchange capabilities, including redundant and diversely routed data exchange infrastructure within the Reliability Coordinator’s primary Control Center, for the exchange of Real-time data with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, as specified in the requirement.

R3. Each Reliability Coordinator shall test its primary Control Center data exchange capabilities specified in Requirement R2 for redundant functionality at least once every 90 calendar days. If the test is unsuccessful, the Reliability Coordinator shall initiate action within two hours to restore redundant functionality. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

M3. Each Reliability Coordinator shall have, and provide upon request, evidence that it tested its primary Control Center data exchange capabilities specified in Requirement R2 for redundant functionality, or experienced an event that demonstrated the redundant functionality; and if the test was unsuccessful, initiated action within two hours to restore redundant functionality as specified in Requirement R3. Evidence
could include, but is not limited to: dated and time-stamped test records, operator logs, voice recordings, or electronic communications.

R4. Each Reliability Coordinator shall provide its System Operators with the authority to approve planned outages and maintenance of its telecommunication, monitoring and analysis capabilities. [Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]

M4. Each Reliability Coordinator shall have, and provide upon request evidence that could include, but is not limited to, a documented procedure or equivalent evidence that will be used to confirm that the Reliability Coordinator has provided its System Operators with the authority to approve planned outages and maintenance of its telecommunication, monitoring and analysis capabilities.

R5. Each Reliability Coordinator shall monitor Facilities, the status of Remedial Action Schemes, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. [Violation Risk Factor: High] [Time Horizon: Real-Time Operations]

M5. Each Reliability Coordinator shall have, and provide upon request, evidence that could include, but is not limited to, Energy Management System description documents, computer printouts, SCADA data collection, or other equivalent evidence that will be used to confirm that it has monitored Facilities, the status of Remedial Action Schemes, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.

R6. Each Reliability Coordinator shall have monitoring systems that provide information utilized by the Reliability Coordinator’s operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant infrastructure. [Violation Risk Factor: High] [Time Horizon: Real-time Operations]

M6. The Reliability Coordinator shall have, and provide upon request, evidence that could include, but is not limited to, Energy Management System description documents, computer printouts, SCADA data collection, or other equivalent evidence that will be used to confirm that it has monitoring systems consistent with the requirement.
C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:
“Compliance Enforcement Authority” means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention:
The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- The Reliability Coordinator shall retain its current, in force document and any documents in force for the current year and previous calendar year for Requirements R2 and R4 and Measures M2 and M4.
- The Reliability Coordinator shall retain evidence for Requirement R3 and Measure M3 for the most recent 12 calendar months, with the exception of operator logs and voice recordings which shall be retained for a minimum of 90 calendar days.
- The Reliability Coordinator shall keep data or evidence for Requirements R5 and R6 and Measures M5 and M6 for the current calendar year and one previous calendar year.

1.3. Compliance Monitoring and Enforcement Program
As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

</table>

The Reliability Coordinator did not have monitoring systems that provide information utilized by the Reliability Coordinator’s operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant infrastructure.
D. Regional Variance

A. Regional Variance for the Western Electricity Coordinating Council Region

The following Interconnection-wide variance shall be applicable in the Western Electricity Coordinating Council (WECC) region.

Purpose
To develop a methodology that creates models for performing Operational Planning Analyses and Real-time Assessments.

Applicability
As used in this WECC Regional Variance, Reliability Coordinator is specific to those Reliability Coordinators providing Reliability Coordinator service(s) to entities operating within the Western Interconnection, regardless of where the Reliability Coordinator may be located.

Requirements and Measures

D.A.7. Each Reliability Coordinator shall, in coordination with other Reliability Coordinators, develop a common Interconnection-wide methodology to determine the modeling and monitoring of BES and non-BES Elements that are internal and external to its Reliability Coordinator Area, necessary for providing operational awareness of the impacts on Bulk Electric System Facilities within its Reliability Coordinator Area, including at a minimum: ([Violation Risk Factor: High] [Time Horizon: Operations Planning])

D.A.7.1. A method for development, maintenance, and periodic review of a Western Interconnection-wide reference model to serve as the baseline from which Reliability Coordinator’s operational models are derived;

D.A.7.2. The impacts of Inter-area oscillations;

D.A.7.3. A method to determine Contingencies included in analyses and assessments;

D.A.7.4. A method to determine Remedial Action Schemes included in analyses and assessments;

D.A.7.5. A method to determine forecast data included in analyses and assessments; and

D.A.7.6. A method for the validation and periodic review of the Reliability Coordinator’s operational model for steady state and dynamic/oscillatory system response.

M.D.A.7. Each Reliability Coordinator will have evidence that it developed a common Western Interconnection-wide methodology, addressing modeling and
monitoring, in coordination with other Reliability Coordinators, that includes the features required in D.A.7.

**D.A.8.** Each Reliability Coordinator shall use the methodology developed in D.A.7. ([Violation Risk Factor: High] [Time Horizon: Operations Planning])

**M.D.A.8.** Each Reliability Coordinator will have evidence that it uses the methodology developed in D.A.7., as required in D.A.8. above.

**Compliance**

**Evidence Retention:**

- The Reliability Coordinator shall keep data or evidence for Requirements R5, R6, and the WECC Regional Variance, and Measures M5, M6, and the WECC Regional Variance for the current calendar year and one previous calendar year.

Guidelines and Technical Basis
None.
Rationale

Rationale text from the development of IRO-002-4 in Project 2014-03 and IRO-002-5 in Project 2016-01 follows. Additional information can be found on the Project 2014-03 project page and the Project 2016-01 project page.

Changes made to the proposed definitions were made in order to respond to issues raised in NOPR paragraphs 55, 73, and 74 dealing with analysis of SOLs in all time horizons, questions on Protection Systems and Special Protection Systems in NOPR paragraph 78, and recommendations on phase angles from the SW Outage Report (recommendation 27). The intent of such changes is to ensure that Real-time Assessments contain sufficient details to result in an appropriate level of situational awareness. Some examples include: 1) analyzing phase angles which may result in the implementation of an Operating Plan to adjust generation or curtail transactions so that a Transmission facility may be returned to service, or 2) evaluating the impact of a modified Contingency resulting from the status change of a Special Protection Scheme from enabled/in-service to disabled/out-of-service.

Rationale for Requirements:
The data exchange elements of Requirements R1 and R2 from approved IRO-002-2 have been added back into proposed IRO-002-4 in order to ensure that there is no reliability gap. The Project 2014-03 SDT found no proposed requirements in the current project that covered the issue. Voice communication is covered in proposed COM-001-2 but data communications needs to remain in IRO-002-4 as it is not covered in proposed COM-001-2. Staffing of communications and facilities in corresponding requirements from IRO-002-2 is addressed in approved PER-004-2, Requirement R1 and has been deleted from this draft.

Rationale for R2:
Requirement R2 from IRO-002-3 has been deleted because approved EOP-008-1, Requirement R1, part 1.6.2 addresses redundancy and back-up concerns for outages of analysis tools. New Requirement R4 (R6 in IRO-002-5) has been added to address NOPR paragraphs 96 and 97: “...As we explain above, the reliability coordinator’s obligation to monitor SOLs is important to reliability because a SOL can evolve into an IROL during deteriorating system conditions, and for potential system conditions such as this, the reliability coordinator’s monitoring of SOLs provides a necessary backup function to the transmission operator....”

Rationale for Requirements R1 and R2: (note: R1 proposed for retirement in IRO-002-7 as part of Project 2018-03 Standard Efficiency Review Retirements)
The proposed changes address directives for redundancy and diverse routing of data exchange capabilities (FERC Order No. 817 Para 47).

Redundant and diversely routed data exchange capabilities consist of data exchange infrastructure components (e.g., switches, routers, servers, power supplies, and network cabling and communication paths between these components in the primary Control Center for the exchange of system operating data) that will provide continued functionality despite failure or malfunction of an individual component within the Reliability Coordinator's (RC) primary
Control Center. Redundant and diversely routed data exchange capabilities preclude single points of failure in primary Control Center data exchange infrastructure from halting the flow of Real-time data. Requirement R2 does not require automatic or instantaneous fail-over of data exchange capabilities. Redundancy and diverse routing may be achieved in various ways depending on the arrangement of the infrastructure or hardware within the RC's primary Control Center.

The reliability objective of redundancy is to provide for continued data exchange functionality during outages, maintenance, or testing of data exchange infrastructure. For periods of planned or unplanned outages of individual data exchange components, the proposed requirements do not require additional redundant data exchange infrastructure components solely to provide for redundancy.

Infrastructure that is not within the RC's primary Control Center is not addressed by the proposed requirement.

**Rationale for Requirement R3:**
The revised requirement addresses directives for testing of data exchange capabilities used in primary Control Centers (FERC Order No. 817 Para 51).

A test for redundant functionality demonstrates that data exchange capabilities will continue to operate despite the malfunction or failure of an individual component (e.g., switches, routers, servers, power supplies, and network cabling and communication paths between these components in the primary Control Center for the exchange of system operating data). An entity's testing practices should, over time, examine the various failure modes of its data exchange capabilities. When an actual event successfully exercises the redundant functionality, it can be considered a test for the purposes of the proposed requirement.

**Rationale for R4 (R6 in IRO-002-5 and IRO-002-7):**
The requirement was added back from approved IRO-002-2 as the Project 2014-03 SDT found no proposed requirements that covered the issues.
A. Introduction

1. **Title:** Reliability Coordination – Monitoring and Analysis
2. **Number:** IRO-002-57
3. **Purpose:** To provide System Operators with the capabilities necessary to monitor and analyze data needed to perform their reliability functions.
4. **Applicability:**
   4.1. **Functional Entities:**
      4.1.1. Reliability Coordinators
5. **Effective Date:** See Implementation Plan

B. Requirements and Measures

R1. **Reserved.** Each Reliability Coordinator shall have data exchange capabilities with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for it to perform its Operational Planning Analyses. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

M1. **Reserved.** Each Reliability Coordinator shall have, and provide upon request, evidence that could include, but is not limited to, a document that lists its data exchange capabilities with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for it to perform its Operational Planning Analyses.

R2. Each Reliability Coordinator shall have data exchange capabilities, with redundant and diversely routed data exchange infrastructure within the Reliability Coordinator’s primary Control Center, for the exchange of Real-time data with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for performing its Real-time monitoring and Real-time Assessments. [Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-time Operations]

M2. Each Reliability Coordinator shall have, and provide upon request, evidence that could include, but is not limited to, system specifications, system diagrams, or other documentation that lists its data exchange capabilities, including redundant and diversely routed data exchange infrastructure within the Reliability Coordinator’s primary Control Center, for the exchange of Real-time data with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, as specified in the requirement.

R3. Each Reliability Coordinator shall test its primary Control Center data exchange capabilities specified in Requirement R2 for redundant functionality at least once every 90 calendar days. If the test is unsuccessful, the Reliability Coordinator shall initiate action within two hours to restore redundant functionality. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]
M3. Each Reliability Coordinator shall have, and provide upon request, evidence that it tested its primary Control Center data exchange capabilities specified in Requirement R2 for redundant functionality, or experienced an event that demonstrated the redundant functionality; and if the test was unsuccessful, initiated action within two hours to restore redundant functionality as specified in Requirement R3. Evidence could include, but is not limited to: dated and time-stamped test records, operator logs, voice recordings, or electronic communications.

R4. Each Reliability Coordinator shall provide its System Operators with the authority to approve planned outages and maintenance of its telecommunication, monitoring and analysis capabilities. [Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]

M4. Each Reliability Coordinator shall have, and provide upon request evidence that could include, but is not limited to, a documented procedure or equivalent evidence that will be used to confirm that the Reliability Coordinator has provided its System Operators with the authority to approve planned outages and maintenance of its telecommunication, monitoring and analysis capabilities.

R5. Each Reliability Coordinator shall monitor Facilities, the status of Remedial Action Schemes, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. [Violation Risk Factor: High] [Time Horizon: Real-Time Operations]

M5. Each Reliability Coordinator shall have, and provide upon request, evidence that could include, but is not limited to, Energy Management System description documents, computer printouts, SCADA data collection, or other equivalent evidence that will be used to confirm that it has monitored Facilities, the status of Remedial Action Schemes, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.

R6. Each Reliability Coordinator shall have monitoring systems that provide information utilized by the Reliability Coordinator’s operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant infrastructure. [Violation Risk Factor: High] [Time Horizon: Real-time Operations]

M6. The Reliability Coordinator shall have, and provide upon request, evidence that could include, but is not limited to, Energy Management System description documents, computer printouts, SCADA data collection, or other equivalent evidence that will be used to confirm that it has monitoring systems consistent with the requirement.
C. Compliance

1. Compliance Monitoring Process

   1.1. Compliance Enforcement Authority:
   “Compliance Enforcement Authority” means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

   1.2. Evidence Retention:
   The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

   The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

   - The Reliability Coordinator shall retain its current, in force document and any documents in force for the current year and previous calendar year for Requirements R1, R2, and R4 and Measures M1, M2, and M4.
   - The Reliability Coordinator shall retain evidence for Requirement R3 and Measure M3 for the most recent 12 calendar months, with the exception of operator logs and voice recordings which shall be retained for a minimum of 90 calendar days.
   - The Reliability Coordinator shall keep data or evidence for Requirements R5 and R6 and Measures M5 and M6 for the current calendar year and one previous calendar year.

   1.3. Compliance Monitoring and Enforcement Program
   As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

The Reliability Coordinator did not have monitoring systems that provide information utilized by the Reliability Coordinator’s operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant infrastructure.

determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.
D. Regional Variances

A. Regional Variance for the Western Electricity Coordinating Council Region

The following Interconnection-wide variance shall be applicable in the Western Electricity Coordinating Council (WECC) region.

Purpose
To develop a methodology that creates models for performing Operational Planning Analyses and Real-time Assessments.

Applicability
As used in this WECC Regional Variance, Reliability Coordinator is specific to those Reliability Coordinators providing Reliability Coordinator service(s) to entities operating within the Western Interconnection, regardless of where the Reliability Coordinator may be located.

Requirements and Measures

D.A.7. Each Reliability Coordinator shall, in coordination with other Reliability Coordinators, develop a common Interconnection-wide methodology to determine the modeling and monitoring of BES and non-BES Elements that are internal and external to its Reliability Coordinator Area, necessary for providing operational awareness of the impacts on Bulk Electric System Facilities within its Reliability Coordinator Area, including at a minimum: ([Violation Risk Factor: High] [Time Horizon: Operations Planning])

D.A.7.1. A method for development, maintenance, and periodic review of a Western Interconnection-wide reference model to serve as the baseline from which Reliability Coordinator’s operational models are derived;

D.A.7.2. The impacts of Inter-area oscillations;

D.A.7.3. A method to determine Contingencies included in analyses and assessments;

D.A.7.4. A method to determine Remedial Action Schemes included in analyses and assessments;

D.A.7.5. A method to determine forecast data included in analyses and assessments; and

D.A.7.6. A method for the validation and periodic review of the Reliability Coordinator’s operational model for steady state and dynamic/oscillatory system response.

M.D.A.7. Each Reliability Coordinator will have evidence that it developed a common Western Interconnection-wide methodology, addressing modeling and
monitoring, in coordination with other Reliability Coordinators, that includes the features required in D.A.7.

**D.A.8.** Each Reliability Coordinator shall use the methodology developed in D.A.7. (Violation Risk Factor: High) [Time Horizon: Operations Planning])

**M.D.A.8.** Each Reliability Coordinator will have evidence that it uses the methodology developed in D.A.7., as required in D.A.8. above.

### Compliance

**Evidence Retention:**

- The Reliability Coordinator shall keep data or evidence for Requirements R5, R6, and the WECC Regional Variance, and Measures M5, M6, and the WECC Regional Variance for the current calendar year and one previous calendar year.

Guidelines and Technical Basis
None.
Rationale

During development of IRO-002-5, text boxes are embedded within the standard to explain the rationale for various parts of the standard. Upon Board adoption of IRO-002-5, the text from the rationale text boxes will be moved to this section.

Rationale text from the development of IRO-002-4 in Project 2014-03 and IRO-002-5 in Project 2016-01 follows. Additional information can be found on the Project 2014-03 project page and the Project 2016-01 project page.

Changes made to the proposed definitions were made in order to respond to issues raised in NOPR paragraphs 55, 73, and 74 dealing with analysis of SOLs in all time horizons, questions on Protection Systems and Special Protection Systems in NOPR paragraph 78, and recommendations on phase angles from the SW Outage Report (recommendation 27). The intent of such changes is to ensure that Real-time Assessments contain sufficient details to result in an appropriate level of situational awareness. Some examples include: 1) analyzing phase angles which may result in the implementation of an Operating Plan to adjust generation or curtail transactions so that a Transmission facility may be returned to service, or 2) evaluating the impact of a modified Contingency resulting from the status change of a Special Protection Scheme from enabled/in-service to disabled/out-of-service.

Rationale for Requirements:
The data exchange elements of Requirements R1 and R2 from approved IRO-002-2 have been added back into proposed IRO-002-4 in order to ensure that there is no reliability gap. The Project 2014-03 SDT found no proposed requirements in the current project that covered the issue. Voice communication is covered in proposed COM-001-2 but data communications needs to remain in IRO-002-4 as it is not covered in proposed COM-001-2. Staffing of communications and facilities in corresponding requirements from IRO-002-2 is addressed in approved PER-004-2, Requirement R1 and has been deleted from this draft.

Rationale for R2:
Requirement R2 from IRO-002-3 has been deleted because approved EOP-008-1, Requirement R1, part 1.6.2 addresses redundancy and back-up concerns for outages of analysis tools. New Requirement R4 (R6 in IRO-002-5) has been added to address NOPR paragraphs 96 and 97: “...As we explain above, the reliability coordinator’s obligation to monitor SOLs is important to reliability because a SOL can evolve into an IROL during deteriorating system conditions, and for potential system conditions such as this, the reliability coordinator’s monitoring of SOLs provides a necessary backup function to the transmission operator....”

Rationale for Requirements R1 and R2: (note: R1 proposed for retirement in IRO-002-76 as part of Project 2018-03 Standard Efficiency Review Retirements)
The proposed changes address directives for redundancy and diverse routing of data exchange capabilities (FERC Order No. 817 Para 47).

Redundant and diversely routed data exchange capabilities consist of data exchange infrastructure components (e.g., switches, routers, servers, power supplies, and network
cabling and communication paths between these components in the primary Control Center for the exchange of system operating data) that will provide continued functionality despite failure or malfunction of an individual component within the Reliability Coordinator's (RC) primary Control Center. Redundant and diversely routed data exchange capabilities preclude single points of failure in primary Control Center data exchange infrastructure from halting the flow of Real-time data. Requirement R2 does not require automatic or instantaneous fail-over of data exchange capabilities. Redundancy and diverse routing may be achieved in various ways depending on the arrangement of the infrastructure or hardware within the RC's primary Control Center.

The reliability objective of redundancy is to provide for continued data exchange functionality during outages, maintenance, or testing of data exchange infrastructure. For periods of planned or unplanned outages of individual data exchange components, the proposed requirements do not require additional redundant data exchange infrastructure components solely to provide for redundancy.

Infrastructure that is not within the RC's primary Control Center is not addressed by the proposed requirement.

**Rationale for Requirement R3:**
The revised requirement addresses directives for testing of data exchange capabilities used in primary Control Centers (FERC Order No. 817 Para 51).

A test for redundant functionality demonstrates that data exchange capabilities will continue to operate despite the malfunction or failure of an individual component (e.g., switches, routers, servers, power supplies, and network cabling and communication paths between these components in the primary Control Center for the exchange of system operating data). An entity's testing practices should, over time, examine the various failure modes of its data exchange capabilities. When an actual event successfully exercises the redundant functionality, it can be considered a test for the purposes of the proposed requirement.

**Rationale for R4 (R6 in IRO-002-5 and IRO-002-76):**
The requirement was added back from approved IRO-002-2 as the Project 2014-03 SDT found no proposed requirements that covered the issues.
Exhibit A-2

Proposed Reliability Standard TOP-001-5
A. Introduction

1. Title: Transmission Operations
2. Number: TOP-001-5
3. Purpose: To prevent instability, uncontrolled separation, or Cascading outages that adversely impact the reliability of the Interconnection by ensuring prompt action to prevent or mitigate such occurrences.

4. Applicability:

   4.1. Functional Entities:
      
      4.1.1. Balancing Authority
      4.1.2. Transmission Operator
      4.1.3. Generator Operator
      4.1.4. Distribution Provider

5. Effective Date: See Implementation Plan
B. Requirements and Measures

R1. Each Transmission Operator shall act to maintain the reliability of its Transmission Operator Area via its own actions or by issuing Operating Instructions. [Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-time Operations]

M1. Each Transmission Operator shall have and provide evidence which may include but is not limited to dated operator logs, dated records, dated and time-stamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it acted to maintain the reliability of its Transmission Operator Area via its own actions or by issuing Operating Instructions.

R2. Each Balancing Authority shall act to maintain the reliability of its Balancing Authority Area via its own actions or by issuing Operating Instructions. [Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-time Operations]

M2. Each Balancing Authority shall have and provide evidence which may include but is not limited to dated operator logs, dated records, dated and time-stamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it acted to maintain the reliability of its Balancing Authority Area via its own actions or by issuing Operating Instructions.

R3. Each Balancing Authority, Generator Operator, and Distribution Provider shall comply with each Operating Instruction issued by its Transmission Operator(s), unless such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements. [Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-Time Operations]

M3. Each Balancing Authority, Generator Operator, and Distribution Provider shall make available upon request, evidence that it complied with each Operating Instruction issued by the Transmission Operator(s) unless such action could not be physically implemented or it would have violated safety, equipment, regulatory, or statutory requirements. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence in electronic or hard copy format. In such cases, the Balancing Authority, Generator Operator, and Distribution Provider shall have and provide copies of the safety, equipment, regulatory, or statutory requirements as evidence for not complying with the Transmission Operator’s Operating Instruction. If such a situation has not occurred, the Balancing Authority, Generator Operator, or Distribution Provider may provide an attestation.

R4. Each Balancing Authority, Generator Operator, and Distribution Provider shall inform its Transmission Operator of its inability to comply with an Operating Instruction issued by its Transmission Operator. [Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-Time Operations]
M4. Each Balancing Authority, Generator Operator, and Distribution Provider shall make available upon request, evidence which may include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent evidence in electronic or hard copy format, that it informed its Transmission Operator of its inability to comply with its Operating Instruction issued. If such a situation has not occurred, the Balancing Authority, Generator Operator, or Distribution Provider may provide an attestation.

R5. Each Transmission Operator, Generator Operator, and Distribution Provider shall comply with each Operating Instruction issued by its Balancing Authority, unless such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements. [Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-Time Operations]

M5. Each Transmission Operator, Generator Operator, and Distribution Provider shall make available upon request, evidence that it complied with each Operating Instruction issued by its Balancing Authority unless such action could not be physically implemented or it would have violated safety, equipment, regulatory, or statutory requirements. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence in electronic or hard copy format. In such cases, the Transmission Operator, Generator Operator, and Distribution Provider shall have and provide copies of the safety, equipment, regulatory, or statutory requirements as evidence for not complying with the Balancing Authority’s Operating Instruction. If such a situation has not occurred, the Transmission Operator, Generator Operator, or Distribution Provider may provide an attestation.

R6. Each Transmission Operator, Generator Operator, and Distribution Provider shall inform its Balancing Authority of its inability to comply with an Operating Instruction issued by its Balancing Authority. [Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-Time Operations]

M6. Each Transmission Operator, Generator Operator, and Distribution Provider shall make available upon request, evidence which may include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent evidence in electronic or hard copy format, that it informed its Balancing Authority of its inability to comply with its Operating Instruction. If such a situation has not occurred, the Transmission Operator, Generator Operator, or Distribution Provider may provide an attestation.

R7. Each Transmission Operator shall assist other Transmission Operators within its Reliability Coordinator Area, if requested and able, provided that the requesting Transmission Operator has implemented its comparable Emergency procedures, unless such assistance cannot be physically implemented or would violate safety, equipment, regulatory, or statutory requirements. [Violation Risk Factor: High] [Time Horizon: Real-Time Operations]
M7. Each Transmission Operator shall make available upon request, evidence that comparable requested assistance, if able, was provided to other Transmission Operators within its Reliability Coordinator Area unless such assistance could not be physically implemented or would have violated safety, equipment, regulatory, or statutory requirements. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence in electronic or hard copy format. If no request for assistance was received, the Transmission Operator may provide an attestation.

R8. Each Transmission Operator shall inform its Reliability Coordinator, known impacted Balancing Authorities, and known impacted Transmission Operators of its actual or expected operations that result in, or could result in, an Emergency. [Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-Time Operations]

M8. Each Transmission Operator shall make available upon request, evidence that it informed its Reliability Coordinator, known impacted Balancing Authorities, and known impacted Transmission Operators of its actual or expected operations that result in, or could result in, an Emergency. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence. If no such situations have occurred, the Transmission Operator may provide an attestation.

R9. Each Balancing Authority and Transmission Operator shall notify its Reliability Coordinator and known impacted interconnected entities of all planned outages, and unplanned outages of 30 minutes or more, for telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels between the affected entities. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Same-Day Operations, Real-Time Operations]

M9. Each Balancing Authority and Transmission Operator shall make available upon request, evidence that it notified its Reliability Coordinator and known impacted interconnected entities of all planned outages, and unplanned outages of 30 minutes or more, for telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence. If such a situation has not occurred, the Balancing Authority or Transmission Operator may provide an attestation.

R10. Each Transmission Operator shall perform the following for determining System Operating Limit (SOL) exceedances within its Transmission Operator Area: [Violation Risk Factor: High] [Time Horizon: Real-Time Operations]

10.1. Monitor Facilities within its Transmission Operator Area;
10.2. Monitor the status of Remedial Action Schemes within its Transmission Operator Area;

10.3. Monitor non-BES facilities within its Transmission Operator Area identified as necessary by the Transmission Operator;

10.4. Obtain and utilize status, voltages, and flow data for Facilities outside its Transmission Operator Area identified as necessary by the Transmission Operator;

10.5. Obtain and utilize the status of Remedial Action Schemes outside its Transmission Operator Area identified as necessary by the Transmission Operator; and

10.6. Obtain and utilize status, voltages, and flow data for non-BES facilities outside its Transmission Operator Area identified as necessary by the Transmission Operator.

M10. Each Transmission Operator shall have, and provide upon request, evidence that could include but is not limited to Energy Management System description documents, computer printouts, Supervisory Control and Data Acquisition (SCADA) data collection, or other equivalent evidence that will be used to confirm that it monitored or obtained and utilized data as required to determine any System Operating Limit (SOL) exceedances within its Transmission Operator Area.

R11. Each Balancing Authority shall monitor its Balancing Authority Area, including the status of Remedial Action Schemes that impact generation or Load, in order to maintain generation-Load-interchange balance within its Balancing Authority Area and support Interconnection frequency. [Violation Risk Factor: High] [Time Horizon: Real-Time Operations]

M11. Each Balancing Authority shall have, and provide upon request, evidence that could include but is not limited to Energy Management System description documents, computer printouts, SCADA data collection, or other equivalent evidence that will be used to confirm that it monitors its Balancing Authority Area, including the status of Remedial Action Schemes that impact generation or Load, in order to maintain generation-Load-interchange balance within its Balancing Authority Area and support Interconnection frequency.

R12. Each Transmission Operator shall not operate outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL T_v. [Violation Risk Factor: High] [Time Horizon: Real-time Operations]

M12. Each Transmission Operator shall make available evidence to show that for any occasion in which it operated outside any identified Interconnection Reliability Operating Limit (IROL), the continuous duration did not exceed its associated IROL T_v. Such evidence could include but is not limited to dated computer logs or reports in electronic or hard copy format specifying the date, time, duration, and details of the
excursion. If such a situation has not occurred, the Transmission Operator may provide an attestation that an event has not occurred.

R13. Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. [Violation Risk Factor: High] [Time Horizon: Real-time Operations]

M13. Each Transmission Operator shall have, and make available upon request, evidence to show it ensured that a Real-Time Assessment was performed at least once every 30 minutes. This evidence could include but is not limited to dated computer logs showing times the assessment was conducted, dated checklists, or other evidence.

R14. Each Transmission Operator shall initiate its Operating Plan to mitigate a SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment. [Violation Risk Factor: High] [Time Horizon: Real-time Operations]

M14. Each Transmission Operator shall have evidence that it initiated its Operating Plan for mitigating SOL exceedances identified as part of its Real-time monitoring or Real-time Assessments. This evidence could include but is not limited to dated computer logs showing times the Operating Plan was initiated, dated checklists, or other evidence.

R15. Each Transmission Operator shall inform its Reliability Coordinator of actions taken to return the System to within limits when a SOL has been exceeded. [Violation Risk Factor: Medium] [Time Horizon: Real-Time Operations]

M15. Each Transmission Operator shall make available evidence that it informed its Reliability Coordinator of actions taken to return the System to within limits when a SOL was exceeded. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, or dated computer printouts. If such a situation has not occurred, the Transmission Operator may provide an attestation.

R16. Each Transmission Operator shall provide its System Operators with the authority to approve planned outages and maintenance of its telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels between affected entities. [Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]

M16. Each Transmission Operator shall have, and provide upon request, evidence that could include but is not limited to a documented procedure or equivalent evidence that will be used to confirm that the Transmission Operator has provided its System Operators with the authority to approve planned outages and maintenance of telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels between affected entities.

R17. Each Balancing Authority shall provide its System Operators with the authority to approve planned outages and maintenance of its telemetering and control equipment, monitoring and assessment capabilities, and associated communication.
channels between affected entities. [Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]

M17. Each Balancing Authority shall have, and provide upon request, evidence that could include but is not limited to a documented procedure or equivalent evidence that will be used to confirm that the Balancing Authority has provided its System Operators with the authority to approve planned outages and maintenance of its telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels between affected entities.

R18. Each Transmission Operator shall operate to the most limiting parameter in instances where there is a difference in SOLs. [Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]

M18. Each Transmission Operator shall have, and provide upon request, evidence that could include but is not limited to operator logs, voice recordings, electronic communications, or equivalent evidence that will be used to determine if it operated to the most limiting parameter in instances where there is a difference in SOLs.

R19. Reserved.

M19. Reserved.

R20. Each Transmission Operator shall have data exchange capabilities, with redundant and diversely routed data exchange infrastructure within the Transmission Operator's primary Control Center, for the exchange of Real-time data with its Reliability Coordinator, Balancing Authority, and the entities it has identified it needs data from in order for it to perform its Real-time monitoring and Real-time Assessments. [Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-time Operations]

M20. Each Transmission Operator shall have, and provide upon request, evidence that could include, but is not limited to, system specifications, system diagrams, or other documentation that lists its data exchange capabilities, including redundant and diversely routed data exchange infrastructure within the Transmission Operator’s primary Control Center, for the exchange of Real-time data with its Reliability Coordinator, Balancing Authority, and the entities it has identified it needs data from in order to perform its Real-time monitoring and Real-time Assessments as specified in the requirement.

R21. Each Transmission Operator shall test its primary Control Center data exchange capabilities specified in Requirement R20 for redundant functionality at least once every 90 calendar days. If the test is unsuccessful, the Transmission Operator shall initiate action within two hours to restore redundant functionality. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

M21. Each Transmission Operator shall have, and provide upon request, evidence that it tested its primary Control Center data exchange capabilities specified in Requirement R20 for the redundant functionality, or experienced an event that demonstrated the
redundant functionality; and, if the test was unsuccessful, initiated action within two hours to restore redundant functionality as specified in Requirement R21. Evidence could include, but is not limited to: dated and time-stamped test records, operator logs, voice recordings, or electronic communications.

R22. Reserved.

M22. Reserved.

R23. Each Balancing Authority shall have data exchange capabilities, with redundant and diversely routed data exchange infrastructure within the Balancing Authority's primary Control Center, for the exchange of Real-time data with its Reliability Coordinator, Transmission Operator, and the entities it has identified it needs data from in order for it to perform its Real-time monitoring and analysis functions. [Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-time Operations]

M23. Each Balancing Authority shall have, and provide upon request, evidence that could include, but is not limited to, system specifications, system diagrams, or other documentation that lists its data exchange capabilities, including redundant and diversely routed data exchange infrastructure within the Balancing Authority's primary Control Center, for the exchange of Real-time data with its Reliability Coordinator, Transmission Operator, and the entities it has identified it needs data from in order to perform its Real-time monitoring and analysis functions as specified in the requirement.

R24. Each Balancing Authority shall test its primary Control Center data exchange capabilities specified in Requirement R23 for redundant functionality at least once every 90 calendar days. If the test is unsuccessful, the Balancing Authority shall initiate action within two hours to restore redundant functionality. [Violation Risk Factor: Medium ] [Time Horizon: Operations Planning]

M24. Each Balancing Authority shall have, and provide upon request, evidence that it tested its primary Control Center data exchange capabilities specified in Requirement R23 for redundant functionality, or experienced an event that demonstrated the redundant functionality; and, if the test was unsuccessful, initiated action within two hours to restore redundant functionality as specified in Requirement R24. Evidence could include, but is not limited to: dated and time-stamped test records, operator logs, voice recordings, or electronic communications.
C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:
“Compliance Enforcement Authority” means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention:
The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

• Each Balancing Authority, Transmission Operator, Generator Operator, and Distribution Provider shall each keep data or evidence for each applicable Requirement R1 through R11, and Measure M1 through M11, for the current calendar year and one previous calendar year, with the exception of operator logs and voice recordings which shall be retained for a minimum of 90 calendar days, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

• Each Transmission Operator shall retain evidence for three calendar years of any occasion in which it has exceeded an identified IROL and its associated IROL T_v as specified in Requirement R12 and Measure M12.

• Each Transmission Operator shall keep data or evidence for Requirement R13 and Measure M13 for a rolling 30-day period, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

• Each Transmission Operator shall retain evidence and that it initiated its Operating Plan to mitigate a SOL exceedance as specified in Requirement R14 and Measurement M14 for three calendar years.

• Each Transmission Operator and Balancing Authority shall each keep data or evidence for each applicable Requirement R15 through R18, and Measure M15 through M18 for the current calendar year and one previous calendar year, with the exception of operator logs and voice recordings which shall be retained for a minimum of 90 calendar days.
• Each Transmission Operator shall keep data or evidence for Requirement R20 and Measure M20 for the current calendar year and one previous calendar year.

• Each Transmission Operator shall keep evidence for Requirement R21 and Measure M21 for the most recent twelve calendar months, with the exception of operator logs and voice recordings which shall be retained for a minimum of 90 calendar days.

• Each Balancing Authority shall keep data or evidence for Requirement R23 and Measure M23 for the current calendar year and one previous calendar year.

• Each Balancing Authority shall keep evidence for Requirement R24 and Measure M24 for the most recent twelve calendar months, with the exception of operator logs and voice recordings which shall be retained for a minimum of 90 calendar days.

1.3. **Compliance Monitoring and Enforcement Program**

As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

**R8.**

The Transmission Operator did not inform one known impacted Transmission Operator or 5% or less of the known impacted Transmission Operators, whichever is greater, of its actual or expected operations that resulted in, or could have resulted in, an Emergency on respective Transmission Operator Areas.

OR,

The Transmission Operator did not inform one known impacted Balancing

The Transmission Operator did not inform two known impacted Transmission Operators or more than 5% and less than or equal to 10% of the known impacted Transmission Operators, whichever is greater, of its actual or expected operations that resulted in, or could have resulted in, an Emergency on respective Transmission Operator Areas.

OR,

The Transmission Operator did not inform two known impacted Balancing

The Transmission Operator did not inform three known impacted Transmission Operators or more than 10% and less than or equal to 15% of the known impacted Transmission Operators, whichever is greater, of its actual or expected operations that resulted in, or could have resulted in, an Emergency on respective Transmission Operator Areas.

OR,

The Transmission Operator did not inform three known impacted Balancing

The Transmission Operator did not inform its Reliability Coordinator of its actual or expected operations that resulted in, or could have resulted in, an Emergency on those respective Transmission Operator Areas.

OR,

The Transmission Operator did not inform four or more known impacted Transmission Operators or more than 15% of the known impacted Transmission Operators of its actual or expected operations.

None.

E. Associated Documents
The Project 2014-03 SDT has created the SOL Exceedance White Paper as guidance on SOL issues and the URL for that document is: http://www.nerc.com/pa/stand/Pages/TOP0013RI.aspx.

Operating Plan - An Operating Plan includes general Operating Processes and specific Operating Procedures. It may be an overview document which provides a prescription for an Operating Plan for the next-day, or it may be a specific plan to address a specific SOL or IROL exceedance identified in the Operational Planning Analysis (OPA). Consistent with the NERC definition, Operating Plans can be general in nature, or they can be specific plans to address specific reliability issues. The use of the term Operating Plan in the revised TOP/IRO standards allows room for both. An Operating Plan references processes and procedures, including electronic data exchange, which are available to the System Operator on a daily basis to allow the operator to reliably address conditions which may arise throughout the day. It is valid for tomorrow, the day after, and the day after that. Operating Plans should be augmented by temporary operating guides which outline prevention/mitigation plans for specific situations which are identified day-to-day in an OPA or a Real-time Assessment (RTA). As the definition in the Glossary of Terms states, a restoration plan is an example of an Operating Plan. It contains all the overarching principles that the System Operator needs to work his/her way through the restoration process. It is not a specific document written for a specific blackout scenario but rather a collection of tools consisting of processes, procedures, and automated software systems that are available to the operator to use in restoring the system. An Operating Plan can in turn be looked upon in a similar manner. It does not contain a prescription for the specific set-up for tomorrow but contains a treatment of all the processes, procedures, and automated software systems that are at the operator’s disposal. The existence of an Operating Plan, however, does not preclude the need for creating specific action plans for specific SOL or IROL exceedances identified in the OPA. When a Reliability Coordinator performs an OPA, the analysis may reveal instances of possible SOL or IROL exceedances for pre- or post-Contingency conditions. In these instances, Reliability Coordinators are expected to ensure that there are plans in place to prevent or mitigate those SOLs or IROLS, should those operating conditions be encountered the next day. The Operating Plan may contain a description of the process by which specific prevention or mitigation plans for day-to-day SOL or IROL exceedances identified in the OPA are handled and communicated. This approach could alleviate any potential administrative burden associated with perceived requirements for continual day-to-day updating of “the Operating Plan document” for compliance purposes.

Guidelines and Technical Basis

None.

Rationale

Rationale text from the development of TOP-001-3 in Project 2014-03 and TOP-001-4 in Project 2016-01 follows. Additional information can be found on the Project 2014-03 and Project 2016-01 pages.

Rationale for Requirement R3:
The phrase ‘cannot be physically implemented’ means that a Transmission Operator may request something to be done that is not physically possible due to its lack of knowledge of the system involved.

Rationale for Requirement R10:
New proposed Requirement R10 is derived from approved IRO-003-2, Requirement R1, adapted to the Transmission Operator Area. This new requirement is in response to NOPR paragraph 60 concerning monitoring capabilities for the Transmission Operator. New Requirement R11 covers the Balancing Authorities. Monitoring of external systems can be accomplished via data links.

The revised requirement addresses directives for Transmission Operator (TOP) monitoring of some non-Bulk Electric System (BES) facilities as necessary for determining System Operating Limit (SOL) exceedances (FERC Order No. 817 Para 35-36). The proposed requirement corresponds with approved IRO-002-4 Requirement R4 (proposed IRO-002-5 Requirement R5), which specifies the Reliability Coordinator's (RC) monitoring responsibilities for determining SOL exceedances.

The intent of the requirement is to ensure that all facilities (i.e., BES and non-BES) that can adversely impact reliability of the BES are monitored. As used in TOP and IRO Reliability Standards, monitoring involves observing operating status and operating values in Real-time for awareness of system conditions. The facilities that are necessary for determining SOL exceedances should be either designated as part of the BES, or otherwise be incorporated into monitoring when identified by planning and operating studies such as the Operational Planning Analysis (OPA) required by TOP-002-4 Requirement R1 and IRO-008-2 Requirement R1. The SDT recognizes that not all non-BES facilities that a TOP considers necessary for its monitoring needs will need to be included in the BES.

The non-BES facilities that the TOP is required to monitor are only those that are necessary for the TOP to determine SOL exceedances within its Transmission Operator Area. TOPs perform various analyses and studies as part of their functional obligations that could lead to identification of non-BES facilities that should be monitored for determining SOL exceedances. Examples include:

- OPA;
- Real-time Assessments (RTA);
• Analysis performed by the TOP as part of BES Exception processing for including a facility in the BES; and
• Analysis which may be specified in the RC's outage coordination process that leads the TOP to identify a non-BES facility that should be temporarily monitored for determining SOL exceedances.

TOP-003-3 Requirement R1 specifies that the TOP shall develop a data specification which includes data and information needed by the TOP to support its OPAs, Real-time monitoring, and RTAs. This includes non-BES data and external network data as deemed necessary by the TOP.

The format of the proposed requirement has been changed from the approved standard to more clearly indicate which monitoring activities are required to be performed.

**Rationale for Requirement R13:**
The new Requirement R13 is in response to NOPR paragraphs 55 and 60 concerning Real-time analysis responsibilities for Transmission Operators and is copied from approved IRO-008-1, Requirement R2. The Transmission Operator’s Operating Plan will describe how to perform the Real-time Assessment. The Operating Plan should contain instructions as to how to perform Operational Planning Analysis and Real-time Assessment with detailed instructions and timing requirements as to how to adapt to conditions where processes, procedures, and automated software systems are not available (if used). This could include instructions such as an indication that no actions may be required if system conditions have not changed significantly and that previous Contingency analysis or Real-time Assessments may be used in such a situation.

**Rationale for Requirement R14:**
The original Requirement R8 was deleted and original Requirements R9 and R11 were revised in order to respond to NOPR paragraph 42 which raised the issue of handling all SOLs and not just a sub-set of SOLs. The SDT has developed a white paper on SOL exceedances that explains its intent on what needs to be contained in such an Operating Plan. These Operating Plans are developed and documented in advance of Real-time and may be developed from Operational Planning Assessments required per proposed TOP-002-4 or other assessments. Operating Plans could be augmented by temporary operating guides which outline prevention/mitigation plans for specific situations which are identified day-to-day in an Operational Planning Assessment or a Real-time Assessment. The intent is to have a plan and philosophy that can be followed by an operator.

**Rationale for Requirements R16 and R17:**
In response to IERP Report recommendation 3 on authority.
Rationale for Requirement R18:
Moved from approved IRO-005-3.1a, Requirement R10. Transmission Service Provider, Distribution Provider, Load-Serving Entity, Generator Operator, and Purchasing-Selling Entity are deleted as those entities will receive instructions on limits from the responsible entities cited in the requirement. Note – Derived limits replaced by SOLs for clarity and specificity. SOLs include voltage, Stability, and thermal limits and are thus the most limiting factor.

Rationale for Requirements R19 and R20 (R19, R20, R22, and R23 in TOP-001-4):
[Note: Requirement R19 proposed for retirement under Project 2018-03 Standards Efficiency Review Retirements.]

The proposed changes address directives for redundancy and diverse routing of data exchange capabilities (FERC Order No. 817 Para 47).

Redundant and diversely routed data exchange capabilities consist of data exchange infrastructure components (e.g., switches, routers, servers, power supplies, and network cabling and communication paths between these components in the primary Control Center for the exchange of system operating data) that will provide continued functionality despite failure or malfunction of an individual component within the Transmission Operator's (TOP) primary Control Center. Redundant and diversely routed data exchange capabilities preclude single points of failure in primary Control Center data exchange infrastructure from halting the flow of Real-time data. Requirement R20 does not require automatic or instantaneous fail-over of data exchange capabilities. Redundancy and diverse routing may be achieved in various ways depending on the arrangement of the infrastructure or hardware within the TOP's primary Control Center.

The reliability objective of redundancy is to provide for continued data exchange functionality during outages, maintenance, or testing of data exchange infrastructure. For periods of planned or unplanned outages of individual data exchange components, the proposed requirements do not require additional redundant data exchange infrastructure components solely to provide for redundancy.

Infrastructure that is not within the TOP’s primary Control Center is not addressed by the proposed requirement.

Rationale for Requirement R21:
The proposed requirement addresses directives for testing of data exchange capabilities used in primary Control Centers (FERC Order No. 817 Para 51).

A test for redundant functionality demonstrates that data exchange capabilities will continue to operate despite the malfunction or failure of an individual component (e.g., switches, routers, servers, power supplies, and network cabling and communication paths between these components in the primary Control Center for the exchange of system operating data). An entity's testing practices should, over time, examine the various failure modes of its data
exchange capabilities. When an actual event successfully exercises the redundant functionality, it can be considered a test for the purposes of the proposed requirement.

**Rationale for Requirements R22 and R23:**
[Note: Requirement R22 proposed for retirement under Project 2018-03 Standards Efficiency Review Retirements]

The proposed changes address directives for redundancy and diverse routing of data exchange capabilities (FERC Order No. 817 Para 47).

Redundant and diversely routed data exchange capabilities consist of data exchange infrastructure components (e.g., switches, routers, servers, power supplies, and network cabling and communication paths between these components in the primary Control Center for the exchange of system operating data) that will provide continued functionality despite failure or malfunction of an individual component within the Balancing Authority's (BA) primary Control Center. Redundant and diversely routed data exchange capabilities preclude single points of failure in primary Control Center data exchange infrastructure from halting the flow of Real-time data. Requirement R23 does not require automatic or instantaneous fail-over of data exchange capabilities. Redundancy and diverse routing may be achieved in various ways depending on the arrangement of the infrastructure or hardware within the BA's primary Control Center.

The reliability objective of redundancy is to provide for continued data exchange functionality during outages, maintenance, or testing of data exchange infrastructure. For periods of planned or unplanned outages of individual data exchange components, the proposed requirements do not require additional redundant data exchange infrastructure components solely to provide for redundancy.

Infrastructure that is not within the BA's primary Control Center is not addressed by the proposed requirement.

**Rationale for Requirement R24:**
The proposed requirement addresses directives for testing of data exchange capabilities used in primary Control Centers (FERC Order No. 817 Para 51).

A test for redundant functionality demonstrates that data exchange capabilities will continue to operate despite the malfunction or failure of an individual component (e.g., switches, routers, servers, power supplies, and network cabling and communication paths between these components in the primary Control Center for the exchange of system operating data). An entity's testing practices should, over time, examine the various failure modes of its data exchange capabilities. When an actual event successfully exercises the redundant functionality, it can be considered a test for the purposes of the proposed requirement.
A. Introduction

1. Title: Transmission Operations
2. Number: TOP-001-45
3. Purpose: To prevent instability, uncontrolled separation, or Cascading outages that adversely impact the reliability of the Interconnection by ensuring prompt action to prevent or mitigate such occurrences.
4. Applicability:
   4.1. Functional Entities:
      4.1.1. Balancing Authority
      4.1.2. Transmission Operator
      4.1.3. Generator Operator
      4.1.4. Distribution Provider
5. Effective Date: See Implementation Plan

B. Requirements and Measures

R1. Each Transmission Operator shall act to maintain the reliability of its Transmission Operator Area via its own actions or by issuing Operating Instructions. [Violation Risk Factor: High][Time Horizon: Same-Day Operations, Real-time Operations]

M1. Each Transmission Operator shall have and provide evidence which may include but is not limited to dated operator logs, dated records, dated and time-stamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it acted to maintain the reliability of its Transmission Operator Area via its own actions or by issuing Operating Instructions.

R2. Each Balancing Authority shall act to maintain the reliability of its Balancing Authority Area via its own actions or by issuing Operating Instructions. [Violation Risk Factor: High][Time Horizon: Same-Day Operations, Real-time Operations]

M2. Each Balancing Authority shall have and provide evidence which may include but is not limited to dated operator logs, dated records, dated and time-stamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it acted to maintain the reliability of its Balancing Authority Area via its own actions or by issuing Operating Instructions.
R3. Each Balancing Authority, Generator Operator, and Distribution Provider shall comply with each Operating Instruction issued by its Transmission Operator(s), unless such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements. [Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-Time Operations]

M3. Each Balancing Authority, Generator Operator, and Distribution Provider shall make available upon request, evidence that it complied with each Operating Instruction issued by the Transmission Operator(s) unless such action could not be physically implemented or it would have violated safety, equipment, regulatory, or statutory requirements. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence in electronic or hard copy format. In such cases, the Balancing Authority, Generator Operator, and Distribution Provider shall have and provide copies of the safety, equipment, regulatory, or statutory requirements as evidence for not complying with the Transmission Operator's Operating Instruction. If such a situation has not occurred, the Balancing Authority, Generator Operator, or Distribution Provider may provide an attestation.

R4. Each Balancing Authority, Generator Operator, and Distribution Provider shall inform its Transmission Operator of its inability to comply with an Operating Instruction issued by its Transmission Operator. [Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-Time Operations]

M4. Each Balancing Authority, Generator Operator, and Distribution Provider shall make available upon request, evidence which may include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent evidence in electronic or hard copy format, that it informed its Transmission Operator of its inability to comply with its Operating Instruction issued. If such a situation has not occurred, the Balancing Authority, Generator Operator, or Distribution Provider may provide an attestation.

R5. Each Transmission Operator, Generator Operator, and Distribution Provider shall comply with each Operating Instruction issued by its Balancing Authority, unless such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements. [Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-Time Operations]

M5. Each Transmission Operator, Generator Operator, and Distribution Provider shall make available upon request, evidence that it complied with each Operating Instruction issued by its Balancing Authority unless such action could not be physically implemented or it would have violated safety, equipment, regulatory, or statutory requirements. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence in electronic or hard copy format. In such cases, the
Transmission Operator, Generator Operator, and Distribution Provider shall have and provide copies of the safety, equipment, regulatory, or statutory requirements as evidence for not complying with the Balancing Authority’s Operating Instruction. If such a situation has not occurred, the Transmission Operator, Generator Operator, or Distribution Provider may provide an attestation.

R6. Each Transmission Operator, Generator Operator, and Distribution Provider shall inform its Balancing Authority of its inability to comply with an Operating Instruction issued by its Balancing Authority. [Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-Time Operations]

M6. Each Transmission Operator, Generator Operator, and Distribution Provider shall make available upon request, evidence which may include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent evidence in electronic or hard copy format, that it informed its Balancing Authority of its inability to comply with its Operating Instruction. If such a situation has not occurred, the Transmission Operator, Generator Operator, or Distribution Provider may provide an attestation.

R7. Each Transmission Operator shall assist other Transmission Operators within its Reliability Coordinator Area, if requested and able, provided that the requesting Transmission Operator has implemented its comparable Emergency procedures, unless such assistance cannot be physically implemented or would violate safety, equipment, regulatory, or statutory requirements. [Violation Risk Factor: High] [Time Horizon: Real-Time Operations]

M7. Each Transmission Operator shall make available upon request, evidence that comparable requested assistance, if able, was provided to other Transmission Operators within its Reliability Coordinator Area unless such assistance could not be physically implemented or would have violated safety, equipment, regulatory, or statutory requirements. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence in electronic or hard copy format. If no request for assistance was received, the Transmission Operator may provide an attestation.

R8. Each Transmission Operator shall inform its Reliability Coordinator, known impacted Balancing Authorities, and known impacted Transmission Operators of its actual or expected operations that result in, or could result in, an Emergency. [Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-Time Operations]

M8. Each Transmission Operator shall make available upon request, evidence that it informed its Reliability Coordinator, known impacted Balancing Authorities, and known impacted Transmission Operators of its actual or expected operations that result in, or could result in, an Emergency. Such evidence could include but is not
limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence. If no such situations have occurred, the Transmission Operator may provide an attestation.

**R9.** Each Balancing Authority and Transmission Operator shall notify its Reliability Coordinator and known impacted interconnected entities of all planned outages, and unplanned outages of 30 minutes or more, for telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels between the affected entities. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Same-Day Operations, Real-Time Operations]

**M9.** Each Balancing Authority and Transmission Operator shall make available upon request, evidence that it notified its Reliability Coordinator and known impacted interconnected entities of all planned outages, and unplanned outages of 30 minutes or more, for telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence. If such a situation has not occurred, the Balancing Authority or Transmission Operator may provide an attestation.

**R10.** Each Transmission Operator shall perform the following for determining System Operating Limit (SOL) exceedances within its Transmission Operator Area: [Violation Risk Factor: High] [Time Horizon: Real-Time Operations]

10.1. Monitor Facilities within its Transmission Operator Area;

10.2. Monitor the status of Remedial Action Schemes within its Transmission Operator Area;

10.3. Monitor non-BES facilities within its Transmission Operator Area identified as necessary by the Transmission Operator;

10.4. Obtain and utilize status, voltages, and flow data for Facilities outside its Transmission Operator Area identified as necessary by the Transmission Operator;

10.5. Obtain and utilize the status of Remedial Action Schemes outside its Transmission Operator Area identified as necessary by the Transmission Operator; and

10.6. Obtain and utilize status, voltages, and flow data for non-BES facilities outside its Transmission Operator Area identified as necessary by the Transmission Operator.

**M10.** Each Transmission Operator shall have, and provide upon request, evidence that could include but is not limited to Energy Management System description documents, computer printouts, Supervisory Control and Data Acquisition (SCADA)
data collection, or other equivalent evidence that will be used to confirm that it monitored or obtained and utilized data as required to determine any System Operating Limit (SOL) exceedances within its Transmission Operator Area.

R11. Each Balancing Authority shall monitor its Balancing Authority Area, including the status of Remedial Action Schemes that impact generation or Load, in order to maintain generation-Load-interchange balance within its Balancing Authority Area and support Interconnection frequency. [Violation Risk Factor: High] [Time Horizon: Real-Time Operations]

M11. Each Balancing Authority shall have, and provide upon request, evidence that could include but is not limited to Energy Management System description documents, computer printouts, SCADA data collection, or other equivalent evidence that will be used to confirm that it monitors its Balancing Authority Area, including the status of Remedial Action Schemes that impact generation or Load, in order to maintain generation-Load-interchange balance within its Balancing Authority Area and support Interconnection frequency.

R12. Each Transmission Operator shall not operate outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL Tv. [Violation Risk Factor: High] [Time Horizon: Real-time Operations]

M12. Each Transmission Operator shall make available evidence to show that for any occasion in which it operated outside any identified Interconnection Reliability Operating Limit (IROL), the continuous duration did not exceed its associated IROL Tv. Such evidence could include but is not limited to dated computer logs or reports in electronic or hard copy format specifying the date, time, duration, and details of the excursion. If such a situation has not occurred, the Transmission Operator may provide an attestation that an event has not occurred.

R13. Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. [Violation Risk Factor: High] [Time Horizon: Real-time Operations]

M13. Each Transmission Operator shall have, and make available upon request, evidence to show it ensured that a Real-Time Assessment was performed at least once every 30 minutes. This evidence could include but is not limited to dated computer logs showing times the assessment was conducted, dated checklists, or other evidence.

R14. Each Transmission Operator shall initiate its Operating Plan to mitigate a SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment. [Violation Risk Factor: High] [Time Horizon: Real-time Operations]

M14. Each Transmission Operator shall have evidence that it initiated its Operating Plan for mitigating SOL exceedances identified as part of its Real-time monitoring or Real-time
Assessments. This evidence could include but is not limited to dated computer logs showing times the Operating Plan was initiated, dated checklists, or other evidence.

**R15.** Each Transmission Operator shall inform its Reliability Coordinator of actions taken to return the System to within limits when a SOL has been exceeded. \[Violation Risk Factor: Medium\] [Time Horizon: Real-Time Operations]

**M15.** Each Transmission Operator shall make available evidence that it informed its Reliability Coordinator of actions taken to return the System to within limits when a SOL was exceeded. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, or dated computer printouts. If such a situation has not occurred, the Transmission Operator may provide an attestation.

**R16.** Each Transmission Operator shall provide its System Operators with the authority to approve planned outages and maintenance of its telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels between affected entities. \[Violation Risk Factor: High\] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]

**M16.** Each Transmission Operator shall have, and provide upon request, evidence that could include but is not limited to a documented procedure or equivalent evidence that will be used to confirm that the Transmission Operator has provided its System Operators with the authority to approve planned outages and maintenance of telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels between affected entities.

**R17.** Each Balancing Authority shall provide its System Operators with the authority to approve planned outages and maintenance of its telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels between affected entities. \[Violation Risk Factor: High\] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]

**M17.** Each Balancing Authority shall have, and provide upon request, evidence that could include but is not limited to a documented procedure or equivalent evidence that will be used to confirm that the Balancing Authority has provided its System Operators with the authority to approve planned outages and maintenance of telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels between affected entities.

**R18.** Each Transmission Operator shall operate to the most limiting parameter in instances where there is a difference in SOLs. \[Violation Risk Factor: High\] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]

**M18.** Each Transmission Operator shall have, and provide upon request, evidence that could include but is not limited to operator logs, voice recordings, electronic
communications, or equivalent evidence that will be used to determine if it operated
to the most limiting parameter in instances where there is a difference in SOLs.

R19. **Reserved.** Each Transmission Operator shall have data exchange capabilities with the entities it has identified it needs data from in order to perform its Operational Planning Analyses. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

M19. **Reserved.** Each Transmission Operator shall have, and provide upon request, evidence that could include, but is not limited to, operator logs, system specifications, system diagrams, or other evidence that it has data exchange capabilities with the entities it has identified it needs data from in order to perform its Operational Planning Analyses.

R20. Each Transmission Operator shall have data exchange capabilities, with redundant and diversely routed data exchange infrastructure within the Transmission Operator's primary Control Center, for the exchange of Real-time data with its Reliability Coordinator, Balancing Authority, and the entities it has identified it needs data from in order for it to perform its Real-time monitoring and Real-time Assessments. [Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-time Operations]

M20. Each Transmission Operator shall have, and provide upon request, evidence that could include, but is not limited to, system specifications, system diagrams, or other documentation that lists its data exchange capabilities, including redundant and diversely routed data exchange infrastructure within the Transmission Operator's primary Control Center, for the exchange of Real-time data with its Reliability Coordinator, Balancing Authority, and the entities it has identified it needs data from in order to perform its Real-time monitoring and Real-time Assessments as specified in the requirement.

R21. Each Transmission Operator shall test its primary Control Center data exchange capabilities specified in Requirement R20 for redundant functionality at least once every 90 calendar days. If the test is unsuccessful, the Transmission Operator shall initiate action within two hours to restore redundant functionality. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

M21. Each Transmission Operator shall have, and provide upon request, evidence that it tested its primary Control Center data exchange capabilities specified in Requirement R20 for the redundant functionality, or experienced an event that demonstrated the redundant functionality; and, if the test was unsuccessful, initiated action within two hours to restore redundant functionality as specified in Requirement R21. Evidence could include, but is not limited to: dated and time-stamped test records, operator logs, voice recordings, or electronic communications.

R22. **Reserved.** Each Balancing Authority shall have data exchange capabilities with the entities it has identified it needs data from in order to develop its Operating Plan for
M22. **Reserved.** Each Balancing Authority shall have, and provide upon request, evidence that could include, but is not limited to, operator logs, system specifications, system diagrams, or other evidence that it has data exchange capabilities with the entities it has identified it needs data from in order to develop its Operating Plan for next-day operations.

R23. Each Balancing Authority shall have data exchange capabilities, with redundant and diversely routed data exchange infrastructure within the Balancing Authority's primary Control Center, for the exchange of Real-time data with its Reliability Coordinator, Transmission Operator, and the entities it has identified it needs data from in order for it to perform its Real-time monitoring and analysis functions. **[Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-time Operations]**

M23. Each Balancing Authority shall have, and provide upon request, evidence that could include, but is not limited to, system specifications, system diagrams, or other documentation that lists its data exchange capabilities, including redundant and diversely routed data exchange infrastructure within the Balancing Authority's primary Control Center, for the exchange of Real-time data with its Reliability Coordinator, Transmission Operator, and the entities it has identified it needs data from in order to perform its Real-time monitoring and analysis functions as specified in the requirement.

R24. Each Balancing Authority shall test its primary Control Center data exchange capabilities specified in Requirement R23 for redundant functionality at least once every 90 calendar days. If the test is unsuccessful, the Balancing Authority shall initiate action within two hours to restore redundant functionality. **[Violation Risk Factor: Medium ] [Time Horizon: Operations Planning]**

M24. Each Balancing Authority shall have, and provide upon request, evidence that it tested its primary Control Center data exchange capabilities specified in Requirement R23 for redundant functionality, or experienced an event that demonstrated the redundant functionality; and, if the test was unsuccessful, initiated action within two hours to restore redundant functionality as specified in Requirement R24. Evidence could include, but is not limited to: dated and time-stamped test records, operator logs, voice recordings, or electronic communications.

### C. Compliance

1. **Compliance Monitoring Process**

   1.1. **Compliance Enforcement Authority:**
   
   “Compliance Enforcement Authority” means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in
their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention:
The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- Each Balancing Authority, Transmission Operator, Generator Operator, and Distribution Provider shall each keep data or evidence for each applicable Requirement R1 through R11, and Measure M1 through M11, for the current calendar year and one previous calendar year, with the exception of operator logs and voice recordings which shall be retained for a minimum of 90 calendar days, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- Each Transmission Operator shall retain evidence for three calendar years of any occasion in which it has exceeded an identified IROL and its associated IROL $T_v$ as specified in Requirement R12 and Measure M12.

- Each Transmission Operator shall keep data or evidence for Requirement R13 and Measure M13 for a rolling 30-day period, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- Each Transmission Operator shall retain evidence and that it initiated its Operating Plan to mitigate a SOL exceedance as specified in Requirement R14 and Measurement M14 for three calendar years.

- Each Transmission Operator and Balancing Authority shall each keep data or evidence for each applicable Requirement R15 through R19, and Measure M15 through M18 for the current calendar year and one previous calendar year, with the exception of operator logs and voice recordings which shall be retained for a minimum of 90 calendar days.

- Each Transmission Operator shall keep data or evidence for Requirement R20 and Measure M20 for the current calendar year and one previous calendar year.

- Each Transmission Operator shall keep evidence for Requirement R21 and Measure M21 for the most recent twelve calendar months, with the exception
of operator logs and voice recordings which shall be retained for a minimum of 90 calendar days.

- Each Balancing Authority shall keep data or evidence for Requirement R22 and Measure M22 for the current calendar year and one previous calendar year, with the exception of operator logs and voice recordings which shall be retained for a minimum of 90 calendar days.

- Each Balancing Authority shall keep data or evidence for Requirement R23 and Measure M23 for the current calendar year and one previous calendar year.

- Each Balancing Authority shall keep evidence for Requirement R24 and Measure M24 for the most recent twelve calendar months, with the exception of operator logs and voice recordings which shall be retained for a minimum of 90 calendar days.

1.3. **Compliance Monitoring and Enforcement Program**

As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

E. Associated Documents

The Implementation Plan and other project documents can be found on the project page.

The Project 2014-03 SDT has created the SOL Exceedance White Paper as guidance on SOL issues and the URL for that document is: http://www.nerc.com/pa/stand/Pages/TOP0013RI.aspx.

Operating Plan - An Operating Plan includes general Operating Processes and specific Operating Procedures. It may be an overview document which provides a prescription for an Operating Plan for the next-day, or it may be a specific plan to address a specific SOL or IROL exceedance identified in the Operational Planning Analysis (OPA). Consistent with the NERC definition, Operating Plans can be general in nature, or they can be specific plans to address specific reliability issues. The use of the term Operating Plan in the revised TOP/IRO standards allows room for both. An Operating Plan references processes and procedures, including electronic data exchange, which are available to the System Operator on a daily basis to allow the operator to reliably address conditions which may arise throughout the day. It is valid for tomorrow, the day after, and the day after that. Operating Plans should be augmented by temporary operating guides which outline prevention/mitigation plans for specific situations which are identified day-to-day in an OPA or a Real-time Assessment (RTA). As the definition in the Glossary of Terms states, a restoration plan is an example of an Operating Plan. It contains all the overarching principles that the System Operator needs to work his/her way through the restoration process. It is not a specific document written for a specific blackout scenario but rather a collection of tools consisting of processes, procedures, and automated software systems that are available to the operator to use in restoring the system. An Operating Plan can in turn be looked upon in a similar manner. It does not contain a prescription for the specific set-up for tomorrow but contains a treatment of all the processes, procedures, and automated software systems that are at the operator’s disposal. The existence of an Operating Plan, however, does not preclude the need for creating specific action plans for specific SOL or IROL exceedances identified in the OPA. When a Reliability Coordinator performs an OPA, the analysis may reveal instances of possible SOL or IROL exceedances for pre- or post-Contingency conditions. In these instances, Reliability Coordinators are expected to ensure that there are plans in place to prevent or mitigate those SOLs or IROls, should those operating conditions be encountered the next day. The Operating Plan may contain a description of the process by which specific prevention or mitigation plans for day-to-day SOL or IROL exceedances identified in the OPA are handled and communicated. This approach could alleviate any potential administrative burden associated with perceived requirements for continual day-to-day updating of “the Operating Plan document” for compliance purposes.

Guidelines and Technical Basis

None
Rationale

During development of TOP-001-4, text boxes are embedded within the standard to explain the rationale for various parts of the standard. Upon Board adoption of TOP-001-4, the text from the rationale text boxes will be moved to this section.

Rationale text from the development of TOP-001-3 in Project 2014-03 and TOP-001-4 in Project 2016-01 follows. Additional information can be found on the Project 2014-03 project page and the Project 2016-01 project page.

Rationale for Requirement R3:
The phrase ‘cannot be physically implemented’ means that a Transmission Operator may request something to be done that is not physically possible due to its lack of knowledge of the system involved.

Rationale for Requirement R10:
New proposed Requirement R10 is derived from approved IRO-003-2, Requirement R1, adapted to the Transmission Operator Area. This new requirement is in response to NOPR paragraph 60 concerning monitoring capabilities for the Transmission Operator. New Requirement R11 covers the Balancing Authorities. Monitoring of external systems can be accomplished via data links.

The revised requirement addresses directives for Transmission Operator (TOP) monitoring of some non-Bulk Electric System (BES) facilities as necessary for determining System Operating Limit (SOL) exceedances (FERC Order No. 817 Para 35-36). The proposed requirement corresponds with approved IRO-002-4 Requirement R4 (proposed IRO-002-5 Requirement R5), which specifies the Reliability Coordinator’s (RC) monitoring responsibilities for determining SOL exceedances.

The intent of the requirement is to ensure that all facilities (i.e., BES and non-BES) that can adversely impact reliability of the BES are monitored. As used in TOP and IRO Reliability Standards, monitoring involves observing operating status and operating values in Real-time for awareness of system conditions. The facilities that are necessary for determining SOL exceedances should be either designated as part of the BES, or otherwise be incorporated into monitoring when identified by planning and operating studies such as the Operational Planning Analysis (OPA) required by TOP-002-4 Requirement R1 and IRO-008-2 Requirement R1. The SDT recognizes that not all non-BES facilities that a TOP considers necessary for its monitoring needs will need to be included in the BES.

The non-BES facilities that the TOP is required to monitor are only those that are necessary for the TOP to determine SOL exceedances within its Transmission Operator Area. TOPs perform various analyses and studies as part of their functional obligations that could lead to identification of non-BES facilities that should be monitored for determining SOL exceedances. Examples include:

- OPA;
- Real-time Assessments (RTA);
• Analysis performed by the TOP as part of BES Exception processing for including a facility in the BES; and
• Analysis which may be specified in the RC's outage coordination process that leads the TOP to identify a non-BES facility that should be temporarily monitored for determining SOL exceedances.

TOP-003-3 Requirement R1 specifies that the TOP shall develop a data specification which includes data and information needed by the TOP to support its OPAs, Real-time monitoring, and RTAs. This includes non-BES data and external network data as deemed necessary by the TOP.

The format of the proposed requirement has been changed from the approved standard to more clearly indicate which monitoring activities are required to be performed.

Rationale for Requirement R13:
The new Requirement R13 is in response to NOPR paragraphs 55 and 60 concerning Real-time analysis responsibilities for Transmission Operators and is copied from approved IRO-008-1, Requirement R2. The Transmission Operator’s Operating Plan will describe how to perform the Real-time Assessment. The Operating Plan should contain instructions as to how to perform Operational Planning Analysis and Real-time Assessment with detailed instructions and timing requirements as to how to adapt to conditions where processes, procedures, and automated software systems are not available (if used). This could include instructions such as an indication that no actions may be required if system conditions have not changed significantly and that previous Contingency analysis or Real-time Assessments may be used in such a situation.

Rationale for Requirement R14:
The original Requirement R8 was deleted and original Requirements R9 and R11 were revised in order to respond to NOPR paragraph 42 which raised the issue of handling all SOLs and not just a sub-set of SOLs. The SDT has developed a white paper on SOL exceedances that explains its intent on what needs to be contained in such an Operating Plan. These Operating Plans are developed and documented in advance of Real-time and may be developed from Operational Planning Assessments required per proposed TOP-002-4 or other assessments. Operating Plans could be augmented by temporary operating guides which outline prevention/mitigation plans for specific situations which are identified day-to-day in an Operational Planning Assessment or a Real-time Assessment. The intent is to have a plan and philosophy that can be followed by an operator.

Rationale for Requirements R16 and R17:
In response to IERP Report recommendation 3 on authority.

Rationale for Requirement R18:
Moved from approved IRO-005-3.1a, Requirement R10. Transmission Service Provider, Distribution Provider, Load-Serving Entity, Generator Operator, and Purchasing-Selling Entity are deleted as those entities will receive instructions on limits from the responsible entities.
cited in the requirement. Note – Derived limits replaced by SOLs for clarity and specificity. SOLs include voltage, Stability, and thermal limits and are thus the most limiting factor.

Rationale for Requirements R19 and R20 (R19, R20, R22, and R23 in TOP-001-4):

Added for consistency with proposed IRO-002-4, Requirement R1. Data exchange capabilities are required to support the data specification concept in proposed TOP-003-3. [Note: Requirement R19 proposed for retirement under Project 2018-03 Standards Efficiency Review Retirements.]

The proposed changes address directives for redundancy and diverse routing of data exchange capabilities (FERC Order No. 817 Para 47).

Redundant and diversely routed data exchange capabilities consist of data exchange infrastructure components (e.g., switches, routers, servers, power supplies, and network cabling and communication paths between these components in the primary Control Center for the exchange of system operating data) that will provide continued functionality despite failure or malfunction of an individual component within the Transmission Operator's (TOP) primary Control Center. Redundant and diversely routed data exchange capabilities preclude single points of failure in primary Control Center data exchange infrastructure from halting the flow of Real-time data. Requirement R20 does not require automatic or instantaneous fail-over of data exchange capabilities. Redundancy and diverse routing may be achieved in various ways depending on the arrangement of the infrastructure or hardware within the TOP's primary Control Center.

The reliability objective of redundancy is to provide for continued data exchange functionality during outages, maintenance, or testing of data exchange infrastructure. For periods of planned or unplanned outages of individual data exchange components, the proposed requirements do not require additional redundant data exchange infrastructure components solely to provide for redundancy.

Infrastructure that is not within the TOP's primary Control Center is not addressed by the proposed requirement.

Rationale for Requirement R21:

The proposed requirement addresses directives for testing of data exchange capabilities used in primary Control Centers (FERC Order No. 817 Para 51).

A test for redundant functionality demonstrates that data exchange capabilities will continue to operate despite the malfunction or failure of an individual component (e.g., switches, routers, servers, power supplies, and network cabling and communication paths between these components in the primary Control Center for the exchange of system operating data). An entity's testing practices should, over time, examine the various failure modes of its data exchange capabilities. When an actual event successfully exercises the redundant functionality, it can be considered a test for the purposes of the proposed requirement.
Rationale for Requirements R22 and R23:

[Note: Requirement R22 proposed for retirement under Project 2018-03 Standards Efficiency Review Retirements]

The proposed changes address directives for redundancy and diverse routing of data exchange capabilities (FERC Order No. 817 Para 47).

Redundant and diversely routed data exchange capabilities consist of data exchange infrastructure components (e.g., switches, routers, servers, power supplies, and network cabling and communication paths between these components in the primary Control Center for the exchange of system operating data) that will provide continued functionality despite failure or malfunction of an individual component within the Balancing Authority's (BA) primary Control Center. Redundant and diversely routed data exchange capabilities preclude single points of failure in primary Control Center data exchange infrastructure from halting the flow of Real-time data. Requirement R23 does not require automatic or instantaneous fail-over of data exchange capabilities. Redundancy and diverse routing may be achieved in various ways depending on the arrangement of the infrastructure or hardware within the BA's primary Control Center.

The reliability objective of redundancy is to provide for continued data exchange functionality during outages, maintenance, or testing of data exchange infrastructure. For periods of planned or unplanned outages of individual data exchange components, the proposed requirements do not require additional redundant data exchange infrastructure components solely to provide for redundancy.

Infrastructure that is not within the BA's primary Control Center is not addressed by the proposed requirement.

Rationale for Requirement R24:

The proposed requirement addresses directives for testing of data exchange capabilities used in primary Control Centers (FERC Order No. 817 Para 51).

A test for redundant functionality demonstrates that data exchange capabilities will continue to operate despite the malfunction or failure of an individual component (e.g., switches, routers, servers, power supplies, and network cabling and communication paths between these components in the primary Control Center for the exchange of system operating data). An entity's testing practices should, over time, examine the various failure modes of its data exchange capabilities. When an actual event successfully exercises the redundant functionality, it can be considered a test for the purposes of the proposed requirement.
Exhibit A-3

Proposed Reliability Standard VAR-001-6
A. Introduction

1. Title: Voltage and Reactive Control
2. Number: VAR-001-6
3. Purpose: To ensure that voltage levels, reactive flows, and reactive resources are monitored, controlled, and maintained within limits in Real-time to protect equipment and the reliable operation of the Interconnection.

4. Applicability:
   4.1. Transmission Operators
   4.2. Generator Operators within the Western Interconnection (for the WECC Variance)

5. Effective Date: See Implementation Plan.
B. Requirements and Measures

R1. Each Transmission Operator shall specify a system voltage schedule (which is either a range or a target value with an associated tolerance band) as part of its plan to operate within System Operating Limits and Interconnection Reliability Operating Limits. [Violation Risk Factor: High] [Time Horizon: Operations Planning]

1.1. Each Transmission Operator shall provide a copy of the voltage schedules (which is either a range or a target value with an associated tolerance band) to its Reliability Coordinator and adjacent Transmission Operators within 30 calendar days of a request.

M1. The Transmission Operator shall have evidence that it specified system voltage schedules using either a range or a target value with an associated tolerance band.

For part 1.1, the Transmission Operator shall have evidence that the voltage schedules (which is either a range or a target value with an associated tolerance band) were provided to its Reliability Coordinator and adjacent Transmission Operators within 30 calendar days of a request. Evidence may include, but is not limited to, emails, website postings, and meeting minutes.

R2. Reserved.

M2. Reserved.

R3. Each Transmission Operator shall operate or direct the Real-time operation of devices to regulate transmission voltage and reactive flow as necessary. [Violation Risk Factor: High] [Time Horizon: Real-time Operations, Same-day Operations, and Operations Planning]

M3. Each Transmission Operator shall have evidence that actions were taken to operate capacitive and inductive resources as necessary in Real-time. This may include, but is not limited to, instructions to Generator Operators to: 1) provide additional voltage support; 2) bring resources on-line; or 3) make manual adjustments.

R4. Each Transmission Operator shall specify the criteria that will exempt generators: 1) from following a voltage or Reactive Power schedule, 2) from having its automatic voltage regulator (AVR) in service or from being in voltage control mode, or 3) from having to make any associated notifications. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

4.1 If a Transmission Operator determines that a generator has satisfied the exemption criteria, it shall notify the associated Generator Operator.

M4. Each Transmission Operator shall have evidence of the documented criteria for generator exemptions.

For part 4.1, the Transmission Operator shall also have evidence to show that, for each generator in its area that is exempt: 1) from following a voltage or Reactive Power schedule, 2) from having its automatic voltage regulator (AVR) in service or from being in voltage control mode, or 3) from having to make any notifications, the
associated Generator Operator was notified of this exemption.

R5. Each Transmission Operator shall specify a voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band) at either the high voltage side or low voltage side of the generator step-up transformer at the Transmission Operator’s discretion. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

5.1. The Transmission Operator shall provide the voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band) to the associated Generator Operator and direct the Generator Operator to comply with the schedule in automatic voltage control mode (the AVR is in service and controlling voltage).

5.2. The Transmission Operator shall provide the Generator Operator with the notification requirements for deviations from the voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band).

5.3. The Transmission Operator shall provide the criteria used to develop voltage schedules or Reactive Power schedule (which is either a range or a target value with an associated tolerance band) to the Generator Operator within 30 days of receiving a request.

M5. The Transmission Operator shall have evidence of a documented voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band).

For part 5.1, the Transmission Operator shall have evidence it provided a voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band) to the applicable Generator Operators, and that the Generator Operator was directed to comply with the schedule in automatic voltage control mode, unless exempted.

For part 5.2, the Transmission Operator shall have evidence it provided notification requirements for deviations from the voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band). For part 5.3, the Transmission Operator shall have evidence it provided the criteria used to develop voltage schedules or Reactive Power schedule (which is either a range or a target value with an associated tolerance band) within 30 days of receiving a request by a Generator Operator.

R6. After consultation with the Generator Owner regarding necessary step-up transformer tap changes and the implementation schedule, the Transmission Operator shall provide documentation to the Generator Owner specifying the required tap changes, a timeframe for making the changes, and technical justification for these changes. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

M6. The Transmission Operator shall have evidence that it provided documentation to
the Generator Owner when a change was needed to a generating unit’s step-up transformer tap in accordance with the requirement and that it consulted with the Generator Owner.
C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” refers to NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time a registered entity is required to retain specific evidence to demonstrate compliance. For instances in which the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask the registered entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Operator shall retain evidence for Measures M1 and M3 through M6 for 12 months. The Compliance Monitor shall retain any audit data for three years.

1.3. Compliance Monitoring and Assessment Processes:

“Compliance Monitoring and Assessment Processes” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.4. Additional Compliance Information:

None.

D. **Regional Variances**

The following Interconnection-wide variance shall be applicable in the Western Electricity Coordinating Council (WECC) and replaces, in their entirety, Requirements R4 and R5. Please note that Requirement R4 is deleted and R5 is replaced with the following requirements.

**Requirements and Measures**

**E.A.13** Each Transmission Operator shall issue any one of the following types of voltage schedules to the Generator Operators for each of their generation resources that are on-line and part of the Bulk Electric System within the Transmission Operator Area: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same-day Operations]*

- A voltage set point with a voltage tolerance band and a specified period.
- An initial volt-ampere reactive output or initial power factor output with a voltage tolerance band for a specified period that the Generator Operator uses to establish a generator bus voltage set point.
- A voltage band for a specified period.

**M.E.A.13** Each Transmission Operator will have evidence that it provided the voltage schedules to the Generator Operator, as required in E.A.13. Evidence may include, but is not limited to, dated spreadsheets, reports, voice recordings, or other documentation containing the voltage schedule including set points, tolerance bands, and specified periods as required in Requirement E.A.13.

**E.A.14** Each Transmission Operator shall provide one of the following voltage schedule reference points for each generation resource in its area to the Generator Operator. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same-day Operations]*

- The generator terminals.
- The high side of the generator step-up transformer.
- The point of interconnection.
- A location designated by mutual agreement between the Transmission Operator and Generator Operator.

**M.E.A.14** The Transmission Operator will have evidence that it provided one of the voltage schedule reference points for each generation resource in its area to the Generator Operator, as required in E.A.14. Evidence may include, but is not limited to dated letters, e-mail, or other documentation that contains notification to the Generator Operator of the voltage schedule reference point for each generation resource.

**E.A.15** Each Generator Operator shall provide its voltage set point conversion methodology from the point in Requirement E.A.14 to the generator terminals.
within 30 calendar days of request by its Transmission Operator. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

M.E.A.15 The Generator Operator will have evidence that within 30 calendar days of request by its Transmission Operator it provided its voltage set point conversion methodology from the point in Requirement E.A.14 to the generator terminals, as required in E.A.15. Evidence may include, but is not limited to, dated reports, spreadsheets, or other documentation.

E.A.16 Each Transmission Operator shall provide to the Generator Operator, within 30 calendar days of a request for data by the Generator Operator, its transmission equipment data and operating data that supports development of the voltage set point conversion methodology. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

M.E.A.16 The Transmission Operator will have evidence that within 30 calendar days of request by its Generator Operator it provided data to support development of the voltage set point conversion methodology, as required in E.A.16. Evidence may include, but is not limited to, dated reports, spreadsheets, or other documentation.

E.A.17 Each Generator Operator shall meet the following control loop specifications if the Generator Operator uses control loops external to the automatic voltage regulators (AVR) to manage Mvar loading: [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]

E.A.17.1 Each control loop’s design incorporates the AVR’s automatic voltage controlled response to voltage deviations during System Disturbances.

E.A.17.2 Each control loop is only used by mutual agreement between the Generator Operator and the Transmission Operator affected by the control loop.

M.E.A.17 If the Generator Operator uses outside control loops to manage Mvar loading, the Generator Operator will have evidence that it met the control loop specifications in sub-parts E.A.17.1 through E.A.17.2, as required in E.A.17 and its sub-parts. Evidence may include, but is not limited to, design specifications with identified agreed-upon control loops, system reports, or other dated documentation.

Guidelines and Technical Basis
For technical basis for each requirement, please review the rationale provided for each requirement.

Rationale:
During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for R1:
Paragraph 1868 of Order No. 693 requires NERC to add more "detailed and definitive requirements on “established limits” and “sufficient reactive resources”, and identify  acceptable margins (i.e. voltage and/or reactive power margins)." Since Order No. 693 was issued, however, several FAC and TOP standards have become enforceable to add more requirements around voltage limits. More specifically, FAC-011 and FAC-014 require that System Operating Limits (SOLs) and reliability margins are established. The NERC Glossary definition of SOLs includes both: 1) voltage stability ratings (Applicable pre- and post- Contingency Voltage Stability) and 2) System Voltage Limits (Applicable pre- and post- Contingency voltage limits). Therefore, for reliability reasons Requirement R1 now requires a Transmission Operator (TOP) to set voltage or Reactive Power schedules with associated tolerance bands. Further, since neighboring areas can affect each other greatly, each TOP must also provide a copy of these schedules to its Reliability Coordinator (RC) and adjacent TOP upon request.

Rationale for R3:
The VAR SDT determined that for reliability purposes, the TOP must ensure sufficient voltage support is provided in Real-time in order to operate within an SOL.

Rationale for R4:
The VAR SDT received significant feedback on instances when a TOP would need the flexibility for defining exemptions for generators. These exemptions can be tailored as the TOP deems necessary for the specific area’s needs. The goal of this requirement is to provide a TOP the ability to exempt a Generator Operator (GOP) from: 1) a voltage or Reactive Power schedule, 2) a setting on the AVR, or 3) any VAR-002 notifications based on the TOP’s criteria. Feedback from the industry detailed many system events that would require these types of exemptions which included, but are not limited to: 1) maintenance during shoulder months, 2) scenarios where two units are located within close proximity and both cannot be in voltage control mode, and 3) large system voltage swings where it would harm reliability if all GOP were to notify their respective TOP of deviations at one time. Also, in an effort to improve the requirement, the sub-requirements containing an exemption list were removed from the currently enforceable standard because this created more compliance issues with regard to how often the list would be updated and maintained.

Rationale for R5:
The new requirement provides transparency regarding the criteria used by the TOP to establish the voltage schedule. This requirement also provides a vehicle for the TOP to use appropriate
granularity when setting notification requirements for deviation from the voltage or Reactive Power schedule. Additionally, this requirement provides clarity regarding a “tolerance band” as specified in the voltage schedule and the control dead-band in the generator’s excitation system.

Voltage schedule tolerances are the bandwidth that accompanies the voltage target in a voltage schedule, should reflect the anticipated fluctuation in voltage at the Generation Operator’s facility during normal operations, and be based on the TOP’s assessment of N-1 and credible N-2 system contingencies. The voltage schedule’s bandwidth should not be confused with the control dead-band that is programmed into a Generation Operator’s automatic voltage regulator’s control system, which should be adjusting the AVR prior to reaching either end of the voltage schedule’s bandwidth.

Rationale for R6:
Although tap settings are first established prior to interconnection, this requirement could not be deleted because no other standard addresses when a tap setting must be adjusted. If the tap setting is not properly set, then the amount of VARs produced by a unit can be affected.
## A. Introduction

1. **Title:** Voltage and Reactive Control

2. **Number:** VAR-001-56

3. **Purpose:** To ensure that voltage levels, reactive flows, and reactive resources are monitored, controlled, and maintained within limits in Real-time to protect equipment and the reliable operation of the Interconnection.

4. **Applicability:**
   - 4.1. Transmission Operators
   - 4.2. Generator Operators within the Western Interconnection (for the WECC Variance)

5. **Effective Date:** The standard shall become effective on the first day of the first calendar quarter after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction. See Implementation Plan.
B. Requirements and Measures

R1. Each Transmission Operator shall specify a system voltage schedule (which is either a range or a target value with an associated tolerance band) as part of its plan to operate within System Operating Limits and Interconnection Reliability Operating Limits. [Violation Risk Factor: High] [Time Horizon: Operations Planning]

1.1. Each Transmission Operator shall provide a copy of the voltage schedules (which is either a range or a target value with an associated tolerance band) to its Reliability Coordinator and adjacent Transmission Operators within 30 calendar days of a request.

M1. The Transmission Operator shall have evidence that it specified system voltage schedules using either a range or a target value with an associated tolerance band.

For part 1.1, the Transmission Operator shall have evidence that the voltage schedules (which is either a range or a target value with an associated tolerance band) were provided to its Reliability Coordinator and adjacent Transmission Operators within 30 calendar days of a request. Evidence may include, but is not limited to, emails, website postings, and meeting minutes.

R2. Reserved Each Transmission Operator shall schedule sufficient reactive resources to regulate voltage levels under normal and Contingency conditions. Transmission Operators can provide sufficient reactive resources through various means including, but not limited to, reactive generation scheduling, transmission line and reactive resource switching, and using controllable load. [Violation Risk Factor: High] [Time Horizon: Real-time Operations, Same-day Operations, and Operations Planning]

M2. Reserved Each Transmission Operator shall have evidence of scheduling sufficient reactive resources based on their assessments of the system. For the operations planning time horizon, Transmission Operators shall have evidence of assessments used as the basis for how resources were scheduled.

R3. Each Transmission Operator shall operate or direct the Real-time operation of devices to regulate transmission voltage and reactive flow as necessary. [Violation Risk Factor: High] [Time Horizon: Real-time Operations, Same-day Operations, and Operations Planning]

M3. Each Transmission Operator shall have evidence that actions were taken to operate capacitive and inductive resources as necessary in Real-time. This may include, but is not limited to, instructions to Generator Operators to: 1) provide additional voltage support; 2) bring resources on-line; or 3) make manual adjustments.

R4. Each Transmission Operator shall specify the criteria that will exempt generators: 1) from following a voltage or Reactive Power schedule, 2) from having its automatic voltage regulator (AVR) in service or from being in voltage control mode, or 3) from having to make any associated notifications. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]
4.1 If a Transmission Operator determines that a generator has satisfied the exemption criteria, it shall notify the associated Generator Operator.

M4. Each Transmission Operator shall have evidence of the documented criteria for generator exemptions.

For part 4.1, the Transmission Operator shall also have evidence to show that, for each generator in its area that is exempt: 1) from following a voltage or Reactive Power schedule, 2) from having its automatic voltage regulator (AVR) in service or from being in voltage control mode, or 3) from having to make any notifications, the associated Generator Operator was notified of this exemption.

R5. Each Transmission Operator shall specify a voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band) at either the high voltage side or low voltage side of the generator step-up transformer at the Transmission Operator’s discretion. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

5.1. The Transmission Operator shall provide the voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band) to the associated Generator Operator and direct the Generator Operator to comply with the schedule in automatic voltage control mode (the AVR is in service and controlling voltage).

5.2. The Transmission Operator shall provide the Generator Operator with the notification requirements for deviations from the voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band).

5.3. The Transmission Operator shall provide the criteria used to develop voltage schedules or Reactive Power schedule (which is either a range or a target value with an associated tolerance band) to the Generator Operator within 30 days of receiving a request.

M5. The Transmission Operator shall have evidence of a documented voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band).

For part 5.1, the Transmission Operator shall have evidence it provided a voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band) to the applicable Generator Operators, and that the Generator Operator was directed to comply with the schedule in automatic voltage control mode, unless exempted.

For part 5.2, the Transmission Operator shall have evidence it provided notification requirements for deviations from the voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band). For part 5.3, the Transmission Operator shall have evidence it provided the criteria used to develop voltage schedules or Reactive Power schedule (which is either a range or a target value with an associated tolerance band).
value with an associated tolerance band) within 30 days of receiving a request by a Generator Operator.

R6. After consultation with the Generator Owner regarding necessary step-up transformer tap changes and the implementation schedule, the Transmission Operator shall provide documentation to the Generator Owner specifying the required tap changes, a timeframe for making the changes, and technical justification for these changes. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

M6. The Transmission Operator shall have evidence that it provided documentation to the Generator Owner when a change was needed to a generating unit’s step-up transformer tap in accordance with the requirement and that it consulted with the Generator Owner.
C. **Compliance**

1. **Compliance Monitoring Process:**

1.1. **Compliance Enforcement Authority:**

As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” refers to NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. **Evidence Retention:**

The following evidence retention periods identify the period of time a registered entity is required to retain specific evidence to demonstrate compliance. For instances in which the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask the registered entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Operator shall retain evidence for Measures M1 and M3 through M6 for 12 months. The Compliance Monitor shall retain any audit data for three years.

1.3. **Compliance Monitoring and Assessment Processes:**

“Compliance Monitoring and Assessment Processes” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.4. **Additional Compliance Information:**

None.

Lower

The Transmission Operator does not provide either the technical justification or timeframe for changing generator step-up tap settings.

N/A

N/A

The Transmission Operator does not provide the technical justification and the timeframe for changing generator step-up tap settings.

requirements for deviations from the voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band).
D. Regional Variances

The following Interconnection-wide variance shall be applicable in the Western Electricity Coordinating Council (WECC) and replaces, in their entirety, Requirements R4 and R5. Please note that Requirement R4 is deleted and R5 is replaced with the following requirements.

Requirements and Measures

E.A.13 Each Transmission Operator shall issue any one of the following types of voltage schedules to the Generator Operators for each of their generation resources that are on-line and part of the Bulk Electric System within the Transmission Operator Area: [Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same-day Operations]

- A voltage set point with a voltage tolerance band and a specified period.
- An initial volt-ampere reactive output or initial power factor output with a voltage tolerance band for a specified period that the Generator Operator uses to establish a generator bus voltage set point.
- A voltage band for a specified period.

M.E.A.13 Each Transmission Operator will have evidence that it provided the voltage schedules to the Generator Operator, as required in E.A.13. Evidence may include, but is not limited to, dated spreadsheets, reports, voice recordings, or other documentation containing the voltage schedule including set points, tolerance bands, and specified periods as required in Requirement E.A.13.

E.A.14 Each Transmission Operator shall provide one of the following voltage schedule reference points for each generation resource in its area to the Generator Operator. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same-day Operations]

- The generator terminals.
- The high side of the generator step-up transformer.
- The point of interconnection.
- A location designated by mutual agreement between the Transmission Operator and Generator Operator.

M.E.A.14 The Transmission Operator will have evidence that it provided one of the voltage schedule reference points for each generation resource in its area to the Generator Operator, as required in E.A.14. Evidence may include, but is not limited to dated letters, e-mail, or other documentation that contains notification to the Generator Operator of the voltage schedule reference point for each generation resource.

E.A.15 Each Generator Operator shall provide its voltage set point conversion methodology from the point in Requirement E.A.14 to the generator terminals
within 30 calendar days of request by its Transmission Operator. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

**M.E.A.15** The Generator Operator will have evidence that within 30 calendar days of request by its Transmission Operator it provided its voltage set point conversion methodology from the point in Requirement E.A.14 to the generator terminals, as required in E.A.15. Evidence may include, but is not limited to, dated reports, spreadsheets, or other documentation.

**E.A.16** Each Transmission Operator shall provide to the Generator Operator, within 30 calendar days of a request for data by the Generator Operator, its transmission equipment data and operating data that supports development of the voltage set point conversion methodology. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

**M.E.A.16** The Transmission Operator will have evidence that within 30 calendar days of request by its Generator Operator it provided data to support development of the voltage set point conversion methodology, as required in E.A.16. Evidence may include, but is not limited to, dated reports, spreadsheets, or other documentation.

**E.A.17** Each Generator Operator shall meet the following control loop specifications if the Generator Operator uses control loops external to the automatic voltage regulators (AVR) to manage Mvar loading: [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]

**E.A.17.1** Each control loop’s design incorporates the AVR’s automatic voltage controlled response to voltage deviations during System Disturbances.

**E.A.17.2.** Each control loop is only used by mutual agreement between the Generator Operator and the Transmission Operator affected by the control loop.

**M.E.A.17** If the Generator Operator uses outside control loops to manage Mvar loading, the Generator Operator will have evidence that it met the control loop specifications in sub-parts E.A.17.1 through E.A.17.2, as required in E.A.17 and its sub-parts. Evidence may include, but is not limited to, design specifications with identified agreed-upon control loops, system reports, or other dated documentation.

### Lower VSL

The Generator Operator did not meet the control loop specifications in E.A.17.2 when the Generator Operator uses control loop external to the AVR to manage Mvar loading.

### Moderate VSL

The Generator Operator did not meet the control loop specifications in E.A.17.1 when the Generator Operator uses control loop external to the AVR to manage Mvar loading.

### High VSL

The Generator Operator did not meet the control loop specifications in E.A.17.1 through E.A.17.2 when the Generator Operator uses control loop external to the AVR to manage Mvar loading.

### E. Interpretations

None.

### F. Associated Documents

None.

Guidelines and Technical Basis

For technical basis for each requirement, please review the rationale provided for each requirement.

Rationale:
During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for R1:
Paragraph 1868 of Order No. 693 requires NERC to add more "detailed and definitive requirements on “established limits” and “sufficient reactive resources”, and identify acceptable margins (i.e. voltage and/or reactive power margins)." Since Order No. 693 was issued, however, several FAC and TOP standards have become enforceable to add more requirements around voltage limits. More specifically, FAC-011 and FAC-014 require that System Operating Limits (SOLs) and reliability margins are established. The NERC Glossary definition of SOLs includes both: 1) voltage stability ratings (Applicable pre- and post- Contingency Voltage Stability) and 2) System Voltage Limits (Applicable pre- and post- Contingency voltage limits). Therefore, for reliability reasons Requirement R1 now requires a Transmission Operator (TOP) to set voltage or Reactive Power schedules with associated tolerance bands. Further, since neighboring areas can affect each other greatly, each TOP must also provide a copy of these schedules to its Reliability Coordinator (RC) and adjacent TOP upon request.

Rationale for R2:
Paragraph 1875 from Order No. 693 directed NERC to include requirements to run voltage stability analysis periodically, using online techniques where commercially available and offline tools when online tools are not available. This standard does not explicitly require the periodic voltage stability analysis because such analysis would be performed pursuant to the SOL methodology developed under the FAC standards. TOP standards also require the TOP to operate within SOLs and Interconnection Reliability Operating Limits (IROL). The VAR standard drafting team (SDT) and industry participants also concluded that the best models and tools are the ones that have been proven and the standard should not add a requirement for a responsible entity to purchase new online simulations tools. Thus, the VAR SDT simplified the requirements to ensuring sufficient reactive resources are online or scheduled. Controllable load is specifically included to answer FERC's directive in Order No. 693 at Paragraph 1879.

Rationale for R3:
The VAR SDT determined that for reliability purposes, the TOP must ensure sufficient voltage support is provided in Real-time in order to operate within an SOL.
Rationale for R4:
The VAR SDT received significant feedback on instances when a TOP would need the flexibility for defining exemptions for generators. These exemptions can be tailored as the TOP deems necessary for the specific area’s needs. The goal of this requirement is to provide a TOP the ability to exempt a Generator Operator (GOP) from: 1) a voltage or Reactive Power schedule, 2) a setting on the AVR, or 3) any VAR-002 notifications based on the TOP’s criteria. Feedback from the industry detailed many system events that would require these types of exemptions which included, but are not limited to: 1) maintenance during shoulder months, 2) scenarios where two units are located within close proximity and both cannot be in voltage control mode, and 3) large system voltage swings where it would harm reliability if all GOP were to notify their respective TOP of deviations at one time. Also, in an effort to improve the requirement, the sub-requirements containing an exemption list were removed from the currently enforceable standard because this created more compliance issues with regard to how often the list would be updated and maintained.

Rationale for R5:
The new requirement provides transparency regarding the criteria used by the TOP to establish the voltage schedule. This requirement also provides a vehicle for the TOP to use appropriate granularity when setting notification requirements for deviation from the voltage or Reactive Power schedule. Additionally, this requirement provides clarity regarding a “tolerance band” as specified in the voltage schedule and the control dead-band in the generator’s excitation system.

Voltage schedule tolerances are the bandwidth that accompanies the voltage target in a voltage schedule, should reflect the anticipated fluctuation in voltage at the Generation Operator’s facility during normal operations, and be based on the TOP’s assessment of N-1 and credible N-2 system contingencies. The voltage schedule’s bandwidth should not be confused with the control dead-band that is programmed into a Generation Operator’s automatic voltage regulator’s control system, which should be adjusting the AVR prior to reaching either end of the voltage schedule’s bandwidth.

Rationale for R6:
Although tap settings are first established prior to interconnection, this requirement could not be deleted because no other standard addresses when a tap setting must be adjusted. If the tap setting is not properly set, then the amount of VARs produced by a unit can be affected.
Exhibit B

Implementation Plan
Implementation Plan
Project 2018-03 Standards Efficiency Review Retirements

Applicable Standard(s)
• FAC-008-4 – Facility Ratings
• INT-006-5 – Evaluation of Interchange Transactions
• INT-009-3 – Implementation of Interchange
• IRO-002-7 – Reliability Coordination – Monitoring and Analysis
• PRC-004-6 – Protection System Misoperation Identification and Correction
• TOP-001-5 – Transmission Operations
• VAR-001-6 – Voltage and Reactive Control

Requested Retirement(s)
• FAC-008-3 – Facility Ratings
• FAC-013-2 – Assessment of Transfer Capability for the Near-term Transmission Planning Horizon
• INT-004-3.1 – Dynamic Transfers
• INT-006-4 – Evaluation of Interchange Transactions
• INT-009-2.1 – Implementation of Interchange
• INT-010-2.1 – Interchange Initiation and Modification for Reliability
• IRO-002-6 – Reliability Coordination – Monitoring and Analysis
• MOD-001-1a – Available Transmission System Capability
• MOD-004-1 – Capacity Benefit Margin
• MOD-008-1 – Transmission Readability Margin Calculation Methodology
• MOD-020-0 – Providing Interruptible Demands and Direct Control Load Management Data to System Operators and Reliability Coordinators
• MOD-028-2 – Area Interchange Methodology
• MOD-029-2a – Rated System Path Methodology
• MOD-030-3 – Flowgate Methodology
• PRC-004-5(i) – Protection System Misoperation Identification and Correction
• TOP-001-4 – Transmission Operations
• VAR-001-5 – Voltage and Reactive Control
Requested Withdrawal

- MOD-001-2 – Available Transmission System Capability

Applicable Entities

See subject standards.

Background

In 2017, NERC initiated the Standards Efficiency Review. The scope of this project was to use a risk-based approach to identify potential efficiencies through retirement or modification of Reliability Standard requirements. Following the completion of the first phase of work, the Standards Efficiency Review Team submitted a Standard Authorization Request (SAR) to the NERC Standards Committee in August 2018.

Project 2018-03 Standards Efficiency Review Retirements was initiated to consider and implement the recommendations for Reliability Standard retirements contained in the SAR. This project proposes to:

- retire several Reliability Standards on the grounds that the requirements contained therein are duplicative to other requirements, administrative in nature, or are otherwise unnecessary for reliability;
- revise several currently-effective Reliability Standards to remove duplicative, administrative, or otherwise unnecessary requirements (thereby retiring those requirements); and
- withdraw a standard, MOD-001-2, that is currently pending approval by applicable governmental authorities.

General Considerations

For Reliability Standards that are proposed to be retired in their entirety (i.e., no new standard version is proposed), this Implementation Plan provides that the retirement shall become effective immediately upon regulatory approval.

For Reliability Standards that are revised to remove requirements, the revised standards will become effective on the first day of the first calendar quarter that is three (3) months after applicable regulatory approval. This implementation timeframe reflects consideration that entities may need time to update their internal systems and documentation to reflect the new standard version numbers.

Effective Date

Reliability Standards FAC-008-4, INT-006-5, INT-009-3, IRO-002-7, PRC-004-6, TOP-001-5, and VAR-001-6

Where approval by an applicable governmental authority is required, the standard shall become effective on the first day of the first calendar quarter that is three (3) months after the effective date of the applicable governmental authority’s order approving the standard, or as otherwise provided for by the applicable governmental authority.
Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is three (3) months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

**Retirement Date**

**Reliability Standards FAC-008-3, INT-006-4, INT-009-2.1, IRO-002-6, PRC-004-5(i), TOP-001-4, and VAR-001-5**
The Reliability Standard shall be retired immediately prior to the effective date of the revised standard in the particular jurisdiction in which the revised standard is becoming effective.

**Reliability Standards FAC-013-2, INT-004-3.1, INT-010-2.1, MOD-001-1a, MOD-004-1, MOD-008-1, MOD-020-0, MOD-028-2, MOD-029-2a, and MOD-030-3**
The Reliability Standard shall be retired on the effective date of the applicable governmental authority’s order approving retirement of the standard, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the standard shall be retired on the date the standard is retired by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.
Exhibit D

Analysis of Violation Risk Factors and Violation Severity Levels
Exhibit D-1

Proposed Reliability Standard IRO-002-7
Violation Risk Factor and Violation Severity Level Justifications
Project 2018-03 Standards Efficiency Review Retirements

This document provides the standard drafting team’s (SDT’s) justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in proposed Reliability Standard IRO-002-7. Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the Electric Reliability Organizations (ERO) Sanction Guidelines. The SDT applied the following NERC criteria and FERC Guidelines when developing the VRFs and VSLs for the requirements.

NERC Criteria for Violation Risk Factors

**High Risk Requirement**
A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

**Medium Risk Requirement**
A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.
Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

FERC Guidelines for Violation Risk Factors

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report
FERC seeks to ensure that VRFs assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.
Guideline (2) - Consistency within a Reliability Standard
FERC expects a rational connection between the sub-Requirement VRF assignments and the main Requirement VRF assignment.

Guideline (3) - Consistency among Reliability Standards
FERC expects the assignment of VRFs corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) - Consistency with NERC’s Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular VRF level conforms to NERC’s definition of that risk level.

Guideline (5) - Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.
NERC Criteria for Violation Severity Levels

VSLs define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple “degrees” of noncompliant performance and may have only one, two, or three VSLs.

VSLs should be based on NERC’s overarching criteria shown in the table below:

<table>
<thead>
<tr>
<th>Lower VSL</th>
<th>Moderate VSL</th>
<th>High VSL</th>
<th>Severe VSL</th>
</tr>
</thead>
<tbody>
<tr>
<td>The performance or product measured almost meets the full intent of the requirement.</td>
<td>The performance or product measured meets the majority of the intent of the requirement.</td>
<td>The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.</td>
<td>The performance or product measured does not substantively meet the intent of the requirement.</td>
</tr>
</tbody>
</table>

FERC Order of Violation Severity Levels

The FERC VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

**Guideline (1) - Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance**

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

**Guideline (2) - Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties**

A violation of a “binary” type requirement must be a “Severe” VSL.

Do not use ambiguous terms such as “minor” and “significant” to describe noncompliant performance.

**Guideline (3) - Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement**

VSLs should not expand on what is required in the requirement.
Guideline (4) – Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

VRF Justification for IRO-002-7, Requirement R2
The VRF did not change from the previously FERC approved IRO-002-5 Reliability Standard.

VRF Justification for IRO-002-7, Requirement R3
The VRF did not change from the previously FERC approved IRO-002-5 Reliability Standard.

VRF Justification for IRO-002-7, Requirement R4
The VRF did not change from the previously FERC approved IRO-002-5 Reliability Standard.

VRF Justification for IRO-002-7, Requirement R5
The VRF did not change from the previously FERC approved IRO-002-5 Reliability Standard.

VRF Justification for IRO-002-7, Requirement R6
The VRF did not change from the previously FERC approved IRO-002-5 Reliability Standard.

VSL Justification for IRO-002-7, Requirement R2
The VSL did not change from the previously FERC approved IRO-002-5 Reliability Standard.

VSL Justification for IRO-002-7, Requirement R3
The VSL did not change from the previously FERC approved IRO-002-5 Reliability Standard.

VSL Justification for IRO-002-7, Requirement R4
The VSL did not change from the previously FERC approved IRO-002-5 Reliability Standard.

VSL Justification for IRO-002-7, Requirement R5
The VSL did not change from the previously FERC approved IRO-002-5 Reliability Standard.

VSL Justification for IRO-002-7, Requirement R6
The VSL did not change from the previously FERC approved IRO-002-5 Reliability Standard.
Exhibit D-2

Proposed Reliability Standard TOP-001-5
Violation Risk Factor and Violation Severity Level Justifications
Project 2018-03 Standards Efficiency Review Retirements

This document provides the standard drafting team’s (SDT’s) justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in proposed Reliability Standard TOP-001-5. Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the Electric Reliability Organizations (ERO) Sanction Guidelines. The SDT applied the following NERC criteria and FERC Guidelines when developing the VRFs and VSLs for the requirements.

NERC Criteria for Violation Risk Factors

High Risk Requirement
A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement
A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.
Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

FERC Guidelines for Violation Risk Factors

Guideline (1) - Consistency with the Conclusions of the Final Blackout Report
FERC seeks to ensure that VRFs assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.
**Guideline (2) - Consistency within a Reliability Standard**
FERC expects a rational connection between the sub-Requirement VRF assignments and the main Requirement VRF assignment.

**Guideline (3) - Consistency among Reliability Standards**
FERC expects the assignment of VRFs corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

**Guideline (4) - Consistency with NERC’s Definition of the Violation Risk Factor Level**
Guideline (4) was developed to evaluate whether the assignment of a particular VRF level conforms to NERC’s definition of that risk level.

**Guideline (5) - Treatment of Requirements that Co-mingle More Than One Obligation**
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.
NERC Criteria for Violation Severity Levels

VSLs define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple “degrees” of noncompliant performance and may have only one, two, or three VSLs.

VSLs should be based on NERC’s overarching criteria shown in the table below:

<table>
<thead>
<tr>
<th>Lower VSL</th>
<th>Moderate VSL</th>
<th>High VSL</th>
<th>Severe VSL</th>
</tr>
</thead>
<tbody>
<tr>
<td>The performance or product measured almost meets the full intent of the requirement.</td>
<td>The performance or product measured meets the majority of the intent of the requirement.</td>
<td>The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.</td>
<td>The performance or product measured does not substantively meet the intent of the requirement.</td>
</tr>
</tbody>
</table>

FERC Order of Violation Severity Levels

The FERC VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

**Guideline (1) - Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance**

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

**Guideline (2) - Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties**

A violation of a “binary” type requirement must be a “Severe” VSL.

Do not use ambiguous terms such as “minor” and “significant” to describe noncompliant performance.

**Guideline (3) - Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement**

VSLs should not expand on what is required in the requirement.
Guideline (4) - Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

VRF Justification for TOP-001-5, Requirement R1
The VRF did not change from the previously FERC approved TOP-001-4 Reliability Standard.

VRF Justification for TOP-001-5, Requirement R2
The VRF did not change from the previously FERC approved TOP-001-4 Reliability Standard.

VRF Justification for TOP-001-5, Requirement R3
The VRF did not change from the previously FERC approved TOP-001-4 Reliability Standard.

VRF Justification for TOP-001-5, Requirement R4
The VRF did not change from the previously FERC approved TOP-001-4 Reliability Standard.

VRF Justification for TOP-001-5, Requirement R5

The VRF did not change from the previously FERC approved TOP-001-4 Reliability Standard.
VRF Justification for TOP-001-5, Requirement R24
The VRF did not change from the previously FERC approved TOP-001-4 Reliability Standard.

VSL Justification for TOP-001-5, Requirement R1
The VSL did not change from the previously FERC approved TOP-001-4 Reliability Standard.

VSL Justification for TOP-001-5, Requirement R2
The VSL did not change from the previously FERC approved TOP-001-4 Reliability Standard.

VSL Justification for TOP-001-5, Requirement R3
The VSL did not change from the previously FERC approved TOP-001-4 Reliability Standard.

VSL Justification for TOP-001-5, Requirement R4
The VSL did not change from the previously FERC approved TOP-001-4 Reliability Standard.

VSL Justification for TOP-001-5, Requirement R5
The VSL did not change from the previously FERC approved TOP-001-4 Reliability Standard.

VSL Justification for TOP-001-5, Requirement R6
The VSL did not change from the previously FERC approved TOP-001-4 Reliability Standard.

VSL Justification for TOP-001-5, Requirement R7
The VSL did not change from the previously FERC approved TOP-001-4 Reliability Standard.

VSL Justification for TOP-001-5, Requirement R8
The VSL did not change from the previously FERC approved TOP-001-4 Reliability Standard.

VSL Justification for TOP-001-5, Requirement R9
The VSL did not change from the previously FERC approved TOP-001-4 Reliability Standard.

VSL Justification for TOP-001-5, Requirement R10
The VSL did not change from the previously FERC approved TOP-001-4 Reliability Standard.
VSL Justification for TOP-001-5, Requirement R11
The VSL did not change from the previously FERC approved TOP-001-4 Reliability Standard.

VSL Justification for TOP-001-5, Requirement R12
The VSL did not change from the previously FERC approved TOP-001-4 Reliability Standard.

VSL Justification for TOP-001-5, Requirement R13
The VSL did not change from the previously FERC approved TOP-001-4 Reliability Standard.

VSL Justification for TOP-001-5, Requirement R14
The VSL did not change from the previously FERC approved TOP-001-4 Reliability Standard.

VSL Justification for TOP-001-5, Requirement R15
The VSL did not change from the previously FERC approved TOP-001-4 Reliability Standard.

VSL Justification for TOP-001-5, Requirement R16
The VSL did not change from the previously FERC approved TOP-001-4 Reliability Standard.

VSL Justification for TOP-001-5, Requirement R17
The VSL did not change from the previously FERC approved TOP-001-4 Reliability Standard.

VSL Justification for TOP-001-5, Requirement R18
The VSL did not change from the previously FERC approved TOP-001-4 Reliability Standard.

VSL Justification for TOP-001-5, Requirement R20
The VSL did not change from the previously FERC approved TOP-001-4 Reliability Standard.

VSL Justification for TOP-001-5, Requirement R21
The VSL did not change from the previously FERC approved TOP-001-4 Reliability Standard.

VSL Justification for TOP-001-5, Requirement R23
The VSL did not change from the previously FERC approved TOP-001-4 Reliability Standard.

VSL Justification for TOP-001-5, Requirement R24
The VSL did not change from the previously FERC approved TOP-001-4 Reliability Standard.
Exhibit D-3

Proposed Reliability Standard VAR-001-6
Violation Risk Factor and Violation Severity Level Justifications
Project 2018-03 Standards Efficiency Review Retirements

This document provides the standard drafting team’s (SDT’s) justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in proposed Reliability Standard VAR-001-6. Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base PenaltyAmount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the Electric Reliability Organizations (ERO) Sanction Guidelines. The SDT applied the following NERC criteria and FERC Guidelines when developing the VRFs and VSLs for the requirements.

NERC Criteria for Violation Risk Factors

High Risk Requirement
A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement
A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.
Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

FERC Guidelines for Violation Risk Factors

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report
FERC seeks to ensure that VRFs assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.
**Guideline (2) - Consistency within a Reliability Standard**
FERC expects a rational connection between the sub-Requirement VRF assignments and the main Requirement VRF assignment.

**Guideline (3) - Consistency among Reliability Standards**
FERC expects the assignment of VRFs corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

**Guideline (4) - Consistency with NERC’s Definition of the Violation Risk Factor Level**
Guideline (4) was developed to evaluate whether the assignment of a particular VRF level conforms to NERC’s definition of that risk level.

**Guideline (5) - Treatment of Requirements that Co-mingle More Than One Obligation**
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.
**NERC Criteria for Violation Severity Levels**

VSLs define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple “degrees” of noncompliant performance and may have only one, two, or three VSLs.

VSLs should be based on NERC’s overarching criteria shown in the table below:

<table>
<thead>
<tr>
<th>Lower VSL</th>
<th>Moderate VSL</th>
<th>High VSL</th>
<th>Severe VSL</th>
</tr>
</thead>
<tbody>
<tr>
<td>The performance or product measured almost meets the full intent of the requirement.</td>
<td>The performance or product measured meets the majority of the intent of the requirement.</td>
<td>The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.</td>
<td>The performance or product measured does not substantively meet the intent of the requirement.</td>
</tr>
</tbody>
</table>

**FERC Order of Violation Severity Levels**

The FERC VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

**Guideline (1) - Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance**

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

**Guideline (2) - Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties**

A violation of a “binary” type requirement must be a “Severe” VSL.

Do not use ambiguous terms such as “minor” and “significant” to describe noncompliant performance.

**Guideline (3) - Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement**

VSLs should not expand on what is required in the requirement.
Guideline (4) - Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

VRF Justification for VAR-001-6, Requirement R1
The VRF did not change from the previously FERC approved VAR-001-5 Reliability Standard.

VRF Justification for VAR-001-6, Requirement R3
The VRF did not change from the previously FERC approved VAR-001-5 Reliability Standard.

VRF Justification for VAR-001-6, Requirement R4
The VRF did not change from the previously FERC approved VAR-001-5 Reliability Standard.

VRF Justification for VAR-001-6, Requirement R5
The VRF did not change from the previously FERC approved VAR-001-5 Reliability Standard.

VRF Justification for VAR-001-6, Requirement R6
The VRF did not change from the previously FERC approved VAR-001-5 Reliability Standard.

VSL Justification for VAR-001-6, Requirement R1
The VSL did not change from the previously FERC approved VAR-001-5 Reliability Standard.

VSL Justification for VAR-001-6, Requirement R3
The VSL did not change from the previously FERC approved VAR-001-5 Reliability Standard.

VSL Justification for VAR-001-6, Requirement R4
The VSL did not change from the previously FERC approved VAR-001-5 Reliability Standard.

VSL Justification for VAR-001-6, Requirement R5
The VSL did not change from the previously FERC approved VAR-001-5 Reliability Standard.

VSL Justification for VAR-001-6, Requirement R6
The VSL did not change from the previously FERC approved VAR-001-5 Reliability Standard.
Exhibit E

Technical Rationale
Project 2018-03 - Standards Efficiency Review
Retirements
Technical Justifications

Background:
The North American Electric Reliability Corporation (NERC) Project 2018-03 – Standards Efficiency Review (SER) Retirements, was established for the Standard Drafting Team (SDT) to evaluate each recommendation for retirement identified in the Standard Authorization Request (SAR).

The Reliability Standards have their origins in the voluntary consensus Operating Guides and Planning Standards. These original documents were modified into what we currently know as the “Version 0” standards. The objective of the added granularity to the requirements was to support the reliable operation of the Bulk Electric System (BES). These requirements were prescriptive, and meant to provide an industry-wide approach to achieving the reliability objectives of the standards. In the last 10 years, the industry has matured and adopted compliance through the Reliability Standards, and the continuance of the added granularity of the requirements do not contribute to the efficiency and effectiveness of Reliability Standards.

In 2010, NERC determined that absolute, “do exactly as the standard dictates” requirements, in some cases, did not satisfy the reliability goal and required the entity to perform specific actions to be compliant, while not effectively adding to the overall reliability goal. NERC then embarked on a shift in the standards paradigm to what is now known as ‘results-based standards,’ wherein the standards specify what reliability results from the requirements, while affording entities flexibility in achieving those results. The development guidance, provided by NERC, can be found at the following link:

Many of the requirements that the Project 2018-03 SDT are proposing to retire in this project pre-date the maturity of the results-based standards paradigm. As a result, those requirements are overly prescriptive and often express the same obligation in several standards and requirements.

Purpose:
The purpose of the Technical Justification Document is to assist in the understanding of the technical rationale associated with each recommendation for retirement identified in the SAR.
Technical Justifications for Phase I of Project 2018-03 Standards Efficiency Review - Retirements

BAL-005-1, Requirements R4 and R6
SAR Recommendation: Retire
Project 2018-03 SDT Recommendation: Retain

Rationale
The SDT determined these requirements should be retained for the following reasons:

Requirements R4 and R6 of BAL-005-1 are requirements specific to the calculation of the Area Control Error (ACE). TOP-010-1(i) Requirement R2 covers ACE with the wording of “...analysis functions and Real-time monitoring...” but does not cover specifics, such as: quality flags for missing or invalid data that is part of BAL-005-1, Requirement R4, or the accuracy of scan rates that is part of BAL-005-1, Requirement R6.

In TOP-010-1(i), Requirement R2 (revised from TOP-010-1) covers the calculation and monitoring of ACE; however, the language: “Each Balancing Authority (BA) shall implement an Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its analysis functions and Real-time monitoring,” is only addressing quality. In BAL-005-1 (revised from BAL-005-0.2b) Requirement R4 states: “The BA shall make available to the operator information associated with reporting ACE including, but not limited to, quality flags indicating missing or invalid data.” Requirement R6 of BAL-005-1 states: “Each BA that is within a multiple BA Interconnection shall implement an Operating Process to identify and mitigate errors affecting the accuracy of scan rate data used in the calculation of the Reporting ACE for each BA area.” Both of these requirements are specific to identifying missing or invalid data plus scan rates, not just the quality of the Real-time data.

The SER Phase I team will communicate with the SER Phase II team regarding Requirements R4 and R6 of BAL-005-1 to determine if there is opportunity for revisions to TOP-010-1(i), Requirement R2, that would satisfy the missing or invalid data plus scan rates. If the SER Phase II team takes an approach for such determinations, and then finds that there is that opportunity, then Requirements R4 and R6 of BAL-005-1 may be candidates for retirement within that project or a future project.

COM-002-4, Requirement R2
SAR Recommendation: Retire
Project 2018-03 SDT Recommendation: Retain

Rationale
The SDT determined this requirement should be retained for the following reasons:

While training on communications protocols would fall into an entity’s systematic approach to training, the requirements do not explicitly mandate training on communications protocols. It is essential for all operators to have a common level of understanding, and be trained in three-part communication. During development of COM-002-4, it was determined that because PER-005-2 would not meet the NERC Board of Trustees (BOT) November 7, 2013 Resolution to mandate training, that the SDT include a requirement
to conduct initial training in order to ensure that a baseline of training is complete before an individual is placed in a position to use the communications protocols. Requiring initial training is not overly burdensome to an entity, and any subsequent training can be covered in PER-005-2, or through the operator feedback loop as determined by the entity.

The SER Phase I team will communicate with the SER Phase II team regarding Requirement R2 of COM-002-4 to determine if there is opportunity for revisions to PER-005-2, Requirement R2 that would satisfy the training requirements specific to training on communications protocols. If the SER Phase II team takes an approach for such determinations, and then finds that there is that opportunity, then Requirement R2 of COM-002-4 may be a candidate for retirement within that project or a future project.

**EOP-005-3, Requirement R8**
**SAR Recommendation: Retire**
**Project 2018-03 SDT Recommendation: Retain**

**Rationale**
The SDT determined this requirement should be retained for the following reasons:

The PER-005-2 standard entails training processes; however, it does not specifically provide for System restoration training. In PER-005-2, the requirement to provide System restoration training no longer exists. In fact, the rationale to remove the minimum training requirement specific to System restoration from PER-005-1 was, in part, based on the existence of the former Requirement R10 in EOP-005-2 (Requirement R8 of EOP-005-3) and Requirement R9 in EOP-006-2 (Requirement R7 of EOP-006-3). If Requirement R8 in EOP-005-3 is removed, then there will not be any requirements to provide System restoration training to operating personnel in any of the Reliability Standards.

A specific requirement for System restoration training should be maintained because, while a System shutdown is a low probability, it could have a high impact if not done properly. The SER Phase I team will communicate with the SER Phase II team regarding Requirement R8 of EOP-005-3 to determine if there is opportunity for revisions to PER-005-2 that would satisfy the training requirements specific to System restoration training. If the SER Phase II team takes an approach for such determinations and then finds that there is that opportunity, then Requirement R8 of EOP-005-3 may be a candidate for retirement within that project or a future project.

**EOP-006-3, Requirement R7**
**SAR Recommendation: Retire**
**Project 2018-03 SDT Recommendation: Retain**

**Rationale**
The SDT determined this requirement should be retained for the following reasons:

The PER-005-2 standard entails training processes; however, it does not specifically provide for System restoration training. In PER-005-2, the requirement to provide System restoration training no longer exists. In fact, the rationale to remove the minimum training requirement specific to System restoration from PER-005-1 was, in part, based on the existence of former Requirement R9 in EOP-006-2
(Requirement R7 of EOP-006-3). If Requirement R7 in EOP-006-3 is removed, then there will not be any requirements to provide System restoration training to operating personnel in any of the Reliability Standards.

A specific requirement for System restoration training should be maintained because, while a System shutdown is a low probability, it could have a high impact if not done properly. The SER Phase I team will communicate with the SER Phase II team regarding Requirement R7 of EOP-006-3 to determine if there is opportunity for revisions to PER-005-2 that would satisfy the training requirements specific to System restoration training. If the SER Phase II team takes an approach for such determinations and then finds that there is that opportunity, then Requirement R7 of EOP-006-3 may be a candidate for retirement within that project or a future project.

**FAC-008-3, Requirements R7 and R8**

**SAR Recommendation: Retire**

**Project 2018-03 SDT Recommendation: Retire**

**Rationale**
The SDT determined these requirements should be retired for the following reasons:

These requirements are duplicative of the data provision standards MOD-032-1, IRO-010-2, and TOP-003-3. In MOD-032-1, Requirement R1, the Planning Coordinator (PC) and Transmission Planners (TP) develop modeling data requirements and reporting according to Attachment 1. In MOD-032-1, Requirement R2, the Transmission Owner (TO) and Generator Owner (GO) provide power capabilities data in Item 3, and facility ratings data in Items 3(f), 4(c) and 6(g) in the steady-state column of Attachment 1, as requested by the TP or PC.

IRO-010-2, Requirement R1, and TOP-003-3, Requirement R1 require the Reliability Coordinator (RC) and the Transmission Operator (TOP) to list necessary data and information needed to perform its Operating Planning Analyses and Real-Time Assessments. This data includes facility ratings as inputs to System Operating Limits (SOL) monitoring. IRO-010-2, Requirement R3, and TOP-003-3, Requirement R5, require that the TO and the GO to respond to the RC’s and the TOP’s requests.

**FAC-013-2 Requirements R1, R2, R4, R5 and R6 (all)**

**SAR Recommendation: Retire**

**Project 2018-03 SDT Recommendation: Retire**

**Rationale**
The SDT determined this standard should be retired for the following reasons:

The requirement for PCs to have a methodology for and to perform an annual assessment of Transfer Capability for a single year in the Near-Term Transmission Planning Horizon does not benefit System reliability beyond that provided by other Reliability Standards. This Reliability Standard is primarily administrative in nature and does not require specific performance metrics or coordination among functional entities. In general, FAC-013-2 fails to meet System reliability objectives in the following ways:
• Assessing transfer capability above the “known commitments for Firm Transmission Service and Interchange” required by TPL-001-4 (R1.1.5), serves a market function as opposed to securing System reliability.
• Individual PCs develop their own methodologies that may be disparate from each other.
• Impacted functional entities, such as the TP, do not have meaningful input into the methodology or analysis.
• The standard does not specify performance metrics or define what acceptable System performance is.
• Entities that receive the methodology or assessment results are not obligated to use or consider the information in their assessments.
• Requirement R4 only requires the assessment be performed for one year in the Near-Term Transmission Planning Horizon. The PC can arbitrarily choose this year, and the analysis does not guarantee transmission service that is necessary for System reliability.

Assessing transfer capability in the planning horizon is a method to test the robustness of the System. Robustness testing of a System is not an indicator of reliability because there is no metric for robustness. Additionally, the proposed retirement of FAC-013-2 does not preclude any entity from performing studies to assess transfer capability for their own purposes. The reliability benefit of doing such an assessment varies from entity to entity, with some entities not having a benefit for the assessment of it at all. The 2013 NERC Independent Experts Review Project (IERP) identified Requirements R2 and R3 as administrative and recommended them for retirement. Requirement R3 was approved for retirement by the Federal Energy Regulatory Commission (FERC) in 2014.

**INT-004-3.1 Requirements R1, R2 and R3 (all)**
*SAR Recommendation: Retire*
*Project 2018-03 SDT Recommendation: Retire*

**Rationale**

The SDT determined this standard should be retired for the following reasons:

INT-004-3.1 may be retired since it satisfies Paragraph 81 Criteria ‘B6 – Commercial or Business Practice.’ Interchange scheduling and congestion are elements that impact transmission costs, rather than actual reliable management of the BES. Furthermore, the applicable entity for Requirements R1 and R2, the Purchasing-Selling Entity (PSE), has been removed from the list of NERC Functional Entities, supporting the market-based observations herein. Requirement R3 specifically refers to “Pseudo-Ties that are included in the North American Energy Standards Board (NAESB) Electric Industry Registry,” reinforcing the tie to the NAESB Wholesale Electric Quadrant (WEQ) Business Practice Standards.
INT-006-4, Requirements R3.1, R4, and R5
SAR Recommendation: Retire
Project 2018-03 SDT Recommendation: Retire

**Rationale**
The SDT determined these requirements should be retired for the following reasons:

INT-006-4, Requirement R3 Part 3.1 can be retired under Paragraph 81, Criterion A. There is no substantive impact on reliability with requiring the RC to be notified when a Reliability Adjustment Arranged Interchange has been denied.

INT-006-4, Requirement R4 can be retired under Paragraph 81, Criteria A and B7. Covered in NAESB e-Tagging specifications, Section 1.6.3.1 and Section 1.3, Request State. This requirement outlines the conditions that must exist for an Arranged Interchange to transition to Confirmed Interchange. NAESB Electronic Tagging Specification Section 1.6.3.1 and Section 1.3, Request State, stipulate these exact requirements. INT-006-4, Requirement R4 is being recommended for retirement. The requirement is accomplished through a BA’s e-Tag Authority Service and does not have an impact on reliability.

INT-006-4, Requirement R5 can be retired under Paragraph 81, Criteria A and B7. This is covered in NAESB e-Tagging specifications, Section 1.6.4. This requirement outlines who is notified when the transition to Confirmed Interchange occurs. NAESB Electronic Tagging Specification, Section 1.6.4, stipulate these exact requirements. INT-006-4, Requirement R5, is being recommended for retirement; the requirement is accomplished through a BA’s e-Tag Authority Service and does not have an impact on reliability.

INT-009-2.1, Requirement R2
SAR Recommendation: Retire
Project 2018-03 SDT Recommendation: Retire

**Rationale**
The SDT determined this requirement should be retired for the following reasons:

This requirement can be retired under Paragraph 81, Criterion B7. INT-009-2.1, Requirement R2, is redundant with the approved NERC Reliability Standard BAL-005-1, Requirement R7.

INT-010-2.1 Requirements R1, R2 and R3 (all)
SAR Recommendation: Retire
Project 2018-03 SDT Recommendation: Retire

**Rationale**
The SDT determined this standard should be retired for the following reasons:

The opportunity exists to retire Reliability Standard INT-010-2.1 in its entirety.

INT-010-2.1, Requirement R1: (1) Retire under Paragraph 81, Criteria B6 and B7 and (2) the IERP also recommended INT-010-2.1 Requirement R1 for retirement. More stringent tagging requirements already
exist in NAESB WEQ-004-1. Therefore, this requirement is duplicative and does little, if anything, to benefit or protect the reliable operation of the BES.

INT-010-2.1, Requirement R2: (1) Retire under Paragraph 81, Criteria B6 and B7 and (2) the IERP also recommended INT-010-2.1 Requirement R2 for retirement. More stringent tagging requirements already exist in NAESB WEQ-004-8. Therefore, this requirement is duplicative and does little, if anything, to benefit or protect the reliable operation of the BES.

INT-010-2.1, Requirement R3: (1) Retire under Paragraph 81, Criteria B6 and B7 and (2) the IERP also recommended INT-010-2.1 Requirement R3 for retirement. More stringent tagging requirements already exist in NAESB WEQ-004-1. Therefore, this requirement is duplicative and does little, if anything, to benefit or protect the reliable operation of the BES.

IRO-002-5, Requirements R1, R4 and R6:
SAR Recommendation: Retire
Project 2018-03 SDT Recommendation: Retire Requirement R1, Retain Requirements R4 and R6

Rationale
The SDT determined that Requirement R1 should be retired for the following reasons:

Requirement R1 of IRO-002-5 is redundant to other requirements in the Interconnection Reliability Operations and Coordination (IRO) family of standards. Requirement R1 and data exchange for the Operational Planning Assessment (OPA) is inherent to Requirement R2 that has a higher Violation Risk Factor (VRF) and is tied to the OPA in IRO-010-2, Requirement R3. The requirement is a control for aiding compliance with IRO-008-2, Requirement R1, related to the performance of an OPA, and it is duplicative to Requirement R3 in IRO-010-2. The purpose statement of IRO-010-2 is for the RC: “To prevent instability, uncontrolled separation, or Cascading outages the adversely impact reliability, by ensuring the Reliability Coordinator has the data it needs to monitor and assess the operation of its Reliability Coordinator Area.” The Purpose statement of IRO-008-2 is for the RC to: “Perform the analysis to prevent instability, uncontrolled separation, or Cascading” and with the data collected per IRO-010-2. The data exchange capabilities are indicated in IRO-010-2, Requirement R3, which includes BA’s and TOPs, and IRO-008-2, Requirement R1, requires the RC to perform the OPA, which makes IRO-002-5, Requirement R1, redundant with the aforementioned standards and requirements.

IRO-010-2 (R1) requires the RC to identify the data it needs to perform its OPA’s, Real-time monitoring, and Real-time Assessments. Requirement R1 clearly states what is required, 1.1 A list of data and information needed by the RC to support its OPA, Real-time monitoring, and Real-time assessments including non-BES data and external network data, as deemed necessary by the RC, 1.2 Provisions for notification of current Protection System and Special Protection Systems status or degradation that impacts System Reliability, 1.3 A periodicity for providing data, 1.4 The deadline by which the respondent is to provide the indicated data. Requirement R2 clearly states, “The RC shall distribute its data specifications to entities that have data required by the RC’s OPAs, Real-time monitoring, and Real-time Assessments. Requirement R3 gets to the core of the data exchange capabilities “Each RC, BA, GO, GOP, Load-Serving Entity (LSE), TOP, TO, and Distribution Provider (DP) receiving a data specification in
Requirement R2 shall satisfy the obligations of the documented specifications using 3.1 A mutually agreeable format, 3.2 A mutually agreeable process for resolving data conflicts, 3.3 A mutually agreeable security protocol. Additionally, to comply with IRO-008-2, Requirement R1, the RC must have received all of the data it needs to perform the OPA. Finally, Measure M1 for IRO-002-5, Requirement R1, states that an entity needs to have documentation describing its data exchange capabilities with other entities, which is administrative in nature. As such, the IRO-002-5, Requirement R1, is not needed to support reliability and can be retired.

The SDT determined that Requirements R4 and R6 should be retained for the following reasons:

IRO-002-5, Requirements R4 and R6 are necessary for the Real-time operators to be assured of having the tools necessary to monitor the BES; therefore, retirement of these requirements is not being sought during this phase of the project.

The requirements in IRO-010-2 shall satisfy the obligations of identifying the data required and means for delivering the data for the Operational Planning Analysis Real-time monitoring, and Real-time Assessments. This data exchange is accomplished via a redundant/secure communications, such as Inter Control Center Communication Protocol (ICCP), email, voltage schedules, outage scheduling that all RCs, BAs and TOPs use to exchange the required data.

**IRO-008-2, Requirement R6**

_SAR Recommendation: Retire_  
_Project 2018-03 SDT Recommendation: Retain_  

**Rationale**  
The SDT determined this requirement should be retained for the following reasons:

Although IRO-008-2, Requirement R6, appears to be administrative in nature, there are reliability benefits to knowing what actions were taken to prevent or mitigate the exceedance. Therefore, retirement of IRO-008-2, Requirement R6, is not being sought during this phase of the project.

**IRO-014-3, Requirement R3**

_SAR Recommendation: Retire_  
_Project 2018-03 SDT Recommendation: Retain_  

**Rationale**  
The SDT determined this requirement should be retained for the following reasons:

The reliability objective of “notification” is mandated as a part of the RC having and implementing Operating Procedures, Operating Processes, or Operating Plans that include criteria and processes for notifications (Requirement R1, Part 1.1); this ensures RC operations are coordinated to maintain reliability of the BES. As such, a separate requirement for ensuring notifications are made to impacted RCs is duplicative. However, the IRO-014-3, Requirement R1, time horizon would need to be revised to a time horizon of “Real-time” if Requirement R3 were to be retired. Revision of Requirement R1 is outside the
scope of the project, so retirement of IRO-014-3, Requirement R3, is not being sought during this phase of the project.

The SER Phase I team will communicate with the SER Phase II team regarding Requirement R3 of IRO-014-3 to determine if there is opportunity for revision to IRO-014-3, Requirement R1, that would satisfy the revision of the time horizon to “Real-time.” If the SER Phase II team takes an approach for such determinations and then finds that there is that opportunity, then Requirements R3 of IRO-014-3 may be a candidate for retirement within that project or within a future project.

IRO-017-1, Requirement R3
SAR Recommendation: Retire
Project 2018-03 SDT Recommendation: Retain

**Rationale**
The SDT determined this requirement should be retained for the following reasons:

IRO-017-1 is not entirely duplicative of TPL-001-4, Requirement R8. The RC should be added as a named recipient to TPL-001-4 prior to considering IRO-017-1, Requirement R3, for retirement.

The SER Phase I team will communicate with the SER Phase II team regarding Requirement R3 of IRO-017-1 to determine if there is opportunity for revisions to TLP-001-4 that would satisfy the adding of the RC as a named recipient. If the SER Phase II team takes an approach for such determinations and then finds that there is that opportunity, then Requirement R3 of IRO-017-1 may be a candidate for retirement within that project or within a future project.

MOD-004-1, MOD-008-1, MOD-028-2, MOD-029-2a, MOD-030-3, MOD-001-1a and proposed MOD-001-2
SAR Recommendation: Retire
Project 2018-03 SDT Recommendation: Retire

**Rationale**
The SDT determined these standards should be retired for the following reasons:

Available Transfer Capability (ATC)/Available Flowgate Capability (AFC), as well as e-Tags, are commercially-focused elements, facilitating interchange and balancing of interchange. The Real-time System operators are ambivalent of these commercial arrangements, as they must maintain reliability of the BES according to System Operating Limits (SOLs) and Interconnection Reliability Operating Limits (IROLs). If a scheduled interchange would violate SOLs or IROLs, the Real-time operators must disregard the scheduled interchange and operate the System to its actual reliability limits.

MOD-002-1: Entities are not required to determine Total Flowgate Capability (TFC), Total Transfer Capability (TTC), Available Flowgate Capability (AFC), Available Transfer Capability (ATC), Capacity Benefit Margin (CBM), or Transmission Reliability Margin (TRM), therefore; this is a conditional obligation, and there is no requirement that entities coordinate their methodologies. A reliability-based requirement
would establish obligations to ensure consistency between entities’ methodologies. These requirements are administrative in nature and have no performance measure.

Additionally, TOPs and/or TSPs are not obligated in any fashion to determine TFC, TTC, AFC, ATC, CBM or TRM, nor are any criteria established for these quantities. Therefore, the requirements here require that entities that use an optional mechanism with no related criteria provide a methodology document and associated implementation documents, with no criteria as to what those documents must include, rather than just their “methodology.” That reinforces that these are all administrative documents with little (if any) reliability benefit.

Further, Requirement R3 establishes that the TSP develops CBM for the benefit of the LSE, which has been removed from the list of NERC Functional Entities.

Finally, Requirements R5 and R6, through their clear and focused references to Open Access Same-Time Information System (OASIS), further emphasize the commercial elements of these subjects, and that this information, shared with other market participants, may easily be subject to FERC transparency rules commonly known as FERC Standards of Conduct under Rule 888. The definition of AFC also explicitly contains the term, “A measure of the transfer capability remaining in the physical transmission network for further commercial activity over and above already committed uses.” This seems to leave little question about the market focus of particularly Flowgate Capability.

**MOD-020-0, Requirement R1 (all)**
**SAR Recommendation: Retire**
**Project 2018-03 SDT Recommendation: Retire**

**Rationale**
The SDT determined this standard should be retired for the following reasons:

MOD-031-2 and IRO-010-2 do not give the necessary entities the authority to request relevant information, nor does MOD-031-2 and IRO-010-2 require the associated entities to provide that information. Demand-Side Management (DSM) data may be related to the near-term operating time horizon and/or the planning time horizons, but not to the Real-time operating time horizon that the RC and TOP are operating in. According to TOP-001-4, Requirements R1 and R2, and IRO-001-4, Requirement R1, the RC, BA and TOP must operate the BES according to SOLs and IROLs, and do not generally have control over DSM. They do have the authority to issue Operating Instruction to other entities as needed to maintain BES reliability within SOLs and IROLs; the entities receiving Operating Instructions are obligated, per TOP-001-4, Requirement R3, to follow those instructions, subject to the exceptions noted within that requirement. Further, the Demand Response Availability Data System (DADS) collects and disseminates data regarding Demand Response programs according to Section 1600 of the NERC Rules of Procedure. All entities identified in MOD-020-0, Requirement R1, are sources of DADS data, have access to DADS data, or both.

DSM and Direct Control Load Management (DLCM) may be regarded as long-term planning and operations planning time horizon resources, but particularly with a “on request within 30 calendar days”
obligation in the requirement, is not a resource for the Real-time or day-ahead operating time horizon for RCs and TOPs, which must plan to operate, and actually operate, the BES within SOL’s and IROL’s, a subset of SOLs. In addition, the amount of interruptible demands and DLCM at the TP, Resource Planner (RP), and/or LSE (which has been removed from the compliance registry and is no longer obligated to comply with NERC standards) level is not of locational benefit to TOPs and RCs to assist them in operating within SOL’s, as such information, were it to be provided within a usable time frame, would not be sufficiently granular to assist the TOP and RC. All meaningful information regarding interruptible demands and DLCM is available from DADS, which in the United States (US), is a mandatory reporting mechanism, regulated per Section 1600 of the NERC Rules of Procedure. DSM and DLCM are financially-enabled mechanisms whereupon RPs may encourage customers and customer groups to permit local control of their load in exchange for rate considerations, and this local control may or may not be sited in such a manner to provide any benefit to TOP’s and RC’s; which, again, are obligated by NERC Standards to operate the BES within SOL’s.

**PRC-004-5(i), Requirement R4**

**SAR Recommendation: Retire**

**Project 2018-03 SDT Recommendation: Retire**

**Rationale**

The SDT determined this requirement should be retired for the following reasons:

The standard’s purpose is to identify and correct the causes of Misoperations of Protection Systems for BES Elements. The Reliability Standard’s Guideline and Technical Basis for Requirement R4 considers due diligence that an entity must make in determining the cause of a Protection System Misoperation.

The compliance activities associated with this requirement fall into tracking of milestones and do not improve reliability. Requirement R4 acts as a control to support compliance with Requirements R1 and R3. It is in the best interest of the entity to continue to investigate and detect whether its Protection System components caused a Misoperation and develop a corrective plan for the identified Protection System component. This can be achieved through the entity’s internal control policies and procedures engineered to maximize efficiency and reliability. Entities endeavor to determine the cause of a Misoperation, and doing so may take extended time if equipment outages are necessary. However, if an entity is unable to determine the cause, further investigation(s) using the same event data are unlikely to lead to identification of the cause. Proposed retirement of Requirement R4 does not preclude the entity’s responsibility to continue the investigation to identify the cause of Misoperations; however, it does alleviate the need to keep tracking documents for showing investigative actions.

**PRC-015-1 Requirements R1, R2, and R3 (all)**

**SAR Recommendation: Retire**

**Project 2018-03 SDT Recommendation: Retain**

**Rationale**

The SDT determined this standard should be retained for the following reasons:

PRC-015-1 is scheduled to be retired on 12/31/2020 under the PRC-012-2 Implementation Plan (IP).
PRC-018-1 Requirements R1, R2, R3, R4, R5 and R6 (all)
SAR Recommendation: Retire
Project 2018-03 SDT Recommendation: Retain

**Rationale**
The SDT determined this standard should be retained for the following reasons:

PRC-018-1 is superseded by PRC-002-2 in Year 2022. The PRC-002-2 IP states: “Standard PRC-018-1 shall remain effective throughout the phased implementation period of PRC-002-2...”

TOP-001-4 Requirements R16, R17, R19 and R22
SAR Recommendation: Retire
Project 2018-03 SDT Recommendation: Retain Requirements R16 and R17, Retire Requirements R19 and R22

**Rationale**
The SDT determined Requirements R16 and R17 should be retained for the following reasons:

Requirements R16 and R17 of TOP-001-4 need to be retained to make it clear that the System Operator (SO) has authority to postpone, cancel or recall planned outages of Energy Management System (EMS), IT or communications-related equipment. Although some RCs may include this type of equipment in their outage coordination process (IRO-017-1), the inclusion of EMS, IT or communications-related equipment is not explicitly required by IRO-017-1, Requirement R1. As such, a potential gap in the standards would exist if TOP-001-4, Requirements R16 and R17, were retired. Requirements R16 and R17 are necessary for the Real-time operators to be assured of having the tools necessary to monitor the BES. Therefore, retirement of TOP-001-4, Requirements R16 and R17, is not being sought during this phase of the project.

The purpose of TOP-003-3 is to ensure adequate data is collected by the BA and TOP to fulfill their operational and planning responsibilities. The purpose of TOP-002-4 is to ensure each BA and TOP have plans to operate within specified limits using the data provided in TOP-003-3. The data exchange capabilities that are indicated in TOP-001-4, Requirements R19 and R22, for the BA and TOP are redundant with TOP-003-3, Requirements R3, R4 and R5, and TOP-002-4, Requirement R1.

The SDT determined Requirements R19 and R22 should be retired for the following reasons:

TOP-001-4, Requirement R19, is redundant to other requirements in the Transmission Operations (TOP) family of standards. For TOPs, the existing TOP-003-3, Requirement R5, cannot be fulfilled by entities unless data exchange capabilities exist between the TOP and the supplying entities. Similarly, TOP-002-4, Requirement R1, cannot be fulfilled by the TOP unless the data needed to perform the OPA has been received from the supplying entities (i.e., data had to be exchanged). As such, Requirement R19 in TOP-001-4 is not needed to support reliability and can be retired.

TOP-001-4, Requirement R22, is redundant to other requirements in the TOP family of standards. For the
BA, the existing TOP-003-3, Requirement R5, cannot be fulfilled by entities unless data exchange capabilities exist between the BA and the supplying entities. Similarly, TOP-002-4, Requirement R4 cannot be fulfilled by the BA unless the data needed to develop its Operating Plan for next-day operations has been received from the supplying entities (i.e., data had to be exchanged). As such, Requirement R22 in TOP-001-4 is not needed to support reliability and can be retired.

VAR-001-5*, Requirements R2 and R3
SAR Recommendation: Retire
Project 2018-03 SDT Recommendation: Retire Requirement R2, Retain Requirement R3

**Rationale**
The SDT determined Requirement R2 should be retired for the following reasons:

VAR-001-5, Requirement R2 states, “Each Transmission Operator shall schedule sufficient reactive resources to regulate voltage levels under normal and Contingency conditions. Transmission Operators can provide sufficient reactive resources through various means including, but not limited to, reactive generation scheduling, transmission line and reactive resource switching, and using controllable load”

VAR-001-5, Requirement R2, contains two sentences, with the first sentence being a requirement and the second being a guidance statement. Each sentence is analyzed separately.

The first sentence requires the TOP to schedule sufficient reactive resources to regulate voltage levels under normal and contingency conditions. By using the OPA as described and required in TOP-002-4 and the criteria described in TOP-001-4, Requirement R10, the TOP must use a variety of tools to regulate voltage levels, including reactive control. Using Real-time Contingency Analysis (RTCA) tools allows the TOP to determine specific actions to regulate voltage during contingency conditions. Additionally, the TOP uses Real-time monitoring, allowing it to make real-time decisions on voltage during normal conditions. These allow the TOP to quantify the use of reactive resources and makes VAR-001-5, Requirement R2, unnecessary.

Further to this requirement that a TOP have sufficient reactive resources, the planning standard TPL-001-4 requires the PA and TP to conduct studies on their transmission Systems to ensure it operates reliably over a broad spectrum of System conditions and following a wide range of probable Contingencies. These studies include available reactive resource capabilities. The studies provide corrective action plans (CAPs) when the analysis indicates an inability of the System to meet performance requirements. CAPs include, as necessary, the amount of reactive resource capabilities needed. This ensures that the TOP has available an adequate number of reactive resources to operate under normal contingency conditions.

TOP-002-4, Requirement R1, requires an OPA to be completed to ensure no SOL is violated, and TOP-001-4, Requirement R10, provides the criteria that the TOP shall use for determining SOL exceedances, which includes monitoring voltages. If an SOL violation is identified, then the TOP shall have an Operating Plan to mitigate the violation. The requirements in TOP-001-4 and TOP-002-4 direct the TOP to maintain reliability of the BES and to mitigate SOL exceedances. If the TOP identifies no SOLs, voltage or otherwise, then the TOP has enough resources "scheduled" to maintain reliability of its BES. The remaining VAR-001-
5 requirements mandate that a TOP ensures voltage, reactive flows, and reactive resources are monitored, controlled, and maintained with limits. The Facilities Design, Connections and Maintenance (FAC) family of standards ensure the proper BES Facilities and/or Elements are built with applicable equipment and System ratings.

Specifically,

1. TOP-002-4 - Operations Planning with an effective date of April 1, 2017

   Requirement R1 of this standard requires the TOP to have an OPA that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any of its SOL’s. Requirement R2 requires the TOP to have an Operating Plan(s) for next-day operations to address potential SOL exceedances identified as a result of its OPA as required in Requirement R1.

   An Operating Plan is defined by NERC as “A document that identifies a group of activities that may be used to achieve some goal. An Operating Plan may contain Operating Procedures and Operating Processes. A company-specific System restoration plan that includes an Operating Procedure for black-starting units, Operating Processes for communicating restoration progress with other entities, etc., is an example of an Operating Plan.”

   In order to mitigate SOL exceedances, or to address potential SOL exceedances, the TOP must have a variety of tools available to immediately address such condition; one such tool is reactive resources. The TOP must have an adequate number of reactive resources to mitigate any potential or actual SOL exceedance. The adequate or sufficient number is determined through analysis.

2. TOP-001-4 – Transmission Operations with an effective date of July 1, 2018

   Requirement R13 requires each TOP to ensure a Real-time Assessment is performed at least once every 30 minutes, and Requirement R14 requires the TOP to initiate its Operating Plan to mitigate a SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment.

   This requirement, again, addresses that the TOP have an Operating Plan to mitigate SOL exceedances. The same requirement of TOP exists here as it did under TOP-002-4; the TOP must have an adequate number of reactive resources to mitigate SOL exceedances. The adequate or sufficient number is determined through analysis.

   The second sentence of VAR-001-5 R2 states: “Transmission Operators can provide sufficient reactive resources through various means including, but not limited to, reactive generation scheduling, transmission line and reactive resource switching, and using controllable load.” As noted by the VAR Enhanced Periodic Review group during its September 2016 meeting, and agreed to herein, this language is guidance or a measure and is unnecessary in the requirement. It was suggested then, as well as now, that perhaps this language be moved to a guidance section or document.

   The SDT determined that Requirement R3 should be retained for the following reasons: For reliability purposes, the TOP must ensure sufficient voltage support is provided in Real-time in order to operate within an SOL to prevent voltage-collapse events wherein the operation within SOLs/IROLs itself is not adequate to assure stable voltage operations in both steady-state and transient
conditions. The TOP family of standards does not provide sufficient granularity to assure that adequate voltage/reactive resources, both of magnitude and type, are operated to voltage and reactive flow as necessary.

* VAR-001-4.2 is an inactive standard. VAR-001-5 changed the Western Electricity Coordinating Council (WECC) variance, and not the continent-wide requirements. VAR-001-5 became effective January 1, 2019.
Exhibit F

Summary of Development History and Complete Record of Development
Summary of Development History
Summary of Development History

The development record for proposed revised and retired Reliability Standards developed through Project 2018-03 Standards Efficiency Review Retirements is summarized below.

I. **Overview of the Standard Drafting Team**

When evaluating a proposed Reliability Standard, the Commission is expected to give “due weight” to the technical expertise of the ERO.1 The technical expertise of the ERO is derived from the standard drafting team ("SDT") selected to lead each project in accordance with Section 4.3 of the NERC Standard Processes Manual.2 For this project, the SDT consisted of industry experts, all with a diverse set of experiences. A roster of the Project 2018-03 – Standards Efficiency Review SDT members is included in Exhibit G.

II. **Standard Development History**

A. **Background**

The purpose of Project 2018-03 – Standards Efficiency Review was to consider which standards could be revised or retired based on the review in phase one of the Standards Efficiency Review ("SER") initiative.3

The purpose of the SER was is to evaluate NERC Reliability Standards using a risk-based approach to identify potential efficiencies through retirement or modification of Reliability Standard requirements. In phase one of the SER, each existing and future enforceable Reliability Standard requirement addressing operations and planning (i.e., excluding CIP) was assigned to a review subteam for evaluation based on its associated time horizon (Real-time Operations, Long-

---

3 Details of phase one of the Standards Efficiency Review initiative can be found here: https://www.nerc.com/pa/Stand/Pages/Standards-Efficiency-Review.aspx.
term Planning, and Operations Planning). Each SER subteam was composed of individuals that, combined, represented a broad range of experience; including compliance, engineering, operations, planning, and legal. The cross-functional expertise of the subteams allowed for a more comprehensive review from multiple viewpoints. Along with the subteam reviews, NERC asked stakeholders to submit an SER Matrix spreadsheet indicating potential revisions and retirements among existing Reliability Standards. SER Matrix submissions were open from December 13, 2017 through February 2, 2018.

Based on the SER Matrix responses and the results of subteam reviews, the review team developed a draft SAR recommending retiring over 100 requirements across more than 30 standards. The SER review team posted its recommendations in the form of a draft SAR for comments from June 7, 2018 through July 10, 2018. The SER review team submitted a SAR to NERC on August 7, 2018.

B. Standard Authorization Request Development

On August 22, 2018, the NERC Standards Committee authorized the posting of the SER SAR and the solicitation of nominations for a Project 2018-03 Standards Efficiency Review drafting team. The SAR was posted for a 30-day formal comment period from August 28, 2018 through September 26, 2018. On October 17, 2018, the Standards Committee appointed a standard drafting team.

C. First Posting – Comment Period, Initial Ballot, and Non-binding Poll

The Project 2018-03 – Standards Efficiency Review drafting team considered each of the retirement recommendations contained in the SAR and determined that it was appropriate to pursue retirements in the standards listed below as well as those in the FAC, INT, MOD, and
PRC families addressed in a separate concurrently-filed petition. Where the team determined to propose the retirement of one or more individual requirement(s) in Reliability Standards, the team proposed a new version of the standard in which the retired requirement(s) was replaced with the word “Reserved.”

The following proposed revised Reliability Standards, the associated Implementation Plan, Violation Risk Factors, Violation Severity Levels, and other associated documents were posted for a 45-day formal comment period from February 27, 2019 through April 12, 2019 with a parallel initial ballot and non-binding poll held during the last 10 days of the comment period from April 3, 2019 through April 12, 2019. The results are summarized in the table below. The voting statistics are listed below, and the Ballot Results page provides detailed results.5

5 https://sbs.nerc.net/Ballot/BallotResults.
6 On final ballot, this was assigned version number IRO-002-7.
7 https://sbs.nerc.net/Ballot/BallotResults.
E. Board of Trustees Adoption

The NERC Board of Trustees adopted the proposed Reliability Standards on May 9, 2019.⁸

---

The 10-day final ballots for the Project 2018-03 Standards Efficiency Review Retirements concluded 8 p.m. Eastern, Thursday, May 2, 2019 and the voting results can be accessed via the links below. The standards will be submitted to the Board of Trustees for adoption and then filed with the appropriate regulatory authorities.

Note: Proposed Reliability Standard IRO-002-7 reflects a change of version (during initial posting under this project it was posted as IRO-002-6) due to the addition of a new Variance for the WECC region, developed through the WECC standard development process and was adopted by the WECC Board of Directors on March 6, 2019. Proposed Reliability Standard VAR-001-6 reflects the version update from VAR-001-4.2 (an inactive standard). VAR-001-5 became effective January 1, 2019 due to the WECC variance.

Project Scope
The Standard Authorization Request (SAR) drafting team evaluated NERC Reliability Standards using a risk-based approach to identify potential efficiencies through retirement or modification of Reliability Standard Requirements. Many Reliability Standards have been mandatory and enforceable for 10+ years in North America. The SAR drafting team identified potential candidate requirements that are not essential for reliability, could be simplified or consolidated, and could thereby reduce regulatory obligations and/or compliance burden.

Each existing and future enforceable Reliability Standard Requirement was assigned to a Standards Efficiency Review (SER) SAR subteam for evaluation based on its associated time horizon. Each SER SAR subteam was composed of individuals that, combined, represented a broad range of experience; including compliance, engineering, operations, planning, and legal. The cross-functional expertise of the subteams allowed for a more comprehensive reviews from multiple viewpoints.

Standards Efficiency Review Page
Standards Efficiency Review Retirements (SER-Retirements)
In Phase 1 of the SER project, the SER-Retirements standards drafting team will implement the recommendations in the SAR. The SER-Retirements standards drafting team is comprised of a mix of team members with Real-time Operations, Long-term Planning, and Operations Planning expertise to evaluate each requirement in the body of NERC Reliability Standards for unconditional retirement; i.e., these requirements may be retired without any modifications to other standards or requirements. The observations/rationales for retiring the requirements are currently listed in the project’s SAR.

#### SAR Type (Check as many as apply)

- [ ] New Standard
- [x] Withdraw/retire an Existing Standard
- [ ] Revision to Existing Standard(s)
- [ ] Add, Modify or Retire a Glossary Term
- [ ] Imminent Action/Confidential Issue (SPM Section 10)
- [ ] Variance development or revision
- [ ] Other (Please specify)

#### Justification for this proposed standard development project (Check all that apply to help NERC prioritize development)

- [ ] Regulatory Initiation
- [ ] Emerging Risk (Reliability Issues Steering Committee) Identified
- [ ] Reliability Standard Development Plan
- [ ] NERC Standing Committee Identified
- [ ] Enhanced Periodic Review Initiated
- [x] Industry Stakeholder Identified

#### Industry Need (What Bulk Electric System (BES) reliability benefit does the proposed project provide?)

Many NERC Reliability Standards have been mandatory and enforceable for over 10 years in North America. Phase 1 of the Standards Efficiency Review (SER) project seeks to identify requirements that are potential candidates for retirement because they are no longer essential for reliability. Retiring these requirements would increase efficiencies by reducing regulatory obligations and/or compliance burden.

#### Purpose or Goal (How does this proposed project provide the reliability-related benefit described above?)

Phase 1 of this project reduces the number of mandatory and enforceable requirements with which registered entities must comply.
**Project Scope (Define the parameters of the proposed project):**

The Standards Efficiency Review (SER) team used a risk-based approach to evaluate the reliability benefit of each requirement. Based on its analyses, the SER team is recommending the requirements listed below be retired.

</table>
Detailed Description (Describe the proposed deliverable(s) with sufficient detail for a drafting team to execute the project. If you propose a new or substantially revised Reliability Standard or definition, provide: (1) a technical justification which includes a discussion of the reliability-related benefits of developing a new or revised Reliability Standard or definition, and (2) a technical foundation document (e.g. research paper) to guide development of the Standard or definition):

In Phase 1 of the Standards Efficiency Review (SER) project, three SER teams [Real-time Operations (RT), Long-term Planning (LT), and Operations Planning (OP)] evaluated each requirement in the body of NERC Reliability Standards for unconditional retirement i.e. these requirements may be retired without any modifications to other standards or requirements. The observations/rationales for retiring the requirements (identified in the Project Scope above) are listed below.

**BAL-005-1** R4, R6 (RT)

The reliability objective of this requirement is duplicative of **TOP-010-1(i)** R2.

The Balancing Authority is already required by **TOP-010-1(i)** R2 to have an Operating Process/Procedure to address quality of Real-time data (including Reporting ACE) which includes criteria to evaluate the data, provisions to indicate the quality of the data to the System Operator, and actions to address data quality issues with other entities.

The same logic applies for R6 since **TOP-010-1(i)** R2 requires an Operating Process/Procedure to include criteria to evaluate the data, provisions to indicate the quality of the data to the System Operator, and actions to address data quality issues with other entities.

**COM-002-4** R2 (RT)

The related compliance activities are duplicative of the activities covered by the Systematic Approach to Training in Reliability Standard **PER-005-2**. Issuing and receiving Operating Instructions according to a company’s specific communications protocols is a fundamental Real-time reliability-related task and would be included in an entity’s **PER-005-2** training program to ensure System Operators are competent to perform the activities necessary for compliance with **COM-002-4** R4 – R7. Additionally, Communication Methods (e.g. Three-Part Communications) is part of the knowledge content expected to be performed by all System Operators for the Certification Examination.

**EOP-005-3** R8 (OP)

The related compliance activities are duplicative of the activities covered by the Systematic Approach to Training in Reliability Standard **PER-005-2**. System restoration is a reliability-related task.

---

1 The NERC Rules of Procedure require a technical justification for new or substantially revised Reliability Standards. Please attach pertinent information to this form before submittal to NERC.
and would be included in an entity's training program for its System Operators to ensure that System Operators are certified and competent to perform restoration activities.

**EOP-006-3 R7 (OP)**
The related compliance activities are duplicative of the activities covered by the Systematic Approach to Training in Reliability Standard **PER-005-2**. System restoration is a reliability-related task and would be included in an entity's training program for its System Operators to ensure that System Operators are certified and competent to perform restoration activities.

**FAC-008-3 R7, R8 (OP)**
These requirements are duplicative of the data provision standards MOD-32-1, IRO-010-2, and TOP-003-3.

In **MOD-032-1 R1**, the PC and TP develop modeling data requirements and reporting according to Attachment 1. In MOD-032-1 R2, the TO and GO provide power capabilities data in item 3 and facility ratings data in items 3f, 4c, 6g in the steady-state column of Attachment 1 as requested by the TP or PC.

**IRO-010-2 R1** and **TOP-003-3 R1** require the RC and TOP to list necessary data and information needed to perform its Operating Planning Analyses and Real-Time Assessments. This data necessarily includes facility ratings as inputs to SOL monitoring. **IRO-010-2 R3** and **TOP-003-3 R5** require the TO and GO to respond to the RC’s and TOP’s requests.

**FAC-013-2 R1, R2, R4, R5, R6 (ALL) (LT)**
The requirement for Planning Coordinators (PC) to have a methodology for and to perform an annual assessment of Transfer Capability for a single year in the Near-Term Transmission Planning Horizon does not benefit System reliability beyond that provided by other Reliability Standards. This Reliability Standard is primarily administrative in nature and does not require specific performance metrics or coordination among functional entities.

In general, FAC-013-2 fails to meet System reliability objectives in the following ways:

- Individual PCs develop their own methodologies that may be very disparate from each other.
- Impacted functional entities, such as Transmission Planners (TP), do not have meaningful input into the methodology or analysis.
- The standard does not specify performance metrics or define what acceptable system performance is.
- Entities that receive the methodology or assessment results are not obligated to use or even consider the information in their assessments.
- R4 only requires the assessment to be performed for one year in the Near-Term Transmission Planning Horizon. This year can be arbitrarily chosen by the PC and the analysis does not guarantee transmission service that is necessary for System reliability.
• Assessing transfer capability above the “known commitments for Firm Transmission Service and Interchange” required by TPL-001-4 (R1.1.5), serves a market function as opposed to securing System reliability.

• Assessing transfer capability in the planning horizon is a method to test the robustness of the system. Robustness testing of a system is not an indicator of reliability because there is no metric for robustness.

Additionally, the proposed retirement of FAC-013 does not preclude any entity from performing studies to assess transfer capability for their own purposes. The reliability benefit of doing such an assessment varies from entity to entity with some entities not having a benefit for the assessment it at all. The 2013 NERC Independent Experts Review Project identified R2 and R3 as administrative and recommended them for retirement. R3 was approved for retirement by FERC in 2014.

**INT-004-3.1 R1. (RT and OP)**
This requirement is no longer enforceable as the Purchasing Selling Entity is no longer a NERC registered function. The NERC INT Periodic Review Team completed its analysis and determined the requirement is duplicative of the NAESB WEQ Business Practice Standards, specifically covered in existing NAESB WEQ-004-1 and WEQ-004-5, and in proposed NAESB WEQ-004-1.8. Additionally, the NERC Independent Expert Review Panel concluded the requirement qualified for Paragraph 81 retirement as it does little, if anything, to benefit or protect the reliable operation of the BES.

**INT-004-3.1 R2 (RT and OP)**
This requirement is no longer enforceable as the Purchasing Selling Entity is no longer a NERC registered entity. The NERC INT Periodic Review Team completed its analysis and determined the requirement is duplicative of a currently proposed revision to the NAESB WEQ Business Practice Standards. The language in R2, requiring Confirmed Interchange associated with Dynamic Schedules or Pseudo-Ties being updated for future hours when any of the three conditions cited in the requirement occur, is contained almost verbatim in the proposed NAESB WEQ-004-23. Additionally, the Independent Expert Review Team concluded the requirement qualified for Paragraph 81 retirement as it does little, if anything, to benefit or protect the reliable operation of the BES.

**INT-004-3.1 R3 (OP)**
This requirement qualifies for Paragraph 81 retirement as it only obligates entities to register information with an entity, which the failure to do so would create no discernable reliability impact. The standard states the purpose of the requirement is allow for pseudo-tie coordination, which is already guided and more clearly explained within the NERC Pseudo-Tie Coordination Reference Document. Reliability Coordinator visibility to Pseudo-Ties is provided under existing NERC Standard IRO-010-2 Requirement R2. Therefore, this requirement is redundant and does little, if anything, to benefit or protect the reliable operation of the BES.

**INT-006-4 R3.1 (RT and OP)**
The INT Periodic Review Team (PRT) (Project 2017-04) conclusion supports retirement of this
requirement. The INT PRT found no impact on reliability in requiring the RC being notified when a Reliability Adjustment Arranged Interchange has been denied. Additionally, RCs are notified via the electronic tag when a Reliability Adjustment Arranged Interchange is denied, as required in the NAESB e-Tagging Specifications.

**INT-006-4** R4 (RT and OP)
The INT Periodic Review Team (PRT) (Project 2017-04) conclusion supports retirement of this requirement as it is duplicative of the NAESB e-Tagging Specifications Section 1.6.3.1 and Section 1.3, and is not a reliability-related task performed by a NERC registered entity.

**INT-006-4** R5 (RT)
The INT Periodic Review Team (PRT) (Project 2017-04) conclusion supports retirement of this requirement as it is duplicative of the NAESB e-Tagging Specifications Section 1.6.4, and is not a reliability-related task performed by a NERC registered entity. Additionally, it is contained on the list of standards not commonly identified through an IRA process.

**INT-009-2.1** R2 (RT)
This requirement can be retired under Paragraph 81 Criteria B7, as the requirement for Balancing Authorities to establish an agreed upon interchange metering source is redundant with approved NERC Reliability Standard **BAL-005-1**, R7.

**INT-010-2.1** R1, R3 (RT)
These requirements satisfy Paragraph 81 Criteria ‘B6 – Commercial or Business Practice’ and ‘B7 – Redundant’ because more stringent requirement(s) that meet the objectives are already included in WEQ-004-1 of the NAESB WEQ Business Practice Standards. In the absence of these requirements, all Interchange would have an RFI submitted for it, which is the more beneficial and prevalent existing outcome. The submittal of an RFI after Interchange has begun is for commercial purposes rather than reliability issues. The requirement to submit an RFI exists in the NAESB Business Practice Standards. Therefore, this requirement is duplicative and does little, if anything, to benefit or protect the reliable operation of the BES.

**INT-010-2.1** R2 (RT)
This requirement satisfies Paragraph 81 Criteria ‘B6 – Commercial or Business Practice’ and ‘B7 – Redundant’ because more stringent tagging requirement(s) that meet the objectives are already included in WEQ-004-8 of the NAESB WEQ Business Practice Standards. In the absence of this requirement, all Reliability Adjustment Arranged Interchange would have a modification submitted for it, which is the more beneficial and prevalent existing outcome. The submittal of a modification to a RFI after the modification has begun is for commercial purposes rather than reliability issues. The requirement to modify an RFI exists in the NAESB Business Practice Standards. Therefore, this requirement is duplicative and does little, if anything, to benefit or protect the reliable operation of the BES.

**IRO-002-5** R1 (OP)
The requirement is a control for aiding compliance with IRO-008-2 R1 related to the performance of an Operational Planning Analysis (OPA), and it is duplicative to R3 in IRO-010-2. IRO-010-2 requires the RC to identify the data it needs to perform its OPA (R1), which entities need to provide such data (R2), and then obligates those registered entities to then supply the data (R3). For an entity to fulfill IRO-010-2 R3, it must be able to exchange data with the requesting RC. Additionally, to comply with IRO-008-2 R1, the RC must have received all of the data it needs to perform the OPA. Finally, the measure (M1) for IRO-002-5 R1 states that an entity needs to have documentation describing its data exchange capabilities with other entities, which is administrative in nature.

IRO-002-5 R4 (OP)
This requirement can be retired because it does not contribute to reliability of the BES. The authority to approve or deny outages to any equipment, whether load-carrying or not, is a fundamental attribute of the System Operator role.

IRO-002-5 R6 (RT)
This requirement to have monitoring systems is unnecessary because IRO-002-5 R5 requires the monitoring of the systems which pre-supposes the ability (tools) to do so.

IRO-008-2 R6 (RT)
There is a potential for this requirement to become purely administrative in nature and not provide any reliability benefits. An Operating Plan required by IRO-014-3 R1, Part 1.1. or IRO-008-2 R5 would already include specific actions to notify impacted parties. The notifications for this requirement are after-the-fact and if the TOP, BA or other RC are a party to the implemented Operating Plan, then they would already be following the direction of the RC until notified.

IRO-014-3 R3 (RT)
The reliability objective of “notification” is mandated as a part of the RC having and implementing Operating Procedures, Operating Processes, or Operating Plans that include criteria and processes for notifications (R1, Part 1.1).

IRO-017-1 R3 (LT)
The reliability objective of this requirement is duplicative of the reliability objective of TPL-001-4, R8 which mandates each Planning Coordinator and Transmission Planner distribute its Planning Assessment results to adjacent Planning Coordinators and adjacent Transmission Planners and to any other functional entity that has a reliability related need and submits a written request.

MOD-020-0 R1 (ALL) (LT)
This requirement is duplicative of the data provision requirements included in Reliability Standards MOD-031-2 and IRO-010-2.

MOD-020-0 R1 requires the Load-Serving Entity, Transmission Planner, and Resource Planner to provide Interruptible Demand and Direct Control Load Management upon requests by the Transmission Operators, Balancing Authorities, and Reliability Coordinators.
In **MOD-031-2** R1.4.5 requires the Planning Coordinator or Balancing Authority to request, as necessary, total available peak hour forecast of controllable and dispatchable Demand Side Management from the applicable entities. R2 then requires each applicable entity identified in the data request to provide the requested data to the PC or BA.

In **IRO-010-2** R1 requires the Reliability Coordinator to list necessary data and information needed to perform its Operating Planning Analyses and Real-Time Assessments, and R2 requires the RC to distribute its data specifications to all applicable entities. R3 then requires each applicable entity to respond to the request as specified.

**PRC-004-5(i) R4 (OP)**
The compliance activities associated with this requirement fall into tracking of milestones and do not improve reliability. Requirement R4 acts as a control to support compliance with requirements R1 & R3. It is in the best interest of the entity to continue to investigate and detect whether its Protection System components caused a mis-operation and develop a corrective plan for the identified Protection System component. This can be achieved through the entity’s internal control policies and procedures engineered to maximize efficiency and reliability. Entities endeavor to determine the cause of a Misoperation and doing so may take extended time if equipment outages are necessary. However, if an entity is unable to determine the cause, further investigation(s) using the same event data are unlikely to lead to identification of the cause. Proposed retirement of R4 does not preclude the entity’s responsibility to continue the investigation to identify the cause of mis-operation. However, it does alleviate the need to keep tracking documents for the sake of showing investigative actions.

**PRC-015-1 R1, R2, R3 (All) (LT)**
PRC-015-1 will be retired as it will be superseded by PRC-012-2. R1 requires the applicable entities to maintain a list of RAS which is an administrative requirement that does not contribute to the reliability of the BES. R2 references PRC-012-1 R1 which is not enforceable and will be superseded by PRC-012-2. Requirement R3 will be superseded by PRC-012-2. In support of the Independent Expert Review Panel’s (IERP) justification to retire the standard: "P81 Administrative/Documentation", this is an administrative requirement. RE and NERC already have authority to request such information.

**PRC-018-1 R1, R2, R3, R4, R5, R6 (All) (LT)**
This standard requires both the TO or GO to ensure that DME's installed per PRC-002-1 and meet specific criteria. PRC-002-1 was never approved by FERC but PRC-018 was approved on the basis that each RRO would establish a DME program and that even if PRC-002-1 were not approved; PRC-018 could be enforced per the RRO program. Most RRO's have retired their programs which establish the scope of DME's for this standard. Furthermore, there are differences in the methodologies used by the RRO’s to establish scope of DME’s and what is mandated by requirement R1 of PRC-002-2. The lists of DME’s and where they are installed will differ from PRC-018-1 and PRC-002-2.
**TOP-001-4 R16, R17 (OP)**
These requirements can be retired because the authority to approve or deny outages of any equipment, whether load carrying or not, is a fundamental attribute of the system operator role. This was recognized by NERC and FERC in Project 2007-03 where the authority language in former Standard **TOP-001-1** R1 was removed from the revised TOP standards approved by both NERC and FERC.

**TOP-001-4 R19 (OP)**
The requirement is a control for aiding compliance with **TOP-002-4** R1 related to the performance of an Operational Planning Analysis (OPA) and it is duplicative to requirements R5 in **TOP-003-3**. Standard TOP-003-3 requires the TOP to identify the data it needs to perform its OPA (R1), which entities need to provide such data (R3), and then obligates those registered entities to then supply the data (R5). For an entity to fulfill TOP-003-3 R5, it must be able to exchange data with the requesting TOP. Additionally, to comply with TOP-002-4 R1, the TOP must have received all of the data it needs to perform the OPA.

**TOP-001-4 R22 (OP)**
The requirement is a control for aiding compliance with **TOP-002-4** R4 related to preparing Operating Plans and it is duplicative to requirement R5 in **TOP-003-3**. Standard TOP-003-3 requires the BA to identify the data it needs to perform its analysis functions (R2), which entities need to provide such data (R4), and then obligates those registered entities to then supply the data (R5). For an entity to fulfill TOP-003-3 R5, it must be able to exchange data with the requesting BA. Additionally, to comply with TOP-002-4 R4, the BA must have received all of the data it needs to perform its analysis functions.

**VAR-001-4.2 R2 (OP)**
This requirement is duplicative of other SOL requirements. R2 is related to maintaining the system within SOLs because a voltage limit is a form of SOL. **TOP-002-4** already requires TOPs to identify where the potential SOL exceedances might occur for next-day operations and prepare a plan to mitigate these potential SOL exceedances, including notifying entities of their role in those plans (R3). When moving into real-time operations, the requirements of **TOP-001-4** govern and the TOP continues to be obligated to operate within SOLs and direct the operation of the system to operate within SOLs or return to operation within SOLs (R12 and R14). R1 of TOP-001-4 requires the TOP to act and direct action to maintain reliability, including obtaining necessary reactive resources as described in VAR-001-4.2 R2.

**VAR-001-4.2 R3 (OP)**
This requirement is duplicative of TOP-001-4 requirements:
- **TOP-001-4** R1, which states that the TOP "shall act to maintain the reliability of its Transmission Operator Area via its own actions or by issuing Operating Instructions." The requirement to "act" using all available actions, whether by "its own actions" or by the actions of others via "issuing
"Operating Instructions" is the same as VAR-001-4.2 R3 to "operate or direct ... operation of devices to regulate ... voltage and reactive flow."

- The purpose of the actions taken under VAR-001-4.2, R3 is the same purpose accomplished by TOP-001-4 R1, R10, R12, R13 and R14 by acting to operate within limits (SOLs and IROLs) to maintain reliability of its transmission system.

**VAR-001-4.2 E.A.15 (RT)**
This is a Regional variance requirement applicable to WECC only. The continent-wide requirement **VAR-002-4.1 R2.3** addresses the same reliability objective.

Additionally, the following Standards and Requirements were consolidated into MOD-001-2 in project 2012-05, which was filed for regulatory approval on February 10, 2014, and is still pending approval.

MOD-001-1a R1, R2, R3, R4, R5, R6, R7, R8, R9 (OP)
MOD-004-1 R1, R2, R3, R4, R5, R6, R7, R8, R9, R10, R11, R12 (OP)
MOD-008-1 R1, R2, R3, R4, R5 (OP)
MOD-028-2 R1, R2, R3, R4, R5, R6, R7, R8, R9, R10, R11 (OP)
MOD-029-2a R1, R2, R3, R4, R5, R6, R7, R8 (OP)
MOD-030-3 R1, R2, R3, R4, R5, R6, R7, R8, R9, R10 (OP)

The February 10, 2014 petition notes that ATC/AFC are commercially-based values used to facilitate a market for unused transmission capacity in an open access environment and that the values do not directly control the operation of the BPS. It further acknowledges that TOPs are ultimately responsible for operating the grid in a reliable manner consistent with System Operating Limits, not ATC/AFC values. Nevertheless, the filing proposes MOD-001-2 for approval by FERC indicating ATC/AFC values have the potential to influence Real-time conditions on the Bulk-Power System and impact Real-time operations. Although, ATC/AFC values may have the potential to influence Real-Time conditions, there are a number of approved Reliability Standards that address potential impacts to Real-time operations and operation of the grid in a reliable manner consistent with System Operation Limits. This includes TOP Reliability Standard improvements that have been filed and approved since the MOD-001-2 filing in February 2014. NAESB may further address market issues associated with ATC/AFC, however these commercially-based values and market related issues should not be addressed through NERC Reliability standards.

Therefore, we recommend that NERC withdraw the February 10, 2014 petition related to MOD-001-2 and proceed with the retirement of the above listed MOD standards.

**Cost Impact Assessment, if known (Provide a paragraph describing the potential cost impacts associated with the proposed project):**

The team did not identify any known cost impacts.

**Please describe any unique characteristics of the BES facilities that may be impacted by this proposed standard development project (e.g. Dispersed Generation Resources):**
No unique characteristics of the BES facilities that may be impacted by this proposal were identified by the SER team.

To assist the NERC Standards Committee in appointing a drafting team with the appropriate members, please indicate to which Functional Entities the proposed standard(s) should apply (e.g. Transmission Operator, Reliability Coordinator, etc. See the most recent version of the NERC Functional Model for definitions):

All.

Do you know of any consensus building activities in connection with this SAR? If so, please provide any recommendations or findings resulting from the consensus building activity.

SER Project Team(s)

Are there any related standards or SARs that should be assessed for impact as a result of this proposed project? If so which standard(s) or project number(s)?

None identified by the SER team.

Are there alternatives (e.g. guidelines, white paper, alerts, etc.) that have been considered or could meet the objectives? If so, please list the alternatives.

### Reliability Principles

Does this proposed standard development project support at least one of the following Reliability Principles ([Reliability Interface Principles](#))? Please check all those that apply.

- [ ] 1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
- [ ] 2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
- [ ] 3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
- [ ] 4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.
- [ ] 5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.
- [ ] 6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
- [ ] 7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
- [x] 8. Bulk power systems shall be protected from malicious physical or cyber attacks.

### Market Interface Principles

---

2 Consensus building activities are occasionally conducted by NERC and/or project review teams. They typically are conducted to obtain industry inputs prior to proposing any standard development project to revise, or develop a standard or definition.
Market Interface Principles

Does the proposed standard development project comply with all of the following Market Interface Principles?

<table>
<thead>
<tr>
<th>Market Interface Principles</th>
<th>Enter (yes/no)</th>
</tr>
</thead>
<tbody>
<tr>
<td>1. A reliability standard shall not give any market participant an unfair competitive advantage.</td>
<td>yes</td>
</tr>
<tr>
<td>2. A reliability standard shall neither mandate nor prohibit any specific market structure.</td>
<td>yes</td>
</tr>
<tr>
<td>3. A reliability standard shall not preclude market solutions to achieving compliance with that standard.</td>
<td>yes</td>
</tr>
<tr>
<td>4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards.</td>
<td>yes</td>
</tr>
</tbody>

Unofficial Comment Form
Standards Efficiency Review

Do not use this form for submitting comments. Use the Standards Balloting and Commenting System to provide feedback on the Standards Efficiency Review (SER) Standards Authorization Request. Comments must be submitted by 8 p.m. Eastern, Wednesday, September 26, 2018.

Additional information about this project is available on the project page. If you have questions, contact Standards Developer, Laura Anderson (via email) or at 404-446-9671.

Background
Many NERC Reliability Standards have been mandatory and enforceable for 10+ years in North America. Phase 1 of the SER project seeks to identify requirements that are potential candidates for retirement because they are no longer essential for reliability. Retiring these requirements would increase efficiencies by reducing regulatory obligations and/or compliance burden. Using a risk-based approach, three SER teams [Real-time Operations (RT), Long-term Planning (LT), and Operations Planning (OP)] evaluated the reliability benefit of each requirement in the body of NERC Reliability Standards. Based on the analyses, the SER teams are recommending the requirements listed in this posting be retired. The SER Team maintains that these requirements can be retired without impacting any other standards; i.e., no modifications to other requirements in other standards are necessary. Phase 2 of the SER Project will focus on modifying and/or consolidating requirements throughout the body of standards.

Questions
1. Do you agree with the recommendations and rationales to retire the proposed requirements? If not, please state the standard(s) and requirement number(s) in your response(s) along with your rationale(s) for not retiring the requirement(s).
   □ Yes
   □ No
   Comments:

2. Do you agree that NERC should proceed with this project?
   □ Yes
   □ No
   Comments:
Standards Announcement
Standards Efficiency Review

Formal Comment Period Open through September 26, 2018

Now Available

A formal comment period for the Standards Efficiency Review (SER) Standard Authorization Request is open through 8 p.m. Eastern, Wednesday, September 26, 2018.

Purpose
Many NERC Reliability Standards have been mandatory and enforceable for over 10 years in North America. Phase 1 of the SER project seeks to identify requirements that are potential candidates for retirement because they are no longer essential for reliability. Retiring these requirements would increase efficiencies by reducing regulatory obligations and/or compliance burden.

Commenting
Use the Standards Balloting and Commenting System (SBS) to submit comments. If you experience issues using the SBS, contact Wendy Muller. An unofficial Word version of the comment form is posted on the project page.

- If you are having difficulty accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out, contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern).

- Passwords expire every 6 months and must be reset.

- The SBS is not supported for use on mobile devices.

- Please be mindful of ballot and comment period closing dates. We ask to allow at least 48 hours for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts prior to the last day.

Next Steps
The SER drafting team will review all responses received during the comment period and determine the next steps of the project.

For more information or assistance, contact Standards Developer, Laura Anderson (via email) or at (404) 446-9671.
Comment Report

Project Name: Standards Efficiency Review | SAR 2nd Posting
Comment Period Start Date: 8/28/2018
Comment Period End Date: 9/26/2018
Associated Ballots:

There were 36 sets of responses, including comments from approximately 140 different people from approximately 95 companies representing 10 of the Industry Segments as shown in the table on the following pages.
Questions

1. Do you agree with the recommendations and rationales to retire the proposed requirements? If not, please state the standard(s) and requirement number(s) in your response(s) along with your rationale(s) for not retiring the requirement(s).

2. Do you agree that NERC should proceed with this project?

Consumers Energy's position is that PRC-004-5(i) R4 can be removed as long as comments are added to R5 to clarify that a “meaningful investigation must occur to determine the root cause”. That statement can then be considered for the next SAR committee.

If the statement can’t be considered at the next SAR committee, then Consumers’ position would be to go with leaving R4.

Consumers Energy is in agreement with retirement of the other requirements recommended for retirement.

APS agrees with the vast majority of these recommended retirements, but APS disagrees that EOP-005-3 R8 is duplicative of activities covered by the Systematic Approach to Training in Reliability Standard PER-005-2. While system restoration is a reliability-related task that would be included in an entity’s training program for its System Operators, it is a risk to assume that all Transmission Operators would provide System restoration training under its operations training program at the frequency and of the scope required under EOP-005-2, R8 (parts 8.1-8.5).

Louisville Gas and Electric Company and Kentucky Utilities Company (LG&E/KU) strongly disagrees with the proposed retirement of VAR-001-4.2 R2 because requiring each Transmission Operator to schedule, provide, and have evidence of scheduling sufficient reactive resources to regulate voltage levels under normal and Contingency conditions is necessary for the reliability of the BES. Reactive power resources are required to maintain voltage stability on the BES. Therefore, removing the requirement to ensure that each Transmission Operator schedules and provides sufficient reactive resources and has the documentation that sufficient reactive resources have been scheduled will be harmful to ensuring the reliability of the BES. Instead of retiring VAR-001-4.2 R2, there should be additional guidance (i.e. Implementation Guidance) to suggest how the transmission control center complies with R2.

**Response**

Colby Bellville - Duke Energy - 1,3,5,6 - FRCC,SERC,RF, Group Name Duke Energy

**Answer**

No

**Document Name**

**Comment**

**MOD-001-2:** Duke Energy objects to the drafting team’s recommendation to retire MOD-001-2. FERC has not yet ruled on NAESB standards, and eliminating the responsibilities in MOD-001-2 would be in direct conflict with FERC Order 890 and would leave the industry with no consistency on calculation of ATC. Without a consistent method of calculating ATC throughout the industry this would potentially force a BA/TOP to inspect every Tag. This is avoided by having MOD-001-2 enforceable.

**FAC-013-2:** Duke Energy re-states its disagreement with the proposal regarding FAC-013-2. This standard was developed in response to FERC Directives in Orders 693 and 729. In the Orders, FERC directed NERC to establish a standard requiring Planning Coordinators to calculate transfer capability in the planning horizon (years one through five) and communicate the results. We disagree with the notion that FAC-013-2 has no bearing on reliability of the BES. In the FAC-013-2 — Planning Transfer Capability White Paper that was drafted during development of the standard, the standard’s benefit to reliability is stated:

“Further, FAC-013-2 requires that a Planning Transfer Capability Methodology Document (PTCMD) be developed for the calculation of Planning Transfer Capabilities (PTC) beyond 13 months in the future to provide additional information for the Planning Coordinator to use in planning for BES reliability.”

Another pertinent excerpt from the White Paper mentions how FAC-013-2 covers aspects of grid reliability not covered in the TPL standards:

“The TPL planning standards do not specify the need to document transfer capability calculation methods that may be used in the planning horizon. To cover that aspect of planning for BES reliability, the FAC-013-2 standard specifies that Planning Coordinators must perform PTC calculations as part of the planning process, that the method must be documented and shared with other entities as specified in the standard.”

Lastly, see the quote from the White Paper below that further illustrates the necessity of FAC-013-2, and how it helps address past concerns from FERC.

“The application of FAC-013-2 will provide PTC values that are an indicator of the robustness of the future transmission system and facilitate communication between adjacent Planning Coordinators. It will result in meeting FERC’s concerns regarding transfer capability in the planning horizon and provide important information that Planning Coordinators will be able to apply in their efforts to reliably plan the BES.”

**IRO-017 (R3):** FERC mandated that RC’s and TP’s coordinate on the impact of known outages on TPL assessment results. It appears that the SDT believes that this can be retired because the TPL standard requires TP’s to send their assessment results to adjacent PC’s and TP’s and anyone else
who asks. The result of this retirement may mean that nothing gets to the RC unless they ask and even then it doesn’t require the TP and RC to work together to resolve conflicts.

Ruida Shu - Northeast Power Coordinating Council - 1,2,3,4,5,6,7,8,9,10 - NPCC, Group Name RSC no Dominion

Answer

No

Comment

We agree with the majority of the retirement recommendations of the SER teams in all but a few instances. These are listed below:

INT-009-2.1 R2
The SAR rationale is that it is redundant with NAESB business practices. However, NAESB rules are not applicable in Ontario. While NAESB is more stringent, during reliability curtailments, system operators require flexibility given to them by INT-010 to manage the e-tags.

IRO-002-5 R4
This requirement is needed for the system operator to manage the grid.

IRO-008-2 R6
Keeping impacted entities informed in a timely fashion is good operating practice.

TOP-001-4 R16
This requirement is needed for the system operator to manage the grid.

In the rationale presented to retire COM-002-4 R2, the SER is assuming or expecting that initial training for each of its operating personnel responsible for the Real-time operation of the interconnected Bulk Electric System is being covered in PER-005-2. PER-005-2 does not prescribe what training entities must include.

In the rationale presented to retire EOP-005-3 R8, the SER is assuming or expecting that System restoration is a reliability-related task and would be included in an entity's training program for its System Operators. PER-005-2 does not prescribe what training entities must include.
FAC-003-4 Requirements R5 and R6: These requirements should be retired because R5 and R6 are controls and good utility practices but do not enhance BES reliability over R1 and R2. R1 and R2 fulfill the purpose of the standard through measurable actions. Also, the NERC Rules of Procedure allow consideration for extenuating circumstances relative to R5.

FAC-008-3 Requirement R8: Requirements R.8.1.2 and R8.2 are not duplicative of TOP-003-3 or IRO-010-2. FAC-008-3 Requirement R8.2 necessitates that TOs provide to their associated RCs, PCs, TPs, TOs and TOPs the Requirement R8.1.2 "identity of the most limiting equipment of the Facilities," Requirement R8.2.1 "identity of the existing next most limiting equipment of the Facilities," and Requirement R8.2.2 "Thermal Rating for the next most limiting equipment identified in Requirement R8, Part 8.2.1," whereas the TOP-003-3 or IRO-1010-2 standards do not appear to have this requirement.

IRO-010-2 Requirement R1 specifies the types of data that an RC collects from applicable entities, so that the RC may perform OPAs, RTM and RTAs. The OPA RTM and RTA definitions (in the NERC Glossary of Terms) each mention “Facility Ratings” as an input (into OPA’s, RTM and RTA’s). However, neither IRO-010-2, Requirement R1, nor the OPA, RTM and/or RTA definitions (in the NERC Glossary of Terms) contain the level of specificity in FAC-008-3 Requirement R8 (to “identity the most and the existing next most limiting equipment of the Facilities” and “the Thermal Rating for the next most limiting equipment identified in Requirement R8, Part 8.2.1”). Similarly, TOP-003-3 Requirement R5 requires identified entities to fulfill a data specification provided by a BA or TOP so that OPAs, RTM, and RTA’s may be performed. As in the case of IRO-010-2 Requirement R1 and the OPA, RTM and RTA definitions, TOP-003-3 does not require identification of the most and the existing next most limiting equipment of the Facilities and the Thermal Rating for the next most limiting equipment identified in FAC-008-3 Requirement R8, Part 8.2.1.”

NUC-001-3 R1: The requirement is administrative in nature, as Requirement R1 actions are inherent in Requirement R2 since each entity “shall have in effect” an agreement.

Response

Leonard Kula - Independent Electricity System Operator - 2

Answer

No

Document Name

Comment

IESO thanks the Standard Efficiency Review (SER) teams for all their hard work reviewing and analyzing the NERC Standards and requirements for possible retirements. The IESO agrees with the majority of the retirement recommendations of the SER teams in all but a few instances. These are listed below:

INT-009-2.1 R2

The SAR rationale is that it is redundant with NAESB business practices. NAESB is not regulatory and, therefore, we are not measured by compliance to NAESB. Furthermore, we do not design our business practices around NAESB rules.

While NAESB is more stringent, during reliability curtailments, we need the flexibility given to us by INT-010. This standard allows us to take action to address a reliability need and manage the e-tags after the concern has been addressed – allowing us to manage the e-tags later. We still need this flexibility as the e-tag system does not feed our dispatch tool directly and we would not want to be the “hold up” for a reliability curtailment so we can line up e-tag with our dispatch tools.

IRO-002-5 R4
This is fundamental to how we manage the grid. In the absence of this standard the RC’s ability to monitor its BES area may become unavailable or deteriorated with no knowledge to the system operator.

IRO-008-2 R6

When and RC, TOP or BA becomes aware another RC is exceeding an SOL or an IROL that RC, TOP or BA may need to take mitigating actions to maintain reliability, therefore we disagree that with the SAR rationale that this requirement is administrative in nature and does provide reliability benefit. Keeping impacted entities informed in a timely fashion is good operating practice.

TOP-001-4 R16

This is fundamental to how we manage the grid. In the absence of this standard the TOP’s ability to monitor its BES area may become unavailable or deteriorated with no knowledge to the system operator.

TOP-001-4 R17

This is fundamental to how we manage the grid. In the absence of this standard the TOP’s ability to monitor its BES area may become unavailable or deteriorated with no knowledge to the system operator.

Response

Sean Cavote - PSEG - 1,3,5,6 - NPCC,RF, Group Name PSEG REs

Answer No

Document Name

Comment

PSEG generally agrees with the purpose, scope, and content of the SAR, with the following exceptions:

**FAC-003-4 Requirements R5 and R6:** These requirements should be retired because R5 and R6 are controls and good utility practices but do not enhance BES reliability over R1 and R2. R1 and R2 fulfill the purpose of the standard through measurable actions. Also, the NERC Rules of Procedure allow consideration for extenuating circumstances relative to R5.

**FAC-008-3 Requirement R8:** Requirements R.8.1.2 and R8.2 are not duplicative of TOP-003-3 or IRO-010-2. FAC-008-3 Requirement R8.2 necessitates that TOs provide to their associated RCs, PCs, TPs, TOs and TOPs the Requirement R8.1.2 “identity of the most limiting equipment of the Facilities,” Requirement R8.2.1 “identity of the existing next most limiting equipment of the Facilities,” and Requirement R8.2.2 “Thermal Rating for the next most limiting equipment identified in Requirement R8, Part 8.2.1,” whereas the TOP-003-3 or IRO-1010-2 standards do not appear to have this requirement.

IRO-010-2 Requirement R1 specifies the types of data that an RC collects from applicable entities, so that the RC may perform OPAs, RTM and RTAs. The OPA RTM and RTA definitions (in the NERC Glossary of Terms) each mention “Facility Ratings” as an input (into OPA’s, RTM and RTA’s). However, neither IRO-010-2, Requirement R1, nor the OPA, RTM and/or RTA definitions (in the NERC Glossary of Terms) contain the level of specificity in FAC-008-3 Requirement R8 (to “identity the most and the existing next most limiting equipment of the Facilities” and “the Thermal Rating for the next most limiting equipment identified in Requirement R8, Part 8.2.1”). Similarly, TOP-003-3 Requirement R5 requires identified entities to fulfill a data specification provided by a BA or TOP so that OPAs, RTM, and RTA’s may be performed. As in the case of IRO-010-2 Requirement R1 and the
OPA, RTM and RTA definitions, TOP-003-3 does not require identification of the most and the existing next most limiting equipment of the Facilities and the Thermal Rating for the next most limiting equipment identified in FAC-008-3 Requirement R8, Part 8.2.1.

**NUC-001-3 R1:** The requirement is administrative in nature, as Requirement R1 actions are inherent in Requirement R2 since each entity "shall have in effect" an agreement.

---

**Response**

Marsha Morgan - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC, Group Name Southern Company

**Answer**

No

**Document Name**

In general Southern Company agrees with the proposed requirements for retirement. However, Southern Company disagrees with the recommendations and rationales to retire the proposed requirements as noted below:

Southern does not agree with the recommendation and rationale to retire BAL-005-1 R4 and R6. We believe that it is in the best interest of both clarity and reliability to have these requirements in both the BA and TOP standards as these functions are separately registered.

Southern does not agree that NERC should withdraw the petition regarding MOD-001-2. The combined effect of both MOD-001-2 and NAESB's WEQ-023 strike the appropriate balance between reliability and market related issues.

Southern Company recommends delaying the retirement of MOD-001-1a, MOD-004-1, MOD-008-1, MOD-028-2, MOD-029-2a and MOD-030-3 until NERC's MOD-001-2 and NAESB's WEQ-023 are approved by the Commission (FERC). Once approved by the Commission, the industry should have adequate time to ensure a seamless transition to the new construct.

Southern believes that reliability-related tasks are determined by each individual entity. There is no obligation in the current NERC Reliability Standards to include the topics covered in EOP-005-3 (R8) or EOP-006-3 (R7) in the reliability related tasks for a TOP.

Southern believes that reliability related tasks are determined by each individual entity. There is no obligation in a NERC standard requirement to include the topics covered in COM-002-4 R2 in the Reliability Related tasks for a TOP.

Southern does not agree with the rationale for retiring IRO-002-5 R4. While we agree with the statement in the rationale, it doesn't cover how an Operator has authority over various entities to direct the cancellation of outages. It's not found anywhere else in the NERC standards and for entities where the TOP may be a different company than the RC, an appropriately written NERC standard would help ensure that the RC Operator had the authority to deny a telecommunications outage that affected key operational data provided by the TOP to the RC.

Southern does not agree with the recommendation for IRO-014-3 R3. R1.1 does not require notification of RCs and leaves it to the discretion of the RC experiencing the emergency to determine who is notified. Moreover, what if the Emergency being experienced is not covered in an Operating Procedure, Process or Operating Plans? The rationale assumes that all Operating Plans are generic and would cover all possible Emergencies experienced, but R1 of the standard doesn't state that.

Southern does not agree with the overall rationale for retiring TOP-001-4 R16 and R17. While we support the wording in the rationale, it doesn't fully encapsulate how an Operator has authority over entities to direct the cancellation of outages. This language is not found anywhere else in the NERC Reliability Standards and for entities where the TO and GO may be a different company than the TOP, an appropriately written NERC standard would
help ensure that the TOP Operator had the authority to deny a telecommunications outage that affected key operational data provided by the TO and/or GO to the TOP.

Response

Michael Godbout - Hydro-Québec TransÉnergie - 1 - NPCC

Answer

No

Comment

We agree with all the requirements proposed for retirement and with their rationales, except for the following:

FAC-008-3 R7

We disagree with the rationale. As stated in the Hydro-Québec TransÉnergie's comments on the previous SAR, requirement FAC-008-3 R7 is not entirely redundant to MOD-032, IRO-010 and TOP-003 because the latter requirements to do address all the functions of FAC-008-3 R7. Namely, the TO function is excluded. The rationale should state that the TO function request is not essential to reliability and on that basis it is dropped and the remaining obligations are redundant to the aforementioned alternatives. If that is out of scope of this project, it should be addressed in the follow-on project. We consider that the requirement should be removed, one way or the other.

IRO-002-5 R6

We disagree with the stated rationale. As stated in the Hydro-Québec TransÉnergie's comments on the previous SAR, R6 requires communication over a “redundant infrastructure” which is not mentioned in requirement R5. Arguably, that aspect could be considered redundant to R2. In that case, the recommendation would remain valid.

COM-002-4 R2, EOP-005-3 R8, EOP-006-3 R7

The proposed transfer to PER-005-2 could leave a gap, as per our informal comments on the matter in the previous comment round.

IRO-006-5 R1

The applicable entity in requirement R1 is the RC. IRO-001-4 R2 is not applicable to the RC function. As such, we disagree with the rationale and the recommendation.

IRO-017-1 R3

We disagree on the stated rationale and with the recommendation. Removing R3 shifts the responsibility for identifying the affected RC by a plan from the planner to the RC. Therefore, R3 is not duplicative with TPL-001-4 R8.

MOD-020-0 R1

We disagree with the rationale. MOD-020-1 allows operators (RC and TOP) to request information. In contrast, MOD-031-2 does not give RC or TOP the authority to request DSM information. IRO-010-2 does give the RC that authority but does not apply to the RP. So unless the NERC functional model guarantees that the DP has that information, there could be a gap.
We disagree with the rationale and with the recommendation. If it is the case that auditors consider a non-compliance with respect to R2 or R3 a violation regardless of R4, then R4 is indeed useless. Since the intention of the standard was to allow an entity to extend its examination period, R2, R3 and R4 should be rewritten to achieve this intent. Cutting out R4 changes the intention of the standard to provide extensions to entities in order for them to identify causes of misops.

Electric Reliability Council of Texas, Inc. (ERCOT) agrees with the recommendations and rationales to retire the following requirements identified in the Standards Authorization Request (SAR):

- FAC-008-3 R7, R8
- FAC-013-2 R1, R2, R4, R5, R6 (All)
- INT-004-3.1 R1, R2, R3 (All)
- TOP-001-4 R19, R22

ERCOT does not oppose the retirement of the following requirements identified in the SAR, but does not necessarily agree with each stated rationale articulated in support of retirement:

- BAL-005-1 R4, R6
- COM-002-4 R2
- EOP-005-3 R8
- EOP-006-3 R7
- INT-006-4 R3.1, R4, R5
- INT-009-2.1 R2
ERCOT does not agree with the recommendation and rationale to retire the following standard identified in the SAR for the reasons stated below:

PRC-004-5(i) R4

ERCOT does not support the outright retirement of PRC-004-5(i) Requirement R4 because to do so would eliminate the requirement to investigate in its entirety. However, ERCOT agrees that the requirement as written may impose unnecessary burden by requiring repeated investigations despite the potential inability of a Transmission Owner, Generator Owner, or Distribution Provider to identify the cause(s) of a Misoperation.

Response
A. BPA appreciates the opportunity to comment to the NERC Standards Effectiveness Review (SER) team on the path forward specifically concerning MOD-001-2 and the associated MOD standards (MOD-001-1a, MOD-004-1, MOD-008-1, MOD-028-2, MOD-029-2a, MOD-030-3.) BPA does not support the recommendation that NERC withdraw the February 10, 2014 petition to FERC related to MOD-001-2. Although NAESB completed the WEQ-023 Modeling Business Practice Standards which was based on a request from NERC to NAESB to address changes to the NERC MOD-001-2 Reliability Standards not yet ratified by FERC, FERC has not ratified the NAESB BP s. BPA supports the overall effort to migrate the commercial and business aspects of the NERC MOD Reliability Standards into corresponding NAESB Business Practice Standards, a position BPA filed on 09/26/16 in response to the FERC Notice of Proposed Rulemaking (156 FERC ¶ 61,055). In that NOPR, FERC makes clear that the status of the NAESB WEQ-023 Modeling standards and the NERC MOD-001-2 standards are now intertwined. Both are under consideration as part of FERC’s overall inquiry into ATC calculations. This includes Docket No. RM14-7-000, dealing with the original February 10, 2014 petition, as well as a related inquiry into ATC from Docket No. AD15-5-000. BPA recommends FERC address the overall ATC topic currently pending these dockets. FERC guidance on the overall direction of ATC standards is overdue and essential before NERC and/or NAESB invest further resources into companion standards. Because only Regulated utilities fall under the purview of the NAESB business practices, BPA urges NERC to closely collaborate with NAESB so there is a joint recommendation moving forward to FERC if NERC intends to proceed with modifying its approach to the February 10, 2014 petition.

B. BPA disagrees with the retirement of INT-004-3.1. NAESB Business Practice Standard WEQ-004 version 3.1 and FERC Docket RM05-5-25 are pending FERC approval. Additionally, NAESB Business Practices are not enforceable. Finally, the Pseudo-Tie Coordination Reference Document is just that, a reference document, and also not enforceable.

C. BPA supports the retirement of all other requirements in scope.

<td></td>
<td>Phase I calls for the full retirement of FAC-013-2, it is noted by the NSRF that the current NERC Project 2015-09 is proposing FAC-013-3. The NSRF asks whether FAC-013-3 needs to be referenced from the SAR for future handling, should the FAC-013-2 retirement be successful. Similar situation with VAR-001-4.2 E.A. 15. The NSRF notes that VAR-001-5, which has been approved by the NERC Board of Trustees, contains E.A. 15 in Attachment 1. Does VAR-001-5 E.A.15 need to be referenced from the SAR for future handling, should the VAR-001-4.2 E.A. 15 retirement be successful?</td>

We agree with the following comments submitted by TAPS:

We believe the justifications for the SAR’s proposed retirements are well-explained. We also believe, however, that several additional requirements should be retired either as part of this SAR or in Phase 2, as set forth below.

COM-001-3 R1, R2, R3, R4, R5, R6, R7, R8, R9, R10, R11, R12, and R13 (ALL)

Basic functionality. This should be part of the certification process for BAs, TOPs and RCs. For all other entities (DPs and GOs), it is not necessary to require communication to be proven as the RC, TOP or BA will assure that they can make contact with these entities, and all entities have internal and external Interpersonal Communications Capabilities. This Standard basically states to have primary and back up communications (a phone). In today’s world, basic, daily functionality necessitates multiple avenues of communications such as a land line phone, a cell phone, text messaging, a radio, satellite phone, etc. This Standard is not necessary for reliability; it only enforces a compliance “gotcha” if a registered entity’s primary communication system fails. There is not a reliability benefit from COM-001-3, just administrative burden. Communications are a basic function of every registered entity. The entire Standard should be retired.

COM-002-4 R3

R1 protocols cover all aspects of operating protocols. If communication is a reliability-related task, then training is covered in PER-005.

COM-002-4 R4

R4 and its subrequirements are a control and should not be an auditable item.

COM-002-4 R5, R6, R7

There should be no difference between an Operation Instruction under normal conditions and under Emergency conditions. R1 covers all Operating instructions. By imposing additional requirements on Operating Instructions that are issued during an emergency, R5, R6, and R7 make it necessary for entities to track whether each Operating Instruction was issued during an Emergency or during normal operations, in order to be able to demonstrate compliance. This administrative burden does not enhance reliability.

EOP-005-3 R3
Verify through NERC Certification program.

EOP-008-2 R2
Verify through NERC Certification program.

EOP-008-2 R3, R4
NERC Certified Operators can be addressed through Certification Program. R6 addresses Primary and Backup and can also address the sub-bullets in this Requirement. Sub-bullets of R4 can be addressed in R8.

EOP-010-1 R2
This is for situational awareness only and may be a mitigating feature of R1. If one K warning is not sent out, it becomes a non-compliance issue. This is also covered in EOP-011-1, R1.2.1.

EOP-010-1 R3.1
R3.1 is contained in R1. Per part 3.1, this will force the TOP to prove a negative if they did not receive any space weather information. Part 3.2 starts the mitigating processes for GMD events and part 3.3 concludes them. Part 3.1 is administrative in nature as alone, it does not accomplish anything; parts 3.2 and 3.3 mitigate the GMD. Recommend part 3.1 be retired. If not retired, part 3.1 should be modified to clearly state in the requirements or measures that proof of compliance is to show the steps only and entities are not required to prove a null set of data.

EOP-011-1 R1 subparts
R1.1 does not enhance or enforce reliability; it is only an auditable item. R1.2.2, R1.2.3, R1.2.4, R1.2.5, and R1.2.6 are all actions or event types that require actions. These are all event-specific. The Operating plan will just say that the operator will do something to mitigate these events. Then it becomes an auditable item in the Operating Plan, only. R1 is simple enough: have a plan for emergencies. Recommend subcomponents be retired.

EOP-011-1 R2 subparts
R2.1 does not enhance or enforce reliability; it is only an auditable item. R2.2.3 and its parts and R2.2.4, R2.2.5, R2.2.6, R2.2.7, R2.2.8 and R2.2.9 are all actions or event types that require actions. These are all event-specific. The Operating plan will just say that the operator will do something to mitigate these events. Then it becomes an auditable item in the Operating Plan. R2 is simple enough: have a plan for emergencies. Recommend subcomponents be retired.

EOP-011-1 R4
This is common sense. We do not need a Requirement to state that we have a specific time to update something issued by the RC. The RC can simply state have an update back by a certain time. This becomes a time “gotcha” issue during an audit or self report. This does not support system reliability.

EOP-011-1 R5

This is in line with the justification for retiring R4, as this is also common sense. The RC will act immediately on all emergency notifications. The time frame of 30 minutes only become an auditable point and does not support reliability. If the requirement is not retired, at minimum the 30 minute criterion should be deleted.

EOP-011-1 R6

This is clearly stated in the Functional model under Real Time actions and does not need to be contained here; the RC will act immediately on all emergency notifications. Recommend retirement of this Requirement.

FAC-002-2 R2, R3, R4, R5

Inherent in R1.

FAC-003-4 R4

R4 is a notification process only, without the next step of clearing happening. This alone does not support reliability. The clearing of the encroaching vegetation does support reliability and is covered in R1, R2, and R6.

FAC-008-3 R1, R2, R3, R6

Generator Facility Ratings are not useful as they are often different from the capability determined through MOD-025. This Standard is usually based solely on the nameplate ratings of components that are covered by this Standard. Nameplate ratings become irrelevant with MOD-025-2, which captures the true capabilities of the asset. The TP will be notified of MOD-025-2 findings. If the RC wants to know the MOD-025-2 capabilities, then they can ask for it under IRO-010-2. The TOP can also request the same information under TOP-003-3.

IRO-001-4 R1

This is the basic functionality of an RC, as outlined in the Functional Model.

IRO-001-4 R2

Per the Functional Model, the BA, TOP, and GOP have reliability interactions with the RC, hence supporting a secure and stable reliable system. The DP does not receive instructions from the RC; rather, they receive information from the BA and TOP.
IRO-001-4 R3
This does not need to be a Requirement. The RC can simply ask whether the registered entity has the ability to accomplish the task. If the entity can't, the RC will take alternate actions.

IRO-002-5 R3
Requirement 2 already provides for two active paths. A NERC certification program can ensure that the paths are being used periodically.

IRO-008-2 R3
The RC’s performance of the analysis is identified in R1. A separately enforceable requirement that the RC take the common-sense action of informing impacted entities is unnecessary.

IRO-008-2 R4
IRO-018-1 R2, when implemented, will address RTA quality. The quality process could also assure RTA activity in accordance with utility practice (RTA, RTA backup, etc) without a hard standard-based 30 minute compliance threshold. Candidate for NERC certification program.

IRO-008-2 R5
This requirement supports R2 and process can be verified through NERC Certification (process review).

IRO-010-2 R3
Real time data transmission involves telemetry for thousands of points scanned or updated every few seconds. Retaining evidence of providing this volume of data is burdensome.

MOD-033-1 R2
This requires demonstration of the negative and after the fact validation. This should be part of the Event Analysis process and not a NERC Requirement.

NUC-001-3 R9
Requirement is administrative as it only specifies what must be in the agreement. R9 can be moved to a Guidance document since R9's second bullet states "The Nuclear Plant Generator Operator and the Transmission Entity are responsible for ensuring all the R9 elements are addressed." An item can be addressed by stating that it is not applicable for the entity.
PER-003-1 R1, R2, R3 (ALL)

This Requirement is predicated on the NERC exam which is the responsibility of NERC and the PCGC, not a Registered Entity. Recommend this Standard be retired. Operators are trained on competencies. Competencies can be verified through the training Standards. Certifications should be verified through the NERC Certification program.

PER-004-2 R1

In addition to being redundant with PER-003-1 (which we also recommend be retired), this requirement is part of the Certification process and does not need to be within a Standard.

PER-004-2 R2

Already covered by IRO-009 R1/R2.

PER-005-2 R5, R6

Operations Support Personnel know their impact on reliability and the task list. The prep and training used for OSP and the trainers is better spent for their job duties in support of reliability.

PRC-002-2 R1-R12 (ALL)

Disturbance monitoring is for post-event analysis and does not have direct impact on reliability. Guidelines and best business practices are sufficient to help improve accuracy and coordination. This very granular and prescriptive standard is not needed.

PRC-004-5(i) R2, R3, R5

Only R1 and R6 are required in order to support system reliability and stability. This Standard has too many time frames within each requirement and only provides a compliance gotcha if not followed. Time frames don't support reliability. The intent of this Standard is if you have a mis-operation that you notify everyone involved and fix it so it (hopefully) doesn't happen again.

PRC-005-6 R5

For PRC-005 Unresolved Maintenance Items (UMIs) are a low-volume and low-risk population with little to zero proven actual risk. We are not aware of any events where UMIs were cited as a primary or contributory cause to a BES outage in the Events Analysis program. Given the low volume of actual documented risk impacts and the low volume of self-logs or spreadsheet Notice of Penalty (SNOPs and NOPs), the UMI definition and requirement should be retired. If not retired, the UMIs should be modified to clearly state in the requirements or measures that compliance by exception is allowed and that regulated entities are not required to prove a null set of data.
TOP-001-4 R1
The basic functionality of a TOP is to operate or direct operation of equipment to maintain reliability. COM-002-4 clearly indicates that the TOP will be using Operating Instructions. Please see responses re IRO-001-4 for additional retirement justification.

TOP-001-4 R2, R4-R7
Please see responses re IRO-001-4 for retirement justification.

TOP-001-4 R3
Requirement language is poorly worded because it is not specifically tied to Operating Instructions issued under TOP-001-4 R1 (i.e., Operating Instructions issued to maintain reliability). As such, every entity in R3 must maintain a list of every Operating Instruction issued or received, whether the OI was issued for reliability or not. The NERC Glossary of Terms definition for Operating Instruction pulls in all orders given to others to change the state of a BES Element, which means all planned switching orders issued by the operator, not just OIs issued for reliability. This requirement would be improved by both limiting the duration Operating Instruction evidence needs to be retained and clarifying that the requirement applies only to OIs from TOP-001-4 R1. The RSAW for TOP-001-4 R3 must also be corrected because it directs the audit to begin with the list of "all" Operating Instructions. Please see responses re IRO-001-4 for additional retirement justification.

TOP-001-4 R8
Covered by EOP-011 R5 or can be merged with same Requirement. Please see responses re IRO-001-4 for additional retirement justification.

TOP-001-4 R9
EMS quality codes suffice for notifications of RTU outages and were accepted by the RRO. However, the Regional Entity does not agree. So now unplanned outages need to be tracked for 30 minute overages for reporting. This detracts from reliability and does not enhance reliability, especially when these outages are already indicated by quality codes. Please see responses re IRO-001-4 for additional retirement justification.

TOP-001-4 R13
TOP-010-1 R3, when implemented, will address RTA quality. The quality process could also assure RTA activity in accordance with utility practice (RTA, RTA backup, etc.) without a hard Requirement-based 30-minute compliance threshold. Candidate for NERC Certification program.

TOP-001-4 R21
R20 already provides for two active paths and could address the concept of using the alternate periodically. A NERC certification program can ensure that the paths are being used periodically.

TOP-001-4 R24
R23 already provides for two active paths and could address the concept of using the alternate periodically. A NERC certification program can ensure that the paths are being used periodically.

TOP-002-4 R3

The TOP's performance of the analysis is required by R1. A separately enforceable requirement that the TOP take the common-sense action of informing impacted entities is unnecessary. Could be verified through NERC certification.

TOP-002-4 R4, R5, and R7

Daily Operating Plans are not needed for BAs. Generation dispatch information can be gathered and shared through data provision requirements.

TPL-007-1 R1

Administrative.

VAR-001-4.1 R1

Duplicative of FAC-014.

VAR-001-4.2 R5

All of R5 appears to be administrative and a common-sense operations item. All entities keep impedance and tap information on their transformers. There isn't any reason to withhold information if requested, so a mandatory standard backed by sanctions to provide information within 30 days is simply an administrative clock. It's wasteful of both entity and regulator resources.

VAR-002-4.1 R3

Duplicative of other standards requiring data provision. There is no justification for the 30 minute timing requirement; if a timing requirement is retained, it is not a good reliability practice to require notification "within 30 minutes," but only if status is not restored within 30 minutes.

VAR-002-4.1 R4

Duplicative of other standards requiring data provision. There is no justification for a 30 minute time limit and this becomes a compliance trap.

VAR-002-4.1 R5

Duplicative of other standards requiring data provision.

**Answer**
Yes

**Document Name**

**Comment**
JEAs appreciates the effort of the SER Team and agrees with the recommendations and rationales to retire the proposed requirements with the exception of two comments:

1. JEA disagrees with the rationale for the retirement of PRC-004-5(i) R4. This requirement applies only when the cause of a Misoperation has not been determined and requires the TO/GO/DP to perform investigative actions every two quarters until a cause is identified OR a declaration is made that no cause was identified.
   
a) The SAR states, "Requirement R4 acts as a control to support compliance with requirements R1 & R3." However, R4 is not a control for determining "whether its Protection System component(s) caused a Misoperation", but is the next step if the cause of a Misoperation, "for a Misoperation identified in accordance with Requirement R1 or R3", has not been determined.

b) The SAR also states, "It is in the best interest of the entity to continue to investigate and detect whether its Protection System components caused a mis-operation", but this is more than just in the best interest of the entity. R1 requires the entity to "identify whether its Protection System component(s) caused a Misoperation."

   c) The SAR also states, "However, if an entity is unable to determine the cause, further investigation(s) using the same event data are unlikely to lead to identification of the cause." But, investigative actions do improve reliability if they result in the identification of a cause. If no cause is identified, the TO/GO/DP can simply declare that no cause was identified, thereby satisfying the requirement.

There may be valid reasons for retiring this requirement (milestone tracking doesn’t improve reliability, this is a typical best practice, etc.), but the reasons listed above are not valid based upon the current standard language.
2. JEA disagrees with the rationale for the retirements of COM-002-4 R2, EOP-005-3 R8, and EOP-006-3 R7. These requirements are not duplicated in the current version of PER-005-2. PER-005-2 R1.1 allows for the RC, BA, and TOP to create a list of BES "company-specific Real-time reliability-related tasks based on a defined and documented methodology", but, if specific tasks are intended, then they should be stated directly. It's implied that these reliability-related tasks would include communication protocols and system restoration, but PER-005-2 only requires a methodology to be followed rather than setting forth explicit minimum competency requirements which is what the requirements proposed for retirement include.

Furthermore, there is clear distinction between the "initial training" of COM-002-4 R2 which occurs "prior to that individual operator issuing an Operating Instruction" and the continuous learning of PER-005-2.

**COM-002-4 R2** – Requires initial training on communication protocols; NERC proposes that R2 be retired as this topic should be covered in a PER-005-2 compliant Systematic Approach to Training program. Training on ATC communication protocols and tasks to issue and receive op instructions are part of the SCO initial training program. As such, we agree with retirement of COM-002-4 R2.

**EOP-005-3 R8** – requires annual system restoration training; NERC proposes that R8 be retired as this topic should be covered in a PER-005-2 compliant Systematic Approach to Training program. Agree as we have three tasks in regards to PSR in the SCO initial training program. Our continuing education program also has annual PSR training (classroom and DTS). As such, we agree with retirement of EOP-005-3 R8.

**TOP-001-4 R16** - NERC Certified Operators can be addressed through Certification Program and authority is part of the qualification. PER-005-2 training supports this. As such, we agree with retirement of TOP-001-4 R16.

**TOP-001-4 R19**: the language used to describe how this is managed is through requirements in TOP-003-3 and TOP-002-4. As such, we agree with retirement of TOP-001-4 R19.

**VAR-001-4 R2**: TOP-001 and TOP-002 require the Transmission Operator to identify System Operating Limit exceedances during real-time and next-day conditions, respectively. System Operating Limits include voltage limits and management of reactive resources as described in VAR-001-4 R2 is fulfilled by acting according to the TOP standards. As such, we agree with retirement of VAR-001-4 R2.
The directive in VAR-001-4.2 R3 is fulfilled as a result of compliance with TOP-001-3 R1, R12 and R14; in that the obligation in R1 to maintain the reliability of its operator area is unachievable by the TO if it does not operate devices to regulate voltage and reactive flow; additionally, TOP-001 R12 and R14 cover addressing System Operating Limits and Interconnection Reliability Operating Limits, where the definition includes voltage stability ratings and system voltage limits. As such, we agree with retirement of VAR-001-4 R3.

FMPA agrees with the following comments submitted by TAPS:

We believe the justifications for the SAR’s proposed retirements are well-explained. We also believe, however, that several additional requirements should be retired either as part of this SAR or in Phase 2, as set forth below.

<table>
<thead>
<tr>
<th>COM-001-3 R1, R2, R3, R4, R5, R6, R7, R8, R9, R10, R11, R12, and R13 (ALL)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Basic functionality. This should be part of the certification process for BAs, TOPs and RCs. For all other entities (DPs and GOs), it is not necessary to require communication to be proven as the RC, TOP or BA will assure that they can make contact with these entities, and all entities have internal and external Interpersonal Communications Capabilities. This Standard basically states to have primary and back up communications (a phone). In today’s world, basic, daily functionality necessitates multiple avenues of communications such as a land line phone, a cell phone, text messaging, a radio, satellite phone, etc. This Standard is not necessary for reliability; it only enforces a compliance “gotcha” if a registered entity’s primary communication system fails. There is not a reliability benefit from COM-001-3, just administrative burden. Communications are a basic function of every registered entity. The entire Standard should be retired.</td>
</tr>

NERC Certified Operators can be addressed through Certification Program. R6 addresses Primary and Backup and can also address the sub-bullets in this Requirement. Sub-bullets of R4 can be addressed in R8.

This is for situational awareness only and may be a mitigating feature of R1. If one K warning is not sent out, it becomes a non-compliance issue. This is also covered in EOP-011-1, R1.2.1.

R3.1 is contained in R1. Per part 3.1, this will force the TOP to prove a negative if they did not receive any space weather information. Part 3.2 starts the mitigating processes for GMD events and part 3.3 concludes them. Part 3.1 is administrative in nature as alone, it does not accomplish anything; parts 3.2 and 3.3 mitigate the GMD. Recommend part 3.1 be retired. If not retired, part 3.1 should be modified to clearly state in the requirements or measures that proof of compliance is to show the steps only and entities are not required to prove a null set of data.

R1 does not enhance or enforce reliability; it is only an auditable item. R1.2.2, R1.2.3, R1.2.4, R1.2.5, and R1.2.6 are all actions or event types that require actions. These are all event-specific. The Operating plan will just say that the operator will do something to mitigate these events. Then it becomes an auditable item in the Operating Plan, only. R1 is simple enough: have a plan for emergencies. Recommend subcomponents be retired.

R2.1 does not enhance or enforce reliability; it is only an auditable item. R2.2.3 and its parts and R2.2.4, R2.2.5, R2.2.6, R2.2.7, R2.2.8 and R2.2.9 are all actions or event types that require actions. These are all event-specific. The Operating plan will just say that the operator will do something to mitigate these events. Then it becomes an auditable item in the Operating Plan. R2 is simple enough: have a plan for emergencies. Recommend subcomponents be retired.

This is common sense. We do not need a Requirement to state that we have a specific time to update something issued by the RC. The RC can simply state have an update back by a certain time. This becomes a time “gotcha” issue during an audit or self report. This does not support system reliability.
This is in line with the justification for retiring R4, as this is also common sense. The RC will act immediately on all emergency notifications. The time frame of 30 minutes only become an auditable point and does not support reliability. If the requirement is not retired, at minimum the 30 minute criterion should be deleted.

EOP-011-1 R6

This is clearly stated in the Functional model under Real Time actions and does not need to be contained here; the RC will act immediately on all emergency notifications. Recommend retirement of this Requirement.

FAC-002-2 R2, R3, R4, R5

Inherent in R1.

FAC-003-4 R4

R4 is a notification process only, without the next step of clearing happening. This alone does not support reliability. The clearing of the encroaching vegetation does support reliability and is covered in R1, R2, and R6.

FAC-008-3 R1, R2, R3, R6

Generator Facility Ratings are not useful as they are often different from the capability determined through MOD-025. This Standard is usually based solely on the nameplate ratings of components that are covered by this Standard. Nameplate ratings become irrelevant with MOD-025-2, which captures the true capabilities of the asset. The TP will be notified of MOD-025-2 findings. If the RC wants to know the MOD-025-2 capabilities, then they can ask for it under IRO-010-2. The TOP can also request the same information under TOP-003-3.

IRO-001-4 R1

This is the basic functionality of an RC, as outlined in the Functional Model.

IRO-001-4 R2

Per the Functional Model, the BA, TOP, and GOP have reliability interactions with the RC, hence supporting a secure and stable reliable system. The DP does not receive instructions from the RC; rather, they receive information from the BA and TOP.

IRO-001-4 R3

This does not need to be a Requirement. The RC can simply ask whether the registered entity has the ability to accomplish the task. If the entity can't, the RC will take alternate actions.
Requirement 2 already provides for two active paths. A NERC certification program can ensure that the paths are being used periodically.

The RC's performance of the analysis is identified in R1. A separately enforceable requirement that the RC take the common-sense action of informing impacted entities is unnecessary.

IRO-018-1 R2, when implemented, will address RTA quality. The quality process could also assure RTA activity in accordance with utility practice (RTA, RTA backup, etc) without a hard standard-based 30 minute compliance threshold. Candidate for NERC certification program.

This requirement supports R2 and process can be verified through NERC Certification (process review).

Real time data transmission involves telemetry for thousands of points scanned or updated every few seconds. Retaining evidence of providing this volume of data is burdensome.

This requires demonstration of the negative and after the fact validation. This should be part of the Event Analysis process and not a NERC Requirement.

Requirement is administrative as it only specifies what must be in the agreement. R9 can be moved to a Guidance document since R9's second bullet states "The Nuclear Plant Generator Operator and the Transmission Entity are responsible for ensuring all the R9 elements are addressed." An item can be addressed by stating that it is not applicable for the entity.

This Requirement is predicated on the NERC exam which is the responsibility of NERC and the PCGC, not a Registered Entity. Recommend this Standard be retired. Operators are trained on competencies. Competencies can be verified through the training Standards. Certifications should be verified through the NERC Certification program.
PER-004-2 R1
In addition to being redundant with PER-003-1 (which we also recommend be retired), this requirement is part of the Certification process and does not need to be within a Standard.

PER-004-2 R2
Already covered by IRO-009 R1/R2.

PER-005-2 R5, R6
Operations Support Personnel know their impact on reliability and the task list. The prep and training used for OSP and the trainers is better spent for their job duties in support of reliability.

PRC-002-2 R1-R12 (ALL)
Disturbance monitoring is for post-event analysis and does not have direct impact on reliability. Guidelines and best business practices are sufficient to help improve accuracy and coordination. This very granular and prescriptive standard is not needed.

PRC-004-5(i) R2, R3, R5
Only R1 and R6 are required in order to support system reliability and stability. This Standard has too many time frames within each requirement and only provides a compliance gotcha if not followed. Time frames don’t support reliability. The intent of this Standard is if you have a mis-operation that you notify everyone involved and fix it so it (hopefully) doesn’t happen again.

PRC-005-6 R5
For PRC-005 Unresolved Maintenance Items (UMIs) are a low-volume and low-risk population with little to zero proven actual risk. We are not aware of any events where UMIs were cited as a primary or contributory cause to a BES outage in the Events Analysis program. Given the low volume of actual documented risk impacts and the low volume of self-logs or spreadsheet Notice of Penalty (SNOPs and NOPs), the UMI definition and requirement should be retired. If not retired, the UMIs should be modified to clearly state in the requirements or measures that compliance by exception is allowed and that regulated entities are not required to prove a null set of data.

TOP-001-4 R1
The basic functionality of a TOP is to operate or direct operation of equipment to maintain reliability. COM-002-4 clearly indicates that the TOP will be using Operating Instructions. Please see responses re IRO-001-4 for additional retirement justification.
Please see responses re IRO-001-4 for retirement justification.

TOP-001-4 R3

Requirement language is poorly worded because it is not specifically tied to Operating Instructions issued under TOP-001-4 R1 (i.e., Operating Instructions issued to maintain reliability). As such, every entity in R3 must maintain a list of every Operating Instruction issued or received, whether the OI was issued for reliability or not. The NERC Glossary of Terms definition for Operating Instruction pulls in all orders given to others to change the state of a BES Element, which means all planned switching orders issued by the operator, not just OIs issued for reliability. This requirement would be improved by both limiting the duration Operating Instruction evidence needs to be retained and clarifying that the requirement applies only to OIs from TOP-001-4 R1. The RSAW for TOP-001-4 R3 must also be corrected because it directs the audit to begin with the list of "all" Operating Instructions. Please see responses re IRO-001-4 for additional retirement justification.

TOP-001-4 R8

Covered by EOP-011 R5 or can be merged with same Requirement. Please see responses re IRO-001-4 for additional retirement justification.

TOP-001-4 R9

EMS quality codes suffice for notifications of RTU outages and were accepted by the RRO. However, the Regional Entity does not agree. So now unplanned outages need to be tracked for 30 minute overages for reporting. This detracts from reliability and does not enhance reliability, especially when these outages are already indicated by quality codes. Please see responses re IRO-001-4 for additional retirement justification.

TOP-001-4 R13

TOP-010-1 R3, when implemented, will address RTA quality. The quality process could also assure RTA activity in accordance with utility practice (RTA, RTA backup, etc.) without a hard Requirement-based 30-minute compliance threshold. Candidate for NERC Certification program.

TOP-001-4 R21

R20 already provides for two active paths and could address the concept of using the alternate periodically. A NERC certification program can ensure that the paths are being used periodically.

TOP-001-4 R24

R23 already provides for two active paths and could address the concept of using the alternate periodically. A NERC certification program can ensure that the paths are being used periodically.
The TOP's performance of the analysis is required by R1. A separately enforceable requirement that the TOP take the common-sense action of informing impacted entities is unnecessary. Could be verified through NERC certification.

TOP-002-4 R4, R5, and R7

Daily Operating Plans are not needed for BAs. Generation dispatch information can be gathered and shared through data provision requirements.

TPL-007-1 R1

Administrative.

VAR-001-4.1 R1

Duplicative of FAC-014.

VAR-001-4.2 R5

All of R5 appears to be administrative and a common-sense operations item. All entities keep impedance and tap information on their transformers. There isn't any reason to withhold information if requested, so a mandatory standard backed by sanctions to provide information within 30 days is simply an administrative clock. It's wasteful of both entity and regulator resources.

VAR-002-4.1 R3

Duplicative of other standards requiring data provision. There is no justification for the 30 minute timing requirement; if a timing requirement is retained, it is not a good reliability practice to require notification "within 30 minutes," but only if status is not restored within 30 minutes.

VAR-002-4.1 R4

Duplicative of other standards requiring data provision. There is no justification for a 30 minute time limit and this becomes a compliance trap.

VAR-002-4.1 R5

Duplicative of other standards requiring data provision.
TAPS appreciates the work of the Standards Efficiency Review Teams in developing this SAR. We believe the justifications for the SAR’s proposed retirements are well-explained. We also believe, however, that several additional requirements should be retired either as part of this SAR or in Phase 2, as set forth below.

**COM-001-3 R1, R2, R3, R4, R5, R6, R7, R8, R9, R10, R11, R12, and R13 (ALL)**

Basic functionality. This should be part of the certification process for BAs, TOPs and RCs. For all other entities (DPs and GOs), it is not necessary to require communication to be proven as the RC, TOP or BA will assure that they can make contact with these entities, and all entities have internal and external Interpersonal Communications Capabilities. This Standard basically states to have primary and back up communications (a phone). In today's world, basic, daily functionality necessitates multiple avenues of communications such as a land line phone, a cell phone, text messaging, a radio, satellite phone, etc. This Standard is not necessary for reliability; it only enforces a compliance “gotcha” if a registered entity’s primary communication system fails. There is not a reliability benefit from COM-001-3, just administrative burden. Communications are a basic function of every registered entity. The entire Standard should be retired.

**COM-002-4 R3**

R1 protocols cover all aspects of operating protocols. If communication is a reliability-related task, then training is covered in PER-005.

**COM-002-4 R4**

R4 and its subrequirements are a control and should not be an auditable item.

**COM-002-4 R5, R6, R7**

There should be no difference between an Operation Instruction under normal conditions and under Emergency conditions. R1 covers all Operating instructions. By imposing additional requirements on Operating Instructions that are issued during an emergency, R5, R6, and R7 make it necessary for entities to track whether each Operating Instruction was issued during an Emergency or during normal operations, in order to be able to demonstrate compliance. This administrative burden does not enhance reliability.

**EOP-005-3 R3**

Verify through NERC Certification program.

**EOP-008-2 R2**

Verify through NERC Certification program.

**EOP-008-2 R3, R4**

NERC Certified Operators can be addressed through Certification Program. R6 addresses Primary and Backup and can also address the sub-bullets in this Requirement. Sub-bullets of R4 can be addressed in R8.

**EOP-010-1 R2**

This is for situational awareness only and may be a mitigating feature of R1. If one K warning is not sent out, it becomes a non-compliance issue. This is also covered in EOP-011-1, R1.2.1.
EOP-010-1 R3.1
R3.1 is contained in R1. Per part 3.1, this will force the TOP to prove a negative if they did not receive any space weather information. Part 3.2 starts the mitigating processes for GMD events and part 3.3 concludes them. Part 3.1 is administrative in nature as alone, it does not accomplish anything; parts 3.2 and 3.3 mitigate the GMD. Recommend part 3.1 be retired. If not retired, part 3.1 should be modified to clearly state in the requirements or measures that proof of compliance is to show the steps only and entities are not required to prove a null set of data.

EOP-011-1 R1 subparts
R1.1 does not enhance or enforce reliability; it is only an auditable item. R1.2.2, R1.2.3, R1.2.4, R1.2.5, and R1.2.6 are all actions or event types that require actions. These are all event-specific. The Operating plan will just say that the operator will do something to mitigate these events. Then it becomes an auditable item in the Operating Plan, only. R1 is simple enough: have a plan for emergencies. Recommend subcomponents be retired.

EOP-011-1 R2 subparts
R2.1 does not enhance or enforce reliability; it is only an auditable item. R2.2.3 and its parts and R2.2.4, R2.2.5, R2.2.6, R2.2.7, R2.2.8 and R2.2.9 are all actions or event types that require actions. These are all event-specific. The Operating plan will just say that the operator will do something to mitigate these events. Then it becomes an auditable item in the Operating Plan. R2 is simple enough: have a plan for emergencies. Recommend subcomponents be retired.

EOP-011-1 R4
This is common sense. We do not need a Requirement to state that we have a specific time to update something issued by the RC. The RC can simply state have an update back by a certain time. This becomes a time “gotcha” issue during an audit or self report. This does not support system reliability.

EOP-011-1 R5
This is in line with the justification for retiring R4, as this is also common sense. The RC will act immediately on all emergency notifications. The time frame of 30 minutes only become an auditable point and does not support reliability. If the requirement is not retired, at minimum the 30 minute criterion should be deleted.

EOP-011-1 R6
This is clearly stated in the Functional model under Real Time actions and does not need to be contained here; the RC will act immediately on all emergency notifications. Recommend retirement of this Requirement.

FAC-002-2 R2, R3, R4, R5
Inherent in R1.

FAC-003-4 R4
R4 is a notification process only, without the next step of clearing happening. This alone does not support reliability. The clearing of the encroaching vegetation does support reliability and is covered in R1, R2, and R6.

FAC-008-3 R1, R2, R3, R6
Generator Facility Ratings are not useful as they are often different from the capability determined through MOD-025. This Standard is usually based solely on the nameplate ratings of components that are covered by this Standard. Nameplate ratings become irrelevant with MOD-025-2, which captures the true capabilities of the asset. The TP will be notified of MOD-025-2 findings. If the RC wants to know the MOD-025-2 capabilities, then they can ask for it under IRO-010-2. The TOP can also request the same information under TOP-003-3.

IRO-001-4 R1
This is the basic functionality of an RC, as outlined in the Functional Model.

IRO-001-4 R2
Per the Functional Model, the BA, TOP, and GOP have reliability interactions with the RC, hence supporting a secure and stable reliable system. The DP does not receive instructions from the RC; rather, they receive information from the BA and TOP.
IRO-001-4 R3
This does not need to be a Requirement. The RC can simply ask whether the registered entity has the ability to accomplish the task. If the entity can't, the RC will take alternate actions.

IRO-002-5 R3
Requirement 2 already provides for two active paths. A NERC certification program can ensure that the paths are being used periodically.

IRO-008-2 R3
The RC's performance of the analysis is identified in R1. A separately enforceable requirement that the RC take the common-sense action of informing impacted entities is unnecessary.

IRO-008-2 R4
IRO-018-1 R2, when implemented, will address RTA quality. The quality process could also assure RTA activity in accordance with utility practice (RTA, RTA backup, etc) without a hard standard-based 30 minute compliance threshold. Candidate for NERC certification program.

IRO-008-2 R5
This requirement supports R2 and process can be verified through NERC Certification (process review).

IRO-010-2 R3
Real time data transmission involves telemetry for thousands of points scanned or updated every few seconds. Retaining evidence of providing this volume of data is burdensome.

MOD-033-1 R2
This requires demonstration of the negative and after the fact validation. This should be part of the Event Analysis process and not a NERC Requirement.

NUC-001-3 R9
Requirement is administrative as it only specifies what must be in the agreement. R9 can be moved to a Guidance document since R9's second bullet states "The Nuclear Plant Generator Operator and the Transmission Entity are responsible for ensuring all the R9 elements are addressed." An item can be addressed by stating that it is not applicable for the entity.

PER-003-1 R1, R2, R3 (ALL)
This Requirement is predicated on the NERC exam which is the responsibility of NERC and the PCGC, not a Registered Entity. Recommend this Standard be retired. Operators are trained on competencies. Competencies can be verified through the training Standards. Certifications should be verified through the NERC Certification program.

PER-004-2 R1
In addition to being redundant with PER-003-1 (which we also recommend be retired), this requirement is part of the Certification process and does not need to be within a Standard.

PER-004-2 R2
Already covered by IRO-009 R1/R2.

PER-005-2 R5, R6
Operations Support Personnel know their impact on reliability and the task list. The prep and training used for OSP and the trainers is better spent for their job duties in support of reliability.

PRC-002-2 R1-R12 (ALL)
Disturbance monitoring is for post-event analysis and does not have direct impact on reliability. Guidelines and best business practices are sufficient to help improve accuracy and coordination. This very granular and prescriptive standard is not needed.

PRC-004-5(i) R2, R3, R5
Only R1 and R6 are required in order to support system reliability and stability. This Standard has too many time frames within each requirement and
only provides a compliance gotcha if not followed. Time frames don't support reliability. The intent of this Standard is if you have a mis-operation that you notify everyone involved and fix it so it (hopefully) doesn't happen again.

**PRC-005-6 R5**
For PRC-005 Unresolved Maintenance Items (UMIs) are a low-volume and low-risk population with little to zero proven actual risk. We are not aware of any events where UMIs were cited as a primary or contributory cause to a BES outage in the Events Analysis program. TOP-010-1 R3, when implemented, will address RTA quality. The quality process could also assure RTA activity in accordance with utility practice (RTA, RTA backup, etc.) without a hard Requirement-based 30-minute compliance threshold. Candidate for NERC Certification program.

**TOP-001-4 R20**
R20 already provides for two active paths and could address the concept of using the alternate periodically. A NERC certification program can ensure that the paths are being used periodically.

**TOP-001-4 R21**
R23 already provides for two active paths and could address the concept of using the alternate periodically. A NERC certification program can ensure that the paths are being used periodically.

**TOP-002-4 R3**
The TOP's performance of the analysis is required by R1. A separately enforceable requirement that the TOP take the common-sense action of informing impacted entities is unnecessary. Could be verified through NERC certification.

**TOP-002-4 R4, R5, and R7**
Daily Operating Plans are not needed for BAs. Generation dispatch information can be gathered and shared through data provision requirements.
TPL-007-1 R1
Administrative.

VAR-001-4.1 R1
Duplicative of FAC-014.

VAR-001-4.2 R5
All of R5 appears to be administrative and a common-sense operations item. All entities keep impedance and tap information on their transformers. There isn't any reason to withhold information if requested, so a mandatory standard backed by sanctions to provide information within 30 days is simply an administrative clock. It's wasteful of both entity and regulator resources.

VAR-002-4.1 R3
Duplicative of other standards requiring data provision. There is no justification for the 30 minute timing requirement; if a timing requirement is retained, it is not a good reliability practice to require notification “within 30 minutes,” but only if status is not restored within 30 minutes.

VAR-002-4.1 R4
Duplicative of other standards requiring data provision. There is no justification for a 30 minute time limit and this becomes a compliance trap.

VAR-002-4.1 R5
Duplicative of other standards requiring data provision.

Response

Ginette Lacasse - Seattle City Light - 1,3,4,5,6 - WECC, Group Name Seattle City Light Ballot Body

Answer Yes

Document Name

Comment

On behalf of our City Light SMEs, we believe these requirements should be retired.

Response

Wendy Center - U.S. Bureau of Reclamation - 1,5

Answer Yes

Document Name

Comment
Reclamation applauds this effort to retire duplicate and unnecessary requirements, and suggests a future project to consolidate additional requirements and evaluate the NERC Glossary of Terms for clarity and efficiency.

**Response**

**Karie Barczak - DTE Energy - Detroit Edison Company - 3,4,5, Group Name DTE Energy - DTE Electric**

**Answer**

Yes

**Document Name**

**Comment**

there is value examining the standards/requirements after 10 years of being enforceable. Data requests may be enforced by NERC Rules of Procedure Section 1600. A company's compliance culture is known now along with their internal controls. It makes sense to alleviate administrative burdens by a comprehensive review approach. We applaud NERC for this important effort.

There were 36 sets of responses, including comments from approximately 140 different people from approximately 95 companies representing 10 of the Industry Segments as shown in the table on the following pages.
Questions

1. Do you agree with the recommendations and rationales to retire the proposed requirements? If not, please state the standard(s) and requirement number(s) in your response(s) along with your rationale(s) for not retiring the requirement(s).

2. Do you agree that NERC should proceed with this project?

1. Do you agree with the recommendations and rationales to retire the proposed requirements? If not, please state the standard(s) and requirement number(s) in your response(s) along with your rationale(s) for not retiring the requirement(s).

Jeanne Kurzynowski - CMS Energy - Consumers Energy Company - 1,3,4,5 - RF, Group Name Consumers Energy Company

Answer
No

Document Name

Comment

Consumers Energy's position is that PRC-004-5(i) R4 can be removed as long as comments are added to R5 to clarify that a “meaningful investigation must occur to determine the root cause”. That statement can then be considered for the next SAR committee.

If the statement can’t be considered at the next SAR committee, then Consumers’ position would be to go with leaving R4.

Consumers Energy is in agreement with retirement of the other requirements recommended for retirement.

Response
Thank you for your comment and support. The additional requirements suggested are not identified within the SAR, and thus are out of scope for this project. Your comment will be referred to the Phase II Standards Efficiency Review Team for consideration in a future phase of their work.

Kelsi Rigby - APS - Arizona Public Service Co. - 1,3,5,6

Answer
No

Document Name

Comment

APS agrees with the vast majority of these recommended retirements, but APS disagrees that EOP-005-3 R8 is duplicative of activities covered by the Systematic Approach to Training in Reliability Standard PER-005-2. While system restoration is a reliability-related task that would be included in an entity's training program for its System Operators, it is a risk to assume that all Transmission Operators would provide System restoration training under its operations training program at the frequency and of the scope required under EOP-005-2, R8 (parts 8.1-8.5).

Response
Thank you for your comments.

The SER SDT agrees that Requirement R8 of EOP-005-3 be retained. The SER SDT also believes that Requirement R7 of EOP-006-3 be maintained. The PER-005 standard entails training processes, however it is does not specifically provide for system restoration training.
In PER-005-2 (revised from PER-005-1), the requirement to provide system restoration training no longer exists. In fact, the rationale to remove the minimum training requirement specific to system restoration from PER-005-1 was, in part, based on the existence of former Requirement R10 in EOP-005-2 (Requirement R8 of EOP-005-3). If Requirement R8 in EOP-005-3 is removed, then there will not be any requirements to provide system restoration training to operating personnel in any of the standards.

The SDT believes a specific requirement for system restoration training should be maintained because, while a system shutdown is low probability, it could have a high impact if not done properly.

The SER Phase I SDT will communicate with the SER Phase II SAR DT regarding Requirement R8 of EOP-005-3 and Requirement R7 in EOP-006-3 to determine if there is opportunity for revisions to PER-005-2 that would satisfy the training requirements specific to system restoration training; and, if there is that opportunity, then Requirement R8 of EOP-005-3 may be able to be looked at for retirement within that project or in a future project. If certain elements are essential within an entity’s training program, those elements should be explicitly identified in a future version of PER-005 prior to retiring from other standards; such as those identified in EOP-005.

Devin Shines - PPL - Louisville Gas and Electric Co. - 3,5,6 - SERC, Group Name Louisville Gas and Electric Company and Kentucky Utilities Company

Answer
No

Document Name
Comment

Louisville Gas and Electric Company and Kentucky Utilities Company (LG&E/KU) strongly disagrees with the proposed retirement of VAR-001-4.2 R2 because requiring each Transmission Operator to schedule, provide, and have evidence of scheduling sufficient reactive resources to regulate voltage levels under normal and Contingency conditions is necessary for the reliability of the BES. Reactive power resources are required to maintain voltage stability on the BES. Therefore, removing the requirement to ensure that each Transmission Operator schedules and provides sufficient reactive resources and has the documentation that sufficient reactive resources have been scheduled will be harmful to ensuring the reliability of the BES. Instead of retiring VAR-001-4.2 R2, there should be additional guidance (i.e. Implementation Guidance) to suggest how the transmission control center complies with R2.

Response
Thank you for your comment.

VAR-001-5, Requirement R2 is duplicative with the existing requirements in the TOP-001-4 and TOP-002-4 standards, which direct the TOP to plan and operate within in System Operating Limit (SOL) values, which includes system voltage limits. TOP-002-4, Requirement R1, requires the Transmission Operator to complete an Operational Planning Analysis (OPA) to assess whether any of its planned operations for the next day will exceed any System Operating Limits (SOL) ; TOP-001-4, Requirement R10 provides the criteria that the TOP shall use for determining SOL exceedances, which includes monitoring voltages. If an SOL violation is identified, then the TOP shall have an Operating Plan to mitigate the violation. TOP-001-4 and TOP-002-4 requirements direct the TOP to maintain reliability of the BES and mitigate SOL exceedances. If the TOP identifies no SOLs, voltage or otherwise, then the TOP has enough resources "scheduled" to maintain reliability of its BES. Requirements R1, R3, R4, R5 and R6 of VAR-001-5 ensure that a TOP require that voltage, reactive flows, and reactive resources are monitored, controlled, and maintained with limits. Finally, the FAC Standards ensure the proper BES Facilities and/or Elements are built with applicable equipment and system ratings.

Colby Bellville - Duke Energy - 1,3,5,6 - FRCC,SERC,RF, Group Name Duke Energy

Answer
No

Document Name
Comment
MOD-001-2: Duke Energy objects to the drafting team’s recommendation to retire MOD-001-2. FERC has not yet ruled on NAESB standards, and eliminating the responsibilities in MOD-001-2 would be in direct conflict with FERC Order 890 and would leave the industry with no consistency on calculation of ATC. Without a consistent method of calculating ATC throughout the industry this would potentially force a BA/TOP to inspect every Tag. This is avoided by having MOD-001-2 enforceable.

FAC-013-2: Duke Energy re-states its disagreement with the proposal regarding FAC-013-2. This standard was developed in response to FERC Directives in Orders 693 and 729. In the Orders, FERC directed NERC to establish a standard requiring Planning Coordinators to calculate transfer capability in the planning horizon (years one through five) and communicate the results. We disagree with the notion that FAC-013-2 has no bearing on reliability of the BES. In the FAC-013-2 — Planning Transfer Capability White Paper that was drafted during development of the standard, the standard’s benefit to reliability is stated:

“Further, FAC-013-2 requires that a Planning Transfer Capability Methodology Document (PTCMD) be developed for the calculation of Planning Transfer Capabilities (PTC) beyond 13 months in the future to provide additional information for the Planning Coordinator to use in planning for BES reliability.”

Another pertinent excerpt from the White Paper mentions how FAC-013-2 covers aspects of grid reliability not covered in the TPL standards:

“The TPL planning standards do not specify the need to document transfer capability calculation methods that may be used in the planning horizon. To cover that aspect of planning for BES reliability, the FAC-013-2 standard specifies that Planning Coordinators must perform PTC calculations as part of the planning process, that the method must be documented and shared with other entities as specified in the standard.”

Lastly, see the quote from the White Paper below that further illustrates the necessity of FAC-013-2, and how it helps address past concerns from FERC.

“The application of FAC-013-2 will provide PTC values that are an indicator of the robustness of the future transmission system and facilitate communication between adjacent Planning Coordinators. It will result in meeting FERC’s concerns regarding transfer capability in the planning horizon and provide important information that Planning Coordinators will be able to apply in their efforts to reliably plan the BES.”

IRO-017 (R3): FERC mandated that RC’s and TP’s coordinate on the impact of known outages on TPL assessment results. It appears that the SDT believes that this can be retired because the TPL standard requires TP’s to send their assessment results to adjacent PC’s and TP’s and anyone else who asks. The result of this retirement may mean that nothing gets to the RC unless they ask and even then it doesn’t require the TP and RC to work together to resolve conflicts.

Response

Thank you for your comments.

IRO-017-1, Requirement R3: IRO-017-1 is not entirely duplicative of TPL-001-4, Requirement R8. The RC should be added as a named recipient to TPL-001-4 prior to considering IRO-017-1, Requirement R3 for retirement. The SER Phase I SDT will communicate with the SER Phase II SAR DT regarding Requirement R3 of IRO-017-1 to determine if there is opportunity for revisions to TPL-001-4 to name the RC as a recipient; and, if there is that opportunity, then Requirement R3 of IRO-017-1 may be able to be looked at for retirement within that project or in a future project.

MOD-004-1, MOD-008-1, MOD-028-2, MOD-029-2a, MOD-030-3 and proposed MOD-001-2 – ATC/AFC, as well as tags (or eTags) are commercially-focused elements, facilitating interchange and balancing of interchange. The real-time system operators are ambivalent of these commercial arrangements, as they must maintain reliability of the BES according to System Operating Limits (SOLs) and Interconnection Reliability Operating Limits (IROLs). If a scheduled interchange would violate SOLs or IROLs, the real-time operators must disregard the scheduled interchange and operate the system to its actual reliability limits. This observation is reinforced by NERC’s statement in the 2015 filing related to risk-based reliability proposing removal of the Interchange Authority from the compliance registry, where they stated, “NERC proposes to remove interchange authorities as functional entities, explaining that the activities of the interchange authority are commercial in nature and, thus, the removal will have little if any impact on reliability of the bulk electric system.” FERC acknowledged this in their March 15, 2015 order, where
they stated, “we approve NERC’s proposed removal of the interchange authority as a functional entity. As explained by NERC, the interchange authority performs a commercial function, essentially quality control activity in verifying and communicating interchange schedules.”

FAC-013-2 - It is important to note the white paper referenced in the above comment was written in 2010. There have been significant substantive changes to the body of standards since that time. For example, referenced TPL and MOD standards have been superseded by newer versions, and other standards never became effective (FAC-012).

The white paper does not demonstrate continued need for the FAC-013-2 standard for the following reasons:

- As stated in the SER’s justification for the retirement of FAC-013, “assessing transfer capability above the “known commitments for Firm Transmission Service and Interchange” required by TPL-001-4 Requirement R1.1.5 (2014), serves a market function as opposed to securing System reliability.” It is true that some entities depend on power transfers to meet their load obligations, and assessing transfers would provide that entity a reliability benefit, but that is not true for all other entities.

- Also as stated in the SER’s justification for the retirement of FAC-013, “R4 only requires the assessment to be performed for one year in the Near-Term Transmission Planning Horizon. This year can be arbitrarily chosen by the PC and the analysis does not guarantee transmission service that is necessary for System reliability.”

- The FAC-013 standard does not contain a requirement to develop or communicate “transfer capabilities” (values).

- There is no minimum performance requirement or minimum acceptable transfer capability or margin documented in the standard.

The requirement for Planning Coordinators (PC) to have a methodology for and to perform an annual assessment of Transfer Capability for a single year in the Near-Term Transmission Planning Horizon does not benefit System reliability beyond that provided by other Reliability Standards. This Reliability Standard is primarily administrative in nature and does not require specific performance metrics or coordination among functional entities. In general, FAC-013-2 fails to meet System reliability objectives in the following ways:

- Individual PCs develop their own methodologies that may be very disparate from each other.

- Impacted functional entities, such as Transmission Planners (TP), do not have meaningful input into the methodology or analysis.

- The standard does not specify performance metrics or define what acceptable system performance is.

- Entities that receive the methodology or assessment results are not obligated to use or even consider the information in their assessments.

- R4 only requires the assessment to be performed for one year in the Near-Term Transmission Planning Horizon. This year can be arbitrarily chosen by the PC and the analysis does not guarantee transmission service that is necessary for System reliability.

- Assessing transfer capability above the “known commitments for Firm Transmission Service and Interchange” required by TPL-001-4 (R1.1.5), serves a market function as opposed to securing System reliability.

- Assessing transfer capability in the planning horizon is a method to test the robustness of the system. Robustness testing of a system is not an indicator of reliability because there is no metric for robustness. Additionally, the proposed retirement of FAC-013 does not preclude any entity from performing studies to assess transfer capability for their own purposes. The reliability benefit of doing such an assessment varies from entity to entity, with some entities not having a benefit for the assessment at all. The 2013 NERC Independent Experts Review Project identified R2 and R3 as administrative and recommended them for retirement. R3 was approved for retirement by FERC in 2014.

We agree with the majority of the retirement recommendations of the SER teams in all but a few instances. These are listed below:

INT-009-2.1 R2

The SAR rationale is that it is redundant with NAESB business practices. However, NAESB rules are not applicable in Ontario. While NAESB is more stringent, during reliability curtailments, system operators require flexibility given to them by INT-010 to manage the e-tags.
This requirement is needed for the system operator to manage the grid.

IRO-008-2 R6

Keeping impacted entities informed in a timely fashion is good operating practice.

TOP-001-4 R16

This requirement is needed for the system operator to manage the grid.

TOP-001-4 R17

This requirement is needed for the system operator to manage the grid.

In the rationale presented to retire COM-002-4 R2, the SER is assuming or expecting that initial training for each of its operating personnel responsible for the Real-time operation of the interconnected Bulk Electric System is being covered in PER-005-2. PER-005-2 does not prescribe what training entities must include.

In the rationale presented to retire EOP-005-3 R8, the SER is assuming or expecting that System restoration is a reliability-related task and would be included in an entity's training program for its System Operators. PER-005-2 does not prescribe what training entities must include.

FAC-003-4 Requirements R5 and R6: These requirements should be retired because R5 and R6 are controls and good utility practices but do not enhance BES reliability over R1 and R2. R1 and R2 fulfill the purpose of the standard through measurable actions. Also, the NERC Rules of Procedure allow consideration for extenuating circumstances relative to R5.

FAC-008-3 Requirement R8: Requirements R.8.1.2 and R.8.2 are not duplicative of TOP-003-3 or IRO-010-2. FAC-008-3 Requirement R8.2 necessitates that TOs provide to their associated RCs, PCs, TPs, TOs and TOPs the Requirement R8.1.2 “identity of the most limiting equipment of the Facilities,” Requirement R8.2.1 “identity of the existing next most limiting equipment of the Facilities,” and Requirement R8.2.2 “Thermal Rating for the next most limiting equipment identified in Requirement R8, Part 8.2.1,” whereas the TOP-003-3 or IRO-1010-2 standards do not appear to have this requirement.

IRO-010-2 Requirement R1 specifies the types of data that an RC collects from applicable entities, so that the RC may perform OPAs, RTM and RTAs. The OPA RTM and RTA definitions (in the NERC Glossary of Terms) each mention “Facility Ratings” as an input (into OPA’s, RTM and RTA’s). However, neither IRO-010-2, Requirement R1, nor the OPA, RTM and/or RTA definitions (in the NERC Glossary of Terms) contain the level of specificity in FAC-008-3 Requirement R8 (to “identity the most and the existing next most limiting equipment of the Facilities” and “the Thermal Rating for the next most limiting equipment identified in Requirement R8, Part 8.2.1”). Similarly, TOP-003-3 Requirement R5 requires identified entities to fulfill a data specification provided by a BA or TOP so that OPAs, RTM, and RTA’s may be performed. As in the case of IRO-010-2 Requirement R1 and the OPA, RTM and RTA definitions, TOP-003-3 does not require identification of the most and the existing next most limiting equipment of the Facilities and the Thermal Rating for the next most limiting equipment identified in FAC-008-3 Requirement R8, Part 8.2.1.”

NUC-001-3 R1: The requirement is administrative in nature, as Requirement R1 actions are inherent in Requirement R2 since each entity “shall have in effect” an agreement.

Response
Thank you for your comments:

**INT-009-2.1, Requirement R2:** This requirement can be retired under Paragraph 81 criteria, as the requirement is redundant with approved NERC Reliability Standard BAL-005-1, Requirement R7. As discussed in the SAR, the SDT recommends retirement of INT-009-2.1, Requirement R2.

**FAC-008-3/4, Requirement 8:** This requirement is duplicative of the data provision standards MOD-032-1, IRO-010-2, and TOP-003-3. These requirements are duplicative of the data provision standards MOD-032-1, IRO-010-2, and TOP-003-3. In MOD-032-1, Requirement R1, the Planning Coordinator (PC) and Transmission Provider (TP) develop modeling data requirements and reporting according to Attachment 1. In MOD-032-1 R2, the Transmission Operator (TO) and Generator Operator (GO) provide power capabilities data in Item 3, and facility ratings data in Items 3(f), 4(c) and 6(g) in the steady-state column of Attachment 1, as requested by the TP or PC.

IRO-010-2, Requirement R1 and TOP-003-3, Requirement R1 require the Reliability Coordinator (RC) and the Transmission Operator (TOP) to list necessary data and information needed to perform its Operating Planning Analyses and Real-Time Assessments. This data necessarily includes facility ratings as inputs to SOL monitoring. IRO-010-2, Requirement R3 and TOP-003-3, Requirement R5 require that the TO and the GO to respond to the RC’s and the TOP’s requests.

**COM-002-4, Requirement R2:** While the SDT agrees that training on communications protocols would fall into an entity’s systematic approach to training, the requirements do not explicitly mandate training on communications protocols. It is essential for all operators to have a common level of understanding and be trained in three-part communication. During development of COM-002-4, it was determined that because PER-005 would not meet the NERC Board of Trustees November 7, 2013 Resolution to mandate training, that SDT included a requirement to conduct initial training in order to ensure that a baseline of training is complete before an individual is placed in a position to use the communications protocols. Requiring initial training is not overly burdensome to an entity and any subsequent training can be covered in PER-005 or through the operator feedback loop as determined by the entity.

The SER Phase I SDT will communicate with the SER Phase II SAR DT regarding Requirement R2 of COM-002-4 to determine if there is opportunity for revisions to PER-005-2 that would satisfy the training requirements specific to training on communications protocols; and, if there is that opportunity, then Requirement R2 of COM-002-4 may be able to be looked at for retirement within that project or in a future project.

**EOP-005-3, Requirement R8 and EOP-006-3 Requirement R7:**

The SER SDT agrees that Requirement R8 of EOP-005-3 be retained. The SER SDT also believes that Requirement R7 of EOP-006-3 be maintained. The PER-005 standard entails training processes, however it is does not specifically provide for system restoration training.

In PER-005-2 (revised from PER-005-1), the requirement to provide system restoration training no longer exists. In fact, the rationale to remove the minimum training requirement specific to system restoration from PER-005-1 was, in part, based on the existence of former Requirement R10 in EOP-005-2 (Requirement R8 of EOP-005-3) and Requirement R9 in EOP-006-2 (Requirement R7 of EOP-006-3). If Requirement R8 in EOP-005-3 is removed, then there will not be any requirements to provide system restoration training to operating personnel in any of the standards.

The SDT team believes a specific requirement for system restoration training should be maintained, because while a system shutdown is low probability, it could have a high impact if not done properly. The SER Phase I SDT will communicate with the SER Phase II SAR DT regarding Requirement R8 of EOP-005-3 and Requirement R7 in EOP-006-3 to determine if there is opportunity for revisions to PER-005-2 that would satisfy the training requirements specific to system restoration training; and, if there is that opportunity, then Requirement R8 of EOP-005-3 and Requirement R7 in EOP-006-3 may be able to be looked at for retirement within that project or in a future project. If certain elements are essential within an entity’s training program, those elements should be explicitly identified in a future version of PER-005 prior to retiring from other standards; such as those identified in EOP-005 and EOP-006.

**NUC-001-3 R1:** Is out of scope for this projects, as it is not listed in the final SAR. The SER Phase I SDT will communicate with the SER Phase II SAR DT regarding Requirement R1 of NUC-001-3 to determine if there is opportunity for revisions; and, if there is that opportunity, then Requirement R1 of NUC-001-3 may be able to be looked at for retirement within that project or in a future project.

Comment
IESO thanks the Standard Efficiency Review (SER) teams for all their hard work reviewing and analyzing the NERC Standards and requirements for possible retirements. The IESO agrees with the majority of the retirement recommendations of the SER teams in all but a few instances. These are listed below:

**INT-009-2.1 R2**

The SAR rationale is that it is redundant with NAESB business practices. NAESB is not regulatory and, therefore, we are not measured by compliance to NAESB. Furthermore, we do not design our business practices around NAESB rules.

While NAESB is more stringent, during reliability curtailments, we need the flexibility given to us by INT-010. This standard allows us to take action to address a reliability need and manage the e-tags after the concern has been addressed – allowing us to manage the e-tags later. We still need this flexibility as the e-tag system does not feed our dispatch tool directly and we would not want to be the “hold up” for a reliability curtailment so we can line up e-tag with our dispatch tools.

**IRO-002-5 R4**

This is fundamental to how we manage the grid. In the absence of this standard the RC's ability to monitor its BES area may become unavailable or deteriorated with no knowledge to the system operator.

**IRO-008-2 R6**

When and RC, TOP or BA becomes aware another RC is exceeding an SOL or an IROL that RC, TOP or BA may need to take mitigating actions to maintain reliability, therefore we disagree that with the SAR rationale that this requirement is administrative in nature and does provide reliability benefit. Keeping impacted entities informed in a timely fashion is good operating practice.

**TOP-001-4 R16**

This is fundamental to how we manage the grid. In the absence of this standard the TOP’s ability to monitor its BES area may become unavailable or deteriorated with no knowledge to the system operator.

**TOP-001-4 R17**

This is fundamental to how we manage the grid. In the absence of this standard the TOP’s ability to monitor its BES area may become unavailable or deteriorated with no knowledge to the system operator.

**Response**

Thank you for your comments.

**INT-009-2.1, Requirement R2:** This requirement can be retired under Paragraph 81 criteria, as the requirement is redundant with approved NERC Reliability Standard BAL-005-1, Requirement R7. As discussed in the SAR, the SDT recommends retirement of INT-009-2.1, Requirement R2.

**TOP-001-4, Requirements R16 and R17** – The SDT agrees that these requirements are necessary for the real-time operators to be assured of having the tools necessary to monitor the BES and does not intend to seek retirement of these Requirements during this phase of the project.

**IRO-002-5, Requirement R4** - The SDT agrees that these requirements are necessary for the real-time operators to be assured of having the tools necessary to monitor the BES and does not intend to seek retirement of this Requirement during this phase of the project.
IRO-008-2, Requirement R6 – Although IRO-008-2, Requirement R6 appears to be administrative in nature, the SDT believes there are reliability benefits to knowing what actions were taken to prevent or mitigate the exceedance. Therefore, the team does not intend to seek retirement of this Requirement during this phase of the project.

Sean Cavote - PSEG - 1,3,5,6 - NPCC,RF, Group Name PSEG REs

Answer No

Document Name

Comment

PSEG generally agrees with the purpose, scope, and content of the SAR, with the following exceptions:

**FAC-003-4 Requirements R5 and R6**: These requirements should be retired because R5 and R6 are controls and good utility practices but do not enhance BES reliability over R1 and R2. R1 and R2 fulfill the purpose of the standard through measurable actions. Also, the NERC Rules of Procedure allow consideration for extenuating circumstances relative to R5.

**FAC-008-3 Requirement R8**: Requirements R.8.1.2 and R8.2 are not duplicative of TOP-003-3 or IRO-010-2. FAC-008-3 Requirement R8.2 necessitates that TOs provide to their associated RCs, PCs, TPs, TOs and TOPs the Requirement R8.1.2 “identity of the most limiting equipment of the Facilities,” Requirement R8.2.1 “identity of the existing next most limiting equipment of the Facilities,” and Requirement R8.2.2 “Thermal Rating for the next most limiting equipment identified in Requirement R8, Part 8.2.1,” whereas the TOP-003-3 or IRO-1010-2 standards do not appear to have this requirement.

**IRO-010-2 Requirement R1**: specifies the types of data that an RC collects from applicable entities, so that the RC may perform OPAs, RTM and RTAs. The OPA RTM and RTA definitions (in the NERC Glossary of Terms) each mention “Facility Ratings” as an input (into OPA’s, RTM and RTA’s). However, neither IRO-010-2, Requirement R1, nor the OPA, RTM and/or RTA definitions (in the NERC Glossary of Terms) contain the level of specificity in FAC-008-3 Requirement R8 (to “identity the most and the existing next most limiting equipment of the Facilities” and “the Thermal Rating for the next most limiting equipment identified in Requirement R8, Part 8.2.1”). Similarly, TOP-003-3 Requirement R5 requires identified entities to fulfill a data specification provided by a BA or TOP so that OPAs, RTM, and RTA’s may be performed. As in the case of IRO-010-2 Requirement R1 and the OPA, RTM and RTA definitions, TOP-003-3 does not require identification of the most and the existing next most limiting equipment of the Facilities and the Thermal Rating for the next most limiting equipment identified in FAC-008-3 Requirement R8, Part 8.2.1.”

**NUC-001-3 R1**: The requirement is administrative in nature, as Requirement R1 actions are inherent in Requirement R2 since each entity “shall have in effect” an agreement.

Response

Thank you for your comments.

**FAC-003-4 R5 and R6, and NUC-001-3** are not identified within the SAR, and thus are out of scope for this project. Your comment will be referred to the Standards Efficiency Review Team for consideration in a future phase of their work.

**FAC-008-3/4, Requirement 8**: This requirement is duplicative of the data provision standards MOD-032-1, IRO-010-2, and TOP-003-3. These requirements are duplicative of the data provision standards MOD-032-1, IRO-010-2, and TOP-003-3.

In MOD-032-1, Requirement R1, the Planning Coordinator (PC) and Transmission Provider (TP) develop modeling data requirements and reporting according to Attachment 1. In MOD-032-1 R2, the Transmission Operator (TO) and Generator Operator (GO) provide power capabilities data in Item 3, and facility ratings data in Items 3(f), 4(c) and 6(g) in the steady-state column of Attachment 1, as requested by the TP or PC.
IRO-010-2, Requirement R1 and TOP-003-3, Requirement R1 require the Reliability Coordinator (RC) and the Transmission Operator (TOP) to list necessary data and information needed to perform its Operating Planning Analyses and Real-Time Assessments. This data necessarily includes facility ratings as inputs to SOL monitoring. IRO-010-2, Requirement R3 and TOP-003-3, Requirement R5 require that the TO and the GO to respond to the RC’s and the TOP’s requests.

NUC-001-3 R1: Is out of scope for this projects, as it is not listed in the final SAR. The SER Phase I SDT will communicate with the SER Phase II SAR DT regarding Requirement R1 of NUC-001-3 to determine if there is opportunity for revisions; and, if there is that opportunity, then Requirement R1 of NUC-001-3 may be able to be looked at for retirement within that project or in a future project.

</tbody>
</table>

In general Southern Company agrees with the proposed requirements for retirement. However, Southern Company disagrees with the recommendations and rationales to retire the proposed requirements as noted below:

Southern does not agree with the recommendation and rationale to retire BAL-005-1 R4 and R6. We believe that it is in the best interest of both clarity and reliability to have these requirements in both the BA and TOP standards as these functions are separately registered.

Southern does not agree that NERC should withdraw the petition regarding MOD-001-2. The combined effect of both MOD-001-2 and NAESB's WEQ-023 strike the appropriate balance between reliability and market related issues.

Southern Company recommends delaying the retirement of MOD-001-1a, MOD-004-1, MOD-008-1, MOD-028-2, MOD-029-2a and MOD-030-3 until NERC's MOD-001-2 and NAESB's WEQ-023 are approved by the Commission (FERC). Once approved by the Commission, the industry should have adequate time to ensure a seamless transition to the new construct.

Southern believes that reliability-related tasks are determined by each individual entity. There is no obligation in the current NERC Reliability Standards to include the topics covered in EOP-005-3 (R8) or EOP-006-3 (R7) in the reliability related tasks for a TOP.

Southern believes that reliability related tasks are determined by each individual entity. There is no obligation in a NERC standard requirement to include the topics covered in COM-002-4 R2 in the Reliability Related tasks for a TOP.

Southern does not agree with the rationale for retiring IRO-002-5 R4. While we agree with the statement in the rationale, it doesn't cover how an Operator has authority over various entities to direct the cancellation of outages. It's not found anywhere else in the NERC standards and for entities where the TOP may be a different company than the RC, an appropriately written NERC standard would help ensure that the RC Operator had the authority to deny a telecommunications outage that affected key operational data provided by the TOP to the RC.

Southern does not agree with the recommendation for IRO-014-3 R3. R1.1 does not require notification of RCs and leaves it to the discretion of the RC experiencing the emergency to determine who is notified. Moreover, what if the Emergency being experienced is not covered in an Operating Procedure, Process or Operating Plans? The rationale assumes that all Operating Plans are generic and would cover all possible Emergencies experienced, but R1 of the standard doesn't state that.

Southern does not agree with the overall rationale for retiring TOP-001-4 R16 and R17. While we support the wording in the rationale, it doesn't fully encapsulate how an Operator has authority over entities to direct the cancellation of outages. This language is not found anywhere else in the NERC Reliability Standards and for entities where the TO and GO may be a different company than the TOP, an appropriately written NERC standard would help ensure that the TOP Operator had the authority to deny a telecommunications outage that affected key operational data provided by the TO and/or GO to the TOP.
Response

Thank you for your comments.
The SER SDT agrees that Requirement R4 and R6 of BAL-005-1 be retained, as both requirements are specific to the calculation of the ACE. The TOP-010-1(i) R2 covers ACE with the wording of “analysis functions and Real-time monitoring” but does not cover specifics such as quality flags for missing or invalid data that is part of the requirement for BAL-005-1 R4 or the accuracy of scan rates that is part of BAL-005-1 R6.

In TOP-010-1(i) R2 (revised from TOP-010-1) the requirement R2 covers the calculation and monitoring of ACE, while the language “Each Balancing Authority shall implement an Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its analysis functions and Real-time monitoring” this is only addressing quality. In BAL-005-1 (revised from BAL-005-0.2b) the requirement R4 states “The Balancing Authority shall make available to the operator information associated with Reporting ACE including, but not limited to, quality flags indicating missing or invalid data. Requirement R6 of BAL-005-1 states “Each Balancing Authority that is within a multiple Balancing Authority Interconnection shall implement an Operating Process to identify and mitigate errors affecting the accuracy of scan rate data used in the calculation of the Reporting ACE for each Balancing Authority Area. Both of these requirements are specific to identifying missing or invalid data plus scan rates not just the quality of the Real-time data.

The SER Phase I SDT will communicate the SR Phase II SAR DT regarding Requirement R4 and R6 of BAL-005-1 to determine if there is opportunity for revisions to TOP-010-1(i) R2 that would satisfy the missing or invalid data plus scan rates and if there is that opportunity, then Requirements R4 and R6 of BAL-005-1 may be able to be looked at for retirement within the project or in a future project.

EOP-005-3, Requirement R8 and EOP-006-3 Requirement R7:
The SER SDT agrees that Requirement R8 of EOP-005-3 be retained. The SER SDT also believes that Requirement R7 of EOP-006-3 be maintained. The PER-005 standard entails training processes, however it is does not specifically provide for system restoration training.

In PER-005-2 (revised from PER-005-1), the requirement to provide system restoration training no longer exists. In fact, the rationale to remove the minimum training requirement specific to system restoration from PER-005-1 was, in part, based on the existence of former Requirement R10 in EOP-005-2 (Requirement R8 of EOP-005-3) and Requirement R9 in EOP-006-2 (Requirement R7 of EOP-006-3). If Requirement R8 in EOP-005-3 is removed, then there will not be any requirements to provide system restoration training to operating personnel in any of the standards.

The SDT team believes a specific requirement for system restoration training should be maintained, because while a system shutdown is low probability, it could have a high impact if not done properly The SER Phase I SDT will communicate with the SER Phase II SAR DT regarding Requirement R8 of EOP-005-3 and Requirement R7 in EOP-006-3 to determine if there is opportunity for revisions to PER-005-2 that would satisfy the training requirements specific to system restoration training; and, if there is that opportunity, then Requirement R8 of EOP-005-3 and Requirement R7 in EOP-006-3 may be able to be looked at for retirement within that project or in a future project. If certain elements are essential within an entity’s training program, those elements should be explicitly identified in a future version of PER-005 prior to retiring from other standards; such as those identified in EOP-005 and EOP-006.

COM-002-4 Requirement R2:
While training on communications protocols would fall into an entity’s systematic approach to training, the requirements do not explicitly mandate training on communications protocols. It is essential for all operators to have a common level of understanding and be trained in three-part communication. During development of COM-002-4, it was determined that because PER-005 would not meet the NERC Board of Trustees November 7, 2013 Resolution to mandate training, that SDT included a requirement to conduct initial training in order to ensure that a baseline of training is complete before an individual is placed in a position to use the communications protocols. Requiring initial training is not overly burdensome to an entity and any subsequent training can be covered in PER-005 or through the operator feedback loop as determined by the entity.

The SER Phase I SDT will communicate with the SER Phase II SAR DT regarding Requirement R2 of COM-002-4 to determine if there is opportunity for revisions to PER-005-2 that would satisfy the training requirements specific to training on communications protocols; and, if there is that opportunity, then Requirement R2 of COM-002-4 may be able to be looked at for retirement within that project or in a future project.

IRO-014-3, Requirement R3: The reliability objective of “notification” is mandated as a part of the RC having and implementing Operating Procedures, Operating Processes, or Operating Plans that include criteria and processes for notifications (R1, Part 1.1), this ensures RC operations are coordinated to maintain reliability of the
MOD-004-1, MOD-008-1, MOD-028-2, MOD-029-2a, MOD-030-3 and proposed MOD-001-2 – ATC/AFC, as well as tags (or eTags) are commercially-focused elements, facilitating interchange and balancing of interchange. The real-time system operators are ambivalent of these commercial arrangements, as they must maintain reliability of the BES according to System Operating Limits (SOLs) and Interconnection Reliability Operating Limits (IROLs). If a scheduled interchange would violate SOLs or IROLs, the real-time operators must disregard the scheduled interchange and operate the system to its actual reliability limits. This observation is reinforced by NERC’s statement in the 2015 filing related to risk-based reliability proposing removal of the Interchange Authority from the compliance registry, where they stated, “NERC proposes to remove interchange authorities as functional entities, explaining that the activities of the interchange authority are commercial in nature and, thus, the removal will have little if any impact on reliability of the bulk electric system.” FERC acknowledged this in their March 15, 2015 order, where they stated, “we approve NERC’s proposed removal of the interchange authority as a functional entity. As explained by NERC, the interchange authority performs a commercial function, essentially quality control activity in verifying and communicating interchange schedules.”

TOP-001-4, Requirements R16 and R17 – The SDT agrees that these requirements are necessary for the real-time operators to be assured of having the tools necessary to monitor the BES and does not intend to seek retirement of these Requirements during this phase of the project.

IRO-002-5, Requirement R4 - The SDT agrees that these requirements are necessary for the real-time operators to be assured of having the tools necessary to monitor the BES and does not intend to seek retirement of this Requirement during this phase of the project.

Michael Godbout - Hydro-Québec TransÉnergie - 1 - NPCC

<tbody>
<tr>
<td>Answer</td>
<td>No</td>
</tr>
</tbody>
</table>

We agree with all the requirements proposed for retirement and with their rationales, except for the following:

FAC-008-3 R7

We disagree with the rationale. As stated in the Hydro-Québec TransÉnergie's comments on the previous SAR, requirement FAC-008-3 R7 is not entirely redundant to MOD-032, IRO-010 and TOP-003 because the latter requirements to do address all the functions of FAC-008-3 R7. Namely, the TO function is excluded. The rationale should state that the TO function request is not essential to reliability and on that basis it is dropped and the remaining obligations are redundant to the aforementioned alternatives. If that is out of scope of this project, it should be addressed in the follow-on project. We consider that the requirement should be removed, one way or the other.

IRO-002-5 R6

We disagree with the stated rationale. As stated in the Hydro-Québec TransÉnergie’s comments on the previous SAR, R6 requires communication over a “redundant infrastructure” which is not mentioned in requirement R5. Arguably, that aspect could be considered redundant to R2. In that case, the recommendation would remain valid.

COM-002-4 R2, EOP-005-3 R8, EOP-006-3 R7

The proposed transfer to PER-005-2 could leave a gap, as per our informal comments on the matter in the previous comment round.

IRO-006-5 R1

The applicable entity in requirement R1 is the RC. IRO-001-4 R2 is not applicable to the RC function. As such, we disagree with the rationale and the recommendation.

IRO-017-1 R3
We disagree on the stated rationale and with the recommendation. Removing R3 shifts the responsibility for identifying the affected RC by a plan from the planner to the RC. Therefore, R3 is not duplicative with TPL-001-4 R8.

MOD-020-0 R1

We disagree with the rationale. MOD-020-1 allows operators (RC and TOP) to request information. In contrast, MOD-031-2 does not give RC or TOP the authority to request DSM information. IRO-010-2 does give the RC that authority but does not apply to the RP. So unless the NERC functional model guarantees that the DP has that information, there could be a gap.

PRC-004-5(i) R4

We disagree with the rationale and with the recommendation. If t is the case that auditors consider a non-compliance with respect to R2 or R3 a violation regardless of R4, then R4 is indeed useless. Since the intention of the standard was to allow an entity to extend its examination period, R2, R3 and R4 should be rewritten to achieve this intent. Cutting out R4 changes the intention of the standard to provide extensions to entities in order for them to identify causes of misops.

Thank you for your comments:

**FAC-008-3/4, Requirement 8:** This requirement is duplicative of the data provision standards MOD-032-1, IRO-010-2, and TOP-003-3. These requirements are duplicative of the data provision standards MOD-032-1, IRO-010-2, and TOP-003-3.

In MOD-032-1, Requirement R1, the Planning Coordinator (PC) and Transmission Provider (TP) develop modeling data requirements and reporting according to Attachment 1. In MOD-032-1 R2, the Transmission Operator (TO) and Generator Operator (GO) provide power capabilities data in Item 3, and facility ratings data in Items 3(f), 4(c) and 6(g) in the steady-state column of Attachment 1, as requested by the TP or PC.

IRO-010-2, Requirement R1 and TOP-003-3, Requirement R1 require the Reliability Coordinator (RC) and the Transmission Operator (TOP) to list necessary data and information needed to perform its Operating Planning Analyses and Real-Time Assessments. This data necessarily includes facility ratings as inputs to SOL monitoring. IRO-010-2, Requirement R3 and TOP-003-3, Requirement R5 require that the TO and the GO to respond to the RC’s and the TOP’s requests.

**IRO-002-5, Requirement R4** - The SDT agrees that these requirements are necessary for the real-time operators to be assured of having the tools necessary to monitor the BES and does not intend to seek retirement of this Requirement during this phase of the project.

**EOP-005-3, Requirement R8 and EOP-006-3 Requirement R7:**

The SER SDT agrees that Requirement R8 of EOP-005-3 be retained. The SER SDT also believes that Requirement R7 of EOP-006-3 be maintained. The PER-005 standard entails training processes, however it is does not specifically provide for system restoration training.

In PER-005-2 (revised from PER-005-1), the requirement to provide system restoration training no longer exists. In fact, the rationale to remove the minimum training requirement specific to system restoration from PER-005-1 was, in part, based on the existence of former Requirement R10 in EOP-005-2 (Requirement R8 of EOP-005-3) and Requirement R9 in EOP-006-2 (Requirement R7 of EOP-006-3). If Requirement R8 in EOP-005-3 is removed, then there will not be any requirements to provide system restoration training to operating personnel in any of the standards.

The SDT team believes a specific requirement for system restoration training should be maintained, because while a system shutdown is low probability, it could have a high impact if not done properly. The SER Phase I SDT will communicate with the SER Phase II SAR DT regarding Requirement R8 of EOP-005-3 and Requirement R7 in EOP-006-3 to determine if there is opportunity for revisions to PER-005-2 that would satisfy the training requirements specific to system restoration training.
and, if there is that opportunity, then Requirement R8 of EOP-005-3 and Requirement R7 in EOP-006-3 may be able to be looked at for retirement within that project or in a future project. If certain elements are essential within an entity’s training program, those elements should be explicitly identified in a future version of PER-005 prior to retiring from other standards; such as those identified in EOP-005 and EOP-006.

**COM-002-4 Requirement R2:**

While training on communications protocols would fall into an entity’s systematic approach to training, the requirements do not explicitly mandate training on communications protocols. It is essential for all operators to have a common level of understanding and be trained in three-part communication. During development of COM-002-4, it was determined that because PER-005 would not meet the NERC Board of Trustees November 7, 2013 Resolution to mandate training, that SDT included a requirement to conduct initial training in order to ensure that a baseline of training is complete before an individual is placed in a position to use the communications protocols. Requiring initial training is not overly burdensome to an entity and any subsequent training can be covered in PER-005 or through the operator feedback loop as determined by the entity.

The SER Phase I SDT will communicate with the SER Phase II SAR DT regarding Requirement R2 of COM-002-4 to determine if there is opportunity for revisions to PER-005-2 that would satisfy the training requirements specific to training on communications protocols; and, if there is that opportunity, then Requirement R2 of COM-002-4 may be able to be looked at for retirement within that project or in a future project.

**IRO-017-1, Requirement R3:** IRO-017-1 is not entirely duplicative of TPL-001-4, Requirement R8. The RC should be added as a named recipient to TPL-001-4 prior to considering IRO-017-1, Requirement R3 for retirement. The SER Phase I SDT will communicate with the SER Phase II SAR DT regarding Requirement R3 of IRO-017-1 to determine if there is opportunity for revisions to TPL-001-4 to name the RC as a recipient; and, if there is that opportunity, then Requirement R3 of IRO-017-1 may be able to be looked at for retirement within that project or in a future project.

**IRO-006-5, Requirement R1 –** This requirement is not identified in the SAR for this project and will not be proposed for retirement.

**MOD-020-0, Requirement R1 –** We disagree that MOD-031-2 and IRO-010-2 do not give the necessary entities the authority to request the relevant information and that those standard do not also require the associated entities to provide that information. Demand-Side Management data is necessarily related to the near-term operating time horizon, as well as the planning time horizons, but not to the real-time operating time horizon that the RC and TOP are operating in. According to TOP-001-4 R1 and R2, and IRO-001-4 R1, the RC, BA and TOP must operate the BES according to SOLs and IROLs, and do not generally have control over demand-side management. They do have the authority to issue Operating Instruction to other entities as needed to maintain BES reliability within SOLs and IROLs; the entities receiving Operating Instructions are obligated, per TOP-001-4 R3, to follow those instructions, subject to the exceptions noted within that requirement. Further, the Demand Response Availability Data System (DADS) collects and disseminates data regarding Demand Response programs according to Section 1600 of the NERC Rules of Procedure. All entities identified in MOD-020-0 R1 are sources of DADS data, have access to DADS data, or both.

**PRC-004-5(i), Requirement R4:** The Standard's purpose is to identify and correct the causes of Misoperations of Protection Systems for Bulk Electric System (BES) Elements. The Standard's Guideline and Technical Basis for R4, starting on Page 29, considers due diligence that an entity must make in determining the cause of a Protection System misoperation. The additional requirements suggested are not identified within the SAR, and thus are out-of-scope for this project. Your comment will be referred to the Standards Efficiency Review Team for consideration in a future phase of their work.

**Brandon Gleason - Electric Reliability Council of Texas, Inc. – 2**

<table>
<thead>

**Comment**

Electric Reliability Council of Texas, Inc. (ERCOT) agrees with the recommendations and rationales to retire the following requirements identified in the Standards Authorization Request (SAR):

FAC-008-3 R7, R8
FAC-013-2 R1, R2, R4, R5, R6 (All)
ERCOT does not oppose the retirement of the following requirements identified in the SAR, but does not necessarily agree with each stated rationale articulated in support of retirement:

- BAL-005-1 R4, R6
- COM-002-4 R2
- EOP-005-3 R8
- EOP-006-3 R7
- INT-006-4 R3.1, R4, R5
- INT-009-2.1 R2
- INT-010-2.1 R1, R2, R3 (All)*
- IRO-002-5 R1, R4, R6
- IRO-008-2 R6
- IRO-014-3 R3
- IRO-017 R3
- MOD-001-1a R1, R2, R3, R4, R5, R6, R7, R8, R9 (All)
- MOD-001-2 R1, R2, R3, R4, R5, R6 (All)
- MOD-004-1 R1, R2, R3, R4, R5, R6, R7, R8, R9, R10, R11, R12 (All)
- MOD-008-1 R1, R2, R3, R4, R5 (All)
- MOD-020-0 R1 (All)
- MOD-028-2 R1, R2, R3, R4, R5, R6, R7, R8, R9, R10, R11 (All)
- MOD-029-2a R1, R2, R3, R4, R5, R6, R7, R8 (All)
- MOD-030-3 R1, R2, R3, R4, R5, R6, R7, R8, R9, R10 (All)
- PRC-015-1 R1, R2, R3 (All)
- PRC-018-1 R1, R2, R3, R4, R5, R6 (All)
- TOP-001-4 R16, R17
- VAR-001-4.2 R2, R3
*Because INT-009-2.1 R1 refers to INT-010-2, it may be preferable to defer consideration of the retirement of the requirements in INT-010-2 to Phase II of Standards Efficiency Review.

ERCOT does not agree with the recommendation and rationale to retire the following standard identified in the SAR for the reasons stated below:

PRC-004-5(i) R4

ERCOT does not support the outright retirement of PRC-004-5(i) Requirement R4 because to do so would eliminate the requirement to investigate in its entirety. However, ERCOT agrees that the requirement as written may impose unnecessary burden by requiring repeated investigations despite the potential inability of a Transmission Owner, Generator Owner, or Distribution Provider to identify the cause(s) of a Misoperation.

Response

Thank you for your comments. The SER SDT will be updating rationales on proposed retirements as the project progresses. The SER SDT agrees that Requirement R4 and R6 of BAL-005-1 be retained, as both requirements are specific to the calculation of the ACE. The TOP-010-1(i) R2 covers ACE with the wording of “analysis functions and Real-time monitoring” but does not cover specifics such as quality flags for missing or invalid data that is part of the requirement for BAL-005-1 R4 or the accuracy of scan rates that is part of BAL-005-1 R6.

In TOP-010-1(i) R2 (revised from TOP-010-1) the requirement R2 covers the calculation and monitoring of ACE, while the language “Each Balancing Authority shall implement an Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its analysis functions and Real-time monitoring” this is only addressing quality. In BAL-005-1 (revised from BAL-005-0.2b) the requirement R4 states “The Balancing Authority shall make available to the operator information associated with Reporting ACE including, but not limited to, quality flags indicating missing or invalid data. Requirement R6 of BAL-005-1 states “Each Balancing Authority that is within a multiple Balancing Authority Interconnection shall implement an Operating Process to identify and mitigate errors affecting the accuracy of scan rate data used in the calculation of the Reporting ACE for each Balancing Authority Area. Both of these requirements are specific to identifying missing or invalid data plus scan rates not just the quality of the Real-time data.

The SER Phase I SDT will communicate the SR Phase II SAR DT regarding Requirement R4 and R6 of BAL-005-1 to determine if there is opportunity for revisions to TOP-010-1(i) R2 that would satisfy the missing or invalid data plus scan rates and if there is that opportunity, then Requirements R4 and R6 of BAL-005-1 may be able to be looked at for retirement within the project or in a future project.

INT-009-2.1, Requirement R2: This requirement can be retired under Paragraph 81 criteria, as the requirement is redundant with approved NERC Reliability Standard BAL-005-1, Requirement R7.

PRC-004-5(i), Requirement R4: Removing this requirement from the standard does not preclude entities from conducting any and all investigative actions necessary. Accountability of an entity’s rigor and due diligence will be evident in compliance with the other Standard Requirements.
A. BPA appreciates the opportunity to comment to the NERC Standards Effectiveness Review (SER) team on the path forward specifically concerning MOD-001-2 and the associated MOD standards (MOD-001-1a, MOD-004-1, MOD-008-1, MOD-028-2, MOD-029-2a, MOD-030-3.) BPA does not support the recommendation that NERC withdraw the February 10, 2014 petition to FERC related to MOD-001-2. Although NAESB completed the WEQ-023 Modeling Business Practice Standards which was based on a request from NERC to NAESB to address changes to the NERC MOD-001-2 Reliability Standards not yet ratified by FERC, FERC has not ratified the NAESB BPs. BPA supports the overall effort to migrate the commercial and business aspects of the NERC MOD Reliability Standards into corresponding NAESB Business Practice Standards, a position BPA filed on 09/26/16 in response to the FERC Notice of Proposed Rulemaking (156 FERC ¶ 61,055). In that NOPR, FERC makes clear that the status of the NAESB WEQ-023 Modeling standards and the NERC MOD-001-2 standards are now intertwined. Both are under consideration as part of FERC’s overall inquiry into ATC calculations. This includes Docket No. RM14-7-000, dealing with the original February 10, 2014 petition, as well as a related inquiry into ATC from Docket No. AD15-5-000. BPA recommends FERC address the overall ATC topic currently pending these dockets. FERC guidance on the overall direction of ATC standards is overdue and essential before NERC and/or NAESB invest further resources into companion standards. Because only Regulated utilities fall under the purview of the NAESB business practices, BPA urges NERC to closely collaborate with NAESB so there is a joint recommendation moving forward to FERC if NERC intends to proceed with modifying its approach to the February 10, 2014 petition.

B. BPA disagrees with the retirement of INT-004-3.1. NAESB Business Practice Standard WEQ-004 version 3.1 and FERC Docket RM05-5-25 are pending FERC approval. Additionally, NAESB Business Practices are not enforceable. Finally, the Pseudo-Tie Coordination Reference Document is just that, a reference document, and also not enforceable.

C. BPA supports the retirement of all other requirements in scope.

**Response**

Thank you for your comments.

**INT-004-3.1, Requirements R1, R2, R3:** This standard may be retired since it satisfies Paragraph 81 Criteria ‘B6 – Commercial or Business Practice.’ Interchange scheduling and congestion are elements that impact transmission costs, rather than actual reliable management of the BES. Furthermore, the applicable entity for Requirements R1 and R2, the Purchasing-Selling Entity, has been removed from the list of NERC Functional Entities, supporting the market-based observations herein. R3 specifically refers to “Pseudo-Ties that are included in the NAESB Electric Industry Registry,” reinforcing the tie to NAESB WEQ Business Practice Standards.

**MOD-004-1, MOD-008-1, MOD-028-2, MOD-029-2a, MOD-030-3 and proposed MOD-001-2** – ATC/AFC, as well as tags (or eTags) are commercially-focused elements, facilitating interchange and balancing of interchange. The real-time system operators are ambivalent of these commercial arrangements, as they must maintain reliability of the BES according to System Operating Limits (SOLs) and Interconnection Reliability Operating Limits (IROLs). If a scheduled interchange would violate SOLs or IROLs, the real-time operators must disregard the scheduled interchange and operate the system to its actual reliability limits. This observation is reinforced by NERC’s statement in the 2015 filing related to risk-based reliability proposing removal of the Interchange Authority from the compliance registry, where they stated, “NERC proposes to remove interchange authorities as functional entities, explaining that the activities of the interchange authority are commercial in nature and, thus, the removal will have little if any impact on reliability of the bulk electric system.” FERC acknowledged this in their March 15, 2015 order, where they stated, “we approve NERC’s proposed removal of the interchange authority as a functional entity. As explained by NERC, the interchange authority performs a commercial function, essentially quality control activity in verifying and communicating interchange schedules.”

Comment

Phase I calls for the full retirement of FAC-013-2, it is noted by the NSRF that the current NERC Project 2015-09 is proposing FAC-013-3. The NSRF asks whether FAC-013-3 needs to be referenced from the SAR for future handling, should the FAC-013-2 retirement be successful.

Similar situation with VAR-001-4.2 E.A. 15. The NSRF notes that VAR-001-5, which has been approved by the NERC Board of Trustees, contains E.A. 15 in Attachment 1. Does VAR-001-5 E.A.15 need to be referenced from the SAR for future handling, should the VAR-001-4.2 E.A. 15 retirement be successful?

Thomas Foltz - AEP - 3,5

Answer

Yes

Document Name

Comment

AEP supports the work and overall recommendations of the Standards Drafting Team with the following qualifiers:

AEP does not agree that PRC-004-5(i) R4 meets the drafting team’s “Evaluation Criteria for Retiring Reliability Standards Requirements”, as the declaration of “no cause found” is made only within this obligation (i.e. “is not redundant”). Regarding the reliability rationale, we would agree that not all investigative actions in and of themselves improve reliability, however the ability to track investigative actions over an extended period of time ensures more riguer is applied to the investigative progress.
Thank you for your comment. Retiring this requirement from the standard does not preclude entities from conducting any and all investigative actions necessary. Accountability of an entities rigor and due diligence will be evident in compliance with the other Standard Requirements.

**PRC-004-5(i), Requirement R4:** The Standard's purpose is to identify and correct the causes of Misoperations of Protection Systems for Bulk Electric System (BES) Elements. The Standard's Guideline and Technical Basis for R4, starting on Page 29, considers due diligence that an entity must make in determining the cause of a Protection System misoperation. Your comment will be referred to the Standards Efficiency Review Team for consideration in a future phase of their work. Removing a requirement does not preclude an entity from tracking over a period of time.

</tbody>
</table>

We believe the justifications for the SAR’s proposed retirements are well-explained. We also believe, however, that several additional requirements should be retired either as part of this SAR or in Phase 2, as set forth below.

COM-001-3 R1, R2, R3, R4, R5, R6, R7, R8, R9, R10, R11, R12, and R13 (ALL)

Basic functionality. This should be part of the certification process for BAs, TOPs and RCs. For all other entities (DPs and GOs), it is not necessary to require communication to be proven as the RC, TOP or BA will assure that they can make contact with these entities, and all entities have internal and external Interpersonal Communications Capabilities. This Standard basically states to have primary and back up communications (a phone). In today's world, basic, daily functionality necessitates multiple avenues of communications such as a land line phone, a cell phone, text messaging, a radio, satellite phone, etc. This Standard is not necessary for reliability; it only enforces a compliance “gotcha” if a registered entity's primary communication system fails. There is not a reliability benefit from COM-001-3, just administrative burden. Communications are a basic function of every registered entity. The entire Standard should be retired.

COM-002-4 R3
R1 protocols cover all aspects of operating protocols. If communication is a reliability-related task, then training is covered in PER-005.

COM-002-4 R4
R4 and its subrequirements are a control and should not be an auditable item.

COM-002-4 R5, R6, R7
There should be no difference between an Operation Instruction under normal conditions and under Emergency conditions. R1 covers all Operating instructions. By imposing additional requirements on Operating Instructions that are issued during an emergency, R5, R6, and R7 make it necessary for entities to track whether each Operating Instruction was issued during an Emergency or during normal operations, in order to be able to demonstrate compliance. This administrative burden does not enhance reliability.

EOP-005-3 R3
Verify through NERC Certification program.

EOP-008-2 R2
Verify through NERC Certification program.

EOP-008-2 R3, R4
NERC Certified Operators can be addressed through Certification Program. R6 addresses Primary and Backup and can also address the sub-bullets in this Requirement. Sub-bullets of R4 can be addressed in R8.

EOP-010-1 R2
This is for situational awareness only and may be a mitigating feature of R1. If one K warning is not sent out, it becomes a non-compliance issue. This is also covered in EOP-011-1, R1.2.1.

EOP-010-1 R3.1
R3.1 is contained in R1. Per part 3.1, this will force the TOP to prove a negative if they did not receive any space weather information. Part 3.2 starts the mitigating processes for GMD events and part 3.3 concludes them. Part 3.1 is administrative in nature as alone, it does not accomplish anything; parts 3.2 and 3.3 mitigate the GMD. Recommend part 3.1 be retired. If not retired, part 3.1 should be modified to clearly state in the requirements or measures that proof of compliance is to show the steps only and entities are not required to prove a null set of data.
EOP-011-1 R1 subparts

R1.1 does not enhance or enforce reliability; it is only an auditable item. R1.2.2, R1.2.3, R1.2.4, R1.2.5, and R1.2.6 are all actions or event types that require actions. These are all event-specific. The Operating plan will just say that the operator will do something to mitigate these events. Then it becomes an auditable item in the Operating Plan, only. R1 is simple enough: have a plan for emergencies. Recommend subcomponents be retired.

EOP-011-1 R2 subparts

R2.1 does not enhance or enforce reliability; it is only an auditable item. R2.2.3 and its parts and R2.2.4, R2.2.5, R2.2.6, R2.2.7, R2.2.8 and R2.2.9 are all actions or event types that require actions. These are all event-specific. The Operating plan will just say that the operator will do something to mitigate these events. Then it becomes an auditable item in the Operating Plan. R2 is simple enough: have a plan for emergencies. Recommend subcomponents be retired.

EOP-011-1 R4

This is common sense. We do not need a Requirement to state that we have a specific time to update something issued by the RC. The RC can simply state have an update back by a certain time. This becomes a time “gotcha” issue during an audit or self report. This does not support system reliability.

EOP-011-1 R5

This is in line with the justification for retiring R4, as this is also common sense. The RC will act immediately on all emergency notifications. The time frame of 30 minutes only become an auditable point and does not support reliability. If the requirement is not retired, at minimum the 30 minute criterion should be deleted.

EOP-011-1 R6

This is clearly stated in the Functional model under Real Time actions and does not need to be contained here; the RC will act immediately on all emergency notifications. Recommend retirement of this Requirement.

FAC-002-2 R2, R3, R4, R5

Inherent in R1.

FAC-003-4 R4

R4 is a notification process only, without the next step of clearing happening. This alone does not support reliability. The clearing of the encroaching vegetation does support reliability and is covered in R1, R2, and R6.

FAC-008-3 R1, R2, R3, R6
Generator Facility Ratings are not useful as they are often different from the capability determined through MOD-025. This Standard is usually based solely on the nameplate ratings of components that are covered by this Standard. Nameplate ratings become irrelevant with MOD-025-2, which captures the true capabilities of the asset. The TP will be notified of MOD-025-2 findings. If the RC wants to know the MOD-025-2 capabilities, then they can ask for it under IRO-010-2. The TOP can also request the same information under TOP-003-3.

IRO-001-4 R1
This is the basic functionality of an RC, as outlined in the Functional Model.

IRO-001-4 R2
Per the Functional Model, the BA, TOP, and GOP have reliability interactions with the RC, hence supporting a secure and stable reliable system. The DP does not receive instructions from the RC; rather, they receive information from the BA and TOP.

IRO-001-4 R3
This does not need to be a Requirement. The RC can simply ask whether the registered entity has the ability to accomplish the task. If the entity can't, the RC will take alternate actions.

IRO-002-5 R3
Requirement 2 already provides for two active paths. A NERC certification program can ensure that the paths are being used periodically.

IRO-008-2 R3
The RC's performance of the analysis is identified in R1. A separately enforceable requirement that the RC take the common-sense action of informing impacted entities is unnecessary.

IRO-008-2 R4
IRO-018-1 R2, when implemented, will address RTA quality. The quality process could also assure RTA activity in accordance with utility practice (RTA, RTA backup, etc) without a hard standard-based 30 minute compliance threshold. Candidate for NERC certification program.

IRO-008-2 R5
This requirement supports R2 and process can be verified through NERC Certification (process review).

IRO-010-2 R3
Real time data transmission involves telemetry for thousands of points scanned or updated every few seconds. Retaining evidence of providing this volume of data is burdensome.

MOD-033-1 R2

This requires demonstration of the negative and after the fact validation. This should be part of the Event Analysis process and not a NERC Requirement.

NUC-001-3 R9

Requirement is administrative as it only specifies what must be in the agreement. R9 can be moved to a Guidance document since R9's second bullet states "The Nuclear Plant Generator Operator and the Transmission Entity are responsible for ensuring all the R9 elements are addressed." An item can be addressed by stating that it is not applicable for the entity.

PER-003-1 R1, R2, R3 (ALL)

This Requirement is predicated on the NERC exam which is the responsibility of NERC and the PCGC, not a Registered Entity. Recommend this Standard be retired. Operators are trained on competencies. Competencies can be verified through the training Standards. Certifications should be verified through the NERC Certification program.

PER-004-2 R1

In addition to being redundant with PER-003-1 (which we also recommend be retired), this requirement is part of the Certification process and does not need to be within a Standard.

PER-004-2 R2

Already covered by IRO-009 R1/R2.

PER-005-2 R5, R6

Operations Support Personnel know their impact on reliability and the task list. The prep and training used for OSP and the trainers is better spent for their job duties in support of reliability.

PRC-002-2 R1-R12 (ALL)

Disturbance monitoring is for post-event analysis and does not have direct impact on reliability. Guidelines and best business practices are sufficient to help improve accuracy and coordination. This very granular and prescriptive standard is not needed.
PRC-004-5(i) R2, R3, R5

Only R1 and R6 are required in order to support system reliability and stability. This Standard has too many time frames within each requirement and only provides a compliance gotcha if not followed. Time frames don't support reliability. The intent of this Standard is if you have a mis-operation that you notify everyone involved and fix it so it (hopefully) doesn't happen again.

PRC-005-6 R5

For PRC-005 Unresolved Maintenance Items (UMIs) are a low-volume and low-risk population with little to zero proven actual risk. We are not aware of any events where UMIs were cited as a primary or contributory cause to a BES outage in the Events Analysis program. Given the low volume of actual documented risk impacts and the low volume of self-logs or spreadsheet Notice of Penalty (SNOPs and NOPs), the UMI definition and requirement should be retired. If not retired, the UMIs should be modified to clearly state in the requirements or measures that compliance by exception is allowed and that regulated entities are not required to prove a null set of data.

TOP-001-4 R1

The basic functionality of a TOP is to operate or direct operation of equipment to maintain reliability. COM-002-4 clearly indicates that the TOP will be using Operating Instructions. Please see responses re IRO-001-4 for additional retirement justification.

TOP-001-4 R2, R4-R7

Please see responses re IRO-001-4 for retirement justification.

TOP-001-4 R3

Requirement language is poorly worded because it is not specifically tied to Operating Instructions issued under TOP-001-4 R1 (i.e., Operating Instructions issued to maintain reliability). As such, every entity in R3 must maintain a list of every Operating Instruction issued or received, whether the OI was issued for reliability or not. The NERC Glossary of Terms definition for Operating Instruction pulls in all orders given to others to change the state of a BES Element, which means all planned switching orders issued by the operator, not just OIs issued for reliability. This requirement would be improved by both limiting the duration Operating Instruction evidence needs to be retained and clarifying that the requirement applies only to OIs from TOP-001-4 R1. The RSAW for TOP-001-4 R3 must also be corrected because it directs the audit to begin with the list of "all" Operating Instructions. Please see responses re IRO-001-4 for additional retirement justification.

TOP-001-4 R8

Covered by EOP-011 R5 or can be merged with same Requirement. Please see responses re IRO-001-4 for additional retirement justification.

TOP-001-4 R9

EMS quality codes suffice for notifications of RTU outages and were accepted by the RRO. However, the Regional Entity does not agree. So now unplanned outages need to be tracked for 30 minute overages for reporting. This detracts from reliability and does not enhance reliability, especially when these outages are already indicated by quality codes. Please see responses re IRO-001-4 for additional retirement justification.
TOP-001-4 R13

TOP-010-1 R3, when implemented, will address RTA quality. The quality process could also assure RTA activity in accordance with utility practice (RTA, RTA backup, etc.) without a hard Requirement-based 30-minute compliance threshold. Candidate for NERC Certification program.

TOP-001-4 R21

R20 already provides for two active paths and could address the concept of using the alternate periodically. A NERC certification program can ensure that the paths are being used periodically.

TOP-001-4 R24

R23 already provides for two active paths and could address the concept of using the alternate periodically. A NERC certification program can ensure that the paths are being used periodically.

TOP-002-4 R3

The TOP's performance of the analysis is required by R1. A separately enforceable requirement that the TOP take the common-sense action of informing impacted entities is unnecessary. Could be verified through NERC certification.

TOP-002-4 R4, R5, and R7

Daily Operating Plans are not needed for BAs. Generation dispatch information can be gathered and shared through data provision requirements.

TPL-007-1 R1

Administrative.

VAR-001-4.1 R1

Duplicate of FAC-014.

VAR-001-4.2 R5

All of R5 appears to be administrative and a common-sense operations item. All entities keep impedance and tap information on their transformers. There isn't any reason to withhold information if requested, so a mandatory standard backed by sanctions to provide information within 30 days is simply an administrative clock. It's wasteful of both entity and regulator resources.
### VAR-002-4.1 R3

Duplicative of other standards requiring data provision. There is no justification for the 30 minute timing requirement; if a timing requirement is retained, it is not a good reliability practice to require notification "within 30 minutes," but only if status is not restored within 30 minutes.

### VAR-002-4.1 R4

Duplicative of other standards requiring data provision. There is no justification for a 30 minute time limit and this becomes a compliance trap.

### VAR-002-4.1 R5

Duplicative of other standards requiring data provision.

</table>
1. JEA disagrees with the rationale for the retirement of PRC-004-5(i) R4. This requirement applies only when the cause of a Misoperation has not been determined and requires the TO/GO/DP to perform investigative actions every two quarters until a cause is identified OR a declaration is made that no cause was identified.

   a) The SAR states, “Requirement R4 acts as a control to support compliance with requirements R1 & R3.” However, R4 is not a control for determining “whether its Protection System component(s) caused a Misoperation”, but is the next step if the cause of a Misoperation, “for a Misoperation identified in accordance with Requirement R1 or R3”, has not been determined.

   b) The SAR also states, “It is in the best interest of the entity to continue to investigate and detect whether its Protection System components caused a mis-operation”, but this is more than just in the best interest of the entity. R1 requires the entity to “identify whether its Protection System component(s) caused a Misoperation.”

   c) The SAR also states, “However, if an entity is unable to determine the cause, further investigation(s) using the same event data are unlikely to lead to identification of the cause.” But, investigative actions do improve reliability if they result in the identification of the cause. If no cause is identified, the TO/GO/DP can simply declare that no cause was identified, thereby satisfying the requirement.

There may be valid reasons for retiring this requirement (milestone tracking doesn’t improve reliability, this is a typical best practice, etc.), but the reasons listed above are not valid based upon the current standard language.

2. JEA disagrees with the rationale for the retirements of COM-002-4 R2, EOP-005-3 R8, and EOP-006-3 R7. These requirements are not duplicated in the current version of PER-005-2. PER-005-2 R1.1 allows for the RC, BA, and TOP to create a list of BES “company-specific Real-time reliability-related tasks based on a defined and documented methodology”, but, if specific tasks are intended, then they should be stated directly. It’s implied that these reliability-related tasks would include communication protocols and system restoration, but PER-005-2 only requires a methodology to be followed rather than setting forth explicit minimum competency requirements which is what the requirements proposed for retirement include.

Furthermore, there is clear distinction between the “initial training” of COM-002-4 R2 which occurs “prior to that individual operator issuing an Operating Instruction” and the continuous learning of PER-005-2.

Response

Thank you for your comments.

PRC-004-5(i) Requirement R4:

Removing the requirement from the standard does not preclude entities from conducting any and all investigative actions necessary. The rigor and due diligence of the actions taken to identify the cause of Misoperations will be evident in compliance with the other Standard Requirements. Your comment will be referred to the Standards Efficiency Review Team for consideration in a future phase of their work.

EOP-005-3, Requirement R8 and EOP-006-3 Requirement R7:

The SER SDT agrees that Requirement R8 of EOP-005-3be retained. The SER SDT also believes that Requirement R7 of EOP-006-3 be maintained. The PER-005 standard entails training processes, however it is does not specifically provide for system restoration training.

In PER-005-2 (revised from PER-005-1), the requirement to provide system restoration training no longer exists. In fact, the rationale to remove the minimum training requirement specific to system restoration from PER-005-1 was, in part, based on the existence of former Requirement R10 in EOP-005-2 (Requirement R8 of EOP-005-3) and Requirement R9 in EOP-006-2 (Requirement R7 of EOP-006-3). If Requirement R8 in EOP-005-3 is removed, then there will not be any requirements to provide system restoration training to operating personnel in any of the standards.
The SDT team believes a specific requirement for system restoration training should be maintained, because while a system shutdown is low probability, it could have a high impact if not done properly. The SER Phase I SDT will communicate with the SER Phase II SAR DT regarding Requirement R8 of EOP-005-3 and Requirement R7 in EOP-006-3 to determine if there is opportunity for revisions to PER-005-2 that would satisfy the training requirements specific to system restoration training; and, if there is that opportunity, then Requirement R8 of EOP-005-3 and Requirement R7 in EOP-006-3 may be able to be looked at for retirement within that project or in a future project. If certain elements are essential within an entity’s training program, those elements should be explicitly identified in a future version of PER-005 prior to retiring from other standards; such as those identified in EOP-005 and EOP-006.

COM-002-4 Requirement R2:

While training on communications protocols would fall into an entity’s systematic approach to training, the requirements do not explicitly mandate training on communications protocols. It is essential for all operators to have a common level of understanding and be trained in three-part communication. During development of COM-002-4, it was determined that because PER-005 would not meet the NERC Board of Trustees November 7, 2013 Resolution to mandate training, that SDT included a requirement to conduct initial training in order to ensure that a baseline of training is complete before an individual is placed in a position to use the communications protocols. Requiring initial training is not overly burdensome to an entity and any subsequent training can be covered in PER-005 or through the operator feedback loop as determined by the entity.

The SER Phase I SDT will communicate with the SER Phase II SAR DT regarding Requirement R2 of COM-002-4 to determine if there is opportunity for revisions to PER-005-2 that would satisfy the training requirements specific to training on communications protocols; and, if there is that opportunity, then Requirement R2 of COM-002-4 may be able to be looked at for retirement within that project or in a future project.

<table>

**COM-002-4 R2** – Requires initial training on communication protocols; NERC proposes that R2 be retired as this topic should be covered in a PER-005-2 compliant Systematic Approach to Training program. Training on ATC communication protocols and tasks to issue and receive op instructions are part of the SCO initial training program. As such, we agree with retirement of COM-002-4 R2.

**EOP-005-3 R8** – requires annual system restoration training; NERC proposes that R8 be retired as this topic should be covered in a PER-005-2 compliant Systematic Approach to Training program. Agree as we have three tasks in regards to PSR in the SCO initial training program. Our continuing education program also has annual PSR training (classroom and DTS). As such, we agree with retirement of EOP-005-3 R8.

**TOP-001-4 R16** – NERC Certified Operators can be addressed through Certification Program and authority is part of the qualification. PER-005-2 training supports this. As such, we agree with retirement of TOP-001-4 R16.

**TOP-001-4 R19** – the language used to describe how this is managed is through requirements in TOP-003-3 and TOP-002-4. As such, we agree with retirement of TOP-001-4 R19.
VAR-001-4 R2: TOP-001 and TOP-002 require the Transmission Operator to identify System Operating Limit exceedances during real-time and next-day conditions, respectively. System Operating Limits include voltage limits and management of reactive resources as described in VAR-001-4 R2 is fulfilled by acting according to the TOP standards. As such, we agree with retirement of VAR-001-4 R2.

VAR-001-4 R3: The directive in VAR-001-4.2 R3 is fulfilled as a result of compliance with TOP-001-3 R1, R12 and R14; in that the obligation in R1 to maintain the reliability of its operator area is unachievable by the TO if it does not operate devices to regulate voltage and reactive flow; additionally, TOP-001 R 12 and R14 cover addressing System Operating Limits and Interconnection Reliability Operating Limits, where the definition includes voltage stability ratings and system voltage limits. As such, we agree with retirement of VAR-001-4 R3.

Response
Thank you for your comments and support. However, based on the comments received and the SAR SDT’s analysis, the SAR SDT does not intend to propose the following Reliability Standard Requirements for retirement: EOP-005-3, Requirement R8; EOP-006-3, Requirement R7; COM-002-4, Requirement R2; TOP-001-4, Requirement R16; and VAR-001-5, Requirement R3.

Karie Barczak - DTE Energy - Detroit Edison Company - 3,4,5, Group Name DTE Energy - DTE Electric

Scott McGough - Georgia System Operations Corporation - 3,4

FMPA agrees with the following comments submitted by TAPS:

We believe the justifications for the SAR’s proposed retirements are well-explained. We also believe, however, that several additional requirements should be retired either as part of this SAR or in Phase 2, as set forth below.

**COM-001-3 R1, R2, R3, R4, R5, R6, R7, R8, R9, R10, R11, R12, and R13 (ALL)**

Basic functionality. This should be part of the certification process for BAs, TOPs and RCs. For all other entities (DPs and GOs), it is not necessary to require communication to be proven as the RC, TOP or BA will assure that they can make contact with these entities, and all entities have internal and external Interpersonal Communications Capabilities. This Standard basically states to have primary and back up communications (a phone). In today's world, basic, daily functionality necessitates multiple avenues of communications such as a land line phone, a cell phone, text messaging, a radio, satellite phone, etc. This Standard is not necessary for reliability; it only enforces a compliance “gotcha” if a registered entity’s primary communication system fails. There is not a reliability benefit from COM-001-3, just administrative burden. Communications are a basic function of every registered entity. The entire Standard should be retired.

**COM-002-4 R3**

R1 protocols cover all aspects of operating protocols. If communication is a reliability-related task, then training is covered in PER-005.

**COM-002-4 R4**

R4 and its subrequirements are a control and should not be an auditable item.

**COM-002-4 R5, R6, R7**

There should be no difference between an Operation Instruction under normal conditions and under Emergency conditions. R1 covers all Operating instructions. By imposing additional requirements on Operating Instructions that are issued during an emergency, R5, R6, and R7 make it necessary for entities to track whether each Operating Instruction was issued during an Emergency or during normal operations, in order to be able to demonstrate compliance. This administrative burden does not enhance reliability.

**EOP-005-3 R3**

Verify through NERC Certification program.
EOP-008-2 R2
Verify through NERC Certification program.

EOP-008-2 R3, R4
NERC Certified Operators can be addressed through Certification Program. R6 addresses Primary and Backup and can also address the sub-bullets in this Requirement. Sub-bullets of R4 can be addressed in R8.

EOP-010-1 R2
This is for situational awareness only and may be a mitigating feature of R1. If one K warning is not sent out, it becomes a non-compliance issue. This is also covered in EOP-011-1, R1.2.1.

EOP-010-1 R3.1
R3.1 is contained in R1. Per part 3.1, this will force the TOP to prove a negative if they did not receive any space weather information. Part 3.2 starts the mitigating processes for GMD events and part 3.3 concludes them. Part 3.1 is administrative in nature as alone, it does not accomplish anything; parts 3.2 and 3.3 mitigate the GMD. Recommend part 3.1 be retired. If not retired, part 3.1 should be modified to clearly state in the requirements or measures that proof of compliance is to show the steps only and entities are not required to prove a null set of data.

EOP-011-1 R1 subparts
R1.1 does not enhance or enforce reliability; it is only an auditable item. R1.2.2, R1.2.3, R1.2.4, R1.2.5, and R1.2.6 are all actions or event types that require actions. These are all event-specific. The Operating plan will just say that the operator will do something to mitigate these events. Then it becomes an auditable item in the Operating Plan, only. R1 is simple enough: have a plan for emergencies. Recommend subcomponents be retired.

EOP-011-1 R2 subparts
R2.1 does not enhance or enforce reliability; it is only an auditable item. R2.2.3 and its parts and R2.2.4, R2.2.5, R2.2.6, R2.2.7, R2.2.8 and R2.2.9 are all actions or event types that require actions. These are all event-specific. The Operating plan will just say that the operator will do something to mitigate these events. Then it becomes an auditable item in the Operating Plan. R2 is simple enough: have a plan for emergencies. Recommend subcomponents be retired.

EOP-011-1 R4
This is common sense. We do not need a Requirement to state that we have a specific time to update something issued by the RC. The RC can simply state have an update back by a certain time. This becomes a time “gotcha” issue during an audit or self report. This does not support system reliability.
EOP-011-1 R5
This is in line with the justification for retiring R4, as this is also common sense. The RC will act immediately on all emergency notifications. The time frame of 30 minutes only become an auditable point and does not support reliability. If the requirement is not retired, at minimum the 30 minute criterion should be deleted.

EOP-011-1 R6
This is clearly stated in the Functional model under Real Time actions and does not need to be contained here; the RC will act immediately on all emergency notifications. Recommend retirement of this Requirement.

FAC-002-2 R2, R3, R4, R5
Inherent in R1.

FAC-003-4 R4
R4 is a notification process only, without the next step of clearing happening. This alone does not support reliability. The clearing of the encroaching vegetation does support reliability and is covered in R1, R2, and R6.

FAC-008-3 R1, R2, R3, R6
Generator Facility Ratings are not useful as they are often different from the capability determined through MOD-025. This Standard is usually based solely on the nameplate ratings of components that are covered by this Standard. Nameplate ratings become irrelevant with MOD-025-2, which captures the true capabilities of the asset. The TP will be notified of MOD-025-2 findings. If the RC wants to know the MOD-025-2 capabilities, then they can ask for it under IRO-010-2. The TOP can also request the same information under TOP-003-3.

IRO-001-4 R1
This is the basic functionality of an RC, as outlined in the Functional Model.

IRO-001-4 R2
Per the Functional Model, the BA, TOP, and GOP have reliability interactions with the RC, hence supporting a secure and stable reliable system. The DP does not receive instructions from the RC; rather, they receive information from the BA and TOP.

IRO-001-4 R3
This does not need to be a Requirement. The RC can simply ask whether the registered entity has the ability to accomplish the task. If the entity can't, the RC will take alternate actions.

IRO-002-5 R3
Requirement 2 already provides for two active paths. A NERC certification program can ensure that the paths are being used periodically.

IRO-008-2 R3
The RC's performance of the analysis is identified in R1. A separately enforceable requirement that the RC take the common-sense action of informing impacted entities is unnecessary.

IRO-008-2 R4
IRO-018-1 R2, when implemented, will address RTA quality. The quality process could also assure RTA activity in accordance with utility practice (RTA, RTA backup, etc) without a hard standard-based 30 minute compliance threshold. Candidate for NERC certification program.

IRO-008-2 R5
This requirement supports R2 and process can be verified through NERC Certification (process review).

IRO-010-2 R3
Real time data transmission involves telemetry for thousands of points scanned or updated every few seconds. Retaining evidence of providing this volume of data is burdensome.

MOD-033-1 R2
This requires demonstration of the negative and after the fact validation. This should be part of the Event Analysis process and not a NERC Requirement.

NUC-001-3 R9
Requirement is administrative as it only specifies what must be in the agreement. R9 can be moved to a Guidance document since R9's second bullet states "The Nuclear Plant Generator Operator and the Transmission Entity are responsible for ensuring all the R9 elements are addressed." An item can be addressed by stating that it is not applicable for the entity.

PER-003-1 R1, R2, R3 (ALL)
This Requirement is predicated on the NERC exam which is the responsibility of NERC and the PCGC, not a Registered Entity. Recommend this Standard be retired. Operators are trained on competencies. Competencies can be verified through the training Standards. Certifications should be verified through the NERC Certification program.

PER-004-2 R1

In addition to being redundant with PER-003-1 (which we also recommend be retired), this requirement is part of the Certification process and does not need to be within a Standard.

PER-004-2 R2

Already covered by IRO-009 R1/R2.

PER-005-2 R5, R6

Operations Support Personnel know their impact on reliability and the task list. The prep and training used for OSP and the trainers is better spent for their job duties in support of reliability.

PRC-002-2 R1-R12 (ALL)

Disturbance monitoring is for post-event analysis and does not have direct impact on reliability. Guidelines and best business practices are sufficient to help improve accuracy and coordination. This very granular and prescriptive standard is not needed.

PRC-004-5(i) R2, R3, R5

Only R1 and R6 are required in order to support system reliability and stability. This Standard has too many time frames within each requirement and only provides a compliance gotcha if not followed. Time frames don’t support reliability. The intent of this Standard is if you have a mis-operation that you notify everyone involved and fix it so it (hopefully) doesn’t happen again.

PRC-005-6 R5

For PRC-005 Unresolved Maintenance Items (UMIs) are a low-volume and low-risk population with little to zero proven actual risk. We are not aware of any events where UMIs were cited as a primary or contributory cause to a BES outage in the Events Analysis program. Given the low volume of actual documented risk impacts and the low volume of self-logs or spreadsheet Notice of Penalty (SNOPs and NOPs), the UMI definition and requirement should be retired. If not retired, the UMIs should be modified to clearly state in the requirements or measures that compliance by exception is allowed and that regulated entities are not required to prove a null set of data.

TOP-001-4 R1
The basic functionality of a TOP is to operate or direct operation of equipment to maintain reliability. COM-002-4 clearly indicates that the TOP will be using Operating Instructions. Please see responses re IRO-001-4 for additional retirement justification.

TOP-001-4 R2, R4-R7

Please see responses re IRO-001-4 for retirement justification.

TOP-001-4 R3

Requirement language is poorly worded because it is not specifically tied to Operating Instructions issued under TOP-001-4 R1 (i.e., Operating Instructions issued to maintain reliability). As such, every entity in R3 must maintain a list of every Operating Instruction issued or received, whether the OI was issued for reliability or not. The NERC Glossary of Terms definition for Operating Instruction pulls in all orders given to others to change the state of a BES Element, which means all planned switching orders issued by the operator, not just OIs issued for reliability. This requirement would be improved by both limiting the duration Operating Instruction evidence needs to be retained and clarifying that the requirement applies only to OIs from TOP-001-4 R1. The RSAW for TOP-001-4 R3 must also be corrected because it directs the audit to begin with the list of "all" Operating Instructions. Please see responses re IRO-001-4 for additional retirement justification.

TOP-001-4 R8

Covered by EOP-011 R5 or can be merged with same Requirement. Please see responses re IRO-001-4 for additional retirement justification.

TOP-001-4 R9

EMS quality codes suffice for notifications of RTU outages and were accepted by the RRO. However, the Regional Entity does not agree. So now unplanned outages need to be tracked for 30 minute overages for reporting. This detracts from reliability and does not enhance reliability, especially when these outages are already indicated by quality codes. Please see responses re IRO-001-4 for additional retirement justification.

TOP-001-4 R13

TOP-010-1 R3, when implemented, will address RTA quality. The quality process could also assure RTA activity in accordance with utility practice (RTA, RTA backup, etc.) without a hard Requirement-based 30-minute compliance threshold. Candidate for NERC Certification program.

TOP-001-4 R21

R20 already provides for two active paths and could address the concept of using the alternate periodically. A NERC certification program can ensure that the paths are being used periodically.
TOP-001-4 R24
R23 already provides for two active paths and could address the concept of using the alternate periodically. A NERC certification program can ensure that the paths are being used periodically.

TOP-002-4 R3
The TOP's performance of the analysis is required by R1. A separately enforceable requirement that the TOP take the common-sense action of informing impacted entities is unnecessary. Could be verified through NERC certification.

TOP-002-4 R4, R5, and R7
Daily Operating Plans are not needed for BAs. Generation dispatch information can be gathered and shared through data provision requirements.

TPL-007-1 R1
Administrative.

VAR-001-4.1 R1
Duplicative of FAC-014.

VAR-001-4.2 R5
All of R5 appears to be administrative and a common-sense operations item. All entities keep impedance and tap information on their transformers. There isn't any reason to withhold information if requested, so a mandatory standard backed by sanctions to provide information within 30 days is simply an administrative clock. It's wasteful of both entity and regulator resources.

VAR-002-4.1 R3
Duplicative of other standards requiring data provision. There is no justification for the 30 minute timing requirement; if a timing requirement is retained, it is not a good reliability practice to require notification "within 30 minutes," but only if status is not restored within 30 minutes.

VAR-002-4.1 R4
Duplicative of other standards requiring data provision. There is no justification for a 30 minute time limit and this becomes a compliance trap.

### Response

Thank you for your support. The additional requirements suggested are not identified within the SAR, and thus are out-of-scope for this project. Your comment will be referred to the Standards Efficiency Review Team for consideration in a future phase of their work.

Thank you for your comments. Please see responses to comments provided by TAPS. The additional requirements suggested are not identified within the SAR, and thus are out-of-scope for this project. Your comment will be referred to the Standards Efficiency Review Team for consideration in a future phase of their work.

**Comment**

TAPS appreciates the work of the Standards Efficiency Review Teams in developing this SAR. We believe the justifications for the SAR’s proposed retirements are well-explained. We also believe, however, that several additional requirements should be retired either as part of this SAR or in Phase 2, as set forth below.

**COM-001-3 R1, R2, R3, R4, R5, R6, R7, R8, R9, R10, R11, R12, and R13 (ALL)**

Basic functionality. This should be part of the certification process for BAs, TOPs and RCs. For all other entities (DPs and GOs), it is not necessary to require communication to be proven as the RC, TOP or BA will assure that they can make contact with these entities, and all entities have internal and external Interpersonal Communications Capabilities. This Standard basically states to have primary and back up communications (a phone). In today's world, basic, daily functionality necessitates multiple avenues of communications such as a land line phone, a cell phone, text messaging, a radio, satellite phone, etc. This Standard is not necessary for reliability; it only enforces a compliance “gotcha” if a registered entity’s primary communication system fails. There is not a reliability benefit from COM-001-3, just administrative burden. Communications are a basic function of every registered entity. The entire Standard should be retired.

**COM-002-4 R3**

R1 protocols cover all aspects of operating protocols. If communication is a reliability-related task, then training is covered in PER-005.

**COM-002-4 R4**

R4 and its subrequirements are a control and should not be an auditable item.

**COM-002-4 R5, R6, R7**

There should be no difference between an Operation Instruction under normal conditions and under Emergency conditions. R1 covers all Operating instructions. By imposing additional requirements on Operating Instructions that are issued during an emergency, R5, R6, and R7 make it necessary for entities to track whether each Operating Instruction was issued during an Emergency or during normal operations, in order to be able to demonstrate compliance. This administrative burden does not enhance reliability.

**EOP-005-3 R3**

Verify through NERC Certification program.
EOP-008-2 R2
Verify through NERC Certification program.

EOP-008-2 R3, R4
NERC Certified Operators can be addressed through Certification Program. R6 addresses Primary and Backup and can also address the sub-bullets in this Requirement. Sub-bullets of R4 can be addressed in R8.

EOP-010-1 R2
This is for situational awareness only and may be a mitigating feature of R1. If one K warning is not sent out, it becomes a non-compliance issue. This is also covered in EOP-011-1, R1.2.1.

EOP-010-1 R3.1
R3.1 is contained in R1. Per part 3.1, this will force the TOP to prove a negative if they did not receive any space weather information. Part 3.2 starts the mitigating processes for GMD events and part 3.3 concludes them. Part 3.1 is administrative in nature as alone, it does not accomplish anything; parts 3.2 and 3.3 mitigate the GMD. Recommend part 3.1 be retired. If not retired, part 3.1 should be modified to clearly state in the requirements or measures that proof of compliance is to show the steps only and entities are not required to prove a null set of data.

EOP-011-1 R1 subparts
R1.1 does not enhance or enforce reliability; it is only an auditable item. R1.2.2, R1.2.3, R1.2.4, R1.2.5, and R1.2.6 are all actions or event types that require actions. These are all event-specific. The Operating plan will just say that the operator will do something to mitigate these events. Then it becomes an auditable item in the Operating Plan, only. R1 is simple enough: have a plan for emergencies. Recommend subcomponents be retired.

EOP-011-1 R2 subparts
R2.1 does not enhance or enforce reliability; it is only an auditable item. R2.2.3 and its parts and R2.2.4, R2.2.5, R2.2.6, R2.2.7, R2.2.8 and R2.2.9 are all actions or event types that require actions. These are all event-specific. The Operating plan will just say that the operator will do something to mitigate these events. Then it becomes an auditable item in the Operating Plan. R2 is simple enough: have a plan for emergencies. Recommend subcomponents be retired.

EOP-011-1 R4
This is common sense. We do not need a Requirement to state that we have a specific time to update something issued by the RC. The RC can simply state have an update back by a certain time. This becomes a time “gotcha” issue during an audit or self report. This does not support system reliability.

EOP-011-1 R5
This is in line with the justification for retiring R4, as this is also common sense. The RC will act immediately on all emergency notifications. The time frame of 30 minutes only become an auditable point and does not support reliability. If the requirement is not retired, at minimum the 30 minute criterion should be deleted.

EOP-011-1 R6
This is clearly stated in the Functional model under Real Time actions and does not need to be contained here; the RC will act immediately on all emergency notifications. Recommend retirement of this Requirement.

FAC-002-2 R2, R3, R4, R5
Inherent in R1.

FAC-003-4 R4
R4 is a notification process only, without the next step of clearing happening. This alone does not support reliability. The clearing of the encroaching vegetation does support reliability and is covered in R1, R2, and R6.

FAC-008-3 R1, R2, R3, R6
Generator Facility Ratings are not useful as they are often different from the capability determined through MOD-025. This Standard is usually based solely on the nameplate ratings of components that are covered by this Standard. Nameplate ratings become irrelevant with MOD-025-2, which
captures the true capabilities of the asset. The TP will be notified of MOD-025-2 findings. If the RC wants to know the MOD-025-2 capabilities, then they can ask for it under IRO-010-2. The TOP can also request the same information under TOP-003-3.

IRO-001-4 R1
This is the basic functionality of an RC, as outlined in the Functional Model.

IRO-001-4 R2
Per the Functional Model, the BA, TOP, and GOP have reliability interactions with the RC, hence supporting a secure and stable reliable system. The DP does not receive instructions from the RC; rather, they receive information from the BA and TOP.

IRO-001-4 R3
This does not need to be a Requirement. The RC can simply ask whether the registered entity has the ability to accomplish the task. If the entity can't, the RC will take alternate actions.

IRO-002-5 R3
Requirement 2 already provides for two active paths. A NERC certification program can ensure that the paths are being used periodically.

IRO-008-2 R3
The RC's performance of the analysis is identified in R1. A separately enforceable requirement that the RC take the common-sense action of informing impacted entities is unnecessary.

IRO-008-2 R4
IRO-018-1 R2, when implemented, will address RTA quality. The quality process could also assure RTA activity in accordance with utility practice (RTA, RTA backup, etc) without a hard standard-based 30 minute compliance threshold. Candidate for NERC certification program.

IRO-008-2 R5
This requirement supports R2 and process can be verified through NERC Certification (process review).

IRO-010-2 R3
Real time data transmission involves telemetry for thousands of points scanned or updated every few seconds. Retaining evidence of providing this volume of data is burdensome.

MOD-033-1 R2
This requires demonstration of the negative and after the fact validation. This should be part of the Event Analysis process and not a NERC Requirement.

NUC-001-3 R9
Requirement is administrative as it only specifies what must be in the agreement. R9 can be moved to a Guidance document since R9's second bullet states "The Nuclear Plant Generator Operator and the Transmission Entity are responsible for ensuring all the R9 elements are addressed." An item can be addressed by stating that it is not applicable for the entity.

PER-003-1 R1, R2, R3 (ALL)
This Requirement is predicated on the NERC exam which is the responsibility of NERC and the PCGC, not a Registered Entity. Recommend this Standard be retired. Operators are trained on competencies. Competencies can be verified through the training Standards. Certifications should be verified through the NERC Certification program.

PER-004-2 R1
In addition to being redundant with PER-003-1 (which we also recommend be retired), this requirement is part of the Certification process and does not need to be within a Standard.

PER-004-2 R2
Already covered by IRO-009 R1/R2.
PER-005-2 R5, R6
Operations Support Personnel know their impact on reliability and the task list. The prep and training used for OSP and the trainers is better spent for their job duties in support of reliability.

PRC-002-2 R1-R12 (ALL)
Disturbance monitoring is for post-event analysis and does not have direct impact on reliability. Guidelines and best business practices are sufficient to help improve accuracy and coordination. This very granular and prescriptive standard is not needed.

PRC-004-5(i) R2, R3, R5
Only R1 and R6 are required in order to support system reliability and stability. This Standard has too many time frames within each requirement and only provides a compliance gotcha if not followed. Time frames don't support reliability. The intent of this Standard is if you have a mis-operation that you notify everyone involved and fix it so it (hopefully) doesn't happen again.

PRC-005-6 R5
For PRC-005 Unresolved Maintenance Items (UMIs) are a low-volume and low-risk population with little to zero proven actual risk. We are not aware of any events where UMIs were cited as a primary or contributory cause to a BES outage in the Events Analysis program. Given the low volume of actual documented risk impacts and the low volume of self-logs or spreadsheet Notice of Penalty (SNOPs and NOPs), the UMI definition and requirement should be retired. If not retired, the UMIs should be modified to clearly state in the requirements or measures that compliance by exception is allowed and that regulated entities are not required to prove a null set of data.

TOP-001-4 R1
The basic functionality of a TOP is to operate or direct operation of equipment to maintain reliability. COM-002-4 clearly indicates that the TOP will be using Operating Instructions. Please see responses re IRO-001-4 for additional retirement justification.

TOP-001-4 R2, R4-R7
Please see responses re IRO-001-4 for retirement justification.

TOP-001-4 R3
Requirement language is poorly worded because it is not specifically tied to Operating Instructions issued under TOP-001-4 R1 (i.e., Operating Instructions issued to maintain reliability). As such, every entity in R3 must maintain a list of every Operating Instruction issued or received, whether the OI was issued for reliability or not. The NERC Glossary of Terms definition for Operating Instruction pulls in all orders given to others to change the state of a BES Element, which means all planned switching orders issued by the operator, not just OIs issued for reliability. This requirement would be improved by both limiting the duration Operating Instruction evidence needs to be retained and clarifying that the requirement applies only to OIs from TOP-001-4 R1. The RSAW for TOP-001-4 R3 must also be corrected because it directs the audit to begin with the list of "all" Operating Instructions. Please see responses re IRO-001-4 for additional retirement justification.

TOP-001-4 R8
Covered by EOP-011 R5 or can be merged with same Requirement. Please see responses re IRO-001-4 for additional retirement justification.

TOP-001-4 R9
EMS quality codes suffice for notifications of RTU outages and were accepted by the RRO. However, the Regional Entity does not agree. So now unplanned outages need to be tracked for 30 minute overages for reporting. This detracts from reliability and does not enhance reliability, especially when these outages are already indicated by quality codes. Please see responses re IRO-001-4 for additional retirement justification.

TOP-001-4 R13
TOP-010-1 R3, when implemented, will address RTA quality. The quality process could also assure RTA activity in accordance with utility practice (RTA, RTA backup, etc.) without a hard Requirement-based 30-minute compliance threshold. Candidate for NERC Certification program.

TOP-001-4 R21
R20 already provides for two active paths and could address the concept of using the alternate periodically. A NERC certification program can ensure that the paths are being used periodically.
TOP-001-4 R24
R23 already provides for two active paths and could address the concept of using the alternate periodically. A NERC certification program can ensure that the paths are being used periodically.

TOP-002-4 R3
The TOP’s performance of the analysis is required by R1. A separately enforceable requirement that the TOP take the common-sense action of informing impacted entities is unnecessary. Could be verified through NERC certification.

TOP-002-4 R4, R5, and R7
Daily Operating Plans are not needed for BAs. Generation dispatch information can be gathered and shared through data provision requirements.

TPL-007-1 R1
Administrative.

VAR-001-4.1 R1
Duplicative of FAC-014.

VAR-001-4.2 R5
All of R5 appears to be administrative and a common-sense operations item. All entities keep impedance and tap information on their transformers. There isn't any reason to withhold information if requested, so a mandatory standard backed by sanctions to provide information within 30 days is simply an administrative clock. It's wasteful of both entity and regulator resources.

VAR-002-4.1 R3
Duplicative of other standards requiring data provision. There is no justification for the 30 minute timing requirement; if a timing requirement is retained, it is not a good reliability practice to require notification “within 30 minutes,” but only if status is not restored within 30 minutes.

VAR-002-4.1 R4
Duplicative of other standards requiring data provision. There is no justification for a 30 minute time limit and this becomes a compliance trap.

VAR-002-4.1 R5
Duplicative of other standards requiring data provision.

Response
Thank you for your comments. Please see responses provided to your comments in Question 1. The additional requirements suggested are not identified within the SAR, and thus are out-of-scope for this project. Your comment will be referred to the Standards Efficiency Review Team for consideration in a future phase of their work.

Ginette Lacasse - Seattle City Light - 1,3,4,5,6 - WECC, Group Name Seattle City Light Ballot Body

Answer
Yes

<td>there is value examining the standards/requirements after 10 years of being enforceable. Data requests may be enforced by NERC Rules of Procedure Section 1600. A company's compliance culture is known now along with their internal controls. It makes sense to alleviate administrative burdens by a comprehensive review approach. We applaud NERC for this important effort.</td>

Unofficial Nomination Form
Standards Efficiency Review Team

Do not use this form for submitting nominations. Use the electronic form to submit nominations for Standards Efficiency Review (SER) drafting team (DT) members. Nominations must be submitted by 8 p.m. Eastern, Monday, September 17, 2018.

Additional information is available on the project page. If you have questions, contact Laura Anderson (via email) or at 404-446-9671.

Project Scope
Many NERC Reliability Standards have been mandatory and enforceable for 10+ years in North America. Phase 1 of the SER project and its resulting Standards Authorization Request (SAR) sought to identify requirements that are potential candidates for retirement because they are no longer essential for reliability. Retiring these requirements would increase efficiencies by reducing regulatory obligations and/or compliance burden. Based on the analyses, the SER teams are recommending the requirements listed in the SAR to be retired. The SER teams maintained that these requirements can be retired without impacting any other standards; i.e., no modifications to other requirements in other standards are necessary.

The SER DT should be composed of individuals that, combined, represent a broad range of experience, including: compliance, engineering, operations, planning, and legal. Having a team made up of cross-functional expertise will allow for more comprehensive inputs from multiple viewpoints.

SER Team Scope

- Collaborate and communicate with a cross-functional team of industry experts on a time-sensitive project timeline
- The SAR was developed using an assessment tool that included criteria & questions to identify candidate requirements that are not essential for reliability, that could be simplified or consolidated, and that could thereby reduce regulatory obligations and/or compliance burden
- Based on the SER SAR team analyses and recommendations, retiring the requirements set out in the SAR
- Flexible schedule and availability are important considering the timeline
### Information about you, the nominator. Self-nominations are permitted.

Provide a brief summary of the nominee’s qualifications for the SER DT position. The summary should be no longer than a single page of single-spaced text.
Standards Announcement
Standards Efficiency Review Drafting Team

Nomination Period Open through September 17, 2018

Now Available

Nominations are being sought for Standards Efficiency Review drafting team members. Nominations must be submitted by 8 p.m. Eastern, Monday, September 17, 2018.

Use the electronic form to submit a nomination. If you experience issues using the electronic form, contact Wendy Muller. An unofficial Word version of the nomination form is posted on the Drafting Team Vacancies page and the project page.

Next Steps
The Standards Committee is expected to appoint members to the team mid-October 2018. Nominees will be notified after they have been selected.

For more information or assistance, contact Standards Developer, Laura Anderson (via email) or at (404) 446-9671.

North American Electric Reliability Corporation

A. Introduction

1. Title: Facility Ratings
2. Number: FAC-008-4
3. Purpose: To ensure that Facility Ratings used in the reliable planning and operation of the Bulk Electric System (BES) are determined based on technically sound principles. A Facility Rating is essential for the determination of System Operating Limits.

4. Applicability:
   4.1. Transmission Owner
   4.2. Generator Owner

5. Effective Date: See Implementation Plan.
B. Requirements and Measures

R1. Each Generator Owner shall have documentation for determining the Facility Ratings of its solely and jointly owned generator Facility(ies) up to the low side terminals of the main step up transformer if the Generator Owner does not own the main step up transformer and the high side terminals of the main step up transformer if the Generator Owner owns the main step up transformer. [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]

1.1. The documentation shall contain assumptions used to rate the generator and at least one of the following:

- Design or construction information such as design criteria, ratings provided by equipment manufacturers, equipment drawings and/or specifications, engineering analyses, method(s) consistent with industry standards (e.g. ANSI and IEEE), or an established engineering practice that has been verified by testing or engineering analysis.
- Operational information such as commissioning test results, performance testing or historical performance records, any of which may be supplemented by engineering analyses.

1.2. The documentation shall be consistent with the principle that the Facility Ratings do not exceed the most limiting applicable Equipment Rating of the individual equipment that comprises that Facility.

M1. Each Generator Owner shall have documentation that shows how its Facility Ratings were determined as identified in Requirement 1.

R2. Each Generator Owner shall have a documented methodology for determining Facility Ratings (Facility Ratings methodology) of its solely and jointly owned equipment connected between the location specified in R1 and the point of interconnection with the Transmission Owner that contains all of the following. [Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]

2.1. The methodology used to establish the Ratings of the equipment that comprises the Facility(ies) shall be consistent with at least one of the following:

- Ratings provided by equipment manufacturers or obtained from equipment manufacturer specifications such as nameplate rating.
- One or more industry standards developed through an open process such as Institute of Electrical and Electronic Engineers (IEEE) or International Council on Large Electric Systems (CIGRE).
- A practice that has been verified by testing, performance history or engineering analysis.
2.2. The underlying assumptions, design criteria, and methods used to determine the Equipment Ratings identified in Requirement R2, Part 2.1 including identification of how each of the following were considered:

2.2.1. Equipment Rating standard(s) used in development of this methodology.

2.2.2. Ratings provided by equipment manufacturers or obtained from equipment manufacturer specifications.

2.2.3. Ambient conditions (for particular or average conditions or as they vary in real-time).

2.2.4. Operating limitations.\(^1\)

2.3. A statement that a Facility Rating shall respect the most limiting applicable Equipment Rating of the individual equipment that comprises that Facility.

2.4. The process by which the Rating of equipment that comprises a Facility is determined.

2.4.1. The scope of equipment addressed shall include, but not be limited to, conductors, transformers, relay protective devices, terminal equipment, and series and shunt compensation devices.

2.4.2. The scope of Ratings addressed shall include, as a minimum, both Normal and Emergency Ratings.

M2. Each Generator Owner shall have a documented Facility Ratings methodology that includes all of the items identified in Requirement 2, Parts 2.1 through 2.4.

R3. Each Transmission Owner shall have a documented methodology for determining Facility Ratings (Facility Ratings methodology) of its solely and jointly owned Facilities (except for those generating unit Facilities addressed in R1 and R2) that contains all of the following: [Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]

3.1. The methodology used to establish the Ratings of the equipment that comprises the Facility shall be consistent with at least one of the following:

- Ratings provided by equipment manufacturers or obtained from equipment manufacturer specifications such as nameplate rating.

- One or more industry standards developed through an open process such as Institute of Electrical and Electronics Engineers (IEEE) or International Council on Large Electric Systems (CIGRE).

- A practice that has been verified by testing, performance history or engineering analysis.

\(^1\) Such as temporary de-ratings of impaired equipment in accordance with good utility practice.
3.2. The underlying assumptions, design criteria, and methods used to determine the Equipment Ratings identified in Requirement R3, Part 3.1 including identification of how each of the following were considered:

3.2.1. Equipment Rating standard(s) used in development of this methodology.

3.2.2. Ratings provided by equipment manufacturers or obtained from equipment manufacturer specifications.

3.2.3. Ambient conditions (for particular or average conditions or as they vary in real-time).

3.2.4. Operating limitations.\(^2\)

3.3. A statement that a Facility Rating shall respect the most limiting applicable Equipment Rating of the individual equipment that comprises that Facility.

3.4. The process by which the Rating of equipment that comprises a Facility is determined.

3.4.1. The scope of equipment addressed shall include, but not be limited to, transmission conductors, transformers, relay protective devices, terminal equipment, and series and shunt compensation devices.

3.4.2. The scope of Ratings addressed shall include, as a minimum, both Normal and Emergency Ratings.

M3. Each Transmission Owner shall have a documented Facility Ratings methodology that includes all of the items identified in Requirement 3, Parts 3.1 through 3.4.

R4. Reserved.

M4. Reserved.

R5. Reserved.

M5. Reserved.

R6. Each Transmission Owner and Generator Owner shall have Facility Ratings for its solely and jointly owned Facilities that are consistent with the associated Facility Ratings methodology or documentation for determining its Facility Ratings. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

M6. Each Transmission Owner and Generator Owner shall have evidence to show that its Facility Ratings are consistent with the documentation for determining its Facility Ratings as specified in Requirement R1 or consistent with its Facility Ratings methodology as specified in Requirements R2 and R3 (Requirement R6).

R7. Reserved.

M7. Reserved.

\(^2\) Such as temporary de-ratings of impaired equipment in accordance with good utility practice.
R8. Reserved.
M8. Reserved.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: “Compliance Enforcement Authority” means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Compliance Monitoring and Enforcement Processes:
- Self-Certifications
- Spot Checking
- Compliance Audits
- Self-Reporting
- Compliance Violation Investigations
- Complaints

1.3. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- The Generator Owner shall keep its current documentation (for R1) and any modifications to the documentation that were in force since last compliance audit period for Measure M1 and Measure M6.
- The Generator Owner shall keep its current, in force Facility Ratings methodology (for R2) and any modifications to the methodology that were in force since last compliance audit period for Measure M2 and Measure M6.
- The Transmission Owner shall keep its current, in force Facility Ratings methodology (for R3) and any modifications to the methodology that were in force since the last compliance audit for Measure M3 and Measure M6.
• The Transmission Owner and Generator Owner shall keep its current, in force Facility Ratings and any changes to those ratings for three calendar years for Measure M6.

• If a Generator Owner or Transmission Owner is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit and all subsequent compliance records.

1.4. **Compliance Monitoring and Enforcement Program:** As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

A. Introduction

1. Title: Facility Ratings
2. Number: FAC-008-34
3. Purpose: To ensure that Facility Ratings used in the reliable planning and operation of the Bulk Electric System (BES) are determined based on technically sound principles. A Facility Rating is essential for the determination of System Operating Limits.

4. Applicability:
   4.1. Transmission Owner
   4.2. Generator Owner

5. Effective Date: The first day of the first calendar quarter that is twelve months beyond the date approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the first day of the first calendar quarter twelve months following BOT adoption. See Implementation Plan.
B. Requirements and Measures

R1. Each Generator Owner shall have documentation for determining the Facility Ratings of its solely and jointly owned generator Facility(ies) up to the low side terminals of the main step up transformer if the Generator Owner does not own the main step up transformer and the high side terminals of the main step up transformer if the Generator Owner owns the main step up transformer. [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]

1.1. The documentation shall contain assumptions used to rate the generator and at least one of the following:

- Design or construction information such as design criteria, ratings provided by equipment manufacturers, equipment drawings and/or specifications, engineering analyses, method(s) consistent with industry standards (e.g. ANSI and IEEE), or an established engineering practice that has been verified by testing or engineering analysis.

- Operational information such as commissioning test results, performance testing or historical performance records, any of which may be supplemented by engineering analyses.

1.2. The documentation shall be consistent with the principle that the Facility Ratings do not exceed the most limiting applicable Equipment Rating of the individual equipment that comprises that Facility.

M1. Each Generator Owner shall have documentation that shows how its Facility Ratings were determined as identified in Requirement 1.

R2. Each Generator Owner shall have a documented methodology for determining Facility Ratings (Facility Ratings methodology) of its solely and jointly owned equipment connected between the location specified in R1 and the point of interconnection with the Transmission Owner that contains all of the following. [Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]

2.1. The methodology used to establish the Ratings of the equipment that comprises the Facility(ies) shall be consistent with at least one of the following:

- Ratings provided by equipment manufacturers or obtained from equipment manufacturer specifications such as nameplate rating.

- One or more industry standards developed through an open process such as Institute of Electrical and Electronic Engineers (IEEE) or International Council on Large Electric Systems (CIGRE).

- A practice that has been verified by testing, performance history or engineering analysis.
2.2. The underlying assumptions, design criteria, and methods used to determine the Equipment Ratings identified in Requirement R2, Part 2.1 including identification of how each of the following were considered:

2.2.1. Equipment Rating standard(s) used in development of this methodology.

2.2.2. Ratings provided by equipment manufacturers or obtained from equipment manufacturer specifications.

2.2.3. Ambient conditions (for particular or average conditions or as they vary in real-time).

2.2.4. Operating limitations.\(^1\)

2.3. A statement that a Facility Rating shall respect the most limiting applicable Equipment Rating of the individual equipment that comprises that Facility.

2.4. The process by which the Rating of equipment that comprises a Facility is determined.

2.4.1. The scope of equipment addressed shall include, but not be limited to, conductors, transformers, relay protective devices, terminal equipment, and series and shunt compensation devices.

2.4.2. The scope of Ratings addressed shall include, as a minimum, both Normal and Emergency Ratings.

M2. Each Generator Owner shall have a documented Facility Ratings methodology that includes all of the items identified in Requirement 2, Parts 2.1 through 2.4.

R3. Each Transmission Owner shall have a documented methodology for determining Facility Ratings (Facility Ratings methodology) of its solely and jointly owned Facilities (except for those generating unit Facilities addressed in R1 and R2) that contains all of the following: [Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]

3.1. The methodology used to establish the Ratings of the equipment that comprises the Facility shall be consistent with at least one of the following:

- Ratings provided by equipment manufacturers or obtained from equipment manufacturer specifications such as nameplate rating.
- One or more industry standards developed through an open process such as Institute of Electrical and Electronics Engineers (IEEE) or International Council on Large Electric Systems (CIGRE).
- A practice that has been verified by testing, performance history or engineering analysis.

\(^1\) Such as temporary de-ratings of impaired equipment in accordance with good utility practice.
3.2. The underlying assumptions, design criteria, and methods used to determine the Equipment Ratings identified in Requirement R3, Part 3.1 including identification of how each of the following were considered:

3.2.1. Equipment Rating standard(s) used in development of this methodology.

3.2.2. Ratings provided by equipment manufacturers or obtained from equipment manufacturer specifications.

3.2.3. Ambient conditions (for particular or average conditions or as they vary in real-time).

3.2.4. Operating limitations.  

3.3. A statement that a Facility Rating shall respect the most limiting applicable Equipment Rating of the individual equipment that comprises that Facility.

3.4. The process by which the Rating of equipment that comprises a Facility is determined.

3.4.1. The scope of equipment addressed shall include, but not be limited to, transmission conductors, transformers, relay protective devices, terminal equipment, and series and shunt compensation devices.

3.4.2. The scope of Ratings addressed shall include, as a minimum, both Normal and Emergency Ratings.

M3. Each Transmission Owner shall have a documented Facility Ratings methodology that includes all of the items identified in Requirement 3, Parts 3.1 through 3.4.

R4. Reserved. Each Transmission Owner shall make its Facility Ratings methodology and each Generator Owner shall each make its documentation for determining its Facility Ratings and its Facility Ratings methodology available for inspection and technical review by those Reliability Coordinators, Transmission Operators, Transmission Planners and Planning Coordinators that have responsibility for the area in which the associated Facilities are located, within 21 calendar days of receipt of a request. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning] (Retirement approved by FERC effective January 21, 2014.)

M4. Reserved. Each Transmission Owner shall have evidence, such as a copy of a dated electronic note, or other comparable evidence to show that it made its Facility Ratings methodology available for inspection within 21 calendar days of a request in accordance with Requirement 4. The Generator Owner shall have evidence, such as a copy of a dated electronic note, or other comparable evidence to show that it made its documentation for determining its Facility Ratings or its Facility Ratings methodology available for inspection within 21 calendar days of a request in accordance with Requirement R4. (Retirement approved by NERC BOT pending applicable regulatory approval.).

2 Such as temporary de-ratings of impaired equipment in accordance with good utility practice.
R5. **Reserved.** If a Reliability Coordinator, Transmission Operator, Transmission Planner or Planning Coordinator provides documented comments on its technical review of a Transmission Owner’s Facility Ratings methodology or Generator Owner’s documentation for determining its Facility Ratings and its Facility Rating methodology, the Transmission Owner or Generator Owner shall provide a response to that commenting entity within 45 calendar days of receipt of those comments. The response shall indicate whether a change will be made to the Facility Ratings methodology and, if no change will be made to that Facility Ratings methodology, the reason why. **[Violation Risk Factor: Lower]  [Time Horizon: Operations Planning]**

(Retirement approved by FERC effective January 21, 2014.)

M5. **Reserved.** If the Reliability Coordinator, Transmission Operator, Transmission Planner or Planning Coordinator provides documented comments on its technical review of a Transmission Owner’s or Generator Owner’s Facility Ratings methodology or a Generator Owner’s documentation for determining its Facility Ratings, the Transmission Owner or Generator Owner shall have evidence, (such as a copy of a dated electronic or hard copy note, or other comparable evidence from the Transmission Owner or Generator Owner addressed to the commenter that includes the response to the comment,) that it provided a response to that commenting entity in accordance with Requirement R5. **(Retirement approved by NERC BOT pending applicable regulatory approval.)**

R6. Each Transmission Owner and Generator Owner shall have Facility Ratings for its solely and jointly owned Facilities that are consistent with the associated Facility Ratings methodology or documentation for determining its Facility Ratings. **[Violation Risk Factor: Medium]  [Time Horizon: Operations Planning]**

M6. Each Transmission Owner and Generator Owner shall have evidence to show that its Facility Ratings are consistent with the documentation for determining its Facility Ratings as specified in Requirement R1 or consistent with its Facility Ratings methodology as specified in Requirements R2 and R3 (Requirement R6).

R7. **Reserved.** Each Generator Owner shall provide Facility Ratings (for its solely and jointly owned Facilities that are existing Facilities, new Facilities, modifications to existing Facilities and re-ratings of existing Facilities) to its associated Reliability Coordinator(s), Planning Coordinator(s), Transmission Planner(s), Transmission Owner(s) and Transmission Operator(s) as scheduled by such requesting entities. **[Violation Risk Factor: Medium]  [Time Horizon: Operations Planning]**

M7. **Reserved.** Each Generator Owner shall have evidence, such as a copy of a dated electronic note, or other comparable evidence to show that it provided its Facility Ratings to its associated Reliability Coordinator(s), Planning Coordinator(s), Transmission Planner(s), Transmission Owner(s) and Transmission Operator(s) in accordance with Requirement R7.

R8. **Reserved.** Each Transmission Owner (and each Generator Owner subject to Requirement R2) shall provide requested information as specified below (for its solely
and jointly owned Facilities that are existing Facilities, new Facilities, modifications to existing Facilities and re-ratings of existing Facilities) to its associated Reliability Coordinator(s), Planning Coordinator(s), Transmission Planner(s), Transmission Owner(s) and Transmission Operator(s): [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

As scheduled by the requesting entities:

8.1.1. Facility Ratings

8.1.2. Identity of the most limiting equipment of the Facilities

8.2. Within 30 calendar days (or a later date if specified by the requester), for any requested Facility with a Thermal Rating that limits the use of Facilities under the requester’s authority by causing any of the following: 1) An Interconnection Reliability Operating Limit, 2) A limitation of Total Transfer Capability, 3) An impediment to generator deliverability, or 4) An impediment to service to a major load center:

8.2.1. Identity of the existing next most limiting equipment of the Facility

8.2.2. The Thermal Rating for the next most limiting equipment identified in Requirement R8, Part 8.2.1.

M8. Reserved. Each Transmission Owner (and Generator Owner subject to Requirement R2) shall have evidence, such as a copy of a dated electronic note, or other comparable evidence to show that it provided its Facility Ratings and identity of limiting equipment to its associated Reliability Coordinator(s), Planning Coordinator(s), Transmission Planner(s), Transmission Owner(s) and Transmission Operator(s) in accordance with Requirement R8.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: “Compliance Enforcement Authority” means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Compliance Monitoring and Enforcement Processes:

- Self-Certifications
- Spot Checking
- Compliance Audits
- Self-Reporting
- Compliance Violation Investigations
• Complaints

1.3. **Evidence Retention**: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- The Generator Owner shall keep its current documentation (for R1) and any modifications to the documentation that were in force since last compliance audit period for Measure M1 and Measure M6.
- The Generator Owner shall keep its current, in force Facility Ratings methodology (for R2) and any modifications to the methodology that were in force since last compliance audit period for Measure M2 and Measure M6.
- The Transmission Owner shall keep its current, in force Facility Ratings methodology (for R3) and any modifications to the methodology that were in force since the last compliance audit for Measure M3 and Measure M6.
- The Transmission Owner and Generator Owner shall keep its current, in force Facility Ratings and any changes to those ratings for three calendar years for Measure M6.
- **The Generator Owner and Transmission Owner shall each keep evidence for Measure M4, and Measure M5, for three calendar years.** (Retirement approved by FERC effective January 21, 2014.)
- The Generator Owner shall keep evidence for Measure M7 for three calendar years.
- **The Transmission Owner (and Generator Owner that is subject to Requirement R2) shall keep evidence for Measure M8 for three calendar years.**
- If a Generator Owner or Transmission Owner is found non-compliant, it shall keep information related to the non-compliance until found compliant.
- The Compliance Enforcement Authority shall keep the last audit and all subsequent compliance records.

**Compliance Monitoring and Enforcement Program**: As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or
information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

A. Introduction

1. **Title:** Evaluation of Interchange Transactions
2. **Number:** INT-006-5
3. **Purpose:** To ensure that responsible entities conduct a reliability assessment of each Arranged Interchange before it is implemented.
4. **Applicability:**
   4.1. Balancing Authority
   4.2. Transmission Service Provider
5. **Effective Date:** See Implementation Plan.
B. Requirements and Measures

R1. Each Balancing Authority shall approve or deny each on-time Arranged Interchange or emergency Arranged Interchange that it receives and shall do so prior to the expiration of the time period defined in Attachment 1, Column B. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning, Same-day Operations, Real-time Operations]

1.1. Each Source and Sink Balancing Authority shall deny the Arranged Interchange or curtail Confirmed Interchange if it does not expect to be capable of supporting the magnitude of the Interchange, including ramping, throughout the duration of the Arranged Interchange.

1.2. Each Balancing Authority shall deny the Arranged Interchange or curtail Confirmed Interchange if the Scheduling Path (proper connectivity of Adjacent Balancing Authorities) between it and its Adjacent Balancing Authorities is invalid.

M1. Each Balancing Authority shall have evidence (such as dated and time stamped electronic logs, or other evidence) that it responded to each request for its approval to transition an Arranged Interchange to a Confirmed Interchange within the time defined in Attachment 1, Column B. (R1)

R2. Each Transmission Service Provider shall approve or deny each on-time Arranged Interchange or emergency Arranged Interchange that it receives and shall do so prior to the expiration of the time period defined in Attachment 1, Column B. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning, Same-day Operations, Real-time Operations]

2.1. Each Transmission Service Provider shall deny the Arranged Interchange or curtail Confirmed Interchange if the transmission path (proper connectivity of adjacent Transmission Service Providers) between it and its adjacent Transmission Service Providers is invalid.

M2. Each Transmission Service Provider shall have evidence (such as dated and time stamped electronic logs, studies, or other evidence) that it responded to each Arranged Interchange or emergency Arranged Interchange within the time defined in Attachment 1, Column B. If the transmission path between the Transmission Service Provider and its adjacent Transmission Service Providers is invalid, each Transmission Service Provider shall have evidence (such as dated and time stamped electronic logs, studies, or other evidence) that it denied the Arranged Interchange or curtailed confirmed Interchange. (R2)

R3. The Source Balancing Authority and the Sink Balancing Authority receiving a Reliability Adjustment Arranged Interchange shall approve or deny it prior to the expiration of the time period defined in Attachment 1, Column B. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning, Same-day Operations, Real-time Operations]
M3. Each Balancing Authority shall have evidence (such as dated and time stamped electronic logs, studies, or other evidence) that when responding to a Reliability Adjustment Arranged Interchange, it either approved the request or denied the request.

R4. Reserved.

M4. Reserved.

R5. Reserved.

M5. Reserved.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: “Compliance Enforcement Authority” means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- The Balancing Authority shall maintain evidence to show compliance with R1 and R3 for the most recent three calendar months plus the current month.

- The Transmission Service Provider shall maintain evidence to show compliance with R2 for the most recent three calendar months plus the current month.

- If a Balancing Authority or Transmission Service Provider is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or
information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

</tbody>
</table>
Guidelines and Technical Basis
Many aspects of managing Interchange are supported by software applications. There are fundamental tasks that each entity should be able to perform in an electronic manner as listed below.

A Load-Serving Entity and Balancing Authority that submits Requests for Interchange should have the capability to electronically:

- Submit a Request for Interchange to a Sink Balancing Authority
- Submit a request to modify Interchange
- Receive distributions of Confirmed Interchange
- Receive distributions of Reliability Adjustment Arranged Interchanges

Each Sink Balancing Authority should have the capability to electronically:

- Receive a Request for Interchange
- Receive a request to modify Interchange
- Validate Requests for Interchange by verifying:
  - Source Balancing Authority megawatts equal Sink Balancing Authority megawatts (adjusted for losses, if appropriate).
  - All reliability entities involved in the Arranged Interchange are valid.
  - Generation source and Load sink are defined.
  - Megawatt profile is defined.
  - Interchange duration is defined.
- Validate request to modify Interchange by verifying:
  - Source Balancing Authority megawatts equal Sink Balancing Authority megawatts (adjusted for losses, if appropriate).
  - Megawatt profile is defined.
  - Interchange duration is defined.
- Distribute the validated Request for Interchange as Arranged Interchange
- Distribute the validated Reliability Adjustment Arranged Interchanges
- Receive communication of approval or denial of Arranged Interchange
  - Distribute notification as each entity approves or denies an Arranged Interchange.
  - Transition Arranged Interchange to Confirmed Interchange if all approvals are received.
  - Distribute notification of whether Arranged Interchange was transitioned to Confirmed Interchange or not.
Submit a request to modify Interchange

Each Load-Serving Entity that approves or denies Arranged Interchange, and each Balancing Authority and Transmission Service Provider should have the capability to electronically:
- Receive distribution of Arranged Interchange
- Communicate approval or denial of the Arranged Interchange to the Sink Balancing Authority
- Receive notification of whether Arranged Interchange was transitioned to Confirmed interchange or not.
- Submit a request to modify Interchange

While Interchange is normally facilitated using electronic communication and software tools, there are occasions with those electronic capabilities are reduced or unavailable. It is recommended that all entities involved in aspects of Interchange should have, maintain and implement a plan describing the manner and timing in which all capabilities listed above will be provided when electronic capabilities are reduced or unavailable. Each plan should address the following topics:
- Alternate methods of communicating Interchange information between Purchasing Selling Entities, Balancing Authorities, and Transmission Service Providers.
- How to notify others that it is activating the plan
- How it will process requests for emergency Arranged Interchange and Reliability Adjustment Arranged Interchange.
- Restrictions and limitations that may apply during the period of reduced or unavailable capability (such as limits on volume, only accepting emergency transactions, etc.).
- Delegation of approval rights and proxy actions, if such approaches will be used.
- How known Confirmed Interchange will be scheduled following a reduction in or loss of capability.
- Personnel plans for short-term and extended periods.
- Training of personnel in the use of the plan.

Rationale:
During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for R1:
Balancing Authorities must take action on a received Arranged Interchange within a certain time frame. Requirement R1, Parts 1.1 and 1.2 provide reliability-related reasons that a Balancing Authority must deny an Arranged Interchange, but Balancing Authorities may deny
for other reasons. If the conditions described in Requirement R1, Parts 1.1 or 1.2 are recognized after approval is granted, the Balancing Authority may curtail the Confirmed Interchange prior to implementation.

Rationale for R2:
TSPs must take action on a received Arranged Interchange within a certain time frame. Requirement R2, Part 2.1 provides reliability-related reasons that a TSP must deny an Arranged Interchange, but TSPs may deny for other reasons. If the conditions described in Requirement R1, Part 2.1 are recognized after approval is granted, the TSP may curtail the Confirmed Interchange prior to implementation.
A. Introduction

1. Title: Evaluation of Interchange Transactions

2. Number: INT-006-45

3. Purpose: To ensure that responsible entities conduct a reliability assessment of each Arranged Interchange before it is implemented.

4. Applicability:

4.1. Balancing Authority

4.2. Transmission Service Provider

5. Effective Date: First day of the second calendar quarter after the date that this standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is six months after the date this standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction. See Implementation Plan.

6. Background: This standard was revised as part of the Project 2008-12 Coordinate Interchange Standards effort to combine requirements from the various INT standards into a fewer number of standards and in a logical sequence. The focus of INT-006-4 continues to be the reliability assessment of Interchange Transactions prior to their implementation.

The content of INT-006-4 has been revised and expanded in the following manner:

- R1 was created by revising R1 from INT-006-3. This requirement ensures that Balancing Authorities involved in an Arranged Interchange actively approve or deny the transition to Confirmed Interchange. The requirement also lists criteria to determine when a Balancing Authority must deny the transition.

- R2 was created by revising R1 from INT-006-3. This requirement ensures that Transmission Service Providers involved in an Arranged Interchange actively approve or deny the transition to Confirmed Interchange. The requirement also lists criteria to determine when a Transmission Service Provider must deny the transition.

- R3 was created by revising R1 from INT-006-3. This requirement ensures that Balancing Authorities who receive a Reliability Adjustment Arranged Interchange actively approve or deny the transition to Confirmed Interchange.

- R4 was created by moving and revising R1 from INT-007-1, which has been retired as part of the project. This requirement lists criteria for when a Sink Balancing Authority shall not transition an Arranged Interchange to Confirmed Interchange.
• R5 was created by moving and revising R1 from INT-008-3, which has been retired as part of the project. This requirement lists the entities to which a Sink Balancing Authority must distribute notifications of whether an Arranged Interchange has transitioned to Confirmed Interchange.

• Attachment 1 timing tables for WECC were modified to address scheduling on a 15 minute basis.
B. Requirements and Measures

R1. Each Balancing Authority shall approve or deny each on-time Arranged Interchange or emergency Arranged Interchange that it receives and shall do so prior to the expiration of the time period defined in Attachment 1, Column B. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning, Same-day Operations, Real-time Operations]

1.1. Each Source and Sink Balancing Authority shall deny the Arranged Interchange or curtail Confirmed Interchange if it does not expect to be capable of supporting the magnitude of the Interchange, including ramping, throughout the duration of the Arranged Interchange.

1.2. Each Balancing Authority shall deny the Arranged Interchange or curtail Confirmed Interchange if the Scheduling Path (proper connectivity of Adjacent Balancing Authorities) between it and its Adjacent Balancing Authorities is invalid.

M1. Each Balancing Authority shall have evidence (such as dated and time stamped electronic logs, or other evidence) that it responded to each request for its approval to transition an Arranged Interchange to a Confirmed Interchange within the time defined in Attachment 1, Column B. (R1)

R2. Each Transmission Service Provider shall approve or deny each on-time Arranged Interchange or emergency Arranged Interchange that it receives and shall do so prior to the expiration of the time period defined in Attachment 1, Column B. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning, Same-day Operations, Real-time Operations]

2.1. Each Transmission Service Provider shall deny the Arranged Interchange or curtail Confirmed Interchange if the transmission path (proper connectivity of adjacent Transmission Service Providers) between it and its adjacent Transmission Service Providers is invalid.

M2. Each Transmission Service Provider shall have evidence (such as dated and time stamped electronic logs, studies, or other evidence) that it responded to each Arranged Interchange or emergency Arranged Interchange within the time defined in Attachment 1, Column B. If the transmission path between the Transmission Service Provider and its adjacent Transmission Service Providers is invalid, each Transmission Service Provider shall have evidence (such as dated and time stamped electronic logs, studies, or other evidence) that it denied the Arranged Interchange or curtailed confirmed Interchange. (R2)

R3. The Source Balancing Authority and the Sink Balancing Authority receiving a Reliability Adjustment Arranged Interchange shall approve or deny it prior to the expiration of the time period defined in Attachment 1, Column B. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning, Same-day Operations, Real-time Operations]
3.0. If a Balancing Authority denies a Reliability Adjustment Arranged Interchange, the Balancing Authority must communicate that fact to its Reliability Coordinator no more than 10 minutes after the denial.

A44.M3. Each Balancing Authority shall have evidence (such as dated and time stamped electronic logs, studies, or other evidence) that when responding to a Reliability Adjustment Arranged Interchange, it either approved the request or denied the request, and, if applicable, communicated denial to the Reliability Coordinator no more than 10 minutes after the denial. (R3)

R4. Reserved. Each Sink Balancing Authority shall confirm that none of the following conditions exist prior to transitioning an Arranged Interchange to Confirmed Interchange: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning, Same-day Operations, Real-time Operations]

- It is a Reliability Adjustment Arranged Interchange, the time period specified in Attachment 1, Column B has elapsed, and the Source Balancing Authority or the Sink Balancing Authority associated with the Arranged Interchange has not communicated its approval of the transition.

- It is not a Reliability Adjustment Arranged Interchange, the time period specified in Attachment 1, Column B, has elapsed, and not all Balancing Authorities and Transmission Service Providers associated with the Arranged Interchange have communicated their approval of the transition.

- It is not a Reliability Adjustment Arranged Interchange, the time period specified in Attachment 1, Column B, has elapsed, and any entity associated with the Arranged Interchange has communicated its denial of the transition.

M8.M4. Reserved. Each Sink Balancing Authority shall have evidence (such as dated and time stamped electronic logs, studies, or other evidence) that, under the conditions in R4, it did not transition an Arranged Interchange to Confirmed Interchange. (R4)

R5. Reserved. For each Arranged Interchange that is transitioned to Confirmed Interchange, the Sink Balancing Authority shall notify the following entities of the on-time Confirmed Interchange such that the notification is delivered in time to be incorporated into scheduling systems prior to ramp start as specified in Attachment 1, Column D: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning, Same-day Operations, Real-time Operations]

9.0. The Source Balancing Authority,

10.0. Each Intermediate Balancing Authority,

11.0. Each Reliability Coordinator associated with each Balancing Authority included in the Arranged Interchange,

12.0. Each Transmission Service Provider included in the Arranged Interchange, and

13.0. Each Purchasing Selling Entity included in the Arranged Interchange.
C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: “Compliance Enforcement Authority” means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- The Balancing Authority shall maintain evidence to show compliance with R1, and R3, R4, and R5 for the most recent three calendar months plus the current month.
- The Transmission Service Provider shall maintain evidence to show compliance with R2 for the most recent three calendar months plus the current month.
- If a Balancing Authority or Transmission Service Provider is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Guidelines and Technical Basis

Many aspects of managing Interchange are supported by software applications. There are fundamental tasks that each entity should be able to perform in an electronic manner as listed below.

A Load-Serving Entity and Balancing Authority that submits Requests for Interchange should have the capability to electronically:

- Submit a Request for Interchange to a Sink Balancing Authority
- Submit a request to modify Interchange
- Receive distributions of Confirmed Interchange
- Receive distributions of Reliability Adjustment Arranged Interchanges

Each Sink Balancing Authority should have the capability to electronically:

- Receive a Request for Interchange
- Receive a request to modify Interchange
- Validate Requests for Interchange by verifying:
  - Source Balancing Authority megawatts equal Sink Balancing Authority megawatts (adjusted for losses, if appropriate).
  - All reliability entities involved in the Arranged Interchange are valid.
  - Generation source and Load sink are defined.
  - Megawatt profile is defined.
  - Interchange duration is defined.
- Validate request to modify Interchange by verifying:
  - Source Balancing Authority megawatts equal Sink Balancing Authority megawatts (adjusted for losses, if appropriate).
  - Megawatt profile is defined.
  - Interchange duration is defined.
- Distribute the validated Request for Interchange as Arranged Interchange
- Distribute the validated Reliability Adjustment Arranged Interchanges
- Receive communication of approval or denial of Arranged Interchange
  - Distribute notification as each entity approves or denies an Arranged Interchange.
  - Transition Arranged Interchange to Confirmed Interchange if all approvals are received.
  - Distribute notification of whether Arranged Interchange was transitioned to Confirmed Interchange or not.
Submit a request to modify Interchange

• Each Load-Serving Entity that approves or denies Arranged Interchange, and each Balancing Authority and Transmission Service Provider should have the capability to electronically:
  - Receive distribution of Arranged Interchange
  - Communicate approval or denial of the Arranged Interchange to the Sink Balancing Authority
  - Receive notification of whether Arranged Interchange was transitioned to Confirmed interchange or not.
  - Submit a request to modify Interchange

• While Interchange is normally facilitated using electronic communication and software tools, there are occasions when those electronic capabilities are reduced or unavailable. It is recommended that all entities involved in aspects of Interchange should have, maintain and implement a plan describing the manner and timing in which all capabilities listed above will be provided when electronic capabilities are reduced or unavailable. Each plan should address the following topics:
  - Alternate methods of communicating Interchange information between Purchasing Selling Entities, Balancing Authorities, and Transmission Service Providers.
  - How to notify others that it is activating the plan
  - How it will process requests for emergency Arranged Interchange and Reliability Adjustment Arranged Interchange.
  - Restrictions and limitations that may apply during the period of reduced or unavailable capability (such as limits on volume, only accepting emergency transactions, etc.).
  - Delegation of approval rights and proxy actions, if such approaches will be used.
  - How known Confirmed Interchange will be scheduled following a reduction in or loss of capability.
  - Personnel plans for short-term and extended periods.
  - Training of personnel in the use of the plan.

Rationale:
During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for R1:
Balancing Authorities must take action on a received Arranged Interchange within a certain time frame. Requirement R1, Parts 1.1 and 1.2 provide reliability-related reasons that a Balancing Authority must deny an Arranged Interchange, but Balancing Authorities may deny
for other reasons. If the conditions described in Requirement R1, Parts 1.1 or 1.2 are recognized after approval is granted, the Balancing Authority may curtail the Confirmed Interchange prior to implementation.

**Rationale for R2:**
TSPs must take action on a received Arranged Interchange within a certain time frame. Requirement R2, Part 2.1 provides reliability-related reasons that a TSP must deny an Arranged Interchange, but TSPs may deny for other reasons. If the conditions described in Requirement R1, Part 2.1 are recognized after approval is granted, the TSP may curtail the Confirmed Interchange prior to implementation.
A. Introduction

1. Title: Implementation of Interchange
2. Number: INT-009-3
3. Purpose: To ensure that Balancing Authorities implement the Interchange as agreed upon in the Interchange confirmation process.
4. Applicability:
   4.1. Balancing Authority
5. Effective Date: See Implementation Plan
B. Requirements and Measures

R1. Each Balancing Authority shall agree with each of its Adjacent Balancing Authorities that its Composite Confirmed Interchange with that Adjacent Balancing Authority, at mutually agreed upon time intervals, excluding Dynamic Schedules and Pseudo-Ties and including any Interchange per INT-010-2 not yet captured in the Composite Confirmed Interchange, is: [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]

1.1. Identical in magnitude to that of the Adjacent Balancing Authority, and

1.2. Opposite in sign or direction to that of the Adjacent Balancing Authority.

M1. The Balancing Authority shall have evidence (such as dated logs, voice recordings, electronic records, or other evidence) that its Composite Confirmed Interchange, excluding Dynamic Schedules and Pseudo-Ties and including any Interchange as directed per INT-010-2 not yet captured in the Composite Confirmed Interchange, was agreed to by each Adjacent Balancing Authority, identical in magnitude to those of each Adjacent Balancing Authority, and opposite in sign to that of each Adjacent Balancing Authority. (R1)

R2. Reserved.

M2. Reserved.

R3. Each Balancing Authority in whose area the high-voltage direct current tie is controlled shall coordinate the Confirmed Interchange prior to its implementation with the Transmission Operator of the high-voltage direct current tie. [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations, Operations Planning]

M3. The Balancing Authority shall have evidence (such as dated logs, electronic records, or other evidence) that it coordinated the Confirmed Interchange prior to its implementation with the Transmission Operator of the high-voltage direct current tie. (R3)
C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: “Compliance Enforcement Authority” means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- The Balancing Authority shall maintain evidence to show compliance with R1 and R3 for the most recent 3 months plus the current month.

If a Balancing Authority is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

A. Introduction

1. Title: Implementation of Interchange

2. Number: INT-009-2.13

3. Purpose: To ensure that Balancing Authorities implement the Interchange as agreed upon in the Interchange confirmation process.

4. Applicability:

   4.1. Balancing Authority

5. Effective Date: See Implementation Plan

6. Background: This standard was revised as part of the Project 2008-12 Coordinate Interchange Standards effort to combine requirements from the various INT standards into a fewer number of standards and in a logical sequence. The focus of INT-009-2 continues to be the Balancing Authority to Balancing Authority Interchange confirmation process for Interchange Transactions prior to their implementation.

   The Requirements in INT-009-2 have been expanded to include previous Measures from INT-009-1 and acknowledge Dynamic Schedules and Pseudo-Ties. A new term “Composite Confirmed Interchange” has been introduced.

   The content of INT-009-2 has been revised and expanded in the following manner:

   • R1 was combined with INT-003-3 R1 and modified to ensure that a Balancing Authority agrees to a Composite Confirmed Interchange with each of its Adjacent Balancing Authorities.

   • R2 was created to ensure that Adjacent Balancing Authorities incorporating a Pseudo-Tie agree to a common source for their Actual Net Interchange term for their ACE controls.

   • R3 was created by revising R1.2 from INT-003-3. This requirement ensures that the Balancing Authority that controls a high-voltage direct current tie coordinates the Confirmed Interchange.
B. Requirements and Measures

R1. Each Balancing Authority shall agree with each of its Adjacent Balancing Authorities that its Composite Confirmed Interchange with that Adjacent Balancing Authority, at mutually agreed upon time intervals, excluding Dynamic Schedules and Pseudo-Ties and including any Interchange per INT-010-2 not yet captured in the Composite Confirmed Interchange, is: [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]

1.1. Identical in magnitude to that of the Adjacent Balancing Authority, and
1.2. Opposite in sign or direction to that of the Adjacent Balancing Authority.

M1. The Balancing Authority shall have evidence (such as dated logs, voice recordings, electronic records, or other evidence) that its Composite Confirmed Interchange, excluding Dynamic Schedules and Pseudo-Ties and including any Interchange as directed per INT-010-2 not yet captured in the Composite Confirmed Interchange, was agreed to by each Adjacent Balancing Authority, identical in magnitude to those of each Adjacent Balancing Authority, and opposite in sign to that of each Adjacent Balancing Authority. (R1)

R2. Reserved. The Attaining Balancing Authority and the Native Balancing Authority shall use a dynamic value emanating from an agreed upon common source to account for the Pseudo-Tie in the Actual Net Interchange (NIA) term of their respective control ACE (or alternate control process). [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]

M2. Reserved. The Balancing Authority shall have evidence (such as dated logs, voice recordings, electronic records, written agreement or other evidence) that it used a dynamic value emanating from an agreed upon common source to account for the Pseudo-Tie in the Actual Net Interchange (NIA) term of their respective control ACE (or alternate control process). (R2)

R3. Each Balancing Authority in whose area the high-voltage direct current tie is controlled shall coordinate the Confirmed Interchange prior to its implementation with the Transmission Operator of the high-voltage direct current tie. [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations, Operations Planning]

M3. The Balancing Authority shall have evidence (such as dated logs, electronic records, or other evidence) that it coordinated the Confirmed Interchange prior to its implementation with the Transmission Operator of the high-voltage direct current tie. (R3)
C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: “Compliance Enforcement Authority” means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- The Balancing Authority shall maintain evidence to show compliance with R1, R2 and R3 for the most recent 3 months plus the current month.

If a Balancing Authority is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Guidelines and Technical Basis

Rationale:
During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for R2: R12.3 of BAL-005-2b addresses common metering for Dynamic Schedules and Pseudo-Ties but not their implementation into ACE. Requirement R2 is parallel to R10 of BAL-005-2b which only addresses Dynamic Schedules. Presently, there is a gap in the BAL standards that this requirement fills for Pseudo-Ties.
A. Introduction

1. **Title:** Reliability Coordination – Monitoring and Analysis

2. **Number:** IRO-002-6

3. **Purpose:** To provide System Operators with the capabilities necessary to monitor and analyze data needed to perform their reliability functions.

4. **Applicability:**

   4.1. **Functional Entities:**

   4.1.1. Reliability Coordinators

5. **Effective Date:** See Implementation Plan
B. Requirements and Measures

R1. Reserved.

M1. Reserved.

R2. Each Reliability Coordinator shall have data exchange capabilities, with redundant and diversely routed data exchange infrastructure within the Reliability Coordinator's primary Control Center, for the exchange of Real-time data with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for performing its Real-time monitoring and Real-time Assessments. [Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-time Operations]

M2. Each Reliability Coordinator shall have, and provide upon request, evidence that could include, but is not limited to, system specifications, system diagrams, or other documentation that lists its data exchange capabilities, including redundant and diversely routed data exchange infrastructure within the Reliability Coordinator's primary Control Center, for the exchange of Real-time data with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, as specified in the requirement.

R3. Each Reliability Coordinator shall test its primary Control Center data exchange capabilities specified in Requirement R2 for redundant functionality at least once every 90 calendar days. If the test is unsuccessful, the Reliability Coordinator shall initiate action within two hours to restore redundant functionality. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

M3. Each Reliability Coordinator shall have, and provide upon request, evidence that it tested its primary Control Center data exchange capabilities specified in Requirement R2 for redundant functionality, or experienced an event that demonstrated the redundant functionality; and if the test was unsuccessful, initiated action within two hours to restore redundant functionality as specified in Requirement R3. Evidence could include, but is not limited to: dated and time-stamped test records, operator logs, voice recordings, or electronic communications.

R4. Each Reliability Coordinator shall provide its System Operators with the authority to approve planned outages and maintenance of its telecommunication, monitoring and analysis capabilities. [Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]

M4. Each Reliability Coordinator shall have, and provide upon request evidence that could include, but is not limited to, a documented procedure or equivalent evidence that will be used to confirm that the Reliability Coordinator has provided its System Operators with the authority to approve planned outages and maintenance of its telecommunication, monitoring and analysis capabilities.

R5. Each Reliability Coordinator shall monitor Facilities, the status of Remedial Action Schemes, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to
identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. [Violation Risk Factor: High] [Time Horizon: Real-Time Operations]

M5. Each Reliability Coordinator shall have, and provide upon request, evidence that could include, but is not limited to, Energy Management System description documents, computer printouts, SCADA data collection, or other equivalent evidence that will be used to confirm that it has monitored Facilities, the status of Remedial Action Schemes, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.

R6. Each Reliability Coordinator shall have monitoring systems that provide information utilized by the Reliability Coordinator’s operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant infrastructure. [Violation Risk Factor: High] [Time Horizon: Real-time Operations]

M6. The Reliability Coordinator shall have, and provide upon request, evidence that could include, but is not limited to, Energy Management System description documents, computer printouts, SCADA data collection, or other equivalent evidence that will be used to confirm that it has monitoring systems consistent with the requirement.
C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:
“Compliance Enforcement Authority” means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention:
The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- The Reliability Coordinator shall retain its current, in force document and any documents in force for the current year and previous calendar year for Requirements R2 and R4 and Measures M2 and M4.
- The Reliability Coordinator shall retain evidence for Requirement R3 and Measure M3 for the most recent 12 calendar months, with the exception of operator logs and voice recordings which shall be retained for a minimum of 90 calendar days.
- The Reliability Coordinator shall keep data or evidence for Requirements R5 and R6 and Measures M5 and M6 for the current calendar year and one previous calendar year.

1.3. Compliance Monitoring and Enforcement Program
As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Guidelines and Technical Basis
None.

Rationale
Rationale text from the development of IRO-002-4 in Project 2014-03 and IRO-002-5 in Project 2016-01 follows. Additional information can be found on the Project 2014-03 and Project 2016-01 pages.

Changes made to the proposed definitions were made in order to respond to issues raised in NOPR paragraphs 55, 73, and 74 dealing with analysis of SOLs in all time horizons, questions on Protection Systems and Special Protection Systems in NOPR paragraph 78, and recommendations on phase angles from the SW Outage Report (recommendation 27). The intent of such changes is to ensure that Real-time Assessments contain sufficient details to result in an appropriate level of situational awareness. Some examples include: 1) analyzing phase angles which may result in the implementation of an Operating Plan to adjust generation or curtail transactions so that a Transmission facility may be returned to service, or 2) evaluating the impact of a modified Contingency resulting from the status change of a Special Protection Scheme from enabled/in-service to disabled/out-of-service.

Rationale for Requirements:
The data exchange elements of Requirements R1 and R2 from approved IRO-002-2 have been added back into proposed IRO-002-4 in order to ensure that there is no reliability gap. The Project 2014-03 SDT found no proposed requirements in the current project that covered the issue. Voice communication is covered in proposed COM-001-2 but data communications needs to remain in IRO-002-4 as it is not covered in proposed COM-001-2. Staffing of communications and facilities in corresponding requirements from IRO-002-2 is addressed in approved PER-004-2, Requirement R1 and has been deleted from this draft.

Rationale for R2:
Requirement R2 from IRO-002-3 has been deleted because approved EOP-008-1, Requirement R1, part 1.6.2 addresses redundancy and back-up concerns for outages of analysis tools. New Requirement R4 (R6 in IRO-002-5) has been added to address NOPR paragraphs 96 and 97: “…As we explain above, the reliability coordinator’s obligation to monitor SOLs is important to reliability because a SOL can evolve into an IROL during deteriorating system conditions, and for potential system conditions such as this, the reliability coordinator’s monitoring of SOLs provides a necessary backup function to the transmission operator….”

Rationale for Requirements R1 and R2: (note: R1 proposed for retirement in IRO-002-6 as part of Project 2018-03 Standard Efficiency Review Retirements)
The proposed changes address directives for redundancy and diverse routing of data exchange capabilities (FERC Order No. 817 Para 47).
Redundant and diversely routed data exchange capabilities consist of data exchange infrastructure components (e.g., switches, routers, servers, power supplies, and network cabling and communication paths between these components in the primary Control Center for the exchange of system operating data) that will provide continued functionality despite failure or malfunction of an individual component within the Reliability Coordinator's (RC) primary Control Center. Redundant and diversely routed data exchange capabilities preclude single points of failure in primary Control Center data exchange infrastructure from halting the flow of Real-time data. Requirement R2 does not require automatic or instantaneous fail-over of data exchange capabilities. Redundancy and diverse routing may be achieved in various ways depending on the arrangement of the infrastructure or hardware within the RC's primary Control Center.

The reliability objective of redundancy is to provide for continued data exchange functionality during outages, maintenance, or testing of data exchange infrastructure. For periods of planned or unplanned outages of individual data exchange components, the proposed requirements do not require additional redundant data exchange infrastructure components solely to provide for redundancy.

Infrastructure that is not within the RC's primary Control Center is not addressed by the proposed requirement.

**Rationale for Requirement R3:**
The revised requirement addresses directives for testing of data exchange capabilities used in primary Control Centers (FERC Order No. 817 Para 51).

A test for redundant functionality demonstrates that data exchange capabilities will continue to operate despite the malfunction or failure of an individual component (e.g., switches, routers, servers, power supplies, and network cabling and communication paths between these components in the primary Control Center for the exchange of system operating data). An entity's testing practices should, over time, examine the various failure modes of its data exchange capabilities. When an actual event successfully exercises the redundant functionality, it can be considered a test for the purposes of the proposed requirement.

**Rationale for R4 (R6 in IRO-002-5 and IRO-002-6):**
The requirement was added back from approved IRO-002-2 as the Project 2014-03 SDT found no proposed requirements that covered the issues.
A. Introduction

1. Title: Reliability Coordination – Monitoring and Analysis
2. Number: IRO-002-56
3. Purpose: To provide System Operators with the capabilities necessary to monitor and analyze data needed to perform their reliability functions.
4. Applicability:
   4.1. Functional Entities:
      4.1.1. Reliability Coordinators

5. Effective Date: _See Implementation Plan

B. Requirements and Measures

R1. Reserved. Each Reliability Coordinator shall have data exchange capabilities with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for it to perform its Operational Planning Analyses. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

M1. Reserved. Each Reliability Coordinator shall have, and provide upon request, evidence that could include, but is not limited to, a document that lists its data exchange capabilities with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for it to perform its Operational Planning Analyses.

R2. Each Reliability Coordinator shall have data exchange capabilities, with redundant and diversely routed data exchange infrastructure within the Reliability Coordinator’s primary Control Center, for the exchange of Real-time data with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for performing its Real-time monitoring and Real-time Assessments. [Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-time Operations]

M2. Each Reliability Coordinator shall have, and provide upon request, evidence that could include, but is not limited to, system specifications, system diagrams, or other documentation that lists its data exchange capabilities, including redundant and diversely routed data exchange infrastructure within the Reliability Coordinator’s primary Control Center, for the exchange of Real-time data with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, as specified in the requirement.

R3. Each Reliability Coordinator shall test its primary Control Center data exchange capabilities specified in Requirement R2 for redundant functionality at least once every 90 calendar days. If the test is unsuccessful, the Reliability Coordinator shall initiate action within two hours to restore redundant functionality. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]
M3. Each Reliability Coordinator shall have, and provide upon request, evidence that it tested its primary Control Center data exchange capabilities specified in Requirement R2 for redundant functionality, or experienced an event that demonstrated the redundant functionality; and if the test was unsuccessful, initiated action within two hours to restore redundant functionality as specified in Requirement R3. Evidence could include, but is not limited to: dated and time-stamped test records, operator logs, voice recordings, or electronic communications.

R4. Each Reliability Coordinator shall provide its System Operators with the authority to approve planned outages and maintenance of its telecommunication, monitoring and analysis capabilities. [Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]

M4. Each Reliability Coordinator shall have, and provide upon request evidence that could include, but is not limited to, a documented procedure or equivalent evidence that will be used to confirm that the Reliability Coordinator has provided its System Operators with the authority to approve planned outages and maintenance of its telecommunication, monitoring and analysis capabilities.

R5. Each Reliability Coordinator shall monitor Facilities, the status of Remedial Action Schemes, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. [Violation Risk Factor: High] [Time Horizon: Real-Time Operations]

M5. Each Reliability Coordinator shall have, and provide upon request, evidence that could include, but is not limited to, Energy Management System description documents, computer printouts, SCADA data collection, or other equivalent evidence that will be used to confirm that it has monitored Facilities, the status of Remedial Action Schemes, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.

R6. Each Reliability Coordinator shall have monitoring systems that provide information utilized by the Reliability Coordinator’s operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant infrastructure. [Violation Risk Factor: High] [Time Horizon: Real-time Operations]

M6. The Reliability Coordinator shall have, and provide upon request, evidence that could include, but is not limited to, Energy Management System description documents, computer printouts, SCADA data collection, or other equivalent evidence that will be used to confirm that it has monitoring systems consistent with the requirement.
C. Compliance

1. Compliance Monitoring Process

   1.1. Compliance Enforcement Authority:
   “Compliance Enforcement Authority” means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

   1.2. Evidence Retention:
   The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

   The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

   - The Reliability Coordinator shall retain its current, in force document and any documents in force for the current year and previous calendar year for Requirements R1, R2, and R4 and Measures M1, M2, and M4.
   - The Reliability Coordinator shall retain evidence for Requirement R3 and Measure M3 for the most recent 12 calendar months, with the exception of operator logs and voice recordings which shall be retained for a minimum of 90 calendar days.
   - The Reliability Coordinator shall keep data or evidence for Requirements R5 and R6 and Measures M5 and M6 for the current calendar year and one previous calendar year.

   1.3. Compliance Monitoring and Enforcement Program
   As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Rationale

During development of IRO-002-5, text boxes are embedded within the standard to explain the rationale for various parts of the standard. Upon Board adoption of IRO-002-5, the text from the rationale text boxes will be moved to this section.

Rationale text from the development of IRO-002-4 in Project 2014-03 and IRO-002-5 in Project 2016-01 follows. Additional information can be found on the Project 2014-03 project page and the Project 2016-01 project page.

Changes made to the proposed definitions were made in order to respond to issues raised in NOPR paragraphs 55, 73, and 74 dealing with analysis of SOLs in all time horizons, questions on Protection Systems and Special Protection Systems in NOPR paragraph 78, and recommendations on phase angles from the SW Outage Report (recommendation 27). The intent of such changes is to ensure that Real-time Assessments contain sufficient details to result in an appropriate level of situational awareness. Some examples include: 1) analyzing phase angles which may result in the implementation of an Operating Plan to adjust generation or curtail transactions so that a Transmission facility may be returned to service, or 2) evaluating the impact of a modified Contingency resulting from the status change of a Special Protection Scheme from enabled/in-service to disabled/out-of-service.

Rationale for Requirements:

The data exchange elements of Requirements R1 and R2 from approved IRO-002-2 have been added back into proposed IRO-002-4 in order to ensure that there is no reliability gap. The Project 2014-03 SDT found no proposed requirements in the current project that covered the issue. Voice communication is covered in proposed COM-001-2 but data communications needs to remain in IRO-002-4 as it is not covered in proposed COM-001-2. Staffing of communications and facilities in corresponding requirements from IRO-002-2 is addressed in approved PER-004-2, Requirement R1 and has been deleted from this draft.

Rationale for R2:

Requirement R2 from IRO-002-3 has been deleted because approved EOP-008-1, Requirement R1, part 1.6.2 addresses redundancy and back-up concerns for outages of analysis tools. New Requirement R4 (R6 in IRO-002-5) has been added to address NOPR paragraphs 96 and 97: “...As we explain above, the reliability coordinator’s obligation to monitor SOLs is important to reliability because a SOL can evolve into an IROL during deteriorating system conditions, and for potential system conditions such as this, the reliability coordinator’s monitoring of SOLs provides a necessary backup function to the transmission operator....”

Rationale for Requirements R1 and R2: (note: R1 proposed for retirement in IRO-002-6 as part of Project 2018-03 Standard Efficiency Review Retirements)

The proposed changes address directives for redundancy and diverse routing of data exchange capabilities (FERC Order No. 817 Para 47).

Redundant and diversely routed data exchange capabilities consist of data exchange infrastructure components (e.g., switches, routers, servers, power supplies, and network
cabling and communication paths between these components in the primary Control Center for the exchange of system operating data) that will provide continued functionality despite failure or malfunction of an individual component within the Reliability Coordinator's (RC) primary Control Center. Redundant and diversely routed data exchange capabilities preclude single points of failure in primary Control Center data exchange infrastructure from halting the flow of Real-time data. Requirement R2 does not require automatic or instantaneous fail-over of data exchange capabilities. Redundancy and diverse routing may be achieved in various ways depending on the arrangement of the infrastructure or hardware within the RC's primary Control Center.

The reliability objective of redundancy is to provide for continued data exchange functionality during outages, maintenance, or testing of data exchange infrastructure. For periods of planned or unplanned outages of individual data exchange components, the proposed requirements do not require additional redundant data exchange infrastructure components solely to provide for redundancy.

Infrastructure that is not within the RC's primary Control Center is not addressed by the proposed requirement.

**Rationale for Requirement R3:**
The revised requirement addresses directives for testing of data exchange capabilities used in primary Control Centers (FERC Order No. 817 Para 51).

A test for redundant functionality demonstrates that data exchange capabilities will continue to operate despite the malfunction or failure of an individual component (e.g., switches, routers, servers, power supplies, and network cabling and communication paths between these components in the primary Control Center for the exchange of system operating data). An entity's testing practices should, over time, examine the various failure modes of its data exchange capabilities. When an actual event successfully exercises the redundant functionality, it can be considered a test for the purposes of the proposed requirement.

**Rationale for R4 (R6 in IRO-002-5 and IRO-002-6):**
The requirement was added back from approved IRO-002-2 as the Project 2014-03 SDT found no proposed requirements that covered the issues.
A. Introduction

1. Title: Protection System Misoperation Identification and Correction

2. Number: PRC-004-6

3. Purpose: Identify and correct the causes of Misoperations of Protection Systems for Bulk Electric System (BES) Elements.

4. Applicability:

   4.1. Functional Entities:

   4.1.1 Transmission Owner

   4.1.2 Generator Owner

   4.1.3 Distribution Provider

4.2. Facilities:

   4.2.1 Protection Systems for BES Elements, with the following exclusions:

   4.2.1.1 Non-protective functions that are embedded within a Protection System.

   4.2.1.2 Protective functions intended to operate as a control function during switching.¹

   4.2.1.3 Special Protection Systems (SPS).

   4.2.1.4 Remedial Action Schemes (RAS).

   4.2.1.5 Protection Systems of individual dispersed power producing resources identified under Inclusion I4 of the BES definition where the Misoperations affected an aggregate nameplate rating of less than or equal to 75 MVA of BES Facilities.

   4.2.2 Underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements.

   4.2.3 Undervoltage load shedding (UVLS) that is intended to trip one or more BES Elements.

5. Effective Date: See Implementation Plan.

¹ For additional information and examples, see the “Non-Protective Functions” and “Control Functions” sections in the Application Guidelines.
B. Requirements and Measures

R1. Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated under the circumstances in Parts 1.1 through 1.3 shall, within 120 calendar days of the BES interrupting device operation, identify whether its Protection System component(s) caused a Misoperation: [Violation Risk Factor: High][Time Horizon: Operations Assessment, Operations Planning]

1.1 The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and

1.2 The BES interrupting device owner owns all or part of the Composite Protection System; and

1.3 The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation or was caused by manual intervention in response to its Protection System failure to operate.

M1. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it identified the Misoperation of its Protection System component(s), if any, that meet the circumstances in Requirement R1, Parts 1.1, 1.2, and 1.3 within the allotted time period. Acceptable evidence for Requirement R1, including Parts 1.1, 1.2, and 1.3 may include, but is not limited to the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

R2. Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, provide notification as described in Parts 2.1 and 2.2. [Violation Risk Factor: High][Time Horizon: Operations Assessment, Operations Planning]

2.1 For a BES interrupting device operation by a Composite Protection System or by manual intervention in response to a Protection System failure to operate, notification of the operation shall be provided to the other owner(s) that share Misoperation identification responsibility for the Composite Protection System under the following circumstances:

2.1.1 The BES interrupting device owner shares the Composite Protection System ownership with any other owner; and

2.1.2 The BES interrupting device owner has determined that a Misoperation occurred or cannot rule out a Misoperation; and

2.1.3 The BES interrupting device owner has determined that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation.
2.2 For a BES interrupting device operation by a Protection System component intended to operate as backup protection for a condition on another entity’s BES Element, notification of the operation shall be provided to the other Protection System owner(s) for which that backup protection was provided.

M2. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates notification to the other owner(s), within the allotted time period for either Requirement R2, Part 2.1, including subparts 2.1.1, 2.1.2, and 2.1.3 and Requirement R2, Part 2.2. Acceptable evidence for Requirement R2, including Parts 2.1 and 2.2 may include, but is not limited to the following dated documentation (electronic or hardcopy format): emails, facsimiles, or transmittals.

R3. Each Transmission Owner, Generator Owner, and Distribution Provider that receives notification, pursuant to Requirement R2 shall, within the later of 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation, identify whether its Protection System component(s) caused a Misoperation. [Violation Risk Factor: High][Time Horizon: Operations Assessment, Operations Planning]

M3. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it identified whether its Protection System component(s) caused a Misoperation within the allotted time period. Acceptable evidence for Requirement R3 may include, but is not limited to the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, DME records, test results, or transmittals.

R4. Reserved.

M4. Reserved.

R5. Each Transmission Owner, Generator Owner, and Distribution Provider that owns the Protection System component(s) that caused the Misoperation shall, within 60 calendar days of first identifying a cause of the Misoperation: [Violation Risk Factor: High] [Time Horizon: Operations Planning, Long-Term Planning]

- Develop a Corrective Action Plan (CAP) for the identified Protection System component(s), and an evaluation of the CAP’s applicability to the entity’s other Protection Systems including other locations; or
- Explain in a declaration why corrective actions are beyond the entity’s control or would not improve BES reliability, and that no further corrective actions will be taken.

M5. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it developed a CAP and an evaluation of the CAP’s applicability to other Protection Systems and locations, or a declaration in accordance with Requirement R5. Acceptable evidence for Requirement R5 may include, but is not limited to the following dated documentation (electronic or hardcopy format): CAP and evaluation, or declaration.

R6. Each Transmission Owner, Generator Owner, and Distribution Provider shall
implement each CAP developed in Requirement R5, and update each CAP if actions or timetables change, until completed. [Violation Risk Factor: High][Time Horizon: Operations Planning, Long-Term Planning]

M6. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it implemented each CAP, including updating actions or timetables. Acceptable evidence for Requirement R6 may include, but is not limited to the following dated documentation (electronic or hardcopy format): records that document the implementation of each CAP and the completion of actions for each CAP including revision history of each CAP. Evidence may also include work management program records, work orders, and maintenance records.
C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority
As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention
The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner, and Distribution Provider shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation.

- The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirements R1, R2, and R3, Measures M1, M2, and M3 for a minimum of 12 calendar months following the completion of each Requirement.

- The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirement R5, Measure M5, including any supporting analysis per Requirements R1, R2, and R3, for a minimum of 12 calendar months following completion of each CAP, completion of each evaluation, and completion of each declaration.

- The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirement R6, Measure M6 for a minimum of 12 calendar months following completion of each CAP.

If a Transmission Owner, Generator Owner, or Distribution Provider is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes
- Compliance Audit
- Self-Certification
- Spot Checking
1.4. Additional Compliance Information

None.

Guidelines and Technical Basis

Introduction
This standard addresses the reliability issues identified in the letter\(^3\) from Gerry Cauley, NERC President and CEO, dated January 7, 2011.

“Nearly all major system failures, excluding perhaps those caused by severe weather, have misoperations of relays or automatic controls as a factor contributing to the propagation of the failure. ...Relays can misoperate, either operate when not needed or fail to operate when needed, for a number of reasons. First, the device could experience an internal failure – but this is rare. Most commonly, relays fail to operate correctly due to incorrect settings, improper coordination (of timing and set points) with other devices, ineffective maintenance and testing, or failure of communications channels or power supplies. Preventable errors can be introduced by field personnel and their supervisors or more programmatically by the organization.”

The standard also addresses the findings in the 2011 Risk Assessment of Reliability Performance\(^4\); July 2011.

“...a number of multiple outage events were initiated by protection system Misoperations. These events, which go beyond their design expectations and operating procedures, represent a tangible threat to reliability. A deeper review of the root causes of dependent and common mode events, which include three or more automatic outages, is a high priority for NERC and the industry.”

The State of Reliability 2014\(^5\) report continued to identify Protection System Misoperations as a significant contributor to automatic transmission outage severity. The report recommended completion of the development of PRC-004-3 as part of the solution to address Protection System Misoperations.

Definitions
The Misoperation definition is based on the IEEE/PSRC Working Group I3 “Transmission Protective Relay System Performance Measuring Methodology\(^6\).” Misoperations of a Protection System include failure to operate, slowness in operating, or operating when not required either during a Fault or non-Fault condition.

For reference, a “Protection System” is defined in the Glossary of Terms Used in NERC Reliability Standards (“NERC Glossary”) as:

---

• Protective relays which respond to electrical quantities,
• Communications systems necessary for correct operation of protective functions,
• Voltage and current sensing devices providing inputs to protective relays,
• Station dc supply associated with protective functions (including station batteries, battery chargers, and non-battery-based dc supply), and
• Control circuitry associated with protective functions through the trip coil(s) of the circuit breakers or other interrupting devices.

A BES interrupting device is a BES Element, typically a circuit breaker or circuit switcher that has the capability to interrupt fault current. Although BES interrupting device mechanisms are not part of a Protection System, the standard uses the operation of a BES interrupting device by a Protection System to initiate the review for Misoperation.

The following two definitions are being proposed for inclusion in the NERC Glossary:

**Composite Protection System** – The total complement of Protection System(s) that function collectively to protect an Element. Backup protection provided by a different Element’s Protection System(s) is excluded.

The Composite Protection System definition is based on the principle that an Element’s multiple layers of protection are intended to function collectively. This definition has been introduced in this standard and incorporated into the proposed definition of Misoperation to clarify that the overall performance of an Element’s total complement of protection should be considered while evaluating an operation.

**Composite Protection System – Line Example**
The Composite Protection System of the Alpha-Beta line (Circuit #123) is comprised of current differential, permissive overreaching transfer trip (POTT), step distance (classic zone 1, zone 2, and zone 3), instantaneous-overcurrent, time-overcurrent, out-of-step, and overvoltage protection. The protection is housed at the Alpha and Beta substations, and includes the associated relays, communications systems, voltage and current sensing devices, DC supplies, and control circuitry.

**Composite Protection System – Transformer Example**
The Composite Protection System of the Alpha transformer (#2) is comprised of internal differential, overall differential, instantaneous-overcurrent, and time-overcurrent protection. The protection is housed at the Alpha substation, and includes the associated relays, voltage and current sensing devices, DC supplies, and control circuitry.

**Composite Protection System – Generator Example**
The Composite Protection System of the Beta generator (#3) is comprised of generator differential, overall differential, overcurrent, stator ground, reverse power, volts per hertz, loss-of-field, and undervoltage protection. The protection is housed at the Beta generating plant and at the Beta substation, and includes the associated relays, voltage and current sensing
devices, DC supplies, and control circuitry.

**Composite Protection System – Breaker Failure Example**

Breaker failure protection provides backup protection for the breaker, and therefore is part of the breaker’s Composite Protection System. Considering breaker failure protection to be part of another Element’s Composite Protection System could lead to an incorrect conclusion that a breaker failure operation automatically satisfies the “Slow Trip” criteria of the Misoperation definition.

- An example of a correct operation of the breaker’s Composite Protection System is when the breaker failure relaying tripped because the line relaying operated, but the breaker failed to clear the Fault. The breaker failure relaying operated because of a failed trip coil. The failed trip coil caused a Misoperation of the line’s Composite Protection System.

- An example of a correct operation of the breaker’s Composite Protection System is when the breaker failure relaying tripped because the line relaying operated, but the breaker failed to clear the Fault. Only the breaker failure relaying operated because of a failed breaker mechanism. This was not a Misoperation because the breaker mechanism is not part of the breaker’s Composite Protection System.

- An example of an “Unnecessary Trip – During Fault” is when the breaker failure relaying tripped at the same time as the line relaying during a Fault. The Misoperation was due to the breaker failure timer being set to zero.

**Misoperation** – The failure a Composite Protection System to operate as intended for protection purposes. Any of the following is a Misoperation:

1. **Failure to Trip – During Fault** – A failure of a Composite Protection System to operate for a Fault condition for which it is designed. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.

2. **Failure to Trip – Other Than Fault** – A failure of a Composite Protection System to operate for a non-Fault condition for which it is designed, such as a power swing, undervoltage, overexcitation, or loss of excitation. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.

3. **Slow Trip – During Fault** – A Composite Protection System operation that is slower than required for a Fault condition if the duration of its operating time resulted in the operation of at least one other Element’s Composite Protection System.

4. **Slow Trip – Other Than Fault** – A Composite Protection System operation that is slower than required for a non-Fault condition, such as a power swing, undervoltage, overexcitation, or loss of excitation, if the duration of its operating time resulted in the operation of at least one other Element’s Composite Protection System.

5. **Unnecessary Trip – During Fault** – An unnecessary Composite Protection System operation for a Fault condition on another Element.

6. **Unnecessary Trip – Other Than Fault** – An unnecessary Composite Protection System
operation for a non-Fault condition. A Composite Protection System operation that is caused by personnel during on-site maintenance, testing, inspection, construction, or commissioning activities is not a Misoperation.

The Misoperation definition is based on the principle that an Element’s total complement of protection is intended to operate dependably and securely.

- Failure to automatically reclose after a Fault condition is not included as a Misoperation because reclosing equipment is not included within the definition of Protection System.
- A breaker failure operation does not, in itself, constitute a Misoperation.
- A remote backup operation resulting from a “Failure to Trip” or a “Slow Trip” does not, in itself, constitute a Misoperation.

This proposed definition of Misoperation provides additional clarity over the current version. A Misoperation is the failure of a Composite Protection System to operate as intended for protection purposes. The definition includes six categories which provide further differentiation of what constitutes a Misoperation. These categories are discussed in greater detail in the following sections.

**Failure to Trip – During Fault**
This category of Misoperation typically results in the Fault condition being cleared by remote backup Protection System operation.

**Example 1a:** A failure of a transformer's Composite Protection System to operate for a transformer Fault is a Misoperation.

**Example 1b:** A failure of a "primary" transformer relay (or any other component) to operate for a transformer Fault is not a “Failure to Trip – During Fault” Misoperation as long as another component of the transformer's Composite Protection System operated.

**Example 1c:** A lack of target information does not by itself constitute a Misoperation. When a high-speed pilot system does not target because a high-speed zone element trips first, it would not in and of itself be a Misoperation.

**Example 1d:** A failure of an overall differential relay to operate is not a “Failure to Trip – During Fault” Misoperation as long as another component such as a generator differential relay operated.

**Example 1e:** The Composite Protection System for a bus does not operate during a bus Fault which results in the operation of all local transformer Protection Systems connected to that bus and all remote line Protection Systems connected to that bus isolating the faulted bus from the grid. The operation of the local transformer Protection Systems and the operation of all remote line Protection Systems correctly provided backup protection. There is one “Failure to Trip – During Fault” Misoperation of the bus Composite Protection System.
In analyzing the Protection System for Misoperation, the entity must also consider whether the “Slow Trip – During Fault” category applies to the operation.

**Failure to Trip – Other Than Fault**

This category of Misoperation may have resulted in operator intervention. The “Failure to Trip – Other Than Fault” conditions cited in the definition are examples only, and do not constitute an all-inclusive list.

**Example 2a:** A failure of a generator's Composite Protection System to operate for an unintentional loss of field condition is a Misoperation.

**Example 2b:** A failure of an overexcitation relay (or any other component) is not a "Failure to Trip – Other Than Fault" Misoperation as long as the generator's Composite Protection System operated as intended isolating the generator from the BES.

In analyzing the Protection System for Misoperation, the entity must also consider whether the “Slow Trip – Other Than Fault” category applies to the operation.

**Slow Trip – During Fault**

This category of Misoperation typically results in remote backup Protection System operation before the Fault is cleared.

**Example 3a:** A Composite Protection System that is slower than required for a Fault condition is a Misoperation if the duration of its operating time resulted in the operation of at least one other Element’s Composite Protection System. The current differential element of a multiple function relay failed to operate for a line Fault. The same relay’s time-overcurrent element operated after a time delay. However, an adjacent line also operated from a time-overcurrent element. The faulted line's time-overcurrent element was found to be set to trip too slowly.

**Example 3b:** A failure of a breaker's Composite Protection System to operate as quickly as intended to meet the expected critical Fault clearing time for a line Fault in conjunction with a breaker failure (i.e., stuck breaker) is a Misoperation if it resulted in an unintended operation of at least one other Element’s Composite Protection System. If a generating unit’s Composite Protection System operates due to instability caused by the slow trip of the breaker's Composite Protection System, it is not an “Unnecessary Trip – During Fault” Misoperation of the generating unit’s Composite Protection System. This event would be a “Slow Trip – During Fault” Misoperation of the breaker's Composite Protection System.

**Example 3c:** A line connected to a generation interconnection station is protected with two independent high-speed pilot systems. The Composite Protection System for this line also includes step distance and time-overcurrent schemes in addition to the two pilot systems. During a Fault on this line, the two pilot systems fail to operate and the time-overcurrent scheme operates clearing the Fault with no generating units or other Elements tripping (i.e., no over-trips). This event is not a Misoperation.
The phrase “slower than required” means the duration of its operating time resulted in the operation of at least one other Element’s Composite Protection System. It would be impractical to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should understand whether the speed and outcome of its Protection System operation met their objective. The intent is not to require documentation of exact Protection System operation times, but to assure consideration of relay coordination and system stability by the owner(s) reviewing each Protection System operation.

The phrase “resulted in the operation of any other Composite Protection System” refers to the need to ensure that relaying operates in the proper or planned sequence (i.e., the primary relaying for a faulted Element operates before the remote backup relaying for the faulted Element).

In analyzing the Protection System for Misoperation, the entity must also consider the “Unnecessary Trip – During Fault” category to determine if an “unnecessary trip” applies to the Protection System operation of an Element other than the faulted Element.

If a coordination error was at the local terminal (i.e., set too slow), then it was a "Slow Trip," category of Misoperation at the local terminal.

**Slow Trip – Other Than Fault**

The phrase “slower than required” means the duration of its operating time resulted in the operation of at least one other Element’s Composite Protection System. It would be impractical to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should understand whether the speed and outcome of its Protection System operation met their objective. The intent is not to require documentation of exact Protection System operation times, but to assure consideration of relay coordination and system stability by the owner(s) reviewing each Protection System operation.

**Example 4:** A phase to phase fault occurred on the terminals of a generator. The generator's Composite Protection System and a transmission line's Composite Protection System both operated in response to the fault. It was found during subsequent investigation that the generator protection contained an inappropriate time delay. This caused the transmission line’s correctly set overreaching zone of protection to operate. This was a Misoperation of the generator’s Composite Protection System, but not of the transmission line’s Composite Protection System.

The “Slow Trip – Other Than Fault” conditions cited in the definition are examples only, and do not constitute an all-inclusive list.

**Unnecessary Trip – During Fault**

An operation of a properly coordinated remote Protection System is not in and of itself a Misoperation if the Fault has persisted for a sufficient time to allow the correct operation of the
Composite Protection System of the faulted Element to clear the Fault. A BES interrupting device failure, a “failure to trip” Misoperation, or a “slow trip” Misoperation may result in a proper remote Protection System operation.

**Example 5:** An operation of a transformer's Composite Protection System which trips (i.e., over-trips) for a properly cleared line Fault is a Misoperation. The Fault is cleared properly by the faulted equipment's Composite Protection System (i.e., line relaying) without the need for an external Protection System operation resulting in an unnecessary trip of the transformer protection; therefore, the transformer Protection System operation is a Misoperation.

**Example 5b:** An operation of a line's Composite Protection System which trips (i.e., over-trips) for a properly cleared Fault on a different line is a Misoperation. The Fault is cleared properly by the faulted line's Composite Protection System (i.e., line relaying); however, elsewhere in the system, a carrier blocking signal is not transmitted (e.g., carrier ON/OFF switch found in OFF position) resulting in the operation of a remote Protection System, single-end trip of a non-faulted line. The operation of the Protection System for the non-faulted line is an unnecessary trip during a Fault. Therefore, the non-faulted line Protection System operation is an “Unnecessary Trip – During Fault” Misoperation.

**Example 5c:** If a coordination error was at the remote terminal (i.e., set too fast), then it was an "Unnecessary Trip – During Fault" category of Misoperation at the remote terminal.

**Unnecessary Trip – Other Than Fault**
Unnecessary trips for non-Fault conditions include but are not limited to: power swings, overexcitation, loss of excitation, frequency excursions, and normal operations.

**Example 6a:** An operation of a line's Composite Protection System due to a relay failure during normal operation is a Misoperation.

**Example 6b:** Tripping a generator by the operation of the loss of field protection during an off-nominal frequency condition while the field is intact is a Misoperation assuming the Composite Protection System was not intended to operate under this condition.

**Example 6c:** An impedance line relay trip for a power swing that entered the relay's characteristic is a Misoperation if the power swing was stable and the relay operated because power swing blocking was enabled and should have prevented the trip, but did not.

**Example 6d:** Tripping a generator operating at normal load by the operation of a reverse power protection relay due to a relay failure is a Misoperation.

Additionally, an operation that occurs during a non-Fault condition but was initiated directly by on-site (i.e., real-time) maintenance, testing, inspection, construction, or commissioning is not a Misoperation.

**Example 6e:** A BES interrupting device operation that occurs at the remote end of a line
during a non-Fault condition because a direct transfer trip was initiated by system maintenance and testing activities at the local end of the line is not a Misoperation because of the maintenance exclusion in category 6 of the definition of “Misoperation.”

The “on-site” activities at one location that initiates a trip to another location are included in this exemption. This includes operation of a Protection System when energizing equipment to facilitate measurements, such as verification of current circuits as a part of performing commissioning; however, once the maintenance, testing, inspection, construction, or commissioning activity associated with the Protection System is complete, the "on-site" Misoperation exclusion no longer applies, regardless of the presence of on-site personnel.

**Special Cases**

Protection System operations for these cases would not be a Misoperation.

**Example 7a:** A generator Protection System operation prior to closing the unit breaker(s) is not a Misoperation provided no in-service Elements are tripped.

This type of operation is not a Misoperation because the generating unit is not synchronized and is isolated from the BES. Protection System operations that occur when the protected Element is out of service and that do not trip any in-service Elements are not Misoperations. In some cases where zones of protection overlap, the owner(s) of Elements may decide to allow a Protection System to operate faster in order to gain better overall Protection System performance for an Element.

**Example 7b:** The high-side of a transformer connected to a line may be within the zone of protection of the supplying line’s relaying. In this case, the line relaying is planned to protect the area of the high-side of the transformer and into its primary winding. In order to provide faster protection for the line, the line relaying may be designed and set to operate without direct coordination (or coordination is waived) with local protection for Faults on the high-side of the connected transformer. Therefore, the operation of the line relaying for a high-side transformer Fault operated as intended and would not be a Misoperation.

Below are examples of conditions that would be a Misoperation.

**Example 7c:** A 230 kV shunt capacitor bank was released for operational service. The capacitor bank trips due to a settings error in the capacitor bank differential relay upon energization.

**Example 7d:** A 230/115 kV BES transformer bank trips out when being re-energized due to an incorrect operation of the transformer differential relay for inrush after being released for operational service. Only the high-side breaker opens since the low-side breaker had not yet been closed.

**Non-Protective Functions**

BES interrupting device operations which are initiated by non-protective functions, such as those associated with generator controls, excitation controls, or turbine/boiler controls, static
voltampere-reactive compensators (SVC), flexible ac transmission systems (FACTS), high-voltage dc (HVdc) transmission systems, circuit breaker mechanisms, or other facility control systems are not operations of a Protection System. The standard is not applicable to non-protective functions such as automation (e.g., data collection) or control functions that are embedded within a Protection System.

Control Functions
The entity must make a determination as to whether the standard is applicable to each operation of its Protection System in accordance with the provided exclusions in the standard’s Applicability, see Section 4.2.1. The subject matter experts (SME) developing this standard recognize that entities use Protection Systems as part of a routine practice to control BES Elements. This standard is not applicable to operation of protective functions within a Protection System when intended for controlling a BES Element as a part of an entity’s process or planned switching sequence. The following are examples of conditions to which this standard is not applicable:

Example 8a: The reverse power protective function that operates to remove a generating unit from service using the entity’s normal or routine process.

Example 8b: The reverse power relay enables a permissive trip and the generator operator trips the unit.

The standard is not applicable to operation of the protective relay because its operation is intended as a control function as part of a controlled shutdown sequence for the generator. However, the standard remains applicable to operation of the reverse power relay when it operates for conditions not associated with the controlled shutdown sequence, such as a motoring condition caused by a trip of the prime mover.

The following is another example of a condition to which this standard is not applicable:

Example 8c: Operation of a capacitor bank interrupting device for voltage control using functions embedded within a microprocessor based relay that is part of a Protection System.

The above are examples only, and do not constitute an all-inclusive list to which the standard is not applicable.

Extenuating Circumstances
In the event of a natural disaster or other extenuating circumstances, the December 20, 2012 Sanction Guidelines of the North American Electric Reliability Corporation, Section 2.8, Extenuating Circumstances, reads: “In unique extenuating circumstances causing or contributing to the violation, such as significant natural disasters, NERC or the Regional Entity may significantly reduce or eliminate Penalties.” The Regional Entities to whom NERC has delegated authority will consider extenuating circumstances when considering any sanctions in relation to the timelines outlined in this standard.
The volume of Protection System operations tend to be sporadic. If a high rate of Protection System operations is not sustained, utilities will have an opportunity to catch up within the 120 day period.

**Requirement Time Periods**

The time periods within all the Requirements are distinct and separate. The applicable entity in Requirement R1 has 120 calendar days to identify whether a BES interrupting device operation is a Misoperation. Once the applicable entity has identified a Misoperation, it has completed its performance under Requirement R1. Identified Misoperations with an identified cause become subject to Requirement R5 and any subsequent Requirements as necessary.

In Requirement R2, the applicable entity has 120 calendar days, based on the date of the BES interrupting device operation, to provide notification to the other Protection System owners that meet the circumstances in Parts 2.1 and 2.2. For the case of an applicable entity that was notified (R3), it has the later of 120 calendar days from the date of the BES interrupting device operation or 60 calendar days of notification to identify whether its Protection System components caused a Misoperation.

Once a Misoperation is identified in either Requirement R1 or R3, and the applicable entity did not identify the cause(s) of the Misoperation, the time period for performing at least one investigative action every two full calendar quarters begins.

The time period in Requirement R5 begins when the Misoperation cause is first identified. The applicable entity is allotted 60 calendar days to perform one of the two activities listed in Requirement R5 (e.g., CAP or declaration) to complete its performance under Requirement R5.

Requirement R6 time period is determined by the actions and the associated timetable to complete those actions identified in the CAP. The time periods contained in the CAP may change from time to time and the applicable entity is required to update the timetable when it changes.

Time periods provided in the Requirements are intended to provide a reasonable amount of time to perform each Requirement. Performing activities in the least amount of time facilitates prompt identification of Misoperations, notification to other Protection System owners, identification of the cause(s), correction of the cause(s), and that important information is retained that may be lost due to time.

**Requirement R1**

This Requirement initiates a review of each BES interrupting device operation to identify whether or not a Misoperation may have occurred. Since the BES interrupting device owner typically monitors and tracks device operations, the owner is the logical starting point for identifying Misoperations of Protection Systems for BES Elements. A review is required when (1) a BES interrupting device operates that is caused by a Protection System or by manual intervention in response to a Protection System failure to operate, (2) regardless of whether the owner owns all or part of the Protection System component(s), and (3) the owner identified its Protection System component(s) as causing the BES interrupting device operation or was
caused by manual intervention in response to its Protection System failure to operate.

Since most Misoperations result in the operation of one or more BES interrupting devices, these operations initiate a review to identify any Misoperation. If an Element is manually isolated in response to a failure to operate, the manual isolation of the Element triggers a review for Misoperation.

**Example R1a:** The failure of a loss of field relay on a generating unit where an operator takes action to isolate the unit.

Manual intervention may indicate a Misoperation has occurred, thus requiring the initiation of an investigation by the BES interrupting device owner.

For the case where a BES interrupting device did not operate and remote clearing occurs due to the failure of a Composite Protection System to operate, the BES interrupting device owner would still review the operation under Requirement R1. However, if the BES interrupting device owner determines that its Protection System component operated as backup protection for a condition on another entity’s BES Element, the owner would provide notification of the operation to the other Protection System owner(s) under Requirement R2, Part 2.2.

Protection Systems are made of many components. These components may be owned by different entities. For example, a Generator Owner may own a current transformer that sends information to a Transmission Owner’s differential relay. All of these components and many more are part of a Protection System. It is expected that all of the owners will communicate with each other, sharing information freely, so that Protection System operations can be analyzed, Misoperations identified, and corrective actions taken.

Each entity is expected to use judgment to identify those Protection System operations that meet the definition of Misoperation regardless of the level of ownership. A combination of available information from resources such as counters, relay targets, Supervisory Control and Data Acquisition (SCADA) systems, or DME would typically be used to determine whether or not a Misoperation occurred. The intent of the standard is to classify an operation as a Misoperation if the available information leads to that conclusion. In many cases, it will not be necessary to leverage all available data to determine whether or not a Misoperation occurred. The standard also allows an entity to classify an operation as a Misoperation if entity is not sure. The entity may decide to identify the operation as a Misoperation to satisfy Requirement R1 and continue its investigation for a cause of the Misoperation under Requirement R4. If the continued investigative actions are inconclusive, the entity may declare no cause found and end its investigation. The entity is allotted 120 calendar days from the date of its BES interrupting device operation to identify whether its Protection System component(s) caused a Misoperation.

The Protection System operation may be documented in a variety of ways such as in a report, database, spreadsheet, or list. The documentation may be organized in a variety of ways such as by BES interrupting device, protected Element, or Composite Protection System.
Repeated operations which occur during the same automatic reclosing sequence do not need a separate identification under Requirement R1. Repeated Misoperations which occur during the same 24-hour period do not need a separate identification under Requirement R1. This is consistent with the NERC Misoperations Report\(^7\) which states:

“In order to avoid skewing the data with these repeated events, the NERC SPCS should clarify, in the next annual update of the misoperation template, that all misoperations due to the same equipment and cause within a 24 hour period be recorded as one misoperation.”

The following is an example of a condition that is not a Misoperation.

**Example R1b:** A high impedance Fault occurs within a transformer. The sudden pressure relaying detects and operates for the Fault, but the differential relaying did not operate due to the low Fault current levels. This is not a Misoperation because the Composite Protection System was not required to operate because the Fault was cleared by the sudden pressure relay.

**Requirement R2**

Requirement R2 ensures notification of those who have a role in identifying Misoperations, but were not accounted for within Requirement R1. In the case of multi-entity ownership, the entity that owns the BES interrupting device that operated is expected to use judgment to identify those Protection System operations that meet the definition of Misoperation under Requirement R1; however, if the entity that owns a BES interrupting device determines that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation, it must notify the other Protection System owner(s) that share Misoperation identification responsibility when the criteria in Requirement R2 is met.

This Requirement does not preclude the Protection System owners from initially communicating and working together to determine whether a Misoperation occurred and, if so, the cause. The BES interrupting device owner is only required to officially notify the other owners when it: (1) shares the Composite Protection System ownership with other entity(ies), (2) determines that a Misoperation occurred or cannot rule out a Misoperation, and (3) determines its Protection System component(s) did not cause a Misoperation or is unsure. Officially notifying the other owners without performing a preliminary review may unnecessarily burden the other owners with compliance obligations under Requirement R3, redirect valuable resources, and add little benefit to reliability. The BES interrupting device owner should officially notify other owners when appropriate within the established time period.

The following is an example of a notification to another Protection System owner:

**Example R2a:** Circuit breakers A and B at the Charlie station tripped from directional comparison blocking (DCB) relaying on 03/03/2014 at 15:43 UTC during an external Fault. As discussed last week, the fault records indicate that a problem with your equipment (failure to transmit) caused the operation.

**Example R2b:** A generator unit tripped out immediately upon synchronizing to the grid due to a Misoperation of its overcurrent protection. The Transmission Owner owns the 230 kV generator breaker that operated. The Transmission Owner, as the owner of the BES interrupting device after determining that its Protection System components did not cause the Misoperation, notified the Generator Owner of the operation. The Generator Owner investigated and determined that its Protection System components caused the Misoperation. In this example, the Generator Owner’s Protection System components did cause the Misoperation. As the owner of the Protection System components that caused the Misoperation, the Generator Owner is responsible for creating and implementing the CAP.

A Composite Protection System owned by different functional entities within the same registered entity does not necessarily satisfy the notification criteria in Part 2.1.1 of Requirement R2. For example, if the same personnel within a registered entity perform the Misoperation identification for both the Generator Owner and Transmission Owner functions, then the Misoperation identification would be completely covered in Requirement R1, and therefore notification would not be required. However, if the Misoperation identification is handled by different groups, then notification would be required because the Misoperation identification would not necessarily be covered in Requirement R1.

**Example R2c:** Line A Composite Protection System (owned by entity 1) failed to operate for an internal Fault. As a result, the zone 3 portion of Line B’s Composite Protection System (owned by entity 2) and zone 3 portion of Line C’s Composite Protection System (owned by entity 3) operated to clear the Fault. Entity 2 and 3 notified entity 1 of the remote zone 3 operation.

For the case where a BES interrupting device operates to provide backup protection for a non-BES Element, the entity reviewing the operation is not required to notify the other owners of Protection Systems for non-BES Elements. No notification is required because this Reliability Standard is not applicable to Protection Systems for non-BES Elements.

**Requirement R3**
For Requirement R3 (i.e., notification received), the entity that also owns a portion of the Composite Protection System is expected to use judgment to identify whether the Protection System operation is a Misoperation. A combination of available information from resources such as counters, relay targets, SCADA, DME, and information from the other owner(s) would typically be used to determine whether or not a Misoperation occurred. The intent of the standard is to classify an operation as a Misoperation if the available information leads to that conclusion. In many cases, it will not be necessary to leverage all available data to determine whether or not a Misoperation occurred. The standard also allows an entity to classify an operation as a Misoperation if an entity is not sure. The entity may decide to identify the
operation as a Misoperation to satisfy Requirement R1 and continue its investigation for a cause of the Misoperation. If the continued investigative actions are inconclusive, the entity may declare no cause found and end its investigation.

The entity that is notified by the BES interrupting device owner is allotted the later of 60 calendar days from receipt of notification or 120 calendar days from the BES interrupting device operation date to determine if its portion of the Composite Protection System caused the Protection System operation. It is expected that in most cases of a jointly owned Protection System, the entity making notification would have been in communication with the other owner(s) early in the process. This means that the shorter 60 calendar days only comes into play if the notification occurs in the second half of the 120 calendar days allotted to the BES interrupting device owner in Requirement R1.

The Protection System review may be organized in a variety of ways such as in a report, database, spreadsheet, or list. The documentation may be organized in a variety of ways such as by BES interrupting device, protected Element, or Composite Protection System. The BES interrupting device owner’s notification received may be documented in a variety of ways such as an email or a facsimile.

**Requirement R5**

Resolving the causes of Protection System Misoperations benefits BES reliability by preventing recurrence. The Corrective Action Plan (CAP) is an established tool for resolving operational problems. The NERC Glossary defines a Corrective Action Plan as, "A list of actions and an associated timetable for implementation to remedy a specific problem." Since a CAP addresses specific problems, the determination of what went wrong needs to be completed before developing a CAP. When the Misoperation cause is identified in Requirement R1 or R3, Requirement R5 requires Protection System owner(s) to develop a CAP, or explain why corrective actions are beyond the entity’s control or would not improve BES reliability. The entity must develop the CAP or make a declaration why additional actions are beyond the entity’s control or would not improve BES reliability and that no further corrective actions will be taken within 60 calendar days of first determining a cause.

The SMEs developing this standard recognize there may be multiple causes for a Misoperation. In these circumstances, the CAP would include a remedy for the identified causes. The CAP may be revised if additional causes are found; therefore, the entity has the option to create a single or multiple CAP(s) to correct multiple causes of a Misoperation. The 60 calendar day period for developing a CAP (or declaration) is established on the basis of industry experience which includes operational coordination timeframes, time to consider alternative solutions, coordination of resources, and development of a schedule.

The development of a CAP is intended to document the specific corrective actions needed to be taken to prevent Misoperation recurrence, the timetable for executing such actions, and an evaluation of the CAP’s applicability to the entity’s other Protection Systems including other locations. The evaluation of these other Protection Systems aims to reduce the risk and likelihood of similar Misoperations in other Protection Systems. The Protection System owner is responsible for determining the extent of its evaluation concerning other Protection Systems.
and locations. The evaluation may result in the owner including actions to address Protection Systems at other locations or the reasoning for not taking any action. The CAP and an evaluation of other Protection Systems including other locations must be developed to complete Requirement R5.

The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor within the relay and the evaluation of the cause at similar locations which determined capacitor replacement was not necessary.

For completion of each CAP in Examples R5a through R5d, please see Examples R6a through R6d.

**Example R5a:** Actions: Remove the relay from service. Replace capacitor in the relay. Test the relay. Return to service or replace by 07/01/2014.

Applicability to other Protection Systems: This type of impedance relay has not been experiencing problems and is systematically being replaced with microprocessor relays as Protection Systems are modernized. Therefore, it was assessed that a program for wholesale preemptive replacement of capacitors in this type of impedance relay does not need to be established for the system.

The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor within the relay and the evaluation of the cause at similar locations which determined the capacitors need preemptive correction action.

**Example R5b:** Actions: Remove the relay from service. Replace capacitor in the relay. Test the relay. Return to service or replace by 07/01/2014.

Applicability to other Protection Systems: This type of impedance relay is suspected to have previously tripped at other locations because of the same type of capacitor issue. Based on the evaluation, a program should be established by 12/01/2014 for wholesale preemptive replacement of capacitors in this type of impedance relay.

The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor within the relay and the evaluation of the cause at similar locations which determined the capacitors need preemptive correction action.

**Example R5c:** Actions: Remove the relay from service. Replace capacitor in the relay. Test the relay. Return to service or replace by 07/01/2014.

Applicability to other Protection Systems: This type of impedance relay is suspected to have previously tripped at other locations because of the same type of capacitor issue. Based on the evaluation, the preemptive replacement of capacitors in this type of impedance relay should be pursued for the identified stations A through I by 04/30/2015.

A plan is being developed to replace the impedance relay capacitors at stations A, B, and C.
by 09/01/2014. A second plan is being developed to replace the impedance relay capacitors at stations D, E, and F by 11/01/2014. The last plan will replace the impedance relay capacitors at stations G, H, and I by 02/01/2015.

The following is an example of a CAP for a relay Misoperation that was due to a version 2 firmware problem and the evaluation of the cause at similar locations which determined the firmware needs preemptive correction action.

**Example R5d:** Actions: Provide the manufacturer fault records. Install new firmware pending manufacturer results by 10/01/2014.

Applicability to other Protection Systems: Based on the evaluation of other locations and a risk assessment, the newer firmware version 3 should be installed at all installations that are identified to be version 2. Twelve relays were identified across the system. Proposed completion date is 12/31/2014.

The following are examples of a declaration made where corrective actions are beyond the entity’s control or would not improve BES reliability and that no further corrective actions will be taken.

**Example R5e:** The cause of the Misoperation was due to a non-registered entity communications provider problem.

**Example R5f:** The cause of the Misoperation was due to a transmission transformer tapped industrial customer who initiated a direct transfer trip to a registered entity’s transmission breaker.

In situations where a Misoperation cause emanates from a non-registered outside entity, there may be limited influence an entity can exert on an outside entity and is considered outside of an entity’s control.

The following are examples of declarations made why corrective actions would not improve BES reliability.

**Example R5g:** The investigation showed that the Misoperation occurred due to transients associated with energizing transformer ABC at Station Y. Studies show that de-sensitizing the relay to the recorded transients may cause the relay to fail to operate as intended during power system oscillations.

**Example R5h:** As a result of an operation that left a portion of the power system in an electrical island condition, circuit XYZ within that island tripped, resulting in loss of load within the island. Subsequent investigation showed an overfrequency condition persisted after the formation of that island and the XYZ line protective relay operated. Since this relay was operating outside of its designed frequency range and would not be subject to this condition when line XYZ is operated normally connected to the BES, no corrective action will be taken because BES reliability would not be improved.
Example R5i: During a major ice storm, four of six circuits were lost at Station A. Subsequent to the loss of these circuits, a skywire (i.e., shield wire) broke near station A on line AB (between Station A and B) resulting in a phase-phase Fault. The protection scheme utilized for both protection groups is a permissive overreaching transfer trip (POTT). The Line AB protection at Station B tripped timed for this event (i.e., Slow Trip – During Fault) even though this line had been identified as requiring high speed clearing. A weak infeed condition was created at Station A due to the loss of 4 transmission circuits resulting in the absence of a permissive signal on Line AB from Station A during this Fault. No corrective action will be taken for this Misoperation as even under N-1 conditions, there is normally enough infeed at Station A to send a proper permissive signal to station B. Any changes to the protection scheme to account for this would not improve BES reliability.

A declaration why corrective actions are beyond the entity’s control or would not improve BES reliability should include the Misoperation cause and the justification for taking no corrective action. Furthermore, a declaration that no further corrective actions will be taken is expected to be used sparingly.

Requirement R6
To achieve the stated purpose of this standard, which is to identify and correct the causes of Misoperations of Protection Systems for BES Elements, the responsible entity is required to implement a CAP that addresses the specific problem (i.e., cause(s) of the Misoperation) through completion. Protection System owners are required in the implementation of a CAP to update it when actions or timetable change, until completed. Accomplishing this objective is intended to reduce the occurrence of future Misoperations of a similar nature, thereby improving reliability and minimizing risk to the BES.

The following is an example of a completed CAP for a relay Misoperation that was applying a standing trip (See also, Example R5a).

Example R6a: Actions: The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. A failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.

CAP completed on 06/25/2014.

The following is an example of a completed CAP for a relay Misoperation that was applying a standing trip that resulted in the correction and the establishment of a program for further replacements (See also, Example R5b).

Example R6b: Actions: The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. A failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.
A program for wholesale preemptive replacement of capacitors in this type of impedance relay was established on 10/28/2014.

CAP completed on 10/28/2014.

The following is an example of a completed CAP of corrective actions with a timetable that required updating for a failed relay and preemptive actions for similar installations (See also, Example R5c).

**Example R6c:** Actions: The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. A failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.

The impedance relay capacitor replacement was completed at stations A, B, and C on 08/16/2014. The impedance relay capacitor replacement was completed at stations D, E, and F on 10/24/2014. The impedance relay capacitor replacement for stations G, H, and I were postponed due to resource rescheduling from a scheduled 02/01/15 completion to 04/01/2015 completion. Capacitor replacement was completed on 03/09/2015 at stations G, H, and I. All stations identified in the evaluation have been completed.

CAP completed on 03/09/2015.

The following is an example of a completed CAP for corrective actions with updated actions for a firmware problem and preemptive actions for similar installations. (See also, Example R5d).

**Example R6d:** Actions: Fault records were provided to the manufacturer on 06/04/2014. The manufacturer responded that the Misoperation was caused by a bug in version 2 firmware, and recommended installing version 3 firmware. Version 3 firmware was installed on 08/12/2014.

Nine of the twelve relays were updated to version 3 firmware on 09/23/2014. The manufacturer provided a subsequent update which was determined to be beneficial for the remaining relays. The remaining three of twelve relays identified as having the version 2 firmware were updated to version 3.01 firmware on 11/10/2014.

CAP completed on 11/10/2014.

The CAP is complete when all of the actions identified within the CAP have been completed.
Process Flow Chart: Below is a graphical representation demonstrating the relationships between Requirements:

1. **Entry Point(s)**
   - BES interrupting device owner

2. **The owner of a BES interrupting device that operated, within 120 calendar days of the BES interrupting device operation**
   - Operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate
   - BES interrupting device owner owns all or part of the Protection System component(s)
   - BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation or by manual intervention
   - **When all are TRUE**
     - Shall identify whether BES interrupting device owner’s Protection System component(s) caused a Misoperation

3. **Is a Misop?**
   - **YES**
     - Cause Known?
       - **YES**
         - Document why corrective actions are beyond the entity's control or would not improve BES reliability, and that no further corrective actions will be taken
       - **NO**
         - Develop a CAP and an evaluation

4. **R1**
   - **NO**
     - **Stop**

5. **R2**
   - **YES**
     - Remote Backup Protection Operated?
       - **YES**
         - **Stop**
       - **NO**
         - BES interrupting device owner determined that its Protection System component(s) did not cause the operation or is unsure

6. **R3**
   - The entity that receives notification, within the later of either 60 calendar days of notification or 120 calendar days of the BES interrupting device (s) operation, shall identify whether its Protection System component(s) caused a Misoperation.

7. **R4**
   - **NOTIFIED ENTITIES**
     - BES interrupting device owner must also consider this as a parallel path if a Composite Protection System has multiple owners

8. **Reserved**: An entity that has not determined the cause(s) of a Misoperation shall perform at least one investigative action to determine the cause(s) of the Misoperation, at least once every two full calendar quarters after the Misoperation was first identified, and one of the following completes the investigation:
   - Write a declaration that no cause was identified
   - **Cause found?**
     - **YES**
       - Develop a CAP and an evaluation
     - **NO**
       - **Stop**

9. **R5**
   - Corrective Actions are beyond the entity's control or would not improve BES reliability?
     - **YES**
       - **Stop**
     - **NO**
       - Develop a CAP and an evaluation

10. **R6**
    - Implement each Corrective Action Plan (CAP), and update each CAP if actions or timetables change, until completed.
    - **CAP complete?**
      - **YES**
        - **Stop**
      - **NO**
        - **Stop**
A. Introduction

1. Title: Protection System Misoperation Identification and Correction
2. Number: PRC-004-5(i)6
3. Purpose: Identify and correct the causes of Misoperations of Protection Systems for Bulk Electric System (BES) Elements.
4. Applicability:
   4.1. Functional Entities:
      4.1.1 Transmission Owner
      4.1.2 Generator Owner
      4.1.3 Distribution Provider
   4.2. Facilities:
      4.2.1 Protection Systems for BES Elements, with the following exclusions:
         4.2.1.1 Non-protective functions that are embedded within a Protection System.
         4.2.1.2 Protective functions intended to operate as a control function during switching.1
         4.2.1.3 Special Protection Systems (SPS).
         4.2.1.4 Remedial Action Schemes (RAS).
         4.2.1.5 Protection Systems of individual dispersed power producing resources identified under Inclusion I4 of the BES definition where the Misoperations affected an aggregate nameplate rating of less than or equal to 75 MVA of BES Facilities.
      4.2.2 Underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements.
      4.2.3 Undervoltage load shedding (UVLS) that is intended to trip one or more BES Elements.
5. Effective Date: See Project 2008-02.2 Implementation Plan.

---

1 For additional information and examples, see the "Non-Protective Functions" and "Control Functions" sections in the Application Guidelines.
B. Requirements and Measures

R1. Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated under the circumstances in Parts 1.1 through 1.3 shall, within 120 calendar days of the BES interrupting device operation, identify whether its Protection System component(s) caused a Misoperation: [Violation Risk Factor: High][Time Horizon: Operations Assessment, Operations Planning]

1.1 The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and

1.2 The BES interrupting device owner owns all or part of the Composite Protection System; and

1.3 The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation or was caused by manual intervention in response to its Protection System failure to operate.

M1. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it identified the Misoperation of its Protection System component(s), if any, that meet the circumstances in Requirement R1, Parts 1.1, 1.2, and 1.3 within the allotted time period. Acceptable evidence for Requirement R1, including Parts 1.1, 1.2, and 1.3 may include, but is not limited to the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.
R2. Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, provide notification as described in Parts 2.1 and 2.2. [Violation Risk Factor: High][Time Horizon: Operations Assessment, Operations Planning]

2.1 For a BES interrupting device operation by a Composite Protection System or by manual intervention in response to a Protection System failure to operate, notification of the operation shall be provided to the other owner(s) that share Misoperation identification responsibility for the Composite Protection System under the following circumstances:

2.1.1 The BES interrupting device owner shares the Composite Protection System ownership with any other owner; and

2.1.2 The BES interrupting device owner has determined that a Misoperation occurred or cannot rule out a Misoperation; and

2.1.3 The BES interrupting device owner has determined that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation.

2.2 For a BES interrupting device operation by a Protection System component intended to operate as backup protection for a condition on another entity’s BES Element, notification of the operation shall be provided to the other Protection System owner(s) for which that backup protection was provided.

M2. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates notification to the other owner(s), within the allotted time period for either Requirement R2, Part 2.1, including subparts 2.1.1, 2.1.2, and 2.1.3 and Requirement R2, Part 2.2. Acceptable evidence for Requirement R2, including Parts 2.1 and 2.2 may include, but is not limited to the following dated documentation (electronic or hardcopy format): emails, facsimiles, or transmittals.

R3. Each Transmission Owner, Generator Owner, and Distribution Provider that receives notification, pursuant to Requirement R2 shall, within the later of 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation, identify whether its Protection System component(s) caused a Misoperation. [Violation Risk Factor: High][Time Horizon: Operations Assessment, Operations Planning]

M3. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it identified whether its Protection System component(s) caused a Misoperation within the allotted time period. Acceptable evidence for Requirement R3 may include, but is not limited to the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, DME records, test results, or transmittals.
R4. **Reserved**. Each Transmission Owner, Generator Owner, and Distribution Provider that has not determined the cause(s) of a Misoperation, for a Misoperation identified in accordance with Requirement R1 or R3, shall perform investigative action(s) to determine the cause(s) of the Misoperation at least once every two full calendar quarters after the Misoperation was first identified, until one of the following completes the investigation: [Violation Risk Factor: High] [Time Horizon: Operations Assessment, Operations Planning]

- The identification of the cause(s) of the Misoperation; or
- A declaration that no cause was identified.

M4. **Reserved**. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it performed at least one investigative action according to Requirement R4 every two full calendar quarters until a cause is identified or a declaration is made. Acceptable evidence for Requirement R4 may include, but is not limited to the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, DME records, test results, or transmittals.

R5. Each Transmission Owner, Generator Owner, and Distribution Provider that owns the Protection System component(s) that caused the Misoperation shall, within 60 calendar days of first identifying a cause of the Misoperation: [Violation Risk Factor: High] [Time Horizon: Operations Planning, Long-Term Planning]

- Develop a Corrective Action Plan (CAP) for the identified Protection System component(s), and an evaluation of the CAP’s applicability to the entity’s other Protection Systems including other locations; or
- Explain in a declaration why corrective actions are beyond the entity’s control or would not improve BES reliability, and that no further corrective actions will be taken.

M5. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it developed a CAP and an evaluation of the CAP’s applicability to other Protection Systems and locations, or a declaration in accordance with Requirement R5. Acceptable evidence for Requirement R5 may include, but is not limited to the following dated documentation (electronic or hardcopy format): CAP and evaluation, or declaration.

R6. Each Transmission Owner, Generator Owner, and Distribution Provider shall implement each CAP developed in Requirement R5, and update each CAP if actions or timetables change, until completed. [Violation Risk Factor: High] [Time Horizon: Operations Planning, Long-Term Planning]
M6. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it implemented each CAP, including updating actions or timetables. Acceptable evidence for Requirement R6 may include, but is not limited to the following dated documentation (electronic or hardcopy format): records that document the implementation of each CAP and the completion of actions for each CAP including revision history of each CAP. Evidence may also include work management program records, work orders, and maintenance records.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner, and Distribution Provider shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation.

- The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirements R1, R2, and R3, and R4, Measures M1, M2, and M3, and M4 for a minimum of 12 calendar months following the completion of each Requirement.

- The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirement R5, Measure M5, including any supporting analysis per Requirements R1, R2, and R3, and R4, for a minimum of 12 calendar months following completion of each CAP, completion of each evaluation, and completion of each declaration.

- The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirement R6, Measure M6 for a minimum of 12 calendar months following completion of each CAP.

If a Transmission Owner, Generator Owner, or Distribution Provider is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.
The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes

- Compliance Audit
- Self-Certification
- Spot Checking
- Compliance Investigation
- Self-Reporting
- Complaint

1.4. Additional Compliance Information

None.

Guidelines and Technical Basis

Introduction

This standard addresses the reliability issues identified in the letter\(^3\) from Gerry Cauley, NERC President and CEO, dated January 7, 2011.

“Nearly all major system failures, excluding perhaps those caused by severe weather, have misoperations of relays or automatic controls as a factor contributing to the propagation of the failure. ...Relays can misoperate, either operate when not needed or fail to operate when needed, for a number of reasons. First, the device could experience an internal failure – but this is rare. Most commonly, relays fail to operate correctly due to incorrect settings, improper coordination (of timing and set points) with other devices, ineffective maintenance and testing, or failure of communications channels or power supplies. Preventable errors can be introduced by field personnel and their supervisors or more programmatically by the organization.”

The standard also addresses the findings in the 2011 Risk Assessment of Reliability Performance\(^4\); July 2011.

“...a number of multiple outage events were initiated by protection system Misoperations. These events, which go beyond their design expectations and operating procedures, represent a tangible threat to reliability. A deeper review of the root causes of dependent and common mode events, which include three or more automatic outages, is a high priority for NERC and the industry.”

The State of Reliability 2014\(^5\) report continued to identify Protection System Misoperations as a significant contributor to automatic transmission outage severity. The report recommended completion of the development of PRC-004-3 as part of the solution to address Protection System Misoperations.

Definitions

The Misoperation definition is based on the IEEE/PSRC Working Group I3 “Transmission Protective Relay System Performance Measuring Methodology\(^6\).” Misoperations of a Protection System include failure to operate, slowness in operating, or operating when not required either during a Fault or non-Fault condition.

---

For reference, a “Protection System” is defined in the Glossary of Terms Used in NERC Reliability Standards (“NERC Glossary”) as:

- Protective relays which respond to electrical quantities,
- Communications systems necessary for correct operation of protective functions,
- Voltage and current sensing devices providing inputs to protective relays,
- Station dc supply associated with protective functions (including station batteries, battery chargers, and non-battery-based dc supply), and
- Control circuitry associated with protective functions through the trip coil(s) of the circuit breakers or other interrupting devices.

A BES interrupting device is a BES Element, typically a circuit breaker or circuit switcher that has the capability to interrupt fault current. Although BES interrupting device mechanisms are not part of a Protection System, the standard uses the operation of a BES interrupting device by a Protection System to initiate the review for Misoperation.

The following two definitions are being proposed for inclusion in the NERC Glossary:

**Composite Protection System –** The total complement of Protection System(s) that function collectively to protect an Element. Backup protection provided by a different Element’s Protection System(s) is excluded.

The Composite Protection System definition is based on the principle that an Element’s multiple layers of protection are intended to function collectively. This definition has been introduced in this standard and incorporated into the proposed definition of Misoperation to clarify that the overall performance of an Element’s total complement of protection should be considered while evaluating an operation.

**Composite Protection System – Line Example**

The Composite Protection System of the Alpha-Beta line (Circuit #123) is comprised of current differential, permissive overreaching transfer trip (POTT), step distance (classic zone 1, zone 2, and zone 3), instantaneous-overcurrent, time-overcurrent, out-of-step, and overvoltage protection. The protection is housed at the Alpha and Beta substations, and includes the associated relays, communications systems, voltage and current sensing devices, DC supplies, and control circuitry.

**Composite Protection System – Transformer Example**

The Composite Protection System of the Alpha transformer (#2) is comprised of internal differential, overall differential, instantaneous-overcurrent, and time-overcurrent protection. The protection is housed at the Alpha substation, and includes the associated relays, voltage and current sensing devices, DC supplies, and control circuitry.
Composite Protection System – Generator Example

The Composite Protection System of the Beta generator (#3) is comprised of generator differential, overall differential, overcurrent, stator ground, reverse power, volts per hertz, loss-of-field, and undervoltage protection. The protection is housed at the Beta generating plant and at the Beta substation, and includes the associated relays, voltage and current sensing devices, DC supplies, and control circuitry.

Composite Protection System – Breaker Failure Example

Breaker failure protection provides backup protection for the breaker, and therefore is part of the breaker’s Composite Protection System. Considering breaker failure protection to be part of another Element’s Composite Protection System could lead to an incorrect conclusion that a breaker failure operation automatically satisfies the “Slow Trip” criteria of the Misoperation definition.

- An example of a correct operation of the breaker’s Composite Protection System is when the breaker failure relaying tripped because the line relaying operated, but the breaker failed to clear the Fault. The breaker failure relaying operated because of a failed trip coil. The failed trip coil caused a Misoperation of the line’s Composite Protection System.

- An example of a correct operation of the breaker’s Composite Protection System is when the breaker failure relaying tripped because the line relaying operated, but the breaker failed to clear the Fault. Only the breaker failure relaying operated because of a failed breaker mechanism. This was not a Misoperation because the breaker mechanism is not part of the breaker’s Composite Protection System.

- An example of an “Unnecessary Trip – During Fault” is when the breaker failure relaying tripped at the same time as the line relaying during a Fault. The Misoperation was due to the breaker failure timer being set to zero.

Misoperation – The failure a Composite Protection System to operate as intended for protection purposes. Any of the following is a Misoperation:

1. **Failure to Trip – During Fault** – A failure of a Composite Protection System to operate for a Fault condition for which it is designed. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.

2. **Failure to Trip – Other Than Fault** – A failure of a Composite Protection System to operate for a non-Fault condition for which it is designed, such as a power swing, undervoltage, overexcitation, or loss of excitation. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.
3. **Slow Trip – During Fault** – A Composite Protection System operation that is slower than required for a Fault condition if the duration of its operating time resulted in the operation of at least one other Element’s Composite Protection System.

4. **Slow Trip – Other Than Fault** – A Composite Protection System operation that is slower than required for a non-Fault condition, such as a power swing, undervoltage, overexcitation, or loss of excitation, if the duration of its operating time resulted in the operation of at least one other Element’s Composite Protection System.

5. **Unnecessary Trip – During Fault** – An unnecessary Composite Protection System operation for a Fault condition on another Element.

6. **Unnecessary Trip – Other Than Fault** – An unnecessary Composite Protection System operation for a non-Fault condition. A Composite Protection System operation that is caused by personnel during on-site maintenance, testing, inspection, construction, or commissioning activities is not a Misoperation.

The Misoperation definition is based on the principle that an Element’s total complement of protection is intended to operate dependably and securely.

- Failure to automatically reclose after a Fault condition is not included as a Misoperation because reclosing equipment is not included within the definition of Protection System.
- A breaker failure operation does not, in itself, constitute a Misoperation.
- A remote backup operation resulting from a “Failure to Trip” or a “Slow Trip” does not, in itself, constitute a Misoperation.

This proposed definition of Misoperation provides additional clarity over the current version. A Misoperation is the failure of a Composite Protection System to operate as intended for protection purposes. The definition includes six categories which provide further differentiation of what constitutes a Misoperation. These categories are discussed in greater detail in the following sections.

**Failure to Trip – During Fault**

This category of Misoperation typically results in the Fault condition being cleared by remote backup Protection System operation.

**Example 1a:** A failure of a transformer's Composite Protection System to operate for a transformer Fault is a Misoperation.

**Example 1b:** A failure of a "primary" transformer relay (or any other component) to operate for a transformer Fault is not a "Failure to Trip – During Fault" Misoperation as long as another component of the transformer's Composite Protection System operated.

**Example 1c:** A lack of target information does not by itself constitute a Misoperation. When a high-speed pilot system does not target because a high-speed zone element trips first, it would not in and of itself be a Misoperation.
Example 1d: A failure of an overall differential relay to operate is not a “Failure to Trip – During Fault” Misoperation as long as another component such as a generator differential relay operated.

Example 1e: The Composite Protection System for a bus does not operate during a bus Fault which results in the operation of all local transformer Protection Systems connected to that bus and all remote line Protection Systems connected to that bus isolating the faulted bus from the grid. The operation of the local transformer Protection Systems and the operation of all remote line Protection Systems correctly provided backup protection. There is one “Failure to Trip – During Fault” Misoperation of the bus Composite Protection System.

In analyzing the Protection System for Misoperation, the entity must also consider whether the “Slow Trip – During Fault” category applies to the operation.

Failure to Trip – Other Than Fault

This category of Misoperation may have resulted in operator intervention. The “Failure to Trip – Other Than Fault” conditions cited in the definition are examples only, and do not constitute an all-inclusive list.

Example 2a: A failure of a generator’s Composite Protection System to operate for an unintentional loss of field condition is a Misoperation.

Example 2b: A failure of an overexcitation relay (or any other component) is not a “Failure to Trip – Other Than Fault” Misoperation as long as the generator’s Composite Protection System operated as intended isolating the generator from the BES.

In analyzing the Protection System for Misoperation, the entity must also consider whether the “Slow Trip – Other Than Fault” category applies to the operation.

Slow Trip – During Fault

This category of Misoperation typically results in remote backup Protection System operation before the Fault is cleared.

Example 3a: A Composite Protection System that is slower than required for a Fault condition is a Misoperation if the duration of its operating time resulted in the operation of at least one other Element’s Composite Protection System. The current differential element of a multiple function relay failed to operate for a line Fault. The same relay’s time-overcurrent element operated after a time delay. However, an adjacent line also operated from a time-overcurrent element. The faulted line’s time-overcurrent element was found to be set to trip too slowly.
Example 3b: A failure of a breaker's Composite Protection System to operate as quickly as intended to meet the expected critical Fault clearing time for a line Fault in conjunction with a breaker failure (i.e., stuck breaker) is a Misoperation if it resulted in an unintended operation of at least one other Element’s Composite Protection System. If a generating unit’s Composite Protection System operates due to instability caused by the slow trip of the breaker’s Composite Protection System, it is not an “Unnecessary Trip – During Fault” Misoperation of the generating unit’s Composite Protection System. This event would be a “Slow Trip – During Fault” Misoperation of the breaker’s Composite Protection System.

Example 3c: A line connected to a generation interconnection station is protected with two independent high-speed pilot systems. The Composite Protection System for this line also includes step distance and time-overcurrent schemes in addition to the two pilot systems. During a Fault on this line, the two pilot systems fail to operate and the time-overcurrent scheme operates clearing the Fault with no generating units or other Elements tripping (i.e., no over-trips). This event is not a Misoperation.

The phrase “slower than required” means the duration of its operating time resulted in the operation of at least one other Element’s Composite Protection System. It would be impractical to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should understand whether the speed and outcome of its Protection System operation met their objective. The intent is not to require documentation of exact Protection System operation times, but to assure consideration of relay coordination and system stability by the owner(s) reviewing each Protection System operation.

The phrase “resulted in the operation of any other Composite Protection System” refers to the need to ensure that relaying operates in the proper or planned sequence (i.e., the primary relaying for a faulted Element operates before the remote backup relaying for the faulted Element).

In analyzing the Protection System for Misoperation, the entity must also consider the “Unnecessary Trip – During Fault” category to determine if an “unnecessary trip” applies to the Protection System operation of an Element other than the faulted Element.

If a coordination error was at the local terminal (i.e., set too slow), then it was a “Slow Trip,” category of Misoperation at the local terminal.

Slow Trip – Other Than Fault

The phrase “slower than required” means the duration of its operating time resulted in the operation of at least one other Element’s Composite Protection System. It would be impractical to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should understand whether the speed and outcome of its Protection System operation met their objective. The intent is not to require documentation of exact Protection System operation times, but to assure consideration of relay coordination and system stability by the owner(s) reviewing each Protection System operation.
times, but to assure consideration of relay coordination and system stability by the owner(s) reviewing each Protection System operation.

**Example 4:** A phase to phase fault occurred on the terminals of a generator. The generator’s Composite Protection System and a transmission line’s Composite Protection System both operated in response to the fault. It was found during subsequent investigation that the generator protection contained an inappropriate time delay. This caused the transmission line’s correctly set overreaching zone of protection to operate. This was a Misoperation of the generator’s Composite Protection System, but not of the transmission line’s Composite Protection System.

The “Slow Trip – Other Than Fault” conditions cited in the definition are examples only, and do not constitute an all-inclusive list.

**Unnecessary Trip – During Fault**

An operation of a properly coordinated remote Protection System is not in and of itself a Misoperation if the Fault has persisted for a sufficient time to allow the correct operation of the Composite Protection System of the faulted Element to clear the Fault. A BES interrupting device failure, a “failure to trip” Misoperation, or a “slow trip” Misoperation may result in a proper remote Protection System operation.

**Example 5:** An operation of a transformer’s Composite Protection System which trips (i.e., over-trips) for a properly cleared line Fault is a Misoperation. The Fault is cleared properly by the faulted equipment’s Composite Protection System (i.e., line relaying) without the need for an external Protection System operation resulting in an unnecessary trip of the transformer protection; therefore, the transformer Protection System operation is a Misoperation.

**Example 5b:** An operation of a line’s Composite Protection System which trips (i.e., over-trips) for a properly cleared Fault on a different line is a Misoperation. The Fault is cleared properly by the faulted line’s Composite Protection System (i.e., line relaying); however, elsewhere in the system, a carrier blocking signal is not transmitted (e.g., carrier ON/OFF switch found in OFF position) resulting in the operation of a remote Protection System, single-end trip of a non-faulted line. The operation of the Protection System for the non-faulted line is an unnecessary trip during a Fault. Therefore, the non-faulted line Protection System operation is an “Unnecessary Trip – During Fault” Misoperation.

**Example 5c:** If a coordination error was at the remote terminal (i.e., set too fast), then it was an “Unnecessary Trip – During Fault” category of Misoperation at the remote terminal.
**Unnecessary Trip – Other Than Fault**

Unnecessary trips for non-Fault conditions include but are not limited to: power swings, overexcitation, loss of excitation, frequency excursions, and normal operations.

**Example 6a:** An operation of a line’s Composite Protection System due to a relay failure during normal operation is a Misoperation.

**Example 6b:** Tripping a generator by the operation of the loss of field protection during an off-nominal frequency condition while the field is intact is a Misoperation assuming the Composite Protection System was not intended to operate under this condition.

**Example 6c:** An impedance line relay trip for a power swing that entered the relay’s characteristic is a Misoperation if the power swing was stable and the relay operated because power swing blocking was enabled and should have prevented the trip, but did not.

**Example 6d:** Tripping a generator operating at normal load by the operation of a reverse power protection relay due to a relay failure is a Misoperation.

Additionally, an operation that occurs during a non-Fault condition but was initiated directly by on-site (i.e., real-time) maintenance, testing, inspection, construction, or commissioning is not a Misoperation.

**Example 6e:** A BES interrupting device operation that occurs at the remote end of a line during a non-Fault condition because a direct transfer trip was initiated by system maintenance and testing activities at the local end of the line is not a Misoperation because of the maintenance exclusion in category 6 of the definition of “Misoperation.”

The “on-site” activities at one location that initiates a trip to another location are included in this exemption. This includes operation of a Protection System when energizing equipment to facilitate measurements, such as verification of current circuits as a part of performing commissioning; however, once the maintenance, testing, inspection, construction, or commissioning activity associated with the Protection System is complete, the “on-site” Misoperation exclusion no longer applies, regardless of the presence of on-site personnel.

**Special Cases**

Protection System operations for these cases would not be a Misoperation.

**Example 7a:** A generator Protection System operation prior to closing the unit breaker(s) is not a Misoperation provided no in-service Elements are tripped.

This type of operation is not a Misoperation because the generating unit is not synchronized and is isolated from the BES. Protection System operations that occur when the protected Element is out of service and that do not trip any in-service Elements are not Misoperations.

In some cases where zones of protection overlap, the owner(s) of Elements may decide to allow a Protection System to operate faster in order to gain better overall Protection System performance for an Element.
Example 7b: The high-side of a transformer connected to a line may be within the zone of protection of the supplying line’s relaying. In this case, the line relaying is planned to protect the area of the high-side of the transformer and into its primary winding. In order to provide faster protection for the line, the line relaying may be designed and set to operate without direct coordination (or coordination is waived) with local protection for Faults on the high-side of the connected transformer. Therefore, the operation of the line relaying for a high-side transformer Fault operated as intended and would not be a Misoperation.

Below are examples of conditions that would be a Misoperation.

**Example 7c:** A 230 kV shunt capacitor bank was released for operational service. The capacitor bank trips due to a settings error in the capacitor bank differential relay upon energization.

**Example 7d:** A 230/115 kV BES transformer bank trips out when being re-energized due to an incorrect operation of the transformer differential relay for inrush after being released for operational service. Only the high-side breaker opens since the low-side breaker had not yet been closed.

**Non-Protective Functions**

BES interrupting device operations which are initiated by non-protective functions, such as those associated with generator controls, excitation controls, or turbine/boiler controls, static voltampere-reactive compensators (SVC), flexible ac transmission systems (FACTS), high-voltage dc (HVdc) transmission systems, circuit breaker mechanisms, or other facility control systems are not operations of a Protection System. The standard is not applicable to non-protective functions such as automation (e.g., data collection) or control functions that are embedded within a Protection System.

**Control Functions**

The entity must make a determination as to whether the standard is applicable to each operation of its Protection System in accordance with the provided exclusions in the standard’s Applicability, see Section 4.2.1. The subject matter experts (SME) developing this standard recognize that entities use Protection Systems as part of a routine practice to control BES Elements. This standard is not applicable to operation of protective functions within a Protection System when intended for controlling a BES Element as a part of an entity’s process or planned switching sequence. The following are examples of conditions to which this standard is not applicable:

**Example 8a:** The reverse power protective function that operates to remove a generating unit from service using the entity’s normal or routine process.

**Example 8b:** The reverse power relay enables a permissive trip and the generator operator trips the unit.
The standard is not applicable to operation of the protective relay because its operation is intended as a control function as part of a controlled shutdown sequence for the generator. However, the standard remains applicable to operation of the reverse power relay when it operates for conditions not associated with the controlled shutdown sequence, such as a motoring condition caused by a trip of the prime mover.

The following is another example of a condition to which this standard is not applicable:

**Example 8c:** Operation of a capacitor bank interrupting device for voltage control using functions embedded within a microprocessor based relay that is part of a Protection System.

The above are examples only, and do not constitute an all-inclusive list to which the standard is not applicable.

**Extenuating Circumstances**

In the event of a natural disaster or other extenuating circumstances, the December 20, 2012 Sanction Guidelines of the North American Electric Reliability Corporation, Section 2.8, Extenuating Circumstances, reads: “In unique extenuating circumstances causing or contributing to the violation, such as significant natural disasters, NERC or the Regional Entity may significantly reduce or eliminate Penalties.” The Regional Entities to whom NERC has delegated authority will consider extenuating circumstances when considering any sanctions in relation to the timelines outlined in this standard.

The volume of Protection System operations tend to be sporadic. If a high rate of Protection System operations is not sustained, utilities will have an opportunity to catch up within the 120 day period.

**Requirement Time Periods**

The time periods within all the Requirements are distinct and separate. The applicable entity in Requirement R1 has 120 calendar days to identify whether a BES interrupting device operation is a Misoperation. Once the applicable entity has identified a Misoperation, it has completed its performance under Requirement R1. Identified Misoperations without an identified cause become subject to Requirement R4 and any subsequent Requirements as necessary. Identified Misoperations with an identified cause become subject to Requirement R5 and any subsequent Requirements as necessary.

In Requirement R2, the applicable entity has 120 calendar days, based on the date of the BES interrupting device operation, to provide notification to the other Protection System owners that meet the circumstances in Parts 2.1 and 2.2. For the case of an applicable entity that was notified (R3), it has the later of 120 calendar days from the date of the BES interrupting device operation or 60 calendar days of notification to identify whether its Protection System components caused a Misoperation.
Once a Misoperation is identified in either Requirement R1 or R3, and the applicable entity did not identify the cause(s) of the Misoperation, the time period for performing at least one investigative action every two full calendar quarters begins. The time period(s) in Requirement R4 resets upon each period. When the applicable entity’s investigative actions identify the cause of the identified Misoperation or the applicable entity declares that no cause was found, the applicable entity has completed its performance in Requirement R4.

The time period in Requirement R5 begins when the Misoperation cause is first identified. The applicable entity is allotted 60 calendar days to perform one of the two activities listed in Requirement R5 (e.g., CAP or declaration) to complete its performance under Requirement R5.

Requirement R6 time period is determined by the actions and the associated timetable to complete those actions identified in the CAP. The time periods contained in the CAP may change from time to time and the applicable entity is required to update the timetable when it changes.

Time periods provided in the Requirements are intended to provide a reasonable amount of time to perform each Requirement. Performing activities in the least amount of time facilitates prompt identification of Misoperations, notification to other Protection System owners, identification of the cause(s), correction of the cause(s), and that important information is retained that may be lost due to time.

**Requirement R1**

This Requirement initiates a review of each BES interrupting device operation to identify whether or not a Misoperation may have occurred. Since the BES interrupting device owner typically monitors and tracks device operations, the owner is the logical starting point for identifying Misoperations of Protection Systems for BES Elements. A review is required when (1) a BES interrupting device operates that is caused by a Protection System or by manual intervention in response to a Protection System failure to operate, (2) regardless of whether the owner owns all or part of the Protection System component(s), and (3) the owner identified its Protection System component(s) as causing the BES interrupting device operation or was caused by manual intervention in response to its Protection System failure to operate.

Since most Misoperations result in the operation of one or more BES interrupting devices, these operations initiate a review to identify any Misoperation. If an Element is manually isolated in response to a failure to operate, the manual isolation of the Element triggers a review for Misoperation.

**Example R1a:** The failure of a loss of field relay on a generating unit where an operator takes action to isolate the unit.

Manual intervention may indicate a Misoperation has occurred, thus requiring the initiation of an investigation by the BES interrupting device owner.

For the case where a BES interrupting device did not operate and remote clearing occurs due to the failure of a Composite Protection System to operate, the BES interrupting device owner would still review the operation under Requirement R1. However, if the BES interrupting device
owner determines that its Protection System component operated as backup protection for a condition on another entity’s BES Element, the owner would provide notification of the operation to the other Protection System owner(s) under Requirement R2, Part 2.2.

Protection Systems are made of many components. These components may be owned by different entities. For example, a Generator Owner may own a current transformer that sends information to a Transmission Owner’s differential relay. All of these components and many more are part of a Protection System. It is expected that all of the owners will communicate with each other, sharing information freely, so that Protection System operations can be analyzed, Misoperations identified, and corrective actions taken.

Each entity is expected to use judgment to identify those Protection System operations that meet the definition of Misoperation regardless of the level of ownership. A combination of available information from resources such as counters, relay targets, Supervisory Control and Data Acquisition (SCADA) systems, or DME would typically be used to determine whether or not a Misoperation occurred. The intent of the standard is to classify an operation as a Misoperation if the available information leads to that conclusion. In many cases, it will not be necessary to leverage all available data to determine whether or not a Misoperation occurred. The standard also allows an entity to classify an operation as a Misoperation if entity is not sure. The entity may decide to identify the operation as a Misoperation to satisfy Requirement R1 and continue its investigation for a cause of the Misoperation under Requirement R4. If the continued investigative actions are inconclusive, the entity may declare no cause found and end its investigation. The entity is allotted 120 calendar days from the date of its BES interrupting device operation to identify whether its Protection System component(s) caused a Misoperation.

The Protection System operation may be documented in a variety of ways such as in a report, database, spreadsheet, or list. The documentation may be organized in a variety of ways such as by BES interrupting device, protected Element, or Composite Protection System.

Repeated operations which occur during the same automatic reclosing sequence do not need a separate identification under Requirement R1. Repeated Misoperations which occur during the same 24-hour period do not need a separate identification under Requirement R1. This is consistent with the NERC Misoperations Report which states:

“In order to avoid skewing the data with these repeated events, the NERC SPCS should clarify, in the next annual update of the misoperation template, that all misoperations due to the same equipment and cause within a 24 hour period be recorded as one misoperation.”

The following is an example of a condition that is not a Misoperation.

---

Example R1b: A high impedance Fault occurs within a transformer. The sudden pressure relaying detects and operates for the Fault, but the differential relaying did not operate due to the low Fault current levels. This is not a Misoperation because the Composite Protection System was not required to operate because the Fault was cleared by the sudden pressure relay.

Requirement R2

Requirement R2 ensures notification of those who have a role in identifying Misoperations, but were not accounted for within Requirement R1. In the case of multi-entity ownership, the entity that owns the BES interrupting device that operated is expected to use judgment to identify those Protection System operations that meet the definition of Misoperation under Requirement R1; however, if the entity that owns a BES interrupting device determines that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation, it must notify the other Protection System owner(s) that share Misoperation identification responsibility when the criteria in Requirement R2 is met.

This Requirement does not preclude the Protection System owners from initially communicating and working together to determine whether a Misoperation occurred and, if so, the cause. The BES interrupting device owner is only required to officially notify the other owners when it: (1) shares the Composite Protection System ownership with other entity(ies), (2) determines that a Misoperation occurred or cannot rule out a Misoperation, and (3) determines its Protection System component(s) did not cause a Misoperation or is unsure. Officially notifying the other owners without performing a preliminary review may unnecessarily burden the other owners with compliance obligations under Requirement R3, redirect valuable resources, and add little benefit to reliability. The BES interrupting device owner should officially notify other owners when appropriate within the established time period.

The following is an example of a notification to another Protection System owner:

Example R2a: Circuit breakers A and B at the Charlie station tripped from directional comparison blocking (DCB) relaying on 03/03/2014 at 15:43 UTC during an external Fault. As discussed last week, the fault records indicate that a problem with your equipment (failure to transmit) caused the operation.
Example R2b: A generator unit tripped out immediately upon synchronizing to the grid due to a Misoperation of its overcurrent protection. The Transmission Owner owns the 230 kV generator breaker that operated. The Transmission Owner, as the owner of the BES interrupting device after determining that its Protection System components did not cause the Misoperation, notified the Generator Owner of the operation. The Generator Owner investigated and determined that its Protection System components caused the Misoperation. In this example, the Generator Owner’s Protection System components did cause the Misoperation. As the owner of the Protection System components that caused the Misoperation, the Generator Owner is responsible for creating and implementing the CAP.

A Composite Protection System owned by different functional entities within the same registered entity does not necessarily satisfy the notification criteria in Part 2.1.1 of Requirement R2. For example, if the same personnel within a registered entity perform the Misoperation identification for both the Generator Owner and Transmission Owner functions, then the Misoperation identification would be completely covered in Requirement R1, and therefore notification would not be required. However, if the Misoperation identification is handled by different groups, then notification would be required because the Misoperation identification would not necessarily be covered in Requirement R1.

Example R2c: Line A Composite Protection System (owned by entity 1) failed to operate for an internal Fault. As a result, the zone 3 portion of Line B’s Composite Protection System (owned by entity 2) and zone 3 portion of Line C’s Composite Protection System (owned by entity 3) operated to clear the Fault. Entity 2 and 3 notified entity 1 of the remote zone 3 operation.

For the case where a BES interrupting device operates to provide backup protection for a non-BES Element, the entity reviewing the operation is not required to notify the other owners of Protection Systems for non-BES Elements. No notification is required because this Reliability Standard is not applicable to Protection Systems for non-BES Elements.

Requirement R3
For Requirement R3 (i.e., notification received), the entity that also owns a portion of the Composite Protection System is expected to use judgment to identify whether the Protection System operation is a Misoperation. A combination of available information from resources such as counters, relay targets, SCADA, DME, and information from the other owner(s) would typically be used to determine whether or not a Misoperation occurred. The intent of the standard is to classify an operation as a Misoperation if the available information leads to that conclusion. In many cases, it will not be necessary to leverage all available data to determine whether or not a Misoperation occurred. The standard also allows an entity to classify an operation as a Misoperation if an entity is not sure. The entity may decide to identify the operation as a Misoperation to satisfy Requirement-R1 and continue its investigation for a cause of the Misoperation. under Requirement R4. If the continued investigative actions are inconclusive, the entity may declare no cause found and end its investigation.
The entity that is notified by the BES interrupting device owner is allotted the later of 60 calendar days from receipt of notification or 120 calendar days from the BES interrupting device operation date to determine if its portion of the Composite Protection System caused the Protection System operation. It is expected that in most cases of a jointly owned Protection System, the entity making notification would have been in communication with the other owner(s) early in the process. This means that the shorter 60 calendar days only comes into play if the notification occurs in the second half of the 120 calendar days allotted to the BES interrupting device owner in Requirement R1.

The Protection System review may be organized in a variety of ways such as in a report, database, spreadsheet, or list. The documentation may be organized in a variety of ways such as by BES interrupting device, protected Element, or Composite Protection System. The BES interrupting device owner's notification received may be documented in a variety of ways such as an email or a facsimile.

**Requirement R4**

The entity in Requirement R4 (i.e., cause identification), whether it is the entity that owns the BES interrupting device or an entity that was notified, is expected to use due diligence in taking investigative action(s) to determine the cause(s) of an identified Misoperation for its portion of the Composite Protection System. The SMEs developing this standard recognize there will be cases where the cause(s) of a Misoperation will not be revealed during the allotted time periods in Requirements R1 or R3; therefore, Requirement R4 provides the entity a mechanism to continue its investigative work to determine the cause(s) of the Misoperation when the cause is not known.

A combination of available information from resources such as counters, relay targets, SCADA, DME, test results, and studies would typically be used to determine the cause of the Misoperation. At least one investigative action must be performed every two full calendar quarters until the investigation is completed.

The following is an example of investigative actions taken to determine the cause of an identified Misoperation:

**Example R4a:** A Misoperation was identified on 03/18/2014. A line outage to test the Protection System was scheduled on 03/24/2014 for 12/15/2014 as the first investigative action (i.e., beyond the next two full calendar quarters) due to summer peak conditions. The protection engineer contacted the manufacturer on 04/10/2014 (i.e., within two full calendar quarters) to obtain any known issues. The engineer reviewed manufacturer’s documents on 05/27/2014. The outage schedule was confirmed on 08/29/2014 and was taken on 12/15/2014. Testing was completed on 12/16/2014 (i.e., in the second two full quarters) revealing the microprocessor relay as the cause of the Misoperation. A CAP is being developed to replace the relay.

Periodic action minimizes compliance burdens and focuses the entity’s effort on determining the cause(s) of the Misoperation while providing measurable evidence. The SMEs recognize
that certain planned investigative actions may require months or years to schedule and complete; therefore, the entity is only required to perform at least one investigative action every two full calendar quarters. If an investigative action is performed in the first quarter of a calendar year, the next investigative action would need to be performed by the end of the third calendar quarter. If an investigative action is performed in the last quarter of a calendar year, the next investigative action would need to be performed by the end of the second calendar quarter of the following calendar year. Investigative actions may include a variety of actions, such as reviewing DME records, performing or reviewing studies, completing relay calibration or testing, requesting manufacturer review, requesting an outage, or confirming a schedule.

The entity’s investigation is complete when it identifies the cause of the Misoperation or makes a declaration that no cause was determined. The declaration is intended to be used if the entity determines that investigative actions have been exhausted or have not provided direction for identifying the Misoperation cause. Historically, approximately 12% of Misoperations are unknown or unexplainable.\(^8\)

Although the entity only has to document its specific investigative actions taken to determine the cause(s) of an identified Misoperation, the entity should consider the benefits of formally organizing (e.g., in a report or database) its actions and findings. Well documented investigative actions and findings may be helpful in future investigations of a similar event or circumstances. A thorough report or database may contain a detailed description of the event, information gathered, investigative actions, findings, possible causes, identified causes, and conclusions. Multiple owners of a Composite Protection System might consider working together to produce a common report for their mutual benefit.

The following are examples of a declaration where no cause was determined:

**Example R4b:** A Misoperation was identified on 04/11/2014. All relays at station A and B functioned properly during testing on 08/26/2014 as the first investigative action. The carrier system functioned properly during testing on 08/27/2014. The carrier coupling equipment functioned properly during testing on 08/28/2014. A settings review completed on 09/03/2014 indicated the relay settings were proper. Since the equipment involved in the operation functioned properly during testing, the settings were reviewed and found to be correct, and the equipment at station A and station B is already monitored. The investigation is being closed because no cause was found.

**Example R4c:** A Misoperation was identified on 03/22/2014. The protection scheme was replaced before the cause was identified. The power line carrier or PLC based protection was replaced with fiber-optic based protection with an in-service date of 04/16/2014. The new system will be monitored for recurrence of the Misoperation.

Requirement R5

Resolving the causes of Protection System Misoperations benefits BES reliability by preventing recurrence. The Corrective Action Plan (CAP) is an established tool for resolving operational problems. The NERC Glossary defines a Corrective Action Plan as, "A list of actions and an associated timetable for implementation to remedy a specific problem." Since a CAP addresses specific problems, the determination of what went wrong needs to be completed before developing a CAP. When the Misoperation cause is identified in Requirement R1 or R3 or R4, Requirement R5 requires Protection System owner(s) to develop a CAP, or explain why corrective actions are beyond the entity’s control or would not improve BES reliability. The entity must develop the CAP or make a declaration why additional actions are beyond the entity’s control or would not improve BES reliability and that no further corrective actions will be taken within 60 calendar days of first determining a cause.

The SMEs developing this standard recognize there may be multiple causes for a Misoperation. In these circumstances, the CAP would include a remedy for the identified causes. The CAP may be revised if additional causes are found; therefore, the entity has the option to create a single or multiple CAP(s) to correct multiple causes of a Misoperation. The 60 calendar day period for developing a CAP (or declaration) is established on the basis of industry experience which includes operational coordination timeframes, time to consider alternative solutions, coordination of resources, and development of a schedule.

The development of a CAP is intended to document the specific corrective actions needed to be taken to prevent Misoperation recurrence, the timetable for executing such actions, and an evaluation of the CAP’s applicability to the entity’s other Protection Systems including other locations. The evaluation of these other Protection Systems aims to reduce the risk and likelihood of similar Misoperations in other Protection Systems. The Protection System owner is responsible for determining the extent of its evaluation concerning other Protection Systems and locations. The evaluation may result in the owner including actions to address Protection Systems at other locations or the reasoning for not taking any action. The CAP and an evaluation of other Protection Systems including other locations must be developed to complete Requirement R5.

The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor within the relay and the evaluation of the cause at similar locations which determined capacitor replacement was not necessary.

For completion of each CAP in Examples R5a through R5d, please see Examples R6a through R6d.

Example R5a: Actions: Remove the relay from service. Replace capacitor in the relay. Test the relay. Return to service or replace by 07/01/2014.

Applicability to other Protection Systems: This type of impedance relay has not been experiencing problems and is systematically being replaced with microprocessor relays as Protection Systems are modernized. Therefore, it was assessed that a program for wholesale preemptive replacement of capacitors in this type of impedance relay does not need to be established for the system.
The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor within the relay and the evaluation of the cause at similar locations which determined the capacitors need preemptive correction action.

**Example R5b:** Actions: Remove the relay from service. Replace capacitor in the relay. Test the relay. Return to service or replace by 07/01/2014.

Applicability to other Protection Systems: This type of impedance relay is suspected to have previously tripped at other locations because of the same type of capacitor issue. Based on the evaluation, a program should be established by 12/01/2014 for wholesale preemptive replacement of capacitors in this type of impedance relay.

The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor within the relay and the evaluation of the cause at similar locations which determined the capacitors need preemptive correction action.

**Example R5c:** Actions: Remove the relay from service. Replace capacitor in the relay. Test the relay. Return to service or replace by 07/01/2014.

Applicability to other Protection Systems: This type of impedance relay is suspected to have previously tripped at other locations because of the same type of capacitor issue. Based on the evaluation, the preemptive replacement of capacitors in this type of impedance relay should be pursued for the identified stations A through I by 04/30/2015.

A plan is being developed to replace the impedance relay capacitors at stations A, B, and C by 09/01/2014. A second plan is being developed to replace the impedance relay capacitors at stations D, E, and F by 11/01/2014. The last plan will replace the impedance relay capacitors at stations G, H, and I by 02/01/2015.

The following is an example of a CAP for a relay Misoperation that was due to a version 2 firmware problem and the evaluation of the cause at similar locations which determined the firmware needs preemptive correction action.

**Example R5d:** Actions: Provide the manufacturer fault records. Install new firmware pending manufacturer results by 10/01/2014.

Applicability to other Protection Systems: Based on the evaluation of other locations and a risk assessment, the newer firmware version 3 should be installed at all installations that are identified to be version 2. Twelve relays were identified across the system. Proposed completion date is 12/31/2014.

The following are examples of a declaration made where corrective actions are beyond the entity’s control or would not improve BES reliability and that no further corrective actions will be taken.

**Example R5e:** The cause of the Misoperation was due to a non-registered entity communications provider problem.
Example R5f: The cause of the Misoperation was due to a transmission transformer tapped industrial customer who initiated a direct transfer trip to a registered entity's transmission breaker.

In situations where a Misoperation cause emanates from a non-registered outside entity, there may be limited influence an entity can exert on an outside entity and is considered outside of an entity's control.

The following are examples of declarations made why corrective actions would not improve BES reliability.

Example R5g: The investigation showed that the Misoperation occurred due to transients associated with energizing transformer ABC at Station Y. Studies show that de-sensitizing the relay to the recorded transients may cause the relay to fail to operate as intended during power system oscillations.

Example R5h: As a result of an operation that left a portion of the power system in an electrical island condition, circuit XYZ within that island tripped, resulting in loss of load within the island. Subsequent investigation showed an overfrequency condition persisted after the formation of that island and the XYZ line protective relay operated. Since this relay was operating outside of its designed frequency range and would not be subject to this condition when line XYZ is operated normally connected to the BES, no corrective action will be taken because BES reliability would not be improved.

Example R5i: During a major ice storm, four of six circuits were lost at Station A. Subsequent to the loss of these circuits, a skywire (i.e., shield wire) broke near station A on line AB (between Station A and B) resulting in a phase-phase Fault. The protection scheme utilized for both protection groups is a permissive overreaching transfer trip (POTT). The Line AB protection at Station B tripped timed for this event (i.e., Slow Trip – During Fault) even though this line had been identified as requiring high speed clearing. A weak infeed condition was created at Station A due to the loss of 4 transmission circuits resulting in the absence of a permissive signal on Line AB from Station A during this Fault. No corrective action will be taken for this Misoperation as even under N-1 conditions, there is normally enough infeed at Station A to send a proper permissive signal to station B. Any changes to the protection scheme to account for this would not improve BES reliability.

A declaration why corrective actions are beyond the entity’s control or would not improve BES reliability should include the Misoperation cause and the justification for taking no corrective action. Furthermore, a declaration that no further corrective actions will be taken is expected to be used sparingly.

Requirement R6

To achieve the stated purpose of this standard, which is to identify and correct the causes of Misoperations of Protection Systems for BES Elements, the responsible entity is required to implement a CAP that addresses the specific problem (i.e., cause(s) of the Misoperation).
through completion. Protection System owners are required in the implementation of a CAP to update it when actions or timetable change, until completed. Accomplishing this objective is intended to reduce the occurrence of future Misoperations of a similar nature, thereby improving reliability and minimizing risk to the BES.

The following is an example of a completed CAP for a relay Misoperation that was applying a standing trip (See also, Example R5a).

**Example R6a:**

**Actions:**
The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. A failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.

CAP completed on 06/25/2014.

The following is an example of a completed CAP for a relay Misoperation that was applying a standing trip that resulted in the correction and the establishment of a program for further replacements (See also, Example R5b).

**Example R6b:**

**Actions:**
The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. A failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.

A program for wholesale preemptive replacement of capacitors in this type of impedance relay was established on 10/28/2014.

CAP completed on 10/28/2014.

The following is an example of a completed CAP of corrective actions with a timetable that required updating for a failed relay and preemptive actions for similar installations (See also, Example R5c).

**Example R6c:**

**Actions:**
The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. A failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.

The impedance relay capacitor replacement was completed at stations A, B, and C on 08/16/2014. The impedance relay capacitor replacement was completed at stations D, E, and F on 10/24/2014. The impedance relay capacitor replacement for stations G, H, and I were postponed due to resource rescheduling from a scheduled 02/01/15 completion to 04/01/2015 completion. Capacitor replacement was completed on 03/09/2015 at stations G, H, and I. All stations identified in the evaluation have been completed.

CAP completed on 03/09/2015.
The following is an example of a completed CAP for corrective actions with updated actions for a firmware problem and preemptive actions for similar installations. (See also, Example R5d).

**Example R6d:** Actions: fault records were provided to the manufacturer on 06/04/2014. The manufacturer responded that the Misoperation was caused by a bug in version 2 firmware, and recommended installing version 3 firmware. Version 3 firmware was installed on 08/12/2014.

Nine of the twelve relays were updated to version 3 firmware on 09/23/2014. The manufacturer provided a subsequent update which was determined to be beneficial for the remaining relays. The remaining three of twelve relays identified as having the version 2 firmware were updated to version 3.01 firmware on 11/10/2014.

CAP completed on 11/10/2014.

The CAP is complete when all of the actions identified within the CAP have been completed.

**Process Flow Chart:** Below is a graphical representation demonstrating the relationships between Requirements:
When all are TRUE

BES interrupting device owner owns all or part of the Protection System component(s) or by manual intervention in response to a Protection System failure to operate

BES interrupting device owner determined that its Protection System component(s) caused the BES interrupting device(s) operation or by manual intervention

BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device (s) operation or by manual intervention

BES interrupting device owner determined that its Protection System component(s) did not cause the operation or is unsure

When all are TRUE

The owner of a BES interrupting device that operated, within 120 calendar days of the BES interrupting device operation

Shall identify whether BES interrupting device owner’s Protection System component(s) caused a Misoperation

Reserved. An entity that has not determined the cause(s) of a Misoperation shall perform at least one investigative action to determine the cause(s) of the Misoperation, at least once every two full calendar quarters after the Misoperation was first identified, until one of the following completes the investigation:

1. Complete a CAP and an evaluation.
2. Implement each Corrective Action Plan (CAP), and update each CAP if actions or timetables change, until completed.
3. Develop a CAP and an evaluation.
4. Implement each Corrective Action Plan (CAP), and update each CAP if actions or timetables change, until completed.
5. Document why corrective actions are beyond the entity’s control or would not improve BES reliability, and that no further corrective actions will be taken.
6. Stop

Causation Known?

R6

Entry Point(s) → Notified Entities

BES interrupting device owner

(2.1) The owner of a BES interrupting device that operated, within 120 calendar days of the BES interrupting device operation

Shall notify the other owner(s) of the Protection System of the BES interrupting device operation

The entity that receives notification, within the later of either 60 calendar days of notification or 120 calendar days of the BES interrupting device operation, shall identify whether its Protection System component(s) caused a Misoperation.

The entity that owns the Protection System component that caused the Misoperation, within 60 calendar days of first identifying a cause

Corrective Actions are beyond the entity’s control or would not improve BES reliability?

Corrective Actions are beyond the entity’s control or would not improve BES reliability.

Causation Identified

Field Code Changed
Rationale

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for Introduction

The only revisions made to version of PRC-004-4 are revisions to section 4.2 Facilities to clarify applicability of the Requirements of the standard at generator Facilities. These applicability revisions are intended to clarify and provide for consistent application of the Requirements to BES generator Facilities included in the BES through Inclusion I4 — Dispersed Power Producing Resources.

Rationale for Applicability

Misoperations occurring on the Protection Systems of individual generation resources identified under Inclusion I4 of the BES definition do not have a material impact on BES reliability when considered individually; however, the aggregate capability of these resources may impact BES reliability if a number of Protection Systems on the individual power producing resources incorrectly operated or failed to operate as designed during a system event. To recognize the potential for the Protection Systems of individual power producing resources to affect the reliability of the BES, 4.2.1.5 of the Facilities section reflects the threshold consistent with the revised BES definition. See FERC Order Approving Revised Definition, P 20, Docket No. RD14-2-000. The intent of 4.2.1.5 of the Facilities section is to exclude from the standard requirements these Protection Systems for “common-mode failure” type scenarios affecting less than or equal to 75 MVA aggregated nameplate generating capability at these dispersed generating facilities.
A. Introduction

1. Title: Transmission Operations
2. Number: TOP-001-5
3. Purpose: To prevent instability, uncontrolled separation, or Cascading outages that adversely impact the reliability of the Interconnection by ensuring prompt action to prevent or mitigate such occurrences.

4. Applicability:
   
   4.1. Functional Entities:
      
   4.1.1. Balancing Authority
   4.1.2. Transmission Operator
   4.1.3. Generator Operator
   4.1.4. Distribution Provider

5. Effective Date: See Implementation Plan
B. Requirements and Measures

R1. Each Transmission Operator shall act to maintain the reliability of its Transmission Operator Area via its own actions or by issuing Operating Instructions. [Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-time Operations]

M1. Each Transmission Operator shall have and provide evidence which may include but is not limited to dated operator logs, dated records, dated and time-stamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it acted to maintain the reliability of its Transmission Operator Area via its own actions or by issuing Operating Instructions.

R2. Each Balancing Authority shall act to maintain the reliability of its Balancing Authority Area via its own actions or by issuing Operating Instructions. [Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-time Operations]

M2. Each Balancing Authority shall have and provide evidence which may include but is not limited to dated operator logs, dated records, dated and time-stamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it acted to maintain the reliability of its Balancing Authority Area via its own actions or by issuing Operating Instructions.

R3. Each Balancing Authority, Generator Operator, and Distribution Provider shall comply with each Operating Instruction issued by its Transmission Operator(s), unless such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements. [Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-Time Operations]

M3. Each Balancing Authority, Generator Operator, and Distribution Provider shall make available upon request, evidence that it complied with each Operating Instruction issued by the Transmission Operator(s) unless such action could not be physically implemented or it would have violated safety, equipment, regulatory, or statutory requirements. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence in electronic or hard copy format. In such cases, the Balancing Authority, Generator Operator, and Distribution Provider shall have and provide copies of the safety, equipment, regulatory, or statutory requirements as evidence for not complying with the Transmission Operator’s Operating Instruction. If such a situation has not occurred, the Balancing Authority, Generator Operator, or Distribution Provider may provide an attestation.

R4. Each Balancing Authority, Generator Operator, and Distribution Provider shall inform its Transmission Operator of its inability to comply with an Operating Instruction issued by its Transmission Operator. [Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-Time Operations]
M4. Each Balancing Authority, Generator Operator, and Distribution Provider shall make available upon request, evidence which may include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent evidence in electronic or hard copy format, that it informed its Transmission Operator of its inability to comply with its Operating Instruction issued. If such a situation has not occurred, the Balancing Authority, Generator Operator, or Distribution Provider may provide an attestation.

R5. Each Transmission Operator, Generator Operator, and Distribution Provider shall comply with each Operating Instruction issued by its Balancing Authority, unless such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements. [Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-Time Operations]

M5. Each Transmission Operator, Generator Operator, and Distribution Provider shall make available upon request, evidence that it complied with each Operating Instruction issued by its Balancing Authority unless such action could not be physically implemented or it would have violated safety, equipment, regulatory, or statutory requirements. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence in electronic or hard copy format. In such cases, the Transmission Operator, Generator Operator, and Distribution Provider shall have and provide copies of the safety, equipment, regulatory, or statutory requirements as evidence for not complying with the Balancing Authority’s Operating Instruction. If such a situation has not occurred, the Transmission Operator, Generator Operator, or Distribution Provider may provide an attestation.

R6. Each Transmission Operator, Generator Operator, and Distribution Provider shall inform its Balancing Authority of its inability to comply with an Operating Instruction issued by its Balancing Authority. [Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-Time Operations]

M6. Each Transmission Operator, Generator Operator, and Distribution Provider shall make available upon request, evidence which may include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent evidence in electronic or hard copy format, that it informed its Balancing Authority of its inability to comply with its Operating Instruction. If such a situation has not occurred, the Transmission Operator, Generator Operator, or Distribution Provider may provide an attestation.

R7. Each Transmission Operator shall assist other Transmission Operators within its Reliability Coordinator Area, if requested and able, provided that the requesting Transmission Operator has implemented its comparable Emergency procedures, unless such assistance cannot be physically implemented or would violate safety, equipment, regulatory, or statutory requirements. [Violation Risk Factor: High] [Time Horizon: Real-Time Operations]
M7. Each Transmission Operator shall make available upon request, evidence that comparable requested assistance, if able, was provided to other Transmission Operators within its Reliability Coordinator Area unless such assistance could not be physically implemented or would have violated safety, equipment, regulatory, or statutory requirements. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence in electronic or hard copy format. If no request for assistance was received, the Transmission Operator may provide an attestation.

R8. Each Transmission Operator shall inform its Reliability Coordinator, known impacted Balancing Authorities, and known impacted Transmission Operators of its actual or expected operations that result in, or could result in, an Emergency. [Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-Time Operations]

M8. Each Transmission Operator shall make available upon request, evidence that it informed its Reliability Coordinator, known impacted Balancing Authorities, and known impacted Transmission Operators of its actual or expected operations that result in, or could result in, an Emergency. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence. If no such situations have occurred, the Transmission Operator may provide an attestation.

R9. Each Balancing Authority and Transmission Operator shall notify its Reliability Coordinator and known impacted interconnected entities of all planned outages, and unplanned outages of 30 minutes or more, for telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels between the affected entities. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Same-Day Operations, Real-Time Operations]

M9. Each Balancing Authority and Transmission Operator shall make available upon request, evidence that it notified its Reliability Coordinator and known impacted interconnected entities of all planned outages, and unplanned outages of 30 minutes or more, for telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence. If such a situation has not occurred, the Balancing Authority or Transmission Operator may provide an attestation.

R10. Each Transmission Operator shall perform the following for determining System Operating Limit (SOL) exceedances within its Transmission Operator Area: [Violation Risk Factor: High] [Time Horizon: Real-Time Operations]

10.1. Monitor Facilities within its Transmission Operator Area;
10.2. Monitor the status of Remedial Action Schemes within its Transmission Operator Area;

10.3. Monitor non-BES facilities within its Transmission Operator Area identified as necessary by the Transmission Operator;

10.4. Obtain and utilize status, voltages, and flow data for Facilities outside its Transmission Operator Area identified as necessary by the Transmission Operator;

10.5. Obtain and utilize the status of Remedial Action Schemes outside its Transmission Operator Area identified as necessary by the Transmission Operator; and

10.6. Obtain and utilize status, voltages, and flow data for non-BES facilities outside its Transmission Operator Area identified as necessary by the Transmission Operator.

M10. Each Transmission Operator shall have, and provide upon request, evidence that could include but is not limited to Energy Management System description documents, computer printouts, Supervisory Control and Data Acquisition (SCADA) data collection, or other equivalent evidence that will be used to confirm that it monitored or obtained and utilized data as required to determine any System Operating Limit (SOL) exceedances within its Transmission Operator Area.

R11. Each Balancing Authority shall monitor its Balancing Authority Area, including the status of Remedial Action Schemes that impact generation or Load, in order to maintain generation-Load-interchange balance within its Balancing Authority Area and support Interconnection frequency. [Violation Risk Factor: High] [Time Horizon: Real-Time Operations]

M11. Each Balancing Authority shall have, and provide upon request, evidence that could include but is not limited to Energy Management System description documents, computer printouts, SCADA data collection, or other equivalent evidence that will be used to confirm that it monitors its Balancing Authority Area, including the status of Remedial Action Schemes that impact generation or Load, in order to maintain generation-Load-interchange balance within its Balancing Authority Area and support Interconnection frequency.

R12. Each Transmission Operator shall not operate outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL $T_v$. [Violation Risk Factor: High] [Time Horizon: Real-time Operations]

M12. Each Transmission Operator shall make available evidence to show that for any occasion in which it operated outside any identified Interconnection Reliability Operating Limit (IROL), the continuous duration did not exceed its associated IROL $T_v$. Such evidence could include but is not limited to dated computer logs or reports in electronic or hard copy format specifying the date, time, duration, and details of the
excursion. If such a situation has not occurred, the Transmission Operator may provide an attestation that an event has not occurred.

R13. Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. [Violation Risk Factor: High] [Time Horizon: Real-time Operations]

M13. Each Transmission Operator shall have, and make available upon request, evidence to show it ensured that a Real-Time Assessment was performed at least once every 30 minutes. This evidence could include but is not limited to dated computer logs showing times the assessment was conducted, dated checklists, or other evidence.

R14. Each Transmission Operator shall initiate its Operating Plan to mitigate a SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment. [Violation Risk Factor: High] [Time Horizon: Real-time Operations]

M14. Each Transmission Operator shall have evidence that it initiated its Operating Plan for mitigating SOL exceedances identified as part of its Real-time monitoring or Real-time Assessments. This evidence could include but is not limited to dated computer logs showing times the Operating Plan was initiated, dated checklists, or other evidence.

R15. Each Transmission Operator shall inform its Reliability Coordinator of actions taken to return the System to within limits when a SOL has been exceeded. [Violation Risk Factor: Medium] [Time Horizon: Real-Time Operations]

M15. Each Transmission Operator shall make available evidence that it informed its Reliability Coordinator of actions taken to return the System to within limits when a SOL was exceeded. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, or dated computer printouts. If such a situation has not occurred, the Transmission Operator may provide an attestation.

R16. Each Transmission Operator shall provide its System Operators with the authority to approve planned outages and maintenance of its telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels between affected entities. [Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]

M16. Each Transmission Operator shall have, and provide upon request, evidence that could include but is not limited to a documented procedure or equivalent evidence that will be used to confirm that the Transmission Operator has provided its System Operators with the authority to approve planned outages and maintenance of telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels between affected entities.

R17. Each Balancing Authority shall provide its System Operators with the authority to approve planned outages and maintenance of its telemetering and control equipment, monitoring and assessment capabilities, and associated communication
channels between affected entities. [Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]

M17. Each Balancing Authority shall have, and provide upon request, evidence that could include but is not limited to a documented procedure or equivalent evidence that will be used to confirm that the Balancing Authority has provided its System Operators with the authority to approve planned outages and maintenance of its telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels between affected entities.

R18. Each Transmission Operator shall operate to the most limiting parameter in instances where there is a difference in SOLs. [Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]

M18. Each Transmission Operator shall have, and provide upon request, evidence that could include but is not limited to operator logs, voice recordings, electronic communications, or equivalent evidence that will be used to determine if it operated to the most limiting parameter in instances where there is a difference in SOLs.

R19. Reserved.

M19. Reserved.

R20. Each Transmission Operator shall have data exchange capabilities, with redundant and diversely routed data exchange infrastructure within the Transmission Operator's primary Control Center, for the exchange of Real-time data with its Reliability Coordinator, Balancing Authority, and the entities it has identified it needs data from in order for it to perform its Real-time monitoring and Real-time Assessments. [Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-time Operations]

M20. Each Transmission Operator shall have, and provide upon request, evidence that could include, but is not limited to, system specifications, system diagrams, or other documentation that lists its data exchange capabilities, including redundant and diversely routed data exchange infrastructure within the Transmission Operator’s primary Control Center, for the exchange of Real-time data with its Reliability Coordinator, Balancing Authority, and the entities it has identified it needs data from in order to perform its Real-time monitoring and Real-time Assessments as specified in the requirement.

R21. Each Transmission Operator shall test its primary Control Center data exchange capabilities specified in Requirement R20 for redundant functionality at least once every 90 calendar days. If the test is unsuccessful, the Transmission Operator shall initiate action within two hours to restore redundant functionality. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

M21. Each Transmission Operator shall have, and provide upon request, evidence that it tested its primary Control Center data exchange capabilities specified in Requirement R20 for the redundant functionality, or experienced an event that demonstrated the
redundant functionality; and, if the test was unsuccessful, initiated action within two hours to restore redundant functionality as specified in Requirement R21. Evidence could include, but is not limited to: dated and time-stamped test records, operator logs, voice recordings, or electronic communications.

R22. Reserved.

M22. Reserved.

R23. Each Balancing Authority shall have data exchange capabilities, with redundant and diversely routed data exchange infrastructure within the Balancing Authority’s primary Control Center, for the exchange of Real-time data with its Reliability Coordinator, Transmission Operator, and the entities it has identified it needs data from in order for it to perform its Real-time monitoring and analysis functions. [Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-time Operations]

M23. Each Balancing Authority shall have, and provide upon request, evidence that could include, but is not limited to, system specifications, system diagrams, or other documentation that lists its data exchange capabilities, including redundant and diversely routed data exchange infrastructure within the Balancing Authority’s primary Control Center, for the exchange of Real-time data with its Reliability Coordinator, Transmission Operator, and the entities it has identified it needs data from in order to perform its Real-time monitoring and analysis functions as specified in the requirement.

R24. Each Balancing Authority shall test its primary Control Center data exchange capabilities specified in Requirement R23 for redundant functionality at least once every 90 calendar days. If the test is unsuccessful, the Balancing Authority shall initiate action within two hours to restore redundant functionality. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

M24. Each Balancing Authority shall have, and provide upon request, evidence that it tested its primary Control Center data exchange capabilities specified in Requirement R23 for redundant functionality, or experienced an event that demonstrated the redundant functionality; and, if the test was unsuccessful, initiated action within two hours to restore redundant functionality as specified in Requirement R24. Evidence could include, but is not limited to: dated and time-stamped test records, operator logs, voice recordings, or electronic communications.
C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:

“Compliance Enforcement Authority” means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention:

The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- Each Balancing Authority, Transmission Operator, Generator Operator, and Distribution Provider shall each keep data or evidence for each applicable Requirement R1 through R11, and Measure M1 through M11, for the current calendar year and one previous calendar year, with the exception of operator logs and voice recordings which shall be retained for a minimum of 90 calendar days, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- Each Transmission Operator shall retain evidence for three calendar years of any occasion in which it has exceeded an identified IROL and its associated IROL Tv as specified in Requirement R12 and Measure M12.

- Each Transmission Operator shall keep data or evidence for Requirement R13 and Measure M13 for a rolling 30-day period, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- Each Transmission Operator shall retain evidence and that it initiated its Operating Plan to mitigate a SOL exceedance as specified in Requirement R14 and Measurement M14 for three calendar years.

- Each Transmission Operator and Balancing Authority shall each keep data or evidence for each applicable Requirement R15 through R18, and Measure M15 through M18 for the current calendar year and one previous calendar year, with the exception of operator logs and voice recordings which shall be retained for a minimum of 90 calendar days.
• Each Transmission Operator shall keep data or evidence for Requirement R20 and Measure M20 for the current calendar year and one previous calendar year.

• Each Transmission Operator shall keep evidence for Requirement R21 and Measure M21 for the most recent twelve calendar months, with the exception of operator logs and voice recordings which shall be retained for a minimum of 90 calendar days.

• Each Balancing Authority shall keep data or evidence for Requirement R23 and Measure M23 for the current calendar year and one previous calendar year.

• Each Balancing Authority shall keep evidence for Requirement R24 and Measure M24 for the most recent twelve calendar months, with the exception of operator logs and voice recordings which shall be retained for a minimum of 90 calendar days.

1.3. Compliance Monitoring and Enforcement Program

As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

E. Associated Documents
The Project 2014-03 SDT has created the SOL Exceedance White Paper as guidance on SOL issues and the URL for that document is: http://www.nerc.com/pa/stand/Pages/TOP0013RI.aspx.

Operating Plan - An Operating Plan includes general Operating Processes and specific Operating Procedures. It may be an overview document which provides a prescription for an Operating Plan for the next-day, or it may be a specific plan to address a specific SOL or IROL exceedance identified in the Operational Planning Analysis (OPA). Consistent with the NERC definition, Operating Plans can be general in nature, or they can be specific plans to address specific reliability issues. The use of the term Operating Plan in the revised TOP/IRO standards allows room for both. An Operating Plan references processes and procedures, including electronic data exchange, which are available to the System Operator on a daily basis to allow the operator to reliably address conditions which may arise throughout the day. It is valid for tomorrow, the day after, and the day after that. Operating Plans should be augmented by temporary operating guides which outline prevention/mitigation plans for specific situations which are identified day-to-day in an OPA or a Real-time Assessment (RTA). As the definition in the Glossary of Terms states, a restoration plan is an example of an Operating Plan. It contains all the overarching principles that the System Operator needs to work his/her way through the restoration process. It is not a specific document written for a specific blackout scenario but rather a collection of tools consisting of processes, procedures, and automated software systems that are available to the operator to use in restoring the system. An Operating Plan can in turn be looked upon in a similar manner. It does not contain a prescription for the specific set-up for tomorrow but contains a treatment of all the processes, procedures, and automated software systems that are at the operator’s disposal. The existence of an Operating Plan, however, does not preclude the need for creating specific action plans for specific SOL or IROL exceedances identified in the OPA. When a Reliability Coordinator performs an OPA, the analysis may reveal instances of possible SOL or IROL exceedances for pre- or post-Contingency conditions. In these instances, Reliability Coordinators are expected to ensure that there are plans in place to prevent or mitigate those SOLs or IRLs, should those operating conditions be encountered the next day. The Operating Plan may contain a description of the process by which specific prevention or mitigation plans for day-to-day SOL or IROL exceedances identified in the OPA are handled and communicated. This approach could alleviate any potential administrative burden associated with perceived requirements for continual day-to-day updating of “the Operating Plan document” for compliance purposes.

Guidelines and Technical Basis
None.

Rationale
Rationale text from the development of TOP-001-3 in Project 2014-03 and TOP-001-4 in Project 2016-01 follows. Additional information can be found on the Project 2014-03 and Project 2016-01 pages.

Rationale for Requirement R3:
The phrase ‘cannot be physically implemented’ means that a Transmission Operator may request something to be done that is not physically possible due to its lack of knowledge of the system involved.

Rationale for Requirement R10:
New proposed Requirement R10 is derived from approved IRO-003-2, Requirement R1, adapted to the Transmission Operator Area. This new requirement is in response to NOPR paragraph 60 concerning monitoring capabilities for the Transmission Operator. New Requirement R11 covers the Balancing Authorities. Monitoring of external systems can be accomplished via data links.

The revised requirement addresses directives for Transmission Operator (TOP) monitoring of some non-Bulk Electric System (BES) facilities as necessary for determining System Operating Limit (SOL) exceedances (FERC Order No. 817 Para 35-36). The proposed requirement corresponds with approved IRO-002-4 Requirement R4 (approved IRO-002-5 Requirement R5), which specifies the Reliability Coordinator's (RC) monitoring responsibilities for determining SOL exceedances.

The intent of the requirement is to ensure that all facilities (i.e., BES and non-BES) that can adversely impact reliability of the BES are monitored. As used in TOP and IRO Reliability Standards, monitoring involves observing operating status and operating values in Real-time for awareness of system conditions. The facilities that are necessary for determining SOL exceedances should be either designated as part of the BES, or otherwise be incorporated into monitoring when identified by planning and operating studies such as the Operational Planning Analysis (OPA) required by TOP-002-4 Requirement R1 and IRO-008-2 Requirement R1. The SDT recognizes that not all non-BES facilities that a TOP considers necessary for its monitoring needs will need to be included in the BES.

The non-BES facilities that the TOP is required to monitor are only those that are necessary for the TOP to determine SOL exceedances within its Transmission Operator Area. TOPs perform various analyses and studies as part of their functional obligations that could lead to identification of non-BES facilities that should be monitored for determining SOL exceedances. Examples include:

- OPA;
- Real-time Assessments (RTA);
• Analysis performed by the TOP as part of BES Exception processing for including a facility in the BES; and
• Analysis which may be specified in the RC's outage coordination process that leads the TOP to identify a non-BES facility that should be temporarily monitored for determining SOL exceedances.

TOP-003-3 Requirement R1 specifies that the TOP shall develop a data specification which includes data and information needed by the TOP to support its OPAs, Real-time monitoring, and RTAs. This includes non-BES data and external network data as deemed necessary by the TOP.

The format of the proposed requirement has been changed from the approved standard to more clearly indicate which monitoring activities are required to be performed.

Rationale for Requirement R13:
The new Requirement R13 is in response to NOPR paragraphs 55 and 60 concerning Real-time analysis responsibilities for Transmission Operators and is copied from approved IRO-008-1, Requirement R2. The Transmission Operator’s Operating Plan will describe how to perform the Real-time Assessment. The Operating Plan should contain instructions as to how to perform Operational Planning Analysis and Real-time Assessment with detailed instructions and timing requirements as to how to adapt to conditions where processes, procedures, and automated software systems are not available (if used). This could include instructions such as an indication that no actions may be required if system conditions have not changed significantly and that previous Contingency analysis or Real-time Assessments may be used in such a situation.

Rationale for Requirement R14:
The original Requirement R8 was deleted and original Requirements R9 and R11 were revised in order to respond to NOPR paragraph 42 which raised the issue of handling all SOLs and not just a sub-set of SOLs. The SDT has developed a white paper on SOL exceedances that explains its intent on what needs to be contained in such an Operating Plan. These Operating Plans are developed and documented in advance of Real-time and may be developed from Operational Planning Assessments required per proposed TOP-002-4 or other assessments. Operating Plans could be augmented by temporary operating guides which outline prevention/mitigation plans for specific situations which are identified day-to-day in an Operational Planning Assessment or a Real-time Assessment. The intent is to have a plan and philosophy that can be followed by an operator.

Rationale for Requirements R16 and R17:
In response to IERP Report recommendation 3 on authority.
Rationale for Requirement R18:
Moved from approved IRO-005-3.1a, Requirement R10. Transmission Service Provider, Distribution Provider, Load-Serving Entity, Generator Operator, and Purchasing-Selling Entity are deleted as those entities will receive instructions on limits from the responsible entities cited in the requirement. Note – Derived limits replaced by SOLs for clarity and specificity. SOLs include voltage, Stability, and thermal limits and are thus the most limiting factor.

Rationale for Requirements R19 and R20 (R19, R20, R22, and R23 in TOP-001-4):
[Note: Requirement R19 proposed for retirement under Project 2018-03 Standards Efficiency Review Retirements.]

The proposed changes address directives for redundancy and diverse routing of data exchange capabilities (FERC Order No. 817 Para 47).

Redundant and diversely routed data exchange capabilities consist of data exchange infrastructure components (e.g., switches, routers, servers, power supplies, and network cabling and communication paths between these components in the primary Control Center for the exchange of system operating data) that will provide continued functionality despite failure or malfunction of an individual component within the Transmission Operator’s (TOP) primary Control Center. Redundant and diversely routed data exchange capabilities preclude single points of failure in primary Control Center data exchange infrastructure from halting the flow of Real-time data. Requirement R20 does not require automatic or instantaneous fail-over of data exchange capabilities. Redundancy and diverse routing may be achieved in various ways depending on the arrangement of the infrastructure or hardware within the TOP’s primary Control Center.

The reliability objective of redundancy is to provide for continued data exchange functionality during outages, maintenance, or testing of data exchange infrastructure. For periods of planned or unplanned outages of individual data exchange components, the proposed requirements do not require additional redundant data exchange infrastructure components solely to provide for redundancy.

Infrastructure that is not within the TOP’s primary Control Center is not addressed by the proposed requirement.

Rationale for Requirement R21:
The proposed requirement addresses directives for testing of data exchange capabilities used in primary Control Centers (FERC Order No. 817 Para 51).

A test for redundant functionality demonstrates that data exchange capabilities will continue to operate despite the malfunction or failure of an individual component (e.g., switches, routers, servers, power supplies, and network cabling and communication paths between these components in the primary Control Center for the exchange of system operating data). An entity’s testing practices should, over time, examine the various failure modes of its data
exchange capabilities. When an actual event successfully exercises the redundant functionality, it can be considered a test for the purposes of the proposed requirement.

**Rationale for Requirements R22 and R23:**

[Note: Requirement R22 proposed for retirement under Project 2018-03 Standards Efficiency Review Retirements]

The proposed changes address directives for redundancy and diverse routing of data exchange capabilities (FERC Order No. 817 Para 47).

Redundant and diversely routed data exchange capabilities consist of data exchange infrastructure components (e.g., switches, routers, servers, power supplies, and network cabling and communication paths between these components in the primary Control Center for the exchange of system operating data) that will provide continued functionality despite failure or malfunction of an individual component within the Balancing Authority's (BA) primary Control Center. Redundant and diversely routed data exchange capabilities preclude single points of failure in primary Control Center data exchange infrastructure from halting the flow of Real-time data. Requirement R23 does not require automatic or instantaneous fail-over of data exchange capabilities. Redundancy and diverse routing may be achieved in various ways depending on the arrangement of the infrastructure or hardware within the BA's primary Control Center.

The reliability objective of redundancy is to provide for continued data exchange functionality during outages, maintenance, or testing of data exchange infrastructure. For periods of planned or unplanned outages of individual data exchange components, the proposed requirements do not require additional redundant data exchange infrastructure components solely to provide for redundancy.

Infrastructure that is not within the BA's primary Control Center is not addressed by the proposed requirement.

**Rationale for Requirement R24:**

The proposed requirement addresses directives for testing of data exchange capabilities used in primary Control Centers (FERC Order No. 817 Para 51).

A test for redundant functionality demonstrates that data exchange capabilities will continue to operate despite the malfunction or failure of an individual component (e.g., switches, routers, servers, power supplies, and network cabling and communication paths between these components in the primary Control Center for the exchange of system operating data). An entity's testing practices should, over time, examine the various failure modes of its data exchange capabilities. When an actual event successfully exercises the redundant functionality, it can be considered a test for the purposes of the proposed requirement.
A. Introduction

1. Title: Transmission Operations
2. Number: TOP-001-45
3. Purpose: To prevent instability, uncontrolled separation, or Cascading outages that adversely impact the reliability of the Interconnection by ensuring prompt action to prevent or mitigate such occurrences.
4. Applicability:
   4.1. Functional Entities:
      4.1.1. Balancing Authority
      4.1.2. Transmission Operator
      4.1.3. Generator Operator
      4.1.4. Distribution Provider
5. Effective Date: See Implementation Plan

B. Requirements and Measures

R1. Each Transmission Operator shall act to maintain the reliability of its Transmission Operator Area via its own actions or by issuing Operating Instructions. [Violation Risk Factor: High][Time Horizon: Same-Day Operations, Real-time Operations]

M1. Each Transmission Operator shall have and provide evidence which may include but is not limited to dated operator logs, dated records, dated and time-stamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it acted to maintain the reliability of its Transmission Operator Area via its own actions or by issuing Operating Instructions.

R2. Each Balancing Authority shall act to maintain the reliability of its Balancing Authority Area via its own actions or by issuing Operating Instructions. [Violation Risk Factor: High][Time Horizon: Same-Day Operations, Real-time Operations]

M2. Each Balancing Authority shall have and provide evidence which may include but is not limited to dated operator logs, dated records, dated and time-stamped voice recordings or dated transcripts of voice recordings, electronic communications, or equivalent documentation, that will be used to determine that it acted to maintain the reliability of its Balancing Authority Area via its own actions or by issuing Operating Instructions.
R3. Each Balancing Authority, Generator Operator, and Distribution Provider shall comply with each Operating Instruction issued by its Transmission Operator(s), unless such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements. [Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-Time Operations]

M3. Each Balancing Authority, Generator Operator, and Distribution Provider shall make available upon request, evidence that it complied with each Operating Instruction issued by the Transmission Operator(s) unless such action could not be physically implemented or it would have violated safety, equipment, regulatory, or statutory requirements. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence in electronic or hard copy format. In such cases, the Balancing Authority, Generator Operator, and Distribution Provider shall have and provide copies of the safety, equipment, regulatory, or statutory requirements as evidence for not complying with the Transmission Operator's Operating Instruction. If such a situation has not occurred, the Balancing Authority, Generator Operator, or Distribution Provider may provide an attestation.

R4. Each Balancing Authority, Generator Operator, and Distribution Provider shall inform its Transmission Operator of its inability to comply with an Operating Instruction issued by its Transmission Operator. [Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-Time Operations]

M4. Each Balancing Authority, Generator Operator, and Distribution Provider shall make available upon request, evidence which may include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent evidence in electronic or hard copy format, that it informed its Transmission Operator of its inability to comply with its Operating Instruction issued. If such a situation has not occurred, the Balancing Authority, Generator Operator, or Distribution Provider may provide an attestation.

R5. Each Transmission Operator, Generator Operator, and Distribution Provider shall comply with each Operating Instruction issued by its Balancing Authority, unless such action cannot be physically implemented or it would violate safety, equipment, regulatory, or statutory requirements. [Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-Time Operations]

M5. Each Transmission Operator, Generator Operator, and Distribution Provider shall make available upon request, evidence that it complied with each Operating Instruction issued by its Balancing Authority unless such action could not be physically implemented or it would have violated safety, equipment, regulatory, or statutory requirements. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence in electronic or hard copy format. In such cases, the
TOP-001-4-5 - Transmission Operations

Transmission Operator, Generator Operator, and Distribution Provider shall have and provide copies of the safety, equipment, regulatory, or statutory requirements as evidence for not complying with the Balancing Authority’s Operating Instruction. If such a situation has not occurred, the Transmission Operator, Generator Operator, or Distribution Provider may provide an attestation.

R6. Each Transmission Operator, Generator Operator, and Distribution Provider shall inform its Balancing Authority of its inability to comply with an Operating Instruction issued by its Balancing Authority. [Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-Time Operations]

M6. Each Transmission Operator, Generator Operator, and Distribution Provider shall make available upon request, evidence which may include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or equivalent evidence in electronic or hard copy format, that it informed its Balancing Authority of its inability to comply with its Operating Instruction. If such a situation has not occurred, the Transmission Operator, Generator Operator, or Distribution Provider may provide an attestation.

R7. Each Transmission Operator shall assist other Transmission Operators within its Reliability Coordinator Area, if requested and able, provided that the requesting Transmission Operator has implemented its comparable Emergency procedures, unless such assistance cannot be physically implemented or would violate safety, equipment, regulatory, or statutory requirements. [Violation Risk Factor: High] [Time Horizon: Real-Time Operations]

M7. Each Transmission Operator shall make available upon request, evidence that comparable requested assistance, if able, was provided to other Transmission Operators within its Reliability Coordinator Area unless such assistance could not be physically implemented or would have violated safety, equipment, regulatory, or statutory requirements. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence in electronic or hard copy format. If no request for assistance was received, the Transmission Operator may provide an attestation.

R8. Each Transmission Operator shall inform its Reliability Coordinator, known impacted Balancing Authorities, and known impacted Transmission Operators of its actual or expected operations that result in, or could result in, an Emergency. [Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-Time Operations]

M8. Each Transmission Operator shall make available upon request, evidence that it informed its Reliability Coordinator, known impacted Balancing Authorities, and known impacted Transmission Operators of its actual or expected operations that result in, or could result in, an Emergency. Such evidence could include but is not
limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence. If no such situations have occurred, the Transmission Operator may provide an attestation.

**R9.** Each Balancing Authority and Transmission Operator shall notify its Reliability Coordinator and known impacted interconnected entities of all planned outages, and unplanned outages of 30 minutes or more, for telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels between the affected entities. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Same-Day Operations, Real-Time Operations]*

**M9.** Each Balancing Authority and Transmission Operator shall make available upon request, evidence that it notified its Reliability Coordinator and known impacted interconnected entities of all planned outages, and unplanned outages of 30 minutes or more, for telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, electronic communications, or other equivalent evidence. If such a situation has not occurred, the Balancing Authority or Transmission Operator may provide an attestation.

**R10.** Each Transmission Operator shall perform the following for determining System Operating Limit (SOL) exceedances within its Transmission Operator Area: *[Violation Risk Factor: High] [Time Horizon: Real-Time Operations]*

1. **10.1.** Monitor Facilities within its Transmission Operator Area;
2. **10.2.** Monitor the status of Remedial Action Schemes within its Transmission Operator Area;
3. **10.3.** Monitor non-BES facilities within its Transmission Operator Area identified as necessary by the Transmission Operator;
4. **10.4.** Obtain and utilize status, voltages, and flow data for Facilities outside its Transmission Operator Area identified as necessary by the Transmission Operator;
5. **10.5.** Obtain and utilize the status of Remedial Action Schemes outside its Transmission Operator Area identified as necessary by the Transmission Operator; and
6. **10.6.** Obtain and utilize status, voltages, and flow data for non-BES facilities outside its Transmission Operator Area identified as necessary by the Transmission Operator.

**M10.** Each Transmission Operator shall have, and provide upon request, evidence that could include but is not limited to Energy Management System description documents, computer printouts, Supervisory Control and Data Acquisition (SCADA)
data collection, or other equivalent evidence that will be used to confirm that it monitored or obtained and utilized data as required to determine any System Operating Limit (SOL) exceedances within its Transmission Operator Area.

R11. Each Balancing Authority shall monitor its Balancing Authority Area, including the status of Remedial Action Schemes that impact generation or Load, in order to maintain generation-Load-interchange balance within its Balancing Authority Area and support Interconnection frequency. [Violation Risk Factor: High] [Time Horizon: Real-Time Operations]

M11. Each Balancing Authority shall have, and provide upon request, evidence that could include but is not limited to Energy Management System description documents, computer printouts, SCADA data collection, or other equivalent evidence that will be used to confirm that it monitors its Balancing Authority Area, including the status of Remedial Action Schemes that impact generation or Load, in order to maintain generation-Load-interchange balance within its Balancing Authority Area and support Interconnection frequency.

R12. Each Transmission Operator shall not operate outside any identified Interconnection Reliability Operating Limit (IROL) for a continuous duration exceeding its associated IROL TV. [Violation Risk Factor: High] [Time Horizon: Real-time Operations]

M12. Each Transmission Operator shall make available evidence to show that for any occasion in which it operated outside any identified Interconnection Reliability Operating Limit (IROL), the continuous duration did not exceed its associated IROL TV. Such evidence could include but is not limited to dated computer logs or reports in electronic or hard copy format specifying the date, time, duration, and details of the excursion. If such a situation has not occurred, the Transmission Operator may provide an attestation that an event has not occurred.

R13. Each Transmission Operator shall ensure that a Real-time Assessment is performed at least once every 30 minutes. [Violation Risk Factor: High] [Time Horizon: Real-time Operations]

M13. Each Transmission Operator shall have, and make available upon request, evidence to show it ensured that a Real-Time Assessment was performed at least once every 30 minutes. This evidence could include but is not limited to dated computer logs showing times the assessment was conducted, dated checklists, or other evidence.

R14. Each Transmission Operator shall initiate its Operating Plan to mitigate a SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment. [Violation Risk Factor: High] [Time Horizon: Real-time Operations]

M14. Each Transmission Operator shall have evidence that it initiated its Operating Plan for mitigating SOL exceedances identified as part of its Real-time monitoring or Real-time
Assessments. This evidence could include but is not limited to dated computer logs showing times the Operating Plan was initiated, dated checklists, or other evidence.

R15. Each Transmission Operator shall inform its Reliability Coordinator of actions taken to return the System to within limits when a SOL has been exceeded. [Violation Risk Factor: Medium] [Time Horizon: Real-Time Operations]

M15. Each Transmission Operator shall make available evidence that it informed its Reliability Coordinator of actions taken to return the System to within limits when a SOL was exceeded. Such evidence could include but is not limited to dated operator logs, voice recordings or transcripts of voice recordings, or dated computer printouts. If such a situation has not occurred, the Transmission Operator may provide an attestation.

R16. Each Transmission Operator shall provide its System Operators with the authority to approve planned outages and maintenance of its telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels between affected entities. [Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]

M16. Each Transmission Operator shall have, and provide upon request, evidence that could include but is not limited to a documented procedure or equivalent evidence that will be used to confirm that the Transmission Operator has provided its System Operators with the authority to approve planned outages and maintenance of telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels between affected entities.

R17. Each Balancing Authority shall provide its System Operators with the authority to approve planned outages and maintenance of its telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels between affected entities. [Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]

M17. Each Balancing Authority shall have, and provide upon request, evidence that could include but is not limited to a documented procedure or equivalent evidence that will be used to confirm that the Balancing Authority has provided its System Operators with the authority to approve planned outages and maintenance of telemetering and control equipment, monitoring and assessment capabilities, and associated communication channels between affected entities.

R18. Each Transmission Operator shall operate to the most limiting parameter in instances where there is a difference in SOLs. [Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]

M18. Each Transmission Operator shall have, and provide upon request, evidence that could include but is not limited to operator logs, voice recordings, electronic
communications, or equivalent evidence that will be used to determine if it operated to the most limiting parameter in instances where there is a difference in SOLs.

**R19.** Reserved. Each Transmission Operator shall have data exchange capabilities with the entities it has identified it needs data from in order to perform its Operational Planning Analyses. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

**M19.** Reserved. Each Transmission Operator shall have, and provide upon request, evidence that could include, but is not limited to, operator logs, system specifications, system diagrams, or other evidence that it has data exchange capabilities with the entities it has identified it needs data from in order to perform its Operational Planning Analyses.

**R20.** Each Transmission Operator shall have data exchange capabilities, with redundant and diversely routed data exchange infrastructure within the Transmission Operator’s primary Control Center, for the exchange of Real-time data with its Reliability Coordinator, Balancing Authority, and the entities it has identified it needs data from in order for it to perform its Real-time monitoring and Real-time Assessments. [Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-time Operations]

**M20.** Each Transmission Operator shall have, and provide upon request, evidence that could include, but is not limited to, system specifications, system diagrams, or other documentation that lists its data exchange capabilities, including redundant and diversely routed data exchange infrastructure within the Transmission Operator's primary Control Center, for the exchange of Real-time data with its Reliability Coordinator, Balancing Authority, and the entities it has identified it needs data from in order to perform its Real-time monitoring and Real-time Assessments as specified in the requirement.

**R21.** Each Transmission Operator shall test its primary Control Center data exchange capabilities specified in Requirement R20 for redundant functionality at least once every 90 calendar days. If the test is unsuccessful, the Transmission Operator shall initiate action within two hours to restore redundant functionality. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

**M21.** Each Transmission Operator shall have, and provide upon request, evidence that it tested its primary Control Center data exchange capabilities specified in Requirement R20 for the redundant functionality, or experienced an event that demonstrated the redundant functionality; and, if the test was unsuccessful, initiated action within two hours to restore redundant functionality as specified in Requirement R21. Evidence could include, but is not limited to: dated and time-stamped test records, operator logs, voice recordings, or electronic communications.

**R22.** Reserved. Each Balancing Authority shall have data exchange capabilities with the entities it has identified it needs data from in order to develop its Operating Plan for
M22. **Reserved**. Each Balancing Authority shall have, and provide upon request, evidence that could include, but is not limited to, operator logs, system specifications, system diagrams, or other evidence that it has data exchange capabilities with the entities it has identified it needs data from in order to develop its Operating Plan for next-day operations.

R23. Each Balancing Authority shall have data exchange capabilities, with redundant and diversely routed data exchange infrastructure within the Balancing Authority’s primary Control Center, for the exchange of Real-time data with its Reliability Coordinator, Transmission Operator, and the entities it has identified it needs data from in order for it to perform its Real-time monitoring and analysis functions. **[Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-time Operations]**

M23. Each Balancing Authority shall have, and provide upon request, evidence that could include, but is not limited to, system specifications, system diagrams, or other documentation that lists its data exchange capabilities, including redundant and diversely routed data exchange infrastructure within the Balancing Authority’s primary Control Center, for the exchange of Real-time data with its Reliability Coordinator, Transmission Operator, and the entities it has identified it needs data from in order to perform its Real-time monitoring and analysis functions as specified in the requirement.

R24. Each Balancing Authority shall test its primary Control Center data exchange capabilities specified in Requirement R23 for redundant functionality at least once every 90 calendar days. If the test is unsuccessful, the Balancing Authority shall initiate action within two hours to restore redundant functionality. **[Violation Risk Factor: Medium ] [Time Horizon: Operations Planning]**

M24. Each Balancing Authority shall have, and provide upon request, evidence that it tested its primary Control Center data exchange capabilities specified in Requirement R23 for redundant functionality, or experienced an event that demonstrated the redundant functionality; and, if the test was unsuccessful, initiated action within two hours to restore redundant functionality as specified in Requirement R24. Evidence could include, but is not limited to: dated and time-stamped test records, operator logs, voice recordings, or electronic communications.

**C. Compliance**

1. **Compliance Monitoring Process**

   1.1. **Compliance Enforcement Authority:**

   “Compliance Enforcement Authority” means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in
their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention:
The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- Each Balancing Authority, Transmission Operator, Generator Operator, and Distribution Provider shall each keep data or evidence for each applicable Requirement R1 through R11, and Measure M1 through M11, for the current calendar year and one previous calendar year, with the exception of operator logs and voice recordings which shall be retained for a minimum of 90 calendar days, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- Each Transmission Operator shall retain evidence for three calendar years of any occasion in which it has exceeded an identified IROL and its associated IROL T_v as specified in Requirement R12 and Measure M12.

- Each Transmission Operator shall keep data or evidence for Requirement R13 and Measure M13 for a rolling 30-day period, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- Each Transmission Operator shall retain evidence and that it initiated its Operating Plan to mitigate a SOL exceedance as specified in Requirement R14 and Measurement M14 for three calendar years.

- Each Transmission Operator and Balancing Authority shall each keep data or evidence for each applicable Requirement R15 through R19, and Measure M15 through M18 for the current calendar year and one previous calendar year, with the exception of operator logs and voice recordings which shall be retained for a minimum of 90 calendar days.

- Each Transmission Operator shall keep data or evidence for Requirement R20 and Measure M20 for the current calendar year and one previous calendar year.

- Each Transmission Operator shall keep evidence for Requirement R21 and Measure M21 for the most recent twelve calendar months, with the exception
of operator logs and voice recordings which shall be retained for a minimum of 90 calendar days.

• Each Balancing Authority shall keep data or evidence for Requirement R22 and Measure M22 for the current calendar year and one previous calendar year, with the exception of operator logs and voice recordings which shall be retained for a minimum of 90 calendar days.

• Each Balancing Authority shall keep data or evidence for Requirement R23 and Measure M23 for the current calendar year and one previous calendar year.

• Each Balancing Authority shall keep evidence for Requirement R24 and Measure M24 for the most recent twelve calendar months, with the exception of operator logs and voice recordings which shall be retained for a minimum of 90 calendar days.

1.3. Compliance Monitoring and Enforcement Program
As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

E. Associated Documents

The Implementation Plan and other project documents can be found on the project page.

The Project 2014-03 SDT has created the SOL Exceedance White Paper as guidance on SOL issues and the URL for that document is: http://www.nerc.com/pa/stand/Pages/TOP0013RI.aspx.

Operating Plan - An Operating Plan includes general Operating Processes and specific Operating Procedures. It may be an overview document which provides a prescription for an Operating Plan for the next-day, or it may be a specific plan to address a specific SOL or IROL exceedance identified in the Operational Planning Analysis (OPA). Consistent with the NERC definition, Operating Plans can be general in nature, or they can be specific plans to address specific reliability issues. The use of the term Operating Plan in the revised TOP/IRO standards allows room for both. An Operating Plan references processes and procedures, including electronic data exchange, which are available to the System Operator on a daily basis to allow the operator to reliably address conditions which may arise throughout the day. It is valid for tomorrow, the day after, and the day after that. Operating Plans should be augmented by temporary operating guides which outline prevention/mitigation plans for specific situations which are identified day-to-day in an OPA or a Real-time Assessment (RTA). As the definition in the Glossary of Terms states, a restoration plan is an example of an Operating Plan. It contains all the overarching principles that the System Operator needs to work his/her way through the restoration process. It is not a specific document written for a specific blackout scenario but rather a collection of tools consisting of processes, procedures, and automated software systems that are available to the operator to use in restoring the system. An Operating Plan can in turn be looked upon in a similar manner. It does not contain a prescription for the specific set-up for tomorrow but contains a treatment of all the processes, procedures, and automated software systems that are at the operator’s disposal. The existence of an Operating Plan, however, does not preclude the need for creating specific action plans for specific SOL or IROL exceedances identified in the OPA. When a Reliability Coordinator performs an OPA, the analysis may reveal instances of possible SOL or IROL exceedances for pre- or post-Contingency conditions. In these instances, Reliability Coordinators are expected to ensure that there are plans in place to prevent or mitigate those SOLs or IROLS, should those operating conditions be encountered the next day. The Operating Plan may contain a description of the process by which specific prevention or mitigation plans for day-to-day SOL or IROL exceedances identified in the OPA are handled and communicated. This approach could alleviate any potential administrative burden associated with perceived requirements for continual day-to-day updating of “the Operating Plan document” for compliance purposes.

Guidelines and Technical Basis
None
Rationale

During development of TOP-001-4, text boxes are embedded within the standard to explain the rationale for various parts of the standard. Upon Board adoption of TOP-001-4, the text from the rationale text boxes will be moved to this section.

Rationale text from the development of TOP-001-3 in Project 2014-03 and TOP-001-4 in Project 2016-01 follows. Additional information can be found on the Project 2014-03 project page and the Project 2016-01 project page.

Rationale for Requirement R3:

The phrase ‘cannot be physically implemented’ means that a Transmission Operator may request something to be done that is not physically possible due to its lack of knowledge of the system involved.

Rationale for Requirement R10:

New proposed Requirement R10 is derived from approved IRO-003-2, Requirement R1, adapted to the Transmission Operator Area. This new requirement is in response to NOPR paragraph 60 concerning monitoring capabilities for the Transmission Operator. New Requirement R11 covers the Balancing Authorities. Monitoring of external systems can be accomplished via data links.

The revised requirement addresses directives for Transmission Operator (TOP) monitoring of some non-Bulk Electric System (BES) facilities as necessary for determining System Operating Limit (SOL) exceedances (FERC Order No. 817 Para 35-36). The proposed requirement corresponds with approved IRO-002-4 Requirement R4 (proposed IRO-002-5 Requirement R5), which specifies the Reliability Coordinator’s (RC) monitoring responsibilities for determining SOL exceedances.

The intent of the requirement is to ensure that all facilities (i.e., BES and non-BES) that can adversely impact reliability of the BES are monitored. As used in TOP and IRO Reliability Standards, monitoring involves observing operating status and operating values in Real-time for awareness of system conditions. The facilities that are necessary for determining SOL exceedances should be either designated as part of the BES, or otherwise be incorporated into monitoring when identified by planning and operating studies such as the Operational Planning Analysis (OPA) required by TOP-002-4 Requirement R1 and IRO-008-2 Requirement R1. The SDT recognizes that not all non-BES facilities that a TOP considers necessary for its monitoring needs will need to be included in the BES.

The non-BES facilities that the TOP is required to monitor are only those that are necessary for the TOP to determine SOL exceedances within its Transmission Operator Area. TOPs perform various analyses and studies as part of their functional obligations that could lead to identification of non-BES facilities that should be monitored for determining SOL exceedances. Examples include:

- OPA;
- Real-time Assessments (RTA);
• Analysis performed by the TOP as part of BES Exception processing for including a facility in the BES; and
• Analysis which may be specified in the RC's outage coordination process that leads the TOP to identify a non-BES facility that should be temporarily monitored for determining SOL exceedances.

TOP-003-3 Requirement R1 specifies that the TOP shall develop a data specification which includes data and information needed by the TOP to support its OPAs, Real-time monitoring, and RTAs. This includes non-BES data and external network data as deemed necessary by the TOP.

The format of the proposed requirement has been changed from the approved standard to more clearly indicate which monitoring activities are required to be performed.

**Rationale for Requirement R13:**

The new Requirement R13 is in response to NOPR paragraphs 55 and 60 concerning Real-time analysis responsibilities for Transmission Operators and is copied from approved IRO-008-1, Requirement R2. The Transmission Operator’s Operating Plan will describe how to perform the Real-time Assessment. The Operating Plan should contain instructions as to how to perform Operational Planning Analysis and Real-time Assessment with detailed instructions and timing requirements as to how to adapt to conditions where processes, procedures, and automated software systems are not available (if used). This could include instructions such as an indication that no actions may be required if system conditions have not changed significantly and that previous Contingency analysis or Real-time Assessments may be used in such a situation.

**Rationale for Requirement R14:**

The original Requirement R8 was deleted and original Requirements R9 and R11 were revised in order to respond to NOPR paragraph 42 which raised the issue of handling all SOLs and not just a sub-set of SOLs. The SDT has developed a white paper on SOL exceedances that explains its intent on what needs to be contained in such an Operating Plan. These Operating Plans are developed and documented in advance of Real-time and may be developed from Operational Planning Assessments required per proposed TOP-002-4 or other assessments. Operating Plans could be augmented by temporary operating guides which outline prevention/mitigation plans for specific situations which are identified day-to-day in an Operational Planning Assessment or a Real-time Assessment. The intent is to have a plan and philosophy that can be followed by an operator.

**Rationale for Requirements R16 and R17:**

In response to IERP Report recommendation 3 on authority.

**Rationale for Requirement R18:**

Moved from approved IRO-005-3.1a, Requirement R10. Transmission Service Provider, Distribution Provider, Load-Serving Entity, Generator Operator, and Purchasing-Selling Entity are deleted as those entities will receive instructions on limits from the responsible entities.
cited in the requirement. Note – Derived limits replaced by SOLs for clarity and specificity. SOLs include voltage, Stability, and thermal limits and are thus the most limiting factor.

**Rationale for Requirements R19 and R20 (R19, R20, R22, and R23 in TOP-001-4):**

*Added for consistency with proposed IRO-002-4, Requirement R1. Data exchange capabilities are required to support the data specification concept in proposed TOP-003-3. [Note: Requirement R19 proposed for retirement under Project 2018-03 Standards Efficiency Review Retirements.]*

The proposed changes address directives for redundancy and diverse routing of data exchange capabilities (FERC Order No. 817 Para 47).

Redundant and diversely routed data exchange capabilities consist of data exchange infrastructure components (e.g., switches, routers, servers, power supplies, and network cabling and communication paths between these components in the primary Control Center for the exchange of system operating data) that will provide continued functionality despite failure or malfunction of an individual component within the Transmission Operator's (TOP) primary Control Center. Redundant and diversely routed data exchange capabilities preclude single points of failure in primary Control Center data exchange infrastructure from halting the flow of Real-time data. Requirement R20 does not require automatic or instantaneous fail-over of data exchange capabilities. Redundancy and diverse routing may be achieved in various ways depending on the arrangement of the infrastructure or hardware within the TOP's primary Control Center.

The reliability objective of redundancy is to provide for continued data exchange functionality during outages, maintenance, or testing of data exchange infrastructure. For periods of planned or unplanned outages of individual data exchange components, the proposed requirements do not require additional redundant data exchange infrastructure components solely to provide for redundancy.

Infrastructure that is not within the TOP's primary Control Center is not addressed by the proposed requirement.

**Rationale for Requirement R21:**

The proposed requirement addresses directives for testing of data exchange capabilities used in primary Control Centers (FERC Order No. 817 Para 51).

A test for redundant functionality demonstrates that data exchange capabilities will continue to operate despite the malfunction or failure of an individual component (e.g., switches, routers, servers, power supplies, and network cabling and communication paths between these components in the primary Control Center for the exchange of system operating data). An entity's testing practices should, over time, examine the various failure modes of its data exchange capabilities. When an actual event successfully exercises the redundant functionality, it can be considered a test for the purposes of the proposed requirement.
Rationale for Requirements R22 and R23:

[Note: Requirement R22 proposed for retirement under Project 2018-03 Standards Efficiency Review Retirements]

The proposed changes address directives for redundancy and diverse routing of data exchange capabilities (FERC Order No. 817 Para 47).

Redundant and diversely routed data exchange capabilities consist of data exchange infrastructure components (e.g., switches, routers, servers, power supplies, and network cabling and communication paths between these components in the primary Control Center for the exchange of system operating data) that will provide continued functionality despite failure or malfunction of an individual component within the Balancing Authority's (BA) primary Control Center. Redundant and diversely routed data exchange capabilities preclude single points of failure in primary Control Center data exchange infrastructure from halting the flow of Real-time data. Requirement R23 does not require automatic or instantaneous fail-over of data exchange capabilities. Redundancy and diverse routing may be achieved in various ways depending on the arrangement of the infrastructure or hardware within the BA's primary Control Center.

The reliability objective of redundancy is to provide for continued data exchange functionality during outages, maintenance, or testing of data exchange infrastructure. For periods of planned or unplanned outages of individual data exchange components, the proposed requirements do not require additional redundant data exchange infrastructure components solely to provide for redundancy.

Infrastructure that is not within the BA's primary Control Center is not addressed by the proposed requirement.

Rationale for Requirement R24:

The proposed requirement addresses directives for testing of data exchange capabilities used in primary Control Centers (FERC Order No. 817 Para 51).

A test for redundant functionality demonstrates that data exchange capabilities will continue to operate despite the malfunction or failure of an individual component (e.g., switches, routers, servers, power supplies, and network cabling and communication paths between these components in the primary Control Center for the exchange of system operating data). An entity's testing practices should, over time, examine the various failure modes of its data exchange capabilities. When an actual event successfully exercises the redundant functionality, it can be considered a test for the purposes of the proposed requirement.
A. Introduction

1. Title: Voltage and Reactive Control
2. Number: VAR-001-6
3. Purpose: To ensure that voltage levels, reactive flows, and reactive resources are monitored, controlled, and maintained within limits in Real-time to protect equipment and the reliable operation of the Interconnection.
4. Applicability:
   4.1. Transmission Operators
   4.2. Generator Operators within the Western Interconnection (for the WECC Variance)
5. Effective Date: See Implementation Plan.
B. Requirements and Measures

R1. Each Transmission Operator shall specify a system voltage schedule (which is either a range or a target value with an associated tolerance band) as part of its plan to operate within System Operating Limits and Interconnection Reliability Operating Limits. [Violation Risk Factor: High] [Time Horizon: Operations Planning]

1.1. Each Transmission Operator shall provide a copy of the voltage schedules (which is either a range or a target value with an associated tolerance band) to its Reliability Coordinator and adjacent Transmission Operators within 30 calendar days of a request.

M1. The Transmission Operator shall have evidence that it specified system voltage schedules using either a range or a target value with an associated tolerance band.

For part 1.1, the Transmission Operator shall have evidence that the voltage schedules (which is either a range or a target value with an associated tolerance band) were provided to its Reliability Coordinator and adjacent Transmission Operators within 30 calendar days of a request. Evidence may include, but is not limited to, emails, website postings, and meeting minutes.

R2. Reserved.

M2. Reserved.

R3. Each Transmission Operator shall operate or direct the Real-time operation of devices to regulate transmission voltage and reactive flow as necessary. [Violation Risk Factor: High] [Time Horizon: Real-time Operations, Same-day Operations, and Operations Planning]

M3. Each Transmission Operator shall have evidence that actions were taken to operate capacitive and inductive resources as necessary in Real-time. This may include, but is not limited to, instructions to Generator Operators to: 1) provide additional voltage support; 2) bring resources on-line; or 3) make manual adjustments.

R4. Each Transmission Operator shall specify the criteria that will exempt generators: 1) from following a voltage or Reactive Power schedule, 2) from having its automatic voltage regulator (AVR) in service or from being in voltage control mode, or 3) from having to make any associated notifications. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

4.1 If a Transmission Operator determines that a generator has satisfied the exemption criteria, it shall notify the associated Generator Operator.

M4. Each Transmission Operator shall have evidence of the documented criteria for generator exemptions.

For part 4.1, the Transmission Operator shall also have evidence to show that, for each generator in its area that is exempt: 1) from following a voltage or Reactive Power schedule, 2) from having its automatic voltage regulator (AVR) in service or from being in voltage control mode, or 3) from having to make any notifications, the
associated Generator Operator was notified of this exemption.

R5. Each Transmission Operator shall specify a voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band) at either the high voltage side or low voltage side of the generator step-up transformer at the Transmission Operator’s discretion. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

5.1. The Transmission Operator shall provide the voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band) to the associated Generator Operator and direct the Generator Operator to comply with the schedule in automatic voltage control mode (the AVR is in service and controlling voltage).

5.2. The Transmission Operator shall provide the Generator Operator with the notification requirements for deviations from the voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band).

5.3. The Transmission Operator shall provide the criteria used to develop voltage schedules or Reactive Power schedule (which is either a range or a target value with an associated tolerance band) to the Generator Operator within 30 days of receiving a request.

M5. The Transmission Operator shall have evidence of a documented voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band).

For part 5.1, the Transmission Operator shall have evidence it provided a voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band) to the applicable Generator Operators, and that the Generator Operator was directed to comply with the schedule in automatic voltage control mode, unless exempted.

For part 5.2, the Transmission Operator shall have evidence it provided notification requirements for deviations from the voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band). For part 5.3, the Transmission Operator shall have evidence it provided the criteria used to develop voltage schedules or Reactive Power schedule (which is either a range or a target value with an associated tolerance band) within 30 days of receiving a request by a Generator Operator.

R6. After consultation with the Generator Owner regarding necessary step-up transformer tap changes and the implementation schedule, the Transmission Operator shall provide documentation to the Generator Owner specifying the required tap changes, a timeframe for making the changes, and technical justification for these changes. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

M6. The Transmission Operator shall have evidence that it provided documentation to
the Generator Owner when a change was needed to a generating unit’s step-up transformer tap in accordance with the requirement and that it consulted with the Generator Owner.
C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:
As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” refers to NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:
The following evidence retention periods identify the period of time a registered entity is required to retain specific evidence to demonstrate compliance. For instances in which the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask the registered entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Operator shall retain evidence for Measures M1 and M3 through M6 for 12 months. The Compliance Monitor shall retain any audit data for three years.

1.3. Compliance Monitoring and Assessment Processes:
“Compliance Monitoring and Assessment Processes” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.4. Additional Compliance Information:
None.

D. **Regional Variances**

The following Interconnection-wide variance shall be applicable in the Western Electricity Coordinating Council (WECC) and replaces, in their entirety, Requirements R4 and R5. Please note that Requirement R4 is deleted and R5 is replaced with the following requirements.

**Requirements and Measures**

**E.A.13** Each Transmission Operator shall issue any one of the following types of voltage schedules to the Generator Operators for each of their generation resources that are on-line and part of the Bulk Electric System within the Transmission Operator Area: [Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same-day Operations]

- A voltage set point with a voltage tolerance band and a specified period.
- An initial volt-ampere reactive output or initial power factor output with a voltage tolerance band for a specified period that the Generator Operator uses to establish a generator bus voltage set point.
- A voltage band for a specified period.

**M.E.A.13** Each Transmission Operator will have evidence that it provided the voltage schedules to the Generator Operator, as required in E.A.13. Evidence may include, but is not limited to, dated spreadsheets, reports, voice recordings, or other documentation containing the voltage schedule including set points, tolerance bands, and specified periods as required in Requirement E.A.13.

**E.A.14** Each Transmission Operator shall provide one of the following voltage schedule reference points for each generation resource in its area to the Generator Operator. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same-day Operations]

- The generator terminals.
- The high side of the generator step-up transformer.
- The point of interconnection.
- A location designated by mutual agreement between the Transmission Operator and Generator Operator.

**M.E.A.14** The Transmission Operator will have evidence that it provided one of the voltage schedule reference points for each generation resource in its area to the Generator Operator, as required in E.A.14. Evidence may include, but is not limited to dated letters, e-mail, or other documentation that contains notification to the Generator Operator of the voltage schedule reference point for each generation resource.

**E.A.15** Each Generator Operator shall provide its voltage set point conversion methodology from the point in Requirement E.A.14 to the generator terminals
within 30 calendar days of request by its Transmission Operator. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

M.E.A.15 The Generator Operator will have evidence that within 30 calendar days of request by its Transmission Operator it provided its voltage set point conversion methodology from the point in Requirement E.A.14 to the generator terminals, as required in E.A.15. Evidence may include, but is not limited to, dated reports, spreadsheets, or other documentation.

E.A.16 Each Transmission Operator shall provide to the Generator Operator, within 30 calendar days of a request for data by the Generator Operator, its transmission equipment data and operating data that supports development of the voltage set point conversion methodology. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

M.E.A.16 The Transmission Operator will have evidence that within 30 calendar days of request by its Generator Operator it provided data to support development of the voltage set point conversion methodology, as required in E.A.16. Evidence may include, but is not limited to, dated reports, spreadsheets, or other documentation.

E.A.17 Each Generator Operator shall meet the following control loop specifications if the Generator Operator uses control loops external to the automatic voltage regulators (AVR) to manage Mvar loading: [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]

E.A.17.1 Each control loop's design incorporates the AVR's automatic voltage controlled response to voltage deviations during System Disturbances.

E.A.17.2 Each control loop is only used by mutual agreement between the Generator Operator and the Transmission Operator affected by the control loop.

M.E.A.17 If the Generator Operator uses outside control loops to manage Mvar loading, the Generator Operator will have evidence that it met the control loop specifications in sub-parts E.A.17.1 through E.A.17.2, as required in E.A.17 and its sub-parts. Evidence may include, but is not limited to, design specifications with identified agreed-upon control loops, system reports, or other dated documentation.

Guidelines and Technical Basis
For technical basis for each requirement, please review the rationale provided for each requirement.

Rationale:
During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for R1:
Paragraph 1868 of Order No. 693 requires NERC to add more "detailed and definitive requirements on “established limits” and “sufficient reactive resources”, and identify acceptable margins (i.e. voltage and/or reactive power margins)." Since Order No. 693 was issued, however, several FAC and TOP standards have become enforceable to add more requirements around voltage limits. More specifically, FAC-011 and FAC-014 require that System Operating Limits (SOLs) and reliability margins are established. The NERC Glossary definition of SOLs includes both: 1) voltage stability ratings (Applicable pre- and post- Contingency Voltage Stability) and 2) System Voltage Limits (Applicable pre- and post- Contingency voltage limits). Therefore, for reliability reasons Requirement R1 now requires a Transmission Operator (TOP) to set voltage or Reactive Power schedules with associated tolerance bands. Further, since neighboring areas can affect each other greatly, each TOP must also provide a copy of these schedules to its Reliability Coordinator (RC) and adjacent TOP upon request.

Rationale for R3:
The VAR SDT determined that for reliability purposes, the TOP must ensure sufficient voltage support is provided in Real-time in order to operate within an SOL.

Rationale for R4:
The VAR SDT received significant feedback on instances when a TOP would need the flexibility for defining exemptions for generators. These exemptions can be tailored as the TOP deems necessary for the specific area’s needs. The goal of this requirement is to provide a TOP the ability to exempt a Generator Operator (GOP) from: 1) a voltage or Reactive Power schedule, 2) a setting on the AVR, or 3) any VAR-002 notifications based on the TOP’s criteria. Feedback from the industry detailed many system events that would require these types of exemptions which included, but are not limited to: 1) maintenance during shoulder months, 2) scenarios where two units are located within close proximity and both cannot be in voltage control mode, and 3) large system voltage swings where it would harm reliability if all GOP were to notify their respective TOP of deviations at one time. Also, in an effort to improve the requirement, the sub-requirements containing an exemption list were removed from the currently enforceable standard because this created more compliance issues with regard to how often the list would be updated and maintained.

Rationale for R5:
The new requirement provides transparency regarding the criteria used by the TOP to establish the voltage schedule. This requirement also provides a vehicle for the TOP to use appropriate
granularity when setting notification requirements for deviation from the voltage or Reactive Power schedule. Additionally, this requirement provides clarity regarding a “tolerance band” as specified in the voltage schedule and the control dead-band in the generator’s excitation system.

Voltage schedule tolerances are the bandwidth that accompanies the voltage target in a voltage schedule, should reflect the anticipated fluctuation in voltage at the Generation Operator’s facility during normal operations, and be based on the TOP’s assessment of N-1 and credible N-2 system contingencies. The voltage schedule’s bandwidth should not be confused with the control dead-band that is programmed into a Generation Operator’s automatic voltage regulator’s control system, which should be adjusting the AVR prior to reaching either end of the voltage schedule’s bandwidth.

**Rationale for R6:**
Although tap settings are first established prior to interconnection, this requirement could not be deleted because no other standard addresses when a tap setting must be adjusted. If the tap setting is not properly set, then the amount of VARs produced by a unit can be affected.
A. Introduction

1. Title: Voltage and Reactive Control
2. Number: VAR-001-56
3. Purpose: To ensure that voltage levels, reactive flows, and reactive resources are monitored, controlled, and maintained within limits in Real-time to protect equipment and the reliable operation of the Interconnection.
4. Applicability:
   4.1. Transmission Operators
   4.2. Generator Operators within the Western Interconnection (for the WECC Variance)
5. Effective Date: The standard shall become effective on the first day of the first calendar quarter after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction. See Implementation Plan.
C.B. Requirements and Measures

R1. Each Transmission Operator shall specify a system voltage schedule (which is either a range or a target value with an associated tolerance band) as part of its plan to operate within System Operating Limits and Interconnection Reliability Operating Limits. [Violation Risk Factor: High] [Time Horizon: Operations Planning]

1.1. Each Transmission Operator shall provide a copy of the voltage schedules (which is either a range or a target value with an associated tolerance band) to its Reliability Coordinator and adjacent Transmission Operators within 30 calendar days of a request.

M1. The Transmission Operator shall have evidence that it specified system voltage schedules using either a range or a target value with an associated tolerance band.

For part 1.1, the Transmission Operator shall have evidence that the voltage schedules (which is either a range or a target value with an associated tolerance band) were provided to its Reliability Coordinator and adjacent Transmission Operators within 30 calendar days of a request. Evidence may include, but is not limited to, emails, website postings, and meeting minutes.

R2. Reserved. Each Transmission Operator shall schedule sufficient reactive resources to regulate voltage levels under normal and Contingency conditions. Transmission Operators can provide sufficient reactive resources through various means, including, but not limited to, reactive generation scheduling, transmission line and reactive resource switching, and using controllable load. [Violation Risk Factor: High] [Time Horizon: Real-time Operations, Same-day Operations, and Operations Planning]

M2. Reserved. Each Transmission Operator shall have evidence of scheduling sufficient reactive resources based on their assessments of the system. For the operations planning time horizon, Transmission Operators shall have evidence of assessments used as the basis for how resources were scheduled.

R3. Each Transmission Operator shall operate or direct the Real-time operation of devices to regulate transmission voltage and reactive flow as necessary. [Violation Risk Factor: High] [Time Horizon: Real-time Operations, Same-day Operations, and Operations Planning]

M3. Each Transmission Operator shall have evidence that actions were taken to operate capacitive and inductive resources as necessary in Real-time. This may include, but is not limited to, instructions to Generator Operators to: 1) provide additional voltage support; 2) bring resources on-line; or 3) make manual adjustments.

R4. Each Transmission Operator shall specify the criteria that will exempt generators: 1) from following a voltage or Reactive Power schedule, 2) from having its automatic voltage regulator (AVR) in service or from being in voltage control mode, or 3) from having to make any associated notifications. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]
4.1 If a Transmission Operator determines that a generator has satisfied the exemption criteria, it shall notify the associated Generator Operator.

M4. Each Transmission Operator shall have evidence of the documented criteria for generator exemptions.

For part 4.1, the Transmission Operator shall also have evidence to show that, for each generator in its area that is exempt: 1) from following a voltage or Reactive Power schedule, 2) from having its automatic voltage regulator (AVR) in service or from being in voltage control mode, or 3) from having to make any notifications, the associated Generator Operator was notified of this exemption.

R5. Each Transmission Operator shall specify a voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band) at either the high voltage side or low voltage side of the generator step-up transformer at the Transmission Operator’s discretion. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

5.1. The Transmission Operator shall provide the voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band) to the associated Generator Operator and direct the Generator Operator to comply with the schedule in automatic voltage control mode (the AVR is in service and controlling voltage).

5.2. The Transmission Operator shall provide the Generator Operator with the notification requirements for deviations from the voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band).

5.3. The Transmission Operator shall provide the criteria used to develop voltage schedules or Reactive Power schedule (which is either a range or a target value with an associated tolerance band) to the Generator Operator within 30 days of receiving a request.

M5. The Transmission Operator shall have evidence of a documented voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band).

For part 5.1, the Transmission Operator shall have evidence it provided a voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band) to the applicable Generator Operators, and that the Generator Operator was directed to comply with the schedule in automatic voltage control mode, unless exempted.

For part 5.2, the Transmission Operator shall have evidence it provided notification requirements for deviations from the voltage or Reactive Power schedule (which is either a range or a target value with an associated tolerance band). For part 5.3, the Transmission Operator shall have evidence it provided the criteria used to develop voltage schedules or Reactive Power schedule (which is either a range or a target value with an associated tolerance band).
R6. After consultation with the Generator Owner regarding necessary step-up transformer tap changes and the implementation schedule, the Transmission Operator shall provide documentation to the Generator Owner specifying the required tap changes, a timeframe for making the changes, and technical justification for these changes. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

M6. The Transmission Operator shall have evidence that it provided documentation to the Generator Owner when a change was needed to a generating unit’s step-up transformer tap in accordance with the requirement and that it consulted with the Generator Owner.
**D.C. Compliance**

1. **Compliance Monitoring Process:**

1.1. **Compliance Enforcement Authority:**

   As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” refers to NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. **Evidence Retention:**

   The following evidence retention periods identify the period of time a registered entity is required to retain specific evidence to demonstrate compliance. For instances in which the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask the registered entity to provide other evidence to show that it was compliant for the full time period since the last audit.

   The Transmission Operator shall retain evidence for Measures M1 and M3 through M6 for 12 months. The Compliance Monitor shall retain any audit data for three years.

1.3. **Compliance Monitoring and Assessment Processes:**

   “Compliance Monitoring and Assessment Processes” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.4. **Additional Compliance Information:**

   None.

R6. Operations Planning Lower The Transmission Operator does not provide either the technical justification or timeframe for changing generator step-up tap settings.
E.D. Regional Variances

The following Interconnection-wide variance shall be applicable in the Western Electricity Coordinating Council (WECC) and replaces, in their entirety, Requirements R4 and R5. Please note that Requirement R4 is deleted and R5 is replaced with the following requirements.

Requirements and Measures

E.A.13 Each Transmission Operator shall issue any one of the following types of voltage schedules to the Generator Operators for each of their generation resources that are on-line and part of the Bulk Electric System within the Transmission Operator Area: [Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same-day Operations]

- A voltage set point with a voltage tolerance band and a specified period.
- An initial volt-ampere reactive output or initial power factor output with a voltage tolerance band for a specified period that the Generator Operator uses to establish a generator bus voltage set point.
- A voltage band for a specified period.

M.E.A.13 Each Transmission Operator will have evidence that it provided the voltage schedules to the Generator Operator, as required in E.A.13. Evidence may include, but is not limited to, dated spreadsheets, reports, voice recordings, or other documentation containing the voltage schedule including set points, tolerance bands, and specified periods as required in Requirement E.A.13.

E.A.14 Each Transmission Operator shall provide one of the following voltage schedule reference points for each generation resource in its area to the Generator Operator. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning and Same-day Operations]

- The generator terminals.
- The high side of the generator step-up transformer.
- The point of interconnection.
- A location designated by mutual agreement between the Transmission Operator and Generator Operator.

M.E.A.14 The Transmission Operator will have evidence that it provided one of the voltage schedule reference points for each generation resource in its area to the Generator Operator, as required in E.A.14. Evidence may include, but is not limited to dated letters, e-mail, or other documentation that contains notification to the Generator Operator of the voltage schedule reference point for each generation resource.

E.A.15 Each Generator Operator shall provide its voltage set point conversion methodology from the point in Requirement E.A.14 to the generator terminals.
within 30 calendar days of request by its Transmission Operator. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

**M.E.A.15** The Generator Operator will have evidence that within 30 calendar days of request by its Transmission Operator it provided its voltage set point conversion methodology from the point in Requirement E.A.14 to the generator terminals, as required in E.A.15. Evidence may include, but is not limited to, dated reports, spreadsheets, or other documentation.

**E.A.16** Each Transmission Operator shall provide to the Generator Operator, within 30 calendar days of a request for data by the Generator Operator, its transmission equipment data and operating data that supports development of the voltage set point conversion methodology. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

**M.E.A.16** The Transmission Operator will have evidence that within 30 calendar days of request by its Generator Operator it provided data to support development of the voltage set point conversion methodology, as required in E.A.16. Evidence may include, but is not limited to, dated reports, spreadsheets, or other documentation.

**E.A.17** Each Generator Operator shall meet the following control loop specifications if the Generator Operator uses control loops external to the automatic voltage regulators (AVR) to manage Mvar loading: [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]

**E.A.17.1** Each control loop’s design incorporates the AVR’s automatic voltage controlled response to voltage deviations during System Disturbances.

**E.A.17.2.** Each control loop is only used by mutual agreement between the Generator Operator and the Transmission Operator affected by the control loop.

**M.E.A.17** If the Generator Operator uses outside control loops to manage Mvar loading, the Generator Operator will have evidence that it met the control loop specifications in sub-parts E.A.17.1 through E.A.17.2, as required in E.A.17 and its sub-parts. Evidence may include, but is not limited to, design specifications with identified agreed-upon control loops, system reports, or other dated documentation.

Guidelines and Technical Basis

For technical basis for each requirement, please review the rationale provided for each requirement.

Rationale:
During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for R1:
Paragraph 1868 of Order No. 693 requires NERC to add more “detailed and definitive requirements on “established limits” and “sufficient reactive resources”, and identify acceptable margins (i.e. voltage and/or reactive power margins).” Since Order No. 693 was issued, however, several FAC and TOP standards have become enforceable to add more requirements around voltage limits. More specifically, FAC-011 and FAC-014 require that system operating limits (SOLs) and reliability margins are established. The NERC Glossary definition of SOLs includes both: 1) voltage stability ratings (Applicable pre- and post- Contingency Voltage Stability) and 2) System Voltage Limits (Applicable pre- and post- Contingency voltage limits). Therefore, for reliability reasons Requirement R1 now requires a Transmission Operator (TOP) to set voltage or Reactive Power schedules with associated tolerance bands. Further, since neighboring areas can affect each other greatly, each TOP must also provide a copy of these schedules to its Reliability Coordinator (RC) and adjacent TOP upon request.

Rationale for R2:
Paragraph 1875 from Order No. 693 directed NERC to include requirements to run voltage stability analysis periodically, using online techniques where commercially available and offline tools when online tools are not available. This standard does not explicitly require the periodic voltage stability analysis because such analysis would be performed pursuant to the SOL methodology developed under the FAC standards. TOP standards also require the TOP to operate within SOLs and Interconnection Reliability Operating Limits (IROL). The VAR standard drafting team (SDT) and industry participants also concluded that the best models and tools are the ones that have been proven and the standard should not add a requirement for a responsible entity to purchase new online simulations tools. Thus, the VAR SDT simplified the requirements to ensuring sufficient reactive resources are online or scheduled. Controllable load is specifically included to answer FERC’s directive in Order No. 693 at Paragraph 1879.

Rationale for R3:
Similar to Requirement R2, the VAR SDT determined that for reliability purposes, the TOP must ensure sufficient voltage support is provided in Real-time in order to operate within an SOL.
**Rationale for R4:**
The VAR SDT received significant feedback on instances when a TOP would need the flexibility for defining exemptions for generators. These exemptions can be tailored as the TOP deems necessary for the specific area’s needs. The goal of this requirement is to provide a TOP the ability to exempt a Generator Operator (GOP) from: 1) a voltage or Reactive Power schedule, 2) a setting on the AVR, or 3) any VAR-002 notifications based on the TOP’s criteria. Feedback from the industry detailed many system events that would require these types of exemptions which included, but are not limited to: 1) maintenance during shoulder months, 2) scenarios where two units are located within close proximity and both cannot be in voltage control mode, and 3) large system voltage swings where it would harm reliability if all GOP were to notify their respective TOP of deviations at one time. Also, in an effort to improve the requirement, the sub-requirements containing an exemption list were removed from the currently enforceable standard because this created more compliance issues with regard to how often the list would be updated and maintained.

**Rationale for R5:**
The new requirement provides transparency regarding the criteria used by the TOP to establish the voltage schedule. This requirement also provides a vehicle for the TOP to use appropriate granularity when setting notification requirements for deviation from the voltage or Reactive Power schedule. Additionally, this requirement provides clarity regarding a “tolerance band” as specified in the voltage schedule and the control dead-band in the generator’s excitation system.

Voltage schedule tolerances are the bandwidth that accompanies the voltage target in a voltage schedule, should reflect the anticipated fluctuation in voltage at the Generation Operator’s facility during normal operations, and be based on the TOP’s assessment of N-1 and credible N-2 system contingencies. The voltage schedule’s bandwidth should not be confused with the control dead-band that is programmed into a Generation Operator’s automatic voltage regulator’s control system, which should be adjusting the AVR prior to reaching either end of the voltage schedule’s bandwidth.

**Rationale for R6:**
Although tap settings are first established prior to interconnection, this requirement could not be deleted because no other standard addresses when a tap setting must be adjusted. If the tap setting is not properly set, then the amount of VARs produced by a unit can be affected.
A. Introduction

1. Title: Assessment of Transfer Capability for the Near-Term Transmission Planning Horizon

3. Purpose: To ensure that Planning Coordinators have a methodology for, and perform an annual assessment to identify potential future Transmission System weaknesses and limiting Facilities that could impact the Bulk Electric System’s (BES) ability to reliably transfer energy in the Near-Term Transmission Planning Horizon.

4. Applicability:

4.1. Planning Coordinators

5. Effective Date:

In those jurisdictions where regulatory approval is required, the latter of either the first day of the first calendar quarter twelve months after applicable regulatory approval or the first day of the first calendar quarter six months after MOD-001-1, MOD-028-1, MOD-029-1, and MOD-030-2 are effective.

In those jurisdictions where no regulatory approval is required, the latter of either the first day of the first calendar quarter twelve months after Board of Trustees adoption or the first day of the first calendar quarter six months after MOD-001-1, MOD-028-1, MOD-029-1 and MOD-030-2 are effective.

B. Requirements

R1. Each Planning Coordinator shall have a documented methodology it uses to perform an annual assessment of Transfer Capability in the Near-Term Transmission Planning Horizon (Transfer Capability methodology). The Transfer Capability methodology shall include, at a minimum, the following information: [Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]

1.1. Criteria for the selection of the transfers to be assessed.

1.2. A statement that the assessment shall respect known System Operating Limits (SOLs).

1.3. A statement that the assumptions and criteria used to perform the assessment are consistent with the Planning Coordinator’s planning practices.

1.4. A description of how each of the following assumptions and criteria used in performing the assessment are addressed:

1.4.1. Generation dispatch, including but not limited to long term planned outages, additions and retirements.

1.4.2. Transmission system topology, including but not limited to long term planned Transmission outages, additions, and retirements.

1.4.3. System demand.

1.4.4. Current approved and projected Transmission uses.
1.4.5. Parallel path (loop flow) adjustments.

1.4.6. Contingencies

1.4.7. Monitored Facilities.

1.5. A description of how simulations of transfers are performed through the adjustment of generation, Load or both.

R2. Each Planning Coordinator shall issue its Transfer Capability methodology, and any revisions to the Transfer Capability methodology, to the following entities subject to the following: [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]

2.1. Distribute to the following prior to the effectiveness of such revisions:

2.1.1. Each Planning Coordinator adjacent to the Planning Coordinator’s Planning Coordinator area or overlapping the Planning Coordinator’s area.

2.1.2. Each Transmission Planner within the Planning Coordinator’s Planning Coordinator area.

2.2. Distribute to each functional entity that has a reliability-related need for the Transfer Capability methodology and submits a request for that methodology within 30 calendar days of receiving that written request.

R3. If a recipient of the Transfer Capability methodology provides documented concerns with the methodology, the Planning Coordinator shall provide a documented response to that recipient within 45 calendar days of receipt of those comments. The response shall indicate whether a change will be made to the Transfer Capability methodology and, if no change will be made to that Transfer Capability methodology, the reason why. [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]

(Retirement approved by FERC effective January 21, 2014.)

R4. During each calendar year, each Planning Coordinator shall conduct simulations and document an assessment based on those simulations in accordance with its Transfer Capability methodology for at least one year in the Near-Term Transmission Planning Horizon. [Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]

R5. Each Planning Coordinator shall make the documented Transfer Capability assessment results available within 45 calendar days of the completion of the assessment to the recipients of its Transfer Capability methodology pursuant to Requirement R2, Parts 2.1 and Part 2.2. However, if a functional entity that has a reliability related need for the results of the annual assessment of the Transfer Capabilities makes a written request for such an assessment after the completion of the assessment, the Planning Coordinator shall make the documented Transfer Capability assessment results available to that entity within 45 calendar days of receipt of the request [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]

R6. If a recipient of a documented Transfer Capability assessment requests data to support the assessment results, the Planning Coordinator shall provide such data to that entity within 45 calendar days of receipt of the request. The provision of such data shall be subject to the legal and regulatory obligations of the Planning Coordinator’s area.
regarding the disclosure of confidential and/or sensitive information. [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]

C. Measures

M1. Each Planning Coordinator shall have a Transfer Capability methodology that includes the information specified in Requirement R1.

M2. Each Planning Coordinator shall have evidence such as dated e-mail or dated transmittal letters that it provided the new or revised Transfer Capability methodology in accordance with Requirement R2.

Each Planning Coordinator shall have evidence, such as dated e-mail or dated transmittal letters, that the Planning Coordinator provided a written response to that commenter in accordance with Requirement R3. (Retirement approved by FERC effective January 21, 2014.)

M3. Each Planning Coordinator shall have evidence such as dated assessment results, that it conducted and documented a Transfer Capability assessment in accordance with Requirement R4.

M4. Each Planning Coordinator shall have evidence, such as dated copies of e-mails or transmittal letters, that it made its documented Transfer Capability assessment available to the entities in accordance with Requirement R5.

M5. Each Planning Coordinator shall have evidence, such as dated copies of e-mails or transmittal letters, that it made its documented Transfer Capability assessment data available in accordance with Requirement R6.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

Regional Entity

1.2. Data Retention

The Planning Coordinator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Planning Coordinator shall have its current Transfer Capability methodology and any prior versions of the Transfer Capability methodology that were in force since the last compliance audit to show compliance with Requirement R1.
- The Planning Coordinator shall retain evidence since its last compliance audit to show compliance with Requirement R2.
- The Planning Coordinator shall retain evidence to show compliance with Requirements R3, R4, R5 and R6 for the most recent assessment. (R3 retired-Retirement approved by FERC effective January 21, 2014.)
• If a Planning Coordinator is found non-compliant, it shall keep information related to the non-compliance until found compliant or for the time periods specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

A. Introduction

1. Title: Dynamic Transfers
2. Number: INT-004-3.1
3. Purpose: To ensure Dynamic Schedules and Pseudo-Ties are communicated and accounted for appropriately in congestion management procedures.
4. Applicability:
   4.1. Balancing Authority
   4.2. Purchasing-Selling Entity
5. Effective Date:
   See implementation plan.
6. Background:
   This standard was revised as part of the Project 2008-12 Coordinate Interchange Standards effort to ensure the transparency of Dynamic Transfers.
   - R1 is modified from Requirement R1 of INT-001-3 and transferred into INT-004-3. The revised requirement now includes Pseudo-Ties.
   - R2 is modified from INT-004-2 to separate the triggers for the review of the Dynamic Transfer and when a modification is required for the Dynamic Transfer.
   - R1 and R2 now also apply to Pseudo-Ties. The requirements to create an RFI for Pseudo-Ties ensure that all entities involved are aware of the Dynamic Transfer and agree that the various responsibilities associated with the dynamic transfer have been agreed upon.
   - R3 is created to ensure that coordination occurs between all entities involved prior to the initial implementation of a Pseudo-Tie.
   - The Guidelines and Technical Basis section was added to provide a summary of the considerations that must be given when establishing any Dynamic Transfer.
B. Requirements and Measures

R1. Each Purchasing-Selling Entity that secures energy to serve Load via a Dynamic Schedule or Pseudo-Tie shall ensure that a Request for Interchange is submitted as an on-time\(^1\) Arranged Interchange to the Sink Balancing Authority for that Dynamic Schedule or Pseudo-Tie, unless the information about the Pseudo-Tie is included in congestion management procedure(s) via an alternate method.  

Violation Risk Factor: Lower  
Time Horizon: Operations Planning, Same-day Operations

M1. The Purchasing-Selling Entity shall have evidence (such as dated and time-stamped electronic logs or other evidence) that a Request for Interchange was submitted for Dynamic Schedules and Pseudo-Ties as an on-time Arranged Interchange to the Sink Balancing Authority for the Dynamic Schedule or Pseudo-Tie. For Pseudo-Ties included in congestion management procedure(s) via an alternate method, the Purchasing-Selling Entity shall have evidence such as Interchange Distribution Calculator model data or written / electronic agreement with a Balancing Authority to include the Pseudo-Tie in the congestion management procedure(s). (R1)

R2. The Purchasing-Selling Entity that submits a Request for Interchange in accordance with Requirement R1 shall ensure the Confirmed Interchange associated with that Dynamic Schedule or Pseudo-Tie is updated for future hours in order to support congestion management procedures if any one of the following occurs:  

Violation Risk Factor: Lower  
Time Horizon: Operations Planning, Same Day Operations, Real Time Operations

2.1. For Confirmed Interchange greater than 250 MW for the last hour, the actual hourly integrated energy deviates from the Confirmed Interchange by more than 10% for that hour and that deviation is expected to persist.

2.2. For Confirmed Interchange less than or equal to 250 MW for the last hour, the actual hourly integrated energy deviates from the Confirmed Interchange by more than 25 MW for that hour and that deviation is expected to persist.

2.3. The Purchasing-Selling Entity receives notification from a Reliability Coordinator or Transmission Operator to update the Confirmed Interchange.

M2. The Purchasing-Selling Entity shall have evidence (such as dated and time-stamped electronic logs, reliability studies or other evidence) that it updated its Confirmed Interchange Requests for Interchange when the deviation met the criteria in Requirement R2, Parts 2.1- 2.3. (R2)

R3. Each Balancing Authority shall only implement or operate a Pseudo-Tie that is included in the NAESB Electric Industry Registry publication in order to support

---

\(^1\) Please refer to the timing tables of INT-006-4.
congestion management procedures. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

M3. The Balancing Authority shall have evidence (such as dated and time-stamped electronic logs or other evidence) that it only implemented or operated a Pseudo-Tie that is included in the NAESB Electric Industry Registry publication. (R3)

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

Regional Entity

1.2. Evidence Retention

The Purchasing-Selling Entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority (CEA) to retain specific evidence for a longer period of time as part of an investigation. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

- The Purchasing-Selling Entity shall maintain evidence to show compliance with R1 and R2 for the most recent 3 calendar months plus the current month.
- The Balancing Authority shall maintain evidence to show compliance with R3 for the most recent 3 calendar months plus the current month.

If a Purchasing-Selling Entity or Balancing Authority is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

- Compliance Audit
- Self-Certification
- Spot Check
- Compliance Investigation
- Self-Reporting
- Complaint

1.4. Additional Compliance Information

None

F. Associated Documents
The Balancing Authority implemented or operated a Pseudo-Tie that was not included in the NAESB Electric Industry Registry publication.
Guidelines and Technical Basis

This standard requires the submittal of an Arranged Interchange for both Dynamic Schedules and Pseudo-Ties. In general, Pseudo-Ties are accounted for by all parties as actual Interchange and Dynamic Schedules are accounted for as Scheduled Interchange. The obligations of the entities involved in each type of Dynamic Transfer are dependent on the type of Dynamic Transfer selected. These guidelines provide items that should be considered when determining which type of Dynamic Transfer should be utilized for a given situation.

General Considerations When Establishing and Implementing Dynamic Transfers:

- During the setup of a Dynamic Transfer, a common source of data is established. During that setup, plans should also be established for what will occur when that normal source of data is not available.

- Following any reliability adjustments to a Dynamic Schedule, each Balancing Authority shall use agreed upon values that ensure any limit established by the reliability adjustment is not exceeded.
  - Since the Net Scheduled Interchange term used in its control ACE (or alternate control process) is not the value from the Confirmed Interchange, but from some common source, each Balancing Authority must be prepared to take action to control the data feeding that common source.

- Each Attaining Balancing Authority shall incorporate resources attained via Dynamic Schedules or Pseudo-Ties into its processes for establishing Contingency Reserve requirements, as well as for the purposes of measuring Contingency Reserve response.

The table below describes and outlines the obligations associated with the typical historical application of Pseudo-Ties and Dynamic Schedules related to many of the topics addressed above. In practical application, however, both the Native Balancing Authority and Attaining Balancing Authority can agree to exchange the obligations from that shown in the table below.

**General Considerations for Curtailments of Dynamic Transfers**

The unique handling of curtailments of Dynamic Transfers is described in NERC’s Dynamic Transfer Reference Guidelines, Version 2.

For Dynamic Schedules:

If transmission service between the Source and Sink BA(s) is curtailed then the allowable range of the magnitude of the schedules between them, including Dynamic Schedules, may have to be curtailed accordingly. All BAs involved in a Dynamic Schedule curtailment must also adjust the Dynamic Schedule Signal input to their respective ACE equations to a common value. The value used must be equal to or less than the curtailed Dynamic Schedule tag. Since Dynamic Schedule tags are generally not used as Dynamic Transfer Signals for ACE, this adjustment may require manual entry or other revision to a telemetered or calculated value used by the ACE.

For Pseudo-Ties:

If transmission service between the Native and Attaining BA(s) is curtailed, then the allowable range of the magnitude of the Pseudo-Ties between them must be limited accordingly to these constraints.
Both sections above describe when Curtailments (typically communicated through e-Tags) of Dynamic Transfers require additional action by Balancing Authorities to ensure compliance with the Curtailment.

Curtailments of most tagged transactions are implemented through a change in the Source and Sink Balancing Authorities’ ACE equations. However, changes, including Curtailments, in Dynamic Schedule and Pseudo-Tie tagged transactions do not change the Source and Sink Balancing Authorities’ ACE equations directly. These types of transactions impact the ACE equation via the Dynamic Transfer Signal, not by the e-Tag. As such, Balancing Authorities need to develop additional automation or perform additional manual actions to reduce the Dynamic Transfer Signal in order to comply with the curtailment.

**Rationale:**

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

**Rationale R1:**

This Requirement is intended to ensure that an RFI is submitted for a Dynamic Schedule or Pseudo-Tie. If a forecast is available, it is expected that the forecast will be used to indicate the energy profile on the RFI. If no forecast is available, the energy profile cannot exceed the maximum expected transaction MW amount.

**Rationale R2:**

This requirement does not preclude tags from being updated at any time. The requirement specifies conditions under which the tag must be updated.

A. Introduction

1. Title: Interchange Initiation and Modification for Reliability
2. Number: INT-010-2.1
3. Purpose: To provide guidance for required actions on Confirmed Interchange or Implemented Interchange to address reliability.
4. Applicability:
   4.1. Balancing Authority
5. Effective Date:
   See implementation plan.
6. Background:
   This standard was revised as part of the Project 2008-12 Coordinate Interchange Standards.
   
   - R1 is modified to replace “request for Arranged Interchange” with the correct term “Request for Interchange.” A rationale was developed to clarify use of the term “energy sharing agreement” for this requirement.
   
   - R2 and R3 are modified to shift compliance from the Reliability Coordinator to the Sink Balancing Authority.

B. Requirements and Measures

R1. The Balancing Authority that experiences a loss of resources covered by an energy sharing agreement or other reliability needs covered by an energy sharing agreement shall ensure that a Request for Interchange (RFI) is submitted with a start time no more than 60 minutes beyond the resource loss. If the use of the energy sharing agreement does not exceed 60 minutes from the time of the resource loss, no RFI is required. [Violation Risk Factor: Lower] [Time Horizon: Real Time Operations]

M1. The Balancing Authority that uses its energy sharing agreement where the duration exceeds 60 minutes shall have evidence such as dated and time-stamped RFI, electronic logs or other similar evidence that it submitted an RFI per Requirement R1. (R1)

R2. Each Sink Balancing Authority shall ensure that a Reliability Adjustment Arranged Interchange reflecting a modification is submitted within 60 minutes of the start of the modification if a Reliability Coordinator directs the modification of a Confirmed Interchange or Implemented Interchange for actual or anticipated reliability-related reasons. [Violation Risk Factor: Lower] [Time Horizon: Real Time Operations]

M2. The Sink Balancing Authority shall have evidence such as dated and time-stamped electronic logs or other similar evidence that a Reliability Adjustment Arranged Interchange was submitted within 60 minutes of the start of a modification to either a Confirmed Interchange or an Implemented Interchange that was directed by a Reliability Coordinator for actual or anticipated reliability-related reasons. (R2)
R3. Each Sink Balancing Authority shall ensure that a Request for Interchange is submitted reflecting that Interchange Schedule within 60 minutes of the start of the scheduled Interchange if a Reliability Coordinator directs the scheduling of Interchange for actual or anticipated reliability-related reasons. [Violation Risk Factor: Lower] [Time Horizon: Real Time Operations]

M3. The Sink Balancing Authority shall have evidence such as dated and time-stamped electronic logs or other evidence that a Request for Interchange was submitted reflecting that Interchange Schedule within 60 minutes of the start of any scheduled Interchange that was directed by a Reliability Coordinator for actual or anticipated reliability-related reasons. (R3)
C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

Regional Entity

1.2. Evidence Retention

The Balancing Authority shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority (CEA) to retain specific evidence for a longer period of time as part of an investigation. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

- The Balancing Authority shall maintain evidence to show compliance with R1, R2, and R3, for the most recent three calendar months plus the current month.

- If a Balancing Authority is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

Compliance Audit
Self-Certification
Spot Checking
Compliance Investigation
Self-Reporting
Complaint

1.4. Additional Compliance Information

None

Guidelines and Technical Basis

General Considerations for Curtailments of Dynamic Transfers

The unique handling of Curtailments of Dynamic Transfers is described in NERC’s Dynamic Transfer Reference Guidelines, Version 2.

For Dynamic Schedules:

If transmission service between the Source and Sink BA(s) is curtailed then the allowable range of the magnitude of the schedules between them, including Dynamic Schedules, may have to be curtailed accordingly. All BAs involved in a Dynamic Schedule Curtailment must also adjust the Dynamic Schedule Signal input to their respective ACE equations to a common value. The value used must be equal to or less than the curtailed Dynamic Schedule tag. Since Dynamic Schedule tags are generally not used as Dynamic Transfer Signals for ACE, this adjustment may require manual entry or other revision to a telemetered or calculated value used by the ACE.

For Pseudo-Ties:

If transmission service between the Native and Attaining BA(s) is curtailed, then the allowable range of the magnitude of the Pseudo-Ties between them must be limited accordingly to these constraints.

Both sections above describe when Curtailments (typically communicated through e-Tags) of Dynamic Transfers require additional action by Balancing Authorities to ensure compliance with the Curtailment.

Curtailments of most tagged transactions are implemented through a change in the Source and Sink Balancing Authorities’ ACE equations. However, changes, including Curtailments, in Dynamic Schedule and Pseudo-Tie tagged transactions do not change the Source and Sink Balancing Authorities’ ACE equations directly. These types of transactions impact the ACE equation via the Dynamic Transfer Signal, not by the e-Tag. As such, Balancing Authorities need to develop additional automation or perform additional manual actions to reduce the Dynamic Transfer Signal in order to comply with the Curtailment.

Rationale:

During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for R1:

This requirement was originally revised to replace the term “Request for an Arranged Interchange” with the defined term “Request for Interchange (RFI)” within the requirement. Additional clarification was requested regarding “energy sharing agreement.” There is no NERC Glossary term for this and the CISDT believes that one is not required as these agreements are used for immediate reliability purposes. These could be regional, local, or regulatory reliability agreements which would include the applicable conditions under which the energy could be scheduled.

A. Introduction

1. Title: Available Transmission System Capability
2. Number: MOD-001-1a
3. Purpose: To ensure that calculations are performed by Transmission Service Providers to maintain awareness of available transmission system capability and future flows on their own systems as well as those of their neighbors
4. Applicability:
   4.1. Transmission Service Provider.
   4.2. Transmission Operator.
5. Proposed Effective Date: Immediately after approval of applicable regulatory authorities.

B. Requirements

R1. Each Transmission Operator shall select one of the methodologies¹ listed below for calculating Available Transfer Capability (ATC) or Available Flowgate Capability (AFC) for each ATC Path per time period identified in R2 for those Facilities within its Transmission operating area: [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]
   - The Area Interchange Methodology, as described in MOD-028
   - The Rated System Path Methodology, as described in MOD-029
   - The Flowgate Methodology, as described in MOD-030

R2. Each Transmission Service Provider shall calculate ATC or AFC values as listed below using the methodology or methodologies selected by its Transmission Operator(s): [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]
   2.1. Hourly values for at least the next 48 hours.
   2.2. Daily values for at least the next 31 calendar days.
   2.3. Monthly values for at least the next 12 months (months 2-13).

R3. Each Transmission Service Provider shall prepare and keep current an Available Transfer Capability Implementation Document (ATCID) that includes, at a minimum, the following information: [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]
   3.1. Information describing how the selected methodology (or methodologies) has been implemented, in such detail that, given the same information used by the Transmission Service Provider, the results of the ATC or AFC calculations can be validated.
   3.2. A description of the manner in which the Transmission Service Provider will account for counterflows including:

¹ All ATC Paths do not have to use the same methodology and no particular ATC Path must use the same methodology for all time periods.
R3.2.1. How confirmed Transmission reservations, expected Interchange and internal counterflow are addressed in firm and non-firm ATC or AFC calculations.

R3.2.2. A rationale for that accounting specified in R3.2.

R3.3. The identity of the Transmission Operators and Transmission Service Providers from which the Transmission Service Provider receives data for use in calculating ATC or AFC.

R3.4. The identity of the Transmission Service Providers and Transmission Operators to which it provides data for use in calculating transfer or Flowgate capability.

R3.5. A description of the allocation processes listed below that are applicable to the Transmission Service Provider:

- Processes used to allocate transfer or Flowgate capability among multiple lines or sub-paths within a larger ATC Path or Flowgate.
- Processes used to allocate transfer or Flowgate capabilities among multiple owners or users of an ATC Path or Flowgate.
- Processes used to allocate transfer or Flowgate capabilities between Transmission Service Providers to address issues such as forward looking congestion management and seams coordination.

R3.6. A description of how generation and transmission outages are considered in transfer or Flowgate capability calculations, including:

R3.6.1. The criteria used to determine when an outage that is in effect part of a day impacts a daily calculation.

R3.6.2. The criteria used to determine when an outage that is in effect part of a month impacts a monthly calculation.

R3.6.3. How outages from other Transmission Service Providers that can not be mapped to the Transmission model used to calculate transfer or Flowgate capability are addressed.

R4. The Transmission Service Provider shall notify the following entities before implementing a new or revised ATCID: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

R4.1. Each Planning Coordinator associated with the Transmission Service Provider’s area.

R4.2. Each Reliability Coordinator associated with the Transmission Service Provider’s area.

R4.3. Each Transmission Operator associated with the Transmission Service Provider’s area.

R4.4. Each Planning Coordinator adjacent to the Transmission Service Provider’s area.
R4.5. Each Reliability Coordinator adjacent to the Transmission Service Provider’s area.

R4.6. Each Transmission Service Provider whose area is adjacent to the Transmission Service Provider’s area.

R5. The Transmission Service Provider shall make available the current ATCID to all of the entities specified in R4. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

R6. When calculating Total Transfer Capability (TTC) or Total Flowgate Capability (TFC) the Transmission Operator shall use assumptions no more limiting than those used in the planning of operations for the corresponding time period studied, providing such planning of operations has been performed for that time period. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

R7. When calculating ATC or AFC the Transmission Service Provider shall use assumptions no more limiting than those used in the planning of operations for the corresponding time period studied, providing such planning of operations has been performed for that time period. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

R8. Each Transmission Service Provider that calculates ATC shall recalculate ATC at a minimum on the following frequency, unless none of the calculated values identified in the ATC equation have changed: [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

R8.1. Hourly values, once per hour. Transmission Service Providers are allowed up to 175 hours per calendar year during which calculations are not required to be performed, despite a change in a calculated value identified in the ATC equation.

R8.2. Daily values, once per day.

R8.3. Monthly values, once per week.

R9. Within thirty calendar days of receiving a request by any Transmission Service Provider, Planning Coordinator, Reliability Coordinator, or Transmission Operator for data from the list below solely for use in the requestor’s ATC or AFC calculations, each Transmission Service Provider receiving said request shall begin to make the requested data available to the requestor, subject to the conditions specified in R9.1 and R9.2: [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

- Expected generation and Transmission outages, additions, and retirements.
- Load forecasts.
- Unit commitments and order of dispatch, to include all designated network resources and other resources that are committed or have the legal obligation to run, as they are expected to run, in one of the following formats chosen by the data provider:

Note that the North American Energy Standards Board (NAESB) is developing the companion standards that address the posting of ATC information, including supporting information such as that described in R9.
- Dispatch Order
- Participation Factors
- Block Dispatch

- Firm and non-firm Transmission reservations.
- Aggregated capacity set-aside for Grandfathered obligations
- Firm roll-over rights.
- Any firm and non-firm adjustments applied by the Transmission Service Provider to reflect parallel path impacts.
- Power flow models and underlying assumptions.
- Contingencies, provided in one or more of the following formats:
  - A list of Elements
  - A list of Flowgates
  - A set of selection criteria that can be applied to the Transmission model used by the Transmission Operator and/or Transmission Service Provider

- Facility Ratings.
- Any other services that impact Existing Transmission Commitments (ETCs).
- Values of Capacity Benefit Margin (CBM) and Transmission Reliability Margin (TRM) for all ATC Paths or Flowgates.
- Values of Total Flowgate Capability (TFC) and AFC for any Flowgates considered by the Transmission Service Provider receiving the request when selling Transmission service.
- Values of TTC and ATC for all ATC Paths for those Transmission Service Providers receiving the request that do not consider Flowgates when selling Transmission Service.
- Source and sink identification and mapping to the model.

**R9.1.** The Transmission Service Provider shall make its own current data available, in the format maintained by the Transmission Service Provider, for up to 13 months into the future (subject to confidentiality and security requirements).

**R9.1.1.** If the Transmission Service Provider uses the data requested in its transfer or Flowgate capability calculations, it shall make the data used available.
R9.1.2. If the Transmission Service Provider does not use the data requested in its transfer or Flowgate capability calculations, but maintains that data, it shall make that data available.

R9.1.3. If the Transmission Service Provider does not use the data requested in its transfer or Flowgate capability calculations, and does not maintain that data, it shall not be required to make that data available.

R9.2. This data shall be made available by the Transmission Provider on the schedule specified by the requestor (but no more frequently than once per hour, unless mutually agreed to by the requester and the provider).

C. Measures

M1. The Transmission Operator shall provide evidence (such as a calculation, inclusion of the information in the ATCID, or other written documentation) that it has selected one of the specified methodologies per time period in R2 for use in determining Transfer Capabilities of those Facilities for each ATC Path within the Transmission Operator’s operating area. (R1).

M2. The Transmission Service Provider shall provide ATC or AFC values and identification of the selected methodologies along with other evidence (such as written documentation, processes, or data) to show it calculated ATC or AFC for the following using the selected methodology or methodologies chosen as part of R1 (R2):

- There has been at least 48 hours of hourly values calculated at all times. (R2.1)
- There has been at least 31 consecutive calendar days of daily values calculated at all times. (R2.2)
- There has been at least the next 12 months of monthly values calculated at all times (Months 2-13). (R2.3)

M3. The Transmission Service Provider shall provide its current ATCID that contains all the information specified in R3. (R3)

M4. The Transmission Service Provider shall provide evidence (such as dated electronic mail messages, mail receipts, or voice recordings) that it has notified the entities specified in R4 before a new or revised ATCID was implemented. (R4)

M5. The Transmission Service Provider shall provide evidence (such as a demonstration) that the current ATCID is available to all of the entities specified in R4, as required by R5. (R5)

M6. The Transmission Operator shall provide a copy of the assumptions (such as contingencies, loop flow, generation re-dispatch, switching operating guides or data sources for load forecast and facility outages) used to calculate TTC or TFC as well as other evidence (such as copies of operations planning studies, models, supporting information, or data) to show that the assumptions used in determining TTC or TFC are no more limiting than those used in planning of operations for the corresponding time period studied. Alternatively the Transmission Operator may demonstrate that the same load flow cases are used for both TTC or TFC and Operations Planning.
When different inputs to the calculations are used because the calculations are performed at different times, such that the most recent information is used in any calculation, a difference in that input data shall not be considered to be a difference in assumptions. (R6)

M7. The Transmission Service Provider shall provide a copy of the assumptions (such as contingencies, loop flow, generation re-dispatch, switching operating guides or data sources for load forecast and facility outages) used to calculate ATC or AFC as well as other evidence (such as copies of operations planning studies, models, supporting information, or data) to show that the assumptions used in determining ATC or AFC are no more limiting than those used in planning of operations for the corresponding time period studied. Alternatively the Transmission Service Provider may demonstrate that the same load flow cases are used for both AFC and Operations Planning. When different inputs to the calculations are used because the calculations are performed at different times, such that the most recent information is used in any calculation, a difference in that input data shall not be considered to be a difference in assumptions. (R7)

M8. The Transmission Service Provider calculating ATC shall provide evidence (such as logs or data) that it has calculated the hourly, daily, and monthly values on at least the minimum frequencies specified in R8 or provide evidence (such as data, procedures, or software documentation) that the calculated values identified in the ATC equation have not changed. (R8)

M9. The Transmission Service Provider shall provide a copy of the dated request, if any, for ATC or AFC data as well as evidence to show it responded to that request (such as logs or data) within thirty calendar days of receiving the request, and the requested data items were made available in accordance with R9. (R9)

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

Regional Entity.

1.2. Compliance Monitoring Period and Reset Time Frame

Not applicable.

1.3. Data Retention

The Transmission Operator and Transmission Service Provider shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Transmission Operator shall maintain its current selected method(s) for calculating ATC or AFC and any methods in force since last compliance audit period to show compliance with R1.
- The Transmission Service Provider shall maintain evidence to show compliance with R2, R4, R6, R7, and R8 for the most recent calendar year plus the current year.
- The Transmission Service Provider shall maintain its current, in force ATCID and any prior versions of the ATCID that were in force since the last compliance audit to show compliance with R3.
- The Transmission Service Provider shall maintain evidence to show compliance with R5 for the most recent three calendar years plus the current year.
- The Transmission Operator shall maintain evidence to show compliance with R6 for the most recent calendar year plus the current year.
- If a Transmission Service Provider or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. Compliance Monitoring and Enforcement Processes:

The following processes may be used:
- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

1.5. Additional Compliance Information

None.
## 2. Violation Severity Levels

**Question #1**

Is the “advisory ATC” used under the NYISO tariff subject to the ATC calculation and recalculation requirements in MOD-001-1 Requirements R2 and R8? If not, is it necessary to document the frequency of “advisory” calculations in the responsible entity’s Available Transfer Capability Implementation Document?

**Response to Question #1**

Requirements R2 and R8 of MOD-001-1 are both related to Requirement R1, which defines that ATC methodologies are to be applied to specific “ATC Paths.” The NERC definition of ATC Path is “Any combination of Point of Receipt and Point of Delivery for which ATC is calculated; and any Posted Path.” Based on a review of the language included in this request, the NYISO Open Access Transmission Tariff, and other information posted on the NYISO Web site, it appears that the NYISO does indeed have multiple ATC Paths, which are subject to the calculation and recalculation requirements in Requirements R2 and R8. It appears from reviewing this information that ATC is defined in the NYISO tariff in the same manner in which NERC defines it, making it difficult to conclude that NYISO’s “advisory ATC” is not the same as ATC. In addition, it appears that pre-scheduling is permitted on certain external paths, making the calculation of ATC prior to day ahead necessary on those paths.

The second part of NYISO’s question is only applicable if the first part was answered in the
MOD-029-01 Requirements R5 and R6:

**R5.** When calculating ETC for firm Existing Transmission Commitments (ETC\(_F\)) for a specified period for an ATC Path, the Transmission Service Provider shall use the algorithm below:

\[
ETC_F = NL_F + NITS_F + GF_F + PTP_F + ROR_F + OS_F
\]

Where:

- \(NL_F\) is the firm capacity set aside to serve peak Native Load forecast commitments for the time period being calculated, to include losses, and Native Load growth, not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.
- \(NITS_F\) is the firm capacity reserved for Network Integration Transmission Service serving Load, to include losses, and Load growth, not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.
- \(GF_F\) is the firm capacity set aside for grandfathered Transmission Service and contracts for energy and/or Transmission Service, where executed prior to the effective date of a Transmission Service Provider’s Open Access Transmission Tariff or “safe harbor tariff.”
- \(PTP_F\) is the firm capacity reserved for confirmed Point-to-Point Transmission Service.
- \(ROR_F\) is the firm capacity reserved for Roll-over rights for contracts granting Transmission Customers the right of first refusal to take or continue to take Transmission Service when the Transmission Customer’s Transmission Service contract expires or is eligible for renewal.
- \(OS_F\) is the firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using Firm Transmission Service as specified in the ATCID.

**R6.** When calculating ETC for non-firm Existing Transmission Commitments (ETC\(_NF\)) for all time horizons for an ATC Path the Transmission Service Provider shall use the following algorithm:

\[
ETC_{NF} = NITS_{NF} + GF_{NF} + PTP_{NF} + OS_{NF}
\]

Where:

- \(NITS_{NF}\) is the non-firm capacity set aside for Network Integration Transmission Service serving Load (i.e., secondary service), to include losses, and load growth not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.
- \(GF_{NF}\) is the non-firm capacity set aside for grandfathered Transmission Service and contracts for energy and/or Transmission Service, where executed prior to the
PTP<sub>NF</sub> is non-firm capacity reserved for confirmed Point-to-Point Transmission Service.

OS<sub>NF</sub> is the non-firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using non-firm transmission service as specified in the ATCID.

**Question #2**

Could OS<sub>F</sub> in MOD-029-1 Requirement R5 and OS<sub>NF</sub> in MOD-029-1 Requirement R6 be calculated using Transmission Flow Utilization in the determination of ATC?

**Response to Question #2**

This request for interpretation and the NYISO Open Access Transmission Tariff describe the NYISO’s concept of "Transmission Flow Utilization;" however, it is unclear whether or not Native Load, Point-to-Point Transmission Service, Network Integration Transmission Service, or any of the other components explicitly defined in Requirements R5 and R6 are incorporated into "Transmission Flow Utilization." Provided that "Transmission Flow Utilization" does not include Native Load, Point-to-Point Transmission Service, Network Integration Transmission Service, or any of the other components explicitly defined in Requirements R5 and R6, it is appropriate to be included within the "Other Services" term. However, if "Transmission Flow Utilization" does incorporate those components, then simply including "Transmission Flow Utilization" in “Other Service” would be inappropriate.

A. Introduction

1. Title: Capacity Benefit Margin
2. Number: MOD-004-1
3. Purpose: To promote the consistent and reliable calculation, verification, preservation, and use of Capacity Benefit Margin (CBM) to support analysis and system operations.
4. Applicability:
   4.1. Load-Serving Entities.
   4.2. Resource Planners.
   4.3. Transmission Service Providers.
   4.4. Balancing Authorities.
   4.5. Transmission Planners, when their associated Transmission Service Provider has elected to maintain CBM.
5. Effective Date: First day of the first calendar quarter that is twelve months beyond the date that this standard is approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the standard becomes effective on the first day of the first calendar quarter that is twelve months beyond the date this standard is approved by the NERC Board of Trustees.

B. Requirements

R1. The Transmission Service Provider that maintains CBM shall prepare and keep current a “Capacity Benefit Margin Implementation Document” (CBMID) that includes, at a minimum, the following information:

   [Violation Risk Factor: Medium] [Time Horizon: Operations Planning, Long-term Planning]

R1.1. The process through which a Load-Serving Entity within a Balancing Authority Area associated with the Transmission Service Provider, or the Resource Planner associated with that Balancing Authority Area, may ensure that its need for Transmission capacity to be set aside as CBM will be reviewed and accommodated by the Transmission Service Provider to the extent Transmission capacity is available.

R1.2. The procedure and assumptions for establishing CBM for each Available Transfer Capability (ATC) Path or Flowgate.

R1.3. The procedure for a Load-Serving Entity or Balancing Authority to use Transmission capacity set aside as CBM, including the manner in which the Transmission Service Provider will manage situations where the requested use of CBM exceeds the amount of CBM available.

R2. The Transmission Service Provider that maintains CBM shall make available its current CBMID to the Transmission Operators, Transmission Service Providers, Reliability Coordinators, Transmission Planners, Resource Planners, and Planning Coordinators that are within or adjacent to the Transmission Service Provider’s area, and to the Load Serving Entities and Balancing Authorities within the Transmission Service Provider’s...
area, and notify those entities of any changes to the CBMID prior to the effective date of the change. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

R3. Each Load-Serving Entity determining the need for Transmission capacity to be set aside as CBM for imports into a Balancing Authority Area shall determine that need by:
[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

R3.1. Using one or more of the following to determine the GCIR:
- Loss of Load Expectation (LOLE) studies
- Loss of Load Probability (LOLP) studies
- Deterministic risk-analysis studies
- Reserve margin or resource adequacy requirements established by other entities, such as municipalities, state commissions, regional transmission organizations, independent system operators, Regional Reliability Organizations, or regional entities

R3.2. Identifying expected import path(s) or source region(s).

R4. Each Resource Planner determining the need for Transmission capacity to be set aside as CBM for imports into a Balancing Authority Area shall determine that need by:
[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

R4.1. Using one or more of the following to determine the GCIR:
- Loss of Load Expectation (LOLE) studies
- Loss of Load Probability (LOLP) studies
- Deterministic risk-analysis studies
- Reserve margin or resource adequacy requirements established by other entities, such as municipalities, state commissions, regional transmission organizations, independent system operators, Regional Reliability Organizations, or regional entities

R4.2. Identifying expected import path(s) or source region(s).

R5. At least every 13 months, the Transmission Service Provider that maintains CBM shall establish a CBM value for each ATC Path or Flowgate to be used for ATC or Available Flowgate Capability (AFC) calculations during the 13 full calendar months (months 2-14) following the current month (the month in which the Transmission Service Provider is establishing the CBM values). This value shall: [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

R5.1. Reflect consideration of each of the following if available:
- Any studies (as described in R3.1) performed by Load-Serving Entities for loads within the Transmission Service Provider’s area
- Any studies (as described in R4.1) performed by Resource Planners for loads within the Transmission Service Provider’s area
• Any reserve margin or resource adequacy requirements for loads within the Transmission Service Provider’s area established by other entities, such as municipalities, state commissions, regional transmission organizations, independent system operators, Regional Reliability Organizations, or regional entities

R5.2. Be allocated as follows:
• For ATC Paths, based on the expected import paths or source regions provided by Load-Serving Entities or Resource Planners
• For Flowgates, based on the expected import paths or source regions provided by Load-Serving Entities or Resource Planners and the distribution factors associated with those paths or regions, as determined by the Transmission Service Provider

R6. At least every 13 months, the Transmission Planner shall establish a CBM value for each ATC Path or Flowgate to be used in planning during each of the full calendar years two through ten following the current year (the year in which the Transmission Planner is establishing the CBM values). This value shall: [Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]

R6.1. Reflect consideration of each of the following if available:
• Any studies (as described in R3.1) performed by Load-Serving Entities for loads within the Transmission Planner’s area
• Any studies (as described in R4.1) performed by Resource Planners for loads within the Transmission Planner’s area
• Any reserve margin or resource adequacy requirements for loads within the Transmission Planner’s area established by other entities, such as municipalities, state commissions, regional transmission organizations, independent system operators, Regional Reliability Organizations, or regional entities

R6.2. Be allocated as follows:
• For ATC Paths, based on the expected import paths or source regions provided by Load-Serving Entities or Resource Planners
• For Flowgates, based on the expected import paths or source regions provided by Load-Serving Entities or Resource Planners and the distribution factors associated with those paths or regions, as determined by the Transmission Planner.

R7. Less than 31 calendar days after the establishment of CBM, the Transmission Service Provider that maintains CBM shall notify all the Load-Serving Entities and Resource Planners that determined they had a need for CBM on the Transmission Service Provider’s system of the amount of CBM set aside. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

R8. Less than 31 calendar days after the establishment of CBM, the Transmission Planner shall notify all the Load-Serving Entities and Resource Planners that determined they
had a need for CBM on the system being planned by the Transmission Planner of the amount of CBM set aside. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

R9. The Transmission Service Provider that maintains CBM and the Transmission Planner shall each provide (subject to confidentiality and security requirements) copies of the applicable supporting data, including any models, used for determining CBM or allocating CBM over each ATC Path or Flowgate to the following: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning, Long-term Planning]

R9.1. Each of its associated Transmission Operators within 30 calendar days of their making a request for the data.

R9.2. To any Transmission Service Provider, Reliability Coordinator, Transmission Planner, Resource Planner, or Planning Coordinator within 30 calendar days of their making a request for the data.

R10. The Load-Serving Entity or Balancing Authority shall request to import energy over firm Transfer Capability set aside as CBM only when experiencing a declared NERC Energy Emergency Alert (EEA) 2 or higher. [Violation Risk Factor: Lower] [Time Horizon: Same-day Operations]

R11. When reviewing an Arranged Interchange using CBM, all Balancing Authorities and Transmission Service Providers shall waive, within the bounds of reliable operation, any Real-time timing and ramping requirements. [Violation Risk Factor: Medium] [Time Horizon: Same-day Operations]

R12. The Transmission Service Provider that maintains CBM shall approve, within the bounds of reliable operation, any Arranged Interchange using CBM that is submitted by an “energy deficient entity” under an EEA 2 if: [Violation Risk Factor: Medium] [Time Horizon: Same-day Operations]

R12.1. The CBM is available

R12.2. The EEA 2 is declared within the Balancing Authority Area of the “energy deficient entity,” and

R12.3. The Load of the “energy deficient entity” is located within the Transmission Service Provider’s area.

C. Measures

M1. Each Transmission Service Provider that maintains CBM shall produce its CBMID evidencing inclusion of all information specified in R1. (R1)

M2. Each Transmission Service Provider that maintains CBM shall have evidence (such as dated logs and data, copies of dated electronic messages, or other equivalent evidence) to show that it made the current CBMID available to the Transmission Operators, Transmission Service Providers, Reliability Coordinators, Transmission Planners, and Planning Coordinators specified in R2, and that prior to any change to the CBMID, it notified those entities of the change. (R2)

1 See Attachment 1-EOP-002-0 for explanation.
M3. Each Load-Serving Entity that determined a need for Transmission capacity to be set aside as CBM shall provide evidence (including studies and/or requirements) that it met the criteria in R3. (R3)

M4. Each Resource Planner that determined a need for Transmission capacity to be set aside as CBM shall provide evidence (including studies and/or requirements) that it met the criteria in R4. (R4)

M5. Each Transmission Service Provider that maintains CBM shall provide evidence (such as studies, requirements, and dated CBM values) that it established 13 months of CBM values consistent with the requirements in R5.1 and allocated the values consistent with the requirements in R5.2. (Note that CBM values may legitimately be zero.) (R5)

M6. Each Transmission Planner with an associated Transmission Service Provider that maintains CBM shall provide evidence (such as studies, requirements, and dated CBM values) that it established CBM values for years two through ten consistent with the requirements in R6.1 and allocated the values consistent with the requirements in R6.2. Inclusion of GCIR based on R6.1 and R6.2 within the transmission base case meets this requirement. (Note that CBM values may legitimately be zero.) (R6)

M7. Each Transmission Service Provider that maintains CBM shall provide evidence (such as dated e-mail, data, or other records) that it notified the entities described in R7 of the amount of CBM set aside. (R7)

M8. Each Transmission Planner with an associated Transmission Service Provider that maintains CBM shall provide evidence (such as e-mail, data, or other records) that it notified the entities described in R8 of the amount of CBM set aside. (R8)

M9. Each Transmission Service Provider that maintains CBM and each Transmission Planner shall provide evidence including copies of dated requests for data supporting the calculation of CBM along with other evidences such as copies of electronic messages or other evidence to show that it provided the required entities with copies of the supporting data, including any models, used for allocating CBM as specified in R9. (R9)

M10. Each Load-Serving Entity and Balancing Authority shall provide evidence (such as logs, copies of tag data, or other data from its Reliability Coordinator) that at the time it requested to import energy using firm Transfer Capability set aside as CBM, it was in an EEA 2 or higher. (R10)

M11. Each Balancing Authority and Transmission Service Provider shall provide evidence (such as operating logs and tag data) that it waived Real-time timing and ramping requirements when approving an Arranged Interchange using CBM. (R11)

M12. Each Transmission Service Provider that maintains CBM shall provide evidence including copies of CBM values along with other evidence (such as tags, reports, and supporting data) to show that it approved any Arranged Interchange meeting the criteria in R12. (R12)

D. Compliance
1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority (CEA)
Regional Entity.

1.2. Compliance Monitoring Period and Reset Time Frame
Not applicable.

1.3. Data Retention
- The Transmission Service Provider that maintains CBM shall maintain its current, in force CBMID and any prior versions of the CBMID that were in force during the past three calendar years plus the current year to show compliance with R1.
- The Transmission Service Provider that maintains CBM shall maintain evidence to show compliance with R2, R5, R7, R9, and R12 for the most recent three calendar years plus the current year.
- The Load-Serving Entity shall each maintain evidence to show compliance with R3 and R10 for the most recent three calendar years plus the current year.
- The Resource Planner shall each maintain evidence to show compliance with R4 for the most recent three calendar years plus the current year.
- The Transmission Planner shall maintain evidence to show compliance with R6, R8, and R9 for the most recent three calendar years plus the current year.
- The Balancing Authority shall maintain evidence to show compliance with R10 and R11 for the most recent three calendar years plus the current year.
- The Transmission Service Provider shall maintain evidence to show compliance with R11 for the most recent three calendar years plus the current year.
- If an entity is found non-compliant, it shall keep information related to the non-compliance until found compliant.
- The Compliance Enforcement Authority shall keep the last audit records and all requested and subsequently submitted audit records.

1.4. Compliance Monitoring and Enforcement Processes:
The following processes may be used:
- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

1.5. Additional Compliance Information
None.

A. Introduction

1. Title: Transmission Reliability Margin Calculation Methodology
2. Number: MOD-008-1
3. Purpose: To promote the consistent and reliable calculation, verification, preservation, and use of Transmission Reliability Margin (TRM) to support analysis and system operations.
4. Applicability:
   4.1. Transmission Operators that maintain TRM.
5. Proposed Effective Date: First day of the first calendar quarter that is twelve months beyond the date this standard is approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the standard becomes effective on the first day of the first calendar quarter that is twelve months beyond the date this standard is approved by the NERC Board of Trustees.

B. Requirements

R1. Each Transmission Operator shall prepare and keep current a TRM Implementation Document (TRMID) that includes, as a minimum, the following information:

[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

R1.1. Identification of (on each of its respective ATC Paths or Flowgates) each of the following components of uncertainty if used in establishing TRM, and a description of how that component is used to establish a TRM value:

- Aggregate Load forecast.
- Load distribution uncertainty.
- Forecast uncertainty in Transmission system topology (including, but not limited to, forced or unplanned outages and maintenance outages).
- Allowances for parallel path (loop flow) impacts.
- Allowances for simultaneous path interactions.
- Variations in generation dispatch (including, but not limited to, forced or unplanned outages, maintenance outages and location of future generation).
- Short-term System Operator response (Operating Reserve actions).
- Reserve sharing requirements.
- Inertial response and frequency bias.

R1.2. The description of the method used to allocate TRM across ATC Paths or Flowgates.

R1.3. The identification of the TRM calculation used for the following time periods:

R1.3.1. Same day and real-time.
R1.3.2. Day-ahead and pre-schedule.
R1.3.3. Beyond day-ahead and pre-schedule, up to thirteen months ahead.
R2. Each Transmission Operator shall only use the components of uncertainty from R1.1 to establish TRM, and shall not include any of the components of Capacity Benefit Margin (CBM). Transmission capacity set aside for reserve sharing agreements can be included in TRM. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

R3. Each Transmission Operator shall make available its TRMID, and if requested, underlying documentation (if any) used to determine TRM, in the format used by the Transmission Operator, to any of the following who make a written request no more than 30 calendar days after receiving the request. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]
- Transmission Service Providers
- Reliability Coordinators
- Planning Coordinators
- Transmission Planner
- Transmission Operators

R4. Each Transmission Operator that maintains TRM shall establish TRM values in accordance with the TRMID at least once every 13 months. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

R5. The Transmission Operator that maintains TRM shall provide the TRM values to its Transmission Service Provider(s) and Transmission Planner(s) no more than seven calendar days after a TRM value is initially established or subsequently changed. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

C. Measures

M1. Each Transmission Operator shall produce its TRMID evidencing inclusion of all specified information in R1. (R1)

M2. Each Transmission Operator shall provide evidence including its TRMID, TRM values, CBM values, or other evidence, (such as written documentation, study reports, documentation of its CBM process, and supporting information) to demonstrate that its TRM values did not include any elements of uncertainty beyond those defined in R1.1 and to show that it did not include any of the components of CBM. (R2)

M3. Each Transmission Operator shall provide a dated copy of any request from an entity described in R3. The Transmission Operator shall also provide evidence (such as copies of emails or postal receipts that show the recipient, date and contents) that the requested documentation (such as work papers and load flow cases) was made available within the specified timeframe to the requestor. (R3)

M4. Each Transmission Operator shall provide evidence (such as logs, study report, review notes, or data) that it established TRM values at least once every thirteen months for each of the TRM time periods. (R4)

M5. Each Transmission Operator shall provide evidence (such as logs, email, website postings) that it provided their Transmission Service Provider(s) and Transmission Planner(s) with the updated TRM value as described in R5. (R5)
D. Compliance

1. Compliance Monitoring Process

   1.1. Compliance Enforcement Authority
       Regional Entity.

   1.2. Compliance Monitoring Period and Reset Time Frame
       Not applicable.

   1.3. Data Retention
       The Transmission Operator shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:
       - The Transmission Operator shall have its current, in-force TRMID and any TRMIDs in force since last compliance audit period for R1.
       - The Transmission Operator shall retain evidence to show compliance with R2, R3, and R5 for the most recent three calendar years plus the current year.
       - The Transmission Operator shall retain evidence to show compliance with R4 for the most recent three calendar years plus the current year.
       - If a responsible entity is found non-compliant, it shall keep information related to the non-compliance until found compliant.
       - The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

   1.4. Compliance Monitoring and Enforcement Processes
       Any of the following may be used:
       - Compliance Audits
       - Self-Certifications
       - Spot Checking
       - Compliance Violation Investigations
       - Self-Reporting
       - Complaints

   1.5. Additional Compliance Information
       None.

A. Introduction

1. Title: Providing Interruptible Demands and Direct Control Load Management Data to System Operators and Reliability Coordinators

2. Number: MOD-020-0

3. Purpose: To ensure that assessments and validation of past events and databases can be performed, reporting of actual demand data is needed. Forecast demand data is needed to perform future system assessments to identify the need for system reinforcement for continued reliability. In addition to assist in proper real-time operating, load information related to controllable Demand-Side Management programs is needed.

4. Applicability:
   4.1. Load-Serving Entity
   4.2. Transmission Planner
   4.3. Resource Planner

5. Effective Date: April 1, 2005

B. Requirements

R1. The Load-Serving Entity, Transmission Planner, and Resource Planner shall each make known its amount of interruptible demands and Direct Control Load Management (DCLM) to Transmission Operators, Balancing Authorities, and Reliability Coordinators on request within 30 calendar days.

C. Measures

M1. The Load-Serving Entity, Transmission Planner, and Resource Planner each make known its amount of interruptible demands and DCLM to Transmission Operators, Balancing Authorities and Reliability Coordinators on request within 30 calendar days.

D. Compliance

1. Compliance Monitoring Process
   1.1. Compliance Monitoring Responsibility
       Regional Reliability Organization.
   1.2. Compliance Monitoring Period and Reset Timeframe
       On request (within 30 calendar days).
   1.3. Data Retention
       None specified.
   1.4. Additional Compliance Information
       None.

2. Levels of Non-Compliance
   2.1. Level 1: Interruptible Demands and DCLM data were provided to Reliability Coordinators, Balancing Authorities, and Transmission Operators, but were incomplete.
   2.2. Level 2: Not applicable.
2.3. **Level 3:** Not applicable.

2.4. **Level 4:** Interruptible Demands and DCLM data were not provided to Reliability Coordinators, Balancing Authorities, and Transmission Operators.

E. **Regional Differences**

1. None identified.

A. Introduction

1. **Title:** Area Interchange Methodology

2. **Number:** MOD-028-2

3. **Purpose:** To increase consistency and reliability in the development and documentation of Transfer Capability calculations for short-term use performed by entities using the Area Interchange Methodology to support analysis and system operations.

4. **Applicability:**
   4.1. Each Transmission Operator that uses the Area Interchange Methodology to calculate Total Transfer Capabilities (TTCs) for ATC Paths.
   4.2. Each Transmission Service Provider that uses the Area Interchange Methodology to calculate Available Transfer Capabilities (ATCs) for ATC Paths.

5. **Proposed Effective Date:** In those jurisdictions where regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after applicable regulatory approval. In those jurisdictions where no regulatory approval is required, this standard shall become effective on the first day of the first calendar quarter after Board of Trustees approval.

B. Requirements

R1. Each Transmission Service Provider shall include in its Available Transfer Capability Implementation Document (ATCID), at a minimum, the following information relative to its methodology for determining Total Transfer Capability (TTC): [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

   R1.1. Information describing how the selected methodology has been implemented, in such detail that, given the same information used by the Transmission Operator, the results of the TTC calculations can be validated.

   R1.2. A description of the manner in which the Transmission Operator will account for Interchange Schedules in the calculation of TTC.

   R1.3. Any contractual obligations for allocation of TTC.

   R1.4. A description of the manner in which Contingencies are identified for use in the TTC process.

   R1.5. The following information on how source and sink for transmission service is accounted for in ATC calculations including:

       R1.5.1. Define if the source used for Available Transfer Capability (ATC) calculations is obtained from the source field or the Point of Receipt (POR) field of the transmission reservation

       R1.5.2. Define if the sink used for ATC calculations is obtained from the sink field or the Point of Delivery (POD) field of the transmission reservation
R1.5.3. The source/sink or POR/POD identification and mapping to the model.

R1.5.4. If the Transmission Service Provider’s ATC calculation process involves a grouping of generation, the ATCID must identify how these generators participate in the group.

R2. When calculating TTC for ATC Paths, the Transmission Operator shall use a Transmission model that contains all of the following: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

R2.1. Modeling data and topology of its Reliability Coordinator’s area of responsibility. Equivalent representation of radial lines and facilities 161 kV or below is allowed.

R2.2. Modeling data and topology (or equivalent representation) for immediately adjacent and beyond Reliability Coordination areas.

R2.3. Facility Ratings specified by the Generator Owners and Transmission Owners.

R3. When calculating TTCs for ATC Paths, the Transmission Operator shall include the following data for the Transmission Service Provider’s area. The Transmission Operator shall also include the following data associated with Facilities that are explicitly represented in the Transmission model, as provided by adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

R3.1. For TTCs, use the following (as well as any other values and additional parameters as specified in the ATCID):

R3.1.1. Expected generation and Transmission outages, additions, and retirements, included as specified in the ATCID.

R3.1.2. A daily or hourly load forecast for TTCs used in current-day and next-day ATC calculations.

R3.1.3. A daily load forecast for TTCs used in ATC calculations for days two through 31.

R3.1.4. A monthly load forecast for TTCs used in ATC calculations for months two through 13 months TTCs.

R3.1.5. Unit commitment and dispatch order, to include all designated network resources and other resources that are committed or have the legal obligation to run, (within or out of economic dispatch) as they are expected to run.

R4. When calculating TTCs for ATC Paths, the Transmission Operator shall meet all of the following conditions: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

R4.1. Use all Contingencies meeting the criteria described in the ATCID.

R4.2. Respect any contractual allocations of TTC.
R4.3. Include, for each time period, the Firm Transmission Service expected to be scheduled as specified in the ATCID (filtered to reduce or eliminate duplicate impacts from transactions using Transmission service from multiple Transmission Service Providers) for the Transmission Service Provider, all adjacent Transmission Service Providers, and any Transmission Service Providers with which coordination agreements have been executed modeling the source and sink as follows:

- If the source, as specified in the ATCID, has been identified in the reservation and it is discretely modeled in the Transmission Service Provider’s Transmission model, use the discretely modeled point as the source.

- If the source, as specified in the ATCID, has been identified in the reservation and the point can be mapped to an “equivalence” or “aggregate representation” in the Transmission Service Provider’s Transmission model, use the modeled equivalence or aggregate as the source.

- If the source, as specified in the ATCID, has been identified in the reservation and the point cannot be mapped to a discretely modeled point, an “equivalence,” or an “aggregate representation” in the Transmission Service Provider’s Transmission model, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider from which the power is to be received as the source.

- If the source, as specified in the ATCID, has not been identified in the reservation, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider from which the power is to be received as the source.

- If the sink, as specified in the ATCID, has been identified in the reservation and it is discretely modeled in the Transmission Service Provider’s Transmission model, use the discretely modeled point shall as the sink.

- If the sink, as specified in the ATCID, has been identified in the reservation and the point can be mapped to an “equivalence” or “aggregate representation” in the Transmission Service Provider’s Transmission model, use the modeled equivalence or aggregate as the sink.

- If the sink, as specified in the ATCID, has been identified in the reservation and the point cannot be mapped to a discretely modeled point, an “equivalence,” or an “aggregate representation” in the Transmission Service Provider’s Transmission model, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider to which the power is to be delivered as the sink.

- If the sink, as specified in the ATCID, has not been identified in the reservation, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider to which the power is being delivered as the sink.
R5. Each Transmission Operator shall establish TTC for each ATC Path as defined below:

Violation Risk Factor: Lower [Time Horizon: Operations Planning]

R5.1. At least once within the seven calendar days prior to the specified period for TTCs used in hourly and daily ATC calculations.

R5.2. At least once per calendar month for TTCs used in monthly ATC calculations.

R5.3. Within 24 hours of the unexpected outage of a 500 kV or higher transmission Facility or a transformer with a low-side voltage of 200 kV or higher for TTCs in effect during the anticipated duration of the outage, provided such outage is expected to last 24 hours or longer.

R6. Each Transmission Operator shall establish TTC for each ATC Path using the following process:

Violation Risk Factor: Lower [Time Horizon: Operations Planning]

R6.1. Determine the incremental Transfer Capability for each ATC Path by increasing generation and/or decreasing load within the source Balancing Authority area and decreasing generation and/or increasing load within the sink Balancing Authority area until either:

- A System Operating Limit is reached on the Transmission Service Provider’s system, or
- A SOL is reached on any other adjacent system in the Transmission model that is not on the study path and the distribution factor is 5% or greater.

R6.2. If the limit in step R6.1 can not be reached by adjusting any combination of load or generation, then set the incremental Transfer Capability by the results of the case where the maximum adjustments were applied.

R6.3. Use (as the TTC) the lesser of:

- The sum of the incremental Transfer Capability and the impacts of Firm Transmission Services, as specified in the Transmission Service Provider’s ATCID, that were included in the study model, or

- The sum of Facility Ratings of all ties comprising the ATC Path.

R6.4. For ATC Paths whose capacity uses jointly-owned or allocated Facilities, limit TTC for each Transmission Service Provider so the TTC does not exceed each Transmission Service Provider’s contractual rights.

R7. The Transmission Operator shall provide the Transmission Service Provider of that ATC Path with the most current value for TTC for that ATC Path no more than:

Violation Risk Factor: Lower [Time Horizon: Operations Planning]

R7.1. One calendar day after its determination for TTCs used in hourly and daily ATC calculations.

R7.2. Seven calendar days after its determination for TTCs used in monthly ATC calculations.

1 The Transmission operator may honor distribution factors less than 5% if desired.
R8. When calculating Existing Transmission Commitments (ETCs) for firm commitments (ETCF) for all time periods for an ATC Path the Transmission Service Provider shall use the following algorithm: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

\[ ETC_F = NITS_F + GF_F + PTP_F + ROR_F + OS_F \]

Where:

- **NITS\(_F\)** is the firm capacity set aside for Network Integration Transmission Service (including the capacity used to serve bundled load within the Transmission Service Provider’s area with external sources) on ATC Paths that serve as interfaces with other Balancing Authorities.

- **GF\(_F\)** is the firm capacity set aside for Grandfathered Firm Transmission Service and contracts for energy and/or Transmission Service, where executed prior to the effective date of a Transmission Service Provider’s Open Access Transmission Tariff or safe harbor tariff on ATC Paths that serve as interfaces with other Balancing Authorities.

- **PTP\(_F\)** is the firm capacity reserved for confirmed Point-to-Point Transmission Service.

- **ROR\(_F\)** is the capacity reserved for roll-over rights for Firm Transmission Service contracts granting Transmission Customers the right of first refusal to take or continue to take Transmission Service when the Transmission Customer’s Transmission Service contract expires or is eligible for renewal.

- **OS\(_F\)** is the firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using Firm Transmission Service, including any other firm adjustments to reflect impacts from other ATC Paths of the Transmission Service Provider as specified in the ATCID.

R9. When calculating ETC for non-firm commitments (ETCNF) for all time periods for an ATC Path the Transmission Service Provider shall use the following algorithm: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

\[ ETC_{NF} = NITS_{NF} + GF_{NF} + PTP_{NF} + OS_{NF} \]

Where:

- **NITS\(_{NF}\)** is the non-firm capacity set aside for Network Integration Transmission Service (i.e., secondary service, including the capacity used to serve bundled load within the Transmission Service Provider’s area with external sources) reserved on ATC Paths that serve as interfaces with other Balancing Authorities.

- **GF\(_{NF}\)** is the non-firm capacity reserved for Grandfathered Non-Firm Transmission Service and contracts for energy and/or Transmission Service, where executed prior to the effective date of a Transmission Service Provider’s Open Access Transmission Tariff or safe harbor tariff on ATC Paths that serve as interfaces with other Balancing Authorities.
PTP_{NF} is non-firm capacity reserved for confirmed Point-to-Point Transmission Service.

OS_{NF} is the non-firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using Non-Firm Transmission Service, including any other firm adjustments to reflect impacts from other ATC Paths of the Transmission Service Provider as specified in the ATCID.

**R10.** When calculating firm ATC for an ATC Path for a specified period, the Transmission Service Provider shall utilize the following algorithm: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

\[
ATC_{F} = TTC - ETC_{F} - CBM - TRM + \text{Postbacks}_{F} + \text{counterflows}_{F}
\]

Where:

- \( ATC_{F} \) is the firm Available Transfer Capability for the ATC Path for that period.
- \( TTC \) is the Total Transfer Capability of the ATC Path for that period.
- \( ETC_{F} \) is the sum of existing firm Transmission commitments for the ATC Path during that period.
- \( CBM \) is the Capacity Benefit Margin for the ATC Path during that period.
- \( TRM \) is the Transmission Reliability Margin for the ATC Path during that period.
- \( \text{Postbacks}_{F} \) are changes to firm ATC due to a change in the use of Transmission Service for that period, as defined in Business Practices.
- \( \text{counterflows}_{F} \) are adjustments to firm ATC as determined by the Transmission Service Provider and specified in the ATCID.

**R11.** When calculating non-firm ATC for a ATC Path for a specified period, the Transmission Service Provider shall use the following algorithm: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

\[
ATC_{NF} = TTC - ETC_{F} - ETC_{NF} - CBM_{S} - TRM_{U} + \text{Postbacks}_{NF} + \text{counterflows}_{NF}
\]

Where:

- \( ATC_{NF} \) is the non-firm Available Transfer Capability for the ATC Path for that period.
- \( TTC \) is the Total Transfer Capability of the ATC Path for that period.
- \( ETC_{F} \) is the sum of existing firm Transmission commitments for the ATC Path during that period.
- \( ETC_{NF} \) is the sum of existing non-firm Transmission commitments for the ATC Path during that period.
- \( CBM_{S} \) is the Capacity Benefit Margin for the ATC Path that has been scheduled without a separate reservation during that period.
- \( TRM_{U} \) is the Transmission Reliability Margin for the ATC Path that has not been released for sale (unreleased) as non-firm capacity by the Transmission Service Provider during that period.
Postbacks\textsubscript{NF} are changes to non-firm ATC due to a change in the use of Transmission Service for that period, as defined in Business Practices.

Counterflows\textsubscript{NF} are adjustments to non-firm ATC as determined by the Transmission Service Provider and specified in the ATCID.

C. Measures

M1. Each Transmission Service Provider shall provide its current ATCID that has the information described in R1 to show compliance with R1. (R1)

M2. Each Transmission Operator shall provide evidence including the model used to calculate TTC as well as other evidence (such as Facility Ratings provided by facility owners, written documentation, logs, and data) to show that the modeling requirements in R2 were met. (R2)

M3. Each Transmission Operator shall provide evidence, including scheduled outages, facility additions and retirements, (such as written documentation, logs, and data) that the data described in R3 and R4 were included in the determination of TTC as specified in the ATCID. (R3)

M4. Each Transmission Operator shall provide the contingencies used in determining TTC and the ATCID as evidence to show that the contingencies described in the ATCID were included in the determination of TTC. (R4)

M5. Each Transmission Operator shall provide copies of contracts that contain requirements to allocate TTCs and TTC values to show that any contractual allocations of TTC were respected as required in R4.2. (R4)

M6. Each Transmission Operator shall provide evidence (such as copies of coordination agreements, reservations, interchange transactions, or other documentation) to show that firm reservations were used to estimate scheduled interchange, the modeling of scheduled interchange was based on the rules described in R4.3, and that estimated scheduled interchange was included in the determination of TTC. (R4)

M7. Each Transmission Operator shall provide evidence (such as logs and data and dated copies of requests from the Transmission Service Provider to establish TTCs at specific intervals) that TTCs have been established at least once in the calendar week prior to the specified period for TTCs used in hourly and daily ATC calculations, at least once per calendar month for TTCs used in monthly ATC calculations, and within 24 hours of the unexpected outage of a 500 kV or higher transmission Facility or a autotransformer with a low-side voltage of 200 kV or higher for TTCs in effect during the anticipated duration of the outage; provided such outage is expected to last 24 hours or longer in duration per the specifications in R5. (R5)

M8. Each Transmission Operator shall provide evidence (such as written documentation) that TTCs have been calculated using the process described in R6. (R6)

M9. Each Transmission Operator shall have evidence including a copy of the latest calculated TTC values along with a dated copy of email notices or other equivalent evidence to show that it provided its Transmission Service Provider with the most current values for TTC in accordance with R7. (R7)
M10. The Transmission Service Provider shall demonstrate compliance with R8 by recalculating firm ETC for any specific time period as described in (MOD-001 R2), using the algorithm defined in R8 and with data used to calculate the specified value for the designated time period. The data used must meet the requirements specified in MOD-028-2 and the ATCID. To account for differences that may occur when recalculating the value (due to mixing automated and manual processes), any recalculated value that is within +/- 15% or 15 MW, whichever is greater, of the originally calculated value, is evidence that the Transmission Service Provider used the algorithm in R8 to calculate its firm ETC. (R8)

M11. The Transmission Service Provider shall demonstrate compliance with R9 by recalculating non-firm ETC for any specific time period as described in (MOD-001 R2), using the algorithm defined in R9 and with data used to calculate the specified value for the designated time period. The data used must meet the requirements specified in MOD-028-2 and the ATCID. To account for differences that may occur when recalculating the value (due to mixing automated and manual processes), any recalculated value that is within +/- 15% or 15 MW, whichever is greater, of the originally calculated value, is evidence that the Transmission Service Provider used the algorithm in R8 to calculate its non-firm ETC. (R9)

M12. Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates firm ATCs, as required in R10. Such documentation must show that only the variables allowed in R10 were used to calculate firm ATCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc…). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R10)

M13. Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates non-firm ATCs, as required in R11. Such documentation must show that only the variables allowed in R11 were used to calculate non-firm ATCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc…). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R11)

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

For entities that do not work for the Regional Entity, the Regional Entity shall serve as the Compliance Enforcement Authority.

For functional entities that work for their Regional Entity, the ERO or a Regional Entity approved by the ERO and FERC or other applicable governmental authorities shall serve as the Compliance Enforcement Authority.
1.2. **Data Retention**

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Operator and Transmission Service Provider shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Transmission Service Provider shall retain its current, in force ATCID and any prior versions of the ATCID that were in force since the last compliance audit to show compliance with R1.
- The Transmission Operator shall have its latest model used to calculate TTC and evidence of the previous version to show compliance with R2.
- The Transmission Operator shall retain evidence to show compliance with R3 for the most recent 12 months or until the model used to calculate TTC is updated, whichever is longer.
- The Transmission Operator shall retain evidence to show compliance with R4, R5, R6 and R7 for the most recent 12 months.
- The Transmission Service Provider shall retain evidence to show compliance in calculating hourly values required in R8 and R9 for the most recent 14 days; evidence to show compliance in calculating daily values required in R8 and R9 for the most recent 30 days; and evidence to show compliance in calculating monthly values required in R8 and R9 for the most recent 60 days.
- The Transmission Service Provider shall retain evidence to show compliance with R10 and R11 for the most recent 12 months.
- If a Transmission Service Provider or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.
- The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. **Compliance Monitoring and Enforcement Processes:**

The following processes may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints
1.4. Additional Compliance Information

None.
2. Violation Severity Levels

A. Introduction

1. Title: Rated System Path Methodology
2. Number: MOD-029-2a
3. Purpose: To increase consistency and reliability in the development and documentation of transfer capability calculations for short-term use performed by entities using the Rated System Path Methodology to support analysis and system operations.
4. Applicability:
   4.1. Each Transmission Operator that uses the Rated System Path Methodology to calculate Total Transfer Capabilities (TTCs) for ATC Paths.
   4.2. Each Transmission Service Provider that uses the Rated System Path Methodology to calculate Available Transfer Capabilities (ATCs) for ATC Paths.
5. Proposed Effective Date: See Implementation Plan for the Revised Definition of "Remedial Action Scheme"

B. Requirements

R1. When calculating TTCs for ATC Paths, the Transmission Operator shall use a Transmission model which satisfies the following requirements: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

   R1.1. The model utilizes data and assumptions consistent with the time period being studied and that meets the following criteria:

   R1.1.1. Includes at least:
   
   R1.1.1.1. The Transmission Operator area. Equivalent representation of radial lines and facilities 161kV or below is allowed.
   
   R1.1.1.2. All Transmission Operator areas contiguous with its own Transmission Operator area. (Equivalent representation is allowed.)
   
   R1.1.1.3. Any other Transmission Operator area linked to the Transmission Operator’s area by joint operating agreement. (Equivalent representation is allowed.)

   R1.1.2. Models all system Elements as in-service for the assumed initial conditions.

   R1.1.3. Models all generation (may be either a single generator or multiple generators) that is greater than 20 MVA at the point of interconnection in the studied area.
R1.1.4. Models phase shifters in non-regulating mode, unless otherwise specified in the Available Transfer Capability Implementation Document (ATCID).

R1.1.5. Uses Load forecast by Balancing Authority.

R1.1.6. Uses Transmission Facility additions and retirements.

R1.1.7. Uses Generation Facility additions and retirements.

R1.1.8. Uses Remedial Action Scheme (RAS) models where currently existing or projected for implementation within the studied time horizon.

R1.1.9. Models series compensation for each line at the expected operating level unless specified otherwise in the ATCID.

R1.1.10. Includes any other modeling requirements or criteria specified in the ATCID.

R1.2. Uses Facility Ratings as provided by the Transmission Owner and Generator Owner

R2. The Transmission Operator shall use the following process to determine TTC:

[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

R2.1. Except where otherwise specified within MOD-029-2a, adjust base case generation and Load levels within the updated power flow model to determine the TTC (maximum flow or reliability limit) that can be simulated on the ATC Path while at the same time satisfying all planning criteria contingencies as follows:

R2.1.1. When modeling normal conditions, all Transmission Elements will be modeled at or below 100% of their continuous rating.

R2.1.2. When modeling contingencies the system shall demonstrate transient, dynamic and voltage stability, with no Transmission Element modeled above its Emergency Rating.

R2.1.3. Uncontrolled separation shall not occur.

R2.2. Where it is impossible to actually simulate a reliability-limited flow in a direction counter to prevailing flows (on an alternating current Transmission line), set the TTC for the non-prevailing direction equal to the TTC in the prevailing direction. If the TTC in the prevailing flow direction is dependent on a Remedial Action Scheme (RAS), set the TTC for the non-prevailing flow direction equal to the greater of the maximum flow that can be simulated in the non-prevailing flow direction or the maximum TTC that can be achieved in the prevailing flow direction without use of a RAS.

R2.3. For an ATC Path whose capacity is limited by contract, set TTC on the ATC Path at the lesser of the maximum allowable contract capacity or the reliability limit as determined by R2.1.
R2.4. For an ATC Path whose TTC varies due to simultaneous interaction with one or more other paths, develop a nomogram describing the interaction of the paths and the resulting TTC under specified conditions.

R2.5. The Transmission Operator shall identify when the TTC for the ATC Path being studied has an adverse impact on the TTC value of any existing path. Do this by modeling the flow on the path being studied at its proposed new TTC level simultaneous with the flow on the existing path at its TTC level while at the same time honoring the reliability criteria outlined in R2.1. The Transmission Operator shall include the resolution of this adverse impact in its study report for the ATC Path.

R2.6. Where multiple ownership of Transmission rights exists on an ATC Path, allocate TTC of that ATC Path in accordance with the contractual agreement made by the multiple owners of that ATC Path.

R2.7. For ATC Paths whose path rating, adjusted for seasonal variance, was established, known and used in operation since January 1, 1994, and no action has been taken to have the path rated using a different method, set the TTC at that previously established amount.

R2.8. Create a study report that describes the steps above that were undertaken (R2.1 – R2.7), including the contingencies and assumptions used, when determining the TTC and the results of the study. Where three phase fault damping is used to determine stability limits, that report shall also identify the percent used and include justification for use unless specified otherwise in the ATCID.

R3. Each Transmission Operator shall establish the TTC at the lesser of the value calculated in R2 or any System Operating Limit (SOL) for that ATC Path. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

R4. Within seven calendar days of the finalization of the study report, the Transmission Operator shall make available to the Transmission Service Provider of the ATC Path, the most current value for TTC and the TTC study report documenting the assumptions used and steps taken in determining the current value for TTC for that ATC Path. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

R5. When calculating ETC for firm Existing Transmission Commitments (ETC_F) for a specified period for an ATC Path, the Transmission Service Provider shall use the algorithm below: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

\[ ETC_F = NL_F + NITS_F + GF_F + PTP_F + ROR_F + OS_F \]

Where:

- NL_F is the firm capacity set aside to serve peak Native Load forecast commitments for the time period being calculated, to include losses, and Native Load growth, not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.
NITS$_F$ is the firm capacity reserved for Network Integration Transmission Service serving Load, to include losses, and Load growth, not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

GF$_F$ is the firm capacity set aside for grandfathered Transmission Service and contracts for energy and/or Transmission Service, where executed prior to the effective date of a Transmission Service Provider’s Open Access Transmission Tariff or “safe harbor tariff.”

PTP$_F$ is the firm capacity reserved for confirmed Point-to-Point Transmission Service.

ROR$_F$ is the firm capacity reserved for Roll-over rights for contracts granting Transmission Customers the right of first refusal to take or continue to take Transmission Service when the Transmission Customer’s Transmission Service contract expires or is eligible for renewal.

OS$_F$ is the firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using non-firm transmission service as specified in the ATCID.

R6. When calculating ETC for non-firm Existing Transmission Commitments (ETC$_{NF}$) for all time horizons for an ATC Path the Transmission Service Provider shall use the following algorithm:

\[
\text{Violation Risk Factor: Lower} \quad \text{[Time Horizon: Operations Planning]}
\]

\[
\text{ETC}_{NF} = \text{NITS}_{NF} + \text{GF}_{NF} + \text{PTP}_{NF} + \text{OS}_{NF}
\]

Where:

NITS$_{NF}$ is the non-firm capacity set aside for Network Integration Transmission Service serving Load (i.e., secondary service), to include losses, and load growth not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

GF$_{NF}$ is the non-firm capacity set aside for grandfathered Transmission Service and contracts for energy and/or Transmission Service, where executed prior to the effective date of a Transmission Service Provider’s Open Access Transmission Tariff or “safe harbor tariff.”

PTP$_{NF}$ is non-firm capacity reserved for confirmed Point-to-Point Transmission Service.

OS$_{NF}$ is the non-firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using non-firm transmission service as specified in the ATCID.

R7. When calculating firm ATC for an ATC Path for a specified period, the Transmission Service Provider shall use the following algorithm:

\[
\text{Violation Risk Factor: Lower} \quad \text{[Time Horizon: Operations Planning]}
\]

\[
\text{ATC}_F = \text{TTC} - \text{ETC}_F - \text{CBM} - \text{TRM} + \text{Postbacks}_F + \text{counterflows}_F
\]

Where

ATC$_F$ is the firm Available Transfer Capability for the ATC Path for that period.
TTC is the Total Transfer Capability of the ATC Path for that period.

ETCF is the sum of existing firm commitments for the ATC Path during that period.

CBM is the Capacity Benefit Margin for the ATC Path during that period.

TRM is the Transmission Reliability Margin for the ATC Path during that period.

PostbacksF are changes to firm Available Transfer Capability due to a change in the use of Transmission Service for that period, as defined in Business Practices.

counterflowsF are adjustments to firm Available Transfer Capability as determined by the Transmission Service Provider and specified in their ATCID.

**R8.** When calculating non-firm ATC for an ATC Path for a specified period, the Transmission Service Provider shall use the following algorithm: 

\[
\text{ATCNF} = \text{TTC} - \text{ETCF} - \text{ETCNF} - \text{CBMS} - \text{TRMU} + \text{PostbacksNF} + \text{counterflowsNF}
\]

**Where:**

\text{ATCNF} is the non-firm Available Transfer Capability for the ATC Path for that period.

TTC is the Total Transfer Capability of the ATC Path for that period.

ETCF is the sum of existing firm commitments for the ATC Path during that period.

ETCNF is the sum of existing non-firm commitments for the ATC Path during that period.

CBMS is the Capacity Benefit Margin for the ATC Path that has been scheduled during that period.

TRMU is the Transmission Reliability Margin for the ATC Path that has not been released for sale (unreleased) as non-firm capacity by the Transmission Service Provider during that period.

PostbacksNF are changes to non-firm Available Transfer Capability due to a change in the use of Transmission Service for that period, as defined in Business Practices.

counterflowsNF are adjustments to non-firm Available Transfer Capability as determined by the Transmission Service Provider and specified in its ATCID.
C. Measures

M1. Each Transmission Operator that uses the Rated System Path Methodology shall produce any Transmission model it used to calculate TTC for purposes of calculating ATC for each ATC Path, as required in R1, for the time horizon(s) to be examined. (R1)

M1.1. Production shall be in the same form and format used by the Transmission Operator to calculate the TTC, as required in R1. (R1)

M1.2. The Transmission model produced must include the areas listed in R1.1.1 (or an equivalent representation, as described in the requirement) (R1.1)

M1.3. The Transmission model produced must show the use of the modeling parameters stated in R1.1.2 through R1.1.10; except that, no evidence shall be required to prove: 1) utilization of a Remedial Action Scheme where none was included in the model or 2) that no additions or retirements to the generation or Transmission system occurred. (R1.1.2 through R1.1.10)

M1.4. The Transmission Operator must provide evidence that the models used to determine TTC included Facility Ratings as provided by the Transmission Owner and Generator Owner. (R1.2)

M2. Each Transmission Operator that uses the Rated System Path Methodology shall produce the ATCID it uses to show where it has described and used additional modeling criteria in its ACTID that are not otherwise included in MOD-29 (R1.1.4, R.1.1.9, and R1.1.10).

M3. Each Transmission Operator that uses the Rated System Path Methodology with paths with ratings established prior to January 1, 1994 shall provide evidence the path and its rating were established prior to January 1, 1994. (R2.7)

M4. Each Transmission Operator that uses the Rated System Path Methodology shall produce as evidence the study reports, as required in R.2.8, for each path for which it determined TTC for the period examined. (R2)

M5. Each Transmission Operator shall provide evidence that it used the lesser of the calculated TTC or the SOL as the TTC, by producing: 1) all values calculated pursuant to R2 for each ATC Path, 2) Any corresponding SOLs for those ATC Paths, and 3) the TTC set by the Transmission Operator and given to the Transmission Service Provider for use in R7 and R8 for each ATC Path. (R3)

M6. Each Transmission Operator shall provide evidence (such as logs or data) that it provided the TTC and its study report to the Transmission Service Provider within seven calendar days of the finalization of the study report. (R4)

M7. The Transmission Service Provider shall demonstrate compliance with R5 by recalculating firm ETC for any specific time period as described in (MOD-001 R2), using the algorithm defined in R5 and with data used to calculate the specified value for the designated time period. The data used must meet the requirements specified in MOD-029-2 and the ATCID. To account for differences that may occur when recalculating the value (due to mixing automated and manual processes), any recalculated value that is within +/- 15% or 15 MW, whichever is greater, of the
originally calculated value, is evidence that the Transmission Service Provider used the algorithm in R5 to calculate its firm ETC. (R5)

**M8.** The Transmission Service Provider shall demonstrate compliance with R5 by recalculating non-firm ETC for any specific time period as described in (MOD-001 R2), using the algorithm defined in R6 and with data used to calculate this specified value for the designated time period. The data used must meet the requirements specified in the MOD-029 and the ATCID. To account for differences that may occur when recalculating the value (due to mixing automated and manual processes), any recalculated value that is within +/- 15% or 15 MW, whichever is greater, of the originally calculated value, is evidence that the Transmission Service Provider used the algorithm in R6 to calculate its non-firm ETC. (R6)

**M9.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates firm ATCs, as required in R7. Such documentation must show that only the variables allowed in R7 were used to calculate firm ATCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc…). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R7)

**M10.** Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates non-firm ATCs, as required in R8. Such documentation must show that only the variables allowed in R8 were used to calculate non-firm ATCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc…). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R8)

### D. Compliance

#### 1. Compliance Monitoring Process

1.1. **Compliance Enforcement Authority**

   Regional Entity.

1.2. **Compliance Monitoring Period and Reset Time Frame**

   Not applicable.

1.3. **Data Retention**

   - The Transmission Operator and Transmission Service Provider shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

   - The Transmission Operator shall have its latest models used to determine TTC for R1. (M1)
- The Transmission Operator shall have the current, in force ATCID(s) provided by its Transmission Service Provider(s) and any prior versions of the ATCID that were in force since the last compliance audit to show compliance with R1. (M2)
- The Transmission Operator shall retain evidence of any path and its rating that was established prior to January 1, 1994. (M3)
- The Transmission Operator shall retain the latest version and prior version of the TTC study reports to show compliance with R2. (M4)
- The Transmission Operator shall retain evidence for the most recent three calendar years plus the current year to show compliance with R3 and R4. (M5 and M6)
- The Transmission Service Provider shall retain evidence to show compliance in calculating hourly values required in R5 and R6 for the most recent 14 days; evidence to show compliance in calculating daily values required in R5 and R6 for the most recent 30 days; and evidence to show compliance in calculating daily values required in R5 and R6 for the most recent sixty days. (M7 and M8)
- The Transmission Service Provider shall retain evidence for the most recent three calendar years plus the current year to show compliance with R7 and R8. (M9 and M10)
- If a Transmission Service Provider or Transmission Operator is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.4. **Compliance Monitoring and Enforcement Processes:**

The following processes may be used:

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

1.5. **Additional Compliance Information**

None.
2. Violation Severity Levels

MOD-001-01 Requirement R2:

R2. Each Transmission Service Provider shall calculate ATC or AFC values as listed below using the methodology or methodologies selected by its Transmission Operator(s):

   R2.1. Hourly values for at least the next 48 hours.
   R2.2. Daily values for at least the next 31 calendar days.
   R2.3. Monthly values for at least the next 12 months (months 2-13).

MOD-001-01 Requirement R8:

R8. Each Transmission Service Provider that calculates ATC shall recalculate ATC at a minimum on the following frequency, unless none of the calculated values identified in the ATC equation have changed:

   R8.1. Hourly values, once per hour. Transmission Service Providers are allowed up to 175 hours per calendar year during which calculations are not required to be performed, despite a change in a calculated value identified in the ATC equation.
   R8.2. Daily values, once per day.
   R8.3. Monthly values, once per week.

Question #1

Is the “advisory ATC” used under the NYISO tariff subject to the ATC calculation and recalculation requirements in MOD-001-1 Requirements R2 and R8? If not, is it necessary to document the frequency of “advisory” calculations in the responsible entity’s Available Transfer Capability Implementation Document?

Response to Question #1

Requirements R2 and R8 of MOD-001-1 are both related to Requirement R1, which defines that ATC methodologies are to be applied to specific “ATC Paths.” The NERC definition of ATC Path is “Any combination of Point of Receipt and Point of Delivery for which ATC is calculated; and any Posted Path.” Based on a review of the language included in this request, the NYISO Open Access Transmission Tariff, and other information posted on the NYISO Web site, it appears that the NYISO does indeed have multiple ATC Paths, which are subject to the calculation and recalculation requirements in Requirements R2 and R8. It appears from reviewing this information that ATC is defined in the NYISO tariff in the same manner in which NERC defines it, making it difficult to conclude that NYISO’s “advisory ATC” is not the same as ATC. In addition, it appears that pre-scheduling is permitted on certain external paths, making the calculation of ATC prior to day ahead necessary on those paths.
The second part of NYISO’s question is only applicable if the first part was answered in the negative and therefore will not be addressed.

**Requirement Number and Text of Requirement**

<tr>
<td><strong>R5.</strong> When calculating ETC for firm Existing Transmission Commitments (ETC\textsubscript{F}) for a specified period for an ATC Path, the Transmission Service Provider shall use the algorithm below:</td>
</tr>
</tbody>
</table>
| \[
| \text{ETC}_F = \text{NLF} + \text{NITS}_F + \text{GF}_F + \text{PTP}_F + \text{ROR}_F + \text{OS}_F
| \]
| Where: |
| \[
| \text{NLF} \text{ is the firm capacity set aside to serve peak Native Load forecast commitments for the time period being calculated, to include losses, and Native Load growth, not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.}
| \]
| \[
| \text{NITS}_F \text{ is the firm capacity reserved for Network Integration Transmission Service serving Load, to include losses, and Load growth, not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.}
| \]
| \[
| \text{GF}_F \text{ is the firm capacity set aside for grandfathered Transmission Service and contracts for energy and/or Transmission Service, where executed prior to the effective date of a Transmission Service Provider’s Open Access Transmission Tariff or “safe harbor tariff.”}
| \]
| \[
| \text{PTP}_F \text{ is the firm capacity reserved for confirmed Point-to-Point Transmission Service.}
| \]
| \[
| \text{ROR}_F \text{ is the firm capacity reserved for Roll-over rights for contracts granting Transmission Customers the right of first refusal to take or continue to take Transmission Service when the Transmission Customer’s Transmission Service contract expires or is eligible for renewal.}
| \]
| \[
| \text{OS}_F \text{ is the firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using Firm Transmission Service as specified in the ATCID.}
| \]
| **R6.** When calculating ETC for non-firm Existing Transmission Commitments (ETC\textsubscript{NF}) for all time horizons for an ATC Path the Transmission Service Provider shall use the following algorithm: |
| \[
| \text{ETC}_NF = \text{NITS}_NF + \text{GF}_NF + \text{PTP}_NF + \text{OS}_NF
| \]
| Where: |
| \[
| \text{NITS}_NF \text{ is the non-firm capacity set aside for Network Integration Transmission Service serving Load (i.e., secondary service), to include losses, and load growth not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.}
| \]
GF\textsubscript{NF} is the non-firm capacity set aside for grandfathered Transmission Service and contracts for energy and/or Transmission Service, where executed prior to the effective date of a Transmission Service Provider’s Open Access Transmission Tariff or “safe harbor tariff.”

PTP\textsubscript{NF} is non-firm capacity reserved for confirmed Point-to-Point Transmission Service.

OS\textsubscript{NF} is the non-firm capacity reserved for any other service(s), contract(s), or agreement(s) not specified above using non-firm transmission service as specified in the ATCID.

### Question #2

Could OS\textsubscript{F} in MOD-029-2\textsubscript{a} Requirement R5 and OS\textsubscript{NF} in MOD-029-2\textsubscript{a} Requirement R6 be calculated using Transmission Flow Utilization in the determination of ATC?

### Response to Question #2

This request for interpretation and the NYISO Open Access Transmission Tariff describe the NYISO’s concept of "Transmission Flow Utilization;" however, it is unclear whether or not Native Load, Point-to-Point Transmission Service, Network Integration Transmission Service, or any of the other components explicitly defined in Requirements R5 and R6 are incorporated into "Transmission Flow Utilization." Provided that "Transmission Flow Utilization" does not include Native Load, Point-to-Point Transmission Service, Network Integration Transmission Service, or any of the other components explicitly defined in Requirements R5 and R6, it is appropriate to be included within the "Other Services" term. However, if "Transmission Flow Utilization" does incorporate those components, then simply including "Transmission Flow Utilization" in “Other Service” would be inappropriate.

A. Introduction

1. Title: Flowgate Methodology
2. Number: MOD-030-3
3. Purpose: To increase consistency and reliability in the development and documentation of transfer capability calculations for short-term use performed by entities using the Flowgate Methodology to support analysis and system operations.
4. Applicability:
   4.1.1 Each Transmission Operator that uses the Flowgate Methodology to support the calculation of Available Flowgate Capabilities (AFCs) on Flowgates.
   4.1.2 Each Transmission Service Provider that uses the Flowgate Methodology to calculate AFCs on Flowgates.
5. Proposed Effective Date: See Implementation Plan for the Revised Definition of “Remedial Action Scheme”

B. Requirements

R1. The Transmission Service Provider shall include in its “Available Transfer Capability Implementation Document” (ATCID): [Violation Risk Factor: To Be Determined] [Time Horizon: Operations Planning]
   R1.1. The criteria used by the Transmission Operator to identify sets of Transmission Facilities as Flowgates that are to be considered in Available Flowgate Capability (AFC) calculations.
   R1.2. The following information on how source and sink for transmission service is accounted for in AFC calculations including:
      R1.2.1. Define if the source used for AFC calculations is obtained from the source field or the Point of Receipt (POR) field of the transmission reservation.
      R1.2.2. Define if the sink used for AFC calculations is obtained from the sink field or the Point of Delivery (POD) field of the transmission reservation.
      R1.2.3. The source/sink or POR/POD identification and mapping to the model.
      R1.2.4. If the Transmission Service Provider’s AFC calculation process involves a grouping of generators, the ATCID must identify how these generators participate in the group.

R2. The Transmission Operator shall perform the following: [Violation Risk Factor: To Be Determined] [Time Horizon: Operations Planning]
   R2.1. Include Flowgates used in the AFC process based, at a minimum, on the following criteria:
      R2.1.1. Results of a first Contingency transfer analysis for ATC Paths internal to a Transmission Operator’s system up to the path capability such that at a minimum the first three limiting Elements and their worst associated Contingency combinations with an OTDF of at least 5% and within the Transmission Operator’s system are included as Flowgates.
      R2.1.1.1. Use first Contingency criteria consistent with those first Contingency criteria used in planning of operations for the
applicable time periods, including use of Remedial Action Schemes.

R2.1.1.2. Only the most limiting element in a series configuration needs to be included as a Flowgate.

R2.1.1.3. If any limiting element is kept within its limit for its associated worst Contingency by operating within the limits of another Flowgate, then no new Flowgate needs to be established for such limiting elements or Contingencies.

R2.1.2. Results of a first Contingency transfer analysis from all adjacent Balancing Authority source and sink (as defined in the ATCID) combinations up to the path capability such that at a minimum the first three limiting Elements and their worst associated Contingency combinations with an Outage Transfer Distribution Factor (OTDF) of at least 5% and within the Transmission Operator’s system are included as Flowgates unless the interface between such adjacent Balancing Authorities is accounted for using another ATC methodology.

R2.1.2.1. Use first Contingency criteria consistent with those first Contingency criteria used in planning of operations for the applicable time periods, including use of Remedial Action Schemes.

R2.1.2.2. Only the most limiting element in a series configuration needs to be included as a Flowgate.

R2.1.2.3. If any limiting element is kept within its limit for its associated worst Contingency by operating within the limits of another Flowgate, then no new Flowgate needs to be established for such limiting elements or Contingencies.

R2.1.3. Any limiting Element/Contingency combination at least within its Reliability Coordinator’s Area that has been subjected to an Interconnection-wide congestion management procedure within the last 12 months, unless the limiting Element/Contingency combination is accounted for using another ATC methodology or was created to address temporary operating conditions.

R2.1.4. Any limiting Element/Contingency combination within the Transmission model that has been requested to be included by any other Transmission Service Provider using the Flowgate Methodology or Area Interchange Methodology, where:

R2.1.4.1. The coordination of the limiting Element/Contingency combination is not already addressed through a different methodology, and

- Any generator within the Transmission Service Provider’s area has at least a 5% Power Transfer Distribution Factor (PTDF) or Outage Transfer Distribution Factor (OTDF) impact on the Flowgate when delivered to the aggregate load of its own area, or
- A transfer from any Balancing Area within the Transmission Service Provider’s area to a Balancing Area
adjacent has at least a 5% PTDF or OTDF impact on the Flowgate.
- The Transmission Operator may utilize distribution factors less than 5% if desired.

**R2.1.4.2.** The limiting Element/Contingency combination is included in the requesting Transmission Service Provider’s methodology.

**R2.2.** At a minimum, establish a list of Flowgates by creating, modifying, or deleting Flowgate definitions at least once per calendar year.

**R2.3.** At a minimum, establish a list of Flowgates by creating, modifying, or deleting Flowgates that have been requested as part of R2.1.4 within thirty calendar days from the request.

**R2.4.** Establish the TFC of each of the defined Flowgates as equal to:
- For thermal limits, the System Operating Limit (SOL) of the Flowgate.
- For voltage or stability limits, the flow that will respect the SOL of the Flowgate.

**R2.5.** At a minimum, establish the TFC once per calendar year.

**R2.5.1.** If notified of a change in the Rating by the Transmission Owner that would affect the TFC of a flowgate used in the AFC process, the TFC should be updated within seven calendar days of the notification.

**R2.6.** Provide the Transmission Service Provider with the TFCs within seven calendar days of their establishment.

**R3.** The Transmission Operator shall make available to the Transmission Service Provider a Transmission model to determine Available Flowgate Capability (AFC) that meets the following criteria: [Violation Risk Factor: To Be Determined] [Time Horizon: Operations Planning]

**R3.1.** Contains generation Facility Ratings, such as generation maximum and minimum output levels, specified by the Generator Owners of the Facilities within the model.

**R3.2.** Updated at least once per day for AFC calculations for intra-day, next day, and days two through 30.

**R3.3.** Updated at least once per month for AFC calculations for months two through 13.

**R3.4.** Contains modeling data and system topology for the Facilities within its Reliability Coordinator’s Area. Equivalent representation of radial lines and Facilities161kV or below is allowed.

**R3.5.** Contains modeling data and system topology (or equivalent representation) for immediately adjacent and beyond Reliability Coordination Areas.

**R4.** When calculating AFCs, the Transmission Service Provider shall represent the impact of Transmission Service as follows: [Violation Risk Factor: To Be Determined] [Time Horizon: Operations Planning]

- If the source, as specified in the ATCID, has been identified in the reservation and it is discretely modeled in the Transmission Service Provider’s Transmission model, use the discretely modeled point as the source.
- If the source, as specified in the ATCID, has been identified in the reservation and the point can be mapped to an “equivalence” or “aggregate” representation in the
Transmission Service Provider’s Transmission model, use the modeled equivalence or aggregate as the source.

- If the source, as specified in the ATCID, has been identified in the reservation and the point cannot be mapped to a discretely modeled point or an “equivalence” representation in the Transmission Service Provider’s Transmission model, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider from which the power is to be received as the source.

- If the source, as specified in the ATCID, has not been identified in the reservation use the immediately adjacent Balancing Authority associated with the Transmission Service Provider from which the power is to be received as the source.

- If the sink, as specified in the ATCID, has been identified in the reservation and it is discretely modeled in the Transmission Service Provider’s Transmission model, use the discretely modeled point as the sink.

- If the sink, as specified in the ATCID, has been identified in the reservation and the point can be mapped to an “equivalence” or “aggregate” representation in the Transmission Service Provider’s Transmission model, use the modeled equivalence or aggregate as the sink.

- If the sink, as specified in the ATCID, has been identified in the reservation and the point cannot be mapped to a discretely modeled point or an “equivalence” representation in the Transmission Service Provider’s Transmission model, use the immediately adjacent Balancing Authority associated with the Transmission Service Provider receiving the power as the sink.

- If the sink, as specified in the ATCID, has not been identified in the reservation use the immediately adjacent Balancing Authority associated with the Transmission Service Provider receiving the power as the sink.

R5. When calculating AFCs, the Transmission Service Provider shall: [Violation Risk Factor: To Be Determined] [Time Horizon: Operations Planning]

R5.1. Use the models provided by the Transmission Operator.

R5.2. Include in the transmission model expected generation and Transmission outages, additions, and retirements within the scope of the model as specified in the ATCID and in effect during the applicable period of the AFC calculation for the Transmission Service Provider’s area, all adjacent Transmission Service Providers, and any Transmission Service Providers with which coordination agreements have been executed.

R5.3. For external Flowgates, identified in R2.1.4, use the AFC provided by the Transmission Service Provider that calculates AFC for that Flowgate.

R6. When calculating the impact of ETC for firm commitments (ETCFi) for all time periods for a Flowgate, the Transmission Service Provider shall sum the following: [Violation Risk Factor: To Be Determined] [Time Horizon: Operations Planning]

R6.1. The impact of firm Network Integration Transmission Service, including the impacts of generation to load, in the model referenced in R5.2 for the Transmission Service Provider’s area, based on:

R6.1.1. Load forecast for the time period being calculated, including Native Load and Network Service load
R6.1.2. Unit commitment and Dispatch Order, to include all designated network resources and other resources that are committed or have the legal obligation to run as specified in the Transmission Service Provider's ATCID.

R6.2. The impact of any firm Network Integration Transmission Service, including the impacts of generation to load in the model referenced in R5.2 and has a distribution factor equal to or greater than the percentage\(^1\) used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed based on:

R6.2.1. Load forecast for the time period being calculated, including Native Load and Network Service load

R6.2.2. Unit commitment and Dispatch Order, to include all designated network resources and other resources that are committed or have the legal obligation to run as specified in the Transmission Service Provider's ATCID.

R6.3. The impact of all confirmed firm Point-to-Point Transmission Service expected to be scheduled, including roll-over rights for Firm Transmission Service contracts, for the Transmission Service Provider’s area.

R6.4. The impact of any confirmed firm Point-to-Point Transmission Service expected to be scheduled, filtered to reduce or eliminate duplicate impacts from transactions using Transmission service from multiple Transmission Service Providers, including roll-over rights for Firm Transmission Service contracts having a distribution factor equal to or greater than the percentage\(^2\) used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

R6.5. The impact of any Grandfathered firm obligations expected to be scheduled or expected to flow for the Transmission Service Provider’s area.

R6.6. The impact of any Grandfathered firm obligations expected to be scheduled or expected to flow that have a distribution factor equal to or greater than the percentage\(^3\) used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

R6.7. The impact of other firm services determined by the Transmission Service Provider.

R7. When calculating the impact of ETC for non-firm commitments (ETC\(_{\text{NR}}\)) for all time periods for a Flowgate the Transmission Service Provider shall sum: [Violation Risk Factor: To Be Determined] [Time Horizon: Operations Planning]

\(^1\) A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

\(^2\) A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

\(^3\) A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.
R7.1. The impact of all confirmed non-firm Point-to-Point Transmission Service expected to be scheduled for the Transmission Service Provider’s area.

R7.2. The impact of any confirmed non-firm Point-to-Point Transmission Service expected to be scheduled, filtered to reduce or eliminate duplicate impacts from transactions using Transmission service from multiple Transmission Service Providers, that have a distribution factor equal to or greater than the percentage4 used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

R7.3. The impact of any Grandfathered non-firm obligations expected to be scheduled or expected to flow for the Transmission Service Provider’s area.

R7.4. The impact of any Grandfathered non-firm obligations expected to be scheduled or expected to flow that have a distribution factor equal to or greater than the percentage5 used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

R7.5. The impact of non-firm Network Integration Transmission Service serving Load within the Transmission Service Provider’s area (i.e., secondary service), to include load growth, and losses not otherwise included in Transmission Reliability Margin or Capacity Benefit Margin.

R7.6. The impact of any non-firm Network Integration Transmission Service (secondary service) with a distribution factor equal to or greater than the percentage6 used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider, filtered to reduce or eliminate duplicate impacts from transactions using Transmission service from multiple Transmission Service Providers, for all adjacent Transmission Service Providers and any other Transmission Service Providers with which coordination agreements have been executed.

R7.7. The impact of other non-firm services determined by the Transmission Service Provider.

R8. When calculating firm AFC for a Flowgate for a specified period, the Transmission Service Provider shall use the following algorithm (subject to allocation processes described in the ATCID): [Violation Risk Factor: To Be Determined] [Time Horizon: Operations Planning]

\[
\text{AFC}_F = \text{TFC} - \text{ETC}_{F_i} - \text{CBM}_i - \text{TRM}_i + \text{Postbacks}_{F_i} + \text{counterflows}_{F_i}
\]

Where:

\[\text{AFC}_F\] is the firm Available Flowgate Capability for the Flowgate for that period.

4 A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

5 A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.

6 A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.
TFC is the Total Flowgate Capability of the Flowgate.

ETC_Fi is the sum of the impacts of existing firm Transmission commitments for the Flowgate during that period.

CBM_i is the impact of the Capacity Benefit Margin on the Flowgate during that period.

TRM_i is the impact of the Transmission Reliability Margin on the Flowgate during that period.

Postbacks_Fi are changes to firm AFC due to a change in the use of Transmission Service for that period, as defined in Business Practices.

counterflows_Fi are adjustments to firm AFC as determined by the Transmission Service Provider and specified in their ATCID.

R9. When calculating non-firm AFC for a Flowgate for a specified period, the Transmission Service Provider shall use the following algorithm (subject to allocation processes described in the ATCID): [Violation Risk Factor: To Be Determined] [Time Horizon: Operations Planning]

\[ AFC_{NF} = TFC - ETC_Fi - ETC_{NF} - CBM_i - TRM_i + Postbacks_{NF} + counterflows \]

Where:

AFC_{NF} is the non-firm Available Flowgate Capability for the Flowgate for that period.

TFC is the Total Flowgate Capability of the Flowgate.

ETC_Fi is the sum of the impacts of existing firm Transmission commitments for the Flowgate during that period.

ETC_{NF} is the sum of the impacts of existing non-firm Transmission commitments for the Flowgate during that period.

CBM_i is the impact of any schedules during that period using Capacity Benefit Margin.

TRM_i is the impact on the Flowgate of the Transmission Reliability Margin that has not been released (unreleased) for sale as non-firm capacity by the Transmission Service Provider during that period.

Postbacks_{NF} are changes to non-firm Available Flowgate Capability due to a change in the use of Transmission Service for that period, as defined in Business Practices.

counterflows_{NF} are adjustments to non-firm AFC as determined by the Transmission Service Provider and specified in their ATCID.

R10. Each Transmission Service Provider shall recalculate AFC, utilizing the updated models described in R3.2, R3.3, and R5, at a minimum on the following frequency, unless none of the calculated values identified in the AFC equation have changed: [Violation Risk Factor: To Be Determined] [Time Horizon: Operations Planning]

R10.1. For hourly AFC, once per hour. Transmission Service Providers are allowed up to 175 hours per calendar year during which calculations are not required to be performed, despite a change in a calculated value identified in the AFC equation.

R10.2. For daily AFC, once per day.

R10.3. For monthly AFC, once per week.
R11. When converting Flowgate AFCs to ATCs for ATC Paths, the Transmission Service Provider shall convert those values based on the following algorithm: [Violation Risk Factor: To Be Determined] [Time Horizon: Operations Planning]

\[ ATC = \min(P) \]
\[ P = \{PATC_1, PATC_2, \ldots, PATC_n\} \]
\[ PATC_n = \frac{AFC_n}{DF_{np}} \]

Where:

- **ATC** is the Available Transfer Capability.
- **P** is the set of partial Available Transfer Capabilities for all “impacted” Flowgates honored by the Transmission Service Provider; a Flowgate is considered “impacted” by a path if the Distribution Factor for that path is greater than the percentage\(^7\) used to curtail in the Interconnection-wide congestion management procedure used by the Transmission Service Provider on an OTDF Flowgate or PTDF Flowgate.
- **PATC\(_n\)** is the partial Available Transfer Capability for a path relative to a Flowgate \(n\).
- **AFC\(_n\)** is the Available Flowgate Capability of a Flowgate \(n\).
- **DF\(_{np}\)** is the distribution factor for Flowgate \(n\) relative to path \(p\).

C. Measures

M1. Each Transmission Service Provider shall provide its ATCID and other evidence (such as written documentation) to show that its ATCID contains the criteria used by the Transmission Operator to identify sets of Transmission Facilities as Flowgates and information on how sources and sinks are accounted for in AFC calculations. (R1)

M2. The Transmission Operator shall provide evidence (such as studies and working papers) that all Flowgates that meet the criteria described in R2.1 are considered in its AFC calculations. (R2.1)

M3. The Transmission Operator shall provide evidence (such as logs) that it updated its list of Flowgates at least once per calendar year. (R2.2)

M4. The Transmission Operator shall provide evidence (such as logs and dated requests) that it updated the list of Flowgates within thirty calendar days from a request. (R2.3)

M5. The Transmission Operator shall provide evidence (such as data or models) that it determined the TFC for each Flowgate as defined in R2.4. (R2.4)

M6. The Transmission Operator shall provide evidence (such as logs) that it established the TFCs for each Flowgate in accordance with the timing defined in R2.5. (R2.5)

M7. The Transmission Operator shall provide evidence (such as logs and electronic communication) that it provided the Transmission Service Provider with updated TFCs within seven calendar days of their determination. (R2.6)

---

\(^7\) A percentage less than that used in the Interconnection-wide congestion management procedure may be utilized.
M8. The Transmission Operator shall provide evidence (such as written documentation, logs, models, and data) that the Transmission model used to determine AFCs contains the information specified in R3. (R3)

M9. The Transmission Service Provider shall provide evidence (such as written documentation and data) that the modeling of point-to-point reservations was based on the rules described in R4. (R4)

M10. The Transmission Service Provider shall provide evidence including the models received from Transmission Operators and other evidence (such as documentation and data) to show that it used the Transmission Operator’s models in calculating AFC. (R5.1)

M11. The Transmission Service Provider shall provide evidence (such as written documentation, electronic communications, and data) that all expected generation and Transmission outages, additions, and retirements were included in the AFC calculation as specified in the ATCID. (R5.2)

M12. The Transmission Service Provider shall provide evidence (such as logs, electronic communications, and data) that AFCs provided by third parties on external Flowgates were used instead of those calculated by the Transmission Operator. (R5.3)

M13. The Transmission Service Provider shall demonstrate compliance with R6 by recalculating firm ETC for any specific time period as described in (MOD-001 R2), using the requirements defined in R6 and with data used to calculate the specified value for the designated time period. The data used must meet the requirements specified in this standard and the ATCID. To account for differences that may occur when recalculating the value (due to mixing automated and manual processes), any recalculated value that is within +/- 15% or 15 MW, whichever is greater, of the originally calculated value, is evidence that the Transmission Service Provider used the requirements defined in R6 to calculate its firm ETC. (R6)

M14. The Transmission Service Provider shall demonstrate compliance with R7 by recalculating non-firm ETC for any specific time period as described in (MOD-001 R2), using the requirements defined in R7 and with data used to calculate the specified value for the designated time period. The data used must meet the requirements specified in the standard and the ATCID. To account for differences that may occur when recalculating the value (due to mixing automated and manual processes), any recalculated value that is within +/- 15% or 15 MW, whichever is greater, of the originally calculated value, is evidence that the Transmission Service Provider used the requirements in R7 to calculate its non-firm ETC. (R7)

M15. Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates firm AFCs, as required in R8. Such documentation must show that only the variables allowed in R8 were used to calculate firm AFCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc…). The supporting documentation may be provided in the same form and format as stored by the Transmission Service Provider. (R8)

M16. Each Transmission Service Provider shall produce the supporting documentation for the processes used to implement the algorithm that calculates non-firm AFCs, as required in R9. Such documentation must show that only the variables allowed in R9 were used to calculate non-firm AFCs, and that the processes use the current values for the variables as determined in the requirements or definitions. Note that any variable may legitimately be zero if the
value is not applicable or calculated to be zero (such as counterflows, TRM, CBM, etc…).
The supporting documentation may be provided in the same form and format as stored by the
Transmission Service Provider. (R9)

**M17.** The Transmission Service Provider shall provide evidence (such as documentation, dated
logs, and data) that it calculated AFC on the frequency defined in R10. (R10)

**M18.** The Transmission Service Provider shall provide evidence (such as documentation and data)
when converting Flowgate AFCs to ATCs for ATC Paths, it follows the procedure described
in R11. (R11)

### D. Compliance

1. **Compliance Monitoring Process**

   1.1. **Compliance Enforcement Authority**

   Regional Entity.

   1.2. **Compliance Monitoring Period and Reset Time Frame**

   Not applicable.

   1.3. **Data Retention**

   The Transmission Operator and Transmission Service Provider shall keep data or evidence to
   show compliance as identified below unless directed by its Compliance Enforcement
   Authority to retain specific evidence for a longer period of time as part of an investigation:

   - The Transmission Service Provider shall retain its current, in force ATCID and any prior
     versions of the ATCID that were in force since the last compliance audit to show
     compliance with R1.

   - The Transmission Operator shall have its latest model used to determine flowgates and
     TFC and evidence of the previous version to show compliance with R2 and R3.

   - The Transmission Operator shall retain evidence to show compliance with R2.1, R2.3 for
     the most recent 12 months.

   - The Transmission Operator shall retain evidence to show compliance with R2.2, R2.4
     and R2.5 for the most recent three calendar years plus current year.

   - The Transmission Service Provider shall retain evidence to show compliance with R4 for
     12 months or until the model used to calculate AFC is updated, whichever is longer.

   - The Transmission Service Provider shall retain evidence to show compliance with R5,
     R8, R9, R10, and R11 for the most recent calendar year plus current year.

   - The Transmission Service Provider shall retain evidence to show compliance in
     calculating hourly values required in R6 and R7 for the most recent 14 days; evidence to
     show compliance in calculating daily values required in R6 and R7 for the most recent 30
     days; and evidence to show compliance in calculating monthly values required in R6 and
     R7 for the most recent sixty days.

   - If a Transmission Service Provider or Transmission Operator is found non-compliant, it
     shall keep information related to the non-compliance until found compliant.

   The Compliance Enforcement Authority shall keep the last audit records and all requested
   and submitted subsequent audit records.

1.4. **Compliance Monitoring and Enforcement Processes:**
The following processes may be used:
- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Violation Investigations
- Self-Reporting
- Complaints

1.5. Additional Compliance Information
None.
## 2. Violation Severity Levels

<table>

A. Introduction

1. Title: Available Transmission System Capability
2. Number: MOD-001-2
3. Purpose:

   To ensure that determinations of available transmission system capability are determined in a manner that supports the reliable operation of the Bulk-Power System (BPS) and that the methodology and data underlying those determinations are disclosed to those registered entities that need such information for reliability purposes.

4. Applicability:

   4.1. Functional Entity
       4.1.1 Transmission Operator
       4.1.2 Transmission Service Provider

   4.2. Exemptions: The following is exempt from MOD-001-2.
       4.2.1 Functional Entities operating within the Electric Reliability Council of Texas (ERCOT)

5. Effective Date:

   5.1. The standard shall become effective on the first day of the first calendar quarter that is 18 months after the date that the standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is 18 months after the date the standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction.
B. Requirements and Measures

R1. Each Transmission Operator that determines Total Flowgate Capability (TFC) or Total Transfer Capability (TTC) shall develop a written methodology (or methodologies) for determining TFC or TTC values. The methodology (or methodologies) shall reflect the Transmission Operator’s current practices for determining TFC or TTC values. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

1.1 Each methodology shall describe the method used to account for the following limitations in both the pre- and post-contingency state:

1.1.1 Facility ratings;
1.1.2 System voltage limits;
1.1.3 Transient stability limits;
1.1.4 Voltage stability limits; and
1.1.5 Other System Operating Limits (SOLs).

1.2 Each methodology shall describe the method used to account for each of the following elements, provided such elements impact the determination of TFC or TTC:

1.2.1 The simulation of transfers performed through the adjustment of generation, Load, or both;
1.2.2 Transmission topology, including, but not limited to, additions and retirements;
1.2.3 Expected transmission uses;
1.2.4 Planned outages;
1.2.5 Parallel path (loop flow) adjustments;
1.2.6 Load forecast; and
1.2.7 Generator dispatch, including, but not limited to, additions and retirements.

1.3 Each methodology shall describe the process for including any reliability-related constraints that are requested to be included by another Transmission Operator, provided that (1) the request references this specific requirement, and (2) the requesting Transmission Operator includes those constraints in its TFC or TTC determination.

1.3.1 Each Transmission Operator that uses the Flowgate Methodology shall include in its methodology an impact test process for including requested constraints. If a generator to Load transfer in a registered entity’s area or a transfer to a neighboring registered entity impacts the requested constraint by five percent or greater, the requested constraint shall be included in the TFC determination, otherwise the requested constraint is not required to be included.

1.3.2 Each Transmission Operator that uses the Area Interchange or Rated System Path Methodology shall describe in its methodology the process it uses to account for requested constraints that have a five percent or greater distribution factor for a transfer
between areas in the TTC determination; otherwise the requested constraint is not required to be included. When testing transfers involving the requesting Transmission Operator’s area, the requested constraint may be excluded.

1.3.3 A different method for determining whether requested constraints need to be included in the TFC or TTC determination may be used if agreed to by the Transmission Operators.

M1. Each Transmission Operator that determines TFC or TTC shall provide its current written methodology (or methodologies) or other evidence (such as written documentation) to show that its methodology (or methodologies) contains the following:

- A description of the method used to account for the limits specified in part 1.1. Methods of accounting for these limits may include, but are not limited to, one or more of the following:
  - TFC or TTC being determined by one or more limits.
  - Simulation being used to find the maximum TFC or TTC that remains within the limit.
  - The application of a distribution factor in determining if a limit affects the TFC or TTC value.
  - Monitoring a subset of limits and a statement that those limits are expected to produce the most severe results.
  - A statement that the monitoring of a select limit(s) results in the TFC or TTC not exceeding another set of limits.
  - A statement that one or more of those limits are not applicable to the TFC or TTC determination.

- A description of the method used to account for the elements specified in part 1.2, provided such elements impact the determination of TFC or TTC. Methods of accounting for these elements may include, but are not limited to, one or more of the following:
  - A statement that the element is not accounted for since it does not affect the determination of TFC or TTC.
  - A description of how the element is used in the determination of TFC or TTC.

- A description of the process for including any reliability-related constraints that are requested to be included by another Transmission Operator, as specified in parts 1.3, 1.3.1, 1.3.2, or 1.3.3).

- Each Transmission Operator that determines TFC or TTC shall provide evidence that currently active TFC or TTC values were determined based on its current written methodology, as specified in Requirement R1.

R2. Each Transmission Service Provider that determines Available Flowgate Capability (AFC) or Available Transfer Capability (ATC) shall develop an Available Transfer Capability Implementation Document (ATCID) that describes the methodology (or methodologies) for determining AFC or ATC values. The methodology (or methodologies) shall reflect the Transmission Service Provider’s current practices for determining AFC or ATC values. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]
2.1. Each methodology shall describe the method used to account for the following elements, provided such elements impact the determination of AFC or ATC:

2.1.1. The simulation of transfers performed through the adjustment of generation, Load, or both;

2.1.2. Transmission topology, including, but not limited to, additions and retirements;

2.1.3. Expected transmission uses;

2.1.4. Planned outages;

2.1.5. Parallel path (loop flow) adjustments;

2.1.6. Load forecast; and

2.1.7. Generator dispatch, including, but not limited to, additions and retirements.

2.2. Each Transmission Service Provider that uses the Flowgate Methodology shall, for reliability-related constraints identified in part 1.3, use the AFC determined by the Transmission Service Provider for that constraint.

M2. Each Transmission Service Provider that determines AFC or ATC shall provide its current ATCID or other evidence (such as written documentation) to show that its ATCID contains the following:

- A description of the method used to account for the elements specified in part 2.1, provided such elements impact the determination of AFC or ATC. Methods of accounting for these elements may include, but are not limited to, one or more of the following:
  - A description of how the element is used in the determination of AFC or ATC.
  - A statement that the element is not accounted for since it does not affect the determination of AFC or ATC.
  - A statement that the element is accounted for in the determination of TFC or TTC by the Transmission Operator, and does not otherwise affect the determination of AFC or ATC.

- For each Transmission Service Provider that uses the Flowgate Methodology, a description of the method in which AFC provided by another Transmission Service Provider was used for the reliability-related constraints identified in part 1.3.

- Each Transmission Service Provider that determines AFC or ATC shall provide evidence that currently active AFC or ATC values were determined based on its current written methodology, as specified in Requirement R2.

R3. Each Transmission Service Provider that determines Capacity Benefit Margin (CBM) values shall develop a Capacity Benefit Margin Implementation Document (CBMID) that describes its method for determining CBM values. The method described in the CBMID shall reflect the Transmission Service Provider’s current practices for determining CBM values. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]
M3. Each Transmission Service Provider that determines CBM shall provide evidence, including, but not limited to, its current CBMID, current CBM values, or other evidence (such as written documentation, study reports, or supporting information) to demonstrate that it determined CBM values consistent with its methodology described in the CBMID. If a Transmission Service Provider does not maintain CBM, examples of evidence include, but are not limited to, an attestation, statement, or other documentation that states the Transmission Service Provider does not maintain CBM.

R4. Each Transmission Operator that determines Transmission Reliability Margin (TRM) values shall develop a Transmission Reliability Margin Implementation Document (TRMID) that describes its method for determining TRM values. The method described in the TRMID shall reflect the Transmission Operator’s current practices for determining TRM values. [Violation Risk Factor: Lower][Time Horizon: Operations Planning]

M4. Each Transmission Operator that determines TRM shall provide evidence including, but not limited to, its current TRMID, current TRM values, or other evidence (such as written documentation, study reports, or supporting information) to demonstrate that it determined TRM values consistent with its methodology described in the TRMID. If a Transmission Operator does not maintain TRM, examples of evidence include, but are not limited to, an attestation, statement, or other documentation that states the Transmission Operator does not maintain TRM.

R5. Within 45 calendar days of receiving a written request that references this specific requirement from a Planning Coordinator, Reliability Coordinator, Transmission Operator, Transmission Planner, Transmission Service Provider, or any other registered entity that demonstrates a reliability need, each Transmission Operator or Transmission Service Provider shall provide: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

5.1. A written response to any request for clarification of its TFC or TTC methodology, ATCID, CBMID, or TRMID. If the request for clarification is contrary to the Transmission Operator’s or Transmission Service Provider’s confidentiality, regulatory, or security requirements then a written response shall be provided explaining the clarifications not provided, on what basis and whether there are any options for resolving any of the confidentiality, regulatory, or security concerns.

5.2. If not publicly posted on OASIS or its company website, the Transmission Operator’s effective:

5.2.1 TRMID; and

5.2.2 TFC or TTC methodology.

5.3. If not publicly posted on OASIS or its company website, the Transmission Service Provider’s effective:

5.3.1 ATCID; and

5.3.2 CBMID.
M5. Examples of evidence include, but are not limited to:

- Dated records of the request and the Transmission Operator’s or Transmission Service Provider’s response to the request;
- A statement by the Transmission Operator or Transmission Service Provider that they have received no requests; or
- A statement by the Transmission Operator or Transmission Service Provider that they do not determine one or more of these values: AFC, ATC, CBM, TFC, TTC or TRM.

R6. Each Transmission Operator or Transmission Service Provider that receives a written request from another Transmission Operator or Transmission Service Provider for data related to AFC, ATC, TFC, or TTC determinations that (1) references this specific requirement, and (2) specifies that the requested data is for use in the requesting party’s AFC, ATC, TFC, or TTC determination shall take one of the actions below. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning]

6.1. In responding to a written request for data on an ongoing basis, the Transmission Service Provider or Transmission Operator shall make available its data on an ongoing basis no later than 45 calendar days from receipt of the written request. Unless otherwise agreed upon, the Transmission Operator or Transmission Service Provider is not required to:

6.1.1 Alter the format in which it maintains or uses the data; or

6.1.2 Make available the requested data on a more frequent basis than it produces the data and in no event shall it be required to provide the data more frequently than once an hour.

6.2 In responding to all other data requests, each Transmission Operator or Transmission Service Provider shall make available the requested data within 45 calendar days of receipt of the written request. Unless otherwise agreed upon, the Transmission Operator or Transmission Service Provider is not required to alter the format in which it maintains or uses the data.

6.3 If making available any requested data under parts 6.1 or 6.2 of this requirement is contrary to the Transmission Operator’s or Transmission Service Provider’s confidentiality, regulatory, or security requirements, the Transmission Operator or Transmission Service Provider shall not be required to make available that data; provided that, within 45 calendar days of the written request, it responds to the requesting registered entity specifying the data that is not being provided, on what basis and whether there are any options for resolving any of the confidentiality, regulatory or security concerns.

M6. Examples of evidence for a data request that involves providing data on an ongoing basis (6.1), include, but are not limited to:

- Dated records of a registered entity’s request, and examples of the response being met;
- Dated records of a registered entity’s request, and a statement from the requestor that the request was met (demonstration that the response was met is not required if the requestor confirms it is being provided); or
• A statement by the Transmission Operator or Transmission Service Provider that they have received no requests under this requirement.

Examples of evidence for all other data requests (6.2) include, but are not limited to:
• Dated records of a registered entity’s request, and the response to the request;
• Dated records of a registered entity’s request, and a statement from the requestor that the request was met; or
• A statement by the Transmission Operator or Transmission Service Provider that they have received no requests under this requirement.

An example of evidence of a response by the Transmission Operator or Transmission Service Provider that providing the data would be contrary to the registered entity’s confidentiality, regulatory, or security requirements (6.3) is a response to the requestor specifying the data that is not being provided, on what basis and whether there are any options for resolving any of the confidentiality, regulatory, or security concerns.
C. Compliance

1. Compliance Monitoring Process:

1.1. Compliance Enforcement Authority:

As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” refers to NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention:

The following evidence retention periods identify the period of time a registered entity is required to retain specific evidence to demonstrate compliance. For instances in which the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask the registered entity to provide other evidence to show that it was compliant for the full time period since the last audit.

- Implementation and methodology documents shall be retained for five years.
- Components of the calculations and the results of such calculations for all values contained in the implementation and methodology documents.
  - Hourly values for the most recent 14 days;
  - Daily values for the most recent 30 days; and
  - Monthly values for the most recent 60 days.
- If a Transmission Operator or Transmission Service Provider is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved.
- The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes:

- “Compliance Monitoring and Assessment Processes” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated reliability standard.

1.4. Additional Compliance Information:

- None

Guidelines and Technical Basis
Please see the MOD A White Paper for further information regarding the technical basis for each requirement.

Rationale:
During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for R1:
Total Flowgate Capability (TFC) and Total Transfer Capability (TTC) are the starting points for the Available Flowgate Capability (AFC) and Available Transfer Capability (ATC) values. AFC and ATC values influence Real-time conditions and have the ability to impact Real-time operations. A Transmission Operator (TOP) shall clearly document its methods of determining TFC and TTC so that any TOP or Transmission Service Provider (TSP) that uses the information can clearly understand how the values are determined. The TFC and TTC values shall account for any reliability-related constraints that limit those values as well as system conditions forecasted for the time period for which those values are determined. The TFC and TTC values shall also incorporate constraints on external systems when appropriate, in addition to constraints on the TOP’s own system. Requirement R1 sets requirements for the determination of TFC or TTC, but does not establish if a TOP must determine TFC or TTC.

Rationale for R2:
A TSP must clearly document its methods of determining AFC and ATC so that TOPs or other entities can clearly understand how the values are determined. The AFC and ATC values shall account for system conditions at the time those values would be used. Each TSP that uses the Flowgate Methodology shall also use the AFC value determined by the TSP responsible for an external system constraint where appropriate. Requirement R2 sets requirements for the determination of AFC or ATC, but does not establish if a TSP must determine AFC or ATC.
Application Guidelines

Rationale for R3:
Capacity Benefit Margin (CBM) is one of the values that may be used in determining the AFC or ATC value. CBM is the amount of firm transmission transfer capability preserved by the transmission provider for Load-Serving Entities (LSEs), whose Loads are located on that TSP’s system, to enable access by the LSEs to generation from interconnected systems to meet resource reliability requirements. A clear explanation of how the CBM value is developed is an important aspect of the TSP’s ability to communicate to other entities how that AFC or ATC value was determined. Therefore anytime CBM is used (non-zero) a CBMID is required to communicate the method of determining CBM.

Rationale for R4:
Transmission Reliability Margin (TRM) is one of the values that may be used in determining the AFC or ATC value. TRM accounts for the inherent uncertainty in system conditions and the need for operating flexibility to ensure reliable system operation as system conditions change. An explanation by the TOP of how the TRM value is developed for use in the TSP’s determination of AFC and ATC is an important aspect of the TSP’s ability to communicate to other entities how that AFC or ATC value was determined. Therefore, anytime a TOP provides a non-zero TRM to a TSP, a Transmission Reliability Margin Implementation Document (TRMID) is required to communicate the method of determining TRM.

Rationale for R5:
Clear communication of the methods of determining AFC, ATC, CBM, TFC, TRM, and TTC are necessary to the reliable operation of the Bulk-Power System (BPS). A TOP and TSP are obligated to make available their methodologies for determining AFC, ATC, CBM, TFC, TRM, and TTC to those with a reliability need. The TOP and TSP are further obligated to respond to any requests for clarification on those methodologies, provided that responding to such requests would not be contrary to the registered entities confidentiality, regulatory, or security concerns. The purpose of this requirement is not to monitor every communication that occurs regarding these values, but to ensure that those with reliability need have access to the information. Therefore, the requirement is very specific on when it is invoked so that it does not create an administrative burden on regular communications between registered entities.

Rationale for R6:
This requirement provides a mechanism for each TOP or TSP to access the best available data for use in its calculation of AFC, ATC, CBM, TFC, TRM, and TTC values. Requirement R6 requires that a TOP or TSP share their data, with the caveat that the TOP or TSP is not required to modify that data from the form that they use or maintain it in. For data requests that involve providing data on a regular interval, the TOP or TSP is not obligated to provide the data more frequently than either (1) once an hour, or (2) as often as they update the data. The data provider is also not obligated to provide data that would violate any of its confidentiality, regulatory, or security obligations. The purpose of this requirement is not to monitor every data exchange that occurs regarding these values, but to ensure that those with reliability need have access to the information. Therefore, the requirement is very specific on when it is invoked so that it does not create an administrative burden on regular communications between registered entities.

Implementation Plan
Project 2018-03 Standards Efficiency Review Retirements

Applicable Standard(s)

- FAC-008-4 – Facility Ratings
- INT-006-5 – Evaluation of Interchange Transactions
- INT-009-3 – Implementation of Interchange
- IRO-002-6 – Reliability Coordination – Monitoring and Analysis
- PRC-004-6 – Protection System Misoperation Identification and Correction
- TOP-001-5 – Transmission Operations
- VAR-001-6 – Voltage and Reactive Control

Requested Retirement(s)

- FAC-008-3 – Facility Ratings
- FAC-013-2 – Assessment of Transfer Capability for the Near-term Transmission Planning Horizon
- INT-004-3.1 – Dynamic Transfers
- INT-006-4 – Evaluation of Interchange Transactions
- INT-009-2.1 – Implementation of Interchange
- INT-010-2.1 – Interchange Initiation and Modification for Reliability
- IRO-002-5 – Reliability Coordination – Monitoring and Analysis
- MOD-001-1a – Available Transmission System Capability
- MOD-004-1 – Capacity Benefit Margin
- MOD-008-1 – Transmission Readability Margin Calculation Methodology
- MOD-020-0 – Providing Interruptible Demands and Direct Control Load Management Data to System Operators and Reliability Coordinators
- MOD-028-2 – Area Interchange Methodology
- MOD-029-2a – Rated System Path Methodology
- MOD-030-3 – Flowgate Methodology
- PRC-004-5(i) – Protection System Misoperation Identification and Correction
- TOP-001-4– Transmission Operations
- VAR-001-5– Voltage and Reactive Control
Requested Withdrawal

• MOD-001-2 – Available Transmission System Capability

Applicable Entities
See subject standards.

Background
In 2017, NERC initiated the Standards Efficiency Review. The scope of this project was to use a risk-based approach to identify potential efficiencies through retirement or modification of Reliability Standard requirements. Following the completion of the first phase of work, the Standards Efficiency Review Team submitted a Standard Authorization Request (SAR) to the NERC Standards Committee in August 2018.

Project 2018-03 Standards Efficiency Review Retirements was initiated to consider and implement the recommendations for Reliability Standard retirements contained in the SAR. This project proposes to:

• retire several Reliability Standards on the grounds that the requirements contained therein are duplicative to other requirements, administrative in nature, or are otherwise unnecessary for reliability;
• revise several currently-effective Reliability Standards to remove duplicative, administrative, or otherwise unnecessary requirements (thereby retiring those requirements); and
• withdraw a standard, MOD-001-2, that is currently pending approval by applicable governmental authorities.

General Considerations
For Reliability Standards that are proposed to be retired in their entirety (i.e., no new standard version is proposed), this Implementation Plan provides that the retirement shall become effective immediately upon regulatory approval.

For Reliability Standards that are revised to remove requirements, the revised standards will become effective on the first day of the first calendar quarter that is three (3) months after applicable regulatory approval. This implementation timeframe reflects consideration that entities may need time to update their internal systems and documentation to reflect the new standard version numbers.

Effective Date

Reliability Standards FAC-008-4, INT-006-5, INT-009-3, IRO-002-6, PRC-004-6, TOP-001-5, and VAR-001-6
Where approval by an applicable governmental authority is required, the standard shall become effective on the first day of the first calendar quarter that is three (3) months after the effective date of the applicable governmental authority’s order approving the standard, or as otherwise provided for by the applicable governmental authority.
Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is three (3) months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

**Retirement Date**

The Reliability Standard shall be retired immediately prior to the effective date of the revised standard in the particular jurisdiction in which the revised standard is becoming effective.

The Reliability Standard shall be retired on the effective date of the applicable governmental authority’s order approving retirement of the standard, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the standard shall be retired on the date the standard is retired by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.
Background Information

In 2017, NERC initiated the Standards Efficiency Review (SER). The scope of this project was to use a risk-based approach to identify potential efficiencies through retirement of Reliability Standard Requirements. Following the completion of the first phase of work, the SER Team submitted a Standard Authorization Request (SAR) to the NERC Standards Committee, which the Standards Committee accepted in August 2018.

Project 2018-03 Standards Efficiency Review Retirements was initiated to consider and implement the recommendations for Reliability Standard retirements contained in the SAR. This project proposes to:

- Retire several Reliability Standards on the grounds that the requirements contained therein are duplicative to other requirements, administrative in nature, or are otherwise unnecessary for reliability;
- Revise several currently-effective Reliability Standards to remove duplicative, administrative, or otherwise unnecessary requirements (thereby retiring those requirements); and
- Withdraw a Reliability Standard, MOD-001-2, which is currently pending approval by applicable governmental authorities.

Based on the expertise of the Standard Drafting Team (SDT) and from consideration of the comments received in the SAR posting, the SDT considered the recommendations for retirements listed in the SAR and determined that it would not proceed with several of the recommended retirements for the following reasons:

1. The SDT has determined that additional work is necessary to ensure the retirement of certain standard requirements does not create a reliability gap. The SDT recommends that these standards requirements be considered as part of the SER Phase II effort. These requirements include:
   - BAL-005-1, Requirements R4 and R6
   - COM-002-4, Requirement R2
• EOP-005-3, Requirement R8
• EOP-006-3, Requirement R7
• IRO-014-3, Requirement R3
• IRO-017-1, Requirement R3
• VAR-001-5, Requirement R3

2. The SDT is proposing to take no action on two standards already scheduled for retirement.
   • PRC-015-1, Requirements R1, R2 and R3
   • PRC-018-1, Requirements, R1, R2, R3, R4, R5 and R6

3. The SDT determined the following requirements are inappropriate for retirement because they serve a reliability benefit:
   • IRO-002-5, Requirements R4 and R6
     ▪ Requirements R4 and R6 are necessary for the Real-time operators to be assured of having the tools necessary to monitor the BES. The inclusion of the Energy Management System (EMS), IT or communications-related equipment is not explicitly required by IRO-017-1, Requirement R1.
   • IRO-008-2, Requirement R6
     ▪ Although Requirement R6 appears to be administrative in nature, there are reliability benefits to knowing what actions were taken to prevent or mitigate the exceedance.
   • TOP-001-4, Requirements R16 and R17
     ▪ Requirements R16 and R17 are necessary to make it clear that the System Operator has the authority to postpone, cancel or recall planned outages of EMS, IT or communications-related equipment. Although some Reliability Coordinators may include this type of equipment in their outage coordination process (IRO-017-1), the inclusion of EMS, IT or communications-related equipment is not explicitly required by IRO-017-1, Requirement R1.

The SDT created a justification document that is posted as a supporting document on the project page.
Questions

1. The SDT has determined that additional work is necessary to ensure the retirement of certain standard requirements does not create a reliability gap. The SDT recommends that these standards requirements be considered as part of the SER Phase II effort. These requirements include: BAL-005-1, Requirements R4 and R6; COM-002-4, Requirement R2; EOP-005-3, Requirement R8; EOP-006-3, Requirement R7; IRO-014-3, Requirement R3; IRO-017-1, Requirement R3; and VAR-001-5, Requirement R3. Do you agree with the SDT’s recommendation that these standards requirements be considered as part of the SER Phase II effort? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s recommendation, please provide your explanation.

☐ Yes
☐ No

Comments:

2. The SDT is proposing to take no action on two standards already scheduled for retirement: PRC-015-1, Requirements R1, R2 and R3; and PRC-018-1, Requirements, R1, R2, R3, R4, R5 and R6. Do you agree with the SDT’s recommendation to take no action for these standards already scheduled for retirement? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s recommendation, please provide your explanation.

☐ Yes
☐ No

Comments:

3. The SDT determined the following requirements are inappropriate for retirement because they serve a reliability benefit: IRO-002-5, Requirements R4 and R6; IRO-008-2, Requirement R6, and TOP-001-4, Requirements R16 and R17. Do you agree with the SDT’s recommendation to retain these requirements? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s recommendation, please provide your explanation.

☐ Yes
☐ No

Comments:
4. The SDT is proposing to retire FAC-008-3, Requirements R7 and R8. Do you agree with the SDT’s proposal to retire these requirements? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

☐ Yes
☐ No

Comments:

5. The SDT is proposing to retire FAC-013-2, Requirements R1, R2, R4, R5 and R6 (all). Do you agree with the SDT’s proposal to retire FAC-013-2? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

☐ Yes
☐ No

Comments:

6. The SDT is proposing to retire INT-004-3.1, Requirements R1, R2, and R3 (all). Do you agree with the SDT’s proposal to retire INT-004-3.1? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

☐ Yes
☐ No

Comments:

7. The SDT is proposing to retire INT-006-4, Requirements R3.1, R4, and R5. Do you agree with the SDT’s proposal to retire Requirements R3.1, R4, and R5 of INT-006-4? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

☐ Yes
☐ No

Comments:
8. The SDT is proposing to retire INT-009-2.1, Requirement R2. Do you agree with the SDT’s proposal to retire Requirement R2 of INT-009-2.1? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

☐ Yes
☐ No

Comments:

9. The SDT is proposing to retire INT-010-2.1, Requirements R1, R2, and R3 (all). Do you agree with the SDT’s proposal to retire INT-010-2.1? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

☐ Yes

Violation Risk Factor and Violation Severity Level Justifications
Project 2018-03 Standards Efficiency Review Retirements

This document provides the standard drafting team’s (SDT’s) justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in proposed Reliability Standard FAC-008-4. Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the Electric Reliability Organizations (ERO) Sanction Guidelines. The SDT applied the following NERC criteria and FERC Guidelines when developing the VRFs and VSLs for the requirements.

NERC Criteria for Violation Risk Factors

High Risk Requirement
A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement
A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.
Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

FERC Guidelines for Violation Risk Factors

Guideline (1) - Consistency with the Conclusions of the Final Blackout Report
FERC seeks to ensure that VRFs assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.
**Guideline (2) - Consistency within a Reliability Standard**
FERC expects a rational connection between the sub-Requirement VRF assignments and the main Requirement VRF assignment.

**Guideline (3) - Consistency among Reliability Standards**
FERC expects the assignment of VRFs corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

**Guideline (4) - Consistency with NERC’s Definition of the Violation Risk Factor Level**
Guideline (4) was developed to evaluate whether the assignment of a particular VRF level conforms to NERC’s definition of that risk level.

**Guideline (5) - Treatment of Requirements that Co-mingle More Than One Obligation**
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.
NERC Criteria for Violation Severity Levels

VSLs define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple “degrees” of noncompliant performance and may have only one, two, or three VSLs.

VSLs should be based on NERC’s overarching criteria shown in the table below:

<table>
<thead>
<tr>
<th>Lower VSL</th>
<th>Moderate VSL</th>
<th>High VSL</th>
<th>Severe VSL</th>
</tr>
</thead>
<tbody>
<tr>
<td>The performance or product measured almost meets the full intent of the requirement.</td>
<td>The performance or product measured meets the majority of the intent of the requirement.</td>
<td>The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.</td>
<td>The performance or product measured does not substantively meet the intent of the requirement.</td>
</tr>
</tbody>
</table>

FERC Order of Violation Severity Levels

The FERC VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

**Guideline (1) - Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance**

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

**Guideline (2) - Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties**

A violation of a “binary” type requirement must be a “Severe” VSL.
Do not use ambiguous terms such as “minor” and “significant” to describe noncompliant performance.

**Guideline (3) - Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement**

VSLs should not expand on what is required in the requirement.
Guideline (4) – Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

VRF Justification for FAC-008-4, Requirement R1
The VRF did not change from the previously FERC approved FAC-008-3 Reliability Standard.

VRF Justification for FAC-008-4, Requirement R2
The VRF did not change from the previously FERC approved FAC-008-3 Reliability Standard.

VRF Justification for FAC-008-4, Requirement R3
The VRF did not change from the previously FERC approved FAC-008-3 Reliability Standard.

VRF Justification for FAC-008-4, Requirement R6
The VRF did not change from the previously FERC approved FAC-008-3 Reliability Standard.

VSL Justification for FAC-008-4, Requirement R1
The VSL did not change from the previously FERC approved FAC-008-3 Reliability Standard.

VSL Justification for FAC-008-4, Requirement R2
The VSL did not change from the previously FERC approved FAC-008-3 Reliability Standard.

VSL Justification for FAC-008-4, Requirement R3
The VSL did not change from the previously FERC approved FAC-008-3 Reliability Standard.

VSL Justification for FAC-008-4, Requirement R6
The VSL did not change from the previously FERC approved FAC-008-3 Reliability Standard.
Violation Risk Factor and Violation Severity Level Justifications

Project 2018-03 Standards Efficiency Review Retirements

This document provides the standard drafting team’s (SDT’s) justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in proposed Reliability Standard INT-006-5. Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the Electric Reliability Organizations (ERO) Sanction Guidelines. The SDT applied the following NERC criteria and FERC Guidelines when developing the VRFs and VSLs for the requirements.

NERC Criteria for Violation Risk Factors

**High Risk Requirement**
A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

**Medium Risk Requirement**
A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.
Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

FERC Guidelines for Violation Risk Factors

Guideline (1) - Consistency with the Conclusions of the Final Blackout Report
FERC seeks to ensure that VRFs assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings

Violation Risk Factor and Violation Severity Level Justifications

Project 2018-03 Standards Efficiency Review Retirements

This document provides the standard drafting team’s (SDT’s) justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in proposed Reliability Standard INT-009-3. Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the Electric Reliability Organizations (ERO) Sanction Guidelines. The SDT applied the following NERC criteria and FERC Guidelines when developing the VRFs and VSLs for the requirements.

NERC Criteria for Violation Risk Factors

High Risk Requirement
A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement
A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.
**Lower Risk Requirement**
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

**FERC Guidelines for Violation Risk Factors**

**Guideline (1) - Consistency with the Conclusions of the Final Blackout Report**
FERC seeks to ensure that VRFs assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management

</tbody>
</table>

FERC Order of Violation Severity Levels

The FERC VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

**Guideline (1) - Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance**

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

**Guideline (2) - Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties**

A violation of a “binary” type requirement must be a “Severe” VSL.

Do not use ambiguous terms such as “minor” and “significant” to describe noncompliant performance.

**Guideline (3) - Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement**

VSLs should not expand on what is required in the requirement.
Guideline (4) - Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

VRF Justification for INT-009-3, Requirement R1
The VRF did not change from the previously FERC approved INT-009-2.1 Reliability Standard.

VRF Justification for INT-009-3, Requirement R3
The VRF did not change from the previously FERC approved INT-009-2.1 Reliability Standard.

VSL Justification for INT-009-3, Requirement R1
The VSL did not change from the previously FERC approved INT-009-2.1 Reliability Standard.

VSL Justification for INT-009-3, Requirement R3
The VSL did not change from the previously FERC approved INT-009-2.1 Reliability Standard.
Violation Risk Factor and Violation Severity Level Justifications
Project 2018-03 Standards Efficiency Review Retirements

This document provides the standard drafting team’s (SDT’s) justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in proposed Reliability Standard IRO-002-6. Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the Electric Reliability Organizations (ERO) Sanction Guidelines. The SDT applied the following NERC criteria and FERC Guidelines when developing the VRFs and VSLs for the requirements.

NERC Criteria for Violation Risk Factors

High Risk Requirement
A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement
A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.
Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

FERC Guidelines for Violation Risk Factors

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report
FERC seeks to ensure that VRFs assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.
Guideline (2) - Consistency within a Reliability Standard
FERC expects a rational connection between the sub-Requirement VRF assignments and the main Requirement VRF assignment.

Guideline (3) - Consistency among Reliability Standards
FERC expects the assignment of VRFs corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) - Consistency with NERC’s Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular VRF level conforms to NERC’s definition of that risk level.

Guideline (5) - Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.
NERC Criteria for Violation Severity Levels
VSLs define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple “degrees” of noncompliant performance and may have only one, two, or three VSLs.

VSLs should be based on NERC’s overarching criteria shown in the table below:

<table>
<thead>
<tr>
<th>Lower VSL</th>
<th>Moderate VSL</th>
<th>High VSL</th>
<th>Severe VSL</th>
</tr>
</thead>
<tbody>
<tr>
<td>The performance or product measured almost meets the full intent of the requirement.</td>
<td>The performance or product measured meets the majority of the intent of the requirement.</td>
<td>The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.</td>
<td>The performance or product measured does not substantively meet the intent of the requirement.</td>
</tr>
</tbody>
</table>

FERC Order of Violation Severity Levels
The FERC VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

**Guideline (1) - Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance**
Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

**Guideline (2) - Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties**
A violation of a “binary” type requirement must be a “Severe” VSL.
Do not use ambiguous terms such as “minor” and “significant” to describe noncompliant performance.

**Guideline (3) - Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement**
VSLs should not expand on what is required in the requirement.
**Guideline (4) - Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations**

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

**VRF Justification for IRO-002-6, Requirement R2**
The VRF did not change from the previously FERC approved IRO-002-5 Reliability Standard.

**VRF Justification for IRO-002-6, Requirement R3**
The VRF did not change from the previously FERC approved IRO-002-5 Reliability Standard.

**VRF Justification for IRO-002-6, Requirement R4**
The VRF did not change from the previously FERC approved IRO-002-5 Reliability Standard.

**VRF Justification for IRO-002-6, Requirement R5**
The VRF did not change from the previously FERC approved IRO-002-5 Reliability Standard.

**VRF Justification for IRO-002-6, Requirement R6**
The VRF did not change from the previously FERC approved IRO-002-5 Reliability Standard.

**VSL Justification for IRO-002-6, Requirement R2**
The VSL did not change from the previously FERC approved IRO-002-5 Reliability Standard.

**VSL Justification for IRO-002-6, Requirement R3**

The VSL did not change from the previously FERC approved IRO-002-5 Reliability Standard.
Violation Risk Factor and Violation Severity Level Justifications
Project 2018-03 Standards Efficiency Review Retirements

This document provides the standard drafting team’s (SDT’s) justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in proposed Reliability Standard PRC-004-6. Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the Electric Reliability Organizations (ERO) Sanction Guidelines. The SDT applied the following NERC criteria and FERC Guidelines when developing the VRFs and VSLs for the requirements.

NERC Criteria for Violation Risk Factors

High Risk Requirement
A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement
A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.
**Lower Risk Requirement**
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

**FERC Guidelines for Violation Risk Factors**

**Guideline (1) - Consistency with the Conclusions of the Final Blackout Report**
FERC seeks to ensure that VRFs assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.
Guideline (2) - Consistency within a Reliability Standard
FERC expects a rational connection between the sub-Requirement VRF assignments and the main Requirement VRF assignment.

Guideline (3) - Consistency among Reliability Standards
FERC expects the assignment of VRFs corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) - Consistency with NERC’s Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular VRF level conforms to NERC’s definition of that risk level.

Guideline (5) - Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.
NERC Criteria for Violation Severity Levels

VSLs define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple “degrees” of noncompliant performance and may have only one, two, or three VSLs.

VSLs should be based on NERC’s overarching criteria shown in the table below:

<table>
<thead>
<tr>
<th>Lower VSL</th>
<th>Moderate VSL</th>
<th>High VSL</th>
<th>Severe VSL</th>
</tr>
</thead>
<tbody>
<tr>
<td>The performance or product measured almost meets the full intent of the requirement.</td>
<td>The performance or product measured meets the majority of the intent of the requirement.</td>
<td>The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.</td>
<td>The performance or product measured does not substantively meet the intent of the requirement.</td>
</tr>
</tbody>
</table>

FERC Order of Violation Severity Levels

The FERC VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

**Guideline (1) - Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance**

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

**Guideline (2) - Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties**

A violation of a “binary” type requirement must be a “Severe” VSL.
Do not use ambiguous terms such as “minor” and “significant” to describe noncompliant performance.

**Guideline (3) - Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement**

VSLs should not expand on what is required in the requirement.
Guideline (4) – Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

VRF Justification for PRC-004-6, Requirement R1
The VRF did not change from the previously FERC approved PRC-004-5(i) Reliability Standard.

VRF Justification for PRC-004-6, Requirement R2
The VRF did not change from the previously FERC approved PRC-004-5(i) Reliability Standard.

VRF Justification for PRC-004-6, Requirement R3
The VRF did not change from the previously FERC approved PRC-004-5(i) Reliability Standard.

VRF Justification for PRC-004-6, Requirement R5
The VRF did not change from the previously FERC approved PRC-004-5(i) Reliability Standard.

VRF Justification for PRC-004-6, Requirement R6
The VRF did not change from the previously FERC approved PRC-004-5(i) Reliability Standard.

VSL Justification for PRC-004-6, Requirement R1
The VSL did not change from the previously FERC approved PRC-004-5(i) Reliability Standard.

VSL Justification for PRC-004-6, Requirement R2
The VSL did not change from the previously FERC approved PRC-004-5(i) Reliability Standard.

VSL Justification for PRC-004-6, Requirement R3
The VSL did not change from the previously FERC approved PRC-004-5(i) Reliability Standard.

VSL Justification for PRC-004-6, Requirement R5
The VSL did not change from the previously FERC approved PRC-004-5(i) Reliability Standard.

VSL Justification for PRC-004-6, Requirement R6
The VSL did not change from the previously FERC approved PRC-004-5(i) Reliability Standard.
Violation Risk Factor and Violation Severity Level Justifications

Project 2018-03 Standards Efficiency Review Retirements

This document provides the standard drafting team’s (SDT’s) justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in proposed Reliability Standard TOP-001-5. Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the Electric Reliability Organizations (ERO) Sanction Guidelines. The SDT applied the following NERC criteria and FERC Guidelines when developing the VRFs and VSLs for the requirements.

NERC Criteria for Violation Risk Factors

High Risk Requirement
A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement
A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.
**Lower Risk Requirement**
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

**FERC Guidelines for Violation Risk Factors**

Violation Risk Factor and Violation Severity Level Justifications
Project 2018-03 Standards Efficiency Review Retirements

This document provides the standard drafting team’s (SDT’s) justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in proposed Reliability Standard VAR-001-6. Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the Electric Reliability Organizations (ERO) Sanction Guidelines. The SDT applied the following NERC criteria and FERC Guidelines when developing the VRFs and VSLs for the requirements.

NERC Criteria for Violation Risk Factors

**High Risk Requirement**
A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

**Medium Risk Requirement**
A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.
Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

FERC Guidelines for Violation Risk Factors

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report
FERC seeks to ensure that VRFs assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.
Guideline (2) - Consistency within a Reliability Standard
FERC expects a rational connection between the sub-Requirement VRF assignments and the main Requirement VRF assignment.

Guideline (3) - Consistency among Reliability Standards
FERC expects the assignment of VRFs corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) - Consistency with NERC’s Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular VRF level conforms to NERC’s definition of that risk level.

Guideline (5) - Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.
NERC Criteria for Violation Severity Levels
VSLs define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple “degrees” of noncompliant performance and may have only one, two, or three VSLs.

VSLs should be based on NERC’s overarching criteria shown in the table below:

<table>
<thead>
<tr>
<th>Lower VSL</th>
<th>Moderate VSL</th>
<th>High VSL</th>
<th>Severe VSL</th>
</tr>
</thead>
<tbody>
<tr>
<td>The performance or product measured almost meets the full intent of the requirement.</td>
<td>The performance or product measured meets the majority of the intent of the requirement.</td>
<td>The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.</td>
<td>The performance or product measured does not substantively meet the intent of the requirement.</td>
</tr>
</tbody>
</table>

FERC Order of Violation Severity Levels
The FERC VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

Guideline (1) - Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance
Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline (2) - Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties
A violation of a “binary” type requirement must be a “Severe” VSL.
Do not use ambiguous terms such as “minor” and “significant” to describe noncompliant performance.

Guideline (3) - Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement
VSLs should not expand on what is required in the requirement.
Guideline (4) – Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

VRF Justification for VAR-001-6, Requirement R1
The VRF did not change from the previously FERC approved VAR-001-5 Reliability Standard.

VRF Justification for VAR-001-6, Requirement R3
The VRF did not change from the previously FERC approved VAR-001-5 Reliability Standard.

VRF Justification for VAR-001-6, Requirement R4
The VRF did not change from the previously FERC approved VAR-001-5 Reliability Standard.

VRF Justification for VAR-001-6, Requirement R5
The VRF did not change from the previously FERC approved VAR-001-5 Reliability Standard.

VRF Justification for VAR-001-6, Requirement R6
The VRF did not change from the previously FERC approved VAR-001-5 Reliability Standard.

VSL Justification for VAR-001-6, Requirement R1
The VSL did not change from the previously FERC approved VAR-001-5 Reliability Standard.

VSL Justification for VAR-001-6, Requirement R3
The VSL did not change from the previously FERC approved VAR-001-5 Reliability Standard.

VSL Justification for VAR-001-6, Requirement R4
The VSL did not change from the previously FERC approved VAR-001-5 Reliability Standard.

VSL Justification for VAR-001-6, Requirement R5
The VSL did not change from the previously FERC approved VAR-001-5 Reliability Standard.

VSL Justification for VAR-001-6, Requirement R6
The VSL did not change from the previously FERC approved VAR-001-5 Reliability Standard.
Technical Justifications
Project 2018-03 Standards Efficiency Review Retirements

Purpose: The purpose of the Project 2018-03 – Standards Efficiency Review Retirements Technical Justifications document was for the Standards Drafting Team (SDT) to evaluate each recommendation for retirement identified in the Standards Authorization Request (SAR). It is intended to facilitate understanding about the technical rationale for each recommendation proposed by the SDT.

Technical Justifications for Phase I of Standards Efficiency Review - Retirements

BAL-005-1, Requirements R4 and R6
SAR Recommendation: Retire
Project 2018-03 SDT Recommendation: Retain

Rationale
The SDT believes these requirements should be retained for the following reasons:
Requirements R4 and R6 of BAL-005-1 are requirements specific to the calculation of the Area Control Error (ACE). TOP-010-1(i) Requirement R2 covers ACE with the wording of “…analysis functions and Real-time monitoring…” but does not cover specifics, such as: quality flags for missing or invalid data that is part of BAL-005-1, Requirement R4 or the accuracy of scan rates that is part of BAL-005-1, Requirement R6.

In TOP-010-1(i), Requirement R2 (revised from TOP-010-1) covers the calculation and monitoring of ACE, however, the language: “Each Balancing Authority shall implement an Operating Process or Operating Procedure to address the quality of the Real-time data necessary to perform its analysis functions and Real-time monitoring,” is only addressing quality. In BAL-005-1 (revised from BAL-005-0.2b) Requirement R4 states: “The Balancing Authority shall make available to the operator information associated with Reporting ACE including, but not limited to, quality flags indicating missing or invalid data.” Requirement R6 of BAL-005-1 states: “Each Balancing Authority that is within a multiple Balancing Authority Interconnection shall implement an Operating Process to identify and mitigate errors affecting the accuracy of scan rate data used in the calculation of the Reporting ACE for each Balancing Authority Area.” Both of these requirements are specific to identifying missing or invalid data plus scan rates, not just the quality of the Real-time data.

The Standards Efficiency Review – Retirements (SER Phase I) team will communicate with the Standards Efficiency Review Phase II team regarding Requirements R4 and R6 of BAL-005-1 to determine if there is opportunity for revisions to TOP-010-1(i), Requirement R2 that would satisfy the missing or invalid data plus scan rates. If the Standards Efficiency Review Phase II team takes an approach for such determinations and then finds that there is that opportunity, then Requirements R4 and R6 of BAL-005-1 may be able to be looked at for retirement within that project or within a future project.
COM-002-4, Requirement R2  
SAR Recommendation: Retire  
Project 2018-03 SDT Recommendation: Retain  

*Rationale*  
The SDT believes this requirement should be retained for the following reasons:  
While training on communications protocols would fall into an entity’s systematic approach to training, the requirements do not explicitly mandate training on communications protocols. It is essential for all operators to have a common level of understanding and be trained in three-part communication. During development of COM-002-4, it was determined that because PER-005 would not meet the NERC Board of Trustees (BOT) November 7, 2013 Resolution to mandate training, that SDT included a requirement to conduct initial training in order to ensure that a baseline of training is complete before an individual is placed in a position to use the communications protocols. Requiring initial training is not overly burdensome to an entity and any subsequent training can be covered in PER-005 or through the operator feedback loop as determined by the entity.  

The SER Phase I team will communicate with the Standards Efficiency Review Phase II team regarding Requirement R2 of COM-002-4 to determine if there is opportunity for revisions to PER-005-2, Requirement R2 that would satisfy the training requirements specific to training on communications protocols. If the Standards Efficiency Review Phase II team takes an approach for such determinations and then finds that there is that opportunity, then Requirement R2 of COM-002-4 may be able to be looked at for retirement within that project or within a future project.  

EOP-005-3, Requirement R8  
SAR Recommendation: Retire  
Project 2018-03 SDT Recommendation: Retain  

*Rationale*  
The SDT believes this requirement should be retained for the following reasons:  
The PER-005 standard entails training processes, however it does not specifically provide for system restoration training. In PER-005-2, the requirement to provide system restoration training no longer exists. In fact, the rationale to remove the minimum training requirement specific to system restoration from PER-005-1 was, in part, based on the existence of former Requirement R10 in EOP-005-2 (Requirement R8 of EOP-005-3) and Requirement R9 in EOP-006-2 (Requirement R7 of EOP-006-3). If Requirement R8 in EOP-005-3 is removed, then there will not be any requirements to provide system restoration training to operating personnel in any of the standards.  

A specific requirement for system restoration training should be maintained because, while a system shutdown is a low probability, it could have a high impact if not done properly. The SER Phase I team will communicate with the Standards Efficiency Review Phase II team regarding Requirement R8 of EOP-005-3 to determine if there is opportunity for revisions to PER-005-2 that would satisfy the training requirements specific to system restoration training. If the Standards Efficiency Review Phase II team takes an approach for such determinations and then finds that there is that opportunity, then Requirement R8 of EOP-005-3 may be able to be looked at for retirement within that project or within a future project.
EOP-006-3, Requirement R7
SAR Recommendation: Retire
Project 2018-03 SDT Recommendation: Retain

**Rationale**
The SDT believes this requirement should be retained for the following reasons:
The PER-005 standard entails training processes, however it is does not specifically provide for system restoration training. In PER-005-2, the requirement to provide system restoration training no longer exists. In fact, the rationale to remove the minimum training requirement specific to system restoration from PER-005-1 was, in part, based on the existence of former Requirement R9 in EOP-006-2 (Requirement R7 of EOP-006-3). If Requirement R7 in EOP-006-3 is removed, then there will not be any requirements to provide system restoration training to operating personnel in any of the standards.

A specific requirement for system restoration training should be maintained because, while a system shutdown is a low probability, it could have a high impact if not done properly. A specific requirement for system restoration training should be maintained because, while a system shutdown is a low probability, it could have a high impact if not done properly. The SER Phase I team will communicate with the Standards Efficiency Review Phase II team regarding Requirement R7 of EOP-006-3 to determine if there is opportunity for revisions to PER-005-2 that would satisfy the training requirements specific to system restoration training. If the Standards Efficiency Review Phase II team takes an approach for such determinations and then finds that there is that opportunity, then Requirement R7 of EOP-006-3 may be able to be looked at for retirement within that project or within a future project.

FAC-008-3, Requirements R7 and R8
SAR Recommendation: Retire
Project 2018-03 SDT Recommendation: Retire

**Rationale**
The SDT believes these requirements should be retired for the following reasons:
These requirements are duplicative of the data provision standards MOD-032-1, IRO-010-2, and TOP-003-3. In MOD-032-1, Requirement R1, the Planning Coordinator (PC) and Transmission Provider (TP) develop modeling data requirements and reporting according to Attachment 1. In MOD-032-1 R2, the Transmission Operator (TO) and Generator Operator (GO) provide power capabilities data in Item 3, and facility ratings data in Items 3(f), 4(c) and 6(g) in the steady-state column of Attachment 1, as requested by the TP or PC.

IRO-010-2, Requirement R1 and TOP-003-3, Requirement R1 require the Reliability Coordinator (RC) and the Transmission Operator (TOP) to list necessary data and information needed to perform its Operating Planning Analyses and Real-Time Assessments. This data necessarily includes facility ratings as inputs to SOL monitoring. IRO-010-2, Requirement R3 and TOP-003-3, Requirement R5 require that the TO and the GO to respond to the RC’s and the TOP’s requests.
FAC-013-2 Requirements R1, R2, R4, R5 and R6 (all)
SAR Recommendation: Retire
Project 2018-03 SDT Recommendation: Retire

Rationale
The SDT believes this standard should be retired for the following reasons:
The requirement for Planning Coordinators (PC) to have a methodology for and to perform an annual
assessment of Transfer Capability for a single year in the Near-Term Transmission Planning Horizon does
not benefit System reliability beyond that provided by other Reliability Standards. This Reliability Standard
is primarily administrative in nature and does not require specific performance metrics or coordination
among functional entities. In general, FAC-013-2 fails to meet System reliability objectives in the following
ways:

- Assessing transfer capability above the “known commitments for Firm Transmission Service and
  Interchange” required by TPL-001-4 (R1.1.5), serves a market function as opposed to securing
  System reliability.
- Individual PCs develop their own methodologies that may be very disparate from each other.
- Impacted functional entities, such as TP, do not have meaningful input into the methodology or
  analysis.
- The standard does not specify performance metrics or define what acceptable system
  performance is.
- Entities that receive the methodology or assessment results are not obligated to use or even
  consider the information in their assessments.
- Requirement R4 only requires the assessment to be performed for one year in the Near-Term
  Transmission Planning Horizon. This year can be arbitrarily chosen by the PC and the analysis does
  not guarantee transmission service that is necessary for System reliability.

Assessing transfer capability in the planning horizon is a method to test the robustness of the system.
Robustness testing of a system is not an indicator of reliability because there is no metric for robustness.
Additionally, the proposed retirement of FAC-013-2 does not preclude any entity from performing studies
to assess transfer capability for their own purposes. The reliability benefit of doing such an assessment
varies from entity to entity, with some entities not having a benefit for the assessment it at all. The 2013
NERC Independent Experts Review Project (IERP) identified Requirements R2 and R3 as administrative and
recommended them for retirement. Requirement R3 was approved for retirement by FERC in 2014.

INT-004-3.1 Requirements R1, R2 and R3 (all)
SAR Recommendation: Retire
Project 2018-03 SDT Recommendation: Retire

Rationale
The SDT believes this standard should be retired for the following reasons:
INT-004-3.1 may be retired since it satisfies Paragraph 81 Criteria ‘B6 – Commercial or Business Practice.’
Interchange scheduling and congestion are elements that impact transmission costs, rather than actual
reliable management of the BES. Furthermore, the applicable entity for Requirements R1 and R2, the
Purchasing-Selling Entity, has been removed from the list of NERC Functional Entities, supporting the

**INT-006-4, Requirements R3.1, R4, and R5**
SAR Recommendation: Retire
Project 2018-03 SDT Recommendation: Retire

**Rationale**
The SDT believes these requirements should be retired for the following reasons:
INT-006-4, Requirement R3 Part 3.1 can be retired under Paragraph 81, Criterion A. There is no substantive impact on reliability with requiring the RC to be notified when a Reliability Adjustment Arranged Interchange has been denied.

INT-006-4, Requirement R4 can be retired under Paragraph 81, Criteria A and B7. Covered in North American Energy Standards Board (NAESB) e-Tagging specifications, Section 1.6.3.1 and Section 1.3, Request State. This requirement outlines the conditions that must exist for an Arranged Interchange to transition to Confirmed Interchange. NAESB Electronic Tagging Specification Section 1.6.3.1 and Section 1.3, Request State, stipulate these exact requirements. INT-006-4, Requirement R4 is being recommended for retirement, the requirement is accomplished through a Balancing Authority’s (BA) e-Tag Authority Service and does not have an impact on reliability.

INT-006-4, Requirement R5 can be retired under Paragraph 81, Criteria A and B7. This is covered in NAESB e-Tagging specifications, Section 1.6.4. This requirement outlines who is notified when the transition to Confirmed Interchange occurs. NAESB Electronic Tagging Specification, Section 1.6.4, stipulate these exact requirements. INT-006-4, Requirement R5 is being recommended for retirement, the requirement is accomplished through a BA’s e-Tag Authority Service and does not have an impact on reliability.

**INT-009-2.1, Requirement R2**
SAR Recommendation: Retire
Project 2018-03 SDT Recommendation: Retire

**Rationale**
The SDT believes this requirement should be retired for the following reasons: This requirement can be retired under Paragraph 81, Criterion B7, as the requirement is redundant with approved NERC Reliability Standard BAL-005-1, Requirement R7.

**INT-010-2.1 Requirements R1, R2 and R3 (all)**
SAR Recommendation: Retire
Project 2018-03 SDT Recommendation: Retire

**Rationale**
The SDT believes this standard should be retired for the following reasons: The opportunity exists to retire Reliability Standard INT-010-2.1 in its entirety. INT-010-2.1, Requirement R1: (1) Retire under Paragraph 81, Criteria B6 and B7 and (2) the IERP also recommended for retirement. More stringent tagging requirements already exist in NAESB WEQ-004-1. Therefore, this requirement is
duplicative and does little, if anything, to benefit or protect the reliable operation of the Bulk Electric System (BES).

INT-010-2.1, Requirement R2: (1) Retire under Paragraph 81, Criteria B6 and B7 and (2) the IERP also recommended for retirement. More stringent tagging requirements already exist in NAESB WEQ.004-8. Therefore, this requirement is duplicative and does little, if anything, to benefit or protect the reliable operation of the BES.

INT-010-2.1, Requirement R3: (1) Retire under Paragraph 81, Criteria B6 and B7 and (2) the IERP also recommendation for retirement. More stringent tagging requirements already exist in NAESB WEQ.004-1. Therefore, this requirement is duplicative and does little, if anything, to benefit or protect the reliable operation of the BES.

IRO-002-5, Requirements R1, R4 and R6:
SAR Recommendation: Retire
Project 2018-03 SDT Recommendation: Retire Requirement R1, Retain Requirements R4 and R6

Rationale
The SDT believes that Requirement R1 should be retired for the following reasons: Requirement R1 of IRO-002-5 is redundant to other requirements in the IRO family of standards. The requirement is a control for aiding compliance with IRO-008-2, Requirement R1 related to the performance of an Operational Planning Analysis (OPA), and it is duplicative to Requirement R3 in IRO-010-2. The purpose of IRO-010-2 is to ensure adequate data is collected so that reliability is not adversely impacted by preventing instability, uncontrolled separation, or Cascading outages and is applicable to all functional entities in the RC area. The purpose of IRO-008-2 is for the RC to perform the analysis to prevent instability, uncontrolled separation, or Cascading and with the data collected per IRO-010-2. The data exchange capabilities are indicated in IRO-010-2, Requirement R3, which includes BAs and TOPs, and IRO-008-2, Requirement R1 requires the RC to perform the OPA, which makes IRO-002-5, Requirement R1 redundant with the aforementioned standards and requirements.

IRO-010-2 requires the RC to identify the data it needs to perform its OPA (R1), which entities need to provide such data (R2), and then obligates those registered entities to then supply the data (R3). For an entity to comply with IRO-010-2, Requirement R3, it must be able to exchange data with the requesting RC. Additionally, to comply with IRO-008-2, Requirement R1, the RC must have received all of the data it needs to perform the OPA. Finally, Measure M1 for IRO-002-5, Requirement R1 states that an entity needs to have documentation describing its data exchange capabilities with other entities, which is administrative in nature. As such, the IRO-002-5, Requirement R1 is not needed to support reliability and can be retired.

The SDT believes that Requirements R4 and R6 should be retained for the following reasons: IRO-002-5, Requirements R4 and R6 are necessary for the Real-time operators to be assured of having the tools necessary to monitor the BES; therefore, retirement of these requirements is not being sought during this phase of the project.
Requirement R4 of IRO-002-5 needs to be retained to make it clear that the System Operator has authority to postpone, cancel or recall planned outages of Energy Management System (EMS), Internet Technology (IT), or communications-related equipment. Although some RCs may include this type of equipment in their outage coordination process (cf. IRO-017-1), the inclusion of EMS, IT or communications-related equipment is not explicitly required by IRO-017-1, Requirement R1. In addition, RC equipment outages are not required to follow the RC’s outage coordination process (i.e., IRO-017-1, Requirement R2 is only applicable to TOPs and BAs). As such, a potential gap in the standards would exist if IRO-002-5, Requirement R4 was retired.

IRO-008-2, Requirement R6  
SAR Recommendation: Retire  
Project 2018-03 SDT Recommendation: Retain  

Rationale  
The SDT believes this requirement should be retained for the following reasons: Although IRO-008-2, Requirement R6 appears to be administrative in nature, there are reliability benefits to knowing what actions were taken to prevent or mitigate the exceedance. Therefore, retirement of IRO-008-2, Requirement R6 is not being sought during this phase of the project.

IRO-014-3, Requirement R3  
SAR Recommendation: Retire  
Project 2018-03 SDT Recommendation: Retain  

Rationale  
The SDT believes this requirement should be retained for the following reasons: The reliability objective of “notification” is mandated as a part of the RC having and implementing Operating Procedures, Operating Processes, or Operating Plans that include criteria and processes for notifications (Requirement R1, Part 1.1), this ensures RC operations are coordinated to maintain reliability of the BES. As such, a separate requirement for ensuring notifications are made to impacted RCs is duplicative. However, IRO-014-3, Requirement R1 time horizon would need to be revised to a time horizon of “Real-time” if Requirement R3 were to be retired. Revision of Requirement R1 is outside the scope of the project, so retirement of IRO-014-3, Requirement R3 is not being sought during this phase of the project.

SER Phase I team will communicate with the Standards Efficiency Review Phase II team regarding Requirement R3 of IRO-014-3 to determine if there is opportunity for revision to IRO-014-3, Requirement R1 that would satisfy the revision of the time horizon to “Real-time.” If the Standards Efficiency Review Phase II team takes an approach for such determinations and then finds that there is that opportunity, then Requirements R3 of IRO-014-3 may be able to be looked at for retirement within that project or within a future project.
IRO-017-1, Requirement R3
SAR Recommendation: Retire
Project 2018-03 SDT Recommendation: Retain

**Rationale**
The SDT believes this requirement should be retained for the following reasons:
IRO-017-1 is not entirely duplicative of TPL-001-4, Requirement R8. The RC should be added as a named recipient to TPL-001-4 prior to considering IRO-017-1, Requirement R3 for retirement.
SER Phase I team will communicate with the Standards Efficiency Review Phase II team regarding Requirement R3 of IRO-017-1 to determine if there is opportunity for revisions to TLP-001-4 that would satisfy the adding the RC as a named recipient. If the Standards Efficiency Review Phase II team takes an approach for such determinations and then finds that there is that opportunity, then Requirement R3 of IRO-017-1 may be able to be looked at for retirement within that project or within a future project.

MOD-004-1, MOD-008-1, MOD-028-2, MOD-029-2a, MOD-030-3, MOD-001-1a and proposed MOD-001-2
SAR Recommendation: Retire
Project 2018-03 SDT Recommendation: Retire

**Rationale**
The SDT believes these standards should be retired for the following reasons:
Available Transfer Capability (ATC)/Available Flowgate Capability (AFC), as well as eTags, are commercially-focused elements, facilitating interchange and balancing of interchange. The Real-time system operators are ambivalent of these commercial arrangements, as they must maintain reliability of the BES according to System Operating Limits (SOLs) and Interconnection Reliability Operating Limits (IROLs). If a scheduled interchange would violate SOLs or IROLs, the Real-time operators must disregard the scheduled interchange and operate the system to its actual reliability limits. This observation is reinforced by NERC’s statement in the 2015 filing related to risk-based reliability proposing removal of the Interchange Authority from the compliance registry, where it’s stated: “NERC proposes to remove interchange authorities as functional entities, explaining that the activities of the interchange authority are commercial in nature and, thus, the removal will have little if any impact on reliability of the bulk electric system.” FERC acknowledged this in their March 15, 2015 Order, where they stated: “…we approve NERC’s proposed removal of the interchange authority as a functional entity. As explained by NERC, the interchange authority performs a commercial function, essentially quality control activity in verifying and communicating interchange schedules.”

MOD-020-0, Requirement R1 (all)
SAR Recommendation: Retire
Project 2018-03 SDT Recommendation: Retire

**Rationale**
The SDT believes this standard should be retired for the following reasons:
MOD-031-2 and IRO-010-2 do give the necessary entities the authority to request relevant information nor does MOD-031-2 and IRO-010-2 require the associated entities to provide that information. Demand-Side Management (DSM) data is necessarily related to the near-term operating time horizon, as well as the planning time horizons, but not to the Real-time operating time horizon that the RC and TOP are operating in. According to TOP-001-4, Requirements R1 and R2, and IRO-001-4, Requirement R1, the RC,
BA and TOP must operate the BES according to SOLs and IROLs, and do not generally have control over DSM. They do have the authority to issue Operating Instruction to other entities as needed to maintain BES reliability within SOLs and IROLs; the entities receiving Operating Instructions are obligated, per TOP-001-4, Requirement R3, to follow those instructions, subject to the exceptions noted within that requirement. Further, the Demand Response Availability Data System (DADS) collects and disseminates data regarding Demand Response programs according to Section 1600 of the NERC Rules of Procedure. All entities identified in MOD-020-0 R1 are sources of DADS data, have access to DADS data, or both.

DSM and Direct Control Load Management (DLCM) may be regarded as long-term-planning and operations-planning time horizon resources, but, particularly with a “on request within 30 calendar days” obligation in the requirement, is not a resource for the Real-time or day-ahead operating time horizon for Reliability Coordinators and Transmission Operators, which must plan to operate, and actually operate, the BES within SOLs and IROLs, a subset of SOLs. In addition, the amount of interruptible demands and DLCM at the TP, Resource Planner (RP), and/or Load-Serving Entity (LSE) (which has been removed from the compliance registry and is no longer obligated to comply with NERC standards) level is not of locational benefit to TOPs and RCs to assist them in operating within SOLs, as such information, were it to be provided within a usable time frame, would not be sufficiently granular to assist the TOP and RC. All meaningful information regarding interruptible demands and DLCM is available from DADS, which, in the United States, is a mandatory reporting mechanism, regulated per Section 1600 of the NERC Rules of Procedure. DSM and DLCM are financially-enabled mechanisms whereupon RPs may encourage customers and customer groups to permit local control of their load in exchange for rate considerations. And this local control may or may not be sited in such a manner to provide any benefit to TOPs and RCs; which, again, are obligated by NERC Standards to operate the BES within SOLs.

PRC-004-5(i), Requirement R4
SAR Recommendation: Retire
Project 2018-03 SDT Recommendation: Retire

**Rationale**
The SDT believes this requirement should be retired for the following reasons:
The standard’s purpose is to identify and correct the causes of Misoperations of Protection Systems for BES Elements. The Reliability Standard's Guideline and Technical Basis for Requirement R4 considers due diligence that an entity must make in determining the cause of a Protection System Misoperation.

The compliance activities associated with this requirement fall into tracking of milestones and do not improve reliability. Requirement R4 acts as a control to support compliance with Requirements R1 and R3. It is in the best interest of the entity to continue to investigate and detect whether its Protection System components caused a Misoperation and develop a corrective plan for the identified Protection System component. This can be achieved through the entity’s internal control policies and procedures engineered to maximize efficiency and reliability. Entities endeavor to determine the cause of a Misoperation, and doing so may take extended time if equipment outages are necessary. However, if an entity is unable to determine the cause, further investigation(s) using the same event data are unlikely to lead to identification of the cause. Proposed retirement of Requirement R4 does not preclude the entity’s
responsibility to continue the investigation to identify the cause of Misoperation. However, it does alleviate the need to keep tracking documents for the sake of showing investigative actions.

**PRC-015-1 Requirements R1, R2, and R3 (all)**  
**SAR Recommendation: Retire**  
**Project 2018-03 SDT Recommendation: Retain**  
**Rationale**  
The SDT believes this standard should be retained for the following reasons:  
PRC-015-1 is scheduled to be retired on 12/31/2020 under the PRC-012-2 Implementation Plan (IP).

**PRC-018-1 Requirements R1, R2, R3, R4, R5 and R6 (all)**  
**SAR Recommendation: Retire**  
**Project 2018-03 SDT Recommendation: Retain**  
**Rationale**  
The SDT believes this standard should be retained for the following reasons:  
PRC-018-1 is superseded by PRC-002-2 in Year 2022. The PRC-002-2 IP states: “Standard PRC-018-1 shall remain effective throughout the phased implementation period of PRC-002-2...”

**TOP-001-4 Requirements R16, R17, R19 and R22**  
**SAR Recommendation: Retire**  
**Project 2018-03 SDT Recommendation: Retain Requirements R16 and R17, Retire Requirements R19 and R22**  
**Rationale**  
The SDT believes Requirements R16 and R17 should be retained for the following reasons:  
Requirements R16 and R17 of TOP-001-4 need to be retained to make it clear that the System Operator has authority to postpone, cancel or recall planned outages of EMS, IT or communications-related equipment. Although some RCs may include this type of equipment in their outage coordination process (IRO-017-1), the inclusion of EMS, IT or communications-related equipment is not explicitly required by IRO-017-1, Requirement R1. As such, a potential gap in the standards would exist if TOP-001-4, Requirements R16 and R17 were retired. Requirements R16 and R17 are necessary for the Real-time operators to be assured of having the tools necessary to monitor the BES. Therefore, retirement of TOP-001-4, Requirements R16 and R17 is not being sought during this phase of the project.

The Purpose of TOP-003-3 is to ensure adequate data is collected by the BA and TOP to fulfill their operational and planning responsibilities. The Purpose of TOP-002-4 is to ensure each BA and TOP have plans to operate within specified limits using the data provided in TOP-003-3. The data exchange capabilities that are indicated in TOP-001-4, Requirements R19 and R22 for the BA and TOP are redundant with TOP-003-3, Requirements R3, R4 and R5 and TOP-002-4, Requirement R1.

The SDT believes Requirements R19 and R22 should be retired for the following reasons:  
TOP-001-4, Requirement R19 is redundant to other requirements in the TOP family of standards. For TOPs, the existing TOP-003-3, Requirement R5 cannot be fulfilled by entities unless data exchange capabilities exist between the TOP and the supplying entities. Similarly, TOP-002-4, Requirement R1
cannot be fulfilled by the TOP unless the data needed to perform the OPA has been received from the supplying entities (i.e., data had to be exchanged). As such, Requirement R19 in TOP-001-4 is not needed to support reliability and can be retired.

TOP-001-4, Requirement R22 is redundant to other requirements in the TOP family of standards. For the BA, the existing TOP-003-3, Requirement R5 cannot be fulfilled by entities unless data exchange capabilities exist between the BA and the supplying entities. Similarly, TOP-002-4, Requirement R4 cannot be fulfilled by the BA unless the data needed to develop its Operating Plan for next-day operations has been received from the supplying entities (i.e., data had to be exchanged). As such, Requirement R22 in TOP-001-4 is not needed to support reliability and can be retired.

VAR-001-5*, Requirements R2 and R3
SAR Recommendation: Retire
Project 2018-03 SDT Recommendation: Retire Requirement R2, Retain Requirement R3

Rationale
The SDT believes Requirement R2 should be retired for the following reasons:
VAR-001-5, Requirement R2 is duplicative with the existing requirements in the TOP-001-4 and TOP-002-4, which direct the TOP to plan and operate within in SOL values, which includes system voltage limits. TOP-002-4, Requirement R1 requires an OPA to be completed to ensure no SOL is violated, and TOP-001-4, Requirement R10 provides the criteria that the TOP shall use for determining SOL exceedances, which includes monitoring voltages. If an SOL violation is identified, then the TOP shall have an Operating Plan to mitigate the violation. TOP-001-4 and TOP-002-4 requirements direct the TOP to maintain reliability of the BES and to mitigate SOL exceedances. If the TOP identifies no SOLs, voltage or otherwise, then the TOP has enough resources "scheduled" to maintain reliability of its BES. The remaining VAR-001-4.2 requirements ensure that a TOP ensures voltage, reactive flows, and reactive resources are monitored, controlled, and maintained with limits. The FAC family of standards ensure the proper BES Facilities and/or Elements are built with applicable equipment and system ratings.

TOP-002-4, Requirement R1 thus requires the TOP to have an OPA that assess whether its next-day planned operations will exceed any SOLs, and TOP-001-4, Requirement R10 thus requires that the TOP monitor its Facilities and thus determine SOL exceedances. Further, TOP-001-4, Requirement R14 requires that the TOP “…initiate its Operating Plan to mitigate a SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment…” and TOP-001-4, Requirement R1 requires that the TOP “…shall act to maintain the reliability of its Transmission Operator Area via its own actions or by issuing Operating Instructions.”

Since operating outside voltage limits represents a SOL exceedance, the TOP must have an OPA that assesses whether its next-day operations will exceed SOLs. The TOP has the obligation to initiate an Operating Plan to mitigate an SOL exceedance, and has the responsibility to take any actions under its control and issue Operating Instructions, if needed. The responsibilities elucidated in VAR-001-4.1, Requirement R2 are fully addressed in these other standards; scheduling sufficient reactive resources to regulate voltage levels under normal and Contingency conditions is one of several vital elements of addressing this obligation.
The SDT believes Requirement R3 should be retained for the following reasons: For reliability purposes, the TOP must ensure sufficient voltage support is provided in Real-time in order to operate within an SOL to prevent voltage-collapse events wherein the operation within SOLs/IROLs itself is not adequate to assure stable voltage operations in both steady-state and transient conditions. The TOP-series of standards does not provide sufficient granularity to assure that adequate voltage/reactive resources, both of magnitude and type, are operated to voltage and reactive flow as necessary.

* VAR-001-4.2, is an inactive standard. VAR-001-5 changed the WECC variance, and not the continent-wide requirements. VAR-001-5 became effective January 1, 2019.
Standards Announcement

Project 2018-03 Standards Efficiency Review Retirements

45-day Formal Comment Period Open through April 12, 2019
Ballot Pools Forming through March 28, 2019

Now Available

A 45-day comment period is open for the Project 2018-03 Standards Efficiency Review Retirements until 8 p.m. Eastern, Friday, April 12, 2019.

Commenting

Use the Standards Balloting and Commenting System (SBS) to submit comments. If you experience issues using the SBS, contact Wendy Muller. An unofficial Word version of the comment form is posted on the project page.

Ballot Pools

Ballot pools are being formed through 8 p.m. Eastern, Thursday, March 28, 2019. Registered Ballot Body members can join the ballot pools here. Note that there is a separate ballot for each of the standards, so it is necessary to join multiple pools in order to submit votes on the standards.

- If you are having difficulty accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out, contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern).
- Passwords expire every 6 months and must be reset.
- The SBS is not supported for use on mobile devices.
- Please be mindful of ballot and comment period closing dates. We ask to allow at least 48 hours for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts prior to the last day of a comment/ballot period.

Next Steps

A 10-day initial ballot for the standards (proposed for partial retirement) and non-binding polls of the associated Violation Risk Factors and Violation Severity Levels, as well as ballots for the standards proposed for complete retirement and a standard proposed for withdrawal, will be conducted April 3-12, 2019.

For more information or assistance, contact Standards Developer, Laura Anderson (via email) or at (404) 446-9671.

Standards Announcement
Project 2018-03 Standards Efficiency Review Retirements

45-day Formal Comment Period Open through April 12, 2019
Ballot Pools Forming through March 28, 2019

Now Available

A 45-day comment period is open for the Project 2018-03 Standards Efficiency Review Retirements until 8 p.m. Eastern, Friday, April 12, 2019.

Commenting
Use the Standards Balloting and Commenting System (SBS) to submit comments. If you experience issues using the SBS, contact Wendy Muller. An unofficial Word version of the comment form is posted on the project page.

Ballot Pools
Ballot pools are being formed through 8 p.m. Eastern, Thursday, March 28, 2019. Registered Ballot Body members can join the ballot pools here. Note that there is a separate ballot for each of the standards, so it is necessary to join multiple pools in order to submit votes on the standards.

• If you are having difficulty accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out, contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern).
• Passwords expire every 6 months and must be reset.
• The SBS is not supported for use on mobile devices.
• Please be mindful of ballot and comment period closing dates. We ask to allow at least 48 hours for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts prior to the last day of a comment/ballot period.

Next Steps
A 10-day initial ballot for the standards (proposed for partial retirement) and non-binding polls of the associated Violation Risk Factors and Violation Severity Levels, as well as ballots for the standards proposed for complete retirement and a standard proposed for withdrawal, will be conducted April 3-12, 2019.

Standards Announcement
Project 2018-03 Standards Efficiency Review Retirements

Initial Ballots and Non-ballot Polls Open through April 12, 2019

Now Available

The initial ballots and non-binding polls for the Project 2018-03 Standards Efficiency Review Retirements are open until 8 p.m. Eastern, Friday, April 12, 2019.

Balloting
Members of the ballot pools associated with this project can log into the Standards Balloting and Commenting System (SBS) and submit their votes. If you experience issues using the SBS, contact Wendy Muller.

• If you are having difficulty accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out, contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern).

• Passwords expire every 6 months and must be reset.

• The SBS is not supported for use on mobile devices.

• Please be mindful of ballot and comment period closing dates. We ask to allow at least 48 hours for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts prior to the last day of a comment/ballot period.

Next Steps
The ballot results will be announced and posted on the project page. The drafting team will review all responses received during the comment period and determine the next steps of the project.

For more information or assistance, contact Standards Developer, Laura Anderson (via email) or at (404) 446-9671.
