2018-03 Standards Efficiency Review Retirements PRC-004-6 IN 1 ST
2018-03 Standards Efficiency Review Retirements TOP-001-5 IN 1 ST
2018-03 Standards Efficiency Review Retirements VAR-001-6 IN 1 ST

There were 49 sets of responses, including comments from approximately 119 different people from approximately 81 companies representing 10 of the Industry Segments as shown in the table on the following pages.
Questions

1. SDT has determined that additional work is necessary to ensure the retirement of certain standard requirements does not create a reliability gap. The SDT recommends that these standards requirements be considered as part of the SER Phase II effort. These requirements include: BAL-005-1, Requirements R4 and R6; COM-002-4, Requirement R2; EOP-005-3, Requirement R8; EOP-006-3, Requirement R7; IRO-014-3, Requirement R3; IRO-017-1, Requirement R3; and VAR-001-5, Requirement R3. Do you agree with the SDT’s recommendation that these standards requirements be considered as part of the SER Phase II effort? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s recommendation, please provide your explanation.

2. The SDT is proposing to take no action on two standards already scheduled for retirement: PRC-015-1, Requirements R1, R2 and R3; and PRC-018-1, Requirements R1, R2, R3, R4, R5 and R6. Do you agree with the SDT’s recommendation to take no action for these standards already scheduled for retirement? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s recommendation, please provide your explanation.

3. The SDT determined the following requirements are inappropriate for retirement because they serve a reliability benefit: IRO-002-5, Requirements R4 and R6; IRO-008-2, Requirement R6, and TOP-001-4, Requirements R16 and R17. Do you agree with the SDT’s recommendation to retain these requirements? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s recommendation, please provide your explanation.

4. The SDT is proposing to retire FAC-008-3, Requirements R7 and R8. Do you agree with the SDT’s proposal to retire these requirements? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

5. The SDT is proposing to retire FAC-013-2, Requirements R1, R2, R4, R5 and R6 (all). Do you agree with the SDT’s proposal to retire FAC-013-2? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

6. The SDT is proposing to retire INT-004-3.1, Requirements R1, R2, and R3 (all). Do you agree with the SDT’s proposal to retire INT-004-3.1? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

7. The SDT is proposing to retire INT-006-4, Requirements R3.1, R4, and R5. Do you agree with the SDT’s proposal to retire Requirements R3.1, R4, and R5 of INT-006-4? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

8. The SDT is proposing to retire INT-009-2.1, Requirement R2. Do you agree with the SDT’s proposal to retire Requirement R2 of INT-009-2.1? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.
9. The SDT is proposing to retire INT-010-2.1, Requirements R1, R2, and R3 (all). Do you agree with the SDT’s proposal to retire INT-010-2.1? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

10. The SDT is proposing to retire IRO-002-5, Requirement R1. Do you agree with the SDT’s proposal to retire Requirement R1 of IRO-002-5? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

11. The SDT is proposing to retire MOD-004-1, Requirements R1, R2, R3, R4, R5, R6, R7, R8, R9, R10, R11, and R12 (all). Do you agree with the SDT’s proposal to retire MOD-004-1? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

12. The SDT is proposing to retire MOD-008-1, Requirements R1, R2, R3, R4, and R5 (all). Do you agree with the SDT’s proposal to retire MOD-008-1? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

13. The SDT is proposing to retire MOD-028-2, Requirements R1, R2, R3, R4, R5, R6, R7, R8, R9, R10, and R11 (all). Do you agree with the SDT’s proposal to retire MOD-028-2? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

14. The SDT is proposing to retire MOD-029-2a, Requirements R1, R2, R3, R4, R5, R6, R7, and R8 (all). Do you agree with the SDT’s proposal to retire MOD-029-2a? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

15. The SDT is proposing to retire MOD-030-3, Requirements R1, R2, R3, R4, R5, R6, R7, R8, R9 and R10 (all). Do you agree with the SDT’s proposal to retire MOD-030-3? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

16. The SDT is proposing to retire MOD-001-1a, Requirements R1, R2, R3, R4, R5, R6, R7, R8 and R9 (all). Do you agree with the SDT’s proposal to retire MOD-001-1a? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

17. The SDT is proposing to withdraw Reliability Standard, MOD-001-2, which is currently pending approval by applicable governmental authorities. Do you agree with the SDT’s proposal to withdraw Reliability Standard MOD-001-2? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

18. The SDT is proposing to retire MOD-020-0, Requirement R1 (all). Do you agree with the SDT’s proposal to retire MOD-020-0? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.
19. The SDT is proposing to retire PRC-004-5(i), Requirement R4. Do you agree with the SDT’s proposal to retire Requirement R4 of PRC-004-5(i)? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

20. The SDT is proposing to retire TOP-001-4, Requirements R19 and R22. Do you agree with the SDT’s proposal to retire Requirements R19 and R22 of TOP-001-4? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

21. The SDT is proposing to retire VAR-001-5, Requirement R2. Do you agree with the SDT's proposal to retire Requirement R2 of VAR-001-5? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

22. Please provide any additional comments for the SDT to consider that have not already been provided in the questions above.

1. SDT has determined that additional work is necessary to ensure the retirement of certain standard requirements does not create a reliability gap. The SDT recommends that these standards requirements be considered as part of the SER Phase II effort. These requirements include: BAL-005-1, Requirements R4 and R6; COM-002-4, Requirement R2; EOP-005-3, Requirement R8; EOP-006-3, Requirement R7; IRO-014-3, Requirement R3; IRO-017-1, Requirement R3; and VAR-001-5, Requirement R3. Do you agree with the SDT’s recommendation that these standards requirements be considered as part of the SER Phase II effort? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s recommendation, please provide your explanation.

IID believes these requirements the SDT has recommended to be considered as part of the SER Phase II effort should proceed to ballot as proposed retirements based on the original SAR and recommendations from the SER Phase I teams. This would allow the Registered Ballot Body to vote on whether these requirements are appropriate for retirement or if additional work is necessary. If the retirement of these requirements do not pass ballot, IID supports that they be considered as part of SER Phase II, however the SDT should ensure the SER Phase II scope clearly indicates they will address requirements. Note that the current SER Phase II scope and six efficiency concepts does not indicate they will be addressing specific requirements.

Response

Marsha Morgan - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC, Group Name Southern Company

Answer

No

Document Name

Comment

Regarding BAL-005-1 req.4, Southern Company believes that in order for the BA operators to be able to perform their job effectively, then the BA manager must provide the adequate tools needed that are associated with Reporting ACE. To ensure that the information is correct, the BA manager must ensure that operators have accurate information and have indicators if data is either missing or incorrect. Having the current standard only places an administrative burden on BA entities who already have the tools in place and are training their operators on Reporting ACE. Therefore, retiring this requirement would not leave a gap in reliability.

In regard to BAL-005-1 req. 6, this is another requirement that poses an administrative burden on BA entities as the calculation of Reporting ACE is critical for any entity to effectively balance load/generation and support interconnection frequency. Again, this is an inherent function of BA entities and retiring this requirement would not leave a gap in reliability.

In regard to COM-002-4 req. 2, Southern believes that this requirement could easily be incorporated the current PER-005 standard as it involves System Operator training. Even if the requirement was retired without including it anywhere else in the NERC standards, COM-002-4 R1 would still be enforceable and would require System Operators to follow the documented communication protocols. We don’t believe that any additional work is necessary by the SDT as the retirement of this standard would not result in a reliability gap.

The related compliance activities in EOP-005-3 R8 can easily be incorporated into the PER-005 standards as a part of an entity’s Systematic Approach to Training. System restoration is a reliability-related task and should be included in an entity’s training program for its System Operators to ensure that they are and competent to perform restoration activities.

The related compliance activities in EOP-006-3 R7 can easily be incorporated into the PER-005 standards as a part of an entity’s Systematic Approach to Training. System restoration is a reliability-related task and should be included in an entity’s training program for its System Operators to ensure that they are and competent to perform restoration activities.

In regard to IRO-014-3 req. 3, this is an inherent part of performing as a Reliability Coordinator as coordination is at the heart of this function. A standard requirement is not needed, because the RC serves an area and has responsibilities for multiple entities. Any improprieties by the RC, will surely be voiced by one or more of the member entities and therefore, a requirement is not needed, and therefore we don’t believe that any additional work is necessary by the SDT before retiring this requirement.

In regard to VAL-001-5 R3, Monitoring and maintaining voltage/regulating devices is an inherent responsibility of the TOP entity. It is also essential in ensuring effective operations to effectively transfer power while minimizing losses. Furthermore, it is in the TOP entity’s best interest to maintain system voltage to avoid overloading the system and causing SOLs and IROLs, along with damage to transmission equipment and facilities. Since these...
functions are done inherently, the NERC standard only increases the administrative burden on the entities and therefore, retirement of this requirement would not create a gap in reliability.

**Response**

**Kayleigh Wilkerson - Lincoln Electric System - 5, Group Name Lincoln Electric System**

**Answer** No

**Comment**

In consideration that the actions specified in VAR-001-5 R3 are inherent to the System Operators' core functions, LES believes R3 is still suitable for retirement as part of the SER Phase I effort. The prevention and mitigation of SOL exceedances, as dictated by applicable TOP standards, ensures System Operators utilize the necessary devices to regulate transmission voltage and reactive flow. This requirement provides no additional direction and taken independently is too vague to provide useful guidance in ensuring reliability.

**Response**

**Answer** Yes

**Comment**

If EOP-005-3 R8 is retired, R9 and R10 should be considered at the same time with potential migration into the PER Standards. If EOP-006-3 R7 is retired, R8 should be considered at the same time with potential migration into the PER Standards. Please note that EOP-005-3 and EOP-006-3 are enforceable 04/01/19. If IRO-017-1 R3 is to be retired, A new TPL-001-5 R8 should include the RC function.

**Response**

**Neil Swearingen - Salt River Project - 1,3,5,6 - WECC**

**Answer** Yes

LDWP agrees that IRO-017-1 should be a part of a Phase II effort. If the TPL-001-4 standard is not clarified to notify Peak RC of the transmission results then there may not be a mechanism for notifying the RC about potential IROLs.

Westar and Kansas City Power & Light Co. support Edison Electric Institute's response to Question 1.

Please refer to comments submitted by Edison Electric Institute.

EEI agrees that some Reliability Standards and associated requirements present more complex consideration and research in order to ensure proposed retirements do not create unintended reliability gaps. Moreover, we support the proposal to shift such requirements to the SER Phase II effort. However, the recent posting on the SER Phase II Concepts has created some confusion. EEI recommends that NERC or the SER Advisory provide additional information to help clarify the full scope of the upcoming SER Phase II Project—including these requirements for consideration for Phase II and the proposed Concepts. EEI also encourages the SDT to prioritize these requirements for Phase II so that progress is not held up by the SDT efforts to refine the proposed Concepts.

It appears from the technical rational document that the 2018-03 drafting team believes the Requirements should be revised and retained rather than retired in their entirety. Since standard revision is within the scope of the Phase 2 team, AEP has no objections to the concept of revising COM-002-4 R2, EOP-005-3 R8, IRO-017-1 R3, and VAR-001-5 R3.

2. The SDT is proposing to take no action on two standards already scheduled for retirement: PRC-015-1, Requirements R1, R2 and R3; and PRC-018-1, Requirements, R1, R2, R3, R4, R5 and R6. Do you agree with the SDT's recommendation to take no action for these standards already scheduled for retirement? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT's recommendation, please provide your explanation.

<table>
<thead>

</thead>
<tbody>
<tr>
<td>Kim Thomas</td>
<td>Duke Energy</td>
<td>No</td>
<td>PRC-018-1 references Regional Criteria that must be followed to comply with the standard. Duke Energy requests the drafting team consider the ramifications on PRC-018-1 if a Region has already retired its Regional Criteria applicable to PRC-018 and PRC-002. The absence of any applicable Regional Criteria for a particular Region, makes PRC-018-1 a stronger candidate for immediate retirement.</td>
</tr>
<tr>

<td>GCPD agrees with the initial assessment that these standards should be retired for the originally-identified rationales.</td>
</tr>
<tr>
<td>Sing Tay</td>
<td>OGE Energy - Oklahoma Gas and Electric Co.</td>
<td>No</td>
<td>OKGE disagrees with the SDT's proposal of taking no action on PRC-018-1. Per the PRC-002-2 Implementation Plan,</td>
</tr>
</tbody>
</table>
“Each Transmission Owner, and Generator Owner shall maintain documentation to demonstrate compliance with PRC-018-1 until that entity meets the requirements of PRC-002-2 in accordance with this Implementation Plan. Standard PRC-018-1 shall remain effective throughout the phased implementation period of PRC-002-2 and shall be applicable to an entity’s Disturbance monitoring and reporting activities not yet transitioned to PRC-002-2. PRC-018-1 will be retired following full implementation of PRC-002-2 as noted below.”

OKGE believes this justification is flawed. The requirements in PRC-018-1 states that TOs and GOs are required to install DMEs per the requirements established by its Regional Reliability Organization (RRO). However, in the SPP region, since PRC-002-1 was never approved by FERC and with the creation of PRC-002-2, the requirements that were established by SPP on DMEs were removed from SPP Planning Criteria in April 2017. Currently, the SPP RTO has no DME installation requirements, therefore, the entities in the SPP region do not have a set of criteria to follow to meet the requirements in PRC-018-1 (particularly for requirements R4 and R5, where DME equipment required by the RRO is not specified). OKGE believes PRC-018-1 should be retired prior to PRC-002-2’s full implementation (i.e 7/1/2022).

3. The SDT determined the following requirements are inappropriate for retirement because they serve a reliability benefit: IRO-002-5, Requirements R4 and R6; IRO-008-2, Requirement R6, and TOP-001-4, Requirements R16 and R17. Do you agree with the SDT’s recommendation to retain these requirements? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s recommendation, please provide your explanation.

| TOP-001-4 R16 and R17 do not provide a reliability benefit. They don’t even align with most, if not all, standard business processes. The Outage Coordinator, SCADA EMS, IT Networking, and Communications departments determine the impacts of all “Planned” outages or telemetry equipment. Most System Operators do not even have the technical knowledge to make substantiated decision to delay or postpone this work. Our System Operators may approve “Unplanned” outages but this is a rare exception and is not in scope for these requirements. Other requirements, such as R13 are already in place which demand an extremely high availability of EMS functionality, EMS & IT staff are well aware that unplanned outages impacting the ability to view and solve contingency analysis are unacceptable for anything other than a brief interruption. |

AZPS shares the opinion of many others in the industry that the language in requirements TOP-001-4 R16 and R17 does not, in and of themselves, provide any reliability benefit. Simply having “the authority to approve outages and maintenance” does not assure that an approval occurs, nor is it required to be compliant. Since a simple letter or procedure stating that operators have the stated authority is adequate to demonstrate compliance, this action does not provide a reliability benefit.

**Answer**  
No

**Document Name**

**Comment**

Duke Energy recommends the drafting team consider IRO-008-2 R6 for immediate retirement. We agree with the drafting team’s assertion in the Technical Justifications document that characterizes R6 as administrative in nature. We do not believe that there is much if any reliability benefit in requiring an RC to notify the TOPs or BAs of any SOL/IROL exceedance that was prevented or already mitigated. There is already an Operating Plan in place to be followed for such an event, and alerting Operators of an issue that they are already aware of, and potentially distracting them from dealing with other Real-time issues, is of minimal reliability benefit.

**Daniela Hammons - CenterPoint Energy Houston Electric, LLC - 1**

**Answer**  
No
CenterPoint Energy Houston Electric, LLC does not believe that TOP-001-4, Requirements R16 and R17 to “provide its System Operators with the authority to approve outages and maintenance of its telemetering and control equipment…” themselves provide a reliability benefit. Furthermore, we believe that this “authority” is inherent in “acting to maintain the reliability of its TOP/BA Area via its own actions or by issuing Operating Instructions” as is required by TOP-001-4, Requirement R1 and R2, and as such, R16 and R17 are not needed.

IID believes these requirements the SDT has identified as inappropriate for retirement should proceed to ballot as proposed retirements based on the original SAR and recommendations from the SER Phase I teams. This would allow the Registered Ballot Body to vote on whether these requirements are appropriate for retirement or if additional work is necessary. If the retirement of these requirements do not pass ballot, IID supports that they be considered as part of SER Phase II, however the SDT should ensure the SER Phase II scope clearly indicates they will address requirements. Note that the current SER Phase II scope and six efficiency concepts does not indicate they will be addressing specific requirements.

**Marsha Morgan** - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC, Group Name Southern Company

**Answer**  
No

In regard to IRO-002-5 R4, it should be retired as approving planned outages is a reliability related task and can be easily incorporated into the current PER-005 standard. Although the requirement has a benefit to reliability, it should fall within the Operator Training standards. Therefore, the retirement of this standard requirement would be appropriate.
In regard to IRO-002-5 R6, this requirement administrative in nature and duplicative and should be retired based on the following reason/s:

Before an entity is allowed to function as a Reliability Coordinator, it goes through a certification process, which ensures that the entity has all the relative systems in place to perform system monitoring and assessments. In addition, the certification review also involves determining if the entity’s data/voice communication systems have redundancy, the ability to effectively transfer data and has alarms built in to notify System Operators in the event of adverse changes to the system.

Furthermore, the RC function is on a 3-year audit schedule by the RRO and therefore, the RC will have to continuously show that it has these same capabilities.

In regard to IRO-008-2, R6, we see no reliability benefit in this requirement as both the RC and the impacted entities will already have sufficient monitoring systems in place to ensure that all are aware when a potential SOL/IROL has been prevented/mitigated. The specific actions that the RC took to prevent/mitigate the exceedance only benefits reliability from a possible teaching point to System Operators, who may experience the same type of event in the future.

However, from an operational reliability standpoint, there is no benefit to the RC notifying entities of the actions taken to prevent/mitigate and exceedance and takes the RC’s attention away from performing its responsibility to continuously monitor and assess the system.

We believe that TOP -001-4 R16 and R17 should be retired as the authority to approve planned outages is a reliability related task that can easily be incorporated into the current PER-005 standard. Although the requirements do benefit reliability, they should fall within the Operator Training standards. Therefore, the retirement of these requirements would be appropriate.

ISO-NE recommends to review the retirements of these requirements as part of Phase 2
The California ISO supports the comments of the ISO/RTO Council Standards Review Committee (SRC)

4. The SDT is proposing to retire FAC-008-3, Requirements R7 and R8. Do you agree with the SDT’s proposal to retire these requirements? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

Gregory Campoli - New York Independent System Operator - 2, Group Name ISO/RTO Standards Review Committee

Additional consideration is needed regarding the Facility Ratings requirements and the relationship to the data requirements of MOD-032, IRO-010, and TOP-003-3 and should be a separate project.

Note: ERCOT has not signed on to this SRC joint response, however will provide its own response in a separate submission.

Rachel Coyne - Texas Reliability Entity, Inc. - 10

Due to the importance of the use of accurate Facility Ratings in reliable BES operations and planning, Texas RE recommends FAC-008-3 R7 and R8 remain effective in order to emphasize the need to provide accurate Facility Ratings to entities that require Facility Rating data. These Requirements place an emphasis on the provision of accurate Facility Ratings to the entities responsible for the operation and planning of the BES. Although IRO-010 and MOD-032 data specifications will likely address the provision of Facility Ratings to the these entities, the large quantity of additional data potentially included within the data specifications can lead to a reduced emphasis on the Facility Rating component of the data specification. FAC-008-3 R7 and R8 would focus an entity on a specific facet of data and data exchange.

Moreover, FERC Order 693 Paragraph 771 directed NERC to develop modifications to FAC-008-1 to “for each facility, identify the limiting component and, for critical facilities, the resulting increase in rating of that component is no longer limiting”. Requirement R8 meets this directive by requiring “Identity of the existing next most limiting equipment of the Facility (R8.1) and “The Thermal Rating for the next most limiting equipment (R8.2).

</tr>
<tr>
<td>Comment</td>
<td>We recommend a separate standards development project be initiated to holistically address issues identified during the periodic review of FAC-008-3 and the potential retirement of FAC-008-3 requirements identified during the Standards Efficiency Review. On March 18, 2010, Docket No. RR09-6-000, FERC issued an order directing NERC to propose modification of electric reliability organization rules of procedure. This order included FERC’s concerns regarding facility ratings and limiting elements. (Please see paragraph 13 and 14 of the FERC order.) We believe that additional consideration is needed regarding the Facility Ratings requirements and the relationship to the data requirements of MOD-032, IRO-010, and TOP-003 to ensure that most limiting elements are determined. The equipment data that is required to be provided per the other reliability standards may not be sufficient to determine Facility Ratings, including for use in Real Time Models.</td>

<td>A: While we do not oppose the retirement of R7 and R8, we note that some aspects of R8 were added to address a FERC directive in Order 693. The Commission was so intent on this directive that it ordered NERC to modify its Rules of Procedure in a March 18, 2010 Order (Docket No. RR09-6-000) to better accommodate FERC directives in the Standards development process. FERC denied a NERC request for a stay on making further modifications to FAC-008 in September 2010. This ultimately led to development of FAC-008-3 and the addition of R8 under Project 2009-06. FERC approved FAC-008-3 in an order issued on November 17, 2011 (Docket No. RD11-10). The drafting team should consider whether the standards referenced in the technical rationale supporting retirement of R7 and R8 (MOD-032-1, IRO-010-2, and TOP-003-3) adequately address R8, part 8.2.</td>

**Kim Thomas - Duke Energy - 1,3,5,6 - FRCC,SERC,RF, Group Name Duke Energy**

**Comment**

Duke Energy would like to reiterate its opposition to the retirement of FAC-013-2.

An explanation addressing how FERC’s concerns in Orders 693 and 729 are still addressed needs to be provided. As stated in introduction with the Whitepaper published with the standard in Project 2010-10:

“Through FERC Orders 693 (paragraphs 782 and 794) and 729 (paragraphs 278, 279, 289, 290 and 291), FERC directed NERC to establish a standard requiring Planning Coordinators to calculate transfer capability in the planning horizon and communicate the results. In the FERC Order approving the MOD standards related to ATC/AFC calculations (MOD-001, MOD-028, MOD-029, and MOD-030), FERC did not approve NERC’s request to withdraw FAC-012-1, nor did they approve the retirement of FAC-013-1. With respect to these two Reliability Standards, the Commission disagreed with NERC that they are wholly superseded by the MOD Reliability Standards.

• The Commission noted that, under FAC-012-1, Reliability Coordinators and Planning Authorities would be required to document the methodology used to establish interregional and intra-regional transfer capabilities and to state whether the methodology is applicable to the planning horizon or the operating horizon.

• The Commission also noted that, under FAC-013-1, Reliability Coordinators and Planning Authorities are required to establish a set of inter-regional and intra-regional transfer capabilities that are consistent with the methodology documented under FAC-012-1, which could require the calculation of transfer capabilities for both the planning horizon and the operating horizon.

• The Commission posited that these FAC Reliability Standards were necessary because the proposed MOD Reliability Standards provide only for the calculation of available transfer capability and its components, including total transfer capability, in the operating horizon. Thus, the Commission stated, the proposed MOD Reliability Standards do not govern the calculation of transfer capabilities in the planning horizon, i.e., beyond 13 months in the future.

• The Commission also noted, that the calculation of transfer capabilities in the planning horizon (years one through five) may not be so accurate to support long-term scheduling of the transmission system but that such forecasts will be useful for long-term planning, in general, by measuring sufficient long-term capacity needed to ensure the reliable operation of the Bulk-Power System.
The Commission stated that the responsibility for calculation of transfer capabilities in the planning horizon would be appropriately assigned to the Planning Coordinator and not the Reliability Coordinator.

Consistent with the above philosophy and to address FERC’s concerns, FAC-013-2 requires that Planning Coordinators have a current documented methodology for use in performing an annual assessment of Transfer Capability in the Near-Term Planning Horizon (Transfer Capability Methodology).”

In the Technical Justification document, the SDT states that:

“The requirement for Planning Coordinators (PC) to have a methodology for and to perform an annual assessment of Transfer Capability for a single year in the Near-Term Transmission Planning Horizon does not benefit System reliability beyond that provided by other Reliability Standards.”

Assuming that the drafting team is referencing TPL-001 in the above statement, we would like to point out that TPL-001 standard does not REQUIRE that transfer sensitivities be performed and are not likely to indicate limitations to transfer from neighboring systems which is indicative of a neighbor’s ability to support a system during an energy emergency. In its response to comments the SDT agreed that at some point in the future it would be appropriate to move the requirements of FAC-013-2 into the TPL standards. This was not possible at the time due to the timing requirements necessary to meet FERC’s orders. In addition the SDT’s Whitepaper stated:

“The TPL standards define the studies to be performed, the performance requirements for the BES and the details of the required assessments. FAC-013-2 is intended to identify potential future weaknesses in the system by performance of tests - application of bulk energy transfers to stress the system. FAC-013-2 adds to the understanding of system performance obtained through application of the TPL standards, providing knowledge of potential facilities requiring additional focus and analysis.”

The Technical Justification document also states that:

“This Reliability Standard is primarily administrative in nature and does not require specific performance metrics or coordination among functional entities.”

We disagree with the coordination reference in the above statement. Coordination occurs through sharing of identified limits to transfer through R2 for awareness and any necessary action.

Next, the Technical Justification document states that:
We disagree with the statement that this is solely related to a market function. Transfers serve to stress test the system in ways that the PC deems best to identify weak points on their system and impacts on their neighbors. The Whitepaper published with the standard stated, “In addition, this information is not intended in any way to be associated with the granting or denial of transmission service.”

“Entities that receive the methodology or assessment results are not obligated to use or even consider the information in their assessments.”

While it is true that there is no obligation to use or consider the information in the assessment, as is the case with TPL-001, but the results are required to be shared with neighboring systems. The Whitepaper states “The application of FAC-013-2 will provide an assessment of the robustness of the future transmission system and facilitate communication between adjacent Planning Coordinators. FAC-013-2 addresses FERC's concerns regarding transfer capability in the planning horizon and provides important information that Planning Coordinators will be able to apply in their efforts to reliably plan the BES.”

“Requirement R4 only requires the assessment to be performed for one year in the Near-Term Transmission Planning Horizon. This year can be arbitrarily chosen by the PC and the analysis does not guarantee transmission service that is necessary for System reliability.”

The standard is supposed to provide a stress test as best determined by the PC's operating experience and knowledge to identify future system weaknesses. The Whitepaper states “AC-013-2 allows the Planning Coordinator to develop its Transfer Capability Methodology based on knowledge of its system’s sensitivity to transfers and significance of Facilities to reliability, within the framework provided by FAC-013-2.” It is not intended to provide information regarding transmission service which is studied in a completely different way.

“Assessing transfer capability in the planning horizon is a method to test the robustness of the system. Robustness testing of a system is not an indicator of reliability because there is no metric for robustness.”

While there may not be a standard metric for robustness, assessing transfer capability in the planning horizon does add to the PC's portfolio of knowledge of their system's behavior under stressed conditions.

- **Mike Smith - Manitoba Hydro - 1, Group Name Manitoba Hydro**
  - Answer: Yes
  - Comment: It is important to coordinate the retirement of FAC-013-2 with the retirement of FAC-014-2 under NERC Project 2015-09 Establish and Communicate System Operating Limits. The planning level SOLs required under R3, and R4 of FAC-014-2 are usually established based on the FAC-013-2 Transfer Capability Assessment.

**Comment**

BPA believes the retirement of the INT-004 requirements should be contingent upon the FERC adoption of the corresponding NAESB standards. NAESB standards do not apply equally to industry participants (e.g., not applicable to non-jurisdictional entities).

Kim Thomas - Duke Energy - 1,3,5,6 - FRCC,SERC,RF, Group Name Duke Energy

<table>
<thead>
<tr>
<th>Answer</th>
<th>No</th>
</tr>
</thead>
</table>

**Comment**

Duke Energy disagrees with the proposed retirement of INT-004-3.1. In the Technical Justification document, the drafting team categorizes INT-004-3.1 as more of an impact on transmission costs, rather than reliability. While costs and pricing do not directly impact the reliability aspects of the grid, ensuring levels of transfer and practicing congestion management help to ensure reliability of the grid.

<tr>
<td>Kim Thomas</td>
<td>Duke Energy</td>
<td>1,3,5,6, FRCC, SERC</td>
<td>No</td>
<td>Duke Energy disagrees with the proposed retirements for INT-006-4. We are not confident that this issue is adequately covered in the NAESB standards. Unlike the NERC standards which aim to promote reliability, the NAESB standards are commercially focused, and are not viewed as essential to maintaining a reliable system. We believe that not having these conditions outlined, could negatively impact reliability.</td>
</tr>
<tr>
<td>Brian Millard</td>
<td>Tennessee Valley Authority</td>
<td>1,3,5,6, SERC</td>
<td>No</td>
<td>Disagree, R4, R5 - North American Energy Standards Board (NAESB) e-Tagging specifications is not part of WEQ Business Practice Standards or approved by FERC, this will leave a responsibility gap for compliance.</td>
</tr>
<tr>
<td>Laura Nelson</td>
<td>IDACORP - Idaho Power Company</td>

Marsha Morgan - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC, Group Name Southern Company

Answer | Yes

Document Name

Comment

The requirement is redundant and qualifies for retirement under Paragraph 81. The requirement for BAs to establish an agreed upon interchange meeting source is covered in BAL-005-1 R7.

<td>ISO-NE agrees that the specific content of INT-010, creating an RFI or Reliability Adjusted Arranged Interchange after-the-fact, does not impact reliability. However, if INT-010 is to be retired, then INT-009 R1 must also be modified and that revision is not addressed in the Implementation Plan. INT-009-3 proposed as part of this effort continues to reference INT-010. Therefore, ISO-NE recommends that either INT-009 R1 be modified to simply remove the cross reference to INT-010 or that the retirement of INT-010 and corresponding changes required INT-009 R1 be moved to Phase 2 of this effort.</td>

proposed as part of this effort continues to reference INT-010. Therefore, NPCC recommends that either INT-009 R1 be modified to simply remove the cross reference to INT-010 or that the retirement of INT-010 and corresponding changes required INT-009 R1 be moved to Phase 2 of this effort.

Kim Thomas - Duke Energy - 1,3,5,6 - FRCC,SERC,RF, Group Name Duke Energy
Answer No
Comment Duke Energy disagrees with the drafting team's proposal to retire this standard. The technical rationale document states that this standard can be retired because more stringent tagging requirements already exist under NAESB. Unlike the NERC standards which aim to promote reliability, the NAESB standards are commercially focused, and are not viewed as essential to maintaining a reliable system. While part of INT-010-2.1 may be commercial in nature, we believe that the standard generally supports the reliability of the grid. Also, NAESB is only applicable to jurisdictional entities. Not all entities that are currently NERC Registered Entities, fall under the jurisdiction of NAESB, and would not be required to adhere to any of its business practices.

Brian Millard - Tennessee Valley Authority - 1,3,5,6 - SERC, Group Name Tennessee Valley Authority
Answer No
Comment Disagree, NAESB WEQ BPS 004-1.7 reference NERC INT-010-2.1 R1 for energy sharing groups for conditions not submitting eTags. Not approved by FERC.

Constantin Chitescu - Ontario Power Generation Inc. - 5
Answer No
OPG agrees with RSC position.

Response

Neil Swearingen - Salt River Project - 1,3,5,6 - WECC

Answer Yes

No comments.

Likes 0  Dislikes 0

Response

Preston Walker - PJM Interconnection, L.L.C. - 2 - SERC,RF

Answer Yes

PJM recommends that the retirement of the standard be contingent upon a new NAESB WEQ-004 requirement becoming effective which allows interchange fitting the current INT-010-2.1 criteria to be implemented without an RFI. Such a requirement is currently published as WEQ-004-1.7 under the NAESB WEQ version 3.2 standards. However, the WEQ-004-1.7 requirement would need to be revised. Without this NAESB requirement, a Balancing Authority would not be able to implement interchange transactions described in INT-010-2.1 without an associated RFI which could jeopardize the reliability of the transmission system.

**Marsha Morgan - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC, Group Name Southern Company**

**Answer**

Yes
R1, R2 and R3 are redundant because more stringent requirement(s) that meet the objectives are already included in the NAESB standards (WEQ-004-1 & WEQ-004-8) due to their commercial purposes. These requirements do little, if anything, to benefit or protect the reliable operation of the BES.

**Response**

ERCOT is not opposed to the retirement of these requirements. However, because INT-009-2.1 Requirement R1 refers to INT-010-2, it may be preferable to defer consideration to the retirement of the requirements in INT-010-2.1 to the SER Phase II effort.

11. The SDT is proposing to retire MOD-004-1, Requirements R1, R2, R3, R4, R5, R6, R7, R8, R9, R10, R11, and R12 (all). Do you agree with the SDT’s proposal to retire MOD-004-1? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

Kim Thomas - Duke Energy - 1,3,5,6 - FRCC,SERC,RF, Group Name Duke Energy

Answer
No

Document Name  Attach_DE_SER Question 11_Apr 2019.docx

Comment

While Duke Energy would support the retirement of these MOD standards, we cannot do so if MOD-001-2 is withdrawn. The MOD standards promote reliability of the grid by putting in place common boundaries and provisions that are necessary for various calculations that need to be performed. These calculations are important to reliability by providing the baseline for understanding the operational need. By retiring the MOD standards, and not having MOD-001-2 in place, there will not be provisions in place to aid an entity in calculating transfer capability. There will not be any boundaries in place for the curtailment of service. We disagree with the commercial based focus that the drafting team took in the technical rationale document. While these MOD standards (and ATC calculation) may have some commercial based elements to them, they also put in place valuable boundaries that help promote consistency in how the industry calculates these values. Removing these boundaries does not promote reliability for the Bulk Electric System and introduces additional burden to the real-time System Operator.

The expectation of the System Operators to ensure the reliability of the BES in the real-time when there have been no requirements to ensure how ATC is calculated or coordinated beyond what is required by NAESB is unrealistic. Some of the most glaring issues with relying solely upon NAESB to regulate the calculation of ATC are: FERC does not have oversight for non-jurisdictional TSPs and therefore cannot require them to incorporate NAESB standards. Also, while NAESB has acted on the recommendations of the MOD-A project to incorporate any of the gaps created by the retirement of MOD-001-1a, MOD-004-1, MOD-008-1, MOD-028-2, MOD-029-2a, MOD-030-3 and adoption of MOD-001-2, FERC has not acted on either the NERC or NAESB filings. Further, NAESB has not been requested to modify proposed standards to incorporate any of the gaps created by the retirement of the proposed MOD-001-2.

Additionally, the lack of any NERC regulation for consistent ATC methodologies and requirements for sharing of data and could potentially lead to an increase of TLRs being called as this would be the only tool System Operators could utilize to combat rampant loop flow impacts on the BES. This could very well lead to capacity concerns and load shedding as the increase in TLRs could include firm curtailments causing capacity shortages. Without mandatory ATC standards, a TSP would be able to sell as much service as possible. The overselling of service and the overscheduling of ATC Paths will lead to an increase of FIRM TLR, potentially forcing Transmission Operators and Load Serving Entities to shed FIRM load to comply with the TLR. Over the past eight years the MOD-001, 28,29, & 30 standards have been effective the industry has seen a dramatic reduction in FIRM TLRs.

Included in the Attachment with Duke Energy’s response to this question is the rolling 12-month average of TLRs from the NERC website. Notice the reduction in TLRs from 2008-2011 when the MOD standards were first published (in 2008 when TSP started to incorporate the MOD standards into their ATC methodologies) and 2011 (when the MOD standards were mandatory and enforceable).
Southern continues to disagree with the SER Team’s proposed petition for the withdrawal of MOD-001-2. Again, we believe that the combined effect of enacting MOD-001-2 while migrating MOD-001-1a, MOD-004-1, MOD-008-1, MOD-028-2, MOD-029-2a and MOD-030-3 MOD into the NAESB standards strike an appropriate balance of addressing reliability related concerns, while incorporating any market related issues. Simply stating that ATC/AFC calculations are primarily commercially-focused elements and that there are mechanisms in place to address reliability in real time is an oversimplification of the ATC/AFC concept. Inaccurately modeling and assessing transfer capability which considers real physical transmission limits on both the host and neighboring systems can create extremely complicated situations in real-time that can unduly burden system operators.

However, since FERC has not yet approved MOD-001-2 and has yet to take action on incorporating MOD-001-1a, MOD-004-1, MOD-008-1, MOD-028-2, MOD-029-2a and MOD-030-3 and NAESB’s WEQ-23 into the current NAESB standards, Southern Company recommends delaying the retirement of those existing NERC standards. The objective is to have MOD-001-2 in place at the same time as those submitted to FERC by NAESB. Once approved by the Commission, the industry should have adequate time to ensure a seamless transition to the new construct.

No Comment as long as all MOD-001, MOD-004, MOD-008, MOD-028, MOD-029, and MOD-030 are retired together.

Neil Swearingen - Salt River Project - 1,3,5,6 - WECC

No Comment
Preston Walker - PJM Interconnection, L.L.C. - 2 - SERC,RF

**Answer**
Yes

**Document Name**

**Comment**

PJM was heavily involved in the MOD-001-2 and NAESB WEQ-023 development efforts. PJM is neutral on the proposed retirement of MOD-001-2 but supports the position of the SER for the existing MOD standards as reliability components of congestion management are handled amongst eastern interconnect parties through various established coordination processes. PJM cautions against additional revisions to the NAESB WEQ-023 document, especially those driven by issues unique to particular seams or between specific entities, as those issues may not be realized by other parties. Therefore, blanket revisions may unnecessarily impact reliability and/or market aspects for other entities.

TVA disagrees with the retirement of these standards at this time.

Until a resolution is reached on NAESB’s WEQ-023, and these items are incorporated by reference per the FERC Commission, retirement of these MOD Reliability Standards would leave a significant gap of reliability of ATC in the industry. WEQ-023 (submitted under Version 003.1) was not approved by the Commission to be incorporated by reference at this time and is being considered under an overall inquiry into ATC calculation. This leaves the standard, as written in NAESB as voluntary. MOD-001-2 was drafted with the mindset of leaving only reliability aspects of ATC under NERC oversight and WEQ-023 being approved by the Commission. If MOD-001-2 is withdrawn, there would be no reliability push for ATC requirements under FERC and could potentially cause further delay. Removal of these standards could impact the transparency that is established with sharing data with neighbors as well.

According to Project 2012-05 ATC Revisions (MOD A), MOD-001-2 was developed to address directives in Order No. 729 to modify certain aspects of the MOD A standards and to consolidate the MOD A standards into a single standard covering only the ‘reliability-related impact of ATC and AFC
calculations’. The consolidated approach was intended to maintain NERC’s focus on developing and retaining requirements that support the reliable operation of the Bulk-Power System (BPS).

The WEQ-023 standards drafted did not incorporate honoring neighboring systems nor ensure an entity have an ATCID, or TRMID, or CBMID because the thought was that it would be laid out in the NERC space under MOD-001-2. So NAESB would have to incorporate all of this into the business practice, which would blur the lines of reliability and commercial that the project was developed to address.

TVA agrees with the goal of the Standards Efficiency Review Team to decrease the number of requirements and make the standards less confusing and less burdensome. Yet, it is important that the standards still ensure a relatively consistent and reliable calculation of transfer capability. TVA feels the accurate calculation of transfer capability is a reliability issue. It is the job of the operations planners to give the operators a system that was planned to be reliable. If the operators are given a system that has numerous n-1 overloads planned into the system, then the operational planning engineers did not do their job. We do not want our operators to intentionally have to handle numerous TLRs and generation re-dispatch because of an oversold system. If the TOP and TSP oversell the system, it may be difficult for the operators to maintain system reliability. A transmission system constantly in TLR3 and TLR5 due to inaccurate calculations of transfer capability is a reliability issue and not just a commercial issue. If your neighbor is constantly selling transfer capability and ignoring the impact on your system, this too will affect your reliability. This does not just impact transmission costs as some would believe.

13. The SDT is proposing to retire MOD-028-2, Requirements R1, R2, R3, R4, R5, R6, R7, R8, R9, R10, and R11 (all). Do you agree with the SDT’s proposal to retire MOD-028-2? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

**Marsha Morgan - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC, Group Name** Southern Company

<table>
<thead>
<tr>
<th>Answer</th>
<th>No</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Comment</strong></td>
<td>Southern continues to disagree with the SER Team’s proposed petition for the withdrawal of MOD-001-2. Again, we believe that the combined effect of enacting MOD-001-2 while migrating MOD-001-1a, MOD-004-1, MOD-008-1, MOD-028-2, MOD-029-2a and MOD-030-3 MOD into the NAESB standards strike an appropriate balance of addressing reliability related concerns, while incorporating any market related issues. Simply stating that ATC/AFC calculations are primarily commercially-focused elements and that there are mechanisms in place to address reliability in real time is an oversimplification of the ATC/AFC concept. Inaccurately modeling and assessing transfer capability which considers real physical transmission limits on both the host and neighboring systems can create extremely complicated situations in real-time that can unduly burden system operators. However, since FERC has not yet approved MOD-001-2 and has yet to take action on incorporating MOD-001-1a, MOD-004-1, MOD-008-1, MOD-028-2, MOD-029-2a and MOD-030-3 and NAESB’s WEQ-23 into the current NAESB standards, Southern Company recommends delaying the retirement of those existing NERC standards. The objective is to have MOD-001-2 in place at the same time as those submitted to FERC by NAESB. Once approved by the Commission, the industry should have adequate time to ensure a seamless transition to the new construct.</td>

<tr>
<td>PJM was heavily involved in the MOD-001-2 and NAESB WEQ-023 development efforts. PJM is neutral on the proposed retirement of MOD-001-2 but supports the position of the SER for the existing MOD standards as reliability components of congestion management are handled amongst eastern interconnect parties through various established coordination processes. PJM cautions against additional revisions to the NAESB WEQ-023 document, especially those driven by issues unique to particular seams or between specific entities, as those issues may not be realized by other parties. Therefore, blanket revisions may unnecessarily impact reliability and/or market aspects for other entities.</td>

**Response**

Leonard Kula - Independent Electricity System Operator - 2

**Answer**

Yes

**Document Name**
The current standard addresses aspects that are commercial in nature.

The reliability assessment requirement for determining transfer limits is addressed in FAC-11.

Response

Anton Vu - Los Angeles Department of Water and Power - 6

Answer  Yes

Comment

LDWP agrees that this standard no longer directly impacts system reliability. However, there should be a standardization of TTC/ATC calculation so that there is uniformity between entities.

Response

Brian Millard - Tennessee Valley Authority - 1,3,5,6 - SERC, Group Name Tennessee Valley Authority

Answer  Yes

Preston Walker - PJM Interconnection, L.L.C. - 2 - SERC,RF

Answer
Yes

Document Name

Comment

PJM was heavily involved in the MOD-001-2 and NAESB WEQ-023 development efforts. PJM is neutral on the proposed retirement of MOD-001-2 but supports the position of the SER for the existing MOD standards as reliability components of congestion management are handled amongst eastern interconnect parties through various established coordination processes. PJM cautions against additional revisions to the NAESB WEQ-023 document, especially those driven by issues unique to particular seams or between specific entities, as those issues may not be realized by other parties. Therefore, blanket revisions may unnecessarily impact reliability and/or market aspects for other entities.

15. The SDT is proposing to retire MOD-030-3, Requirements R1, R2, R3, R4, R5, R6, R7, R8, R9 and R10 (all). Do you agree with the SDT’s proposal to retire MOD-030-3? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

Kim Thomas - Duke Energy - 1,3,5,6 - FRCC,SERC,RF, Group Name Duke Energy

Answer  
No

Comment  
See response to question 11.

TVA disagrees with the retirement of these standards at this time.

Until a resolution is reached on NAESB’s WEQ-023, and these items are incorporated by reference per the FERC Commission, retirement of these MOD Reliability Standards would leave a significant gap of reliability of ATC in the industry. WEQ-023 (submitted under Version 003.1) was not approved by the Commission to be incorporated by reference at this time and is being considered under an overall inquiry into ATC calculation. This leaves the standard, as written in NAESB as voluntary. MOD-001-2 was drafted with the mindset of leaving only reliability aspects of ATC under NERC oversight and WEQ-023 being approved by the Commission. If MOD-001-2 is withdrawn, there would be no reliability push for ATC requirements under FERC and could potentially cause further delay. Removal of these standards could impact the transparency that is established with sharing data with neighbors as well.

According to Project 2012-05 ATC Revisions (MOD A), MOD-001-2 was developed to address directives in Order No. 729 to modify certain aspects of the MOD A standards and to consolidate the MOD A standards into a single standard covering only the ‘reliability-related impact of ATC and AFC calculations’. The consolidated approach was intended to maintain NERC’s focus on developing and retaining requirements that support the reliable operation of the Bulk-Power System (BPS).

The WEQ-023 standards drafted did not incorporate honoring neighboring systems nor ensure an entity have an ATCID, or TRMID, or CBMID because the thought was that it would be laid out in the NERC space under MOD-001-2. So NAESB would have to incorporate all of this into the business practice, which would blur the lines of reliability and commercial that the project was developed to address.

TVA agrees with the goal of the Standards Efficiency Review Team to decrease the number of requirements and make the standards less confusing and less burdensome. Yet, it is important that the standards still ensure a relatively consistent and reliable calculation of transfer capability. TVA feels the accurate calculation of transfer capability is a reliability issue. It is the job of the operations planners to give the operators a system that was planned to be reliable. If the operators are given a system that has numerous n-1 overloads planned into the system, then the operational planning engineers did not do their job. We do not want our operators to intentionally have to handle numerous TLRs and generation re-dispatch because of an
oversold system. If the TOP and TSP oversell the system, it may be difficult for the operators to maintain system reliability. A transmission system constantly in TLR3 and TLR5 due to inaccurate calculations of transfer capability is a reliability issue and not just a commercial issue. If your neighbor is constantly selling transfer capability and ignoring the impact on your system, this too will affect your reliability. This does not just impact transmission costs as some would believe.

南方继续不同意SER团队提出的撤回MOD-001-2的请愿书。我们再次认为，同时执行MOD-001-2并移除MOD-001-1a、MOD-004-1、MOD-008-1、MOD-028-2、MOD-029-2a和MOD-030-3 MOD进入NAESB标准将合适地平衡解决可靠性相关问题，同时考虑市场相关问题。只是说ATC/AFC计算主要是商业元素，并且有机制在实时解决可靠性是过度简化ATC/AFC概念。不准确地建模和评估传输能力，考虑了真实物理传输限制的主系统和邻系统可以创造极其复杂的情况，在实时中会过度地负担系统操作员。

然而，由于FERC尚未批准MOD-001-2且尚未采取行动将MOD-001-1a、MOD-004-1、MOD-008-1、MOD-028-2、MOD-029-2a和MOD-030-3 MOD和NAESB的WEQ-23纳入当前NAESB标准，南方公司建议推迟撤回这些现有NERC标准。目标是在FERC提交NAESB审批的MOD-001-2的同时部署这些标准。一旦委员会批准，行业应有足够的时间来确保无缝过渡到新结构。

Answer Yes
Comment No Comment as long as all MOD-001, MOD-004, MOD-008, MOD-028, MOD-029, and MOD-030 are retired together.

MOD001 requires that all registered TOPs establish reliability boundaries in which the TSPs can operate to maximize energy business transactions. By moving MOD-001 from under NERC responsibility, the BES reliability may be compromised. Transfer capability includes the impact on other areas due to the transfer of electric power.

Brandon Gleason - Electric Reliability Council of Texas, Inc. - 2
Answer
Yes

ERCOT is not opposed to the retirement of these requirements.

Kenya Streeter - Edison International - Southern California Edison Company - 6
Answer
Yes

Please refer to comments submitted by Edison Electric Institute.

Aaron Cavanaugh - Bonneville Power Administration - 1,3,5,6 - WECC
Answer
Yes
MOD-001-1a allows Transmission Operators to select, on the record, the methodology for computing the Available Transfer Capability in a standardized manner, which is the foundation for establishing the quantity of transmission capacity, in excess of native load needs and existing commitments, that may be sold to wholesale transmission customers in a fair and transparent fashion via Open Access Same-Time Information System (OASIS). Absent MOD-001-1a or its successor that meets the same objective, Transmission Operators may be at liberty to craft methodology to calculate ATC that may not be in alignment with the industry. This condition, if it prevails, will lead to unfair practice wherein some Transmission Operator may be held to a higher standard while others will be held to a lower standard. This, in turn, creates a less transparent environment for transmission customers to assess how Transmission Operators derive ATC.

17. The SDT is proposing to withdraw Reliability Standard, MOD-001-2, which is currently pending approval by applicable governmental authorities. Do you agree with the SDT’s proposal to withdraw Reliability Standard MOD-001-2? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

Chris Wagner - Santee Cooper - 1

Answer
No

Comment

Recommend that the revised MOD-001-2 move forward as the current in force MOD-001 standard.

Brian Millard - Tennessee Valley Authority - 1,3,5,6 - SERC, Group Name Tennessee Valley Authority

Answer
No

Comment

NERC petitioned FERC for approval of MOD-001-2 in February 2014. The implementation plan called for the retirement of MOD-001-1a, MOD-004-1, MOD-008-1, MOD-028-1, MOD-029-1a, and MOD-030-2. In the petition, NERC characterized the purpose of MOD-001-2 as helping to “ensure that determinations of ATC and AFC are accomplished in a manner that supports the reliable operation of the Bulk Power System.” MOD-001-2 was developed under NERC’s standard development process and was adopted by the NERC Board of Trustees. Now, five plus years after the petition was filed, and with no publicly visible action by FERC on the petition beyond a NOPR issued in June 2014, the SER drafting team is suggesting the petition for MOD-001-2 be withdrawn. It’s not clear how the Real-time operators monitoring of SOLs and IROLs helps ensure that determinations of ATC and
AFC are accomplished in a manner that supports the reliable operation of the Bulk Power System. If there are no standards addressing the determinations of ATC and AFC, you can expect that Real-time operators will be dealing with more SOLs and IROLs in the future.

**Response**

**Marsha Morgan - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC, Group Name** Southern Company

**Answer** No

**Document Name**

**Comment**

Southern continues to disagree with the SDT’s proposed petition for the withdrawal of MOD-001-2. Again, we believe that the combined effect of enacting MOD-001-2 while migrating MOD-001-1a, MOD-004-1, MOD-008-1, MOD-028-2, MOD-029-2a and MOD-030-3 MOD into the NAESB standards would strike an appropriate balance of addressing reliability related concerns, while incorporating any market related issues.

However, since FERC has not yet approved MOD-001-2 nor has yet taken any action on incorporating MOD-001-1a, MOD-004-1, MOD-008-1, MOD-028-2, MOD-029-2a and MOD-030-3 and NAESB’s WEQ-23 into the current NAESB standards, Southern Company recommends delaying the retirement of those standards until they are subsequently approved by the Commission (FERC). Once approved by the Commission, the industry should have adequate time to ensure a seamless transition to the new construct.

18. The SDT is proposing to retire MOD-020-0, Requirement R1 (all). Do you agree with the SDT’s proposal to retire MOD-020-0? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

Jodirah Green - ACES Power Marketing - 1,3,4,5,6 - MRO,WECC,Texas RE,SERC,RF, Group Name ACES Standard Collaborations

Answer

Yes

Comment

Although ACES agrees with the retirement of this Standard, the technical justifications for retirement of requirement 1 requires additional clarification as it creates confusions. More specifically, SAR suggests a different justification than what was provided in slides versus slide 17 from the Industry Webinar which was held on 3/21/19 Outreach Webinar.

19. The SDT is proposing to retire PRC-004-5(i), Requirement R4. Do you agree with the SDT’s proposal to retire Requirement R4 of PRC-004-5(i)? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

Ruida Shu - Northeast Power Coordinating Council - 1,2,3,4,5,6,7,8,9,10 - NPCC, Group Name RSC no Dominion, Con-Edison

Answer  No

Comment  

The retirement of PRC-004-5(i) could potentially burden the entity with an open item, with no closing date, hoping that a new technological breakthrough will finally determine the cause of misoperation. We believe entities will simply declare that no cause for the misoperation was identified and be done with it.

If R4 is retired, one or both of the following approaches will likely be taken by entities:

· Delaying formal declaration of a misoperation for all disturbances until the root cause is identified or until 120 days expires.
· Declaring the cause for a greater percentage of misoperations as “unknown” and not performing the detailed testing to find the true root cause for an issue that is intermittent.

This is not beneficial to the goal of reliability improvements and reduced misoperations.

We recommend that the SDT consider how the ability to declare that “no cause of a misoperation was identified” be retained within the standard to document the end of an investigation. We are concerned that the removal of the ability to declare that no cause of a misoperation was identified may result in audit and compliance concerns.

ERCOT does not support the outright retirement of PRC-004-5(i), Requirement R4 because to do so would eliminate the requirement to investigate in its entirety. However, ERCOT agrees that the Requirement as written may impose unnecessary burden by requiring repeated investigations despite the potential inability of a Transmission Owner, Generator Owner, or Distribution Provider to identify the cause(s) of a Misoperation.

ReliabilityFirst does not agree with the removal of PRC-004-6 Requirement R4 for the following reason:

The concept of a declaration for no identifiable cause is currently introduced in R4 and in the Application Guidelines (now called Supplemental Material) for R4. The one statement from the Application Guidelines for R4 in version 5(i) states,

'The entity’s investigation is complete when it identifies the cause of the Misoperation or makes a declaration that no cause was determined. The declaration is intended to be used if the entity determines that investigative actions have been exhausted or have not provided direction for identifying the Misoperation cause. Historically, approximately 12% of Misoperations are unknown or unexplainable.'

This statement needs to be retained somewhere as an explanation for this use of the declaration. The declaration is also referenced in R5, but for a different reason (problem found but CAP won’t improve reliability of BES). The declaration associated with R4 would be a cause that is ‘unknown/unexplainable’ and all testing and analysis comes up empty. There wouldn’t be a CAP, since nothing was found broken, and the declaration is used to close the investigation. In MIDAS, the CAP Completion Status would be ‘declaration’ rather than improperly coding as ‘CAP – Complete’, since no CAP was developed.

As far as the administrative requirement of ‘corrective action at least once every two calendar quarters’, ReliabilityFirst recommends the following for consideration (see attached as well for redline of requirement):

R4:

Each Transmission Owner, Generator Owner, and Distribution Provider that has not determined the cause(s) of a Misoperation, for a Misoperation identified in accordance with Requirement R1 or R3, shall perform investigative action(s) to determine the cause(s) of the Misoperation [maintaining documentation in sufficient detail to provide clear delineation of the stage and findings of the investigation] until one of the following completes the investigation: [Violation Risk Factor: High] [Time Horizon: Operations Assessment, Operations Planning]
The identification of the cause(s) of the Misoperation; or
A declaration that no cause was identified.

**Response**

**Thomas Foltz - AEP - 5**

| Answer | No |

**Document Name**

**Comment**

AEP does not agree that PRC-004-5(i) R4 meets the drafting team’s “Evaluation Criteria for Retiring Reliability Standards Requirements”, as the declaration of “no cause found” is made only within this obligation (i.e. “is not redundant”). Regarding the reliability rationale, we would agree that not all investigative actions in and of themselves improve reliability, however the ability to track investigative actions over an extended period of time ensures more rigor is applied to the investigative progress.

<tr>
<td>we are concerned that simply retiring this requirement could create some unintended negative consequences. As it is well understood, not all misoperations can be definitively determined no matter how detailed or thorough the investigation. It is for this reason that earlier SDTs included in Requirement R4 the ability to declare that no cause could be determine as part of the Misoperation Identification and Correction process. It is also noteworthy to mention that Requirement R4 is the only requirement within this standard that allows such a declaration. Therefore, care will be needed when retiring Requirement R4 to ensure that language is added to the standard to ensure this important ability and right held by TOs, GOs and DPs is not lost. To better understand this concern, EEI suggests that a thorough review of the flowchart (see R4) on Page 36 of PRC-004-5(i) is conducted by the responsible SDT.</td>

**Response**

**Kevin Salsbury - Berkshire Hathaway - NV Energy - 5**

NV Energy agrees that the investigative actions conducted for Misoperations do not directly improve BES reliability, and thus Requirement R4 should be retired. However, Entities are still required to provide quarterly reports to MIDAS on misoperation types and causes, thus investigation is still a necessary part of this Standard. So, to capture this supplemental administrative requirement, NV Energy would recommend the SDT to modify R5 to include a situation where the cause of the Misoperations is unknown, which ais an allowable entry for cause in MIDAS. We don't think it is clear that the unknown cause can be described in the current language in R5. It is still unclear if an R5 declaration within a CAP that the actions are beyond the entities control can be tied to an "unknown" cause. Given that the R5 "60-day time requirement" starts when the cause is identified, but if the cause is unknown, when does that clock start?. If the current wording in R5 remains intact, entities can technically stop at R3 for Misoperations that it has not identified a cause. We do not believe that this is the intent of the standard.

If this clarity is not provided, there is a potential that when auditing the Requirement, one can determine that a cause must be identified, if there is no clear requirement that allows a cause of "unknown" to be declared.

<td>Avista concurs with EEI comments: “EEI supports the retirement of PRC-004-5(i), Requirement R4; however, we are concerned that simply retiring this requirement could create some unintended negative consequences. As it is well understood, not all misoperations can be definitively determined no matter how detailed or thorough the investigation. It is for this reason that earlier SDTs included in Requirement R4 the ability to declare that no cause could be determined as part of the Misoperation Identification and Correction process. It is also noteworthy to mention that Requirement R4 is the only requirement within this standard that allows such a declaration. Therefore, care will be needed when retiring Requirement R4 to ensure that language is added to the standard to ensure this important ability and right held by TOs, GOs and DPs is not lost. To better understand this concern, EEI suggests that a thorough review of the flowchart (see R4) on Page 36 of PRC-004-5(i) is conducted by the responsible SDT.”</td>

MEC agrees with the SDT that investigative actions for Misoperations do not improve reliability. Therefore, we are prepared to support the SDT’s draft revision to retire R4.

We would also like the drafting team to modify R5 to include a situation where the cause of the Misoperations is unknown. We don’t believe it is clear that the unknown cause can be described in the R5 declaration that the CAP is beyond the entities control. The R5 60 day time requirement starts when the cause is identified. How do you start the clock to develop the CAP if the cause is unknown? The R5 declaration is after this time requirement in the standard. If the current wording in R5 remains intact, entities can technically stop at R3 for Misoperations that it has not identified a cause. I do not think this is the intent of the standard.

Another issue is that an auditor can determine that a cause must be identified if there is no clear requirement that allows a cause known declaration. There are some Misoperations (very few) where the Protection Engineer will not be able to determine a cause. The is why MIDAS has a cause unknown option.

See the PRC-004-5i flowchart and how you jump from R3 to R5 if R4 is removed.

Chris Scanlon - Exelon - 1

Answer

Document Name

Comment

On behalf of Exelon, Segments 1, 3, 5, 6

- On Page 23 of 32 of the posted, proposed “clean” version of PRC-004-6, the sentence:

“Once a Misoperation is identified in either Requirement R1 or R3, and the applicable entity did not identify the cause(s) of the Misoperation, the time period for performing at least one investigative action every two full calendar quarters begins.”

This sentence references the required actions in Requirement R4 of the Standard, which is to be retired. Recommend this sentence be deleted.

- On Page 24 of 32 of the posted, proposed “clean” version of PRC-004-6, in the second to the last paragraph, the phrase “under Requirement R4”. Recommend this phrase be deleted.

- On Page 32 of 32 of the posted, proposed “clean” version of PRC-004-6, in the Flowchart, the area of the Flowchart leading into R5, the box labeled “Cause Known?” has only a path into R5. The Standard must still provide the option to end an investigation with no cause found.

Recommend:

- For a Misoperation with no cause found, the flowchart should also point from “Cause Unknown?” to the “Stop” circle to the left.
• Add “Yes” to the existing path from “Cause Unknown?” to R5, and “No” to the new path to “Stop”.

Response
20. The SDT is proposing to retire TOP-001-4, Requirements R19 and R22. Do you agree with the SDT’s proposal to retire Requirements R19 and R22 of TOP-001-4? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

In regard to R19, this requirement is only administrative in nature as an entity must demonstrate that it has the ability exchange data with all entities that it provides and receives information from to perform its monitoring and assessments, to include operational planning before it can be certified to perform the TOP function. In addition, TOP entities are on a 3-year audit cycle and in which the entity’s data exchange capabilities with other entities are reviewed.

In regard to R22, this requirement is only administrative in nature as an entity must demonstrate that it has the ability exchange data with all entities that it provides and receives information from to perform its monitoring and assessments before it can be certified to perform the BA function. In addition, BA entities are on a 3-year audit cycle in which the entity’s data exchange capabilities with other entities are reviewed.

<tr>
<td>Kim Thomas - Duke Energy - 1,3,5,6 - FRCC,SERC,RF, Group Name</td>
<td>Duke Energy</td>
<td>Duke Energy disagrees with the drafting team's proposal to retire VAR-001-5 R2. This requirement ensures that Operators have the necessary reactive resources they need to provide voltage control. Eliminating this requirement would take away an Operators ability to justify keeping a reactive resource in service and potentially negatively impact the reliability of the grid.</td>
</tr>
<tr>
<td>Laura Nelson - IDACORP - Idaho Power Company - 1</td>
<td></td>
<td>Idaho Power disagrees with the proposed retirement for VAR-001-5 R5 because, while it is difficult to provide evidence for, the requirement for scheduling sufficient reactive resources is important.</td>

Ensuring that an entity has sufficient reactive resources to regulate voltage levels under both normal and contingency conditions is an inherent function of the TOP, and although having a standard requirement may add some reinforcement, it does not necessarily add to reliability. If the TOP fails to provide adequate reactive resources to regulate voltage, it could lead to voltage collapse, damage to equipment, system overloads and blackouts. (All of which are covered in other NERC Reliability Standards). Having this standard requirement in place places an administrative burden on the TOP and takes their time away from operating the transmission system.

ERCOT is not opposed to the retirement of this requirement.

**Response**

**Rachel Coyne - Texas Reliability Entity, Inc. - 10**

**Answer**

**Document Name**

**Comment**

Texas RE is concerned that without VAR-001-5 Requirement R2, Transmission Operators may not put emphasis on scheduling sufficient reactive resources to regulate voltage levels. This could lead to voltage collapse. Additionally, the SDT is relying on the fact that voltage limit is a form of an SOL. Since there is no definition of SOL exceedance, entities may not adequately address voltage issues within the OPA, whereas this requirement emphasizes regulating voltage levels.

Texas RE recommends removing the reference to “Compliance Monitor” in C1.2 Data Retention. Compliance Monitor is an outdated term and there is no definition for it.

**Response**
Although ACES agrees with the retirement Standards MOD-001-1a, MOD-004-1, MOD-008-1, MOD-030-3 and MOD-001-2, ACES cautions the unique position of some of its members requiring them to obtain transmission service across multiple BAAs and participate in transactions between ISO/RTO and non-ISO/RTO entities. This has allowed those entities to witness first-hand the mismatched ATC values across the seams shared by adjacent Transmission Providers. For that reason, we advocated for this at that time and still hold the position that the retirement of these standards should be contingent upon analysis of their retirement impact on entities with such unique situations, like North Carolina Electric Membership Corporation (NCEMC) that depends on the transmission services to meet its load obligation, reliably and economically, within each of their BAAs.

Thank you for the opportunity to comment.

Brandon Gleason - Electric Reliability Council of Texas, Inc. - 2

None.

Rachel Coyne - Texas Reliability Entity, Inc. - 10

Texas RE does not have additional comments.
EEI member companies would like to note our appreciation to NERC for the opportunity afforded to the Industry to provide input into the planned SER Phase I Retirements (Project 2018-03). We are very supportive of those efforts as well as the deferments of some requirements to the SER Phase 2 Project. While we understand that the CIP Standards will also be addressed in the SER Phase 2 Project, we ask that NERC provide additional clarity to the Industry as to how and when these Phase 2 efforts will all tie together. Such an effort would be appreciated by the Industry and would resolve any concerns companies may have related to the Phase 2 effort.

Additionally, EEI Members have noted that when NERC originally queried the Industry for recommendations for possible Reliability Standard Requirements that merit consideration for the Phase 1 effort, the Industry was also told that the CIP Standards would not be considered until the Phase 2 effort. Now that Phase 2 is beginning, EEI looks forward to NERC “consult[ing] with the SER Advisory Group and stakeholders, on a plan to address the CIP Standards in the SER.” (see NERC Standards Efficiency Review Project Update | August 3, 2018) We additionally ask NERC to provide greater clarity and detail as to when stakeholder outreach, similar to the Phase 1 Industry solicitation, will be initiated for CIP Reliability Standards? While NERC did receive a small number of CIP related suggestions within the Phase 1 solicitation, the focus was on the O&P Standards. EEI member companies believe additional solicitation focused on CIP is necessary for effectively addressing CIP Standards in Phase 2.

Please refer to comments submitted by Edison Electric Institute.
At the onset of the Standards Efficiency Review Project NERC stated that there would be an effort to review/revise the CIP standards during phase 2 of the project. The perception by industry was that the CIP standards would go through an iteration of review/revision like the process used by NERC for the O&P standards during phase 1. Can NERC please clarify whether the CIP standards will be more closely reviewed/revised and vetted by industry in subsequent phase of this project.

Response

**Response**

**Kevin Salsbury - Berkshire Hathaway - NV Energy - 5**

**Answer**

**Comment**

NV Energy is appreciative of the efforts taken by NERC and SDT to review the reliability standards and identify these requirements and standards for retirement.

As the efforts with Phase I were dedicated to the O&P Standards, NV Energy is anticipating that in Phase II that this same in-depth review will be conducted for the CIP Standards and Requirements. NV Energy is also looking forward to the inventory of requirements that will be identified with the application of the concepts for the Phase II review.

## Additional comments submitted by Duke Energy

Duke Energy Comment Response to Question 11: for 2018-03 Standards Efficiency Review Retirements comment period ending on: 4/12/2019 8:00 PM

**Question:**

11. The SDT is proposing to retire MOD-004-1, Requirements R1, R2, R3, R4, R5, R6, R7, R8, R9, R10, R11, and R12 (all). Do you agree with the SDT’s proposal to retire MOD-004-1? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

☐ Yes
While Duke Energy would support the retirement of these MOD standards, we cannot do so if MOD-001-2 is withdrawn. The MOD standards promote reliability of the grid by putting in place common boundaries and provisions that are necessary for various calculations that need to be performed. These calculations are important to reliability by providing the baseline for understanding the operational need. By retiring the MOD standards, and not having MOD-001-2 in place, there will not be provisions in place to aid an entity in calculating transfer capability. There will not be any boundaries in place for the curtailment of service. We disagree with the commercial based focus that the drafting team took in the technical rationale document. While these MOD standards (and ATC calculation) may have some commercial based elements to them, they also put in place valuable boundaries that help promote consistency in how the industry calculates these values. Removing these boundaries does not promote reliability for the Bulk Electric System and introduces additional burden to the real-time System Operator.

The expectation of the System Operators to ensure the reliability of the BES in the real-time when there have been no requirements to ensure how ATC is calculated or coordinated beyond what is required by NAESB is unrealistic. Some of the most glaring issues with relying solely upon NAESB to regulate the calculation of ATC are: FERC does not have oversight for non-jurisdictional TSPs and therefore cannot require them to incorporate NAESB standards. Also, while NAESB has acted on the recommendations of the MOD-A project to incorporate any of the gaps created by the retirement of MOD-001-1a, MOD-004-1, MOD-008-1, MOD-028-2, MOD-029-2a, MOD-030-3 and adoption of MOD-001-2, FERC has not acted on either the NERC or NAESB filings. Further, NAESB has not been requested to modify proposed standards to incorporate any of the gaps created by the retirement of the proposed MOD-001-2.

Additionally, the lack of any NERC regulation for consistent ATC methodologies and requirements for sharing of data and could potentially lead to an increase of TLRs being called as this would be the only tool System Operators could utilize to combat rampant loop flow impacts on the BES. This could very well lead to capacity concerns and load shedding as the increase in TLRs could include firm curtailments causing capacity shortages. Without mandatory ATC standards, a TSP would be able to sell as much service as possible. The overselling of service and the overscheduling of ATC Paths will lead to an increase of FIRM TLR, potentially forcing Transmission Operators and Load Serving Entities to shed FIRM load to comply with the TLR. Over the past eight years the MOD-001, 28,29, & 30 standards have been effective the industry has seen a dramatic reduction in FIRM TLRs.

Included in the Attachment with Duke Energy’s response to this question is the rolling 12-month average of TLRs from the NERC website. Notice the reduction in TLRs from 2008-2011 when the MOD standards were first published (in 2008 when TSP started to incorporate the MOD standards into their ATC methodologies) and 2011 (when the MOD standards were mandatory and enforceable).
**Additional comments submitted by ReliabilityFirst**

ReliabilityFirst does not agree with the removal of PRC-004-6 Requirement R4 for the following reason:

1. The concept of a declaration for no identifiable cause is currently introduced in R4 and in the Application Guidelines (now called Supplemental Material) for R4. The one statement from the Application Guidelines for R4 in version 5(i) states,
   a. ‘The entity’s investigation is complete when it identifies the cause of the Misoperation or makes a declaration that no cause was determined. The declaration is intended to be used if the entity determines that investigative actions have been exhausted or have not provided direction for identifying the Misoperation cause. Historically, approximately 12% of Misoperations are unknown or unexplainable.’

   This statement needs to be retained somewhere as an explanation for this use of the declaration. The declaration is also referenced in R5, but for a different reason (problem found but CAP won’t improve reliability of BES). The declaration associated with R4 would be a cause that is ‘unknown/unexplainable’ and all testing and analysis comes up empty. There wouldn’t be a CAP, since nothing was found broken, and the declaration is used to close the investigation. In MIDAS, the CAP Completion Status would be ‘declaration’ rather than improperly coding as ‘CAP – Complete’, since no CAP was developed.
As far as the administrative requirement of ‘corrective action at least once every two calendar quarters’, ReliabilityFirst recommends the following for consideration:

R4:
Each Transmission Owner, Generator Owner, and Distribution Provider that has not determined the cause(s) of a Misoperation, for a Misoperation identified in accordance with Requirement R1 or R3, shall perform investigative action(s) to determine the cause(s) of the Misoperation at least once every two full calendar quarters after the Misoperation was first identified, maintaining documentation in sufficient detail to provide clear delineation of the stage and findings of the investigation until one of the following completes the investigation: [Violation Risk Factor: High] [Time Horizon: Operations Assessment, Operations Planning]
☐ The identification of the cause(s) of the Misoperation; or
☐ A declaration that no cause was identified.
Consideration of Comments

Project Name: 2018-03 Standards Efficiency Review Retirements

Comment Period Start Date: 2/27/2019

Comment Period End Date: 4/12/2019

There were 49 sets of responses, including comments from approximately 119 different people from approximately 81 companies representing the 10 Industry Segments as shown in the table on the following pages.

All comments submitted can be reviewed in their original format on the project page.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process. If you feel there has been an error or omission, you can contact Senior Director of Engineering and Standards Howard Gugel (via email) or at (404) 446-9693.
Questions

1. SDT has determined that additional work is necessary to ensure the retirement of certain standard requirements does not create a reliability gap. The SDT recommends that these standards requirements be considered as part of the SER Phase II effort. These requirements include: BAL-005-1, Requirements R4 and R6; COM-002-4, Requirement R2; EOP-005-3, Requirement R8; EOP-006-3, Requirement R7; IRO-014-3, Requirement R3; IRO-017-1, Requirement R3; and VAR-001-5, Requirement R3. Do you agree with the SDT’s recommendation that these standards requirements be considered as part of the SER Phase II effort? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s recommendation, please provide your explanation.

2. The SDT is proposing to take no action on two standards already scheduled for retirement: PRC-015-1, Requirements R1, R2 and R3; and PRC-018-1, Requirements, R1, R2, R3, R4, R5 and R6. Do you agree with the SDT’s recommendation to take no action for these standards already scheduled for retirement? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s recommendation, please provide your explanation.

3. The SDT determined the following requirements are inappropriate for retirement because they serve a reliability benefit: IRO-002-5, Requirements R4 and R6; IRO-008-2, Requirement R6, and TOP-001-4, Requirements R16 and R17. Do you agree with the SDT’s recommendation to retain these requirements? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s recommendation, please provide your explanation.

4. The SDT is proposing to retire FAC-008-3, Requirements R7 and R8. Do you agree with the SDT’s proposal to retire these requirements? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

5. The SDT is proposing to retire FAC-013-2, Requirements R1, R2, R4, R5 and R6 (all). Do you agree with the SDT’s proposal to retire FAC-013-2? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.
6. The SDT is proposing to retire INT-004-3.1, Requirements R1, R2, and R3 (all). Do you agree with the SDT’s proposal to retire INT-004-3.1? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

7. The SDT is proposing to retire INT-006-4, Requirements R3.1, R4, and R5. Do you agree with the SDT’s proposal to retire Requirements R3.1, R4, and R5 of INT-006-4? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

8. The SDT is proposing to retire INT-009-2.1, Requirement R2. Do you agree with the SDT’s proposal to retire Requirement R2 of INT-009-2.1? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

9. The SDT is proposing to retire INT-010-2.1, Requirements R1, R2, and R3 (all). Do you agree with the SDT’s proposal to retire INT-010-2.1? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

10. The SDT is proposing to retire IRO-002-5, Requirement R1. Do you agree with the SDT’s proposal to retire Requirement R1 of IRO-002-5? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

11. The SDT is proposing to retire MOD-004-1, Requirements R1, R2, R3, R4, R5, R6, R7, R8, R9, R10, R11, and R12 (all). Do you agree with the SDT’s proposal to retire MOD-004-1? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

12. The SDT is proposing to retire MOD-008-1, Requirements R1, R2, R3, R4, and R5 (all). Do you agree with the SDT’s proposal to retire MOD-008-1? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.
13. The SDT is proposing to retire MOD-028-2, Requirements R1, R2, R3, R4, R5, R6, R7, R8, R9, R10, and R11 (all). Do you agree with the SDT’s proposal to retire MOD-028-2? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

14. The SDT is proposing to retire MOD-029-2a, Requirements R1, R2, R3, R4, R5, R6, R7, and R8 (all). Do you agree with the SDT’s proposal to retire MOD-029-2a? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

15. The SDT is proposing to retire MOD-030-3, Requirements R1, R2, R3, R4, R5, R6, R7, R8, R9 and R10 (all). Do you agree with the SDT’s proposal to retire MOD-030-3? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

16. The SDT is proposing to retire MOD-001-1a, Requirements R1, R2, R3, R4, R5, R6, R7, R8 and R9 (all). Do you agree with the SDT’s proposal to retire MOD-001-1a? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

17. The SDT is proposing to withdraw Reliability Standard, MOD-001-2, which is currently pending approval by applicable governmental authorities. Do you agree with the SDT’s proposal to withdraw Reliability Standard MOD-001-2? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

18. The SDT is proposing to retire MOD-020-0, Requirement R1 (all). Do you agree with the SDT’s proposal to retire MOD-020-0? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

19. The SDT is proposing to retire PRC-004-5(i), Requirement R4. Do you agree with the SDT’s proposal to retire Requirement R4 of PRC-004-5(i)? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.
20. **The SDT is proposing to retire TOP-001-4, Requirements R19 and R22. Do you agree with the SDT’s proposal to retire Requirements R19 and R22 of TOP-001-4? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.**

21. **The SDT is proposing to retire VAR-001-5, Requirement R2. Do you agree with the SDT’s proposal to retire Requirement R2 of VAR-001-5? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.**

22. **Please provide any additional comments for the SDT to consider that have not already been provided in the questions above.**
The Industry Segments are:

1 — Transmission Owners
2 — RTOs, ISOs
3 — Load-serving Entities
4 — Transmission-dependent Utilities
5 — Electric Generators
6 — Electricity Brokers, Aggregators, and Marketers
7 — Large Electricity End Users
8 — Small Electricity End Users
9 — Federal, State, Provincial Regulatory or other Government Entities
10 — Regional Reliability Organizations, Regional Entities

1. **SDT has determined that additional work is necessary to ensure the retirement of certain standard requirements does not create a reliability gap. The SDT recommends that these standards requirements be considered as part of the SER Phase II effort. These requirements include: BAL-005-1, Requirements R4 and R6; COM-002-4, Requirement R2; EOP-005-3, Requirement R8; EOP-006-3, Requirement R7; IRO-014-3, Requirement R3; IRO-017-1, Requirement R3; and VAR-001-5, Requirement R3. Do you agree with the SDT’s recommendation that these standards requirements be considered as part of the SER Phase II effort? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s recommendation, please provide your explanation.**

**Summary Response:**

The SDT received comments regarding additional retirements from the SAR. The SDT determined that additional work (and technical rationale) is needed within standards/requirements prior to retirements on these standards/requirements. The SDT used a risk-based approach to evaluate the reliability benefit of each requirement in the SAR for unconditional retirement; i.e. these requirements may be retired without any modifications to other standards or requirements. For each of the standards addressed herein, the SDT determined that modifications would be necessary to other standards/requirements to maintain reliability. Therefore, the SDT referred these standards to Phase II for further disposition.

The SDT received several comments requesting clarification of the Phase II referrals. The Phase II Standards Efficiency Review created a subteam consisting of the team leadership from Project 2018-03 and two members of the Phase II team. This subteam will, independent of the Phase II concept teams, create a SAR to address the standards/requirements they are recommending to move forward for revisions and retirements.

**Comment**

- BAL-005-1 R4 & R6 are now adequately covered under TOP-010-1(i) and are redundant to list under BAL-005-1
• COM-002-4 R2 should be covered in each entities Systematic Approach to Training per PER-005-2.

• EOP-005-3 R8 should be covered in each entities Systematic Approach to Training per PER-005-2.

Response

Thank you for your comments. The SDT determined that additional work (and technical rationale) is needed within standards/requirements prior to retirements on these standards/requirements. The SDT used a risk-based approach to evaluate the reliability benefit of each requirement in the SAR for unconditional retirement; i.e. these requirements may be retired without any modifications to other standards/requirements. For each of the standards addressed herein, the SDT determined that modifications would be necessary to other standards/requirements to maintain reliability. Therefore, the SDT referred these standards/requirements to the SER Phase II effort for further disposition.

A subteam was created consisting of the team leadership from Project 2018-03 Standards Efficiency Review Retirements, and two members of the SER Phase II effort team. This subteam will be independent of the SER Phase II effort concept teams, and will create a SAR to address the standards/requirements they are recommending to move forward for revisions and retirements.

Any comments applicable to the SER Phase II effort, will be referred to the SER Phase II effort subteam for consideration.

BAL-005-1 (R4&R6): In order to retire these requirements, TOP-010-1(i) would require modifications to expressly address quality flags addressing missing or invalid data.

COM-002-4: PER-005-2 currently addresses a systematic approach to training, but does not expressly include the identification of a reliability-related task to address COM-002-4 R2.

EOP-005-3: PER-005-2 currently addresses a systematic approach to training, but does not expressly include the identification of a reliability-related task to address EOP-005-3 R8.
Comment

GCPD agrees with the initial assessment that these standards should be retired for the originally-identified rationales.

Comment

IID determined these requirements the SDT has recommended to be considered as part of the SER Phase II effort should proceed to ballot as proposed retirements based on the original SAR and recommendations from the SER Phase I teams. This would allow the Registered Ballot Body to vote on whether these requirements are appropriate for retirement or if additional work is necessary. If the retirement of
these requirements do not pass ballot, IID supports that they be considered as part of SER Phase II, however the SDT should ensure the SER Phase II scope clearly indicates they will address requirements. Note that the current SER Phase II scope and six efficiency concepts does not indicate they will be addressing specific requirements.

**Marsha Morgan - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC, Group Name Southern Company**

**Answer**
No

**Document Name**

**Comment**
Regarding BAL-005-1 req.4, Southern Company determined that in order for the BA operators to be able to perform their job effectively, then the BA manager must provide the adequate tools needed that are associated with Reporting ACE. To ensure that the information is correct, the BA manager must ensure that operators have accurate information and have indicators if data is either missing or
incorrect. Having the current standard only places an administrative burden on BA entities who already have the tools in place and are training their operators on Reporting ACE. Therefore, retiring this requirement would not leave a gap in reliability.

In regard to BAL-005-1 req. 6, this is another requirement that poses an administrative burden on BA entities as the calculation of Reporting ACE is critical for any entity to effectively balance load/generation and support interconnection frequency. Again, this is an inherent function of BA entities and retiring this requirement would not leave a gap in reliability.

In regard to COM-002-4 req. 2, Southern determined that this requirement could easily be incorporated the current PER-005 standard as it involves System Operator training. Even if the requirement was retired without including it anywhere else in the NERC standards, COM-002-4 R1 would still be enforceable and would require System Operators to follow the documented communication protocols. We don’t believe that any additional work is necessary by the SDT as the retirement of this standard would not result in a reliability gap.

The related compliance activities in EOP-005-3 R8 can easily be incorporated into the PER-005 standards as a part of an entity’s Systematic Approach to Training. System restoration is a reliability-related task and should be included in an entity’s training program for its System Operators to ensure that they are and competent to perform restoration activities.

The related compliance activities in EOP-006-3 R7 can easily be incorporated into the PER-005 standards as a part of an entity’s Systematic Approach to Training. System restoration is a reliability-related task and should be included in an entity’s training program for its System Operators to ensure that they are and competent to perform restoration activities.

In regard to IRO-014-3 req. 3, this is an inherent part of performing as a Reliability Coordinator as coordination is at the heart of this function. A standard requirement is not needed, because the RC serves an area and has responsibilities for multiple entities. Any improprieties by the RC, will surely be voiced by one or more of the member entities and therefore, a requirement is not needed, and therefore we don’t believe that any additional work is necessary by the SDT before retiring this requirement.

In regard to VAR-001-5 R3, Monitoring and maintaining voltage/regulating devices is an inherent responsibility of the TOP entity. It is also essential in ensuring effective operations to effectively transfer power while minimizing losses. Furthermore, it is in the TOP entity’s best interest to maintain system voltage to avoid overloading the system and causing SOLs and IROLs, along with damage to transmission equipment and facilities. Since these functions are done inherently, the NERC standard only increases the administrative burden on the entities and therefore, retirement of this requirement would not create a gap in reliability.
Response

Thank you for your comments. The SDT determined that additional work (and technical rationale) is needed within standards/requirements prior to retirements on these standards/requirements. The SDT used a risk-based approach to evaluate the reliability benefit of each requirement in the SAR for unconditional retirement; i.e. these requirements may be retired without any modifications to other standards/requirements. For each of the standards addressed herein, the SDT determined that modifications would be necessary to other standards/requirements to maintain reliability. BAL-005-1 (R4&R6): In order to retire these requirements, TOP-010-1(i) would require modifications to expressly address quality flags addressing missing or invalid data.
COM-002-4: PER-005-2 currently addresses a systematic approach to training, but does not expressly include the identification of a reliability-related task to address COM-002-4 R2.
EOP-005-3: PER-005-2 currently addresses a systematic approach to training, but does not expressly include the identification of a reliability-related task to address EOP-005-3 R8.
EOP-006-3: PER-005-2 currently addresses a systematic approach to training, but does not expressly include the identification of a reliability-related task to address EOP-006-3 R7
IRO-014-3: IRO-014-3, Requirement R1 time horizon would need to be revised to a time horizon of “Real-time” if Requirement R3 were to be retired. Revision of Requirement R1 is outside the scope of the project, so retirement of IRO-014-3, Requirement R3 is not being sought during this phase of the project.
VAR-001-5: The TOP-series of standards does not provide sufficient granularity to assure that adequate voltage/reactive resources, both of magnitude and type, are operated to voltage and reactive flow as necessary, Requirement R3 is not being sought during this phase of the project.

Please Note: VAR-001-4.2, is an inactive standard. VAR-001-5 changed the WECC variance, and not the continent-wide requirements. VAR-001-5 became effective January 1, 2019.

Kayleigh Wilkerson - Lincoln Electric System - 5, Group Name Lincoln Electric System

Answer
No

Document Name

Comment

In consideration that the actions specified in VAR-001-5 R3 are inherent to the System Operators’ core functions, LES determined R3 is still suitable for retirement as part of the SER Phase I effort. The prevention and mitigation of SOL exceedances, as dictated by applicable TOP standards, ensures System Operators utilize the necessary devices to regulate transmission voltage and reactive flow. This requirement provides no additional direction and taken independently is too vague to provide useful guidance in ensuring reliability.

Anton Vu - Los Angeles Department of Water and Power - 6
LDWP agrees that IRO-017-1 should be a part of a Phase II effort. If the TPL-001-4 standard is not clarified to notify Peak RC of the transmission results then there may not be a mechanism for notifying the RC about potential IROLs.

Quintin Lee - Eversource Energy - 1, Group Name Eversource Group

Answer Yes

Comment
Although we agree with moving these Requirements into the SER Phase II effort, there is a concern that addressing these Requirements may be delayed due to the Phase II 'Concept' selection process. Currently the Phase II Concept process has a timeline that extends into September and that date is only for deciding which recommendation(s) to use.
Also, there is no assurance that the Concepts chosen in Phase II will address the deferred Requirements proposed for retirement in Phase I.

A suggestion would be for the Phase II team to address these deferred Requirements separately as they decide on which Concepts to use.

EEI agrees that some Reliability Standards and associated requirements present more complex consideration and research in order to ensure proposed retirements do not create unintended reliability gaps. Moreover, we support the proposal to shift such requirements to the SER Phase II effort. However, the recent posting on the SER Phase II Concepts has created some confusion. EEI recommends that NERC or the SER Advisory provide additional information to help clarify the full scope of the upcoming SER Phase II Project—including these requirements for consideration for Phase II and the proposed Concepts. EEI also encourages the SDT to prioritize these requirements for Phase II so that progress is not held up by the SDT efforts to refine the proposed Concepts.

Any comments applicable to the SER Phase II effort, will be referred to the SER Phase II effort subteam for consideration.

EOP-005-3: PER-005-2 currently addresses a systematic approach to training, but does not expressly include the identification of a reliability-related task to address EOP-005-3 R8.

EOP-006-3: PER-005-2 currently addresses a systematic approach to training, but does not expressly include the identification of a reliability-related task to address EOP-006-3 R7.

Jodirah Green - ACES Power Marketing - 1,3,4,5,6 - MRO,WECC,Texas RE,SERC,RF, Group Name ACES Standard Collaborations

<table>
<thead>
<tr>
<th>Answer</th>
<th>Yes</th>
</tr>
</thead>
</table>

In conducting the review, we suggest that where requirements are found to be somewhat, but not completely duplicative, consider proceeding with the retirement of the identified requirements and adding any language of the retired requirement that is still pertinent to the requirements which will still be in effect.

Thank you for your comments. The SDT determined that additional work (and technical rationale) is needed within standards/requirements prior to retirements on these standards/requirements. The SDT used a risk-based approach to evaluate the reliability benefit of each requirement in the SAR for unconditional retirement; i.e. these requirements may be retired without any modifications to other standards/requirements. For each of the standards addressed herein, the SDT determined that modifications
would be necessary to other standards/requirements to maintain reliability. Therefore, the SDT referred these standards/requirements to the SER Phase II effort for further disposition.

A subteam was created consisting of the team leadership from Project 2018-03 Standards Efficiency Review Retirements, and two members of the SER Phase II effort team. This subteam will be independent of the SER Phase II effort concept teams, and will create a SAR to address the standards/requirements they are recommending to move forward for revisions and retirements.

Any comments applicable to the SER Phase II effort, will be referred to the SER Phase II effort subteam for consideration.

**Thomas Foltz - AEP - 5**

<table>

</thead>
</table>

**Document Name**

**Comment**

It appears from the technical rational document that the 2018-03 drafting team determined the Requirements should be revised and retained rather than retired in their entirety. Since standard revision is within the scope of the Phase 2 team, AEP has no objections to the concept of revising COM-002-4 R2, EOP-005-3 R8, IRO-017-1 R3, and VAR-001-5 R3.

Thank you for your comment.
2. The SDT is proposing to take no action on two standards already scheduled for retirement: PRC-015-1, Requirements R1, R2 and R3; and PRC-018-1, Requirements, R1, R2, R3, R4, R5 and R6. Do you agree with the SDT’s recommendation to take no action for these standards already scheduled for retirement? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s recommendation, please provide your explanation.

Summary Response:

The SDT received comments regarding the retaining of PRC-015-1 and PRC-018-1. The SDT determined that revisions are needed within the PRC-002-2 Implementation Plan in order to pursue immediate retirement of this standard. The SDT used a risk-based approach to evaluate the reliability benefit of each requirement in the SAR for unconditional retirement. Therefore, the SDT referred these standards to Phase II for further disposition.

Kim Thomas - Duke Energy - 1,3,5,6 - FRCC,SERC,RF, Group Name Duke Energy

<table>
<thead>
<tr>
<th>Answer</th>
<th>No</th>
</tr>
</thead>
</table>

**Comment**

PRC-018-1 references Regional Criteria that must be followed to comply with the standard. Duke Energy requests the drafting team consider the ramifications on PRC-018-1 if a Region has already retired its Regional Criteria applicable to PRC-018 and PRC-002. The absence of any applicable Regional Criteria for a particular Region, makes PRC-018-1 a stronger candidate for immediate retirement.

**Response**

Thank you for your comments. The SDT determined that additional work (and technical rationale) is needed within standards/requirements prior to retirements on these standards/requirements. The SDT used a risk-based approach to evaluate the reliability benefit of each requirement in the SAR for unconditional retirement; i.e. these requirements may be retired without any
modifications to other standards/requirements. For each of the standards addressed herein, the SDT determined that modifications would be necessary to other standards/requirements to maintain reliability. Therefore, the SDT referred these standards/requirements to the SER Phase II effort for further disposition.

A subteam was created consisting of the team leadership from Project 2018-03 Standards Efficiency Review Retirements, and two members of the SER Phase II effort team. This subteam will be independent of the SER Phase II effort concept teams, and will create a SAR to address the standards/requirements they are recommending to move forward for revisions and retirements.

Any comments applicable to the SER Phase II effort, will be referred to the SER Phase II effort subteam for consideration.

Sing Tay - OGE Energy - Oklahoma Gas and Electric Co. - 6, Group Name OKGE

<table>
<thead>
<tr>
<th>Answer</th>
<th>No</th>
</tr>
</thead>
</table>

**Comment**

OKGE disagrees with the SDT’s proposal of taking no action on PRC-018-1. Per the PRC-002-2 Implementation Plan,

“Each Transmission Owner, and Generator Owner shall maintain documentation to demonstrate compliance with PRC-018-1 until that entity meets the requirements of PRC-002-2 in accordance with this Implementation Plan. Standard PRC-018-1 shall remain effective throughout the phased implementation period of PRC-002-2 and shall be applicable to an entity’s Disturbance monitoring and reporting activities not yet transitioned to PRC-002-2. PRC-018-1 will be retired following full implementation of PRC-002-2 as noted below.”

OKGE determined this justification is flawed. The requirements in PRC-018-1 states that TOs and GOs are required to install DMEs per the requirements established by its Regional Reliability Organization (RRO). However, in the SPP region, since PRC-002-1 was never approved by FERC and with the creation of PRC-002-2, the requirements that were established by SPP on DMEs were removed from SPP Planning Criteria in April 2017. Currently, the SPP RTO has no DME installation requirements, therefore, the entities in the SPP region do not have a set of criteria to follow to meet the requirements in PRC-018-1 (particularly for requirements R4 and R5, where DME equipment required by the RRO is not specified). OKGE determined PRC-018-1 should be retired prior to PRC-002-2’s full implementation (i.e 7/1/2022).

3. The SDT determined the following requirements are inappropriate for retirement because they serve a reliability benefit: IRO-002-5, Requirements R4 and R6; IRO-008-2, Requirement R6, and TOP-001-4, Requirements R16 and R17. Do you agree with the SDT’s recommendation to retain these requirements? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s recommendation, please provide your explanation.

Summary Response:

The SDT received several comments on retaining the requirements in IRO-002-5 (R4 and R6), IRO-008-2 (R6), and TOP-001-4 (R16 and R17). The SDT determined that additional work (and technical rationale) is needed within standards/requirements prior to retirements on these standards/requirements. The SDT used a risk-based approach to evaluate the reliability benefit of each requirement in the SAR for unconditional retirement; i.e. these requirements may be retired without any modifications to other standards or requirements. Therefore, the SDT referred these standards to Phase II for further disposition.

IRO-002-5, Requirements R4 and R6 are necessary for the Real-time operators to be assured of having the tools necessary to monitor the BES; therefore, retirement of these requirements is not being sought during this phase of the project.

Requirement R4 of IRO-002-5 needs to be retained to make it clear that the System Operator has authority to postpone, cancel or recall planned outages of Energy Management System (EMS), Internet Technology (IT), or communications-related equipment. Although some RCs may include this type of equipment in their outage coordination process (cf. IRO-017-1), the inclusion of EMS, IT or communications-related equipment is not explicitly required by IRO-017-1, Requirement R1. In addition, RC equipment outages are not required to follow the RC’s outage coordination process (i.e., IRO-017-1, Requirement R2 is only applicable to TOPs and BAs). As such, a potential gap in the standards would exist if IRO-002-5, Requirement R4 was retired.

Although IRO-008-2, Requirement R6 appears to be administrative in nature, there are reliability benefits to knowing what actions were taken to prevent or mitigate the exceedance. Therefore, retirement of IRO-008-2, Requirement R6 is not being sought during this phase of the project.

The SDT determined that additional work (and technical rationale) is needed within standards/requirements prior to retirements on these standards/requirements. The SDT used a risk-based approach to evaluate the reliability benefit of each requirement in the SAR for
unconditional retirement; i.e. these requirements may be retired without any modifications to other standards or requirements. Therefore, the SDT referred these standards to Phase II for further disposition.

The SDT believes Requirements R16 and R17 should be retained for the following reasons:

Requirements R16 and R17 of TOP-001-4 need to be retained to make it clear that the System Operator has authority to postpone, cancel or recall planned outages of EMS, IT or communications-related equipment. Although some RCs may include this type of equipment in their outage coordination process (IRO-017-1), the inclusion of EMS, IT or communications-related equipment is not explicitly required by IRO-017-1, Requirement R1. As such, a potential gap in the standards would exist if TOP-001-4, Requirements R16 and R17 were retired. Requirements R16 and R17 are necessary for the Real-time operators to be assured of having the tools necessary to monitor the BES. Therefore, retirement of TOP-001-4, Requirements R16 and R17 is not being sought during this phase of the project.

Maryanne Darling-Reich - Black Hills Corporation - 1,3,5,6 - WECC

<table>

**Comment**

TOP-001-4 R16 and R17 do not provide a reliability benefit. They don’t even align with most, if not all, standard business processes. The Outage Coordinator, SCADA EMS, IT Networking, and Communications departments determine the impacts of all “Planned” outages or telemetry equipment. Most System Operators do not even have the technical knowledge to make substantiated decision to delay or postpone this work. Our System Operators may approve “Unplanned” outages but this is a rare exception and is not in scope for these requirements. Other requirements, such as R13 are already in place which demand an extremely high availability of EMS functionality, EMS & IT staff are well aware that unplanned outages impacting the ability to view and solve contingency analysis are unacceptable for anything other than a brief interruption.

**Response**

Thank you for your comments. The SDT determined that additional work (and technical rationale) is needed within standards/requirements prior to retirements on these standards/requirements. The SDT used a risk-based approach to evaluate the
reliability benefit of each requirement in the SAR for unconditional retirement; i.e. these requirements may be retired without any modifications to other standards/requirements. For each of the standards addressed herein, the SDT determined that modifications would be necessary to other standards/requirements to maintain reliability. Therefore, the SDT referred these standards/requirements to the SER Phase II effort for further disposition.

A subteam was created consisting of the team leadership from Project 2018-03 Standards Efficiency Review Retirements, and two members of the SER Phase II effort team. This subteam will be independent of the SER Phase II effort concept teams, and will create a SAR to address the standards/requirements they are recommending to move forward for revisions and retirements.

Any comments applicable to the SER Phase II effort, will be referred to the SER Phase II effort subteam for consideration.

The SDT determined Requirements R16 and R17 should be retained for the following reasons:

Requirements R16 and R17 of TOP-001-4 need to be retained to make it clear that the System Operator has authority to postpone, cancel or recall planned outages of EMS, IT or communications-related equipment. Although some RCs may include this type of equipment in their outage coordination process (IRO-017-1), the inclusion of EMS, IT or communications-related equipment is not explicitly required by IRO-017-1, Requirement R1. As such, a potential gap in the standards would exist if TOP-001-4, Requirements R16 and R17 were retired. Requirements R16 and R17 are necessary for the Real-time operators to be assured of having the tools necessary to monitor the BES. Therefore, retirement of TOP-001-4, Requirements R16 and R17 is not being sought during this phase of the project.

Comment

AZPS shares the opinion of many others in the industry that the language in requirements TOP-001-4 R16 and R17 does not, in and of themselves, provide any reliability benefit. Simply having “the authority to approve outages and maintenance” does not assure that an approval occurs, nor is it required to be compliant. Since a simple letter or procedure stating that operators have the stated authority is adequate to demonstrate compliance, this action does not provide a reliability benefit.
Thank you for your comments. The SDT determined that additional work (and technical rationale) is needed within standards/requirements prior to retirements on these standards/requirements. The SDT used a risk-based approach to evaluate the reliability benefit of each requirement in the SAR for unconditional retirement; i.e. these requirements may be retired without any modifications to other standards/requirements. Any comments applicable to the SER Phase II effort, will be referred to the SER Phase II effort subteam for consideration.

Kim Thomas - Duke Energy - 1,3,5,6 - FRCC,SERC,RF, Group Name

Answer

No

Comment

Duke Energy recommends the drafting team consider IRO-008-2 R6 for immediate retirement. We agree with the drafting team’s assertion in the Technical Justifications document that characterizes R6 as administrative in nature. We do not believe that there is much if any reliability benefit in requiring an RC to notify the TOPs or BAs of any SOL/IROL exceedance that was prevented or already mitigated. There is already an Operating Plan in place to be followed for such an event, and alerting Operators of an issue that they are already aware of, and potentially distracting them from dealing with other Real-time issues, is of minimal reliability benefit.
Thank you for your comments.

The SDT determined that this requirement should be retained for the following reasons:

Although IRO-008-2, Requirement R6 appears to be administrative in nature, there are reliability benefits to knowing what actions were taken to prevent or mitigate the exceedance. Therefore, retirement of IRO-008-2, Requirement R6 is not being sought during this phase of the project.

CenterPoint Energy Houston Electric, LLC does not believe that TOP-001-4, Requirements R16 and R17 to “provide its System Operators with the authority to approve outages and maintenance of its telemetering and control equipment…” themselves provide a reliability benefit. Furthermore, we believe that this “authority” is inherent in “acting to maintain the reliability of its TOP/BA Area via its own actions or by issuing Operating Instructions” as is required by TOP-001-4, Requirement R1 and R2, and as such, R16 and R17 are not needed.

**Comment**

IID determined these requirements the SDT has identified as inappropriate for retirement should proceed to ballot as proposed retirements based on the original SAR and recommendations from the SER Phase I teams. This would allow the Registered Ballot Body to vote on whether these requirements are appropriate for retirement or if additional work is necessary. If the retirement of these requirements do not pass ballot, IID supports that they be considered as part of SER Phase II, however the SDT should ensure the SER Phase II scope clearly indicates they will address requirements. Note that the current SER Phase II scope and six efficiency concepts does not indicate they will be addressing specific requirements.
Thank you for your comments. The SDT determined that additional work (and technical rationale) is needed within standards/requirements prior to retirements on these standards/requirements. The SDT used a risk-based approach to evaluate the reliability benefit of each requirement in the SAR for unconditional retirement; i.e. these requirements may be retired without any modifications to other standards/requirements. In regard to IRO-002-5 R4, it should be retired as approving planned outages is a reliability related task and can be easily incorporated into the current PER-005 standard. Although the requirement has a benefit to reliability, it should fall within the Operator Training standards. Therefore, the retirement of this standard requirement would be appropriate.

In regard to IRO-002-5 R6, this requirement administrative in nature and duplicative and should be retired based on the following reason/s:

Before an entity is allowed to function as a Reliability Coordinator, it goes through a certification process, which ensures that the entity has all the relative systems in place to perform system monitoring and assessments. In addition, the certification review also involves determining if the entity’s data/voice communication systems have redundancy, the ability to effectively transfer data and has alarms built in to notify System Operators in the event of adverse changes to the system.
Furthermore, the RC function is on a 3-year audit schedule by the RRO and therefore, the RC will have to continuously show that it has these same capabilities.

In regard to IRO-008-2, R6, we see no reliability benefit in this requirement as both the RC and the impacted entities will already have sufficient monitoring systems in place to ensure that all are aware when a potential SOL/IROL has been prevented/mitigated. The specific actions that the RC took to prevent/mitigate the exceedance only benefits reliability from a possible teaching point to System Operators, who may experience the same type of event in the future.

However, from an operational reliability standpoint, there is no benefit to the RC notifying entities of the actions taken to prevent/mitigate and exceedance and takes the RC's attention away from performing its responsibility to continuously monitor and assess the system.

We believe that TOP -001-4 R16 and R17 should be retired as the authority to approve planned outages is a reliability related task that can easily be incorporated into the current PER-005 standard. Although the requirements do benefit reliability, they should fall within the Operator Training standards. Therefore, the retirement of these requirements would be appropriate.

### Response

The SDT determined that IRO-002-5 Requirements R4 and R6 should be retained for the following reasons:

IRO-002-5, Requirements R4 and R6 are necessary for the Real-time operators to be assured of having the tools necessary to monitor the BES; therefore, retirement of these requirements is not being sought during this phase of the project.

Requirement R4 of IRO-002-5 needs to be retained to make it clear that the System Operator has authority to postpone, cancel or recall planned outages of Energy Management System (EMS), Internet Technology (IT), or communications-related equipment. Although some RCs may include this type of equipment in their outage coordination process (cf. IRO-017-1), the inclusion of EMS, IT or communications-related equipment is not explicitly required by IRO-017-1, Requirement R1. In addition, RC equipment outages are not required to follow the RC’s outage coordination process (i.e., IRO-017-1, Requirement R2 is only applicable to TOPs and BAs). As such, a potential gap in the standards would exist if IRO-002-5, Requirement R4 was retired.
Although IRO-008-2, Requirement R6 appears to be administrative in nature, there are reliability benefits to knowing what actions were taken to prevent or mitigate the exceedance. Therefore, retirement of IRO-008-2, Requirement R6 is not being sought during this phase of the project.

Thank you for your comments. The SDT determined that additional work (and technical rationale) is needed within standards/requirements prior to retirements on these standards/requirements. The SDT used a risk-based approach to evaluate the reliability benefit of each requirement in the SAR for unconditional retirement; i.e. these requirements may be retired without any modifications to other standards/requirements. For each of the standards addressed herein, the SDT determined that modifications would be necessary to other standards/requirements to maintain reliability. Therefore, the SDT referred these standards/requirements to the SER Phase II effort for further disposition.

A subteam was created consisting of the team leadership from Project 2018-03 Standards Efficiency Review Retirements, and two members of the SER Phase II effort team. This subteam will be independent of the SER Phase II effort concept teams, and will create a SAR to address the standards/requirements they are recommending to move forward for revisions and retirements.

Any comments applicable to the SER Phase II effort, will be referred to the SER Phase II effort subteam for consideration. The SDT determined Requirements R16 and R17 should be retained for the following reasons:

Requirements R16 and R17 of TOP-001-4 need to be retained to make it clear that the System Operator has authority to postpone, cancel or recall planned outages of EMS, IT or communications-related equipment. Although some RCs may include this type of equipment in their outage coordination process (IRO-017-1), the inclusion of EMS, IT or communications-related equipment is not explicitly required by IRO-017-1, Requirement R1. As such, a potential gap in the standards would exist if TOP-001-4, Requirements R16 and R17 were retired. Requirements R16 and R17 are necessary for the Real-time operators to be assured of having the tools necessary to monitor the BES. Therefore, retirement of TOP-001-4, Requirements R16 and R17 is not being sought during this phase of the project.

Answer  Yes
ISO-NE recommends to review the retirements of these requirements as part of Phase 2

4. **The SDT is proposing to retire FAC-008-3, Requirements R7 and R8. Do you agree with the SDT’s proposal to retire these requirements? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.**

**Summary Response:**

The SDT received comments regarding the proposed retirement of FAC-008-3 (R7 and R8).

The SDT determined that these requirements should be retired for the following reasons:

These requirements are duplicative of the data provision standards MOD-032-1, IRO-010-2, and TOP-003-3. In MOD-032-1, Requirement R1, the Planning Coordinator (PC) and Transmission Planners (TP) develop modeling data requirements and reporting according to Attachment 1. In MOD-032-1 R2, the Transmission Operator (TO) and Generator Operator (GO) provide power capabilities data in Item 3, and facility ratings data in Items 3(f), 4(c) and 6(g) in the steady-state column of Attachment 1, as requested by the TP or PC.

IRO-010-2, Requirement R1 and TOP-003-3, Requirement R1 require the Reliability Coordinator (RC) and the Transmission Operator (TOP) to list necessary data and information needed to perform its Operating Planning Analyses and Real-Time Assessments. This data necessarily includes facility ratings as inputs to SOL monitoring. IRO-010-2, Requirement R3 and TOP-003-3, Requirement R5 require that the TO and the GO to respond to the RC’s and the TOP’s requests.

The identity and rating of the next most limiting equipment is not of value in the Operations Planning Time Horizon relating to these requirements because the elimination of the most limiting equipment cannot occur in the Operations Planning Time Horizon.

**Gregory Campoli - New York Independent System Operator - 2, Group Name ISO/RTO Standards Review Committee**

Additional consideration is needed regarding the Facility Ratings requirements and the relationship to the data requirements of MOD-032, IRO-010, and TOP-003-3 and should be a separate project.

Note: ERCOT has not signed on to this SRC joint response, however will provide its own response in a separate submission.

**Response**

Thank you for your comment. The SDT determined that these requirements should be retired for the following reasons:

These requirements are duplicative of the data provision standards MOD-032-1, IRO-010-2, and TOP-003-3. In MOD-032-1, Requirement R1, the Planning Coordinator (PC) and Transmission Planners (TP) develop modeling data requirements and reporting according to Attachment 1. In MOD-032-1 R2, the Transmission Operator (TO) and Generator Operator (GO) provide power capabilities data in Item 3, and facility ratings data in Items 3(f), 4(c) and 6(g) in the steady-state column of Attachment 1, as requested by the TP or PC.

IRO-010-2, Requirement R1 and TOP-003-3, Requirement R1 require the Reliability Coordinator (RC) and the Transmission Operator (TOP) to list necessary data and information needed to perform its Operating Planning Analyses and Real-Time Assessments. This data necessarily includes facility ratings as inputs to SOL monitoring. IRO-010-2, Requirement R3 and TOP-003-3, Requirement R5 require that the TO and the GO to respond to the RC’s and the TOP’s requests.

**Rachel Coyne - Texas Reliability Entity, Inc. - 10**

**Comment**

Due to the importance of the use of accurate Facility Ratings in reliable BES operations and planning, Texas RE recommends FAC-008-3 R7 and R8 remain effective in order to emphasize the need to provide accurate Facility Ratings to entities that require Facility Rating data. These Requirements place an emphasis on the provision of accurate Facility Ratings to the entities responsible for the operation and planning of the BES. Although IRO-010 and MOD-032 data specifications will likely address the provision of Facility Ratings to the
these entities, the large quantity of additional data potentially included within the data specifications can lead to a reduced emphasis on the Facility Rating component of the data specification. FAC-008-3 R7 and R8 would focus an entity on a specific facet of data and data exchange.

Moreover, FERC Order 693 Paragraph 771 directed NERC to develop modifications to FAC-008-1 to “for each facility, identify the limiting component and, for critical facilities, the resulting increase in rating of that component is no longer limiting”. Requirement R8 meets this directive by requiring “Identity of the existing next most limiting equipment of the Facility (R8.1) and “The Thermal Rating for the next most limiting equipment (R8.2).

Comment

We recommend a separate standards development project be initiated to holistically address issues identified during the periodic review of FAC-008-3 and the potential retirement of FAC-008-3 requirements identified during the Standards Efficiency Review. On March 18, 2010, Docket No. RR09-6-000, FERC issued an order directing NERC to propose modification of electric reliability organization rules of procedure. This order included FERC’s concerns regarding facility ratings and limiting elements. (Please see paragraph 13 and 14 of the FERC order.) We believe that additional consideration is needed regarding the Facility Ratings requirements and the relationship to the data requirements of MOD-032, IRO-010, and TOP-003 to ensure that most limiting elements are determined. The equipment data that is required to be provided per the other reliability standards may not be sufficient to determine Facility Ratings, including for use in Real Time Models.

Comment

The redline version of FAC-008-3 provided by the SDT does not appear to be the same as the version posted on the NERC website under ‘Mandatory Standards Subject to Enforcement’. However, the wording of the Requirements proposed for retirement is the same.
Response

Thank you for your comment. The SDT updated the template for this standard during development.

Brian Millard - Tennessee Valley Authority - 1,3,5,6 - SERC, Group Name Tennessee Valley Authority
While we do not oppose the retirement of R7 and R8, we note that some aspects of R8 were added to address a FERC directive in Order 693. The Commission was so intent on this directive that it ordered NERC to modify its Rules of Procedure in a March 18, 2010 Order (Docket No. RR09-6-000) to better accommodate FERC directives in the Standards development process. FERC denied a NERC request for a stay on making further modifications to FAC-008 in September 2010. This ultimately led to development of FAC-008-3 and the addition of R8 under Project 2009-06. FERC approved FAC-008-3 in an order issued on November 17, 2011 (Docket No. RD11-10). The drafting team should consider whether the standards referenced in the technical rationale supporting retirement of R7 and R8 (MOD-032-1, IRO-010-2, and TOP-003-3) adequately address R8, part 8.2.

Wendy Center - U.S. Bureau of Reclamation - 5

Reclamation supports the retirement of FAC-008-3 Requirements R7 and R8.

5. The SDT is proposing to retire FAC-013-2, Requirements R1, R2, R4, R5 and R6 (all). Do you agree with the SDT's proposal to retire FAC-013-2? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

Summary Response:

The SDT received comments regarding the proposed retirement of FAC-013-2. Although assessing transfer capability in the planning horizon is a method to test the robustness of the system, robustness testing of a system is not an indicator of reliability because there is no metric for robustness. Additionally, the proposed retirement of FAC-013-2 does not preclude any entity from performing studies to assess transfer capability for their own purposes. The reliability benefit of doing such an assessment varies from entity to entity, with some entities not having a benefit for the assessment it at all. The 2013 NERC Independent Experts Review Project (IERP) identified Requirements R2 and R3 as administrative and recommended them for retirement. Requirement R3 was approved for retirement by FERC in 2014.

TPL-001-5 R1.1.4 takes into consideration Firm Transmission Service and Interchange and R2.1.3 uses expected transfers. Both FAC-013-2 and TPL-001-5 are for the Near-Term Transmission Planning Horizon. This along with a combination of existing TPL, MOD, and FAC Standards ensures the BES is operated reliably by determining the modeling exists to identify any SOL/IROL(s) and the TOP standards ensure entities prevent or mitigate for any SOL/IROL(s). The purpose is to ensure Bulk Electric System operates reliably over a broad spectrum of system conditions and following a wide range of probable contingencies.

Kim Thomas - Duke Energy - 1,3,5,6 - FRCC,SERC,RF, Group Name Duke Energy

Answer
No

Document Name

Comment

Duke Energy would like to reiterate its opposition to the retirement of FAC-013-2.
An explanation addressing how FERC’s concerns in Orders 693 and 729 are still addressed needs to be provided. As stated in introduction with the Whitepaper published with the standard in Project 2010-10:

“Through FERC Orders 693 (paragraphs 782 and 794) and 729 (paragraphs 278, 279, 289, 290 and 291), FERC directed NERC to establish a standard requiring Planning Coordinators to calculate transfer capability in the planning horizon and communicate the results. In the FERC Order approving the MOD standards related to ATC/AFC calculations (MOD-001, MOD-028, MOD-029, and MOD-030), FERC did not approve NERC’s request to withdraw FAC-012-1, nor did they approve the retirement of FAC-013-1. With respect to these two Reliability Standards, the Commission disagreed with NERC that they are wholly superseded by the MOD Reliability Standards.

• The Commission noted that, under FAC-012-1, Reliability Coordinators and Planning Authorities would be required to document the methodology used to establish interregional and intra-regional transfer capabilities and to state whether the methodology is applicable to the planning horizon or the operating horizon.

• The Commission also noted that, under FAC-013-1, Reliability Coordinators and Planning Authorities are required to establish a set of inter-regional and intra-regional transfer capabilities that are consistent with the methodology documented under FAC-012-1, which could require the calculation of transfer capabilities for both the planning horizon and the operating horizon.

• The Commission posited that these FAC Reliability Standards were necessary because the proposed MOD Reliability Standards provide only for the calculation of available transfer capability and its components, including total transfer capability, in the operating horizon. Thus, the Commission stated, the proposed MOD Reliability Standards do not govern the calculation of transfer capabilities in the planning horizon, i.e., beyond 13 months in the future.

• The Commission also noted, that the calculation of transfer capabilities in the planning horizon (years one through five) may not be so accurate to support long-term scheduling of the transmission system but that such forecasts will be useful for long-term planning, in general, by measuring sufficient long-term capacity needed to ensure the reliable operation of the Bulk-Power System.

• The Commission stated that the responsibility for calculation of transfer capabilities in the planning horizon would be appropriately assigned to the Planning Coordinator and not the Reliability Coordinator.

Consistent with the above philosophy and to address FERC’s concerns, FAC-013-2 requires that Planning Coordinators have a current documented methodology for use in performing an annual assessment of Transfer Capability in the Near-Term Planning Horizon (Transfer Capability Methodology).”
In the Technical Justification document, the SDT states that:

“The requirement for Planning Coordinators (PC) to have a methodology for and to perform an annual assessment of Transfer Capability for a single year in the Near-Term Transmission Planning Horizon does not benefit System reliability beyond that provided by other Reliability Standards.”

Assuming that the drafting team is referencing TPL-001 in the above statement, we would like to point out that TPL-001 standard does not REQUIRE that transfer sensitivities be performed and are not likely to indicate limitations to transfer from neighboring systems which is indicative of a neighbor’s ability to support a system during an energy emergency. In its response to comments the SDT agreed that at some point in the future it would be appropriate to move the requirements of FAC-013-2 into the TPL standards. This was not possible at the time due to the timing requirements necessary to meet FERC's orders. In addition the SDT’s Whitepaper stated:

“The TPL standards define the studies to be performed, the performance requirements for the BES and the details of the required assessments. FAC-013-2 is intended to identify potential future weaknesses in the system by performance of tests - application of bulk energy transfers to stress the system. FAC-013-2 adds to the understanding of system performance obtained through application of the TPL standards, providing knowledge of potential facilities requiring additional focus and analysis.”

The Technical Justification document also states that:

“This Reliability Standard is primarily administrative in nature and does not require specific performance metrics or coordination among functional entities.”

We disagree with the coordination reference in the above statement. Coordination occurs through sharing of identified limits to transfer through R2 for awareness and any necessary action.

Next, the Technical Justification document states that:

“Assessing transfer capability above the “known commitments for Firm Transmission Service and Interchange” required by TPL-001-4 (R1.1.5), serves a market function as opposed to securing System reliability.”

We disagree with the statement that this is solely related to a market function. Transfers serve to stress test the system in ways that the PC deems best to identify weak points on their system and impacts on their neighbors. The Whitepaper published with the
standard stated, “In addition, this information is not intended in any way to be associated with the granting or denial of transmission service.”

“Entities that receive the methodology or assessment results are not obligated to use or even consider the information in their assessments.”

While it is true that there is no obligation to use or consider the information in the assessment, as is the case with TPL-001, but the results are required to be shared with neighboring systems. The Whitepaper states “The application of FAC-013-2 will provide an assessment of the robustness of the future transmission system and facilitate communication between adjacent Planning Coordinators. FAC-013-2 addresses FERC’s concerns regarding transfer capability in the planning horizon and provides important information that Planning Coordinators will be able to apply in their efforts to reliably plan the BES.”

“Requirement R4 only requires the assessment to be performed for one year in the Near-Term Transmission Planning Horizon. This year can be arbitrarily chosen by the PC and the analysis does not guarantee transmission service that is necessary for System reliability.”

The standard is supposed to provide a stress test as best determined by the PC’s operating experience and knowledge to identify future system weaknesses. The Whitepaper states “AC-013-2 allows the Planning Coordinator to develop its Transfer Capability Methodology based on knowledge of its system’s sensitivity to transfers and significance of Facilities to reliability, within the framework provided by FAC-013-2.” It is not intended to provide information regarding transmission service which is studied in a completely different way.

“Assessing transfer capability in the planning horizon is a method to test the robustness of the system. Robustness testing of a system is not an indicator of reliability because there is no metric for robustness.”

While there may not be a standard metric for robustness, assessing transfer capability in the planning horizon does add to the PC’s portfolio of knowledge of their system’s behavior under stressed conditions.
Thank you for your comment. Although assessing transfer capability in the planning horizon is a method to test the robustness of the system, robustness testing of a system is not an indicator of reliability because there is no metric for robustness. Additionally, the proposed retirement of FAC-013-2 does not preclude any entity from performing studies to assess transfer capability for their own purposes. The reliability benefit of doing such an assessment varies from entity to entity, with some entities not having a benefit for the assessment at all. The 2013 NERC Independent Experts Review Project (IERP) identified Requirements R2 and R3 as administrative and recommended them for retirement. Requirement R3 was approved for retirement by FERC in 2014.

The California ISO supports the comments of the ISO/RTO Council Standards Review Committee (SRC)

The California ISO has the following additional comment:
"If FAC-013-2 is retired, then FAC-015 development under Project 2015-09 needs to be revisited, as those activities were premised on FAC-013 continuing to be in effect and modified to FAC-013-3 as part of the comprehensive changes within Project 2015-09."

Response
Please see response to comments from ISO/RTO Council Standards Review Committee. The SDT will communicate with the Project 2015-09 Establish and Communicate System Operating Limits NERC staff to determine if any action needs to be taken in response to your comments.

Anton Vu - Los Angeles Department of Water and Power - 6

Answer Yes

Document Name

Comment

LDWP determined FAC-013-2 needs further refinement and standardized metrics so that all Planning Coordinators are following a standard methodology.

6. The SDT is proposing to retire INT-004-3.1, Requirements R1, R2, and R3 (all). Do you agree with the SDT’s proposal to retire INT-004-3.1? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

Summary Response:

The SDT received comments regarding the proposed retirement of INT-004-3.1. The proposed retirement of INT-004 is due to the fact that Requirements R1 and R2 have not been enforceable for four years now since the Purchasing Selling Entity was deregistered. Those requirements are already largely moved into NAESB and the remaining parts of them are proposed to be moved to NAESB. Since there has been no reliability impact of those requirements not being enforceable for four years, there is no evidence they should be reinstated applicable to a different functional entity. Requirement 3 of INT-004 only requires the registration of data in the NAESB registry for the purpose “to ensure that coordination occurs between all entities involved prior to the initial implementation of a Pseudo-Tie.” There is now an extensive NERC Pseudo-Tie Coordination Guideline. One of the primary guiding principles of periodic review teams is to determine if requirements are duplicative and whether they have a significant impact on reliability. Since R3 only serves to register Pseudo-Ties in a registry and their coordination is well-documented, it was unanimous there was no reliability benefit to retaining R3.

---

Aaron Cavanaugh - Bonneville Power Administration - 1,3,5,6 - WECC

Answer  
No

Document Name

Comment

BPA determined the retirement of the INT-004 requirements should be contingent upon the FERC adoption of the corresponding NAESB standards. NAESB standards do not apply equally to industry participants (e.g., not applicable to non-jurisdictional entities).

Comment

INT-004-3.1 should not be retired until NAESB BPS WEQ-004 version 3.1, 3.2 is approved by FERC concerning Dynamic and Pseudo-Ties schedules.

One of the primary guiding principles of periodic review teams is to determine if requirements are duplicative
and whether they have a significant impact on reliability. Since R3 only serves to register Pseudo-Ties in a registry and their coordination is well-documented, it was unanimous there was no reliability benefit to retaining R3.

Kim Thomas - Duke Energy - 1,3,5,6 - FRCC,SERC,RF, Group Name Duke Energy

<table>
<thead>
<tr>
<th>Answer</th>
<th>No</th>
</tr>
</thead>
</table>

**Comment**

Duke Energy disagrees with the proposed retirement of INT-004-3.1. In the Technical Justification document, the drafting team categorizes INT-004-3.1 as more of an impact on transmission costs, rather than reliability. While costs and pricing do not directly impact the reliability aspects of the grid, ensuring levels of transfer and practicing congestion management help to ensure reliability of the grid.

<table>
<thead>
<tr>
<th>Answer</th>
<th>Yes</th>
</tr>
</thead>
</table>

**Document Name**
**Comment**

ACES recommends that the retirement of R3 be contingent upon the implementation of a new NAESB WEQ-004 requirement which necessitates the coordination of Pseudo-ties between impacted entities prior to implementation. This coordination is important for accurate accounting of interchange and ensuring that any related congestion can be properly managed. Without this coordination, the reliability of the system could be impacted.

**Marsha Morgan - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC, Group Name Southern Company**

**Answer**

Yes

**Document Name**

**Comment**

Southern would support retiring these requirements after they have been reviewed for inclusion into the NAESB WEQ Business Standards and subsequently ratified by FERC.

7. The SDT is proposing to retire INT-006-4, Requirements R3.1, R4, and R5. Do you agree with the SDT’s proposal to retire Requirements R3.1, R4, and R5 of INT-006-4? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

Summary Response:

The SDT received comments regarding the proposed retirement of INT-006-4 (R3.1, R4 and R5). The requirements in INT-006 (except for R3.1) proposed for retirement are those that are performed by software in accordance with the NAESB e-Tagging specification. There is no operator action occurring. These validation and notifications occur because of their inclusion in the e-Tagging specification. There are many actions that occur because of these specifications. All of them are not included in NERC requirements and yet they all occur. The retirement of these requirements does not take away visibility of the status of interchange as BAs and TSPs can always see the status of an interchange. Therefore, the performance of these requirements does not provide any visibility that isn’t otherwise present.

Kim Thomas - Duke Energy - 1,3,5,6 - FRCC,SERC,RF, Group Name Duke Energy

Answer: No

Comment:

Duke Energy disagrees with the proposed retirements for INT-006-4. We are not confident that this issue is adequately covered in the NAESB standards. Unlike the NERC standards which aim to promote reliability, the NAESB standards are commercially focused, and are not viewed as essential to maintaining a reliable system. We believe that not having these conditions outlined, could negatively impact reliability.

<tr>
<td>Disagree, R4, R5 - North American Energy Standards Board (NAESB) e-Tagging specifications is not part of WEQ Business Practice Standards or approved by FERC, this will leave a responsibility gap for compliance.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th><strong>Response</strong></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Thank you for your comment. If e-Tagging specifications are important for NAESB’s purposes, NAESB is empowered to address them in NAESB’s business practices. NERC’s role is to establish requirements to maintain reliability and e-Tagging specifications are not related to Bulk Electric System reliability. The requirements in INT-006 (except for R3.1) proposed for retirement are those that are performed by software in accordance with the NAESB e-Tagging specification. There is no operator action occurring. These validation and notifications occur because of their inclusion in the e-Tagging specification. There are many actions that occur because of these specifications. All of them are not included in NERC requirements and yet they all occur. The retirement of these requirements does not take away visibility of the status of interchange as BAs and TSPs can always see the status of an interchange. Therefore, the performance of these requirements does not provide any visibility that isn’t otherwise present.</td>
<td></td>
</tr>
</tbody>
</table>
**Comment**

Idaho Power does not agree with retiring the R3.1 and R5 requirements.

R3.1: It is important to define how long an entity has to approve or deny interchange.
R5: Notification in a timely manner is needed.

Marsha Morgan - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC, Group Name Southern Company

Answer

Yes

Document Name

Comment

R3.1 – There is no impact on reliability in requiring the RC being notified when a Reliability Adjustment Arranged Interchange has been denied. The RC is already notified of a denial via E-tag as required in the NAESB e-Tagging Specifications.

R4 & R5 are duplicative of the NAESB e-Tagging Specifications Section and are not a reliability-related task performed by a NERC registered entity.

Brandon Gleason - Electric Reliability Council of Texas, Inc. - 2

Answer

Yes

Document Name

Comment

ERCOT is not opposed to the retirement of these requirements.

8. The SDT is proposing to retire INT-009-2.1, Requirement R2. Do you agree with the SDT’s proposal to retire Requirement R2 of INT-009-2.1? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

Summary Response:

The SDT received comments regarding the reference of INT-010 in Requirement R1 of INT-009-2.1. To avoid the potential confusion of having a reference to a retired standard in an active requirement, the SDT will remove this reference prior to posting the draft INT-009-3 standard for final ballot.

The SDT, having considered the issue, determined that removal of the INT-010 reference would be consistent with the SAR’s recommendation to retire INT-010-2 and would constitute a non-substantive change that may be made prior to final ballot. The SDT further determined that removal of the INT-010 reference would result in no change to the purpose and intent of the Requirement and that no further changes to this Requirement are necessary. This determination has been vetted by NERC staff and the Standards Committee and it was determined to be a non-substantive change.

Brandon Gleason - Electric Reliability Council of Texas, Inc. - 2

Answer  
Yes

Document Name

Comment

ERCOT is not opposed to the retirement of this requirement.

Response

Thank you for your support.

Marsha Morgan - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC, Group Name Southern Company
The requirement is redundant and qualifies for retirement under Paragraph 81. The requirement for BAs to establish an agreed upon interchange meeting source is covered in BAL-005-1 R7.

Thank you for your comment. Informationally, Paragraph 81 was adopted by the NERC Board of Trustees on February 7, 2013, filed with the appropriate regulatory authority on February 28, 2013, with a Final Rule issued November 21, 2013.

Thank you for your comment.
9. The SDT is proposing to retire INT-010-2.1, Requirements R1, R2, and R3 (all). Do you agree with the SDT’s proposal to retire INT-010-2.1? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

Summary Response:

To avoid the potential confusion of having a reference to a retired standard in an active requirement, the SDT will remove this reference prior to posting the draft INT-009-3 standard for final ballot.

The SDT, having considered the issue, determined that removal of the INT-010 reference would be consistent with the SAR’s recommendation to retire INT-010-2 and would constitute a non-substantive change that may be made prior to final ballot. The SDT further determined that removal of the INT-010 reference would result in no change to the purpose and intent of the Requirement and that no further changes to this Requirement are necessary. This determination has been vetted by NERC staff and the Standards Committee and it was determined to be a non-substantive change.

Answer
No

Comment

ISO-NE agrees that the specific content of INT-010, creating an RFI or Reliability Adjusted Arranged Interchange after-the-fact, does not impact reliability. However, if INT-010 is to be retired, then INT-009 R1 must also be modified and that revision is not addressed in the Implementation Plan. INT-009-3 proposed as part of this effort continues to reference INT-010. Therefore, ISO-NE recommends that either INT-009 R1 be modified to simply remove the cross reference to INT-010 or that the retirement of INT-010 and corresponding changes required INT-009 R1 be moved to Phase 2 of this effort.

Although AZPS agrees these requirements can and should be retired, their retirement must be done in coordination with changes to INT-009-2.1 R1, which references INT-010-2.

Duke Energy disagrees with the drafting team’s proposal to retire this standard. The technical rationale document states that this standard can be retired because more stringent tagging requirements already exist under NAESB. Unlike the NERC standards which aim to promote reliability, the NAESB standards are commercially focused, and are not viewed as essential to maintaining a reliable system. While part of INT-010-2.1 may be commercial in nature, we believe that the standard generally supports the reliability of the grid. Also, NAESB is only applicable to jurisdictional entities. Not all entities that are currently NERC Registered Entities, fall under the jurisdiction of NAESB, and would not be required to adhere to any of its business practices.

Response
Thank you for your comment. While all NERC registered entities may not be subject to NAESB business practices, BAs are expressly applicable under this standard are subject to NAESB business practices.

Brian Millard - Tennessee Valley Authority - 1,3,5,6 - SERC, Group Name Tennessee Valley Authority

Answer No
Document Name

Comment
Disagree, NAESB WEQ BPS 004-1.7 reference NERC INT-010-2.1 R1 for energy sharing groups for conditions not submitting eTags. Not approved by FERC.

Likes 0
Dislikes 0

Response
Thank you for your comment. If e-Tagging specifications are important for NAESB purposes, NAESB is empowered to address them in NAESB’s business practices. NERC’s role is to establish requirements to maintain reliability and e-Tagging specifications are not related to Bulk Electric System reliability.

Preston Walker - PJM Interconnection, L.L.C. - 2 - SERC,RF

Answer  Yes
Document Name

Comment

PJM recommends that the retirement of the standard be contingent upon a new NAESB WEQ-004 requirement becoming effective which allows interchange fitting the current INT-010-2.1 criteria to be implemented without an RFI. Such a requirement is currently published as WEQ-004-1.7 under the NAESB WEQ version 3.2 standards. However, the WEQ-004-1.7 requirement would need to be revised. Without this NAESB requirement, a Balancing Authority would not be able to implement interchange transactions described in INT-010-2.1 without an associated RFI which could jeopardize the reliability of the transmission system.

**Comment**

The SRC agrees that the specific content of INT-010, creating an RFI or Reliability Adjusted Arranged Interchange after-the-fact, does not impact reliability. However, if INT-010 is to be retired, then INT-009 R1 must also be modified and that revision is not addressed in the Implementation Plan. INT-009-3 proposed as part of this effort continues to reference INT-010. Therefore, the SRC recommends that either INT-009 R1 be modified to simply remove the cross reference to INT-010 or that the retirement of INT-010 and corresponding changes required INT-009 R1 be moved to Phase 2 of this effort.

**Response**

Thank you for your comment. To avoid the potential confusion of having a reference to a retired standard in an active requirement, the SDT will remove this reference prior to posting the draft INT-009-3 standard for final ballot.

The SDT, having considered the issue, determined that removal of the INT-010 reference would be consistent with the SAR’s recommendation to retire INT-010-2 and would constitute a non-substantive change that may be made prior to final ballot. The SDT further determined that removal of the INT-010 reference would result in no change to the purpose and intent of the Requirement and that no further changes to this Requirement are necessary. This determination has been vetted by NERC staff and the Standards Committee and it was determined to be a non-substantive change.

R1, R2 and R3 are redundant because more stringent requirement(s) that meet the objectives are already included in the NAESB standards (WEQ-004-1 & WEQ-004-8) due to their commercial purposes. These requirements do little, if anything, to benefit or protect the reliable operation of the BES.

Response
Thank you for your comment.

Brandon Gleason - Electric Reliability Council of Texas, Inc. - 2

Answer Yes

Comment
ERCOT is not opposed to the retirement of these requirements. However, because INT-009-2.1 Requirement R1 refers to INT-010-2, it may be preferable to defer consideration to the retirement of the requirements in INT-010-2.1 to the SER Phase II effort.

10. The SDT is proposing to retire IRO-002-5, Requirement R1. Do you agree with the SDT’s proposal to retire Requirement R1 of IRO-002-5? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

Summary Response:

The SDT received comments regarding the proposed retirement of IRO-002-5 (R1). Requirement R1 and data exchange for the Operation Planning Analysis is inherent to Requirement R2 that actually has a higher Violation Risk Factor and is clearly tied to the Operation Planning Analysis in IRO-010-2, Requirement R3. The requirements in IRO-010-2 satisfy the obligations of identifying the data required and means for delivering the data for the Operational Planning Analysis, Real-time monitoring, and Real-time Assessments. This data exchange is accomplished via redundant/secure communications, such as: Inter Control Center Communication Protocol (ICCP), email, voltage schedules, outage scheduling that all RCs, Bas, and TOPs use to exchange the required data. Additionally, to comply with IRO-008-2, Requirement R1, the RC must have received all of the data it needs to perform the Operation Planning Analysis. Finally, Measure M1 for IRO-002-5, Requirement R1 states that an entity needs to have documentation describing its data exchange capabilities with other entities, which is administrative in nature. As such, the SDT determined that IRO-002-5, Requirement R1 is not needed to support reliability and can be retired.

Please note:

Proposed Reliability Standard IRO-002-7 reflects a change of version (during initial posting under this project it was posted as IRO-002-6) due to the addition of a new Variance for the WECC region, developed through the WECC standard development process and was adopted by the WECC Board of Directors on March 6, 2019.

| Jodirah Green - ACES Power Marketing - 1,3,4,5,6 - MRO,WECC,Texas RE,SERC,RF, Group Name ACES Standard Collaborations |
|--------------------------------------------------|--------------------------------------------------|
| Answer | No |
| Document Name | Comment |
We believe the other requirements of IRO-002-5 are fundamentally based upon R1, as this requirement mandates RCs to have data exchange capabilities. Other requirements in this standard refer to this term periodically. As such, eliminating this requirement would diminish clarity regarding expectations in the remaining requirements. If R1 is retired it could be merged with R2 so that there is a single requirement discussing all data exchange capabilities needed.

Response
Thank you for your comment. Requirement R1 and data exchange for the Operation Planning Analysis is inherent to Requirement R2 that actually has a higher Violation Risk Factor and is clearly tied to the Operation Planning Analysis in IRO-010-2, Requirement R3. The requirements in IRO-010-2 satisfy the obligations of identifying the data required and means for delivering the data for the Operational Planning Analysis, Real-time monitoring, and Real-time Assessments. This data exchange is accomplished via redundant/secure communications, such as: Inter Control Center Communication Protocol (ICCP), email, File Transfer Protocol (FTP), outage scheduling tools that all RCs, BAs, and TOPs use to exchange the required data. Additionally, to comply with IRO-008-2, Requirement R1, the RC must have received all of the data it needs to perform the Operation Planning Analysis. Finally, Measure M1 for IRO-002-5, Requirement R1 states that an entity needs to have documentation describing its data exchange capabilities with other entities, which is administrative in nature. As such, the SDT determined that IRO-002-5, Requirement R1 is not needed to support reliability and can be retired.

Rachel Coyne - Texas Reliability Entity, Inc. - 10

Answer
No

Document Name

Comment
Texas RE is concerned that if IRO-002-5 Requirement R1 was eliminated, Reliability Coordinators may not put emphasis specifically on having data exchange capabilities with their Balancing Authorities and Transmission Operators. This could also lead to a larger engagement scope and the inclusion of IRO-008-2 R1, and IRO-010-2 Requirements R1, R2, and R3, instead of just including IRO-002-5 Requirement R1.
Thank you for your comment. Requirement R1 and data exchange for the Operation Planning Analysis is inherent to Requirement R2 that actually has a higher Violation Risk Factor and is clearly tied to the Operation Planning Analysis in IRO-010-2, Requirement R3. The requirements in IRO-010-2 satisfy the obligations of identifying the data required and means for delivering the data for the Operational Planning Analysis, Real-time monitoring, and Real-time Assessments. **Document Name**
Southern determined that this requirement should be retired as it does not add any additional benefit to reliability. Before an entity is certified to perform the RC function, it must first demonstrate that it has adequate communications (both data and voice) to communicate with BAs and TOPs in its RC area and with those entities adjacent to its RC area. In addition, the RC function is on a 3 year audit cycle and must continue to demonstrate that it has those communication capabilities to remain certified.

11. The SDT is proposing to retire MOD-004-1, Requirements R1, R2, R3, R4, R5, R6, R7, R8, R9, R10, R11, and R12 (all). Do you agree with the SDT’s proposal to retire MOD-004-1? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

Summary Response:

Available Transfer Capability (ATC)/Available Flowgate Capability (AFC), as well as eTags, are commercially-focused elements, facilitating interchange and balancing of interchange. The Real-time system operators are ambivalent of these commercial arrangements, as they must maintain reliability of the BES according to System Operating Limits (SOLs) and Interconnection Reliability Operating Limits (IROLs). If a scheduled interchange would violate SOLs or IROLs, the Real-time operators must disregard the scheduled interchange and operate the system to its actual reliability limits. This observation is reinforced by NERC’s statement in the 2015 filing related to risk-based reliability proposing removal of the Interchange Authority from the compliance registry, where it’s stated: “NERC proposes to remove interchange authorities as functional entities, explaining that the activities of the interchange authority are commercial in nature and, thus, the removal will have little if any impact on reliability of the bulk electric system.” FERC acknowledged this in their March 15, 2015 Order, where they stated: “…we approve NERC’s proposed removal of the interchange authority as a functional entity. As explained by NERC, the interchange authority performs a commercial function, essentially quality control activity in verifying and communicating interchange schedules.”

MOD-001-2:

Requirement R1: TOPs are not required to determine TFC or TTC; therefore, this is a conditional obligation - and there is no requirement that TOPs coordinate their methodologies. The definition of AFC explicitly includes the term “...further commercial activity...” which is explicit that this relates to commercial activity, not reliability-related activity. This requirement also has no performance elements, so there is nothing to measure against.

Requirement R1, Requirement Parts 1.1.1 thru 1.1.4 are expressly the definition of SOLs and are duplicative of the definition. Requirement Part 1.1.5 therefore adds nothing, as there is no provision for “Other SOLs.”

Requirement R1, Requirement Part 1.2.2 are Additions and retirements are Long-term planning related and would be reflected in operational models. Planned outages for the operating time horizon is expressly addressed in TOP-001-4 R9.
Requirement R1, Part 1.3: any reliability-related constraints are already expressed in OPAs and the requirements to operate within SOLs.

Requirement R1, Requirement Part 1.3.1: generation to load transfers does not, in most cases, reflect any physical arrangement. Such transfers assume a system between the two that can handle the transfer; and this system must be operated to respect SOLs.

The SDT determined that Requirement R1, Requirement Part 1.3.2 is ambiguous. There are several distribution factors; one related to outages, one related to transfers, and one related to a composite between the two. It is ambiguous to which of these distribution factors is being addressed.

**Requirement R2:** applies to TSP and Available Flowgate Capacity or Available Transfer Capability. Requirement R1 applies to TOP and Total Flowgate Capacity or Total Transfer Capacity. Otherwise, Requirement R2 is very similar to Requirement R1, and the rationale to retire Requirement R1 also applies to Requirement R2.

**Requirement R3:** CBM is defined as “The amount of firm transmission transfer capability preserved by the transmission provider for Load-Serving Entities (LSEs) whose loads are located on that Transmission Service Provider’s system to enable access by the LSEs to generation from interconnected systems to meet generation reliability requirements. Preservation of CBM for an LSE allows that entity to reduce its installed generating capacity below that which may otherwise have been necessary without interconnections to meet its generation reliability requirements. The transmission transfer capability preserved as CBM is intended to be used by the LSE only in times of emergency generation deficiencies.”

There is no obligation for a TSP to determine CBM; this requirement just applies to TSPs that elect to determine CBM. The requirement contains no criteria regarding what the CBMID must include, rather than generally describing the method.

Further, this requirement has no performance obligation, but to just to have a document; therefore, is administrative.

**Requirement R4:** The SDT vetted Requirement R4 and determined that Requirement R4 does not require TOPs to determine TRM and establish measurable criteria for what the TRMID must include. Further, R4 does not establish any criteria for the TRMID, just that the TOP that has TRM must have a document describing its methodology. Therefore, this requirement is simply administrative on an open-ended conditional duty.
**Requirement R5** and its Requirement Parts:

Requirement Part 5.1: as the TOP or TSP is not required to have a TFC or TTC methodology, or an ATCID, CBMID, or TRMID, other entities that may have a reliability-related need for these, that information is routinely pursuant to the data specifications of the RC (in INT-010-2.1) and the TOP (in TOP-003-3). In Real-time operation of the BES, the limitations related to similar issues is fully addressed by the obligations of TOP-001-4; specifically as related to operating within SOLs and IROLs and issuing and responding to Operating Instructions.

Requirement Part 5.2 and subparts: OASIS is a mechanism to assure that all market participants have simultaneous access to all market-data, such that no participant has an advantage. To provide this information to any participant via any mechanism rather that OASIS or a publicly-accessible company website becomes a FERC Standards of Conduct (SOC) violation.

Requirement Part 5.3 and subparts: OASIS is a mechanism to assure that all market participants have simultaneous access to all market-data, such that no participant has an advantage. To provide this information to any participant via any mechanism rather that OASIS or a publicly-accessible company website becomes a FERC SOC violation.

**Requirement R6:** If this data had a reliability-related need, it would be addressed via the data specifications in INT-010-2.1 (for RC) and TOP-003-3 (for TOP). However, AFC, ATC, TFC, and TTC are not mandatory to establish; thus the party requested for this data may very well not have the data to provide. Further, various TOPs or TSPs that would have these elements are not required to coordinate them, which could easily lead to widely disparate methodologies. Finally, as market-related data, this data would likely be subject to FERC Standards of Conduct, which would require that the data be publicly posted for all other market participants to access.

**Kim Thomas - Duke Energy - 1,3,5,6 - FRCC,SERC,RF, Group Name** Duke Energy

<table>
<thead>
<tr>
<th>Answer</th>
<th>No</th>
</tr>
</thead>
<tbody>
<tr>
<td>Document Name</td>
<td>Attach_DE_SER Question 11_Apr 2019.docx</td>
</tr>
<tr>
<td>Comment</td>
<td>While Duke Energy would support the retirement of these MOD standards, we cannot do so if MOD-001-2 is withdrawn. The MOD standards promote reliability of the grid by putting in place common boundaries and provisions that are necessary for various calculations that need to be performed. These calculations are important to reliability by providing the baseline for understanding the operational need. By retiring the MOD standards, and not having MOD-001-2 in place, there will not be provisions in place to aid an</td>
</tr>
</tbody>
</table>
entity in calculating transfer capability. There will not be any boundaries in place for the curtailment of service. We disagree with the commercial based focus that the drafting team took in the technical rationale document. While these MOD standards (and ATC calculation) may have some commercial based elements to them, they also put in place valuable boundaries that help promote consistency in how the industry calculates these values. Removing these boundaries does not promote reliability for the Bulk Electric System and introduces additional burden to the real-time System Operator.

The expectation of the System Operators to ensure the reliability of the BES in the real-time when there have been no requirements to ensure how ATC is calculated or coordinated beyond what is required by NAESB is unrealistic. Some of the most glaring issues with relying solely upon NAESB to regulate the calculation of ATC are: FERC does not have oversight for non-jurisdictional TSPs and therefore cannot require them to incorporate NAESB standards. Also, while NAESB has acted on the recommendations of the MOD-A project to incorporate any of the gaps created by the retirement of MOD-001-1a, MOD-004-1, MOD-008-1, MOD-028-2, MOD-029-2a, MOD-030-3 and adoption of MOD-001-2, FERC has not acted on either the NERC or NAESB filings. Further, NAESB has not been requested to modify proposed standards to incorporate any of the gaps created by the retirement of the proposed MOD-001-2.

Additionally, the lack of any NERC regulation for consistent ATC methodologies and requirements for sharing of data and could potentially lead to an increase of TLRs being called as this would be the only tool System Operators could utilize to combat rampant loop flow impacts on the BES. This could very well lead to capacity concerns and load shedding as the increase in TLRs could include firm curtailments causing capacity shortages. Without mandatory ATC standards, a TSP would be able to sell as much service as possible. The overselling of service and the overscheduling of ATC Paths will lead to an increase of FIRM TLR, potentially forcing Transmission Operators and Load Serving Entities to shed FIRM load to comply with the TLR. Over the past eight years the MOD-001, 28, 29, & 30 standards have been effective the industry has seen a dramatic reduction in FIRM TLRs.

Included in the Attachment with Duke Energy's response to this question is the rolling 12-month average of TLRs from the NERC website. Notice the reduction in TLRs from 2008-2011 when the MOD standards were first published (in 2008 when TSP started to incorporate the MOD standards into their ATC methodologies) and 2011 (when the MOD standards were mandatory and enforceable).
Thank you for your comments. Available Transfer Capability (ATC)/Available Flowgate Capability (AFC), as well as eTags, are commercially-focused elements, facilitating interchange and balancing of interchange. The Real-time system operators are ambivalent of these commercial arrangements, as they must maintain reliability of the BES according to System Operating Limits (SOLs) and Interconnection Reliability Operating Limits (IROLs). If a scheduled interchange would violate SOLs or IROLs, the Real-time operators must disregard the scheduled interchange and operate the system to its actual reliability limits. This observation is reinforced by NERC’s statement in the 2015 filing related to risk-based reliability proposing removal of the Interchange Authority from the compliance registry, where it’s stated: “NERC proposes to remove interchange authorities as functional entities, explaining that the activities of the interchange authority are commercial in nature and, thus, the removal will have little if any impact on reliability of the bulk electric system.” FERC acknowledged this in their March 15, 2015 Order, where they stated: “…we approve NERC’s proposed removal of the interchange authority as a functional entity. As explained by NERC, the interchange authority performs a commercial function, essentially quality control activity in verifying and communicating interchange schedules.”

MOD-001-2:

Requirement R1: TOPs are not required to determine TFC or TTC; therefore, this is a conditional obligation - and there is no requirement that TOPs coordinate their methodologies. The definition of AFC explicitly includes the term “…further commercial activity…” which is explicit that this relates to commercial activity, not reliability-related activity. This requirement also has no performance elements, so there is nothing to measure against.

Requirement R1, Requirement Parts 1.1.1 thru 1.1.4 are expressly the definition of SOLs and are duplicative of the definition. Requirement Part 1.1.5 therefore adds nothing, as there is no provision for “Other SOLs.”

Requirement R1, Requirement Part 1.2.2 are Additions and retirements are Long-term planning related and would be reflected in operational models. Planned outages for the operating time horizon is expressly addressed in TOP-001-4 R9.

Requirement R1, Part 1.3: any reliability-related constraints are already expressed in OPAs and the requirements to operate within SOLs.

Requirement R1, Requirement Part 1.3.1: generation to load transfers does not, in most cases, reflect any physical arrangement. Such transfers assume a system between the two that can handle the transfer; and this system must be operated to respect SOLs.
The SDT determined that Requirement R1, Requirement Part 1.3.2 is ambiguous. There are several distribution factors; one related to outages, one related to transfers, and one related to a composite between the two. It is ambiguous to which of these distribution factors is being addressed.

**Requirement R2**: applies to TSP and Available Flowgate Capacity or Available Transfer Capability. Requirement R1 applies to TOP and Total Flowgate Capacity or Total Transfer Capacity. Otherwise, Requirement R2 is very similar to Requirement R1, and the rationale to retire Requirement R1 also applies to Requirement R2.

**Requirement R3**: CBM is defined as “The amount of firm transmission transfer capability preserved by the transmission provider for Load-Serving Entities (LSEs) whose loads are located on that Transmission Service Provider’s system to enable access by the LSEs to generation from interconnected systems to meet generation reliability requirements. Preservation of CBM for an LSE allows that entity to reduce its installed generating capacity below that which may otherwise have been necessary without interconnections to meet its generation reliability requirements. The transmission transfer capability preserved as CBM is intended to be used by the LSE only in times of emergency generation deficiencies.”

There is no obligation for a TSP to determine CBM; this requirement just applies to TSPs that elect to determine CBM. The requirement contains no criteria regarding what the CBMID must include, rather that generally describing the method.

Further, this requirement has no performance obligation, but to just to have a document; therefore, is administrative.

**Requirement R4**: The SDT vetted Requirement R4 and determined that Requirement R4 does not require TOPs to determine TRM and establish measurable criteria for what the TRMID must include. Further, R4 does not establish any criteria for the TRMID, just that the TOP that has TRM must have a document describing its methodology. Therefore, this requirement is simply administrative on an open-ended conditional duty.

**Requirement R5** and its Requirement Parts:
Requirement Part 5.1: as the TOP or TSP is not required to have a TFC or TTC methodology, or an ATCID, CBMID, or TRMID, other entities that may have a reliability-related need for these, that information is routinely pursuant to the data specifications of the RC (in INT-010-2.1) and the TOP (in TOP-003-3). In Real-time operation of the BES, the limitations related to similar issues is fully addressed by the obligations of TOP-001-4; specifically as related to operating within SOLs and IROLs and issuing and responding to Operating Instructions.
Requirement Part 5.2 and subparts: OASIS is a mechanism to assure that all market participants have simultaneous access to all market-data, such that no participant has an advantage. To provide this information to any participant via any mechanism rather than OASIS or a publicly-accessible company website becomes a FERC Standards of Conduct (SOC) violation.

Requirement Part 5.3 and subparts: OASIS is a mechanism to assure that all market participants have simultaneous access to all market-data, such that no participant has an advantage. To provide this information to any participant via any mechanism rather than OASIS or a publicly-accessible company website becomes a FERC SOC violation.

**Requirement R6:** If this data had a reliability-related need, it would be addressed via the data specifications in INT-010-2.1 (for RC) and TOP-003-3 (for TOP). However, AFC, ATC, TFC, and TTC are not mandatory to establish; thus the party requested for this data may very well not have the data to provide. Further, various TOPs or TSPs that would have these elements are not required to coordinate them, which could easily lead to widely disparate methodologies. Finally, as market-related data, this data would likely be subject to FERC Standards of Conduct, which would require that the data be publicly posted for all other market participants to access.

**Marsha Morgan - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC, Group Name Southern Company**

**Answer**  
No

**Document Name**

**Comment**

Southern continues to disagree with the SER Team’s proposed petition for the withdrawal of MOD-001-2. Again, we believe that the combined effect of enacting MOD-001-2 while migrating MOD-001-1a, MOD-004-1, MOD-008-1, MOD-028-2, MOD-029-2a and MOD-030-3 MOD into the NAESB standards strike an appropriate balance of addressing reliability related concerns, while incorporating any market related issues. Simply stating that ATC/AFC calculations are primarily commercially-focused elements and that there are mechanisms in place to address reliability in real time is an oversimplification of the ATC/AFC concept. Inaccurately modeling and assessing transfer capability which considers real physical transmission limits on both the host and neighboring systems can create extremely complicated situations in real-time that can unduly burden system operators.

However, since FERC has not yet approved MOD-001-2 and has yet to take action on incorporating MOD-001-1a, MOD-004-1, MOD-008-1, MOD-028-2, MOD-029-2a and MOD-030-3 and NAESB’s WEQ-23 into the current NAESB standards, Southern Company recommends delaying the retirement of those existing NERC standards. The objective is to have MOD-001-2 in place at the same time as those
submitted to FERC by NAESB. Once approved by the Commission, the industry should have adequate time to ensure a seamless transition to the new construct.

Response

Thank you for your comments. Available Transfer Capability (ATC)/Available Flowgate Capability (AFC), as well as eTags, are commercially-focused elements, facilitating interchange and balancing of interchange. The Real-time system operators are ambivalent of these commercial arrangements, as they must maintain reliability of the BES according to System Operating Limits (SOLs) and Interconnection Reliability Operating Limits (IROLs). If a scheduled interchange would violate SOLs or IROLs, the Real-time operators must disregard the scheduled interchange and operate the system to its actual reliability limits. This observation is reinforced by NERC’s statement in the 2015 filing related to risk-based reliability proposing removal of the Interchange Authority from the compliance registry, where it’s stated: “NERC proposes to remove interchange authorities as functional entities, explaining that the activities of the interchange authority are commercial in nature and, thus, the removal will have little if any impact on reliability of the bulk electric system.” FERC acknowledged this in their March 15, 2015 Order, where they stated: “…we approve NERC’s proposed removal of the interchange authority as a functional entity. As explained by NERC, the interchange authority performs a commercial function, essentially quality control activity in verifying and communicating interchange schedules.”

MOD-001-2:

There is no obligation for a TSP to determine CBM; this requirement just applies to TSPs that elect to determine CBM. The requirement contains no criteria regarding what the CBMID must include, rather that generally describing the method.

Further, this requirement has no performance obligation, but to just to have a document; therefore, is administrative.

Requirement R4: The SDT vetted Requirement R4 and determined that Requirement R4 does not require TOPs to determine TRM and establish measurable criteria for what the TRMID must include. Further, R4 does not establish any criteria for the TRMID, just that the TOP that has TRM must have a document describing its methodology. Therefore, this requirement is simply administrative on an open-ended conditional duty.
Requirement R5 and its Requirement Parts:
Requirement Part 5.1: as the TOP or TSP is not required to have a TFC or TTC methodology, or an ATCID, CBMID, or TRMID, other entities that may have a reliability-related need for these, that information is routinely pursuant to the data specifications of the RC (in INT-010-2.1) and the TOP (in TOP-003-3). In Real-time operation of the BES, the limitations related to similar issues is fully addressed by the obligations of TOP-001-4; specifically as related to operating within SOLs and IROLs and issuing and responding to Operating Instructions.

Requirement Part 5.2 and subparts: OASIS is a mechanism to assure that all market participants have simultaneous access to all market-data, such that no participant has an advantage. To provide this information to any participant via any mechanism rather that OASIS or a publicly-accessible company website becomes a FERC SOC violation.

Requirement Part 5.3 and subparts: OASIS is a mechanism to assure that all market participants have simultaneous access to all market-data, such that no participant has an advantage. To provide this information to any participant via any mechanism rather that OASIS or a publicly-accessible company website becomes a FERC SOC violation.

Requirement R6: If this data had a reliability-related need, it would be addressed via the data specifications in INT-010-2.1 (for RC) and TOP-003-3 (for TOP). However, AFC, ATC, TFC, and TTC are not mandatory to establish; thus the party requested for this data may very well not have the data to provide. Further, various TOPs or TSPs that would have these elements are not required to coordinate them, which could easily lead to widely disparate methodologies. Finally, as market-related data, this data would likely be subject to FERC Standards of Conduct, which would require that the data be publicly posted for all other market participants to access.

<td><strong>Comment</strong></td>
<td>PJM was heavily involved in the MOD-001-2 and NAESB WEQ-023 development efforts. PJM is neutral on the proposed retirement of MOD-001-2 but supports the position of the SER for the existing MOD standards as reliability components of congestion management are handled amongst eastern interconnect parties through various established coordination processes. PJM cautions against additional revisions to the NAESB WEQ-023 document, especially those driven by issues unique to particular seams or between specific entities, as those issues may not be realized by other parties. Therefore, blanket revisions may unnecessarily impact reliability and/or market aspects for other entities.</td>

12. The SDT is proposing to retire MOD-008-1, Requirements R1, R2, R3, R4, and R5 (all). Do you agree with the SDT’s proposal to retire MOD-008-1? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

Summary Response:

Available Transfer Capability (ATC)/Available Flowgate Capability (AFC), as well as eTags, are commercially-focused elements, facilitating interchange and balancing of interchange. The Real-time system operators are ambivalent of these commercial arrangements, as they must maintain reliability of the BES according to System Operating Limits (SOLs) and Interconnection Reliability Operating Limits (IROLs). If a scheduled interchange would violate SOLs or IROLs, the Real-time operators must disregard the scheduled interchange and operate the system to its actual reliability limits. This observation is reinforced by NERC’s statement in the 2015 filing related to risk-based reliability proposing removal of the Interchange Authority from the compliance registry, where it’s stated: “NERC proposes to remove interchange authorities as functional entities, explaining that the activities of the interchange authority are commercial in nature and, thus, the removal will have little if any impact on reliability of the bulk electric system.” FERC acknowledged this in their March 15, 2015 Order, where they stated: “…we approve NERC’s proposed removal of the interchange authority as a functional entity. As explained by NERC, the interchange authority performs a commercial function, essentially quality control activity in verifying and communicating interchange schedules.”

MOD-001-2:

Requirement R1: TOPs are not required to determine TFC or TTC; therefore, this is a conditional obligation - and there is no requirement that TOPs coordinate their methodologies. The definition of AFC explicitly includes the term “…further commercial activity…” which is explicit that this relates to commercial activity, not reliability-related activity. This requirement also has no performance elements, so there is nothing to measure against.

Requirement R1, Requirement Parts 1.1.1 thru 1.1.4 are expressly the definition of SOLs and are duplicative of the definition. Requirement Part 1.1.5 therefore adds nothing, as there is no provision for “Other SOLs.”

Requirement R1, Requirement Part 1.2.2 are Additions and retirements are Long-term planning related and would be reflected in operational models. Planned outages for the operating time horizon is expressly addressed in TOP-001-4 R9.
Requirement R1, Part 1.3: any reliability-related constraints are already expressed in OPAs and the requirements to operate within SOLs.

Requirement R1, Requirement Part 1.3.1: generation to load transfers does not, in most cases, reflect any physical arrangement. Such transfers assume a system between the two that can handle the transfer; and this system must be operated to respect SOLs.

The SDT determined that Requirement R1, Requirement Part 1.3.2 is ambiguous. There are several distribution factors; one related to outages, one related to transfers, and one related to a composite between the two. It is ambiguous to which of these distribution factors is being addressed.

**Requirement R2**: applies to TSP and Available Flowgate Capacity or Available Transfer Capability. Requirement R1 applies to TOP and Total Flowgate Capacity or Total Transfer Capacity. Otherwise, Requirement R2 is very similar to Requirement R1, and the rationale to retire Requirement R1 also applies to Requirement R2.

**Requirement R3**: CBM is defined as “The amount of firm transmission transfer capability preserved by the transmission provider for Load-Serving Entities (LSEs) whose loads are located on that Transmission Service Provider’s system to enable access by the LSEs to generation from interconnected systems to meet generation reliability requirements. Preservation of CBM for an LSE allows that entity to reduce its installed generating capacity below that which may otherwise have been necessary without interconnections to meet its generation reliability requirements. The transmission transfer capability preserved as CBM is intended to be used by the LSE only in times of emergency generation deficiencies.”

There is no obligation for a TSP to determine CBM; this requirement just applies to TSPs that elect to determine CBM. The requirement contains no criteria regarding what the CBMID must include, rather that generally describing the method.

Further, this requirement has no performance obligation, but to just to have a document; therefore, is administrative.

**Requirement R4**: The SDT vetted Requirement R4 and determined that Requirement R4 does not require TOPs to determine TRM and establish measurable criteria for what the TRMID must include. Further, R4 does not establish any criteria for the TRMID, just that the TOP that has TRM must have a document describing its methodology. Therefore, this requirement is simply administrative on an open-ended conditional duty.
**Requirement R5** and its Requirement Parts:

Requirement Part 5.1: as the TOP or TSP is not required to have a TFC or TTC methodology, or an ATCID, CBMID, or TRMID, other entities that may have a reliability-related need for these, that information is routinely pursuant to the data specifications of the RC (in INT-010-2.1) and the TOP (in TOP-003-3). In Real-time operation of the BES, the limitations related to similar issues is fully addressed by the obligations of TOP-001-4; specifically as related to operating within SOLs and IROLs and issuing and responding to Operating Instructions.

Requirement Part 5.2 and subparts: OASIS is a mechanism to assure that all market participants have simultaneous access to all market-data, such that no participant has an advantage. To provide this information to any participant via any mechanism rather than OASIS or a publicly-accessible company website becomes a FERC SOC violation.

Requirement Part 5.3 and subparts: OASIS is a mechanism to assure that all market participants have simultaneous access to all market-data, such that no participant has an advantage. To provide this information to any participant via any mechanism rather than OASIS or a publicly-accessible company website becomes a FERC SOC violation.

**Requirement R6:** If this data had a reliability-related need, it would be addressed via the data specifications in INT-010-2.1 (for RC) and TOP-003-3 (for TOP). However, AFC, ATC, TFC, and TTC are not mandatory to establish; thus the party requested for this data may very well not have the data to provide. Further, various TOPs or TSPs that would have these elements are not required to coordinate them, which could easily lead to widely disparate methodologies. Finally, as market-related data, this data would likely be subject to FERC Standards of Conduct, which would require that the data be publicly posted for all other market participants to access.

---

**Marsha Morgan - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC, Group Name Southern Company**

<tbody>
<tr>
<td><strong>Document Name</strong></td>
<td></td>
</tr>
</tbody>
</table>

**Comment**

Southern continues to disagree with the SER Team’s proposed petition for the withdrawal of MOD-001-2. Again, we believe that the combined effect of enacting MOD-001-2 while migrating MOD-001-1a, MOD-004-1, MOD-008-1, MOD-028-2, MOD-029-2a and MOD-030-3 MOD into the NAESB standards strike an appropriate balance of addressing reliability related concerns, while incorporating any market related issues. Simply stating that ATC/AFC calculations are primarily commercially-focused elements and that there are
mechanisms in place to address reliability in real time is an oversimplification of the ATC/AFC concept. Inaccurately modeling and assessing transfer capability which considers real physical transmission limits on both the host and neighboring systems can create extremely complicated situations in real-time that can unduly burden system operators.

However, since FERC has not yet approved MOD-001-2 and has yet to take action on incorporating MOD-001-1a, MOD-004-1, MOD-008-1, MOD-028-2, MOD-029-2a and MOD-030-3 and NAESB’s WEQ-23 into the current NAESB standards, Southern Company recommends delaying the retirement of those existing NERC standards. The objective is to have MOD-001-2 in place at the same time as those submitted to FERC by NAESB. Once approved by the Commission, the industry should have adequate time to ensure a seamless transition to the new construct.

Response

Thank you for your comments. Available Transfer Capability (ATC)/Available Flowgate Capability (AFC), as well as eTags, are commercially-focused elements, facilitating interchange and balancing of interchange. The Real-time system operators are ambivalent of these commercial arrangements, as they must maintain reliability of the BES according to System Operating Limits (SOLs) and Interconnection Reliability Operating Limits (IROLs). If a scheduled interchange would violate SOLs or IROLs, the Real-time operators must disregard the scheduled interchange and operate the system to its actual reliability limits. This observation is reinforced by NERC’s statement in the 2015 filing related to risk-based reliability proposing removal of the Interchange Authority from the compliance registry, where it’s stated: “NERC proposes to remove interchange authorities as functional entities, explaining that the activities of the interchange authority are commercial in nature and, thus, the removal will have little if any impact on reliability of the bulk electric system.” FERC acknowledged this in their March 15, 2015 Order, where they stated: “…we approve NERC’s proposed removal of the interchange authority as a functional entity. As explained by NERC, the interchange authority performs a commercial function, essentially quality control activity in verifying and communicating interchange schedules.”

MOD-001-2:

Requirement R1: TOPs are not required to determine TFC or TTC; therefore, this is a conditional obligation - and there is no requirement that TOPs coordinate their methodologies. The definition of AFC explicitly includes the term “…further commercial activity...” which is
explicit that this relates to commercial activity, not reliability-related activity. This requirement also has no performance elements, so there is nothing to measure against.

Requirement R1, Requirement Parts 1.1.1 thru 1.1.4 are expressly the definition of SOLs and are duplicative of the definition. Requirement Part 1.1.5 therefore adds nothing, as there is no provision for “Other SOLs.”

Requirement R1, Requirement Part 1.2.2 are Additions and retirements are Long-term planning related and would be reflected in operational models. Planned outages for the operating time horizon is expressly addressed in TOP-001-4 R9.

Requirement R1, Part 1.3: any reliability-related constraints are already expressed in OPAs and the requirements to operate within SOLs.

Requirement R1, Requirement Part 1.3.1: generation to load transfers does not, in most cases, reflect any physical arrangement. Such transfers assume a system between the two that can handle the transfer; and this system must be operated to respect SOLs.

The SDT determined that Requirement R1, Requirement Part 1.3.2 is ambiguous. There are several distribution factors; one related to outages, one related to transfers, and one related to a composite between the two. It is ambiguous to which of these distribution factors is being addressed.

**Requirement R2**: applies to TSP and Available Flowgate Capacity or Available Transfer Capability. Requirement R1 applies to TOP and Total Flowgate Capacity or Total Transfer Capacity. Otherwise, Requirement R2 is very similar to Requirement R1, and the rationale to retire Requirement R1 also applies to Requirement R2.

**Requirement R3**: CBM is defined as “The amount of firm transmission transfer capability preserved by the transmission provider for Load-Serving Entities (LSEs) whose loads are located on that Transmission Service Provider’s system to enable access by the LSEs to generation from interconnected systems to meet generation reliability requirements. Preservation of CBM for an LSE allows that entity to reduce its installed generating capacity below that which may otherwise have been necessary without interconnections to meet its generation reliability requirements. The transmission transfer capability preserved as CBM is intended to be used by the LSE only in times of emergency generation deficiencies.”
There is no obligation for a TSP to determine CBM; this requirement just applies to TSPs that elect to determine CBM. The requirement contains no criteria regarding what the CBMID must include, rather that generally describing the method.

Further, this requirement has no performance obligation, but to just to have a document; therefore, is administrative.

**Requirement R4:** The SDT vetted Requirement R4 and determined that Requirement R4 does not require TOPs to determine TRM and establish measurable criteria for what the TRMID must include. Further, R4 does not establish any criteria for the TRMID, just that the TOP that has TRM must have a document describing its methodology. Therefore, this requirement is simply administrative on an open-ended conditional duty.

**Requirement R5** and its Requirement Parts:
Requirement Part 5.1: as the TOP or TSP is not required to have a TFC or TTC methodology, or an ATCID, CBMID, or TRMID, other entities that may have a reliability-related need for these, that information is routinely pursuant to the data specifications of the RC (in INT-010-2.1) and the TOP (in TOP-003-3). In Real-time operation of the BES, the limitations related to similar issues is fully addressed by the obligations of TOP-001-4; specifically as related to operating within SOLs and IROLs and issuing and responding to Operating Instructions.

Requirement Part 5.2 and subparts: OASIS is a mechanism to assure that all market participants have simultaneous access to all market-data, such that no participant has an advantage. To provide this information to any participant via any mechanism rather that OASIS or a publicly-accessible company website becomes a FERC SOC violation.

Requirement Part 5.3 and subparts: OASIS is a mechanism to assure that all market participants have simultaneous access to all market-data, such that no participant has an advantage. To provide this information to any participant via any mechanism rather that OASIS or a publicly-accessible company website becomes a FERC SOC violation.

**Requirement R6:** If this data had a reliability-related need, it would be addressed via the data specifications in INT-010-2.1 (for RC) and TOP-003-3 (for TOP). However, AFC, ATC, TFC, and TTC are not mandatory to establish; thus the party requested for this data may very well not have the data to provide. Further, various TOPs or TSPs that would have these elements are not required to coordinate them, which could easily lead to widely disparate methodologies. Finally, as market-related data, this data would likely be subject to FERC Standards of Conduct, which would require that the data be publicly posted for all other market participants to access.

Brian Millard - Tennessee Valley Authority - 1,3,5,6 - SERC, Group Name Tennessee Valley Authority
TVA disagrees with the retirement of these standards at this time.

Until a resolution is reached on NAESB’s WEQ-023, and these items are incorporated by reference per the FERC Commission, retirement of these MOD Reliability Standards would leave a significant gap of reliability of ATC in the industry. WEQ-023 (submitted under Version 003.1) was not approved by the Commission to be incorporated by reference at this time and is being considered under an overall inquiry into ATC calculation. This leaves the standard, as written in NAESB as voluntary. MOD-001-2 was drafted with the mindset of leaving only reliability aspects of ATC under NERC oversight and WEQ-023 being approved by the Commission. If MOD-001-2 is withdrawn, there would be no reliability push for ATC requirements under FERC and could potentially cause further delay. Removal of these standards could impact the transparency that is established with sharing data with neighbors as well.

According to Project 2012-05 ATC Revisions (MOD A), MOD-001-2 was developed to address directives in Order No. 729 to modify certain aspects of the MOD A standards and to consolidate the MOD A standards into a single standard covering only the ‘reliability-related impact of ATC and AFC calculations’. The consolidated approach was intended to maintain NERC’s focus on developing and retaining requirements that support the reliable operation of the Bulk-Power System (BPS).

The WEQ-023 standards drafted did not incorporate honoring neighboring systems nor ensure an entity have an ATCID, or TRMID, or CBMID because the thought was that it would be laid out in the NERC space under MOD-001-2. So NAESB would have to incorporate all of this into the business practice, which would blur the lines of reliability and commercial that the project was developed to address.

TVA agrees with the goal of the Standards Efficiency Review Team to decrease the number of requirements and make the standards less confusing and less burdensome. Yet, it is important that the standards still ensure a relatively consistent and reliable calculation of transfer capability. TVA feels the accurate calculation of transfer capability is a reliability issue. It is the job of the operations planners to give the operators a system that was planned to be reliable. If the operators are given a system that has numerous n-1 overloads planned into the system, then the operational planning engineers did not do their job. We do not want our operators to intentionally have to handle numerous TLRs and generation re-dispatch because of an oversold system. If the TOP and TSP oversell the system, it may be difficult for the operators to maintain system reliability. A transmission system constantly in TLR3 and TLR5 due to inaccurate calculations of transfer capability is a reliability issue and not just a commercial issue. If your neighbor is constantly selling transfer capability and
ignoring the impact on your system, this too will affect your reliability. This does not just impact transmission costs as some would believe.

Response
Thank you for your comments. Available Transfer Capability (ATC)/Available Flowgate Capability (AFC), as well as eTags, are commercially-focused elements, facilitating interchange and balancing of interchange. The Real-time system operators are ambivalent of these commercial arrangements, as they must maintain reliability of the BES according to System Operating Limits (SOLs) and Interconnection Reliability Operating Limits (IROLs). If a scheduled interchange would violate SOLs or IROLs, the Real-time operators must disregard the scheduled interchange and operate the system to its actual reliability limits. This observation is reinforced by NERC’s statement in the 2015 filing related to risk-based reliability proposing removal of the Interchange Authority from the compliance registry, where it’s stated: “NERC proposes to remove interchange authorities as functional entities, explaining that the activities of the interchange authority are commercial in nature and, thus, the removal will have little if any impact on reliability of the bulk electric system.” FERC acknowledged this in their March 15, 2015 Order, where they stated: “…we approve NERC’s proposed removal of the interchange authority as a functional entity. As explained by NERC, the interchange authority performs a commercial function, essentially quality control activity in verifying and communicating interchange schedules.”

MOD-001-2:

Requirement R1: TOPs are not required to determine TFC or TTC; therefore, this is a conditional obligation - and there is no requirement that TOPs coordinate their methodologies. The definition of AFC explicitly includes the term “...further commercial activity...” which is explicit that this relates to commercial activity, not reliability-related activity. This requirement also has no performance elements, so there is nothing to measure against.

Requirement R1, Requirement Parts 1.1.1 thru 1.1.4 are expressly the definition of SOLs and are duplicative of the definition. Requirement Part 1.1.5 therefore adds nothing, as there is no provision for “Other SOLs.”

Requirement R1, Requirement Part 1.2.2 are Additions and retirements are Long-term planning related and would be reflected in operational models. Planned outages for the operating time horizon is expressly addressed in TOP-001-4 R9.
Requirement R1, Part 1.3: any reliability-related constraints are already expressed in OPAs and the requirements to operate within SOLs.

Requirement R1, Requirement Part 1.3.1: generation to load transfers does not, in most cases, reflect any physical arrangement. Such transfers assume a system between the two that can handle the transfer; and this system must be operated to respect SOLs.

The SDT determined that Requirement R1, Requirement Part 1.3.2 is ambiguous. There are several distribution factors; one related to outages, one related to transfers, and one related to a composite between the two. It is ambiguous to which of these distribution factors is being addressed.

**Requirement R2:** applies to TSP and Available Flowgate Capacity or Available Transfer Capability. Requirement R1 applies to TOP and Total Flowgate Capacity or Total Transfer Capacity. Otherwise, Requirement R2 is very similar to Requirement R1, and the rationale to retire Requirement R1 also applies to Requirement R2.

**Requirement R3:** CBM is defined as “The amount of firm transmission transfer capability preserved by the transmission provider for Load-Serving Entities (LSEs) whose loads are located on that Transmission Service Provider’s system to enable access by the LSEs to generation from interconnected systems to meet generation reliability requirements. Preservation of CBM for an LSE allows that entity to reduce its installed generating capacity below that which may otherwise have been necessary without interconnections to meet its generation reliability requirements. The transmission transfer capability preserved as CBM is intended to be used by the LSE only in times of emergency generation deficiencies.”

There is no obligation for a TSP to determine CBM; this requirement just applies to TSPs that elect to determine CBM. The requirement contains no criteria regarding what the CBMID must include, rather that generally describing the method.

Further, this requirement has no performance obligation, but to just to have a document; therefore, is administrative.

**Requirement R4:** The SDT vetted Requirement R4 and determined that Requirement R4 does not require TOPs to determine TRM and establish measurable criteria for what the TRMID must include. Further, R4 does not establish any criteria for the TRMID, just that the TOP that has TRM must have a document describing its methodology. Therefore, this requirement is simply administrative on an open-ended conditional duty.
Requirement R5 and its Requirement Parts:
Requirement Part 5.1: as the TOP or TSP is not required to have a TFC or TTC methodology, or an ATCID, CBMID, or TRMID, other entities that may have a reliability-related need for these, that information is routinely pursuant to the data specifications of the RC (in INT-010-2.1) and the TOP (in TOP-003-3). In Real-time operation of the BES, the limitations related to similar issues is fully addressed by the obligations of TOP-001-4; specifically as related to operating within SOLs and IROLs and issuing and responding to Operating Instructions.

Requirement Part 5.2 and subparts: OASIS is a mechanism to assure that all market participants have simultaneous access to all market-data, such that no participant has an advantage. To provide this information to any participant via any mechanism rather that OASIS or a publicly-accessible company website becomes a FERC SOC violation.

Requirement Part 5.3 and subparts: OASIS is a mechanism to assure that all market participants have simultaneous access to all market-data, such that no participant has an advantage. To provide this information to any participant via any mechanism rather that OASIS or a publicly-accessible company website becomes a FERC SOC violation.

Requirement R6: If this data had a reliability-related need, it would be addressed via the data specifications in INT-010-2.1 (for RC) and TOP-003-3 (for TOP). However, AFC, ATC, TFC, and TTC are not mandatory to establish; thus the party requested for this data may very well not have the data to provide. Further, various TOPs or TSPs that would have these elements are not required to coordinate them, which could easily lead to widely disparate methodologies. Finally, as market-related data, this data would likely be subject to FERC Standards of Conduct, which would require that the data be publicly posted for all other market participants to access.

Preston Walker - PJM Interconnection, L.L.C. - 2 - SERC,RF

Answer: Yes
PJM was heavily involved in the MOD-001-2 and NAESB WEQ-023 development efforts. PJM is neutral on the proposed retirement of MOD-001-2 but supports the position of the SER for the existing MOD standards as reliability components of congestion management are handled amongst eastern interconnect parties through various established coordination processes. PJM cautions against additional revisions to the NAESB WEQ-023 document, especially those driven by issues unique to particular seams or between specific entities, as those issues may not be realized by other parties. Therefore, blanket revisions may unnecessarily impact reliability and/or market aspects for other entities.

13. The SDT is proposing to retire MOD-028-2, Requirements R1, R2, R3, R4, R5, R6, R7, R8, R9, R10, and R11 (all). Do you agree with the SDT’s proposal to retire MOD-028-2? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

Summary Response:

Available Transfer Capability (ATC)/Available Flowgate Capability (AFC), as well as eTags, are commercially-focused elements, facilitating interchange and balancing of interchange. The Real-time system operators are ambivalent of these commercial arrangements, as they must maintain reliability of the BES according to System Operating Limits (SOLs) and Interconnection Reliability Operating Limits (IROLs). If a scheduled interchange would violate SOLs or IROLs, the Real-time operators must disregard the scheduled interchange and operate the system to its actual reliability limits. This observation is reinforced by NERC’s statement in the 2015 filing related to risk-based reliability proposing removal of the Interchange Authority from the compliance registry, where it’s stated: “NERC proposes to remove interchange authorities as functional entities, explaining that the activities of the interchange authority are commercial in nature and, thus, the removal will have little if any impact on reliability of the bulk electric system.” FERC acknowledged this in their March 15, 2015 Order, where they stated: “…we approve NERC’s proposed removal of the interchange authority as a functional entity. As explained by NERC, the interchange authority performs a commercial function, essentially quality control activity in verifying and communicating interchange schedules.”

MOD-001-2:

Requirement R1: TOPs are not required to determine TFC or TTC; therefore, this is a conditional obligation - and there is no requirement that TOPs coordinate their methodologies. The definition of AFC explicitly includes the term “…further commercial activity…” which is explicit that this relates to commercial activity, not reliability-related activity. This requirement also has no performance elements, so there is nothing to measure against.

Requirement R1, Requirement Parts 1.1.1 thru 1.1.4 are expressly the definition of SOLs and are duplicative of the definition. Requirement Part 1.1.5 therefore adds nothing, as there is no provision for “Other SOLs.”

Requirement R1, Requirement Part 1.2.2 are Additions and retirements are Long-term planning related and would be reflected in operational models. Planned outages for the operating time horizon is expressly addressed in TOP-001-4 R9.
Requirement R1, Part 1.3: any reliability-related constraints are already expressed in OPAs and the requirements to operate within SOLs.

Requirement R1, Requirement Part 1.3.1: generation to load transfers does not, in most cases, reflect any physical arrangement. Such transfers assume a system between the two that can handle the transfer; and this system must be operated to respect SOLs.

The SDT determined that Requirement R1, Requirement Part 1.3.2 is ambiguous. There are several distribution factors; one related to outages, one related to transfers, and one related to a composite between the two. It is ambiguous to which of these distribution factors is being addressed.

**Requirement R2**: applies to TSP and Available Flowgate Capacity or Available Transfer Capability. Requirement R1 applies to TOP and Total Flowgate Capacity or Total Transfer Capacity. Otherwise, Requirement R2 is very similar to Requirement R1, and the rationale to retire Requirement R1 also applies to Requirement R2.

**Requirement R3**: CBM is defined as “The amount of firm transmission transfer capability preserved by the transmission provider for Load-Serving Entities (LSEs) whose loads are located on that Transmission Service Provider’s system to enable access by the LSEs to generation from interconnected systems to meet generation reliability requirements. Preservation of CBM for an LSE allows that entity to reduce its installed generating capacity below that which may otherwise have been necessary without interconnections to meet its generation reliability requirements. The transmission transfer capability preserved as CBM is intended to be used by the LSE only in times of emergency generation deficiencies.”

There is no obligation for a TSP to determine CBM; this requirement just applies to TSPs that elect to determine CBM. The requirement contains no criteria regarding what the CBMID must include, rather that generally describing the method.

Further, this requirement has no performance obligation, but to just to have a document; therefore, is administrative.

**Requirement R4**: The SDT vetted Requirement R4 and determined that Requirement R4 does not require TOPs to determine TRM and establish measurable criteria for what the TRMID must include. Further, R4 does not establish any criteria for the TRMID, just that the TOP that has TRM must have a document describing its methodology. Therefore, this requirement is simply administrative on an open-ended conditional duty.
**Requirement R5** and its Requirement Parts:

Requirement Part 5.1: as the TOP or TSP is not required to have a TFC or TTC methodology, or an ATCID, CBMID, or TRMID, other entities that may have a reliability-related need for these, that information is routinely pursuant to the data specifications of the RC (in INT-010-2.1) and the TOP (in TOP-003-3). In Real-time operation of the BES, the limitations related to similar issues is fully addressed by the obligations of TOP-001-4; specifically as related to operating within SOLs and IROLs and issuing and responding to Operating Instructions.

Requirement Part 5.2 and subparts: OASIS is a mechanism to assure that all market participants have simultaneous access to all market-data, such that no participant has an advantage. To provide this information to any participant via any mechanism rather that OASIS or a publicly-accessible company website becomes a FERC SOC violation.

Requirement Part 5.3 and subparts: OASIS is a mechanism to assure that all market participants have simultaneous access to all market-data, such that no participant has an advantage. To provide this information to any participant via any mechanism rather that OASIS or a publicly-accessible company website becomes a FERC SOC violation.

**Requirement R6:** If this data had a reliability-related need, it would be addressed via the data specifications in INT-010-2.1 (for RC) and TOP-003-3 (for TOP). However, AFC, ATC, TFC, and TTC are not mandatory to establish; thus the party requested for this data may very well not have the data to provide. Further, various TOPs or TSPs that would have these elements are not required to coordinate them, which could easily lead to widely disparate methodologies. Finally, as market-related data, this data would likely be subject to FERC Standards of Conduct, which would require that the data be publicly posted for all other market participants to access.

Marsha Morgan - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC, Group Name Southern Company

Answer

No

Document Name

Comment

Southern continues to disagree with the SER Team’s proposed petition for the withdrawal of MOD-001-2. Again, we believe that the combined effect of enacting MOD-001-2 while migrating MOD-001-1a, MOD-004-1, MOD-008-1, MOD-028-2, MOD-029-2a and MOD-030-3 MOD into the NAESB standards strike an appropriate balance of addressing reliability related concerns, while incorporating any market related issues. Simply stating that ATC/AFC calculations are primarily commercially-focused elements and that there are mechanisms in place to address reliability in real time is an oversimplification of the ATC/AFC concept. Inaccurately modeling and assessing transfer capability which considers real physical transmission limits on both the host and neighboring systems can create extremely complicated situations in real-time that can unduly burden system operators.

However, since FERC has not yet approved MOD-001-2 and has yet to take action on incorporating MOD-001-1a, MOD-004-1, MOD-008-1, MOD-028-2, MOD-029-2a and MOD-030-3 MOD into the current NAESB standards, Southern Company recommends delaying the retirement of those existing NERC standards. The objective is to have MOD-001-2 in place at the same time as those submitted to FERC by NAESB. Once approved by the Commission, the industry should have adequate time to ensure a seamless transition to the new construct.

**Preston Walker - PJM Interconnection, L.L.C. - 2 - SERC,RF**

**Answer**

Yes

**Document Name**

**Comment**

PJM was heavily involved in the MOD-001-2 and NAESB WEQ-023 development efforts. PJM is neutral on the proposed retirement of MOD-001-2 but supports the position of the SER for the existing MOD standards as reliability components of congestion management are handled amongst eastern interconnect parties through various established coordination processes. PJM cautions against additional revisions to the NAESB WEQ-023 document, especially those driven by issues unique to particular seams or between specific entities, as those issues may not be realized by other parties. Therefore, blanket revisions may unnecessarily impact reliability and/or market aspects for other entities.

**Response**

Thank you for your comment.
14. The SDT is proposing to retire MOD-029-2a, Requirements R1, R2, R3, R4, R5, R6, R7, and R8 (all). Do you agree with the SDT’s proposal to retire MOD-029-2a? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

Summary Response:

Available Transfer Capability (ATC)/Available Flowgate Capability (AFC), as well as eTags, are commercially-focused elements, facilitating interchange and balancing of interchange. The Real-time system operators are ambivalent of these commercial arrangements, as they must maintain reliability of the BES according to System Operating Limits (SOLs) and Interconnection Reliability Operating Limits (IROLs). If a scheduled interchange would violate SOLs or IROLs, the Real-time operators must disregard the scheduled interchange and operate the system to its actual reliability limits. This observation is reinforced by NERC’s statement in the 2015 filing related to risk-based reliability proposing removal of the Interchange Authority from the compliance registry, where it’s stated: “NERC proposes to remove interchange authorities as functional entities, explaining that the activities of the interchange authority are commercial in nature and, thus, the removal will have little if any impact on reliability of the bulk electric system.” FERC acknowledged this in their March 15, 2015 Order, where they stated: “…we approve NERC’s proposed removal of the interchange authority as a functional entity. As explained by NERC, the interchange authority performs a commercial function, essentially quality control activity in verifying and communicating interchange schedules.”

MOD-001-2:

**Requirement R1**: TOPs are not required to determine TFC or TTC; therefore, this is a conditional obligation - and there is no requirement that TOPs coordinate their methodologies. The definition of AFC explicitly includes the term “...further commercial activity...” which is explicit that this relates to commercial activity, not reliability-related activity. This requirement also has no performance elements, so there is nothing to measure against.

Requirement R1, Requirement Parts 1.1.1 thru 1.1.4 are expressly the definition of SOLs and are duplicative of the definition. Requirement Part 1.1.5 therefore adds nothing, as there is no provision for “Other SOLs.”

Requirement R1, Requirement Part 1.2.2 are Additions and retirements are Long-term planning related and would be reflected in operational models. Planned outages for the operating time horizon is expressly addressed in TOP-001-4 R9.
Requirement R1, Part 1.3: any reliability-related constraints are already expressed in OPAs and the requirements to operate within SOLs.

Requirement R1, Requirement Part 1.3.1: generation to load transfers does not, in most cases, reflect any physical arrangement. Such transfers assume a system between the two that can handle the transfer; and this system must be operated to respect SOLs.

The SDT determined that Requirement R1, Requirement Part 1.3.2 is ambiguous. There are several distribution factors; one related to outages, one related to transfers, and one related to a composite between the two. It is ambiguous to which of these distribution factors is being addressed.

**Requirement R2**: applies to TSP and Available Flowgate Capacity or Available Transfer Capability. Requirement R1 applies to TOP and Total Flowgate Capacity or Total Transfer Capacity. Otherwise, Requirement R2 is very similar to Requirement R1, and the rationale to retire Requirement R1 also applies to Requirement R2.

**Requirement R3**: CBM is defined as “The amount of firm transmission transfer capability preserved by the transmission provider for Load-Serving Entities (LSEs) whose loads are located on that Transmission Service Provider’s system to enable access by the LSEs to generation from interconnected systems to meet generation reliability requirements. Preservation of CBM for an LSE allows that entity to reduce its installed generating capacity below that which may otherwise have been necessary without interconnections to meet its generation reliability requirements. The transmission transfer capability preserved as CBM is intended to be used by the LSE only in times of emergency generation deficiencies.”

There is no obligation for a TSP to determine CBM; this requirement just applies to TSPs that elect to determine CBM. The requirement contains no criteria regarding what the CBMID must include, rather that generally describing the method.

Further, this requirement has no performance obligation, but to just to have a document; therefore, is administrative.

**Requirement R4**: The SDT vetted Requirement R4 and determined that Requirement R4 does not require TOPs to determine TRM and establish measurable criteria for what the TRMID must include. Further, R4 does not establish any criteria for the TRMID, just that the TOP that has TRM must have a document describing its methodology. Therefore, this requirement is simply administrative on an open-ended conditional duty.
**Requirement R5** and its Requirement Parts:

Requirement Part 5.1: as the TOP or TSP is not required to have a TFC or TTC methodology, or an ATCID, CBMID, or TRMID, other entities that may have a reliability-related need for these, that information is routinely pursuant to the data specifications of the RC (in INT-010-2.1) and the TOP (in TOP-003-3). In Real-time operation of the BES, the limitations related to similar issues is fully addressed by the obligations of TOP-001-4; specifically as related to operating within SOLs and IROLs and issuing and responding to Operating Instructions.

Requirement Part 5.2 and subparts: OASIS is a mechanism to assure that all market participants have simultaneous access to all market-data, such that no participant has an advantage. To provide this information to any participant via any mechanism rather than OASIS or a publicly-accessible company website becomes a FERC SOC violation.

Requirement Part 5.3 and subparts: OASIS is a mechanism to assure that all market participants have simultaneous access to all market-data, such that no participant has an advantage. To provide this information to any participant via any mechanism rather than OASIS or a publicly-accessible company website becomes a FERC SOC violation.

**Requirement R6:** If this data had a reliability-related need, it would be addressed via the data specifications in INT-010-2.1 (for RC) and TOP-003-3 (for TOP). However, AFC, ATC, TFC, and TTC are not mandatory to establish; thus the party requested for this data may very well not have the data to provide. Further, various TOPs or TSPs that would have these elements are not required to coordinate them, which could easily lead to widely disparate methodologies. Finally, as market-related data, this data would likely be subject to FERC Standards of Conduct, which would require that the data be publicly posted for all other market participants to access.

**Marsha Morgan - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC, Group Name Southern Company**

<table>

Southern continues to disagree with the SER Team’s proposed petition for the withdrawal of MOD-001-2. Again, we believe that the combined effect of enacting MOD-001-2 while migrating MOD-001-1a, MOD-004-1, MOD-008-1, MOD-028-2, MOD-029-2a and MOD-030-3 MOD into the NAESB standards strike an appropriate balance of addressing reliability related concerns, while incorporating any market related issues. Simply stating that ATC/AFC calculations are primarily commercially-focused elements and that there are
mechanisms in place to address reliability in real time is an oversimplification of the ATC/AFC concept. Inaccurately modeling and assessing transfer capability which considers real physical transmission limits on both the host and neighboring systems can create extremely complicated situations in real-time that can unduly burden system operators.

However, since FERC has not yet approved MOD-001-2 and has yet to take action on incorporating MOD-001-1a, MOD-004-1, MOD-008-1, MOD-028-2, MOD-029-2a and MOD-030-3 and NAESB’s WEQ-23 into the current NAESB standards, Southern Company recommends delaying the retirement of those existing NERC standards. The objective is to have MOD-001-2 in place at the same time as those submitted to FERC by NAESB. Once approved by the Commission, the industry should have adequate time to ensure a seamless transition to the new construct.

Response

Thank you for your comments. Available Transfer Capability (ATC)/Available Flowgate Capability (AFC), as well as eTags, are commercially-focused elements, facilitating interchange and balancing of interchange. The Real-time system operators are ambivalent of these commercial arrangements, as they must maintain reliability of the BES according to System Operating Limits (SOLs) and Interconnection Reliability Operating Limits (IROLs). If a scheduled interchange would violate SOLs or IROLs, the Real-time operators must disregard the scheduled interchange and operate the system to its actual reliability limits. This observation is reinforced by NERC’s statement in the 2015 filing related to risk-based reliability proposing removal of the Interchange Authority from the compliance registry, where it’s stated: “NERC proposes to remove interchange authorities as functional entities, explaining that the activities of the interchange authority are commercial in nature and, thus, the removal will have little if any impact on reliability of the bulk electric system.” FERC acknowledged this in their March 15, 2015 Order, where they stated: “…we approve NERC’s proposed removal of the interchange authority as a functional entity. As explained by NERC, the interchange authority performs a commercial function, essentially quality control activity in verifying and communicating interchange schedules.”

MOD-001-2:

Requirement R1: TOPs are not required to determine TFC or TTC; therefore, this is a conditional obligation - and there is no requirement that TOPs coordinate their methodologies. The definition of AFC explicitly includes the term “...further commercial activity...” which is
explicit that this relates to commercial activity, not reliability-related activity. This requirement also has no performance elements, so there is nothing to measure against.

Requirement R1, Requirement Parts 1.1.1 thru 1.1.4 are expressly the definition of SOLs and are duplicative of the definition. Requirement Part 1.1.5 therefore adds nothing, as there is no provision for “Other SOLs.”

Requirement R1, Requirement Part 1.2.2 are Additions and retirements are Long-term planning related and would be reflected in operational models. Planned outages for the operating time horizon is expressly addressed in TOP-001-4 R9.

Requirement R1, Part 1.3: any reliability-related constraints are already expressed in OPAs and the requirements to operate within SOLs.

Requirement R1, Requirement Part 1.3.1: generation to load transfers does not, in most cases, reflect any physical arrangement. Such transfers assume a system between the two that can handle the transfer; and this system must be operated to respect SOLs.

The SDT determined that Requirement R1, Requirement Part 1.3.2 is ambiguous. There are several distribution factors; one related to outages, one related to transfers, and one related to a composite between the two. It is ambiguous to which of these distribution factors is being addressed.

**Requirement R2:** applies to TSP and Available Flowgate Capacity or Available Transfer Capability. Requirement R1 applies to TOP and Total Flowgate Capacity or Total Transfer Capacity. Otherwise, Requirement R2 is very similar to Requirement R1, and the rationale to retire Requirement R1 also applies to Requirement R2.

**Requirement R3:** CBM is defined as “The amount of firm transmission transfer capability preserved by the transmission provider for Load-Serving Entities (LSEs) whose loads are located on that Transmission Service Provider’s system to enable access by the LSEs to generation from interconnected systems to meet generation reliability requirements. Preservation of CBM for an LSE allows that entity to reduce its installed generating capacity below that which may otherwise have been necessary without interconnections to meet its generation reliability requirements. The transmission transfer capability preserved as CBM is intended to be used by the LSE only in times of emergency generation deficiencies.”
There is no obligation for a TSP to determine CBM; this requirement just applies to TSPs that elect to determine CBM. The requirement contains no criteria regarding what the CBMID must include, rather that generally describing the method.

Further, this requirement has no performance obligation, but to just to have a document; therefore, is administrative.

Requirement R4: The SDT vetted Requirement R4 and determined that Requirement R4 does not require TOPs to determine TRM and establish measurable criteria for what the TRMID must include. Further, R4 does not establish any criteria for the TRMID, just that the TOP that has TRM must have a document describing its methodology. Therefore, this requirement is simply administrative on an open-ended conditional duty.

Requirement R5 and its Requirement Parts:
Requirement Part 5.1: as the TOP or TSP is not required to have a TFC or TTC methodology, or an ATCID, CBMID, or TRMID, other entities that may have a reliability-related need for these, that information is routinely pursuant to the data specifications of the RC (in INT-010-2.1) and the TOP (in TOP-003-3). In Real-time operation of the BES, the limitations related to similar issues is fully addressed by the obligations of TOP-001-4; specifically as related to operating within SOLs and IROLs and issuing and responding to Operating Instructions.

Leonard Kula - Independent Electricity System Operator - 2

**Answer**  Yes

**Document Name**  

**Comment**  

The current standard addresses aspects that are commercial in nature.

The reliability assessment requirement for determining transfer limits is addressed in FAC-11
Anton Vu - Los Angeles Department of Water and Power - 6

LDWP agrees that this standard no longer directly impacts system reliability. However, there should be a standardization of TTC/ATC calculation so that there is uniformity between entities.

**Preston Walker - PJM Interconnection, L.L.C. - 2 - SERC,RF**

<p>| Comment | PJM was heavily involved in the MOD-001-2 and NAESB WEQ-023 development efforts. PJM is neutral on the proposed retirement of MOD-001-2 but supports the position of the SER for the existing MOD standards as reliability components of congestion management are handled amongst eastern interconnect parties through various established coordination processes. PJM cautions against additional revisions to the NAESB WEQ-023 document, especially those driven by issues unique to particular seams or between specific entities, as those issues may not be realized by other parties. Therefore, blanket revisions may unnecessarily impact reliability and/or market aspects for other entities. |

15. The SDT is proposing to retire MOD-030-3, Requirements R1, R2, R3, R4, R5, R6, R7, R8, R9 and R10 (all). Do you agree with the SDT’s proposal to retire MOD-030-3? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

Summary Response:

Available Transfer Capability (ATC)/Available Flowgate Capability (AFC), as well as eTags, are commercially-focused elements, facilitating interchange and balancing of interchange. The Real-time system operators are ambivalent of these commercial arrangements, as they must maintain reliability of the BES according to System Operating Limits (SOLs) and Interconnection Reliability Operating Limits (IROLs). If a scheduled interchange would violate SOLs or IROLs, the Real-time operators must disregard the scheduled interchange and operate the system to its actual reliability limits. This observation is reinforced by NERC’s statement in the 2015 filing related to risk-based reliability proposing removal of the Interchange Authority from the compliance registry, where it’s stated: “NERC proposes to remove interchange authorities as functional entities, explaining that the activities of the interchange authority are commercial in nature and, thus, the removal will have little if any impact on reliability of the bulk electric system.” FERC acknowledged this in their March 15, 2015 Order, where they stated: “…we approve NERC’s proposed removal of the interchange authority as a functional entity. As explained by NERC, the interchange authority performs a commercial function, essentially quality control activity in verifying and communicating interchange schedules.”

MOD-001-2:

Requirement R1: TOPs are not required to determine TFC or TTC; therefore, this is a conditional obligation - and there is no requirement that TOPs coordinate their methodologies. The definition of AFC explicitly includes the term “…further commercial activity…” which is explicit that this relates to commercial activity, not reliability-related activity. This requirement also has no performance elements, so there is nothing to measure against.

Requirement R1, Requirement Parts 1.1.1 thru 1.1.4 are expressly the definition of SOLs and are duplicative of the definition. Requirement Part 1.1.5 therefore adds nothing, as there is no provision for “Other SOLs.”

Requirement R1, Requirement Part 1.2.2 are Additions and retirements are Long-term planning related and would be reflected in operational models. Planned outages for the operating time horizon is expressly addressed in TOP-001-4 R9.
Requirement R1, Part 1.3: any reliability-related constraints are already expressed in OPAs and the requirements to operate within SOLs.

Requirement R1, Requirement Part 1.3.1: generation to load transfers does not, in most cases, reflect any physical arrangement. Such transfers assume a system between the two that can handle the transfer; and this system must be operated to respect SOLs.

The SDT determined that Requirement R1, Requirement Part 1.3.2 is ambiguous. There are several distribution factors; one related to outages, one related to transfers, and one related to a composite between the two. It is ambiguous to which of these distribution factors is being addressed.

**Requirement R2:** applies to TSP and Available Flowgate Capacity or Available Transfer Capability. Requirement R1 applies to TOP and Total Flowgate Capacity or Total Transfer Capacity. Otherwise, Requirement R2 is very similar to Requirement R1, and the rationale to retire Requirement R1 also applies to Requirement R2.

**Requirement R3:** CBM is defined as “The amount of firm transmission transfer capability preserved by the transmission provider for Load-Serving Entities (LSEs) whose loads are located on that Transmission Service Provider’s system to enable access by the LSEs to generation from interconnected systems to meet generation reliability requirements. Preservation of CBM for an LSE allows that entity to reduce its installed generating capacity below that which may otherwise have been necessary without interconnections to meet its generation reliability requirements. The transmission transfer capability preserved as CBM is intended to be used by the LSE only in times of emergency generation deficiencies.”

There is no obligation for a TSP to determine CBM; this requirement just applies to TSPs that elect to determine CBM. The requirement contains no criteria regarding what the CBMID must include, rather that generally describing the method.

Further, this requirement has no performance obligation, but to just to have a document; therefore, is administrative.

**Requirement R4:** The SDT vetted Requirement R4 and determined that Requirement R4 does not require TOPs to determine TRM and establish measurable criteria for what the TRMID must include. Further, R4 does not establish any criteria for the TRMID, just that the TOP that has TRM must have a document describing its methodology. Therefore, this requirement is simply administrative on an open-ended conditional duty.
**Requirement R5** and its Requirement Parts:

Requirement Part 5.1: as the TOP or TSP is not required to have a TFC or TTC methodology, or an ATCID, CBMID, or TRMID, other entities that may have a reliability-related need for these, that information is routinely pursuant to the data specifications of the RC (in INT-010-2.1) and the TOP (in TOP-003-3). In Real-time operation of the BES, the limitations related to similar issues is fully addressed by the obligations of TOP-001-4; specifically as related to operating within SOLs and IROLs and issuing and responding to Operating Instructions.

Requirement Part 5.2 and subparts: OASIS is a mechanism to assure that all market participants have simultaneous access to all market-data, such that no participant has an advantage. To provide this information to any participant via any mechanism rather that OASIS or a publicly-accessible company website becomes a FERC SOC violation.

Requirement Part 5.3 and subparts: OASIS is a mechanism to assure that all market participants have simultaneous access to all market-data, such that no participant has an advantage. To provide this information to any participant via any mechanism rather that OASIS or a publicly-accessible company website becomes a FERC SOC violation.

**Requirement R6:** If this data had a reliability-related need, it would be addressed via the data specifications in INT-010-2.1 (for RC) and TOP-003-3 (for TOP). However, AFC, ATC, TFC, and TTC are not mandatory to establish; thus the party requested for this data may very well not have the data to provide. Further, various TOPs or TSPs that would have these elements are not required to coordinate them, which could easily lead to widely disparate methodologies. Finally, as market-related data, this data would likely be subject to FERC Standards of Conduct, which would require that the data be publicly posted for all other market participants to access.

TVA disagrees with the retirement of these standards at this time.

Until a resolution is reached on NAESB’s WEQ-023, and these items are incorporated by reference per the FERC Commission, retirement of these MOD Reliability Standards would leave a significant gap of reliability of ATC in the industry. WEQ-023 (submitted under Version 003.1) was not approved by the Commission to be incorporated by reference at this time and is being considered under an overall inquiry into ATC calculation. This leaves the standard, as written in NAESB as voluntary. MOD-001-2 was drafted with the mindset of leaving only reliability aspects of ATC under NERC oversight and WEQ-023 being approved by the Commission. If MOD-001-2 is withdrawn, there would be no reliability push for ATC requirements under FERC and could potentially cause further delay. Removal of these standards could impact the transparency that is established with sharing data with neighbors as well.

According to Project 2012-05 ATC Revisions (MOD A), MOD-001-2 was developed to address directives in Order No. 729 to modify certain aspects of the MOD A standards and to consolidate the MOD A standards into a single standard covering only the ‘reliability-related impact of ATC and AFC calculations’. The consolidated approach was intended to maintain NERC’s focus on developing and retaining requirements that support the reliable operation of the Bulk-Power System (BPS).

The WEQ-023 standards drafted did not incorporate honoring neighboring systems nor ensure an entity have an ATCID, or TRMID, or CBMID because the thought was that it would be laid out in the NERC space under MOD-001-2. So NAESB would have to incorporate all of this into the business practice, which would blur the lines of reliability and commercial that the project was developed to address.

TVA agrees with the goal of the Standards Efficiency Review Team to decrease the number of requirements and make the standards less confusing and less burdensome. Yet, it is important that the standards still ensure a relatively consistent and reliable calculation of transfer capability. TVA feels the accurate calculation of transfer capability is a reliability issue. It is the job of the operations planners to give the operators a system that was planned to be reliable. If the operators are given a system that has numerous n-1 overloads planned
into the system, then the operational planning engineers did not do their job. We do not want our operators to intentionally have to handle numerous TLRs and generation re-dispatch because of an oversold system. If the TOP and TSP oversell the system, it may be difficult for the operators to maintain system reliability. A transmission system constantly in TLR3 and TLR5 due to inaccurate calculations of transfer capability is a reliability issue and not just a commercial issue. If your neighbor is constantly selling transfer capability and ignoring the impact on your system, this too will affect your reliability. This does not just impact transmission costs as some would believe.

**Response**

Thank you for your comments. Available Transfer Capability (ATC)/Available Flowgate Capability (AFC), as well as eTags, are commercially-focused elements, facilitating interchange and balancing of interchange. The Real-time system operators are ambivalent of these commercial arrangements, as they must maintain reliability of the BES according to System Operating Limits (SOLs) and Interconnection Reliability Operating Limits (IROLs). If a scheduled interchange would violate SOLs or IROLs, the Real-time operators must disregard the scheduled interchange and operate the system to its actual reliability limits. This observation is reinforced by NERC’s statement in the 2015 filing related to risk-based reliability proposing removal of the Interchange Authority from the compliance registry, where it’s stated: “NERC proposes to remove interchange authorities as functional entities, explaining that the activities of the interchange authority are commercial in nature and, thus, the removal will have little if any impact on reliability of the bulk electric system.” FERC acknowledged this in their March 15, 2015 Order, where they stated: “…we approve NERC’s proposed removal of the interchange authority as a functional entity. As explained by NERC, the interchange authority performs a commercial function, essentially quality control activity in verifying and communicating interchange schedules.”

**MOD-001-2:**

**Requirement R1:** TOPs are not required to determine TFC or TTC; therefore, this is a conditional obligation - and there is no requirement that TOPs coordinate their methodologies. The definition of AFC explicitly includes the term “…further commercial activity…” which is explicit that this relates to commercial activity, not reliability-related activity. This requirement also has no performance elements, so there is nothing to measure against.
Requirement R1, Requirement Parts 1.1.1 thru 1.1.4 are expressly the definition of SOLs and are duplicative of the definition.
Requirement Part 1.1.5 therefore adds nothing, as there is no provision for “Other SOLs.”

Requirement R1, Requirement Part 1.2.2 are Additions and retirements are Long-term planning related and would be reflected in operational models. Planned outages for the operating time horizon is expressly addressed in TOP-001-4 R9.

Requirement R1, Part 1.3: any reliability-related constraints are already expressed in OPAs and the requirements to operate within SOLs.

Requirement R1, Requirement Part 1.3.1: generation to load transfers does not, in most cases, reflect any physical arrangement. Such transfers assume a system between the two that can handle the transfer; and this system must be operated to respect SOLs.

The SDT determined that Requirement R1, Requirement Part 1.3.2 is ambiguous. There are several distribution factors; one related to outages, one related to transfers, and one related to a composite between the two. It is ambiguous to which of these distribution factors is being addressed.

**Requirement R2**: applies to TSP and Available Flowgate Capacity or Available Transfer Capability. Requirement R1 applies to TOP and Total Flowgate Capacity or Total Transfer Capacity. Otherwise, Requirement R2 is very similar to Requirement R1, and the rationale to retire Requirement R1 also applies to Requirement R2.

**Requirement R3**: CBM is defined as “The amount of firm transmission transfer capability preserved by the transmission provider for Load-Serving Entities (LSEs) whose loads are located on that Transmission Service Provider’s system to enable access by the LSEs to generation from interconnected systems to meet generation reliability requirements. Preservation of CBM for an LSE allows that entity to reduce its installed generating capacity below that which may otherwise have been necessary without interconnections to meet its generation reliability requirements. The transmission transfer capability preserved as CBM is intended to be used by the LSE only in times of emergency generation deficiencies.”

There is no obligation for a TSP to determine CBM; this requirement just applies to TSPs that elect to determine CBM. The requirement contains no criteria regarding what the CBMID must include, rather that generally describing the method.

Further, this requirement has no performance obligation, but to just to have a document; therefore, is administrative.
**Requirement R4:** The SDT vetted Requirement R4 and determined that Requirement R4 does not require TOPs to determine TRM and establish measurable criteria for what the TRMID must include. Further, R4 does not establish any criteria for the TRMID, just that the TOP that has TRM must have a document describing its methodology. Therefore, this requirement is simply administrative on an open-ended conditional duty.

**Requirement R5** and its Requirement Parts:
- **Requirement Part 5.1:** as the TOP or TSP is not required to have a TFC or TTC methodology, or an ATCID, CBMID, or TRMID, other entities that may have a reliability-related need for these, that information is routinely pursuant to the data specifications of the RC (in INT-010-2.1) and the TOP (in TOP-003-3). In Real-time operation of the BES, the limitations related to similar issues is fully addressed by the obligations of TOP-001-4; specifically as related to operating within SOLs and IROLS and issuing and responding to Operating Instructions.
- **Requirement Part 5.2** and subparts: OASIS is a mechanism to assure that all market participants have simultaneous access to all market-data, such that no participant has an advantage. To provide this information to any participant via any mechanism rather than OASIS or a publicly-accessible company website becomes a FERC SOC violation.
- **Requirement Part 5.3** and subparts: OASIS is a mechanism to assure that all market participants have simultaneous access to all market-data, such that no participant has an advantage. To provide this information to any participant via any mechanism rather than OASIS or a publicly-accessible company website becomes a FERC SOC violation.

**Requirement R6:** If this data had a reliability-related need, it would be addressed via the data specifications in INT-010-2.1 (for RC) and TOP-003-3 (for TOP). However, AFC, ATC, TFC, and TTC are not mandatory to establish; thus the party requested for this data may very well not have the data to provide. Further, various TOPs or TSPs that would have these elements are not required to coordinate them, which could easily lead to widely disparate methodologies. Finally, as market-related data, this data would likely be subject to FERC Standards of Conduct, which would require that the data be publicly posted for all other market participants to access.

**Marsha Morgan - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC, Group Name**

<table>
<thead>
<tr>
<th>Answer</th>
<th>No</th>
</tr>
</thead>
<tbody>
<tr>
<td>Document Name</td>
<td></td>
</tr>
<tr>
<td>Comment</td>
<td></td>
</tr>
</tbody>
</table>
Southern continues to disagree with the SER Team’s proposed petition for the withdrawal of MOD-001-2. Again, we believe that the combined effect of enacting MOD-001-2 while migrating MOD-001-1a, MOD-004-1, MOD-008-1, MOD-028-2, MOD-029-2a and MOD-030-3 MOD into the NAESB standards strike an appropriate balance of addressing reliability related concerns, while incorporating any market related issues. Simply stating that ATC/AFC calculations are primarily commercially-focused elements and that there are mechanisms in place to address reliability in real time is an oversimplification of the ATC/AFC concept. Inaccurately modeling and assessing transfer capability which considers real physical transmission limits on both the host and neighboring systems can create extremely complicated situations in real-time that can unduly burden system operators.

However, since FERC has not yet approved MOD-001-2 and has yet to take action on incorporating MOD-001-1a, MOD-004-1, MOD-008-1, MOD-028-2, MOD-029-2a and MOD-030-3 and NAESB’s WEQ-23 into the current NAESB standards, Southern Company recommends delaying the retirement of those existing NERC standards. The objective is to have MOD-001-2 in place at the same time as those submitted to FERC by NAESB. Once approved by the Commission, the industry should have adequate time to ensure a seamless transition to the new construct.

Response

Thank you for your comments. Available Transfer Capability (ATC)/Available Flowgate Capability (AFC), as well as eTags, are commercially-focused elements, facilitating interchange and balancing of interchange. The Real-time system operators are ambivalent of these commercial arrangements, as they must maintain reliability of the BES according to System Operating Limits (SOLs) and Interconnection Reliability Operating Limits (IROLs). If a scheduled interchange would violate SOLs or IROLs, the Real-time operators must disregard the scheduled interchange and operate the system to its actual reliability limits. This observation is reinforced by NERC’s statement in the 2015 filing related to risk-based reliability proposing removal of the Interchange Authority from the compliance registry, where it’s stated: “NERC proposes to remove interchange authorities as functional entities, explaining that the activities of the interchange authority are commercial in nature and, thus, the removal will have little if any impact on reliability of the bulk electric system.” FERC acknowledged this in their March 15, 2015 Order, where they stated: “...we approve NERC’s proposed removal of the interchange authority as a functional entity. As explained by NERC, the interchange authority performs a commercial function, essentially quality control activity in verifying and communicating interchange schedules.”
MOD-001-2:

**Requirement R1:** TOPs are not required to determine TFC or TTC; therefore, this is a conditional obligation - and there is no requirement that TOPs coordinate their methodologies. The definition of AFC explicitly includes the term “...further commercial activity...” which is explicit that this relates to commercial activity, not reliability-related activity. <td>PJM was heavily involved in the MOD-001-2 and NAESB WEQ-023 development efforts. PJM is neutral on the proposed retirement of MOD-001-2 but supports the position of the SER for the existing MOD standards as reliability components of congestion management are handled amongst eastern interconnect parties through various established coordination processes. PJM cautions against additional revisions to the NAESB WEQ-023 document, especially those driven by issues unique to particular seams or between specific entities, as those issues may not be realized by other parties. Therefore, blanket revisions may unnecessarily impact reliability and/or market aspects for other entities.</td>

Thank you for your comment.
16. The SDT is proposing to retire MOD-001-1a, Requirements R1, R2, R3, R4, R5, R6, R7, R8 and R9 (all). Do you agree with the SDT’s proposal to retire MOD-001-1a? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

Summary Response:

Available Transfer Capability (ATC)/Available Flowgate Capability (AFC), as well as eTags, are commercially-focused elements, facilitating interchange and balancing of interchange. The Real-time system operators are ambivalent of these commercial arrangements, as they must maintain reliability of the BES according to System Operating Limits (SOLs) and Interconnection Reliability Operating Limits (IROLs). If a scheduled interchange would violate SOLs or IROLs, the Real-time operators must disregard the scheduled interchange and operate the system to its actual reliability limits. This observation is reinforced by NERC’s statement in the 2015 filing related to risk-based reliability proposing removal of the Interchange Authority from the compliance registry, where it’s stated: “NERC proposes to remove interchange authorities as functional entities, explaining that the activities of the interchange authority are commercial in nature and, thus, the removal will have little if any impact on reliability of the bulk electric system.” FERC acknowledged this in their March 15, 2015 Order, where they stated: “…we approve NERC’s proposed removal of the interchange authority as a functional entity. As explained by NERC, the interchange authority performs a commercial function, essentially quality control activity in verifying and communicating interchange schedules.”

MOD-001-2:

**Requirement R1:** TOPs are not required to determine TFC or TTC; therefore, this is a conditional obligation - and there is no requirement that TOPs coordinate their methodologies. The definition of AFC explicitly includes the term “…further commercial activity…” which is explicit that this relates to commercial activity, not reliability-related activity. This requirement also has no performance elements, so there is nothing to measure against.

Requirement R1, Requirement Parts 1.1.1 thru 1.1.4 are expressly the definition of SOLs and are duplicative of the definition. Requirement Part 1.1.5 therefore adds nothing, as there is no provision for “Other SOLs.”

Requirement R1, Requirement Part 1.2.2 are Additions and retirements are Long-term planning related and would be reflected in operational models. Planned outages for the operating time horizon is expressly addressed in TOP-001-4 R9.
Requirement R1, Part 1.3: any reliability-related constraints are already expressed in OPAs and the requirements to operate within SOLs.

Requirement R1, Requirement Part 1.3.1: generation to load transfers does not, in most cases, reflect any physical arrangement. Such transfers assume a system between the two that can handle the transfer; and this system must be operated to respect SOLs.

The SDT determined that Requirement R1, Requirement Part 1.3.2 is ambiguous. There are several distribution factors; one related to outages, one related to transfers, and one related to a composite between the two. It is ambiguous to which of these distribution factors is being addressed.

**Requirement R2:** applies to TSP and Available Flowgate Capacity or Available Transfer Capability. Requirement R1 applies to TOP and Total Flowgate Capacity or Total Transfer Capacity. Otherwise, Requirement R2 is very similar to Requirement R1, and the rationale to retire Requirement R1 also applies to Requirement R2.

**Requirement R3:** CBM is defined as “The amount of firm transmission transfer capability preserved by the transmission provider for Load-Serving Entities (LSEs) whose loads are located on that Transmission Service Provider’s system to enable access by the LSEs to generation from interconnected systems to meet generation reliability requirements. Preservation of CBM for an LSE allows that entity to reduce its installed generating capacity below that which may otherwise have been necessary without interconnections to meet its generation reliability requirements. The transmission transfer capability preserved as CBM is intended to be used by the LSE only in times of emergency generation deficiencies.”

There is no obligation for a TSP to determine CBM; this requirement just applies to TSPs that elect to determine CBM. The requirement contains no criteria regarding what the CBMID must include, rather that generally describing the method.

Further, this requirement has no performance obligation, but to just to have a document; therefore, is administrative.

**Requirement R4:** The SDT vetted Requirement R4 and determined that Requirement R4 does not require TOPs to determine TRM and establish measurable criteria for what the TRMID must include. Further, R4 does not establish any criteria for the TRMID, just that the TOP that has TRM must have a document describing its methodology. Therefore, this requirement is simply administrative on an open-ended conditional duty.
Requirement R5 and its Requirement Parts:
Requirement Part 5.1: as the TOP or TSP is not required to have a TFC or TTC methodology, or an ATCID, CBMID, or TRMID, other entities that may have a reliability-related need for these, that information is routinely pursuant to the data specifications of the RC (in INT-010-2.1) and the TOP (in TOP-003-3). In Real-time operation of the BES, the limitations related to similar issues is fully addressed by the obligations of TOP-001-4; specifically as related to operating within SOLs and IROLs and issuing and responding to Operating Instructions.

Requirement Part 5.2 and subparts: OASIS is a mechanism to assure that all market participants have simultaneous access to all market-data, such that no participant has an advantage. To provide this information to any participant via any mechanism rather that OASIS or a publicly-accessible company website becomes a FERC SOC violation.

Requirement Part 5.3 and subparts: OASIS is a mechanism to assure that all market participants have simultaneous access to all market-data, such that no participant has an advantage. To provide this information to any participant via any mechanism rather that OASIS or a publicly-accessible company website becomes a FERC SOC violation.

Requirement R6: If this data had a reliability-related need, it would be addressed via the data specifications in INT-010-2.1 (for RC) and TOP-003-3 (for TOP). However, AFC, ATC, TFC, and TTC are not mandatory to establish; thus the party requested for this data may very well not have the data to provide. Further, various TOPs or TSPs that would have these elements are not required to coordinate them, which could easily lead to widely disparate methodologies. Finally, as market-related data, this data would likely be subject to FERC Standards of Conduct, which would require that the data be publicly posted for all other market participants to access.

Marsha Morgan - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC, Group Name Southern Company

<table>
<thead>
<tr>
<th>Answer</th>
<th>No</th>
</tr>
</thead>
<tbody>
<tr>
<td>Document Name</td>
<td></td>
</tr>
<tr>
<td>Comment</td>
<td>Southern continues to disagree with the SER Team’s proposed petition for the withdrawal of MOD-001-2. Again, we believe that the combined effect of enacting MOD-001-2 while migrating MOD-001-1a, MOD-004-1, MOD-008-1, MOD-028-2, MOD-029-2a and MOD-030-3 MOD into the NAESB standards strike an appropriate balance of addressing reliability related concerns, while incorporating any market related issues. Simply stating that ATC/AFC calculations are primarily commercially-focused elements and that there are</td>
</tr>
</tbody>
</table>
mechanisms in place to address reliability in real time is an oversimplification of the ATC/AFC concept. Inaccurately modeling and assessing transfer capability which considers real physical transmission limits on both the host and neighboring systems can create extremely complicated situations in real-time that can unduly burden system operators.

However, since FERC has not yet approved MOD-001-2 and has yet to take action on incorporating MOD-001-1a, MOD-004-1, MOD-008-1, MOD-028-2, MOD-029-2a and MOD-030-3 and NAESB’s WEQ-23 into the current NAESB standards, Southern Company recommends delaying the retirement of those existing NERC standards. The objective is to have MOD-001-2 in place at the same time as those submitted to FERC by NAESB. Once approved by the Commission, the industry should have adequate time to ensure a seamless transition to the new construct.

**Response**

Thank you for your comments. Available Transfer Capability (ATC)/Available Flowgate Capability (AFC), as well as eTags, are commercially-focused elements, facilitating interchange and balancing of interchange. The Real-time system operators are ambivalent of these commercial arrangements, as they must maintain reliability of the BES according to System Operating Limits (SOLs) and Interconnection Reliability Operating Limits (IROLs). If a scheduled interchange would violate SOLs or IROLs, the Real-time operators must disregard the scheduled interchange and operate the system to its actual reliability limits. This observation is reinforced by NERC’s statement in the 2015 filing related to risk-based reliability proposing removal of the Interchange Authority from the compliance registry, where it’s stated: “NERC proposes to remove interchange authorities as functional entities, explaining that the activities of the interchange authority are commercial in nature and, thus, the removal will have little if any impact on reliability of the bulk electric system.” FERC acknowledged this in their March 15, 2015 Order, where they stated: “...we approve NERC’s proposed removal of the interchange authority as a functional entity. **Chris Wagner - Santee Cooper - 1**

**Answer** No

**Document Name**

**Comment**

MOD001 requires that all registered TOPs establish reliability boundaries in which the TSPs can operate to maximize energy business transactions. By moving MOD-001 from under NERC responsibility, the BES reliability may be compromised. Transfer capability includes the impact on other areas due to the transfer of electric power.

**Response**

Thank you for your comments. Available Transfer Capability (ATC)/Available Flowgate Capability (AFC), as well as eTags, are commercially-focused elements, facilitating interchange and balancing of interchange. The Real-time system operators are ambivalent of these commercial arrangements, as they must maintain reliability of the BES according to System Operating Limits (SOLs) and Interconnection Reliability Operating Limits (IROLs). If a scheduled interchange would violate SOLs or IROLs, the Real-time operators must disregard the scheduled interchange and operate the system to its actual reliability limits. This observation is reinforced by NERC’s statement in the 2015 filing related to risk-based reliability proposing removal of the Interchange Authority from the compliance registry, where it’s stated:
“NERC proposes to remove interchange authorities as functional entities, explaining that the activities of the interchange authority are commercial in nature and, thus, the removal will have little if any impact on reliability of the bulk electric system.” FERC acknowledged this in their March 15, 2015 Order, where they stated: “…we approve NERC’s proposed removal of the interchange authority as a functional entity. As explained by NERC, the interchange authority performs a commercial function, essentially quality control activity in verifying and communicating interchange schedules.”

MOD-001-2:

**Requirement R1:** TOPs are not required to determine TFC or TTC; therefore, this is a conditional obligation - and there is no requirement that TOPs coordinate their methodologies. The definition of AFC explicitly includes the term “…further commercial activity…” which is explicit that this relates to commercial activity, not reliability-related activity. This requirement also has no performance elements, so there is nothing to measure against.

Requirement R1, Requirement Parts 1.1.1 thru 1.1.4 are expressly the definition of SOLs and are duplicative of the definition. Requirement Part 1.1.5 therefore adds nothing, as there is no provision for “Other SOLs.”

Requirement R1, Requirement Part 1.2.2 are Additions and retirements are Long-term planning related and would be reflected in operational models. Planned outages for the operating time horizon is expressly addressed in TOP-001-4 R9.

Requirement R1, Part 1.3: any reliability-related constraints are already expressed in OPAs and the requirements to operate within SOLs.

Requirement R1, Requirement Part 1.3.1: generation to load transfers does not, in most cases, reflect any physical arrangement. Such transfers assume a system between the two that can handle the transfer; and this system must be operated to respect SOLs.

The SDT determined that Requirement R1, Requirement Part 1.3.2 is ambiguous. There are several distribution factors; one related to outages, one related to transfers, and one related to a composite between the two. It is ambiguous to which of these distribution factors is being addressed.

**Requirement R2:** applies to TSP and Available Flowgate Capacity or Available Transfer Capability. Requirement R1 applies to TOP and Total Flowgate Capacity or Total Transfer Capacity. Otherwise, Requirement R2 is very similar to Requirement R1, and the rationale to retire Requirement R1 also applies to Requirement R2.
**Requirement R3:** CBM is defined as “The amount of firm transmission transfer capability preserved by the transmission provider for Load-Serving Entities (LSEs) whose loads are located on that Transmission Service Provider’s system to enable access by the LSEs to generation from interconnected systems to meet generation reliability requirements. Preservation of CBM for an LSE allows that entity to reduce its installed generating capacity below that which may otherwise have been necessary without interconnections to meet its generation reliability requirements. The transmission transfer capability preserved as CBM is intended to be used by the LSE only in times of emergency generation deficiencies.”

There is no obligation for a TSP to determine CBM; this requirement just applies to TSPs that elect to determine CBM. The requirement contains no criteria regarding what the CBMID must include, rather that generally describing the method.

Further, this requirement has no performance obligation, but to just to have a document; therefore, is administrative.

**Requirement R4:** The SDT vetted Requirement R4 and determined that Requirement R4 does not require TOPs to determine TRM and establish measurable criteria for what the TRMID must include. Further, R4 does not establish any criteria for the TRMID, just that the TOP that has TRM must have a document describing its methodology. Therefore, this requirement is simply administrative on an open-ended conditional duty.

**Requirement R5** and its Requirement Parts:

Requirement Part 5.1: as the TOP or TSP is not required to have a TFC or TTC methodology, or an ATCID, CBMID, or TRMID, other entities that may have a reliability-related need for these, that information is routinely pursuant to the data specifications of the RC (in INT-010-2.1) and the TOP (in TOP-003-3). In Real-time operation of the BES, the limitations related to similar issues is fully addressed by the obligations of TOP-001-4; specifically as related to operating within SOLs and IROLs and issuing and responding to Operating Instructions.

Requirement Part 5.2 and subparts: OASIS is a mechanism to assure that all market participants have simultaneous access to all market-data, such that no participant has an advantage. To provide this information to any participant via any mechanism rather that OASIS or a publicly-accessible company website becomes a FERC SOC violation.

Requirement Part 5.3 and subparts: OASIS is a mechanism to assure that all market participants have simultaneous access to all market-data, such that no participant has an advantage. To provide this information to any participant via any mechanism rather that OASIS or a publicly-accessible company website becomes a FERC SOC violation.
Requirement R6: If this data had a reliability-related need, it would be addressed via the data specifications in INT-010-2.1 (for RC) and TOP-003-3 (for TOP). However, AFC, ATC, TFC, and TTC are not mandatory to establish; thus the party requested for this data may very well not have the data to provide. Further, various TOPs or TSPs that would have these elements are not required to coordinate them, which could easily lead to widely disparate methodologies. Finally, as market-related data, this data would likely be subject to FERC Standards of Conduct, which would require that the data be publicly posted for all other market participants to access.

Brandon Gleason - Electric Reliability Council of Texas, Inc. - 2

Answer
Yes

Comment
ERCOT is not opposed to the retirement of these requirements.

<td>MOD-001-1a allows Transmission Operators to select, on the record, the methodology for computing the Available Transfer Capability in a standardized manner, which is the foundation for establishing the quantity of transmission capacity, in excess of native load needs and existing commitments, that may be sold to wholesale transmission customers in a fair and transparent fashion via Open Access Same-Time Information System (OASIS). Absent MOD-001-1a or its successor that meets the same objective, Transmission Operators may be at liberty to craft methodology to calculate ATC that may not be in alignment with the industry. This condition, if it prevails, will lead to unfair practice wherein some Transmission Operator may be held to a higher standard while others will be held to a lower standard. This, in turn, creates a less transparent environment for transmission customers to assess how Transmission Operators derive ATC.</td>
</tr>
</tbody>
</table>
Available Transfer Capability (ATC)/Available Flowgate Capability (AFC), as well as eTags, are commercially-focused elements, facilitating interchange and balancing of interchange. The Real-time system operators are ambivalent of these commercial arrangements, as they must maintain reliability of the BES according to System Operating Limits (SOLs) and Interconnection Reliability Operating Limits (IROLs). If a scheduled interchange would violate SOLs or IROLs, the Real-time operators must disregard the scheduled interchange and operate the system to its actual reliability limits. This observation is reinforced by NERC’s statement in the 2015 filing related to risk-based reliability proposing removal of the Interchange Authority from the compliance registry, where it’s stated: “NERC proposes to remove interchange authorities as functional entities, explaining that the activities of the interchange authority are commercial in nature and, thus, the removal will have little if any impact on reliability of the bulk electric system.” FERC acknowledged this in their March 15, 2015 Order, where they stated: “…we approve NERC’s proposed removal of the interchange authority as a functional entity. As explained by NERC, the interchange authority performs a commercial function, essentially quality control activity in verifying and communicating interchange schedules.”

MOD-001-2:

**Requirement R1:** TOPs are not required to determine TFC or TTC; therefore, this is a conditional obligation - and there is no requirement that TOPs coordinate their methodologies. The definition of AFC explicitly includes the term “…further commercial activity…” which is explicit that this relates to commercial activity, not reliability-related activity. This requirement also has no performance elements, so there is nothing to measure against.

Requirement R1, Requirement Parts 1.1.1 thru 1.1.4 are expressly the definition of SOLs and are duplicative of the definition. Requirement Part 1.1.5 therefore adds nothing, as there is no provision for “Other SOLs.”

Requirement R1, Requirement Part 1.2.2 are Additions and retirements are Long-term planning related and would be reflected in operational models. Planned outages for the operating time horizon is expressly addressed in TOP-001-4 R9.

Requirement R1, Part 1.3: any reliability-related constraints are already expressed in OPAs and the requirements to operate within SOLs.
Requirement R1, Requirement Part 1.3.1: generation to load transfers does not, in most cases, reflect any physical arrangement. Such transfers assume a system between the two that can handle the transfer; and this system must be operated to respect SOLs.

The SDT determined that Requirement R1, Requirement Part 1.3.2 is ambiguous. There are several distribution factors; one related to outages, one related to transfers, and one related to a composite between the two. It is ambiguous to which of these distribution factors is being addressed.

**Requirement R2**: applies to TSP and Available Flowgate Capacity or Available Transfer Capability. Requirement R1 applies to TOP and Total Flowgate Capacity or Total Transfer Capacity. Otherwise, Requirement R2 is very similar to Requirement R1, and the rationale to retire Requirement R1 also applies to Requirement R2.

**Requirement R3**: CBM is defined as “The amount of firm transmission transfer capability preserved by the transmission provider for Load-Serving Entities (LSEs) whose loads are located on that Transmission Service Provider’s system to enable access by the LSEs to generation from interconnected systems to meet generation reliability requirements. Preservation of CBM for an LSE allows that entity to reduce its installed generating capacity below that which may otherwise have been necessary without interconnections to meet its generation reliability requirements. The transmission transfer capability preserved as CBM is intended to be used by the LSE only in times of emergency generation deficiencies.”

There is no obligation for a TSP to determine CBM; this requirement just applies to TSPs that elect to determine CBM. The requirement contains no criteria regarding what the CBMID must include, rather that generally describing the method.

Further, this requirement has no performance obligation, but to just to have a document; therefore, is administrative.

**Requirement R4**: The SDT vetted Requirement R4 and determined that Requirement R4 does not require TOPs to determine TRM and establish measurable criteria for what the TRMID must include. Further, R4 does not establish any criteria for the TRMID, just that the TOP that has TRM must have a document describing its methodology. Therefore, this requirement is simply administrative on an open-ended conditional duty.

Please see response to the comments from the ISO/RTO Council Standards Review Committee.

Preston Walker - PJM Interconnection, L.L.C. - 2 - SERC,RF

PJM was heavily involved in the MOD-001-2 and NAESB WEQ-023 development efforts. PJM is neutral on the proposed retirement of MOD-001-2 but supports the position of the SER for the existing MOD standards as reliability components of congestion management are handled amongst eastern interconnect parties through various established coordination processes. PJM cautions against additional revisions to the NAESB WEQ-023 document, especially those driven by issues unique to particular seams or between specific entities, as those issues may not be realized by other parties. Therefore, blanket revisions may unnecessarily impact reliability and/or market aspects for other entities.

Thank you for your comment.
17. The SDT is proposing to withdraw Reliability Standard, MOD-001-2, which is currently pending approval by applicable governmental authorities. Do you agree with the SDT’s proposal to withdraw Reliability Standard MOD-001-2? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

Summary Response:

Available Transfer Capability (ATC)/Available Flowgate Capability (AFC), as well as eTags, are commercially-focused elements, facilitating interchange and balancing of interchange. The Real-time system operators are ambivalent of these commercial arrangements, as they must maintain reliability of the BES according to System Operating Limits (SOLs) and Interconnection Reliability Operating Limits (IROLs). If a scheduled interchange would violate SOLs or IROLs, the Real-time operators must disregard the scheduled interchange and operate the system to its actual reliability limits. This observation is reinforced by NERC’s statement in the 2015 filing related to risk-based reliability proposing removal of the Interchange Authority from the compliance registry, where it’s stated: “NERC proposes to remove interchange authorities as functional entities, explaining that the activities of the interchange authority are commercial in nature and, thus, the removal will have little if any impact on reliability of the bulk electric system.” FERC acknowledged this in their March 15, 2015 Order, where they stated: “…we approve NERC’s proposed removal of the interchange authority as a functional entity. As explained by NERC, the interchange authority performs a commercial function, essentially quality control activity in verifying and communicating interchange schedules.”

MOD-001-2:

Requirement R1: TOPs are not required to determine TFC or TTC; therefore, this is a conditional obligation - and there is no requirement that TOPs coordinate their methodologies. The definition of AFC explicitly includes the term “…further commercial activity…” which is explicit that this relates to commercial activity, not reliability-related activity. This requirement also has no performance elements, so there is nothing to measure against.

Requirement R1, Requirement Parts 1.1.1 thru 1.1.4 are expressly the definition of SOLs and are duplicative of the definition. Requirement Part 1.1.5 therefore adds nothing, as there is no provision for “Other SOLs.”

Requirement R1, Requirement Part 1.2.2 are Additions and retirements are Long-term planning related and would be reflected in operational models. Planned outages for the operating time horizon is expressly addressed in TOP-001-4 R9.
Requirement R1, Part 1.3: any reliability-related constraints are already expressed in OPAs and the requirements to operate within SOLs.

Requirement R1, Requirement Part 1.3.1: generation to load transfers does not, in most cases, reflect any physical arrangement. Such transfers assume a system between the two that can handle the transfer; and this system must be operated to respect SOLs.

The SDT determined that Requirement R1, Requirement Part 1.3.2 is ambiguous. There are several distribution factors; one related to outages, one related to transfers, and one related to a composite between the two. It is ambiguous to which of these distribution factors is being addressed.

**Requirement R2**: applies to TSP and Available Flowgate Capacity or Available Transfer Capability. Requirement R1 applies to TOP and Total Flowgate Capacity or Total Transfer Capacity. Otherwise, Requirement R2 is very similar to Requirement R1, and the rationale to retire Requirement R1 also applies to Requirement R2.

**Requirement R3**: CBM is defined as “The amount of firm transmission transfer capability preserved by the transmission provider for Load-Serving Entities (LSEs) whose loads are located on that Transmission Service Provider’s system to enable access by the LSEs to generation from interconnected systems to meet generation reliability requirements. Preservation of CBM for an LSE allows that entity to reduce its installed generating capacity below that which may otherwise have been necessary without interconnections to meet its generation reliability requirements. The transmission transfer capability preserved as CBM is intended to be used by the LSE only in times of emergency generation deficiencies.”

There is no obligation for a TSP to determine CBM; this requirement just applies to TSPs that elect to determine CBM. The requirement contains no criteria regarding what the CBMID must include, rather that generally describing the method.

Further, this requirement has no performance obligation, but to just to have a document; therefore, is administrative.

**Requirement R4**: The SDT vetted Requirement R4 and determined that Requirement R4 does not require TOPs to determine TRM and establish measurable criteria for what the TRMID must include. Further, R4 does not establish any criteria for the TRMID, just that the TOP that has TRM must have a document describing its methodology. Therefore, this requirement is simply administrative on an open-ended conditional duty.
**Requirement R5** and its Requirement Parts:
Requirement Part 5.1: as the TOP or TSP is not required to have a TFC or TTC methodology, or an ATCID, CBMID, or TRMID, other entities that may have a reliability-related need for these, that information is routinely pursuant to the data specifications of the RC (in INT-010-2.1) and the TOP (in TOP-003-3). In Real-time operation of the BES, the limitations related to similar issues is fully addressed by the obligations of TOP-001-4; specifically as related to operating within SOLs and IROLs and issuing and responding to Operating Instructions.

Requirement Part 5.2 and subparts: OASIS is a mechanism to assure that all market participants have simultaneous access to all market-data, such that no participant has an advantage. To provide this information to any participant via any mechanism rather that OASIS or a publicly-accessible company website becomes a FERC SOC violation.

Requirement Part 5.3 and subparts: OASIS is a mechanism to assure that all market participants have simultaneous access to all market-data, such that no participant has an advantage. To provide this information to any participant via any mechanism rather that OASIS or a publicly-accessible company website becomes a FERC SOC violation.

**Requirement R6:** If this data had a reliability-related need, it would be addressed via the data specifications in INT-010-2.1 (for RC) and TOP-003-3 (for TOP). However, AFC, ATC, TFC, and TTC are not mandatory to establish; thus the party requested for this data may very well not have the data to provide. Further, various TOPs or TSPs that would have these elements are not required to coordinate them, which could easily lead to widely disparate methodologies. Finally, as market-related data, this data would likely be subject to FERC Standards of Conduct, which would require that the data be publicly posted for all other market participants to access.

Thank you for your comments. Available Transfer Capability (ATC)/Available Flowgate Capability (AFC), as well as eTags, are commercially-focused elements, facilitating interchange and balancing of interchange. The Real-time system operators are ambivalent of these commercial arrangements, as they must maintain reliability of the BES according to System Operating Limits (SOLs) and Interconnection Reliability Operating Limits (IROLs). If a scheduled interchange would violate SOLs or IROLs, the Real-time operators must disregard the scheduled interchange and operate the system to its actual reliability limits. This observation is reinforced by NERC's statement in the 2015 filing related to risk-based reliability proposing removal of the Interchange Authority from the compliance registry, where it’s stated: “NERC proposes to remove interchange authorities as functional entities, explaining that the activities of the interchange authority are commercial in nature and, thus, the removal will have little if any impact on reliability of the bulk electric system.” FERC acknowledged this in their March 15, 2015 Order, where they stated: “…we approve NERC’s proposed removal of the interchange authority as a functional entity. As explained by NERC, the interchange authority performs a commercial function, essentially quality control activity in verifying and communicating interchange schedules.”

MOD-001-2:

Requirement R1: TOPs are not required to determine TFC or TTC; therefore, this is a conditional obligation - and there is no requirement that TOPs coordinate their methodologies. The definition of AFC explicitly includes the term “...further commercial activity...” which is explicit that this relates to commercial activity, not reliability-related activity. This requirement also has no performance elements, so there is nothing to measure against.

Requirement R1, Requirement Parts 1.1.1 thru 1.1.4 are expressly the definition of SOLs and are duplicative of the definition. Requirement Part 1.1.5 therefore adds nothing, as there is no provision for “Other SOLs.”

Requirement R1, Requirement Part 1.2.2 are Additions and retirements are Long-term planning related and would be reflected in operational models. Planned outages for the operating time horizon is expressly addressed in TOP-001-4 R9.

Requirement R1, Part 1.3: any reliability-related constraints are already expressed in OPAs and the requirements to operate within SOLs.

Requirement R1, Requirement Part 1.3.1: generation to load transfers does not, in most cases, reflect any physical arrangement. Such transfers assume a system between the two that can handle the transfer; and this system must be operated to respect SOLs.
The SDT determined that Requirement R1, Requirement Part 1.3.2 is ambiguous. There are several distribution factors; one related to outages, one related to transfers, and one related to a composite between the two. It is ambiguous to which of these distribution factors is being addressed.

**Requirement R2**: applies to TSP and Available Flowgate Capacity or Available Transfer Capability. Requirement R1 applies to TOP and Total Flowgate Capacity or Total Transfer Capacity. Otherwise, Requirement R2 is very similar to Requirement R1, and the rationale to retire Requirement R1 also applies to Requirement R2.

**Requirement R3**: CBM is defined as “The amount of firm transmission transfer capability preserved by the transmission provider for Load-Serving Entities (LSEs) whose loads are located on that Transmission Service Provider’s system to enable access by the LSEs to generation from interconnected systems to meet generation reliability requirements. Preservation of CBM for an LSE allows that entity to reduce its installed generating capacity below that which may otherwise have been necessary without interconnections to meet its generation reliability requirements. The transmission transfer capability preserved as CBM is intended to be used by the LSE only in times of emergency generation deficiencies.”

There is no obligation for a TSP to determine CBM; this requirement just applies to TSPs that elect to determine CBM. The requirement contains no criteria regarding what the CBMID must include, rather that generally describing the method.

Further, this requirement has no performance obligation, but to just to have a document; therefore, is administrative.

**Requirement R4**: The SDT vetted Requirement R4 and determined that Requirement R4 does not require TOPs to determine TRM and establish measurable criteria for what the TRMID must include. Further, R4 does not establish any criteria for the TRMID, just that the TOP that has TRM must have a document describing its methodology. Therefore, this requirement is simply administrative on an open-ended conditional duty.

**Requirement R5** and its Requirement Parts:
Requirement Part 5.1: as the TOP or TSP is not required to have a TFC or TTC methodology, or an ATCID, CBMID, or TRMID, other entities that may have a reliability-related need for these, that information is routinely pursuant to the data specifications of the RC (in INT-010-2.1) and the TOP (in TOP-003-3). In Real-time operation of the BES, the limitations related to similar issues is fully addressed by the obligations of TOP-001-4; specifically as related to operating within SOLs and IROLs and issuing and responding to Operating Instructions.
Requirement Part 5.2 and subparts: OASIS is a mechanism to assure that all market participants have simultaneous access to all market-data, such that no participant has an advantage. To provide this information to any participant via any mechanism rather that OASIS or a publicly-accessible company website becomes a FERC SOC violation.

Requirement Part 5.3 and subparts: OASIS is a mechanism to assure that all market participants have simultaneous access to all market-data, such that no participant has an advantage. To provide this information to any participant via any mechanism rather that OASIS or a publicly-accessible company website becomes a FERC SOC violation.

**Requirement R6:** If this data had a reliability-related need, it would be addressed via the data specifications in INT-010-2.1 (for RC) and TOP-003-3 (for TOP). However, AFC, ATC, TFC, and TTC are not mandatory to establish; thus the party requested for this data may very well not have the data to provide. Further, various TOPs or TSPs that would have these elements are not required to coordinate them, which could easily lead to widely disparate methodologies. Finally, as market-related data, this data would likely be subject to FERC Standards of Conduct, which would require that the data be publicly posted for all other market participants to access.

**Answer**

**No**
NERC petitioned FERC for approval of MOD-001-2 in February 2014. The implementation plan called for the retirement of MOD-001-1a, MOD-004-1, MOD-008-1, MOD-028-1, MOD-029-1a, and MOD-030-2. In the petition, NERC characterized the purpose of MOD-001-2 as helping to “ensure that determinations of ATC and AFC are accomplished in a manner that supports the reliable operation of the Bulk Power System.” MOD-001-2 was developed under NERC’s standard development process and was adopted by the NERC Board of Trustees. Now, five plus years after the petition was filed, and with no publicly visible action by FERC on the petition beyond a NOPR issued in June 2014, the SER drafting team is suggesting the petition for MOD-001-2 be withdrawn. It’s not clear how the Real-time operators monitoring of SOLs and IROLs helps ensure that determinations of ATC and AFC are accomplished in a manner that supports the reliable operation of the Bulk Power System. If there are no standards addressing the determinations of ATC and AFC, you can expect that Real-time operators will be dealing with more SOLs and IROLs in the future.

Southern continues to disagree with the SDT’s proposed petition for the withdrawal of MOD-001-2. Again, we believe that the combined effect of enacting MOD-001-2 while migrating MOD-001-1a, MOD-004-1, MOD-008-1, MOD-028-2, MOD-029-2a and MOD-030-3 MOD into the NAESB standards would strike an appropriate balance of addressing reliability related concerns, while incorporating any market related issues.

However, since FERC has not yet approved MOD-001-2 nor has not yet taken any action on incorporating MOD-001-1a, MOD-004-1, MOD-008-1, MOD-028-2, MOD-029-2a and MOD-030-3 and NAESB’s WEQ-23 into the current NAESB standards, Southern Company recommends delaying the retirement of those standards until they are subsequently approved by the Commission (FERC). Once approved by the Commission, the industry should have adequate time to ensure a seamless transition to the new construct.

MOD-001-1a allows Transmission Operators to select, on the record, the methodology for computing the Available Transfer Capability in a standardized manner, which is the foundation for establishing the quantity of transmission capacity, in excess of native load needs and existing commitments, that may be sold to wholesale transmission customers in a fair and transparent fashion via Open Access Same-Time Information System (OASIS). Absent MOD-001-1a or its successor that meets the same objective, Transmission Operators may be at liberty to craft methodology to calculate ATC that may not be in alignment with the industry. This condition, if it prevails, will lead to unfair practice wherein some Transmission Operator may be held to a higher standard while others...
Consideration of Comments | Project 2018-03 Standards Efficiency Retirements

April 23, 2019  399

will be held to a lower standard. This, in turn, creates a less transparent environment for transmission customers to assess how Transmission Operators derive ATC.

Thank you for your comments. Available Transfer Capability (ATC)/Available Flowgate Capability (AFC), as well as eTags, are commercially-focused elements, facilitating interchange and balancing of interchange. The Real-time system operators are ambivalent of these commercial arrangements, as they must maintain reliability of the BES according to System Operating Limits (SOLs) and Interconnection Reliability Operating Limits (IROLs). If a scheduled interchange would violate SOLs or IROLs, the Real-time operators must disregard the scheduled interchange and operate the system to its actual reliability limits. This observation is reinforced by NERC’s statement in the 2015 filing related to risk-based reliability proposing removal of the Interchange Authority from the compliance registry, where it’s stated: “NERC proposes to remove interchange authorities as functional entities, explaining that the activities of the interchange authority are commercial in nature and, thus, the removal will have little if any impact on reliability of the bulk electric system.” FERC acknowledged this in their March 15, 2015 Order, where they stated: “...we approve NERC’s proposed removal of the interchange authority as a functional entity. As explained by NERC, the interchange authority performs a commercial function, essentially quality control activity in verifying and communicating interchange schedules.”

MOD-001-2:

Requirement R1: TOPs are not required to determine TFC or TTC; therefore, this is a conditional obligation - and there is no requirement that TOPs coordinate their methodologies. The definition of AFC explicitly includes the term “…further commercial activity…” which is explicit that this relates to commercial activity, not reliability-related activity. This requirement also has no performance elements, so there is nothing to measure against.

Requirement R1, Requirement Parts 1.1.1 thru 1.1.4 are expressly the definition of SOLs and are duplicative of the definition. Requirement Part 1.1.5 therefore adds nothing, as there is no provision for “Other SOLs.”

Requirement R1, Requirement Part 1.2.2 are Additions and retirements are Long-term planning related and would be reflected in operational models. Planned outages for the operating time horizon is expressly addressed in TOP-001-4 R9.
Requirement R1, Part 1.3: any reliability-related constraints are already expressed in OPAs and the requirements to operate within SOLs.

Requirement R1, Requirement Part 1.3.1: generation to load transfers does not, in most cases, reflect any physical arrangement. Such transfers assume a system between the two that can handle the transfer; and this system must be operated to respect SOLs.

The SDT determined that Requirement R1, Requirement Part 1.3.2 is ambiguous. There are several distribution factors; one related to outages, one related to transfers, and one related to a composite between the two. It is ambiguous to which of these distribution factors is being addressed.

Requirement R2: applies to TSP and Available Flowgate Capacity or Available Transfer Capability. Requirement R1 applies to TOP and Total Flowgate Capacity or Total Transfer Capacity. Otherwise, Requirement R2 is very similar to Requirement R1, and the rationale to retire Requirement R1 also applies to Requirement R2.

Requirement R3: CBM is defined as “The amount of firm transmission transfer capability preserved by the transmission provider for Load-Serving Entities (LSEs) whose loads are located on that Transmission Service Provider’s system to enable access by the LSEs to generation from interconnected systems to meet generation reliability requirements. Preservation of CBM for an LSE allows that entity to reduce its installed generating capacity below that which may otherwise have been necessary without interconnections to meet its generation reliability requirements. The transmission transfer capability preserved as CBM is intended to be used by the LSE only in times of emergency generation deficiencies.”

There is no obligation for a TSP to determine CBM; this requirement just applies to TSPs that elect to determine CBM. The requirement contains no criteria regarding what the CBMID must include, rather that generally describing the method.

Further, this requirement has no performance obligation, but to just to have a document; therefore, is administrative.

Requirement R4: The SDT vetted Requirement R4 and determined that Requirement R4 does not require TOPs to determine TRM and establish measurable criteria for what the TRMID must include. Further, R4 does not establish any criteria for the TRMID, just that the TOP that has TRM must have a document describing its methodology. Therefore, this requirement is simply administrative on an open-ended conditional duty.
Consideration of Comments | Project 2018-03 Standards Efficiency Retirements
April 23, 2019

**Requirement R5** and its Requirement Parts:
Requirement Part 5.1: as the TOP or TSP is not required to have a TFC or TTC methodology, or an ATCID, CBMID, or TRMID, other entities that may have a reliability-related need for these, that information is routinely pursuant to the data specifications of the RC (in INT-010-2.1) and the TOP (in TOP-003-3). In Real-time operation of the BES, the limitations related to similar issues is fully addressed by the obligations of TOP-001-4; specifically as related to operating within SOLs and IROLs and issuing and responding to Operating Instructions.

Requirement Part 5.2 and subparts: OASIS is a mechanism to assure that all market participants have simultaneous access to all market-data, such that no participant has an advantage. To provide this information to any participant via any mechanism rather than OASIS or a publicly-accessible company website becomes a FERC SOC violation.

Requirement Part 5.3 and subparts: OASIS is a mechanism to assure that all market participants have simultaneous access to all market-data, such that no participant has an advantage. To provide this information to any participant via any mechanism rather than OASIS or a publicly-accessible company website becomes a FERC SOC violation.

**Requirement R6:** If this data had a reliability-related need, it would be addressed via the data specifications in INT-010-2.1 (for RC) and TOP-003-3 (for TOP). However, AFC, ATC, TFC, and TTC are not mandatory to establish; thus the party requested for this data may very well not have the data to provide. Further, various TOPs or TSPs that would have these elements are not required to coordinate them, which could easily lead to widely disparate methodologies. Finally, as market-related data, this data would likely be subject to FERC Standards of Conduct, which would require that the data be publicly posted for all other market participants to access.

18. **The SDT is proposing to retire MOD-020-0, Requirement R1 (all). Do you agree with the SDT’s proposal to retire MOD-020-0? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.**

**Summary Response:**

Available Transfer Capability (ATC)/Available Flowgate Capability (AFC), as well as eTags, are commercially-focused elements, facilitating interchange and balancing of interchange. The Real-time system operators are ambivalent of these commercial arrangements, as they must maintain reliability of the BES according to System Operating Limits (SOLs) and Interconnection Reliability Operating Limits (IROLs). If a scheduled interchange would violate SOLs or IROLs, the Real-time operators must disregard the scheduled interchange and operate the system to its actual reliability limits. This observation is reinforced by NERC’s statement in the 2015 filing related to risk-based reliability proposing removal of the Interchange Authority from the compliance registry, where it’s stated: “NERC proposes to remove interchange authorities as functional entities, explaining that the activities of the interchange authority are commercial in nature and, thus, the removal will have little if any impact on reliability of the bulk electric system.” FERC acknowledged this in their March 15, 2015 Order, where they stated: “…we approve NERC’s proposed removal of the interchange authority as a functional entity. As explained by NERC, the interchange authority performs a commercial function, essentially quality control activity in verifying and communicating interchange schedules.”

**MOD-001-2:**

**Requirement R1:** TOPs are not required to determine TFC or TTC; therefore, this is a conditional obligation - and there is no requirement that TOPs coordinate their methodologies. The definition of AFC explicitly includes the term “…further commercial activity…” which is explicit that this relates to commercial activity, not reliability-related activity. This requirement also has no performance elements, so there is nothing to measure against.

Requirement R1, Requirement Parts 1.1.1 thru 1.1.4 are expressly the definition of SOLs and are duplicative of the definition. Requirement Part 1.1.5 therefore adds nothing, as there is no provision for “Other SOLs.”

Requirement R1, Requirement Part 1.2.2 are Additions and retirements are Long-term planning related and would be reflected in operational models. Planned outages for the operating time horizon is expressly addressed in TOP-001-4 R9.
Requirement R1, Part 1.3: any reliability-related constraints are already expressed in OPAs and the requirements to operate within SOLs.

Requirement R1, Requirement Part 1.3.1: generation to load transfers does not, in most cases, reflect any physical arrangement. Such transfers assume a system between the two that can handle the transfer; and this system must be operated to respect SOLs.

The SDT determined that Requirement R1, Requirement Part 1.3.2 is ambiguous. There are several distribution factors; one related to outages, one related to transfers, and one related to a composite between the two. It is ambiguous to which of these distribution factors is being addressed.

**Requirement R2:** applies to TSP and Available Flowgate Capacity or Available Transfer Capability. Requirement R1 applies to TOP and Total Flowgate Capacity or Total Transfer Capacity. Otherwise, Requirement R2 is very similar to Requirement R1, and the rationale to retire Requirement R1 also applies to Requirement R2.

**Requirement R3:** CBM is defined as “The amount of firm transmission transfer capability preserved by the transmission provider for Load-Serving Entities (LSEs) whose loads are located on that Transmission Service Provider’s system to enable access by the LSEs to generation from interconnected systems to meet generation reliability requirements. Preservation of CBM for an LSE allows that entity to reduce its installed generating capacity below that which may otherwise have been necessary without interconnections to meet its generation reliability requirements. The transmission transfer capability preserved as CBM is intended to be used by the LSE only in times of emergency generation deficiencies.”

There is no obligation for a TSP to determine CBM; this requirement just applies to TSPs that elect to determine CBM. The requirement contains no criteria regarding what the CBMID must include, rather that generally describing the method.

Further, this requirement has no performance obligation, but to just to have a document; therefore, is administrative.

**Requirement R4:** The SDT vetted Requirement R4 and determined that Requirement R4 does not require TOPs to determine TRM and establish measurable criteria for what the TRMID must include. Further, R4 does not establish any criteria for the TRMID, just that the TOP that has TRM must have a document describing its methodology. Therefore, this requirement is simply administrative on an open-ended conditional duty.
**Requirement R5** and its Requirement Parts:

Requirement Part 5.1: as the TOP or TSP is not required to have a TFC or TTC methodology, or an ATCID, CBMID, or TRMID, other entities that may have a reliability-related need for these, that information is routinely pursuant to the data specifications of the RC (in INT-010-2.1) and the TOP (in TOP-003-3). In Real-time operation of the BES, the limitations related to similar issues is fully addressed by the obligations of TOP-001-4; specifically as related to operating within SOLs and IROLs and issuing and responding to Operating Instructions.

Requirement Part 5.2 and subparts: OASIS is a mechanism to assure that all market participants have simultaneous access to all market-data, such that no participant has an advantage. To provide this information to any participant via any mechanism rather than OASIS or a publicly-accessible company website becomes a FERC SOC violation.

Requirement Part 5.3 and subparts: OASIS is a mechanism to assure that all market participants have simultaneous access to all market-data, such that no participant has an advantage. To provide this information to any participant via any mechanism rather than OASIS or a publicly-accessible company website becomes a FERC SOC violation.

**Requirement R6:** If this data had a reliability-related need, it would be addressed via the data specifications in INT-010-2.1 (for RC) and TOP-003-3 (for TOP). However, AFC, ATC, TFC, and TTC are not mandatory to establish; thus the party requested for this data may very well not have the data to provide. Further, various TOPs or TSPs that would have these elements are not required to coordinate them, which could easily lead to widely disparate methodologies. Finally, as market-related data, this data would likely be subject to FERC Standards of Conduct, which would require that the data be publicly posted for all other market participants to access.

**Jodirah Green - ACES Power Marketing - 1,3,4,5,6 - MRO,WECC,Texas RE,SERC,RF, Group Name** ACES Standard Collaborations

<table>
<thead>
<tr>
<th>Answer</th>
<th>Yes</th>
</tr>
</thead>
</table>

**Comment**

Although ACES agrees with the retirement of this Standard, the technical justifications for retirement of requirement 1 requires additional clarification as it creates confusions. More specifically, SAR suggests a different justification than what was provided in slides versus slide 17 from the Industry Webinar which was held on 3/21/19 Outreach Webinar.

<tr>
<td>PJM was heavily involved in the MOD-001-2 and NAESB WEQ-023 development efforts. PJM is neutral on the proposed retirement of MOD-001-2 but supports the position of the SER for the existing MOD standards as reliability components of congestion management are handled amongst eastern interconnect parties through various established coordination processes. PJM cautions against additional revisions to the NAESB WEQ-023 document, especially those driven by issues unique to particular seams or between specific entities, as those issues may not be realized by other parties. Therefore, blanket revisions may unnecessarily impact reliability and/or market aspects for other entities.</td>

19. The SDT is proposing to retire PRC-004-5(i), Requirement R4. Do you agree with the SDT’s proposal to retire Requirement R4 of PRC-004-5(i)? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

Summary Response:

The SDT received comments stating that the retirement of PRC-004-5(i) Requirement R4 could potentially burden the entity with an open item, with no closing date, hoping that a new technological break-through will finally determine the cause of misoperation. PRC-004 is subject to a quarterly NERC Rules of Procedure Section 1600 data submittal. All regions subject the quarterly data to a peer review of submittals, which then has the opportunity to further question the entity if needed.

The retirement of PRC-004-5(i) could potentially burden the entity with an open item, with no closing date, hoping that a new technological break-through will finally determine the cause of misoperation. We believe entities will simply declare that no cause for the misoperation was identified and be done with it.

If R4 is retired, one or both of the following approaches will likely be taken by entities:

- Delaying formal declaration of a misoperation for all disturbances until the root cause is identified or until 120 days expires.
- Declaring the cause for a greater percentage of misoperations as “unknown” and not performing the detailed testing to find the true root cause for an issue that is intermittent.

This is not beneficial to the goal of reliability improvements and reduced misoperations.
We recommend that the SDT consider how the ability to declare that “no cause of a misoperation was identified” be retained within the standard to document the end of an investigation. We are concerned that the removal of the ability to declare that no cause of a misoperation was identified may result in audit and compliance concerns.

Brandon Gleason - Electric Reliability Council of Texas, Inc. - 2

Answer  No

Document Name

Comment

ERCOT does not support the outright retirement of PRC-004-5(i), Requirement R4 because to do so would eliminate the requirement to investigate in its entirety. However, ERCOT agrees that the Requirement as written may impose unnecessary burden by requiring repeated investigations despite the potential inability of a Transmission Owner, Generator Owner, or Distribution Provider to identify the cause(s) of a Misoperation.

Anthony Jablonski - ReliabilityFirst - 10

Answer  No
<table>
<thead>
<tr>
<th>Document Name</th>
<th>Project 2018-03 PRC-004-6 R4 Comments.docx</th>
</tr>
</thead>
<tbody>
<tr>
<td>Comment</td>
<td>ReliabilityFirst does not agree with the removal of PRC-004-6 Requirement R4 for the following reason:</td>
</tr>
</tbody>
</table>

The concept of a declaration for no identifiable cause is currently introduced in R4 and in the Application Guidelines (now called Supplemental Material) for R4. The one statement from the Application Guidelines for R4 in version 5(i) states,

‘The entity’s investigation is complete when it identifies the cause of the Misoperation or makes a declaration that no cause was determined. The declaration is intended to be used if the entity determines that investigative actions have been exhausted or have not provided direction for identifying the Misoperation cause. Historically, approximately 12% of Misoperations are unknown or unexplainable.’

This statement needs to be retained somewhere as an explanation for this use of the declaration. The declaration is also referenced in R5, but for a different reason (problem found but CAP won’t improve reliability of BES). The declaration associated with R4 would be a cause that is ‘unknown/unexplainable’ and all testing and analysis comes up empty. There wouldn’t be a CAP, since nothing was found broken, and the declaration is used to close the investigation. In MIDAS, the CAP Completion Status would be ‘declaration’ rather than improperly coding as ‘CAP – Complete’, since no CAP was developed.

As far as the administrative requirement of ‘corrective action at least once every two calendar quarters’, ReliabilityFirst recommends the following for consideration (see attached as well for redline of requirement):

R4:

Each Transmission Owner, Generator Owner, and Distribution Provider that has not determined the cause(s) of a Misoperation, for a Misoperation identified in accordance with Requirement R1 or R3, shall perform investigative action(s) to determine the cause(s) of the Misoperation [maintaining documentation in sufficient detail to provide clear delineation of the stage and findings of the investigation] until one of the following completes the investigation: [Violation Risk Factor: High] [Time Horizon: Operations Assessment, Operations Planning]

☐ The identification of the cause(s) of the Misoperation; or
A declaration that no cause was identified.

Thomas Foltz - AEP - 5

Answer No

Rule Name

Comment

AEP does not agree that PRC-004-5(i) R4 meets the drafting team’s “Evaluation Criteria for Retiring Reliability Standards Requirements”, as the declaration of “no cause found” is made only within this obligation (i.e. “is not redundant”). Regarding the reliability rationale, we would agree that not all investigative actions in and of themselves improve reliability, however the ability to track investigative actions over an extended period of time ensures more rigor is applied to the investigative progress.

Reclamation supports the retirement of PRC-004-5(i) Requirement R4. Reclamation recommends PRC-004-5(i) Requirement R5 be split into two requirements: one to develop a corrective action plan or explain in a declaration why corrective actions are beyond the entity’s control or would not improve BES reliability, and that no further corrective actions will be taken; and one to evaluate the corrective action plan for applicability to the entity’s other Protection Systems including other locations.

Response
Thank you for your comment. PRC-004-5(i) Requirement R5 is out of the scope of this project.

Glen Farmer - Avista - Avista Corporation - 5
Answer Yes

we are concerned that simply retiring this requirement could create some unintended negative consequences. As it is well understood, not all misoperations can be definitively determined no matter how detailed or thorough the investigation. It is for this reason that earlier SDTs included in Requirement R4 the ability to declare that no cause could be determine as part of the Misoperation Identification and Correction process. It is also noteworthy to mention that Requirement R4 is the only requirement within this standard that allows such a declaration. Therefore, care will be needed when retiring Requirement R4 to ensure that language is added to the standard to ensure this important ability and right held by TOs, GOs and DPs is not lost. To better understand this concern, EEI suggests that a thorough review of the flowchart (see R4) on Page 36 of PRC-004-5(i) is conducted by the responsible SDT.”

Response

</thead>
</table>

**Comment**

NV Energy agrees that the investigative actions conducted for Misoperations do not directly improve BES reliability, and thus Requirement R4 should be retired. However, Entities are still required to provide quarterly reports to MIDAS on misoperation types and causes, thus investigation is still a necessary part of this Standard. So, to capture this supplemental administrative requirement, NV Energy would recommend the SDT to modify R5 to include a situation where the cause of the Misoperations is unknown, which is an allowable entry for cause in MIDAS. We don’t think it is clear that the unknown cause can be described in the current language in R5. It is still unclear if an R5 declaration within a CAP that the actions are beyond the entities control can be tied to an "unknown" cause. Given that the R5 "60-day time requirement" starts when the cause is identified, but if the cause is unknown, when does that clock start? If the
current wording in R5 remains intact, entities can technically stop at R3 for Misoperations that it has not identified a cause. We do not believe that this is the intent of the standard.

If this clarity is not provided, there is a potential that when auditing the Requirement, one can determine that a cause must be identified, if there is no clear requirement that allows a cause of "unknown" to be declared.

Avista concurs with EEI comments: “EEI supports the retirement of PRC-004-5(i), Requirement R4; however, we are concerned that simply retiring this requirement could create some unintended negative consequences. As it is well understood, not all misoperations can be definitively determined no matter how detailed or thorough the investigation. It is for this reason that earlier SDTs included in Requirement R4 the ability to declare that no cause could be determined as part of the Misoperation Identification and Correction process. It is also noteworthy to mention that Requirement R4 is the only requirement within this standard that allows such a declaration. Therefore, care will be needed when retiring Requirement R4 to ensure that language is added to the standard to ensure this important ability and right held by TOs, GOs and DPs is not lost. To better understand this concern, EEI suggests that a thorough review of the flowchart (see R4) on Page 36 of PRC-004-5(i) is conducted by the responsible SDT.”

</thead>
<tbody>
<tr>
<td></td>
<td>MEC agrees with the SDT that investigative actions for Misoperations do not improve reliability. Therefore, we are prepared to support the SDT’s draft revision to retire R4.</td>
</tr>
</tbody>
</table>

We would also like the drafting team to modify R5 to include a situation where the cause of the Misoperations is unknown. We don’t believe it is clear that the unknown cause can be described in the R5 declaration that the CAP is beyond the entities control. The R5 60 day time requirement starts when the cause is identified. How do you start the clock to develop the CAP if the cause is unknown? The R5 declaration is after this time requirement in the standard. If the current wording in R5 remains intact, entities can technically stop at R3 for Misoperations that it has not identified a cause. I do not think this is the intent of the standard.

Another issue is that an auditor can determine that a cause must be identified if there is no clear requirement that allows a cause known declaration. There are some Misoperations (very few) where the Protection Engineer will not be able to determine a cause. The is why MIDAS has a cause unknown option.

See the PRC-004-5i flowchart and how you jump from R3 to R5 if R4 is removed.

**Response**

Thank you for your comments. PRC-004 is subject to a quarterly NERC Rules of Procedure Section 1600 data submittal. All regions submit the quarterly data to a peer review group, which then has the opportunity to further question the entity if needed. Requirement R5 is out of scope for this project.

Chris Scanlon - Exelon - 1

**Answer**

**Document Name**

**Comment**

On behalf of Exelon, Segments 1, 3, 5, 6

- On Page 23 of 32 of the posted, proposed “clean” version of PRC-004-6, the sentence:

  “Once a Misoperation is identified in either Requirement R1 or R3, and the applicable entity did not identify the cause(s) of the Misoperation, the time period for performing at least one investigative action every two full calendar quarters begins.”

This sentence references the required actions in Requirement R4 of the Standard, which is to be retired. Recommend this sentence be deleted.

- On Page 24 of 32 of the posted, proposed “clean” version of PRC-004-6, in the second to the last paragraph, the phrase “under Requirement R4”. Recommend this phrase be deleted.
On Page 32 of the posted, proposed “clean” version of PRC-004-6, in the Flowchart, the area of the Flowchart leading into R5, the box labeled “Cause Known?” has only a path into R5. The Standard must still provide the option to end an investigation with no cause found.

Recommend:

- For a Misoperation with no cause found, the flowchart should also point from “Cause Unknown?” to the “Stop” circle to the left.
- Add “Yes” to the existing path from “Cause Unknown?” to R5, and “No” to the new path to “Stop”.

**Response**

Thank you for your comments. The SDT has updated the standard based on comments received. Please see the redline version of the standard’s flowchart on the [project page](#) that demonstrates how an entity proceeds from R3 to R5.
20. The SDT is proposing to retire TOP-001-4, Requirements R19 and R22. Do you agree with the SDT’s proposal to retire Requirements R19 and R22 of TOP-001-4? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

Summary Response:

The SDT received comments indicating concern that if TOP-001-4, Requirements R19 and R22 were retired, Transmission Operators may not put emphasis specifically on having data exchange capabilities with the entities they have identified it needs data from to perform its Operational Planning Analyses and that Balancing Authorities may not put emphasis specifically on having data exchange capabilities with the entities it has identified it needs data from to perform its Operating Plan for next-day operations. The data exchange capabilities that are indicated in TOP-001-4, Requirements R19 and R22 for the Operation Planning Analysis are inherent to Requirement R20 and R23 that actually has a higher Violation Risk Factor and is clearly tied to the Operation Planning Analysis in TOP-003-3 Requirements R1, R2, R3, R4 and R5. The data exchange capabilities are indicated in TOP-003-3, Requirement R1, R2, R3, R4, R5, which includes BAs and TOPs and TOP-002-4, Requirements R1, R2 and R4 to perform the OPA, which makes TOP-001-4 R19 and R22 redundant with the aforementioned standards and requirements. The purpose statement of TOP-003-3 is “To ensure that the Transmission Operator and Balancing Authority have data needed to fulfill their operational and planning responsibilities”. The purpose statement of TOP-002-4 is “To ensure that transmission Operators and Balancing Authorities have plans for operating within specified limits” using the data collected per TOP-003-3 and ensure each BA and TOP have plans to operate within specified limits using the data provided in TOP-003-3. The requirements in TOP-001-4 satisfy the obligations of identifying the data required and means for delivering the data for the Operational Planning Analysis Real-time monitoring, and Real-time Assessments. This data exchange is accomplished via a redundant/secure Inter Control Center Communication Protocol (ICCP) that all RC’s, BA’s TOP’s use to exchange the required data.

Texas RE is concerned that if TOP-001-4 Requirements R19 was eliminated, Transmission Operators may not put emphasis specifically on having data exchange capabilities with the entities they have identified it needs data from to perform its Operational Planning Analyses.

Texas RE is concerned that if TOP-001-4 Requirements R22 was eliminated, Balancing Authorities may not put emphasis specifically on having data exchange capabilities with the entities it has identified it needs data from to perform its Operating Plan for next-day operations.

Response

Thank you for your comments. The data exchange capabilities that are indicated in TOP-001-4, Requirements R19 and R22 for the Operation Planning Analysis are inherent to Requirement R20 and R23 that actually has a higher Violation Risk Factor and is clearly tied to the Operation Planning Analysis in TOP-003-3 Requirements R1, R2, R3, R4 and R5. The data exchange capabilities are indicated in TOP-003-3, Requirement R1, R2, R3, R4, R5, which includes BAs and TOPs and TOP-002-4, Requirements R1, R2 and R4 to perform the OPA, which makes TOP-001-4 R19 and R22 redundant with the aforementioned standards and requirements. The purpose statement of TOP-003-3 is “To ensure that the Transmission Operator and Balancing Authority have data needed to fulfill their operational and planning responsibilities”. The purpose statement of TOP-002-4 is “To ensure that transmission Operators and Balancing Authorities have plans for operating within specified limits” using the data collected per TOP-003-3 and ensure each BA and TOP have plans to operate within specified limits using the data provided in TOP-003-3. The requirements in TOP-001-4 satisfy the obligations of identifying the data required and means for delivering the data for the Operational Planning Analysis Real-time monitoring, and Real-time Assessments. This data exchange is accomplished via a redundant/secure Inter Control Center Communication Protocol (ICCP) that all RC’s, BA’s TOP’s use to exchange the required data.

Marsha Morgan - Southern Company - Southern Company Services, Inc. - 1,3,5,6 - SERC, Group Name Southern Company

Answer

Yes

Document Name

Comment
In regard to R19, this requirement is only administrative in nature as an entity must demonstrate that it has the ability to exchange data with all entities that it provides and receives information from to perform its monitoring and assessments, to include operational planning before it can be certified to perform the TOP function. In addition, TOP entities are on a 3-year audit cycle and in which the entity’s data exchange capabilities with other entities are reviewed.

In regard to R22, this requirement is only administrative in nature as an entity must demonstrate that it has the ability to exchange data with all entities that it provides and receives information from to perform its monitoring and assessments before it can be certified to perform the BA function. In addition, BA entities are on a 3-year audit cycle in which the entity’s data exchange capabilities with other entities are reviewed.

**Answer**

Yes

**Document Name**

**Comment**
Having data exchange capabilities does not add a reliability benefit. Something must be done with the data in order to impact reliability. The authority to request and do something with the data is adequately covered in TOP-003-3.

**Response**

Thank you for your support.
21. The SDT is proposing to retire VAR-001-5, Requirement R2. Do you agree with the SDT’s proposal to retire Requirement R2 of VAR-001-5? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

Summary Response:

The SDT determined Requirement R2 should be retired for the following reasons:

VAR-001-5, Requirement R2 states “Each Transmission Operator shall schedule sufficient reactive resources to regulate voltage levels under normal and Contingency conditions. Transmission Operators can provide sufficient reactive resources through various means including, but not limited to, reactive generation scheduling, transmission line and reactive resource switching, and using controllable load”

VAR-001-5 R2 contains two sentences, with the first sentence being a requirement and the second being a guidance statement. Each sentence is analyzed separately. The first sentence requires the TOP to schedule sufficient reactive resources to regulate voltage levels under normal and contingency conditions. By using the Operational Planning Assessment as described and required in TOP-002-4 and the criteria described in TOP-001-4, R10 the TOP must use a variety of tools to regulate voltage levels, including reactive control. Using Real-time Contingency Analysis tools allows the TOP to determine specific actions to regulate voltage during contingency conditions. Using Real-time monitoring and making real-time decisions on voltage is duplicative with the existing requirements in the TOP-001-4 and TOP-002-4, which direct the TOP to plan and operate within in SOL values, which includes system voltage limits. TOP-002-4, Requirement R1 requires an OPA to be completed to ensure no SOL is violated, and TOP-001-4, Requirement R10 provides the criteria that the TOP shall use for determining SOL exceedances, which includes monitoring voltages. If an SOL violation is identified, then the TOP shall have an Operating Plan to mitigate the violation. TOP-001-4 and TOP-002-4 requirements direct the TOP to maintain reliability of the BES and to mitigate SOL exceedances. If the TOP identifies no SOLs, voltage or otherwise, then the TOP has enough resources "scheduled" to maintain reliability of its BES. The remaining VAR-001-4.2 requirements ensure that a TOP ensures voltage, reactive flows, and reactive resources are monitored, controlled, and maintained with limits. The FAC family of standards ensure the proper BES Facilities and/or Elements are built with applicable equipment and system ratings.

Specifically,
1. TOP-002-4 - Operations Planning with an effective date of April 1, 2017

Requirement 1 of this standard requires the TOP to have an Operational Planning Analysis that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any of its System Operating Limits (SOLs). Requirement 2 requires the TOP to have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1.

An Operating Plan is defined by NERC as “A document that identifies a group of activities that may be used to achieve some goal. An Operating Plan may contain Operating Procedures and Operating Processes. A company-specific system restoration plan that includes an Operating Procedure for black-starting units, Operating Processes for communicating restoration progress with other entities, etc., is an example of an Operating Plan.”

In order to mitigate SOL exceedances, or to address potential SOL exceedances, the TOP must have a variety of tools available to immediately address such condition. One such tool are reactive resources. The TOP MUST have an adequate number of reactive resources to mitigate any potential or actual SOL exceedance. The adequate number is determined through analysis.

2. TOP-001-4 – Transmission Operations with an effective date of July 1, 2018

Requirement 13 requires each TOP to ensure a Real-time Assessment is performed at least once every 30 minutes and Requirement 14 requires the TOP to initiate its Operating Plan to mitigate a SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment.

This is a requirement that the TOP have an Operating Plan to mitigate SOL exceedances. The same requirement of the TOP exists here as it did under TOP-002-4. The TOP MUST have an adequate number of reactive resources to mitigate SOL exceedances. The adequate number is determined through analysis.

The second sentence of VAR-001-5 R2 states “Transmission Operators can provide sufficient reactive resources through various means including, but not limited to, reactive generation scheduling, transmission line and reactive resource switching, and using controllable load.” As noted by the Enhanced Periodic Review group during its September 2016 meeting and agreed to herein, this language is guidance or a measure and is unnecessary in the requirement. It was suggested then that perhaps this language be moved to a guidance section or document.

Kim Thomas - Duke Energy - 1,3,5,6 - FRCC,SERC,RF, Group Name Duke Energy

Answer No
<table>
<thead>
<tr>
<th>Document Name</th>
<th>Comment</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Duke Energy disagrees with the drafting team’s proposal to retire VAR-001-5 R2. This requirement ensures that Operators have the necessary reactive resources they need to provide voltage control. Eliminating this requirement would take away an Operators ability to justify keeping a reactive resource in service and potentially negatively impact the reliability of the grid.</td>

**Document Name**

**Comment**

Idaho Power disagrees with the proposed retirement for VAR-001-5 R5 because, while it is difficult to provide evidence for, the requirement for scheduling sufficient reactive resources is important.

| Likes | 0 |
| Dislikes | 0 |

**Response**

Thank you for your comment. The SDT determined Requirement R2 should be retired for the following reasons:

VAR-001-5, Requirement R2 states “Each Transmission Operator shall schedule sufficient reactive resources to regulate voltage levels under normal and Contingency conditions. Transmission Operators can provide sufficient reactive resources through various means including, but not limited to, reactive generation scheduling, transmission line and reactive resource switching, and using controllable load”

VAR-001-5 R2 contains two sentences, with the first sentence being a requirement and the second being a guidance statement. Each sentence is analyzed separately. The first sentence requires the TOP to schedule sufficient reactive resources to regulate voltage levels under normal and contingency conditions. By using the Operational Planning Assessment as described and required in TOP-002-4 and the criteria described in TOP-001-4, the TOP must use a variety of tools to regulate voltage levels, including reactive control. Using Real-time Contingency Analysis tools allows the TOP to determine specific actions to regulate voltage during contingency conditions. Using Real-time monitoring and making real-time decisions on voltage is duplicative with the existing requirements in the TOP-001-4 and TOP-002-4, which direct the TOP to plan and operate within in SOL values, which includes system voltage limits. TOP-002-4, Requirement R1 requires an OPA to be completed to ensure no SOL is violated, and TOP-001-4, Requirement R10 provides the criteria that the TOP shall
use for determining SOL exceedances, which includes monitoring voltages. If an SOL violation is identified, then the TOP shall have an Operating Plan to mitigate the violation. TOP-001-4 and TOP-002-4 requirements direct the TOP to maintain reliability of the BES and to mitigate SOL exceedances. If the TOP identifies no SOLs, voltage or otherwise, then the TOP has enough resources "scheduled" to maintain reliability of its BES. The remaining VAR-001-4.2 requirements ensure that a TOP ensures voltage, reactive flows, and reactive resources are monitored, controlled, and maintained with limits. The FAC family of standards ensure the proper BES Facilities and/or Elements are built with applicable equipment and system ratings.

Specifically,

5. TOP-002-4 - Operations Planning with an effective date of April 1, 2017

Requirement 1 of this standard requires the TOP to have an Operational Planning Analysis that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any of its System Operating Limits (SOLs). Requirement 2 requires the TOP to have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1.

An Operating Plan is defined by NERC as “A document that identifies a group of activities that may be used to achieve some goal. An Operating Plan may contain Operating Procedures and Operating Processes. A company-specific system restoration plan that includes an Operating Procedure for black-starting units, Operating Processes for communicating restoration progress with other entities, etc. is an example of an Operating Plan.”

In order to mitigate SOL exceedances, or to address potential SOL exceedances, the TOP must have a variety of tools available to immediately address such condition. One such tool are reactive resources. The TOP MUST have an adequate number of reactive resources to mitigate any potential or actual SOL exceedance. The adequate number is determined through analysis.

6. TOP-001-4 – Transmission Operations with an effective date of July 1, 2018

Requirement 13 requires each TOP to ensure a Real-time Assessment is performed at least once every 30 minutes and Requirement 14 requires the TOP to initiate its Operating Plan to mitigate a SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment.

This is a requirement that the TOP have an Operating Plan to mitigate SOL exceedances. The same requirement of the TOP exists here as it did under TOP-002-4. The TOP MUST have an adequate number of reactive resources to mitigate SOL exceedances. The adequate number is determined through analysis.
The second sentence of VAR-001-5 R2 states “Transmission Operators can provide sufficient reactive resources through various means including, but not limited to, reactive generation scheduling, transmission line and reactive resource switching, and using controllable load.” As noted by the Enhanced Periodic Review group during its September 2016 meeting and agreed to herein, this language is guidance or a measure and is unnecessary in the requirement. It was suggested then that perhaps this language be moved to a guidance section or document.

Ensuring that an entity has sufficient reactive resources to regulate voltage levels under both normal and contingency conditions is an inherent function of the TOP, and although having a standard requirement may add some reinforcement, it does not necessarily add to reliability. If the TOP fails to provide adequate reactive resources to regulate voltage, it could lead to voltage collapse, damage to equipment, system overloads and blackouts. (All of which are covered in other NERC Reliability Standards). Having this standard requirement in place places an administrative burden on the TOP and takes their time away from operating the transmission system.

ERCOT is not opposed to the retirement of this requirement.

Thank you for your comment.

Rachel Coyne - Texas Reliability Entity, Inc. - 10

Answer

Document Name

Comment

Texas RE is concerned that without VAR-001-5 Requirement R2, Transmission Operators may not put emphasis on scheduling sufficient reactive resources to regulate voltage levels. This could lead to voltage collapse. Additionally, the SDT is relying on the fact that voltage limit is a form of an SOL. Since there is no definition of SOL exceedance, entities may not adequately address voltage issues within the OPA, whereas this requirement emphasizes regulating voltage levels.

Texas RE recommends removing the reference to “Compliance Monitor” in C1.2 Data Retention. Compliance Monitor is an outdated term and there is no definition for it.

Dislikes 0

Response
Thank you for your comment. The SDT determined Requirement R2 should be retired for the following reasons:

VAR-001-5, Requirement R2 states “Each Transmission Operator shall schedule sufficient reactive resources to regulate voltage levels under normal and Contingency conditions. Transmission Operators can provide sufficient reactive resources through various means including, but not limited to, reactive generation scheduling, transmission line and reactive resource switching, and using controllable load”

VAR-001-5 R2 contains two sentences, with the first sentence being a requirement and the second being a guidance statement. Each sentence is analyzed separately. The first sentence requires the TOP to schedule sufficient reactive resources to regulate voltage levels under normal and contingency conditions. By using the Operational Planning Assessment as described and required in TOP-002-4 and the
criteria described in TOP-001-4, R10 the TOP must use a variety of tools to regulate voltage levels, including reactive control. Using Real-time Contingency Analysis tools allows the TOP to determine specific actions to regulate voltage during contingency conditions. Using Real-time monitoring and making real-time decisions on voltage is duplicative with the existing requirements in the TOP-001-4 and TOP-002-4, which direct the TOP to plan and operate within in SOL values, which includes system voltage limits. TOP-002-4, Requirement R1 requires an OPA to be completed to ensure no SOL is violated, and TOP-001-4, Requirement R10 provides the criteria that the TOP shall use for determining SOL exceedances, which includes monitoring voltages. If an SOL violation is identified, then the TOP shall have an Operating Plan to mitigate the violation. TOP-001-4 and TOP-002-4 requirements direct the TOP to maintain reliability of the BES and to mitigate SOL exceedances. If the TOP identifies no SOLs, voltage or otherwise, then the TOP has enough resources "scheduled" to maintain reliability of its BES. The remaining VAR-001-4.2 requirements ensure that a TOP ensures voltage, reactive flows, and reactive resources are monitored, controlled, and maintained with limits. The FAC family of standards ensure the proper BES Facilities and/or Elements are built with applicable equipment and system ratings.

Specifically,

7. TOP-002-4 - Operations Planning with an effective date of April 1, 2017

   Requirement 1 of this standard requires the TOP to have an Operational Planning Analysis that will allow it to assess whether its planned operations for the next day within its Transmission Operator Area will exceed any of its System Operating Limits (SOLs). Requirement 2 requires the TOP to have an Operating Plan(s) for next-day operations to address potential System Operating Limit (SOL) exceedances identified as a result of its Operational Planning Analysis as required in Requirement R1.

   An Operating Plan is defined by NERC as “A document that identifies a group of activities that may be used to achieve some goal. An Operating Plan may contain Operating Procedures and Operating Processes. A company-specific system restoration plan that includes an Operating Procedure for black-starting units, Operating Processes for communicating restoration progress with other entities, etc., is an example of an Operating Plan.”

   In order to mitigate SOL exceedances, or to address potential SOL exceedances, the TOP must have a variety of tools available to immediately address such condition. One such tool are reactive resources. The TOP MUST have an adequate number of reactive resources to mitigate any potential or actual SOL exceedance. The adequate number is determined through analysis.

8. TOP-001-4 – Transmission Operations with an effective date of July 1, 2018
Requirement 13 requires each TOP to ensure a Real-time Assessment is performed at least once every 30 minutes and Requirement 14 requires the TOP to initiate its Operating Plan to mitigate a SOL exceedance identified as part of its Real-time monitoring or Real-time Assessment.

This is a requirement that the TOP have an Operating Plan to mitigate SOL exceedances. The same requirement of the TOP exists here as it did under TOP-002-4. The TOP MUST have an adequate number of reactive resources to mitigate SOL exceedances. The adequate number is determined through analysis.

The second sentence of VAR-001-5 R2 states “Transmission Operators can provide sufficient reactive resources through various means including, but not limited to, reactive generation scheduling, transmission line and reactive resource switching, and using controllable load.” As noted by the Enhanced Periodic Review group during its September 2016 meeting and agreed to herein, this language is guidance or a measure and is unnecessary in the requirement. It was suggested then that perhaps this language be moved to a guidance section or document.
22. Please provide any additional comments for the SDT to consider that have not already been provided in the questions above.

Summary Response:

MOD: Available Transfer Capability (ATC)/Available Flowgate Capability (AFC), as well as eTags, are commercially-focused elements, facilitating interchange and balancing of interchange. The Real-time system operators are ambivalent of these commercial arrangements, as they must maintain reliability of the BES according to System Operating Limits (SOLs) and Interconnection Reliability Operating Limits (IROLs). If a scheduled interchange would violate SOLs or IROLs, the Real-time operators must disregard the scheduled interchange and operate the system to its actual reliability limits. This observation is reinforced by NERC’s statement in the 2015 filing related to risk-based reliability proposing removal of the Interchange Authority from the compliance registry, where it’s stated: “NERC proposes to remove interchange authorities as functional entities, explaining that the activities of the interchange authority are commercial in nature and, thus, the removal will have little if any impact on reliability of the bulk electric system.” FERC acknowledged this in their March 15, 2015 Order, where they stated: “…we approve NERC’s proposed removal of the interchange authority as a functional entity. As explained by NERC, the interchange authority performs a commercial function, essentially quality control activity in verifying and communicating interchange schedules.”

SER Phase II: The SER Phase II effort can also be followed on the Standards Efficiency Review Project Page.

<table>
<thead>
<tr>
<th>Comment</th>
</tr>
</thead>
</table>

Although ACES agrees with the retirement Standards MOD-001-1a, MOD-004-1, MOD-008-1, MOD-030-3 and MOD-001-2, ACES cautions the unique position of some of its members requiring them to obtain transmission service across multiple BAAs and participate in transactions between ISO/RTO and non-ISO/RTO entities. This has allowed those entities to witness first-hand the mismatched ATC values across the seams shared by adjacent Transmission Providers. For that reason, we advocated for this at that time and still hold the
position that the retirement of these standards should be contingent upon analysis of their retirement impact on entities with such
unique situations, like North Carolina Electric Membership Corporation (NCEMC) that depends on the transmission services to meet its
load obligation, reliably and economically, within each of their BAAs.

Thank you for the opportunity to comment.

Response

Thank you for your comments. Available Transfer Capability (ATC)/Available Flowgate Capability (AFC), as well as eTags, are commercially-
focused elements, facilitating interchange and balancing of interchange. The Real-time system operators are ambivalent of these
commercial arrangements, as they must maintain reliability of the BES according to System Operating Limits (SOLs) and Interconnection
Reliability Operating Limits (IROLs). If a scheduled interchange would violate SOLs or IROLs, the Real-time operators must disregard the
scheduled interchange and operate the system to its actual reliability limits. This observation is reinforced by NERC’s statement in the
2015 filing related to risk-based reliability proposing removal of the Interchange Authority from the compliance registry, where it’s stated:
“NERC proposes to remove interchange authorities as functional entities, explaining that the activities of the interchange authority are
commercial in nature and, thus, the removal will have little if any impact on reliability of the bulk electric system.” FERC acknowledged
this in their March 15, 2015 Order, where they stated: “…we approve NERC’s proposed removal of the interchange authority as a
functional entity. As explained by NERC, the interchange authority performs a commercial function, essentially quality control activity in
verifying and communicating interchange schedules.”

MOD-001-2:

Requirement R1: TOPs are not required to determine TFC or TTC; therefore, this is a conditional obligation - and there is no requirement
that TOPs coordinate their methodologies. The definition of AFC explicitly includes the term “…further commercial activity…” which is
explicit that this relates to commercial activity, not reliability-related activity. This requirement also has no performance elements, so
there is nothing to measure against.

Requirement R1, Requirement Parts 1.1.1 thru 1.1.4 are expressly the definition of SOLs and are duplicative of the definition.
Requirement Part 1.1.5 therefore adds nothing, as there is no provision for “Other SOLs.”
Requirement R1, Requirement Part 1.2.2 are Additions and retirements are Long-term planning related and would be reflected in operational models. Planned outages for the operating time horizon is expressly addressed in TOP-001-4 R9.

Requirement R1, Part 1.3: any reliability-related constraints are already expressed in OPAs and the requirements to operate within SOLs.

Requirement R1, Requirement Part 1.3.1: generation to load transfers does not, in most cases, reflect any physical arrangement. Such transfers assume a system between the two that can handle the transfer; and this system must be operated to respect SOLs.

The SDT determined that Requirement R1, Requirement Part 1.3.2 is ambiguous. There are several distribution factors; one related to outages, one related to transfers, and one related to a composite between the two. It is ambiguous to which of these distribution factors is being addressed.

**Requirement R2**: applies to TSP and Available Flowgate Capacity or Available Transfer Capability. Requirement R1 applies to TOP and Total Flowgate Capacity or Total Transfer Capacity. Otherwise, Requirement R2 is very similar to Requirement R1, and the rationale to retire Requirement R1 also applies to Requirement R2.

**Requirement R3**: CBM is defined as “The amount of firm transmission transfer capability preserved by the transmission provider for Load-Serving Entities (LSEs) whose loads are located on that Transmission Service Provider’s system to enable access by the LSEs to generation from interconnected systems to meet generation reliability requirements. Preservation of CBM for an LSE allows that entity to reduce its installed generating capacity below that which may otherwise have been necessary without interconnections to meet its generation reliability requirements. The transmission transfer capability preserved as CBM is intended to be used by the LSE only in times of emergency generation deficiencies.”

There is no obligation for a TSP to determine CBM; this requirement just applies to TSPs that elect to determine CBM. The requirement contains no criteria regarding what the CBMID must include, rather that generally describing the method.

Further, this requirement has no performance obligation, but to just to have a document; therefore, is administrative.

**Requirement R4**: The SDT vetted Requirement R4 and determined that Requirement R4 does not require TOPs to determine TRM and establish measurable criteria for what the TRMID must include. Further, R4 does not establish any criteria for the TRMID, just that the
TOP that has TRM must have a document describing its methodology. Therefore, this requirement is simply administrative on an open-ended conditional duty.

**Requirement R5** and its Requirement Parts:
Requirement Part 5.1: as the TOP or TSP is not required to have a TFC or TTC methodology, or an ATCID, CBMID, or TRMID, other entities that may have a reliability-related need for these, that information is routinely pursuant to the data specifications of the RC (in INT-010-2.1) and the TOP (in TOP-003-3). In Real-time operation of the BES, the limitations related to similar issues is fully addressed by the obligations of TOP-001-4; specifically as related to operating within SOLs and IROLs and issuing and responding to Operating Instructions.

Requirement Part 5.2 and subparts: OASIS is a mechanism to assure that all market participants have simultaneous access to all market-data, such that no participant has an advantage. To provide this information to any participant via any mechanism rather that OASIS or a publicly-accessible company website becomes a FERC SOC violation.

Requirement Part 5.3 and subparts: OASIS is a mechanism to assure that all market participants have simultaneous access to all market-data, such that no participant has an advantage. To provide this information to any participant via any mechanism rather that OASIS or a publicly-accessible company website becomes a FERC SOC violation.

**Requirement R6:** If this data had a reliability-related need, it would be addressed via the data specifications in INT-010-2.1 (for RC) and TOP-003-3 (for TOP). However, AFC, ATC, TFC, and TTC are not mandatory to establish; thus the party requested for this data may very well not have the data to provide. Further, various TOPs or TSPs that would have these elements are not required to coordinate them, which could easily lead to widely disparate methodologies. Finally, as market-related data, this data would likely be subject to FERC Standards of Conduct, which would require that the data be publicly posted for all other market participants to access.

EEI member companies would like to note our appreciation to NERC for the opportunity afforded to the Industry to provide input into the planned SER Phase I Retirements (Project 2018-03). We are very supportive of those efforts as well as the deferments of some requirements to the SER Phase 2 Project. While we understand that the CIP Standards will also be addressed in the SER Phase 2 Project, we ask that NERC provide additional clarity to the Industry as to how and when these Phase 2 efforts will all tie together. Such an effort would be appreciated by the Industry and would resolve any concerns companies may have related to the Phase 2 effort.
Additionally, EEI Members have noted that when NERC originally queried the Industry for recommendations for possible Reliability Standard Requirements that merit consideration for the Phase 1 effort, the Industry was also told that the CIP Standards would not be considered until the Phase 2 effort. Now that Phase 2 is beginning, EEI looks forward to NERC “consult[ing] with the SER Advisory Group and stakeholders, on a plan to address the CIP Standards in the SER.” (see NERC Standards Efficiency Review Project Update | August 3, 2018) We additionally ask NERC to provide greater clarity and detail as to when stakeholder outreach, similar to the Phase 1 Industry solicitation, will be initiated for CIP Reliability Standards? While NERC did receive a small number of CIP related suggestions within the Phase 1 solicitation, the focus was on the O&P Standards. EEI member companies believe additional solicitation focused on CIP is necessary for effectively addressing CIP Standards in Phase 2.

**Response**

Thank you for your support of the SER Phase I effort. Your comments regarding SER Phase II effort and CIP standards will be forwarded to the appropriate NERC staff leading that effort. The SER Phase II effort can also be followed on the Standards Efficiency Review Project Page.

At the onset of the Standards Efficiency Review Project NERC stated that there would be an effort to review/revise the CIP standards during phase 2 of the project. The perception by industry was that the CIP standards would go through an iteration of review/revision like the process used by NERC for the O&P standards during phase 1. Can NERC please clarify whether the CIP standards will be more closely reviewed/revised and vetted by industry in subsequent phase of this project.

Response

Thank you for your comments. NERC recently developed concepts for the SER Phase II effort that include a CIP Standards Efficiency Review, and solicited industry comments through March 22, 2019. Your comments regarding the SER Phase II effort and CIP standards will be forwarded to the appropriate NERC staff leading that effort. The SER Phase II effort can also be followed on the Standards Efficiency Review Project Page.

Duke Energy Comment Response to Question 11: for 2018-03 Standards Efficiency Review Retirements comment period ending on: 4/12/2019 8:00 PM

Question:

11. The SDT is proposing to retire MOD-004-1, Requirements R1, R2, R3, R4, R5, R6, R7, R8, R9, R10, R11, and R12 (all). Do you agree with the SDT’s proposal to retire MOD-004-1? If you do not agree, please provide comments. Or, if you agree but have comments or suggestions on the SDT’s proposal, please provide your explanation.

☐ Yes
☐ No

Comments:

While Duke Energy would support the retirement of these MOD standards, we cannot do so if MOD-001-2 is withdrawn. The MOD standards promote reliability of the grid by putting in place common boundaries and provisions that are necessary for various calculations that need to be performed. These calculations are important to reliability by providing the baseline for understanding the operational need. By retiring the MOD standards, and not having MOD-001-2 in place, there will not be provisions in place to aid an entity in calculating transfer capability. There will not be any boundaries in place for the curtailment of service. We disagree with the commercial based focus that the drafting team
took in the technical rationale document. While these MOD standards (and ATC calculation) may have some commercial based elements to them, they also put in place valuable boundaries that help promote consistency in how the industry calculates these values. Removing these boundaries does not promote reliability for the Bulk Electric System and introduces additional burden to the real-time System Operator.

The expectation of the System Operators to ensure the reliability of the BES in the real-time when there have been no requirements to ensure how ATC is calculated or coordinated beyond what is required by NAESB is unrealistic. Some of the most glaring issues with relying solely upon NAESB to regulate the calculation of ATC are: FERC does not have oversight for non-jurisdictional TSPs and therefore cannot require them to incorporate NAESB standards. Also, while NAESB has acted on the recommendations of the MOD-A project to incorporate any of the gaps created by the retirement of MOD-001-1a, MOD-004-1, MOD-008-1, MOD-028-2, MOD-029-2a, MOD-030-3 and adoption of MOD-001-2, FERC has not acted on either the NERC or NAESB filings. Further, NAESB has not been requested to modify proposed standards to incorporate any of the gaps created by the retirement of the proposed MOD-001-2.

Additionally, the lack of any NERC regulation for consistent ATC methodologies and requirements for sharing of data and could potentially lead to an increase of TLRs being called as this would be the only tool System Operators could utilize to combat rampant loop flow impacts on the BES. This could very well lead to capacity concerns and load shedding as the increase in TLRs could include firm curtailments causing capacity shortages. Without mandatory ATC standards, a TSP would be able to sell as much service as possible. The overselling of service and the overscheduling of ATC Paths will lead to an increase of FIRM TLR, potentially forcing Transmission Operators and Load Serving Entities to shed FIRM load to comply with the TLR. Over the past eight years the MOD-001, 28,29, & 30 standards have been effective the industry has seen a dramatic reduction in FIRM TLRs.

Included in the Attachment with Duke Energy’s response to this question is the rolling 12-month average of TLRs from the NERC website. Notice the reduction in TLRs from 2008-2011 when the MOD standards were first published (in 2008 when TSP started to incorporate the MOD standards into their ATC methodologies) and 2011 (when the MOD standards were mandatory and enforceable).
ReliabilityFirst does not agree with the removal of PRC-004-6 Requirement R4 for the following reason:

1. The concept of a declaration for no identifiable cause is currently introduced in R4 and in the Application Guidelines (now called Supplemental Material) for R4. The one statement from the Application Guidelines for R4 in version 5(i) states,
a. ‘The entity’s investigation is complete when it identifies the cause of the Misoperation or makes a declaration that no cause was determined. The declaration is intended to be used if the entity determines that investigative actions have been exhausted or have not provided direction for identifying the Misoperation cause. Historically, approximately 12% of Misoperations are unknown or unexplainable.’

This statement needs to be retained somewhere as an explanation for this use of the declaration. The declaration is also referenced in R5, but for a different reason (problem found but CAP won’t improve reliability of BES). The declaration associated with R4 would be a cause that is ‘unknown/unexplainable’ and all testing and analysis comes up empty. There wouldn’t be a CAP, since nothing was found broken, and the declaration is used to close the investigation. In MIDAS, the CAP Completion Status would be ‘declaration’ rather than improperly coding as ‘CAP – Complete’, since no CAP was developed.

As far as the administrative requirement of ‘corrective action at least once every two calendar quarters’, ReliabilityFirst recommends the following for consideration:

R4:
Each Transmission Owner, Generator Owner, and Distribution Provider that has not determined the cause(s) of a Misoperation, for a Misoperation identified in accordance with Requirement R1 or R3, shall perform investigative action(s) to determine the cause(s) of the Misoperation at least once every two full calendar quarters after the Misoperation was first identified, maintaining documentation in sufficient detail to provide clear delineation of the stage and findings of the investigation until one of the following completes the investigation: [Violation Risk Factor: High] [Time Horizon: Operations Assessment, Operations Planning]
☐ The identification of the cause(s) of the Misoperation; or
☐ A declaration that no cause was identified.

End of Report
A. Introduction

1. **Title:** Facility Ratings
2. **Number:** FAC-008-4
3. **Purpose:** To ensure that Facility Ratings used in the reliable planning and operation of the Bulk Electric System (BES) are determined based on technically sound principles. A Facility Rating is essential for the determination of System Operating Limits.

4. **Applicability:**
   - 4.1. Transmission Owner
   - 4.2. Generator Owner

5. **Effective Date:** See Implementation Plan.
B. Requirements and Measures

R1. Each Generator Owner shall have documentation for determining the Facility Ratings of its solely and jointly owned generator Facility(ies) up to the low side terminals of the main step up transformer if the Generator Owner does not own the main step up transformer and the high side terminals of the main step up transformer if the Generator Owner owns the main step up transformer. [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]

1.1. The documentation shall contain assumptions used to rate the generator and at least one of the following:
   - Design or construction information such as design criteria, ratings provided by equipment manufacturers, equipment drawings and/or specifications, engineering analyses, method(s) consistent with industry standards (e.g. ANSI and IEEE), or an established engineering practice that has been verified by testing or engineering analysis.
   - Operational information such as commissioning test results, performance testing or historical performance records, any of which may be supplemented by engineering analyses.

1.2. The documentation shall be consistent with the principle that the Facility Ratings do not exceed the most limiting applicable Equipment Rating of the individual equipment that comprises that Facility.

M1. Each Generator Owner shall have documentation that shows how its Facility Ratings were determined as identified in Requirement 1.

R2. Each Generator Owner shall have a documented methodology for determining Facility Ratings (Facility Ratings methodology) of its solely and jointly owned equipment connected between the location specified in R1 and the point of interconnection with the Transmission Owner that contains all of the following. [Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]

2.1. The methodology used to establish the Ratings of the equipment that comprises the Facility(ies) shall be consistent with at least one of the following:
   - Ratings provided by equipment manufacturers or obtained from equipment manufacturer specifications such as nameplate rating.
   - One or more industry standards developed through an open process such as Institute of Electrical and Electronic Engineers (IEEE) or International Council on Large Electric Systems (CIGRE).
   - A practice that has been verified by testing, performance history or engineering analysis.
2.2. The underlying assumptions, design criteria, and methods used to determine the Equipment Ratings identified in Requirement R2, Part 2.1 including identification of how each of the following were considered:

2.2.1. Equipment Rating standard(s) used in development of this methodology.

2.2.2. Ratings provided by equipment manufacturers or obtained from equipment manufacturer specifications.

2.2.3. Ambient conditions (for particular or average conditions or as they vary in real-time).

2.2.4. Operating limitations.¹

2.3. A statement that a Facility Rating shall respect the most limiting applicable Equipment Rating of the individual equipment that comprises that Facility.

2.4. The process by which the Rating of equipment that comprises a Facility is determined.

2.4.1. The scope of equipment addressed shall include, but not be limited to, conductors, transformers, relay protective devices, terminal equipment, and series and shunt compensation devices.

2.4.2. The scope of Ratings addressed shall include, as a minimum, both Normal and Emergency Ratings.

M2. Each Generator Owner shall have a documented Facility Ratings methodology that includes all of the items identified in Requirement 2, Parts 2.1 through 2.4.

R3. Each Transmission Owner shall have a documented methodology for determining Facility Ratings (Facility Ratings methodology) of its solely and jointly owned Facilities (except for those generating unit Facilities addressed in R1 and R2) that contains all of the following: [Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]

3.1. The methodology used to establish the Ratings of the equipment that comprises the Facility shall be consistent with at least one of the following:

- Ratings provided by equipment manufacturers or obtained from equipment manufacturer specifications such as nameplate rating.

- One or more industry standards developed through an open process such as Institute of Electrical and Electronics Engineers (IEEE) or International Council on Large Electric Systems (CIGRE).

- A practice that has been verified by testing, performance history or engineering analysis.

¹ Such as temporary de-ratings of impaired equipment in accordance with good utility practice.
3.2. The underlying assumptions, design criteria, and methods used to determine the Equipment Ratings identified in Requirement R3, Part 3.1 including identification of how each of the following were considered:

3.2.1. Equipment Rating standard(s) used in development of this methodology.

3.2.2. Ratings provided by equipment manufacturers or obtained from equipment manufacturer specifications.

3.2.3. Ambient conditions (for particular or average conditions or as they vary in real-time).

3.2.4. Operating limitations.²

3.3. A statement that a Facility Rating shall respect the most limiting applicable Equipment Rating of the individual equipment that comprises that Facility.

3.4. The process by which the Rating of equipment that comprises a Facility is determined.

3.4.1. The scope of equipment addressed shall include, but not be limited to, transmission conductors, transformers, relay protective devices, terminal equipment, and series and shunt compensation devices.

3.4.2. The scope of Ratings addressed shall include, as a minimum, both Normal and Emergency Ratings.

M3. Each Transmission Owner shall have a documented Facility Ratings methodology that includes all of the items identified in Requirement 3, Parts 3.1 through 3.4.

R4. Reserved.

M4. Reserved.

R5. Reserved.

M5. Reserved.

R6. Each Transmission Owner and Generator Owner shall have Facility Ratings for its solely and jointly owned Facilities that are consistent with the associated Facility Ratings methodology or documentation for determining its Facility Ratings. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

M6. Each Transmission Owner and Generator Owner shall have evidence to show that its Facility Ratings are consistent with the documentation for determining its Facility Ratings as specified in Requirement R1 or consistent with its Facility Ratings methodology as specified in Requirements R2 and R3 (Requirement R6).

R7. Reserved.

M7. Reserved.

² Such as temporary de-ratings of impaired equipment in accordance with good utility practice.
C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: “Compliance Enforcement Authority” means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Compliance Monitoring and Enforcement Processes:

- Self-Certifications
- Spot Checking
- Compliance Audits
- Self-Reporting
- Compliance Violation Investigations
- Complaints

1.3. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- The Generator Owner shall keep its current documentation (for R1) and any modifications to the documentation that were in force since last compliance audit period for Measure M1 and Measure M6.
- The Generator Owner shall keep its current, in force Facility Ratings methodology (for R2) and any modifications to the methodology that were in force since last compliance audit period for Measure M2 and Measure M6.
- The Transmission Owner shall keep its current, in force Facility Ratings methodology (for R3) and any modifications to the methodology that were in force since the last compliance audit for Measure M3 and Measure M6.
• The Transmission Owner and Generator Owner shall keep its current, in force Facility Ratings and any changes to those ratings for three calendar years for Measure M6.

• If a Generator Owner or Transmission Owner is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit and all subsequent compliance records.

1.4. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

A. Introduction

1. **Title:** Facility Ratings

2. **Number:** FAC-008-34

3. **Purpose:** To ensure that Facility Ratings used in the reliable planning and operation of the Bulk Electric System (BES) are determined based on technically sound principles. A Facility Rating is essential for the determination of System Operating Limits.

4. **Applicability:**
   
   4.1. Transmission Owner
   
   4.2. Generator Owner

5. **Effective Date:** The first day of the first calendar quarter that is twelve months beyond the date approved by applicable regulatory authorities, or in those jurisdictions where regulatory approval is not required, the first day of the first calendar quarter twelve months following BOT adoption. See Implementation Plan.
B. Requirements and Measures

R1. Each Generator Owner shall have documentation for determining the Facility Ratings of its solely and jointly owned generator Facility(ies) up to the low side terminals of the main step up transformer if the Generator Owner does not own the main step up transformer and the high side terminals of the main step up transformer if the Generator Owner owns the main step up transformer. [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]

1.1. The documentation shall contain assumptions used to rate the generator and at least one of the following:

- Design or construction information such as design criteria, ratings provided by equipment manufacturers, equipment drawings and/or specifications, engineering analyses, method(s) consistent with industry standards (e.g. ANSI and IEEE), or an established engineering practice that has been verified by testing or engineering analysis.

- Operational information such as commissioning test results, performance testing or historical performance records, any of which may be supplemented by engineering analyses.

1.2. The documentation shall be consistent with the principle that the Facility Ratings do not exceed the most limiting applicable Equipment Rating of the individual equipment that comprises that Facility.

M1. Each Generator Owner shall have documentation that shows how its Facility Ratings were determined as identified in Requirement 1.

R2. Each Generator Owner shall have a documented methodology for determining Facility Ratings (Facility Ratings methodology) of its solely and jointly owned equipment connected between the location specified in R1 and the point of interconnection with the Transmission Owner that contains all of the following. [Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]

2.1. The methodology used to establish the Ratings of the equipment that comprises the Facility(ies) shall be consistent with at least one of the following:

- Ratings provided by equipment manufacturers or obtained from equipment manufacturer specifications such as nameplate rating.

- One or more industry standards developed through an open process such as Institute of Electrical and Electronic Engineers (IEEE) or International Council on Large Electric Systems (CIGRE).

- A practice that has been verified by testing, performance history or engineering analysis.
2.2. The underlying assumptions, design criteria, and methods used to determine the Equipment Ratings identified in Requirement R2, Part 2.1 including identification of how each of the following were considered:

2.2.1. Equipment Rating standard(s) used in development of this methodology.

2.2.2. Ratings provided by equipment manufacturers or obtained from equipment manufacturer specifications.

2.2.3. Ambient conditions (for particular or average conditions or as they vary in real-time).

2.2.4. Operating limitations.¹

2.3. A statement that a Facility Rating shall respect the most limiting applicable Equipment Rating of the individual equipment that comprises that Facility.

2.4. The process by which the Rating of equipment that comprises a Facility is determined.

2.4.1. The scope of equipment addressed shall include, but not be limited to, conductors, transformers, relay protective devices, terminal equipment, and series and shunt compensation devices.

2.4.2. The scope of Ratings addressed shall include, as a minimum, both Normal and Emergency Ratings.

M2. Each Generator Owner shall have a documented Facility Ratings methodology that includes all of the items identified in Requirement 2, Parts 2.1 through 2.4.

R3. Each Transmission Owner shall have a documented methodology for determining Facility Ratings (Facility Ratings methodology) of its solely and jointly owned Facilities (except for those generating unit Facilities addressed in R1 and R2) that contains all of the following: [Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]

3.1. The methodology used to establish the Ratings of the equipment that comprises the Facility shall be consistent with at least one of the following:

- Ratings provided by equipment manufacturers or obtained from equipment manufacturer specifications such as nameplate rating.

- One or more industry standards developed through an open process such as Institute of Electrical and Electronics Engineers (IEEE) or International Council on Large Electric Systems (CIGRE).

- A practice that has been verified by testing, performance history or engineering analysis.

¹ Such as temporary de-ratings of impaired equipment in accordance with good utility practice.
3.2. The underlying assumptions, design criteria, and methods used to determine the
Equipment Ratings identified in Requirement R3, Part 3.1 including identification of how each of the following were considered:

3.2.1. Equipment Rating standard(s) used in development of this methodology.

3.2.2. Ratings provided by equipment manufacturers or obtained from equipment manufacturer specifications.

3.2.3. Ambient conditions (for particular or average conditions or as they vary in real-time).

3.2.4. Operating limitations.\(^2\)

3.3. A statement that a Facility Rating shall respect the most limiting applicable Equipment Rating of the individual equipment that comprises that Facility.

3.4. The process by which the Rating of equipment that comprises a Facility is determined.

3.4.1. The scope of equipment addressed shall include, but not be limited to, transmission conductors, transformers, relay protective devices, terminal equipment, and series and shunt compensation devices.

3.4.2. The scope of Ratings addressed shall include, as a minimum, both Normal and Emergency Ratings.

M3. Each Transmission Owner shall have a documented Facility Ratings methodology that includes all of the items identified in Requirement 3, Parts 3.1 through 3.4.

R4. Reserved. Each Transmission Owner shall make its Facility Ratings methodology and each Generator Owner shall each make its documentation for determining its Facility Ratings and its Facility Ratings methodology available for inspection and technical review by those Reliability Coordinators, Transmission Operators, Transmission Planners and Planning Coordinators that have responsibility for the area in which the associated Facilities are located, within 21 calendar days of receipt of a request. \([\text{Violation Risk Factor: Lower}] \text{ [Time Horizon: Operations Planning]}\). (Retirement approved by FERC effective January 21, 2014.)

M4. Reserved. Each Transmission Owner shall have evidence, such as a copy of a dated electronic note, or other comparable evidence to show that it made its Facility Ratings methodology available for inspection within 21 calendar days of a request in accordance with Requirement 4. The Generator Owner shall have evidence, such as a copy of a dated electronic note, or other comparable evidence to show that it made its documentation for determining its Facility Ratings or its Facility Ratings methodology available for inspection within 21 calendar days of a request in accordance with Requirement R4. \((\text{Retirement approved by NERC BOT pending applicable regulatory approval.})\).

\(^2\) Such as temporary de-ratings of impaired equipment in accordance with good utility practice.
R5. **Reserved.** If a Reliability Coordinator, Transmission Operator, Transmission Planner or Planning Coordinator provides documented comments on its technical review of a Transmission Owner’s Facility Ratings methodology or Generator Owner’s documentation for determining its Facility Ratings and its Facility Rating methodology, the Transmission Owner or Generator Owner shall provide a response to that commenting entity within 45 calendar days of receipt of those comments. The response shall indicate whether a change will be made to the Facility Ratings methodology and, if no change will be made to that Facility Ratings methodology, the reason why. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning] (Retirement approved by FERC effective January 21, 2014.)

M5. **Reserved.** If the Reliability Coordinator, Transmission Operator, Transmission Planner or Planning Coordinator provides documented comments on its technical review of a Transmission Owner’s or Generator Owner’s Facility Ratings methodology or a Generator Owner’s documentation for determining its Facility Ratings, the Transmission Owner or Generator Owner shall have evidence, (such as a copy of a dated electronic or hard copy note, or other comparable evidence from the Transmission Owner or Generator Owner addressed to the commenter that includes the response to the comment,) that it provided a response to that commenting entity in accordance with Requirement R5. (Retirement approved by NERC BOT pending applicable regulatory approval.)

R6. Each Transmission Owner and Generator Owner shall have Facility Ratings for its solely and jointly owned Facilities that are consistent with the associated Facility Ratings methodology or documentation for determining its Facility Ratings. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

M6. Each Transmission Owner and Generator Owner shall have evidence to show that its Facility Ratings are consistent with the documentation for determining its Facility Ratings as specified in Requirement R1 or consistent with its Facility Ratings methodology as specified in Requirements R2 and R3 (Requirement R6).

R7. **Reserved.** Each Generator Owner shall provide Facility Ratings (for its solely and jointly owned Facilities that are existing Facilities, new Facilities, modifications to existing Facilities and re-ratings of existing Facilities) to its associated Reliability Coordinator(s), Planning Coordinator(s), Transmission Planner(s), Transmission Owner(s) and Transmission Operator(s) as scheduled by such requesting entities. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

M7. **Reserved.** Each Generator Owner shall have evidence, such as a copy of a dated electronic note, or other comparable evidence to show that it provided its Facility Ratings to its associated Reliability Coordinator(s), Planning Coordinator(s), Transmission Planner(s), Transmission Owner(s) and Transmission Operator(s) in accordance with Requirement R7.

R8. **Reserved.** Each Transmission Owner (and each Generator Owner subject to Requirement R2) shall provide requested information as specified below (for its solely
Facility Ratings

and jointly owned Facilities that are existing Facilities, new Facilities, modifications to existing Facilities and re-ratings of existing Facilities) to its associated Reliability Coordinator(s), Planning Coordinator(s), Transmission Planner(s), Transmission Owner(s) and Transmission Operator(s): [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

As scheduled by the requesting entities:

8.1.1. Facility Ratings

8.1.2. Identity of the most limiting equipment of the Facilities

8.2. Within 30 calendar days (or a later date if specified by the requester), for any requested Facility with a Thermal Rating that limits the use of Facilities under the requester’s authority by causing any of the following: 1) An Interconnection Reliability Operating Limit, 2) A limitation of Total Transfer Capability, 3) An impediment to generator deliverability, or 4) An impediment to service to a major load center:

8.2.1. Identity of the existing next most limiting equipment of the Facility

8.2.2. The Thermal Rating for the next most limiting equipment identified in Requirement R8, Part 8.2.1.

M8. Reserved. Each Transmission Owner (and Generator Owner subject to Requirement R2) shall have evidence, such as a copy of a dated electronic note, or other comparable evidence to show that it provided its Facility Ratings and identity of limiting equipment to its associated Reliability Coordinator(s), Planning Coordinator(s), Transmission Planner(s), Transmission Owner(s) and Transmission Operator(s) in accordance with Requirement R8.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: “Compliance Enforcement Authority” means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Compliance Monitoring and Enforcement Processes:

- Self-Certifications
- Spot Checking
- Compliance Audits
- Self-Reporting
- Compliance Violation Investigations
• Complaints

1.3. **Evidence Retention:** The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

• The Generator Owner shall keep its current documentation (for R1) and any modifications to the documentation that were in force since last compliance audit period for Measure M1 and Measure M6.

• The Generator Owner shall keep its current, in force Facility Ratings methodology (for R2) and any modifications to the methodology that were in force since last compliance audit period for Measure M2 and Measure M6.

• The Transmission Owner shall keep its current, in force Facility Ratings methodology (for R3) and any modifications to the methodology that were in force since the last compliance audit for Measure M3 and Measure M6.

• The Transmission Owner and Generator Owner shall keep its current, in force Facility Ratings and any changes to those ratings for three calendar years for Measure M6.

• The Generator Owner and Transmission Owner shall each keep evidence for Measure M4, and Measure M5, for three calendar years. (Retirement approved by FERC effective January 21, 2014.)

• The Generator Owner shall keep evidence for Measure M7 for three calendar years.

• The Transmission Owner (and Generator Owner that is subject to Requirement R2) shall keep evidence for Measure M8 for three calendar years.

• If a Generator Owner or Transmission Owner is found non-compliant, it shall keep information related to the non-compliance until found compliant.

• The Compliance Enforcement Authority shall keep the last audit and all subsequent compliance records.

**Compliance Monitoring and Enforcement Program:** As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or
information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

A. Introduction

1. Title: Evaluation of Interchange Transactions
2. Number: INT-006-5
3. Purpose: To ensure that responsible entities conduct a reliability assessment of each Arranged Interchange before it is implemented.
4. Applicability:
   4.1. Balancing Authority
   4.2. Transmission Service Provider
5. Effective Date: See Implementation Plan.
B. Requirements and Measures

R1. Each Balancing Authority shall approve or deny each on-time Arranged Interchange or emergency Arranged Interchange that it receives and shall do so prior to the expiration of the time period defined in Attachment 1, Column B. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning, Same-day Operations, Real-time Operations]

1.1. Each Source and Sink Balancing Authority shall deny the Arranged Interchange or curtail Confirmed Interchange if it does not expect to be capable of supporting the magnitude of the Interchange, including ramping, throughout the duration of the Arranged Interchange.

1.2. Each Balancing Authority shall deny the Arranged Interchange or curtail Confirmed Interchange if the Scheduling Path (proper connectivity of Adjacent Balancing Authorities) between it and its Adjacent Balancing Authorities is invalid.

M1. Each Balancing Authority shall have evidence (such as dated and time stamped electronic logs, or other evidence) that it responded to each request for its approval to transition an Arranged Interchange to a Confirmed Interchange within the time defined in Attachment 1, Column B. (R1)

R2. Each Transmission Service Provider shall approve or deny each on-time Arranged Interchange or emergency Arranged Interchange that it receives and shall do so prior to the expiration of the time period defined in Attachment 1, Column B. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning, Same-day Operations, Real-time Operations]

2.1. Each Transmission Service Provider shall deny the Arranged Interchange or curtail Confirmed Interchange if the transmission path (proper connectivity of adjacent Transmission Service Providers) between it and its adjacent Transmission Service Providers is invalid.

M2. Each Transmission Service Provider shall have evidence (such as dated and time stamped electronic logs, studies, or other evidence) that it responded to each Arranged Interchange or emergency Arranged Interchange within the time defined in Attachment 1, Column B. If the transmission path between the Transmission Service Provider and its adjacent Transmission Service Providers is invalid, each Transmission Service Provider shall have evidence (such as dated and time stamped electronic logs, studies, or other evidence) that it denied the Arranged Interchange or curtailed confirmed Interchange. (R2)

R3. The Source Balancing Authority and the Sink Balancing Authority receiving a Reliability Adjustment Arranged Interchange shall approve or deny it prior to the expiration of the time period defined in Attachment 1, Column B. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning, Same-day Operations, Real-time Operations]
M3. Each Balancing Authority shall have evidence (such as dated and time stamped electronic logs, studies, or other evidence) that when responding to a Reliability Adjustment Arranged Interchange, it either approved the request or denied the request.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: “Compliance Enforcement Authority” means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- The Balancing Authority shall maintain evidence to show compliance with R1 and R3 for the most recent three calendar months plus the current month.
- The Transmission Service Provider shall maintain evidence to show compliance with R2 for the most recent three calendar months plus the current month.
- If a Balancing Authority or Transmission Service Provider is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or
information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

- Compliance Audits
- Self-Certifications
- Spot Checking
- Compliance Investigations
- Self-Reporting
- Complaint

</tbody>
</table>
Guidelines and Technical Basis
Many aspects of managing Interchange are supported by software applications. There are fundamental tasks that each entity should be able to perform in an electronic manner as listed below.

A Load-Serving Entity and Balancing Authority that submits Requests for Interchange should have the capability to electronically:

- Submit a Request for Interchange to a Sink Balancing Authority
- Submit a request to modify Interchange
- Receive distributions of Confirmed Interchange
- Receive distributions of Reliability Adjustment Arranged Interchanges

Each Sink Balancing Authority should have the capability to electronically:

- Receive a Request for Interchange
- Receive a request to modify Interchange
- Validate Requests for Interchange by verifying:
  - Source Balancing Authority megawatts equal Sink Balancing Authority megawatts (adjusted for losses, if appropriate).
  - All reliability entities involved in the Arranged Interchange are valid.
  - Generation source and Load sink are defined.
  - Megawatt profile is defined.
  - Interchange duration is defined.
- Validate request to modify Interchange by verifying:
  - Source Balancing Authority megawatts equal Sink Balancing Authority megawatts (adjusted for losses, if appropriate).
  - Megawatt profile is defined.
  - Interchange duration is defined.
- Distribute the validated Request for Interchange as Arranged Interchange
- Distribute the validated Reliability Adjustment Arranged Interchanges
- Receive communication of approval or denial of Arranged Interchange
  - Distribute notification as each entity approves or denies an Arranged Interchange.
  - Transition Arranged Interchange to Confirmed Interchange if all approvals are received.
  - Distribute notification of whether Arranged Interchange was transitioned to Confirmed Interchange or not.
Submit a request to modify Interchange

- Each Load-Serving Entity that approves or denies Arranged Interchange, and each Balancing Authority and Transmission Service Provider should have the capability to electronically:
  - Receive distribution of Arranged Interchange
  - Communicate approval or denial of the Arranged Interchange to the Sink Balancing Authority
  - Receive notification of whether Arranged Interchange was transitioned to Confirmed interchange or not.
  - Submit a request to modify Interchange

- While Interchange is normally facilitated using electronic communication and software tools, there are occasions with those electronic capabilities are reduced or unavailable. It is recommended that all entities involved in aspects of Interchange should have, maintain and implement a plan describing the manner and timing in which all capabilities listed above will be provided when electronic capabilities are reduced or unavailable. Each plan should address the following topics:
  - Alternate methods of communicating Interchange information between Purchasing Selling Entities, Balancing Authorities, and Transmission Service Providers.
  - How to notify others that it is activating the plan
  - How it will process requests for emergency Arranged Interchange and Reliability Adjustment Arranged Interchange.
  - Restrictions and limitations that may apply during the period of reduced or unavailable capability (such as limits on volume, only accepting emergency transactions, etc.).
  - Delegation of approval rights and proxy actions, if such approaches will be used.
  - How known Confirmed Interchange will be scheduled following a reduction in or loss of capability.
  - Personnel plans for short-term and extended periods.
  - Training of personnel in the use of the plan.

Rationale:
During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for R1:
Balancing Authorities must take action on a received Arranged Interchange within a certain time frame. Requirement R1, Parts 1.1 and 1.2 provide reliability-related reasons that a Balancing Authority must deny an Arranged Interchange, but Balancing Authorities may deny
for other reasons. If the conditions described in Requirement R1, Parts 1.1 or 1.2 are recognized after approval is granted, the Balancing Authority may curtail the Confirmed Interchange prior to implementation.

Rationale for R2:
TSPs must take action on a received Arranged Interchange within a certain time frame. Requirement R2, Part 2.1 provides reliability-related reasons that a TSP must deny an Arranged Interchange, but TSPs may deny for other reasons. If the conditions described in Requirement R1, Part 2.1 are recognized after approval is granted, the TSP may curtail the Confirmed Interchange prior to implementation.
A. Introduction

1. Title: Evaluation of Interchange Transactions

2. Number: INT-006-45

3. Purpose: To ensure that responsible entities conduct a reliability assessment of each Arranged Interchange before it is implemented.

4. Applicability:
   4.1. Balancing Authority
   4.2. Transmission Service Provider

5. Effective Date: First day of the second calendar quarter after the date that this standard is approved by an applicable governmental authority or as otherwise provided for in a jurisdiction where approval by an applicable governmental authority is required for a standard to go into effect. Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is six months after the date this standard is adopted by the NERC Board of Trustees or as otherwise provided for in that jurisdiction. See Implementation Plan.

6. Background: This standard was revised as part of the Project 2008-12 Coordinate Interchange Standards effort to combine requirements from the various INT standards into a fewer number of standards and in a logical sequence. The focus of INT-006-4 continues to be the reliability assessment of Interchange Transactions prior to their implementation.

The content of INT-006-4 has been revised and expanded in the following manner:

• R1 was created by revising R1 from INT-006-3. This requirement ensures that Balancing Authorities involved in an Arranged Interchange actively approve or deny the transition to Confirmed Interchange. The requirement also lists criteria to determine when a Balancing Authority must deny the transition.

• R2 was created by revising R1 from INT-006-3. This requirement ensures that Transmission Service Providers involved in an Arranged Interchange actively approve or deny the transition to Confirmed Interchange. The requirement also lists criteria to determine when a Transmission Service Provider must deny the transition.

• R3 was created by revising R1 from INT-006-3. This requirement ensures that Balancing Authorities who receive a Reliability Adjustment Arranged Interchange actively approve or deny the transition to Confirmed Interchange.

• R4 was created by moving and revising R1 from INT-007-1, which has been retired as part of the project. This requirement lists criteria for when a Sink Balancing Authority shall not transition an Arranged Interchange to Confirmed Interchange.
• R5 was created by moving and revising R1 from INT-008-3, which has been retired as part of the project. This requirement lists the entities to which a Sink Balancing Authority must distribute notifications of whether an Arranged Interchange has transitioned to Confirmed Interchange.

• Attachment 1 timing tables for WECC were modified to address scheduling on a 15 minute basis.
B. Requirements and Measures

R1. Each Balancing Authority shall approve or deny each on-time Arranged Interchange or emergency Arranged Interchange that it receives and shall do so prior to the expiration of the time period defined in Attachment 1, Column B. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning, Same-day Operations, Real-time Operations]

1.1. Each Source and Sink Balancing Authority shall deny the Arranged Interchange or curtail Confirmed Interchange if it does not expect to be capable of supporting the magnitude of the Interchange, including ramping, throughout the duration of the Arranged Interchange.

1.2. Each Balancing Authority shall deny the Arranged Interchange or curtail Confirmed Interchange if the Scheduling Path (proper connectivity of Adjacent Balancing Authorities) between it and its Adjacent Balancing Authorities is invalid.

M1. Each Balancing Authority shall have evidence (such as dated and time stamped electronic logs, or other evidence) that it responded to each request for its approval to transition an Arranged Interchange to a Confirmed Interchange within the time defined in Attachment 1, Column B. (R1)

R2. Each Transmission Service Provider shall approve or deny each on-time Arranged Interchange or emergency Arranged Interchange that it receives and shall do so prior to the expiration of the time period defined in Attachment 1, Column B. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning, Same-day Operations, Real-time Operations]

2.1. Each Transmission Service Provider shall deny the Arranged Interchange or curtail Confirmed Interchange if the transmission path (proper connectivity of adjacent Transmission Service Providers) between it and its adjacent Transmission Service Providers is invalid.

M2. Each Transmission Service Provider shall have evidence (such as dated and time stamped electronic logs, studies, or other evidence) that it responded to each Arranged Interchange or emergency Arranged Interchange within the time defined in Attachment 1, Column B. If the transmission path between the Transmission Service Provider and its adjacent Transmission Service Providers is invalid, each Transmission Service Provider shall have evidence (such as dated and time stamped electronic logs, studies, or other evidence) that it denied the Arranged Interchange or curtailed confirmed Interchange. (R2)

R3. The Source Balancing Authority and the Sink Balancing Authority receiving a Reliability Adjustment Arranged Interchange shall approve or deny it prior to the expiration of the time period defined in Attachment 1, Column B. [Violation Risk Factor: Lower] [Time Horizon: Operations Planning, Same-day Operations, Real-time Operations]
3.1. If a Balancing Authority denies a Reliability Adjustment Arranged Interchange, the Balancing Authority must communicate that fact to its Reliability Coordinator no more than 10 minutes after the denial.

M3. Each Balancing Authority shall have evidence (such as dated and time stamped electronic logs, studies, or other evidence) that when responding to a Reliability Adjustment Arranged Interchange, it either approved the request or denied the request, and, if applicable, communicated denial to the Reliability Coordinator no more than 10 minutes after the denial. (R3)

R4. Reserved. Each Sink Balancing Authority shall confirm that none of the following conditions exist prior to transitioning an Arranged Interchange to Confirmed Interchange: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning, Same-day Operations, Real-time Operations]

- It is a Reliability Adjustment Arranged Interchange, the time period specified in Attachment 1, Column B has elapsed, and the Source Balancing Authority or the Sink Balancing Authority associated with the Arranged Interchange has not communicated its approval of the transition.
- It is not a Reliability Adjustment Arranged Interchange, the time period specified in Attachment 1, Column B, has elapsed, and not all Balancing Authorities and Transmission Service Providers associated with the Arranged Interchange have communicated their approval of the transition.
- It is not a Reliability Adjustment Arranged Interchange, the time period specified in Attachment 1, Column B, has elapsed, and any entity associated with the Arranged Interchange has communicated its denial of the transition.

M4. Reserved. Each Sink Balancing Authority shall have evidence (such as dated and time stamped electronic logs, studies, or other evidence) that, under the conditions in R4, it did not transition an Arranged Interchange to Confirmed Interchange. (R4)

R5. Reserved. For each Arranged Interchange that is transitioned to Confirmed Interchange, the Sink Balancing Authority shall notify the following entities of the on-time Confirmed Interchange such that the notification is delivered in time to be incorporated into scheduling systems prior to ramp start as specified in Attachment 1, Column D: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning, Same-day Operations, Real-time Operations]

5.1. The Source Balancing Authority,

5.2. Each Intermediate Balancing Authority,

5.3. Each Reliability Coordinator associated with each Balancing Authority included in the Arranged Interchange,

5.4. Each Transmission Service Provider included in the Arranged Interchange, and

5.5. Each Purchasing Selling Entity included in the Arranged Interchange.
M5. Reserved Each Sink Balancing Authority shall have evidence (such as dated and time stamped electronic logs, or other evidence) that it notified the entities of the on-time Confirmed Interchange such that the notification was delivered in time to be incorporated into scheduling systems prior to ramp start as specified in Attachment 1, Column D. (R5)

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: “Compliance Enforcement Authority” means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- The Balancing Authority shall maintain evidence to show compliance with R1, R3, R4, and R5 for the most recent three calendar months plus the current month.
- The Transmission Service Provider shall maintain evidence to show compliance with R2 for the most recent three calendar months plus the current month.
- If a Balancing Authority or Transmission Service Provider is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

</table>
Guidelines and Technical Basis
Many aspects of managing Interchange are supported by software applications. There are fundamental tasks that each entity should be able to perform in an electronic manner as listed below.

A Load-Serving Entity and Balancing Authority that submits Requests for Interchange should have the capability to electronically:

- Submit a Request for Interchange to a Sink Balancing Authority
- Submit a request to modify Interchange
- Receive distributions of Confirmed Interchange
- Receive distributions of Reliability Adjustment Arranged Interchanges

Each Sink Balancing Authority should have the capability to electronically:

- Receive a Request for Interchange
- Receive a request to modify Interchange
- Validate Requests for Interchange by verifying:
  - Source Balancing Authority megawatts equal Sink Balancing Authority megawatts (adjusted for losses, if appropriate).
  - All reliability entities involved in the Arranged Interchange are valid.
  - Generation source and Load sink are defined.
  - Megawatt profile is defined.
  - Interchange duration is defined.
- Validate request to modify Interchange by verifying:
  - Source Balancing Authority megawatts equal Sink Balancing Authority megawatts (adjusted for losses, if appropriate).
  - Megawatt profile is defined.
  - Interchange duration is defined.
- Distribute the validated Request for Interchange as Arranged Interchange
- Distribute the validated Reliability Adjustment Arranged Interchanges
- Receive communication of approval or denial of Arranged Interchange
  - Distribute notification as each entity approves or denies an Arranged Interchange.
  - Transition Arranged Interchange to Confirmed Interchange if all approvals are received.
  - Distribute notification of whether Arranged Interchange was transitioned to Confirmed Interchange or not.
Submit a request to modify Interchange

- Each Load-Serving Entity that approves or denies Arranged Interchange, and each Balancing Authority and Transmission Service Provider should have the capability to electronically:
  - Receive distribution of Arranged Interchange
  - Communicate approval or denial of the Arranged Interchange to the Sink Balancing Authority
  - Receive notification of whether Arranged Interchange was transitioned to Confirmed interchange or not.
  - Submit a request to modify Interchange

While Interchange is normally facilitated using electronic communication and software tools, there are occasions when those electronic capabilities are reduced or unavailable. It is recommended that all entities involved in aspects of Interchange should have, maintain, and implement a plan describing the manner and timing in which all capabilities listed above will be provided when electronic capabilities are reduced or unavailable. Each plan should address the following topics:

- Alternate methods of communicating Interchange information between Purchasing Selling Entities, Balancing Authorities, and Transmission Service Providers.
- How to notify others that it is activating the plan
- How it will process requests for emergency Arranged Interchange and Reliability Adjustment Arranged Interchange.
- Restrictions and limitations that may apply during the period of reduced or unavailable capability (such as limits on volume, only accepting emergency transactions, etc.).
- Delegation of approval rights and proxy actions, if such approaches will be used.
- How known Confirmed Interchange will be scheduled following a reduction in or loss of capability.
- Personnel plans for short-term and extended periods.
- Training of personnel in the use of the plan.

**Rationale:**
During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

**Rationale for R1:**
Balancing Authorities must take action on a received Arranged Interchange within a certain time frame. Requirement R1, Parts 1.1 and 1.2 provide reliability-related reasons that a Balancing Authority must deny an Arranged Interchange, but Balancing Authorities may deny
for other reasons. If the conditions described in Requirement R1, Parts 1.1 or 1.2 are recognized after approval is granted, the Balancing Authority may curtail the Confirmed Interchange prior to implementation.

**Rationale for R2:**
TSPs must take action on a received Arranged Interchange within a certain time frame. Requirement R2, Part 2.1 provides reliability-related reasons that a TSP must deny an Arranged Interchange, but TSPs may deny for other reasons. If the conditions described in Requirement R1, Part 2.1 are recognized after approval is granted, the TSP may curtail the Confirmed Interchange prior to implementation.
A. Introduction

1. Title: Implementation of Interchange
2. Number: INT-009-3
3. Purpose: To ensure that Balancing Authorities implement the Interchange as agreed upon in the Interchange confirmation process.
4. Applicability:
   4.1. Balancing Authority
5. Effective Date: See Implementation Plan
B. Requirements and Measures

R1. Each Balancing Authority shall agree with each of its Adjacent Balancing Authorities that its Composite Confirmed Interchange with that Adjacent Balancing Authority, at mutually agreed upon time intervals, excluding Dynamic Schedules and Pseudo-Ties and including any Interchange not yet captured in the Composite Confirmed Interchange, is: [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]

1.1. Identical in magnitude to that of the Adjacent Balancing Authority, and

1.2. Opposite in sign or direction to that of the Adjacent Balancing Authority.

M1. The Balancing Authority shall have evidence (such as dated logs, voice recordings, electronic records, or other evidence) that its Composite Confirmed Interchange, excluding Dynamic Schedules and Pseudo-Ties and including any Interchange not yet captured in the Composite Confirmed Interchange, was agreed to by each Adjacent Balancing Authority, identical in magnitude to those of each Adjacent Balancing Authority, and opposite in sign to that of each Adjacent Balancing Authority. (R1)

R2. Reserved.

M2. Reserved.

R3. Each Balancing Authority in whose area the high-voltage direct current tie is controlled shall coordinate the Confirmed Interchange prior to its implementation with the Transmission Operator of the high-voltage direct current tie. [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations, Operations Planning]

M3. The Balancing Authority shall have evidence (such as dated logs, electronic records, or other evidence) that it coordinated the Confirmed Interchange prior to its implementation with the Transmission Operator of the high-voltage direct current tie. (R3)
C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: “Compliance Enforcement Authority” means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- The Balancing Authority shall maintain evidence to show compliance with R1 and R3 for the most recent 3 months plus the current month.

If a Balancing Authority is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

A. Introduction

1. Title: Implementation of Interchange

2. Number: INT-009-2.13

3. Purpose: To ensure that Balancing Authorities implement the Interchange as agreed upon in the Interchange confirmation process.

4. Applicability:

   4.1. Balancing Authority

5. Effective Date: See Implementation Plan

6. Background: This standard was revised as part of the Project 2008-12 Coordinate Interchange Standards effort to combine requirements from the various INT standards into a fewer number of standards and in a logical sequence. The focus of INT-009-2 continues to be the Balancing Authority to Balancing Authority Interchange confirmation process for Interchange Transactions prior to their implementation.

The Requirements in INT-009-2 have been expanded to include previous Measures from INT-009-1 and acknowledge Dynamic Schedules and Pseudo-Ties. A new term “Composite Confirmed Interchange” has been introduced.

The content of INT-009-2 has been revised and expanded in the following manner:

- R1 was combined with INT-003-3 R1 and modified to ensure that a Balancing Authority agrees to a Composite Confirmed Interchange with each of its Adjacent Balancing Authorities.
- R2 was created to ensure that Adjacent Balancing Authorities incorporating a Pseudo-Tie agree to a common source for their Actual Net Interchange term for their ACE controls.
- R3 was created by revising R1.2 from INT-003-3. This requirement ensures that the Balancing Authority that controls a high-voltage direct current tie coordinates the Confirmed Interchange.
B. Requirements and Measures

R1. Each Balancing Authority shall agree with each of its Adjacent Balancing Authorities that its Composite Confirmed Interchange with that Adjacent Balancing Authority, at mutually agreed upon time intervals, excluding Dynamic Schedules and Pseudo-Ties and including any Interchange per INT-010-2 not yet captured in the Composite Confirmed Interchange, is: [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]

1.1. Identical in magnitude to that of the Adjacent Balancing Authority, and

1.2. Opposite in sign or direction to that of the Adjacent Balancing Authority.

M1. The Balancing Authority shall have evidence (such as dated logs, voice recordings, electronic records, or other evidence) that its Composite Confirmed Interchange, excluding Dynamic Schedules and Pseudo-Ties and including any Interchange as directed per INT-010-2 not yet captured in the Composite Confirmed Interchange, was agreed to by each Adjacent Balancing Authority, identical in magnitude to those of each Adjacent Balancing Authority, and opposite in sign to that of each Adjacent Balancing Authority. (R1)

R2. Reserved. The Attaining Balancing Authority and the Native Balancing Authority shall use a dynamic value emanating from an agreed upon common source to account for the Pseudo-Tie in the Actual Net Interchange (NIₜₐ) term of their respective control ACE (or alternate control process). [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]

M2. Reserved. The Balancing Authority shall have evidence (such as dated logs, voice recordings, electronic records, written agreement or other evidence) that it used a dynamic value emanating from an agreed upon common source to account for the Pseudo-Tie in the Actual Net Interchange (NIₜₐ) term of their respective control ACE (or alternate control process). (R2)

R3. Each Balancing Authority in whose area the high-voltage direct current tie is controlled shall coordinate the Confirmed Interchange prior to its implementation with the Transmission Operator of the high-voltage direct current tie. [Violation Risk Factor: Medium] [Time Horizon: Real-time Operations, Operations Planning]

M3. The Balancing Authority shall have evidence (such as dated logs, electronic records, or other evidence) that it coordinated the Confirmed Interchange prior to its implementation with the Transmission Operator of the high-voltage direct current tie. (R3)
C. Compliance

1. Compliance Monitoring Process

   1.1. Compliance Enforcement Authority: “Compliance Enforcement Authority” means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

   1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- The Balancing Authority shall maintain evidence to show compliance with R1, R2 and R3 for the most recent 3 months plus the current month.

If a Balancing Authority is found non-compliant, it shall keep information related to the non-compliance until found compliant.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Guidelines and Technical Basis

Rationale:
During development of this standard, text boxes were embedded within the standard to explain the rationale for various parts of the standard. Upon BOT approval, the text from the rationale text boxes was moved to this section.

Rationale for R2: R12.3 of BAL-005-2b addresses common metering for Dynamic Schedules and Pseudo-Ties but not their implementation into ACE. Requirement R2 is parallel to R10 of BAL-005-2b which only addresses Dynamic Schedules. Presently, there is a gap in the BAL standards that this requirement fills for Pseudo-Ties.
A. Introduction

1. Title: Reliability Coordination – Monitoring and Analysis
2. Number: IRO-002-7
3. Purpose: To provide System Operators with the capabilities necessary to monitor and analyze data needed to perform their reliability functions.
4. Applicability:
   4.1. Functional Entities:
   4.1.1. Reliability Coordinators
5. Effective Date: See Implementation Plan

B. Requirements and Measures

R1. Reserved.
M1. Reserved.

R2. Each Reliability Coordinator shall have data exchange capabilities, with redundant and diversely routed data exchange infrastructure within the Reliability Coordinator's primary Control Center, for the exchange of Real-time data with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for performing its Real-time monitoring and Real-time Assessments. [Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-time Operations]

M2. Each Reliability Coordinator shall have, and provide upon request, evidence that could include, but is not limited to, system specifications, system diagrams, or other documentation that lists its data exchange capabilities, including redundant and diversely routed data exchange infrastructure within the Reliability Coordinator's primary Control Center, for the exchange of Real-time data with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, as specified in the requirement.

R3. Each Reliability Coordinator shall test its primary Control Center data exchange capabilities specified in Requirement R2 for redundant functionality at least once every 90 calendar days. If the test is unsuccessful, the Reliability Coordinator shall initiate action within two hours to restore redundant functionality. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

M3. Each Reliability Coordinator shall have, and provide upon request, evidence that it tested its primary Control Center data exchange capabilities specified in Requirement R2 for redundant functionality, or experienced an event that demonstrated the redundant functionality; and if the test was unsuccessful, initiated action within two hours to restore redundant functionality as specified in Requirement R3. Evidence
could include, but is not limited to: dated and time-stamped test records, operator logs, voice recordings, or electronic communications.

**R4.** Each Reliability Coordinator shall provide its System Operators with the authority to approve planned outages and maintenance of its telecommunication, monitoring and analysis capabilities. [Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]

**M4.** Each Reliability Coordinator shall have, and provide upon request evidence that could include, but is not limited to, a documented procedure or equivalent evidence that will be used to confirm that the Reliability Coordinator has provided its System Operators with the authority to approve planned outages and maintenance of its telecommunication, monitoring and analysis capabilities.

**R5.** Each Reliability Coordinator shall monitor Facilities, the status of Remedial Action Schemes, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. [Violation Risk Factor: High] [Time Horizon: Real-Time Operations]

**M5.** Each Reliability Coordinator shall have, and provide upon request, evidence that could include, but is not limited to, Energy Management System description documents, computer printouts, SCADA data collection, or other equivalent evidence that will be used to confirm that it has monitored Facilities, the status of Remedial Action Schemes, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.

**R6.** Each Reliability Coordinator shall have monitoring systems that provide information utilized by the Reliability Coordinator’s operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant infrastructure. [Violation Risk Factor: High] [Time Horizon: Real-time Operations]

**M6.** The Reliability Coordinator shall have, and provide upon request, evidence that could include, but is not limited to, Energy Management System description documents, computer printouts, SCADA data collection, or other equivalent evidence that will be used to confirm that it has monitoring systems consistent with the requirement.

**C. Compliance**

1. Compliance Monitoring Process

   1.1. Compliance Enforcement Authority:
“Compliance Enforcement Authority” means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention:
The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- The Reliability Coordinator shall retain its current, in force document and any documents in force for the current year and previous calendar year for Requirements R2 and R4 and Measures M2 and M4.
- The Reliability Coordinator shall retain evidence for Requirement R3 and Measure M3 for the most recent 12 calendar months, with the exception of operator logs and voice recordings which shall be retained for a minimum of 90 calendar days.
- The Reliability Coordinator shall keep data or evidence for Requirements R5 and R6 and Measures M5 and M6 for the current calendar year and one previous calendar year.

1.3. Compliance Monitoring and Enforcement Program
As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Rationale

Rationale text from the development of IRO-002-4 in Project 2014-03 and IRO-002-5 in Project 2016-01 follows. Additional information can be found on the Project 2014-03 project page and the Project 2016-01 project page.

Changes made to the proposed definitions were made in order to respond to issues raised in NOPR paragraphs 55, 73, and 74 dealing with analysis of SOLs in all time horizons, questions on Protection Systems and Special Protection Systems in NOPR paragraph 78, and recommendations on phase angles from the SW Outage Report (recommendation 27). The intent of such changes is to ensure that Real-time Assessments contain sufficient details to result in an appropriate level of situational awareness. Some examples include: 1) analyzing phase angles which may result in the implementation of an Operating Plan to adjust generation or curtail transactions so that a Transmission facility may be returned to service, or 2) evaluating the impact of a modified Contingency resulting from the status change of a Special Protection Scheme from enabled/in-service to disabled/out-of-service.

Rationale for Requirements:
The data exchange elements of Requirements R1 and R2 from approved IRO-002-2 have been added back into proposed IRO-002-4 in order to ensure that there is no reliability gap. The Project 2014-03 SDT found no proposed requirements in the current project that covered the issue. Voice communication is covered in proposed COM-001-2 but data communications needs to remain in IRO-002-4 as it is not covered in proposed COM-001-2. Staffing of communications and facilities in corresponding requirements from IRO-002-2 is addressed in approved PER-004-2, Requirement R1 and has been deleted from this draft.

Rationale for R2:
Requirement R2 from IRO-002-3 has been deleted because approved EOP-008-1, Requirement R1, part 1.6.2 addresses redundancy and back-up concerns for outages of analysis tools. New Requirement R4 (R6 in IRO-002-5) has been added to address NOPR paragraphs 96 and 97: “...As we explain above, the reliability coordinator’s obligation to monitor SOLs is important to reliability because a SOL can evolve into an IROL during deteriorating system conditions, and for potential system conditions such as this, the reliability coordinator’s monitoring of SOLs provides a necessary backup function to the transmission operator....”

Rationale for Requirements R1 and R2: (note: R1 proposed for retirement in IRO-002-7 as part of Project 2018-03 Standard Efficiency Review Retirements)
The proposed changes address directives for redundancy and diverse routing of data exchange capabilities (FERC Order No. 817 Para 47).

Redundant and diversely routed data exchange capabilities consist of data exchange infrastructure components (e.g., switches, routers, servers, power supplies, and network cabling and communication paths between these components in the primary Control Center for the exchange of system operating data) that will provide continued functionality despite failure or malfunction of an individual component within the Reliability Coordinator's (RC) primary
Control Center. Redundant and diversely routed data exchange capabilities preclude single points of failure in primary Control Center data exchange infrastructure from halting the flow of Real-time data. Requirement R2 does not require automatic or instantaneous fail-over of data exchange capabilities. Redundancy and diverse routing may be achieved in various ways depending on the arrangement of the infrastructure or hardware within the RC's primary Control Center.

The reliability objective of redundancy is to provide for continued data exchange functionality during outages, maintenance, or testing of data exchange infrastructure. For periods of planned or unplanned outages of individual data exchange components, the proposed requirements do not require additional redundant data exchange infrastructure components solely to provide for redundancy.

Infrastructure that is not within the RC's primary Control Center is not addressed by the proposed requirement.

**Rationale for Requirement R3:**
The revised requirement addresses directives for testing of data exchange capabilities used in primary Control Centers (FERC Order No. 817 Para 51).

A test for redundant functionality demonstrates that data exchange capabilities will continue to operate despite the malfunction or failure of an individual component (e.g., switches, routers, servers, power supplies, and network cabling and communication paths between these components in the primary Control Center for the exchange of system operating data). An entity's testing practices should, over time, examine the various failure modes of its data exchange capabilities. When an actual event successfully exercises the redundant functionality, it can be considered a test for the purposes of the proposed requirement.

**Rationale for R4 (R6 in IRO-002-5 and IRO-002-7):**
The requirement was added back from approved IRO-002-2 as the Project 2014-03 SDT found no proposed requirements that covered the issues.
A. Introduction

1. **Title:** Reliability Coordination – Monitoring and Analysis

2. **Number:** IRO-002-67

3. **Purpose:** To provide System Operators with the capabilities necessary to monitor and analyze data needed to perform their reliability functions.

4. **Applicability:**
   
   4.1. **Functional Entities:**
   
   4.1.1. Reliability Coordinators

5. **Effective Date:** See Implementation Plan
B. Requirements and Measures

R1. Reserved.

M1. Reserved.

R2. Each Reliability Coordinator shall have data exchange capabilities, with redundant and diversely routed data exchange infrastructure within the Reliability Coordinator's primary Control Center, for the exchange of Real-time data with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for performing its Real-time monitoring and Real-time Assessments. [Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-time Operations]

M2. Each Reliability Coordinator shall have, and provide upon request, evidence that could include, but is not limited to, system specifications, system diagrams, or other documentation that lists its data exchange capabilities, including redundant and diversely routed data exchange infrastructure within the Reliability Coordinator's primary Control Center, for the exchange of Real-time data with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, as specified in the requirement.

R3. Each Reliability Coordinator shall test its primary Control Center data exchange capabilities specified in Requirement R2 for redundant functionality at least once every 90 calendar days. If the test is unsuccessful, the Reliability Coordinator shall initiate action within two hours to restore redundant functionality. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

M3. Each Reliability Coordinator shall have, and provide upon request, evidence that it tested its primary Control Center data exchange capabilities specified in Requirement R2 for redundant functionality, or experienced an event that demonstrated the redundant functionality; and if the test was unsuccessful, initiated action within two hours to restore redundant functionality as specified in Requirement R3. Evidence could include, but is not limited to: dated and time-stamped test records, operator logs, voice recordings, or electronic communications.

R4. Each Reliability Coordinator shall provide its System Operators with the authority to approve planned outages and maintenance of its telecommunication, monitoring and analysis capabilities. [Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]

M4. Each Reliability Coordinator shall have, and provide upon request evidence that could include, but is not limited to, a documented procedure or equivalent evidence that will be used to confirm that the Reliability Coordinator has provided its System Operators with the authority to approve planned outages and maintenance of its telecommunication, monitoring and analysis capabilities.

R5. Each Reliability Coordinator shall monitor Facilities, the status of Remedial Action Schemes, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to
identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. [Violation Risk Factor: High] [Time Horizon: Real-Time Operations]

**M5.** Each Reliability Coordinator shall have, and provide upon request, evidence that could include, but is not limited to, Energy Management System description documents, computer printouts, SCADA data collection, or other equivalent evidence that will be used to confirm that it has monitored Facilities, the status of Remedial Action Schemes, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.

**R6.** Each Reliability Coordinator shall have monitoring systems that provide information utilized by the Reliability Coordinator’s operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant infrastructure. [Violation Risk Factor: High] [Time Horizon: Real-time Operations]

**M6.** The Reliability Coordinator shall have, and provide upon request, evidence that could include, but is not limited to, Energy Management System description documents, computer printouts, SCADA data collection, or other equivalent evidence that will be used to confirm that it has monitoring systems consistent with the requirement.
C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:
“Compliance Enforcement Authority” means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention:
The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- The Reliability Coordinator shall retain its current, in force document and any documents in force for the current year and previous calendar year for Requirements R2 and R4 and Measures M2 and M4.
- The Reliability Coordinator shall retain evidence for Requirement R3 and Measure M3 for the most recent 12 calendar months, with the exception of operator logs and voice recordings which shall be retained for a minimum of 90 calendar days.
- The Reliability Coordinator shall keep data or evidence for Requirements R5 and R6 and Measures M5 and M6 for the current calendar year and one previous calendar year.

1.3. Compliance Monitoring and Enforcement Program
As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Guidelines and Technical Basis
None.

Rationale
Rationale text from the development of IRO-002-4 in Project 2014-03 and IRO-002-5 in Project 2016-01 follows. Additional information can be found on the Project 2014-03 and Project 2016-01 pages.

Changes made to the proposed definitions were made in order to respond to issues raised in NOPR paragraphs 55, 73, and 74 dealing with analysis of SOLs in all time horizons, questions on Protection Systems and Special Protection Systems in NOPR paragraph 78, and recommendations on phase angles from the SW Outage Report (recommendation 27). The intent of such changes is to ensure that Real-time Assessments contain sufficient details to result in an appropriate level of situational awareness. Some examples include: 1) analyzing phase angles which may result in the implementation of an Operating Plan to adjust generation or curtail transactions so that a Transmission facility may be returned to service, or 2) evaluating the impact of a modified Contingency resulting from the status change of a Special Protection Scheme from enabled/in-service to disabled/out-of-service.

Rationale for Requirements:
The data exchange elements of Requirements R1 and R2 from approved IRO-002-2 have been added back into proposed IRO-002-4 in order to ensure that there is no reliability gap. The Project 2014-03 SDT found no proposed requirements in the current project that covered the issue. Voice communication is covered in proposed COM-001-2 but data communications needs to remain in IRO-002-4 as it is not covered in proposed COM-001-2. Staffing of communications and facilities in corresponding requirements from IRO-002-2 is addressed in approved PER-004-2, Requirement R1 and has been deleted from this draft.

Rationale for R2:
Requirement R2 from IRO-002-3 has been deleted because approved EOP-008-1, Requirement R1, part 1.6.2 addresses redundancy and back-up concerns for outages of analysis tools. New Requirement R4 (R6 in IRO-002-5) has been added to address NOPR paragraphs 96 and 97: “...As we explain above, the reliability coordinator’s obligation to monitor SOLs is important to reliability because a SOL can evolve into an IROL during deteriorating system conditions, and for potential system conditions such as this, the reliability coordinator’s monitoring of SOLs provides a necessary backup function to the transmission operator....”

Rationale for Requirements R1 and R2: (note: R1 proposed for retirement in IRO-002-6-7 as part of Project 2018-03 Standard Efficiency Review Retirements)
The proposed changes address directives for redundancy and diverse routing of data exchange capabilities (FERC Order No. 817 Para 47).
Redundant and diversely routed data exchange capabilities consist of data exchange infrastructure components (e.g., switches, routers, servers, power supplies, and network cabling and communication paths between these components in the primary Control Center for the exchange of system operating data) that will provide continued functionality despite failure or malfunction of an individual component within the Reliability Coordinator's (RC) primary Control Center. Redundant and diversely routed data exchange capabilities preclude single points of failure in primary Control Center data exchange infrastructure from halting the flow of Real-time data. Requirement R2 does not require automatic or instantaneous fail-over of data exchange capabilities. Redundancy and diverse routing may be achieved in various ways depending on the arrangement of the infrastructure or hardware within the RC's primary Control Center.

The reliability objective of redundancy is to provide for continued data exchange functionality during outages, maintenance, or testing of data exchange infrastructure. For periods of planned or unplanned outages of individual data exchange components, the proposed requirements do not require additional redundant data exchange infrastructure components solely to provide for redundancy.

Infrastructure that is not within the RC's primary Control Center is not addressed by the proposed requirement.

**Rationale for Requirement R3:**
The revised requirement addresses directives for testing of data exchange capabilities used in primary Control Centers (FERC Order No. 817 Para 51).

A test for redundant functionality demonstrates that data exchange capabilities will continue to operate despite the malfunction or failure of an individual component (e.g., switches, routers, servers, power supplies, and network cabling and communication paths between these components in the primary Control Center for the exchange of system operating data). An entity's testing practices should, over time, examine the various failure modes of its data exchange capabilities. When an actual event successfully exercises the redundant functionality, it can be considered a test for the purposes of the proposed requirement.

**Rationale for R4 (R6 in IRO-002-5 and IRO-002-67):**
The requirement was added back from approved IRO-002-2 as the Project 2014-03 SDT found no proposed requirements that covered the issues.
A. Introduction

1. **Title:** Reliability Coordination – Monitoring and Analysis
2. **Number:** IRO-002-57
3. **Purpose:** To provide System Operators with the capabilities necessary to monitor and analyze data needed to perform their reliability functions.
4. **Applicability:**
   4.1. **Functional Entities:**
      4.1.1. Reliability Coordinators

5. **Effective Date:** See Implementation Plan

B. Requirements and Measures

R1. **Reserved.** Each Reliability Coordinator shall have data exchange capabilities with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for it to perform its Operational Planning Analyses. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]

M1. **Reserved.** Each Reliability Coordinator shall have, and provide upon request, evidence that could include, but is not limited to, a document that lists its data exchange capabilities with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for it to perform its Operational Planning Analyses.

R2. Each Reliability Coordinator shall have data exchange capabilities, with redundant and diversely routed data exchange infrastructure within the Reliability Coordinator’s primary Control Center, for the exchange of Real-time data with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, for performing its Real-time monitoring and Real-time Assessments. [Violation Risk Factor: High] [Time Horizon: Same-Day Operations, Real-time Operations]

M2. Each Reliability Coordinator shall have, and provide upon request, evidence that could include, but is not limited to, system specifications, system diagrams, or other documentation that lists its data exchange capabilities, including redundant and diversely routed data exchange infrastructure within the Reliability Coordinator’s primary Control Center, for the exchange of Real-time data with its Balancing Authorities and Transmission Operators, and with other entities it deems necessary, as specified in the requirement.

R3. Each Reliability Coordinator shall test its primary Control Center data exchange capabilities specified in Requirement R2 for redundant functionality at least once every 90 calendar days. If the test is unsuccessful, the Reliability Coordinator shall initiate action within two hours to restore redundant functionality. [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]
M3. Each Reliability Coordinator shall have, and provide upon request, evidence that it tested its primary Control Center data exchange capabilities specified in Requirement R2 for redundant functionality, or experienced an event that demonstrated the redundant functionality; and if the test was unsuccessful, initiated action within two hours to restore redundant functionality as specified in Requirement R3. Evidence could include, but is not limited to: dated and time-stamped test records, operator logs, voice recordings, or electronic communications.

R4. Each Reliability Coordinator shall provide its System Operators with the authority to approve planned outages and maintenance of its telecommunication, monitoring and analysis capabilities. [Violation Risk Factor: High] [Time Horizon: Operations Planning, Same-Day Operations, Real-time Operations]

M4. Each Reliability Coordinator shall have, and provide upon request evidence that could include, but is not limited to, a documented procedure or equivalent evidence that will be used to confirm that the Reliability Coordinator has provided its System Operators with the authority to approve planned outages and maintenance of its telecommunication, monitoring and analysis capabilities.

R5. Each Reliability Coordinator shall monitor Facilities, the status of Remedial Action Schemes, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area. [Violation Risk Factor: High] [Time Horizon: Real-Time Operations]

M5. Each Reliability Coordinator shall have, and provide upon request, evidence that could include, but is not limited to, Energy Management System description documents, computer printouts, SCADA data collection, or other equivalent evidence that will be used to confirm that it has monitored Facilities, the status of Remedial Action Schemes, and non-BES facilities identified as necessary by the Reliability Coordinator, within its Reliability Coordinator Area and neighboring Reliability Coordinator Areas to identify any System Operating Limit exceedances and to determine any Interconnection Reliability Operating Limit exceedances within its Reliability Coordinator Area.

R6. Each Reliability Coordinator shall have monitoring systems that provide information utilized by the Reliability Coordinator’s operating personnel, giving particular emphasis to alarm management and awareness systems, automated data transfers, and synchronized information systems, over a redundant infrastructure. [Violation Risk Factor: High] [Time Horizon: Real-time Operations]

M6. The Reliability Coordinator shall have, and provide upon request, evidence that could include, but is not limited to, Energy Management System description documents, computer printouts, SCADA data collection, or other equivalent evidence that will be used to confirm that it has monitoring systems consistent with the requirement.
C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority:

“Compliance Enforcement Authority” means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention:

The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation.

- The Reliability Coordinator shall retain its current, in force document and any documents in force for the current year and previous calendar year for Requirements R1, R2, and R4 and Measures M1, M2, and M4.
- The Reliability Coordinator shall retain evidence for Requirement R3 and Measure M3 for the most recent 12 calendar months, with the exception of operator logs and voice recordings which shall be retained for a minimum of 90 calendar days.
- The Reliability Coordinator shall keep data or evidence for Requirements R5 and R6 and Measures M5 and M6 for the current calendar year and one previous calendar year.

1.3. Compliance Monitoring and Enforcement Program

As defined in the NERC Rules of Procedure, “Compliance Monitoring and Enforcement Program” refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Guidelines and Technical Basis
None.
Rationale

During development of IRO-002-5, text boxes are embedded within the standard to explain the rationale for various parts of the standard. Upon Board adoption of IRO-002-5, the text from the rationale text boxes will be moved to this section.

Rationale text from the development of IRO-002-4 in Project 2014-03 and IRO-002-5 in Project 2016-01 follows. Additional information can be found on the Project 2014-03 project page and the Project 2016-01 project page.

Changes made to the proposed definitions were made in order to respond to issues raised in NOPR paragraphs 55, 73, and 74 dealing with analysis of SOLs in all time horizons, questions on Protection Systems and Special Protection Systems in NOPR paragraph 78, and recommendations on phase angles from the SW Outage Report (recommendation 27). The intent of such changes is to ensure that Real-time Assessments contain sufficient details to result in an appropriate level of situational awareness. Some examples include: 1) analyzing phase angles which may result in the implementation of an Operating Plan to adjust generation or curtail transactions so that a Transmission facility may be returned to service, or 2) evaluating the impact of a modified Contingency resulting from the status change of a Special Protection Scheme from enabled/in-service to disabled/out-of-service.

Rationale for Requirements:

The data exchange elements of Requirements R1 and R2 from approved IRO-002-2 have been added back into proposed IRO-002-4 in order to ensure that there is no reliability gap. The Project 2014-03 SDT found no proposed requirements in the current project that covered the issue. Voice communication is covered in proposed COM-001-2 but data communications needs to remain in IRO-002-4 as it is not covered in proposed COM-001-2. Staffing of communications and facilities in corresponding requirements from IRO-002-2 is addressed in approved PER-004-2, Requirement R1 and has been deleted from this draft.

Rationale for R2:

Requirement R2 from IRO-002-3 has been deleted because approved EOP-008-1, Requirement R1, part 1.6.2 addresses redundancy and back-up concerns for outages of analysis tools. New Requirement R4 (R6 in IRO-002-5) has been added to address NOPR paragraphs 96 and 97: “...As we explain above, the reliability coordinator’s obligation to monitor SOLs is important to reliability because a SOL can evolve into an IROL during deteriorating system conditions, and for potential system conditions such as this, the reliability coordinator’s monitoring of SOLs provides a necessary backup function to the transmission operator....”

Rationale for Requirements R1 and R2: (note: R1 proposed for retirement in IRO-002-76 as part of Project 2018-03 Standard Efficiency Review Retirements)

The proposed changes address directives for redundancy and diverse routing of data exchange capabilities (FERC Order No. 817 Para 47).

Redundant and diversely routed data exchange capabilities consist of data exchange infrastructure components (e.g., switches, routers, servers, power supplies, and network
cabling and communication paths between these components in the primary Control Center for the exchange of system operating data) that will provide continued functionality despite failure or malfunction of an individual component within the Reliability Coordinator’s (RC) primary Control Center. Redundant and diversely routed data exchange capabilities preclude single points of failure in primary Control Center data exchange infrastructure from halting the flow of Real-time data. Requirement R2 does not require automatic or instantaneous fail-over of data exchange capabilities. Redundancy and diverse routing may be achieved in various ways depending on the arrangement of the infrastructure or hardware within the RC’s primary Control Center.

The reliability objective of redundancy is to provide for continued data exchange functionality during outages, maintenance, or testing of data exchange infrastructure. For periods of planned or unplanned outages of individual data exchange components, the proposed requirements do not require additional redundant data exchange infrastructure components solely to provide for redundancy.

Infrastructure that is not within the RC’s primary Control Center is not addressed by the proposed requirement.

**Rationale for Requirement R3:**
The revised requirement addresses directives for testing of data exchange capabilities used in primary Control Centers (FERC Order No. 817 Para 51).

A test for redundant functionality demonstrates that data exchange capabilities will continue to operate despite the malfunction or failure of an individual component (e.g., switches, routers, servers, power supplies, and network cabling and communication paths between these components in the primary Control Center for the exchange of system operating data). An entity's testing practices should, over time, examine the various failure modes of its data exchange capabilities. When an actual event successfully exercises the redundant functionality, it can be considered a test for the purposes of the proposed requirement.

**Rationale for R4 (R6 in IRO-002-5 and IRO-002-76):**
The requirement was added back from approved IRO-002-2 as the Project 2014-03 SDT found no proposed requirements that covered the issues.
A. Introduction

1. Title: Protection System Misoperation Identification and Correction
2. Number: PRC-004-6
3. Purpose: Identify and correct the causes of Misoperations of Protection Systems for Bulk Electric System (BES) Elements.

4. Applicability:
   4.1. Functional Entities:
      4.1.1 Transmission Owner
      4.1.2 Generator Owner
      4.1.3 Distribution Provider

   4.2. Facilities:
      4.2.1 Protection Systems for BES Elements, with the following exclusions:
         4.2.1.1 Non-protective functions that are embedded within a Protection System.
         4.2.1.2 Protective functions intended to operate as a control function during switching.¹
         4.2.1.3 Special Protection Systems (SPS).
         4.2.1.4 Remedial Action Schemes (RAS).
         4.2.1.5 Protection Systems of individual dispersed power producing resources identified under Inclusion I4 of the BES definition where the Misoperations affected an aggregate nameplate rating of less than or equal to 75 MVA of BES Facilities.

      4.2.2 Underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements.

      4.2.3 Undervoltage load shedding (UVLS) that is intended to trip one or more BES Elements.

5. Effective Date: See Implementation Plan.

¹ For additional information and examples, see the “Non-Protective Functions” and “Control Functions” sections in the Application Guidelines.
B. Requirements and Measures

R1. Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated under the circumstances in Parts 1.1 through 1.3 shall, within 120 calendar days of the BES interrupting device operation, identify whether its Protection System component(s) caused a Misoperation: [Violation Risk Factor: High] [Time Horizon: Operations Assessment, Operations Planning]

1.1 The BES interrupting device operation was caused by a Protection System or by manual intervention in response to a Protection System failure to operate; and

1.2 The BES interrupting device owner owns all or part of the Composite Protection System; and

1.3 The BES interrupting device owner identified that its Protection System component(s) caused the BES interrupting device(s) operation or was caused by manual intervention in response to its Protection System failure to operate.

M1. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it identified the Misoperation of its Protection System component(s), if any, that meet the circumstances in Requirement R1, Parts 1.1, 1.2, and 1.3 within the allotted time period. Acceptable evidence for Requirement R1, including Parts 1.1, 1.2, and 1.3 may include, but is not limited to the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, Disturbance Monitoring Equipment (DME) records, test results, or transmittals.

R2. Each Transmission Owner, Generator Owner, and Distribution Provider that owns a BES interrupting device that operated shall, within 120 calendar days of the BES interrupting device operation, provide notification as described in Parts 2.1 and 2.2. [Violation Risk Factor: High] [Time Horizon: Operations Assessment, Operations Planning]

2.1 For a BES interrupting device operation by a Composite Protection System or by manual intervention in response to a Protection System failure to operate, notification of the operation shall be provided to the other owner(s) that share Misoperation identification responsibility for the Composite Protection System under the following circumstances:

2.1.1 The BES interrupting device owner shares the Composite Protection System ownership with any other owner; and

2.1.2 The BES interrupting device owner has determined that a Misoperation occurred or cannot rule out a Misoperation; and

2.1.3 The BES interrupting device owner has determined that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation.
2.2 For a BES interrupting device operation by a Protection System component intended to operate as backup protection for a condition on another entity’s BES Element, notification of the operation shall be provided to the other Protection System owner(s) for which that backup protection was provided.

M2. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates notification to the other owner(s), within the allotted time period for either Requirement R2, Part 2.1, including subparts 2.1.1, 2.1.2, and 2.1.3 and Requirement R2, Part 2.2. Acceptable evidence for Requirement R2, including Parts 2.1 and 2.2 may include, but is not limited to the following dated documentation (electronic or hardcopy format): emails, facsimiles, or transmittals.

R3. Each Transmission Owner, Generator Owner, and Distribution Provider that receives notification, pursuant to Requirement R2 shall, within the later of 60 calendar days of notification or 120 calendar days of the BES interrupting device(s) operation, identify whether its Protection System component(s) caused a Misoperation. [Violation Risk Factor: High] [Time Horizon: Operations Assessment, Operations Planning]

M3. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it identified whether its Protection System component(s) caused a Misoperation within the allotted time period. Acceptable evidence for Requirement R3 may include, but is not limited to the following dated documentation (electronic or hardcopy format): reports, databases, spreadsheets, emails, facsimiles, lists, logs, records, declarations, analyses of sequence of events, relay targets, DME records, test results, or transmittals.

R4. Reserved.

M4. Reserved.

R5. Each Transmission Owner, Generator Owner, and Distribution Provider that owns the Protection System component(s) that caused the Misoperation shall, within 60 calendar days of first identifying a cause of the Misoperation: [Violation Risk Factor: High] [Time Horizon: Operations Planning, Long-Term Planning]

- Develop a Corrective Action Plan (CAP) for the identified Protection System component(s), and an evaluation of the CAP’s applicability to the entity’s other Protection Systems including other locations; or
- Explain in a declaration why corrective actions are beyond the entity’s control or would not improve BES reliability, and that no further corrective actions will be taken.

M5. Each Transmission Owner, Generator Owner, and Distribution Provider shall have dated evidence that demonstrates it developed a CAP and an evaluation of the CAP’s applicability to other Protection Systems and locations, or a declaration in accordance with Requirement R5. Acceptable evidence for Requirement R5 may include, but is not limited to the following dated documentation (electronic or hardcopy format): CAP and evaluation, or declaration.

R6. Each Transmission Owner, Generator Owner, and Distribution Provider shall
implement each CAP developed in Requirement R5, and update each CAP if actions or
timetables change, until completed. [Violation Risk Factor: High][Time Horizon:
Operations Planning, Long-Term Planning]

M6. Each Transmission Owner, Generator Owner, and Distribution Provider shall have
dated evidence that demonstrates it implemented each CAP, including updating
actions or timetables. Acceptable evidence for Requirement R6 may include, but is not
limited to the following dated documentation (electronic or hardcopy format): records
that document the implementation of each CAP and the completion of actions for
each CAP including revision history of each CAP. Evidence may also include work
management program records, work orders, and maintenance records.
C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority
As defined in the NERC Rules of Procedure, “Compliance Enforcement Authority” (CEA) means NERC or the Regional Entity in their respective roles of monitoring and enforcing compliance with the NERC Reliability Standards.

1.2. Evidence Retention
The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Transmission Owner, Generator Owner, and Distribution Provider shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation.

- The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirements R1, R2, and R3, Measures M1, M2, and M3 for a minimum of 12 calendar months following the completion of each Requirement.

- The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirement R5, Measure M5, including any supporting analysis per Requirements R1, R2, and R3, for a minimum of 12 calendar months following completion of each CAP, completion of each evaluation, and completion of each declaration.

- The Transmission Owner, Generator Owner, and Distribution Provider shall retain evidence of Requirement R6, Measure M6 for a minimum of 12 calendar months following completion of each CAP.

If a Transmission Owner, Generator Owner, or Distribution Provider is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved, or for the time specified above, whichever is longer.

The CEA shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes
- Compliance Audit
- Self-Certification
- Spot Checking
• Compliance Investigation
• Self-Reporting
• Complaint

1.4. Additional Compliance Information
None.

Guidelines and Technical Basis

Introduction
This standard addresses the reliability issues identified in the letter\(^3\) from Gerry Cauley, NERC President and CEO, dated January 7, 2011.

“Nearly all major system failures, excluding perhaps those caused by severe weather, have misoperations of relays or automatic controls as a factor contributing to the propagation of the failure. ...Relays can misoperate, either operate when not needed or fail to operate when needed, for a number of reasons. First, the device could experience an internal failure – but this is rare. Most commonly, relays fail to operate correctly due to incorrect settings, improper coordination (of timing and set points) with other devices, ineffective maintenance and testing, or failure of communications channels or power supplies. Preventable errors can be introduced by field personnel and their supervisors or more programatically by the organization.”

The standard also addresses the findings in the 2011 Risk Assessment of Reliability Performance\(^4\); July 2011.

“...a number of multiple outage events were initiated by protection system Misoperations. These events, which go beyond their design expectations and operating procedures, represent a tangible threat to reliability. A deeper review of the root causes of dependent and common mode events, which include three or more automatic outages, is a high priority for NERC and the industry.”

The State of Reliability 2014\(^5\) report continued to identify Protection System Misoperations as a significant contributor to automatic transmission outage severity. The report recommended completion of the development of PRC-004-3 as part of the solution to address Protection System Misoperations.

Definitions
The Misoperation definition is based on the IEEE/PSRC Working Group I3 “Transmission Protective Relay System Performance Measuring Methodology\(^6\)” Misoperations of a Protection System include failure to operate, slowness in operating, or operating when not required either during a Fault or non-Fault condition.

For reference, a “Protection System” is defined in the Glossary of Terms Used in NERC Reliability Standards (“NERC Glossary”) as:

---

• Protective relays which respond to electrical quantities,
• Communications systems necessary for correct operation of protective functions,
• Voltage and current sensing devices providing inputs to protective relays,
• Station dc supply associated with protective functions (including station batteries, battery chargers, and non-battery-based dc supply), and
• Control circuitry associated with protective functions through the trip coil(s) of the circuit breakers or other interrupting devices.

A BES interrupting device is a BES Element, typically a circuit breaker or circuit switcher that has the capability to interrupt fault current. Although BES interrupting device mechanisms are not part of a Protection System, the standard uses the operation of a BES interrupting device by a Protection System to initiate the review for Misoperation.

The following two definitions are being proposed for inclusion in the NERC Glossary:

**Composite Protection System** – The total complement of Protection System(s) that function collectively to protect an Element. Backup protection provided by a different Element’s Protection System(s) is excluded.

The Composite Protection System definition is based on the principle that an Element’s multiple layers of protection are intended to function collectively. This definition has been introduced in this standard and incorporated into the proposed definition of Misoperation to clarify that the overall performance of an Element’s total complement of protection should be considered while evaluating an operation.

**Composite Protection System – Line Example**
The Composite Protection System of the Alpha-Beta line (Circuit #123) is comprised of current differential, permissive overreaching transfer trip (POTT), step distance (classic zone 1, zone 2, and zone 3), instantaneous-overcurrent, time-overcurrent, out-of-step, and overvoltage protection. The protection is housed at the Alpha and Beta substations, and includes the associated relays, communications systems, voltage and current sensing devices, DC supplies, and control circuitry.

**Composite Protection System – Transformer Example**
The Composite Protection System of the Alpha transformer (#2) is comprised of internal differential, overall differential, instantaneous-overcurrent, and time-overcurrent protection. The protection is housed at the Alpha substation, and includes the associated relays, voltage and current sensing devices, DC supplies, and control circuitry.

**Composite Protection System – Generator Example**
The Composite Protection System of the Beta generator (#3) is comprised of generator differential, overall differential, overcurrent, stator ground, reverse power, volts per hertz, loss-of-field, and undervoltage protection. The protection is housed at the Beta generating plant and at the Beta substation, and includes the associated relays, voltage and current sensing
devices, DC supplies, and control circuitry.

**Composite Protection System – Breaker Failure Example**

Breaker failure protection provides backup protection for the breaker, and therefore is part of the breaker’s Composite Protection System. Considering breaker failure protection to be part of another Element’s Composite Protection System could lead to an incorrect conclusion that a breaker failure operation automatically satisfies the “Slow Trip” criteria of the Misoperation definition.

- An example of a correct operation of the breaker’s Composite Protection System is when the breaker failure relaying tripped because the line relaying operated, but the breaker failed to clear the Fault. The breaker failure relaying operated because of a failed trip coil. The failed trip coil caused a Misoperation of the line’s Composite Protection System.

- An example of a correct operation of the breaker’s Composite Protection System is when the breaker failure relaying tripped because the line relaying operated, but the breaker failed to clear the Fault. Only the breaker failure relaying operated because of a failed breaker mechanism. This was not a Misoperation because the breaker mechanism is not part of the breaker’s Composite Protection System.

- An example of an “Unnecessary Trip – During Fault” is when the breaker failure relaying tripped at the same time as the line relaying during a Fault. The Misoperation was due to the breaker failure timer being set to zero.

**Misoperation** – The failure a Composite Protection System to operate as intended for protection purposes. Any of the following is a Misoperation:

1. **Failure to Trip – During Fault** – A failure of a Composite Protection System to operate for a Fault condition for which it is designed. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.

2. **Failure to Trip – Other Than Fault** – A failure of a Composite Protection System to operate for a non-Fault condition for which it is designed, such as a power swing, undervoltage, overexcitation, or loss of excitation. The failure of a Protection System component is not a Misoperation as long as the performance of the Composite Protection System is correct.

3. **Slow Trip – During Fault** – A Composite Protection System operation that is slower than required for a Fault condition if the duration of its operating time resulted in the operation of at least one other Element’s Composite Protection System.

4. **Slow Trip – Other Than Fault** – A Composite Protection System operation that is slower than required for a non-Fault condition, such as a power swing, undervoltage, overexcitation, or loss of excitation, if the duration of its operating time resulted in the operation of at least one other Element’s Composite Protection System.

5. **Unnecessary Trip – During Fault** – An unnecessary Composite Protection System operation for a Fault condition on another Element.

6. **Unnecessary Trip – Other Than Fault** – An unnecessary Composite Protection System operation for a non-Fault condition on another Element.
operation for a non-Fault condition. A Composite Protection System operation that is caused by personnel during on-site maintenance, testing, inspection, construction, or commissioning activities is not a Misoperation.

The Misoperation definition is based on the principle that an Element’s total complement of protection is intended to operate dependably and securely.

- Failure to automatically reclose after a Fault condition is not included as a Misoperation because reclosing equipment is not included within the definition of Protection System.
- A breaker failure operation does not, in itself, constitute a Misoperation.
- A remote backup operation resulting from a “Failure to Trip” or a “Slow Trip” does not, in itself, constitute a Misoperation.

This proposed definition of Misoperation provides additional clarity over the current version. A Misoperation is the failure of a Composite Protection System to operate as intended for protection purposes. The definition includes six categories which provide further differentiation of what constitutes a Misoperation. These categories are discussed in greater detail in the following sections.

**Failure to Trip – During Fault**

This category of Misoperation typically results in the Fault condition being cleared by remote backup Protection System operation.

**Example 1a:** A failure of a transformer's Composite Protection System to operate for a transformer Fault is a Misoperation.

**Example 1b:** A failure of a "primary" transformer relay (or any other component) to operate for a transformer Fault is not a “Failure to Trip – During Fault” Misoperation as long as another component of the transformer's Composite Protection System operated.

**Example 1c:** A lack of target information does not by itself constitute a Misoperation. When a high-speed pilot system does not target because a high-speed zone element trips first, it would not in and of itself be a Misoperation.

**Example 1d:** A failure of an overall differential relay to operate is not a “Failure to Trip – During Fault” Misoperation as long as another component such as a generator differential relay operated.

**Example 1e:** The Composite Protection System for a bus does not operate during a bus Fault which results in the operation of all local transformer Protection Systems connected to that bus and all remote line Protection Systems connected to that bus isolating the faulted bus from the grid. The operation of the local transformer Protection Systems and the operation of all remote line Protection Systems correctly provided backup protection. There is one “Failure to Trip – During Fault” Misoperation of the bus Composite Protection System.
In analyzing the Protection System for Misoperation, the entity must also consider whether the “Slow Trip – During Fault” category applies to the operation.

**Failure to Trip – Other Than Fault**
This category of Misoperation may have resulted in operator intervention. The “Failure to Trip – Other Than Fault” conditions cited in the definition are examples only, and do not constitute an all-inclusive list.

**Example 2a:** A failure of a generator's Composite Protection System to operate for an unintentional loss of field condition is a Misoperation.

**Example 2b:** A failure of an overexcitation relay (or any other component) is not a "Failure to Trip – Other Than Fault" Misoperation as long as the generator’s Composite Protection System operated as intended isolating the generator from the BES.

In analyzing the Protection System for Misoperation, the entity must also consider whether the “Slow Trip – Other Than Fault” category applies to the operation.

**Slow Trip – During Fault**
This category of Misoperation typically results in remote backup Protection System operation before the Fault is cleared.

**Example 3a:** A Composite Protection System that is slower than required for a Fault condition is a Misoperation if the duration of its operating time resulted in the operation of at least one other Element’s Composite Protection System. The current differential element of a multiple function relay failed to operate for a line Fault. The same relay’s time-overcurrent element operated after a time delay. However, an adjacent line also operated from a time-overcurrent element. The faulted line's time-overcurrent element was found to be set to trip too slowly.

**Example 3b:** A failure of a breaker's Composite Protection System to operate as quickly as intended to meet the expected critical Fault clearing time for a line Fault in conjunction with a breaker failure (i.e., stuck breaker) is a Misoperation if it resulted in an unintended operation of at least one other Element’s Composite Protection System. If a generating unit’s Composite Protection System operates due to instability caused by the slow trip of the breaker's Composite Protection System, it is not an “Unnecessary Trip – During Fault” Misoperation of the generating unit’s Composite Protection System. This event would be a “Slow Trip – During Fault” Misoperation of the breaker's Composite Protection System.

**Example 3c:** A line connected to a generation interconnection station is protected with two independent high-speed pilot systems. The Composite Protection System for this line also includes step distance and time-overcurrent schemes in addition to the two pilot systems. During a Fault on this line, the two pilot systems fail to operate and the time-overcurrent scheme operates clearing the Fault with no generating units or other Elements tripping (i.e., no over-trips). This event is not a Misoperation.
The phrase “slower than required” means the duration of its operating time resulted in the operation of at least one other Element’s Composite Protection System. It would be impractical to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should understand whether the speed and outcome of its Protection System operation met their objective. The intent is not to require documentation of exact Protection System operation times, but to assure consideration of relay coordination and system stability by the owner(s) reviewing each Protection System operation.

The phrase “resulted in the operation of any other Composite Protection System” refers to the need to ensure that relaying operates in the proper or planned sequence (i.e., the primary relaying for a faulted Element operates before the remote backup relaying for the faulted Element).

In analyzing the Protection System for Misoperation, the entity must also consider the “Unnecessary Trip – During Fault” category to determine if an “unnecessary trip” applies to the Protection System operation of an Element other than the faulted Element.

If a coordination error was at the local terminal (i.e., set too slow), then it was a "Slow Trip," category of Misoperation at the local terminal.

**Slow Trip – Other Than Fault**

The phrase “slower than required” means the duration of its operating time resulted in the operation of at least one other Element’s Composite Protection System. It would be impractical to provide a precise tolerance in the definition that would be applicable to every type of Protection System. Rather, the owner(s) reviewing each Protection System operation should understand whether the speed and outcome of its Protection System operation met their objective. The intent is not to require documentation of exact Protection System operation times, but to assure consideration of relay coordination and system stability by the owner(s) reviewing each Protection System operation.

**Example 4:** A phase to phase fault occurred on the terminals of a generator. The generator’s Composite Protection System and a transmission line’s Composite Protection System both operated in response to the fault. It was found during subsequent investigation that the generator protection contained an inappropriate time delay. This caused the transmission line’s correctly set overreaching zone of protection to operate. This was a Misoperation of the generator’s Composite Protection System, but not of the transmission line’s Composite Protection System.

The “Slow Trip – Other Than Fault” conditions cited in the definition are examples only, and do not constitute an all-inclusive list.

**Unnecessary Trip – During Fault**

An operation of a properly coordinated remote Protection System is not in and of itself a Misoperation if the Fault has persisted for a sufficient time to allow the correct operation of the...
Composite Protection System of the faulted Element to clear the Fault. A BES interrupting device failure, a “failure to trip” Misoperation, or a “slow trip” Misoperation may result in a proper remote Protection System operation.

**Example 5:** An operation of a transformer’s Composite Protection System which trips (i.e., over-trips) for a properly cleared line Fault is a Misoperation. The Fault is cleared properly by the faulted equipment’s Composite Protection System (i.e., line relaying) without the need for an external Protection System operation resulting in an unnecessary trip of the transformer protection; therefore, the transformer Protection System operation is a Misoperation.

**Example 5b:** An operation of a line’s Composite Protection System which trips (i.e., over-trips) for a properly cleared Fault on a different line is a Misoperation. The Fault is cleared properly by the faulted line’s Composite Protection System (i.e., line relaying); however, elsewhere in the system, a carrier blocking signal is not transmitted (e.g., carrier ON/OFF switch found in OFF position) resulting in the operation of a remote Protection System, single-end trip of a non-faulted line. The operation of the Protection System for the non-faulted line is an unnecessary trip during a Fault. Therefore, the non-faulted line Protection System operation is an “Unnecessary Trip – During Fault” Misoperation.

**Example 5c:** If a coordination error was at the remote terminal (i.e., set too fast), then it was an "Unnecessary Trip – During Fault" category of Misoperation at the remote terminal.

**Unnecessary Trip – Other Than Fault**
Unnecessary trips for non-Fault conditions include but are not limited to: power swings, overexcitation, loss of excitation, frequency excursions, and normal operations.

**Example 6a:** An operation of a line’s Composite Protection System due to a relay failure during normal operation is a Misoperation.

**Example 6b:** Tripping a generator by the operation of the loss of field protection during an off-nominal frequency condition while the field is intact is a Misoperation assuming the Composite Protection System was not intended to operate under this condition.

**Example 6c:** An impedance line relay trip for a power swing that entered the relay’s characteristic is a Misoperation if the power swing was stable and the relay operated because power swing blocking was enabled and should have prevented the trip, but did not.

**Example 6d:** Tripping a generator operating at normal load by the operation of a reverse power protection relay due to a relay failure is a Misoperation.

Additionally, an operation that occurs during a non-Fault condition but was initiated directly by on-site (i.e., real-time) maintenance, testing, inspection, construction, or commissioning is not a Misoperation.

**Example 6e:** A BES interrupting device operation that occurs at the remote end of a line
during a non-Fault condition because a direct transfer trip was initiated by system maintenance and testing activities at the local end of the line is not a Misoperation because of the maintenance exclusion in category 6 of the definition of “Misoperation.”

The “on-site” activities at one location that initiates a trip to another location are included in this exemption. This includes operation of a Protection System when energizing equipment to facilitate measurements, such as verification of current circuits as a part of performing commissioning; however, once the maintenance, testing, inspection, construction, or commissioning activity associated with the Protection System is complete, the "on-site" Misoperation exclusion no longer applies, regardless of the presence of on-site personnel.

Special Cases
Protection System operations for these cases would not be a Misoperation.

Example 7a: A generator Protection System operation prior to closing the unit breaker(s) is not a Misoperation provided no in-service Elements are tripped.

This type of operation is not a Misoperation because the generating unit is not synchronized and is isolated from the BES. Protection System operations that occur when the protected Element is out of service and that do not trip any in-service Elements are not Misoperations. In some cases where zones of protection overlap, the owner(s) of Elements may decide to allow a Protection System to operate faster in order to gain better overall Protection System performance for an Element.

Example 7b: The high-side of a transformer connected to a line may be within the zone of protection of the supplying line’s relaying. In this case, the line relaying is planned to protect the area of the high-side of the transformer and into its primary winding. In order to provide faster protection for the line, the line relaying may be designed and set to operate without direct coordination (or coordination is waived) with local protection for Faults on the high-side of the connected transformer. Therefore, the operation of the line relaying for a high-side transformer Fault operated as intended and would not be a Misoperation.

Below are examples of conditions that would be a Misoperation.

Example 7c: A 230 kV shunt capacitor bank was released for operational service. The capacitor bank trips due to a settings error in the capacitor bank differential relay upon energization.

Example 7d: A 230/115 kV BES transformer bank trips out when being re-energized due to an incorrect operation of the transformer differential relay for inrush after being released for operational service. Only the high-side breaker opens since the low-side breaker had not yet been closed.

Non-Protective Functions
BES interrupting device operations which are initiated by non-protective functions, such as those associated with generator controls, excitation controls, or turbine/boiler controls, static
voltampere-reactive compensators (SVC), flexible ac transmission systems (FACTS), high-voltage
dc (HVdc) transmission systems, circuit breaker mechanisms, or other facility control systems
are not operations of a Protection System. The standard is not applicable to non-protective
functions such as automation (e.g., data collection) or control functions that are embedded
within a Protection System.

Control Functions
The entity must make a determination as to whether the standard is applicable to each
operation of its Protection System in accordance with the provided exclusions in the standard’s
Applicability, see Section 4.2.1. The subject matter experts (SME) developing this standard
recognize that entities use Protection Systems as part of a routine practice to control BES
Elements. This standard is not applicable to operation of protective functions within a
Protection System when intended for controlling a BES Element as a part of an entity’s process
or planned switching sequence. The following are examples of conditions to which this standard
is not applicable:

Example 8a: The reverse power protective function that operates to remove a generating
unit from service using the entity’s normal or routine process.

Example 8b: The reverse power relay enables a permissive trip and the generator operator
trips the unit.

The standard is not applicable to operation of the protective relay because its operation is
intended as a control function as part of a controlled shutdown sequence for the generator.
However, the standard remains applicable to operation of the reverse power relay when it
operates for conditions not associated with the controlled shutdown sequence, such as a
motoring condition caused by a trip of the prime mover.

The following is another example of a condition to which this standard is not applicable:

Example 8c: Operation of a capacitor bank interrupting device for voltage control using
functions embedded within a microprocessor based relay that is part of a Protection
System.

The above are examples only, and do not constitute an all-inclusive list to which the standard is
not applicable.

Extenuating Circumstances
In the event of a natural disaster or other extenuating circumstances, the December 20, 2012
Sanction Guidelines of the North American Electric Reliability Corporation, Section 2.8,
Extenuating Circumstances, reads: “In unique extenuating circumstances causing or
contributing to the violation, such as significant natural disasters, NERC or the Regional Entity
may significantly reduce or eliminate Penalties.” The Regional Entities to whom NERC has
delegated authority will consider extenuating circumstances when considering any sanctions in
relation to the timelines outlined in this standard.
The volume of Protection System operations tend to be sporadic. If a high rate of Protection System operations is not sustained, utilities will have an opportunity to catch up within the 120 day period.

**Requirement Time Periods**
The time periods within all the Requirements are distinct and separate. The applicable entity in Requirement R1 has 120 calendar days to identify whether a BES interrupting device operation is a Misoperation. Once the applicable entity has identified a Misoperation, it has completed its performance under Requirement R1. Identified Misoperations with an identified cause become subject to Requirement R5 and any subsequent Requirements as necessary.

In Requirement R2, the applicable entity has 120 calendar days, based on the date of the BES interrupting device operation, to provide notification to the other Protection System owners that meet the circumstances in Parts 2.1 and 2.2. For the case of an applicable entity that was notified (R3), it has the later of 120 calendar days from the date of the BES interrupting device operation or 60 calendar days of notification to identify whether its Protection System components caused a Misoperation.

Once a Misoperation is identified in either Requirement R1 or R3, and the applicable entity did not identify the cause(s) of the Misoperation, the time period for performing at least one investigative action every two full calendar quarters begins.

The time period in Requirement R5 begins when the Misoperation cause is first identified. The applicable entity is allotted 60 calendar days to perform one of the two activities listed in Requirement R5 (e.g., CAP or declaration) to complete its performance under Requirement R5.

Requirement R6 time period is determined by the actions and the associated timetable to complete those actions identified in the CAP. The time periods contained in the CAP may change from time to time and the applicable entity is required to update the timetable when it changes.

Time periods provided in the Requirements are intended to provide a reasonable amount of time to perform each Requirement. Performing activities in the least amount of time facilitates prompt identification of Misoperations, notification to other Protection System owners, identification of the cause(s), correction of the cause(s), and that important information is retained that may be lost due to time.

**Requirement R1**
This Requirement initiates a review of each BES interrupting device operation to identify whether or not a Misoperation may have occurred. Since the BES interrupting device owner typically monitors and tracks device operations, the owner is the logical starting point for identifying Misoperations of Protection Systems for BES Elements. A review is required when (1) a BES interrupting device operates that is caused by a Protection System or by manual intervention in response to a Protection System failure to operate, (2) regardless of whether the owner owns all or part of the Protection System component(s), and (3) the owner identified its Protection System component(s) as causing the BES interrupting device operation or was
caused by manual intervention in response to its Protection System failure to operate.

Since most Misoperations result in the operation of one or more BES interrupting devices, these operations initiate a review to identify any Misoperation. If an Element is manually isolated in response to a failure to operate, the manual isolation of the Element triggers a review for Misoperation.

**Example R1a:** The failure of a loss of field relay on a generating unit where an operator takes action to isolate the unit.

Manual intervention may indicate a Misoperation has occurred, thus requiring the initiation of an investigation by the BES interrupting device owner.

For the case where a BES interrupting device did not operate and remote clearing occurs due to the failure of a Composite Protection System to operate, the BES interrupting device owner would still review the operation under Requirement R1. However, if the BES interrupting device owner determines that its Protection System component operated as backup protection for a condition on another entity’s BES Element, the owner would provide notification of the operation to the other Protection System owner(s) under Requirement R2, Part 2.2.

Protection Systems are made of many components. These components may be owned by different entities. For example, a Generator Owner may own a current transformer that sends information to a Transmission Owner’s differential relay. All of these components and many more are part of a Protection System. It is expected that all of the owners will communicate with each other, sharing information freely, so that Protection System operations can be analyzed, Misoperations identified, and corrective actions taken.

Each entity is expected to use judgment to identify those Protection System operations that meet the definition of Misoperation regardless of the level of ownership. A combination of available information from resources such as counters, relay targets, Supervisory Control and Data Acquisition (SCADA) systems, or DME would typically be used to determine whether or not a Misoperation occurred. The intent of the standard is to classify an operation as a Misoperation if the available information leads to that conclusion. In many cases, it will not be necessary to leverage all available data to determine whether or not a Misoperation occurred. The standard also allows an entity to classify an operation as a Misoperation if entity is not sure. The entity may decide to identify the operation as a Misoperation to satisfy Requirement R1 and continue its investigation for a cause of the Misoperation. If the continued investigative actions are inconclusive, the entity may declare no cause found and end its investigation. The entity is allotted 120 calendar days from the date of its BES interrupting device operation to identify whether its Protection System component(s) caused a Misoperation.

The Protection System operation may be documented in a variety of ways such as in a report, database, spreadsheet, or list. The documentation may be organized in a variety of ways such as by BES interrupting device, protected Element, or Composite Protection System.

Repeated operations which occur during the same automatic reclosing sequence do not need a
separate identification under Requirement R1. Repeated Misoperations which occur during the same 24-hour period do not need a separate identification under Requirement R1. This is consistent with the NERC *Misoperations Report*\(^7\) which states:

“In order to avoid skewing the data with these repeated events, the NERC SPCS should clarify, in the next annual update of the misoperation template, that all misoperations due to the same equipment and cause within a 24 hour period be recorded as one misoperation.”

The following is an example of a condition that is not a Misoperation.

**Example R1b:** A high impedance Fault occurs within a transformer. The sudden pressure relaying detects and operates for the Fault, but the differential relaying did not operate due to the low Fault current levels. This is not a Misoperation because the Composite Protection System was not required to operate because the Fault was cleared by the sudden pressure relay.

**Requirement R2**

Requirement R2 ensures notification of those who have a role in identifying Misoperations, but were not accounted for within Requirement R1. In the case of multi-entity ownership, the entity that owns the BES interrupting device that operated is expected to use judgment to identify those Protection System operations that meet the definition of Misoperation under Requirement R1; however, if the entity that owns a BES interrupting device determines that its Protection System component(s) did not cause the BES interrupting device(s) operation or cannot determine whether its Protection System components caused the BES interrupting device(s) operation, it must notify the other Protection System owner(s) that share Misoperation identification responsibility when the criteria in Requirement R2 is met.

This Requirement does not preclude the Protection System owners from initially communicating and working together to determine whether a Misoperation occurred and, if so, the cause. The BES interrupting device owner is only required to officially notify the other owners when it: (1) shares the Composite Protection System ownership with other entity(ies), (2) determines that a Misoperation occurred or cannot rule out a Misoperation, and (3) determines its Protection System component(s) did not cause a Misoperation or is unsure. Officially notifying the other owners without performing a preliminary review may unnecessarily burden the other owners with compliance obligations under Requirement R3, redirect valuable resources, and add little benefit to reliability. The BES interrupting device owner should officially notify other owners when appropriate within the established time period.

The following is an example of a notification to another Protection System owner:

**Example R2a:** Circuit breakers A and B at the Charlie station tripped from directional

---

comparison blocking (DCB) relaying on 03/03/2014 at 15:43 UTC during an external Fault. As discussed last week, the fault records indicate that a problem with your equipment (failure to transmit) caused the operation.

Example R2b: A generator unit tripped out immediately upon synchronizing to the grid due to a Misoperation of its overcurrent protection. The Transmission Owner owns the 230 kV generator breaker that operated. The Transmission Owner, as the owner of the BES interrupting device after determining that its Protection System components did not cause the Misoperation, notified the Generator Owner of the operation. The Generator Owner investigated and determined that its Protection System components caused the Misoperation. In this example, the Generator Owner’s Protection System components did cause the Misoperation. As the owner of the Protection System components that caused the Misoperation, the Generator Owner is responsible for creating and implementing the CAP.

A Composite Protection System owned by different functional entities within the same registered entity does not necessarily satisfy the notification criteria in Part 2.1.1 of Requirement R2. For example, if the same personnel within a registered entity perform the Misoperation identification for both the Generator Owner and Transmission Owner functions, then the Misoperation identification would be completely covered in Requirement R1, and therefore notification would not be required. However, if the Misoperation identification is handled by different groups, then notification would be required because the Misoperation identification would not necessarily be covered in Requirement R1.

Example R2c: Line A Composite Protection System (owned by entity 1) failed to operate for an internal Fault. As a result, the zone 3 portion of Line B’s Composite Protection System (owned by entity 2) and zone 3 portion of Line C’s Composite Protection System (owned by entity 3) operated to clear the Fault. Entity 2 and 3 notified entity 1 of the remote zone 3 operation.

For the case where a BES interrupting device operates to provide backup protection for a non-BES Element, the entity reviewing the operation is not required to notify the other owners of Protection Systems for non-BES Elements. No notification is required because this Reliability Standard is not applicable to Protection Systems for non-BES Elements.

Requirement R3
For Requirement R3 (i.e., notification received), the entity that also owns a portion of the Composite Protection System is expected to use judgment to identify whether the Protection System operation is a Misoperation. A combination of available information from resources such as counters, relay targets, SCADA, DME, and information from the other owner(s) would typically be used to determine whether or not a Misoperation occurred. The intent of the standard is to classify an operation as a Misoperation if the available information leads to that conclusion. In many cases, it will not be necessary to leverage all available data to determine whether or not a Misoperation occurred. The standard also allows an entity to classify an operation as a Misoperation if an entity is not sure. The entity may decide to identify the operation as a Misoperation to satisfy Requirement R1 and continue its investigation for a
cause of the Misoperation. If the continued investigative actions are inconclusive, the entity may declare no cause found and end its investigation.

The entity that is notified by the BES interrupting device owner is allotted the later of 60 calendar days from receipt of notification or 120 calendar days from the BES interrupting device operation date to determine if its portion of the Composite Protection System caused the Protection System operation. It is expected that in most cases of a jointly owned Protection System, the entity making notification would have been in communication with the other owner(s) early in the process. This means that the shorter 60 calendar days only comes into play if the notification occurs in the second half of the 120 calendar days allotted to the BES interrupting device owner in Requirement R1.

The Protection System review may be organized in a variety of ways such as in a report, database, spreadsheet, or list. The documentation may be organized in a variety of ways such as by BES interrupting device, protected Element, or Composite Protection System. The BES interrupting device owner’s notification received may be documented in a variety of ways such as an email or a facsimile.

**Requirement R5**

Resolving the causes of Protection System Misoperations benefits BES reliability by preventing recurrence. The Corrective Action Plan (CAP) is an established tool for resolving operational problems. The NERC Glossary defines a Corrective Action Plan as, "A list of actions and an associated timetable for implementation to remedy a specific problem." Since a CAP addresses specific problems, the determination of what went wrong needs to be completed before developing a CAP. When the Misoperation cause is identified in Requirement R1 or R3, Requirement R5 requires Protection System owner(s) to develop a CAP, or explain why corrective actions are beyond the entity’s control or would not improve BES reliability. The entity must develop the CAP or make a declaration why additional actions are beyond the entity’s control or would not improve BES reliability and that no further corrective actions will be taken within 60 calendar days of first determining a cause.

The SMEs developing this standard recognize there may be multiple causes for a Misoperation. In these circumstances, the CAP would include a remedy for the identified causes. The CAP may be revised if additional causes are found; therefore, the entity has the option to create a single or multiple CAP(s) to correct multiple causes of a Misoperation. The 60 calendar day period for developing a CAP (or declaration) is established on the basis of industry experience which includes operational coordination timeframes, time to consider alternative solutions, coordination of resources, and development of a schedule.

The development of a CAP is intended to document the specific corrective actions needed to be taken to prevent Misoperation recurrence, the timetable for executing such actions, and an evaluation of the CAP’s applicability to the entity’s other Protection Systems including other locations. The evaluation of these other Protection Systems aims to reduce the risk and likelihood of similar Misoperations in other Protection Systems. The Protection System owner is responsible for determining the extent of its evaluation concerning other Protection Systems and locations. The evaluation may result in the owner including actions to address Protection
Systems at other locations or the reasoning for not taking any action. The CAP and an evaluation of other Protection Systems including other locations must be developed to complete Requirement R5.

The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor within the relay and the evaluation of the cause at similar locations which determined capacitor replacement was not necessary.

For completion of each CAP in Examples R5a through R5d, please see Examples R6a through R6d.

**Example R5a:** Actions: Remove the relay from service. Replace capacitor in the relay. Test the relay. Return to service or replace by 07/01/2014.

Applicability to other Protection Systems: This type of impedance relay has not been experiencing problems and is systematically being replaced with microprocessor relays as Protection Systems are modernized. Therefore, it was assessed that a program for wholesale preemptive replacement of capacitors in this type of impedance relay does not need to be established for the system.

The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor within the relay and the evaluation of the cause at similar locations which determined the capacitors need preemptive correction action.

**Example R5b:** Actions: Remove the relay from service. Replace capacitor in the relay. Test the relay. Return to service or replace by 07/01/2014.

Applicability to other Protection Systems: This type of impedance relay is suspected to have previously tripped at other locations because of the same type of capacitor issue. Based on the evaluation, a program should be established by 12/01/2014 for wholesale preemptive replacement of capacitors in this type of impedance relay.

The following is an example of a CAP for a relay Misoperation that was applying a standing trip due to a failed capacitor within the relay and the evaluation of the cause at similar locations which determined the capacitors need preemptive correction action.

**Example R5c:** Actions: Remove the relay from service. Replace capacitor in the relay. Test the relay. Return to service or replace by 07/01/2014.

Applicability to other Protection Systems: This type of impedance relay is suspected to have previously tripped at other locations because of the same type of capacitor issue. Based on the evaluation, the preemptive replacement of capacitors in this type of impedance relay should be pursued for the identified stations A through I by 04/30/2015.

A plan is being developed to replace the impedance relay capacitors at stations A, B, and C by 09/01/2014. A second plan is being developed to replace the impedance relay capacitors...
at stations D, E, and F by 11/01/2014. The last plan will replace the impedance relay capacitors at stations G, H, and I by 02/01/2015.

The following is an example of a CAP for a relay Misoperation that was due to a version 2 firmware problem and the evaluation of the cause at similar locations which determined the firmware needs preemptive correction action.

**Example R5d:** Actions: Provide the manufacturer fault records. Install new firmware pending manufacturer results by 10/01/2014.

Applicability to other Protection Systems: Based on the evaluation of other locations and a risk assessment, the newer firmware version 3 should be installed at all installations that are identified to be version 2. Twelve relays were identified across the system. Proposed completion date is 12/31/2014.

The following are examples of a declaration made where corrective actions are beyond the entity’s control or would not improve BES reliability and that no further corrective actions will be taken.

**Example R5e:** The cause of the Misoperation was due to a non-registered entity communications provider problem.

**Example R5f:** The cause of the Misoperation was due to a transmission transformer tapped industrial customer who initiated a direct transfer trip to a registered entity’s transmission breaker.

In situations where a Misoperation cause emanates from a non-registered outside entity, there may be limited influence an entity can exert on an outside entity and is considered outside of an entity’s control.

The following are examples of declarations made why corrective actions would not improve BES reliability.

**Example R5g:** The investigation showed that the Misoperation occurred due to transients associated with energizing transformer ABC at Station Y. Studies show that de-sensitizing the relay to the recorded transients may cause the relay to fail to operate as intended during power system oscillations.

**Example R5h:** As a result of an operation that left a portion of the power system in an electrical island condition, circuit XYZ within that island tripped, resulting in loss of load within the island. Subsequent investigation showed an overfrequency condition persisted after the formation of that island and the XYZ line protective relay operated. Since this relay was operating outside of its designed frequency range and would not be subject to this condition when line XYZ is operated normally connected to the BES, no corrective action will be taken because BES reliability would not be improved.
Example R5i: During a major ice storm, four of six circuits were lost at Station A. Subsequent to the loss of these circuits, a skywire (i.e., shield wire) broke near station A on line AB (between Station A and B) resulting in a phase-phase Fault. The protection scheme utilized for both protection groups is a permissive overreaching transfer trip (POTT). The Line AB protection at Station B tripped timed for this event (i.e., Slow Trip – During Fault) even though this line had been identified as requiring high speed clearing. A weak infeed condition was created at Station A due to the loss of 4 transmission circuits resulting in the absence of a permissive signal on Line AB from Station A during this Fault. No corrective action will be taken for this Misoperation as even under N-1 conditions, there is normally enough infeed at Station A to send a proper permissive signal to station B. Any changes to the protection scheme to account for this would not improve BES reliability.

A declaration why corrective actions are beyond the entity’s control or would not improve BES reliability should include the Misoperation cause and the justification for taking no corrective action. Furthermore, a declaration that no further corrective actions will be taken is expected to be used sparingly.

Requirement R6
To achieve the stated purpose of this standard, which is to identify and correct the causes of Misoperations of Protection Systems for BES Elements, the responsible entity is required to implement a CAP that addresses the specific problem (i.e., cause(s) of the Misoperation) through completion. Protection System owners are required in the implementation of a CAP to update it when actions or timetable change, until completed. Accomplishing this objective is intended to reduce the occurrence of future Misoperations of a similar nature, thereby improving reliability and minimizing risk to the BES.

The following is an example of a completed CAP for a relay Misoperation that was applying a standing trip (See also, Example R5a).

Example R6a: Actions: The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. A failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014. CAP completed on 06/25/2014.

The following is an example of a completed CAP for a relay Misoperation that was applying a standing trip that resulted in the correction and the establishment of a program for further replacements (See also, Example R5b).

Example R6b: Actions: The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. A failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.

A program for wholesale preemptive replacement of capacitors in this type of impedance
relay was established on 10/28/2014.

CAP completed on 10/28/2014.

The following is an example of a completed CAP of corrective actions with a timetable that required updating for a failed relay and preemptive actions for similar installations (See also, Example R5c).

**Example R6c:** Actions: The impedance relay was removed from service on 06/02/2014 because it was applying a standing trip. A failed capacitor was found within the impedance relay and replaced. The impedance relay functioned properly during testing after the capacitor was replaced. The impedance relay was returned to service on 06/05/2014.

The impedance relay capacitor replacement was completed at stations A, B, and C on 08/16/2014. The impedance relay capacitor replacement was completed at stations D, E, and F on 10/24/2014. The impedance relay capacitor replacement for stations G, H, and I were postponed due to resource rescheduling from a scheduled 02/01/15 completion to 04/01/2015 completion. Capacitor replacement was completed on 03/09/2015 at stations G, H, and I. All stations identified in the evaluation have been completed.

CAP completed on 03/09/2015.

The following is an example of a completed CAP for corrective actions with updated actions for a firmware problem and preemptive actions for similar installations. (See also, Example R5d).

**Example R6d:** Actions: fault records were provided to the manufacturer on 06/04/2014. The manufacturer responded that the Misoperation was caused by a bug in version 2 firmware, and recommended installing version 3 firmware. Version 3 firmware was installed on 08/12/2014.

Nine of the twelve relays were updated to version 3 firmware on 09/23/2014. The manufacturer provided a subsequent update which was determined to be beneficial for the remaining relays. The remaining three of twelve relays identified as having the version 2 firmware were updated to version 3.01 firmware on 11/10/2014.

CAP completed on 11/10/2014.

The CAP is complete when all of the actions identified within the CAP have been completed.
Process Flow Chart: Below is a graphical representation demonstrating the relationships between Requirements:

1. **R1**
   - When all are TRUE
   - BES interrupting device owner must also consider this as a parallel path if a Composite Protection System has multiple owners

2. **R2**
   - Shall identify whether BES interrupting device owner’s Protection System component(s) caused a Misoperation

3. **R3**
   - The entity that receives notification, within the later of either 60 calendar days of notification or 120 calendar days of the BES interrupting device operation, shall identify whether its Protection System component(s) caused a Misoperation.

4. **R4**
   - Write a declaration that no cause was identified

5. **R5**
   - Implement each Corrective Action Plan (CAP), and update each CAP if actions or timetables change, until completed.

6. **R6**
   - Document why corrective actions are beyond the entity’s control or would not improve BES reliability, and that no further corrective actions will be taken.
A. Introduction

1. Title: Protection System Misoperation Identification and Correction
2. Number: PRC-004-6
3. Purpose: Identify and correct the causes of Misoperations of Protection Systems for Bulk Electric System (BES) Elements.

4. Applicability:
   4.1. Functional Entities:
      4.1.1 Transmission Owner
      4.1.2 Generator Owner
      4.1.3 Distribution Provider
   4.2. Facilities:
      4.2.1 Protection Systems for BES Elements, with the following exclusions:
         4.2.1.1 Non-protective functions that are embedded within a Protection System.
         4.2.1.2 Protective functions intended to operate as a control function during switching.¹
         4.2.1.3 Special Protection Systems (SPS).
         4.2.1.4 Remedial Action Schemes (RAS).
         4.2.1.5 Protection Systems of individual dispersed power producing resources identified under Inclusion I4 of the BES definition where the Misoperations affected an aggregate nameplate rating of less than or equal to 75 MVA of BES Facilities.
      4.2.2 Underfrequency load shedding (UFLS) that is intended to trip one or more BES Elements.
      4.2.3 Undervoltage load shedding (UVLS) that is intended to trip one or more BES Elements.

5. Effective Date: See Implementation Plan.

¹ For additional information and examples, see the “Non-Protective Functions” and “Control Functions” sections in the Application Guidelines.
B. Requirements and Measures
