TABLE OF CONTENTS

UNITED STATES OF AMERICA
BEFORE THE
FEDERAL ENERGY REGULATORY COMMISSION

North American Electric Reliability Corporation	**)**	**Docket No. _____**
	)	

PETITION OF THE NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION FOR APPROVAL OF PROPOSED RELIABILITY STANDARD EOP-012-3

Pursuant to Section 215(d)(1) of the Federal Power Act ("FPA")[1] and Section 39.5[2] of the Federal Energy Regulatory Commission's ("FERC" or "Commission") regulations, and the Commission's June 27, 2024 order in Docket Nos. RD24-5-000 and RD24-1-000,[3] the North American Electric Reliability Corporation ("NERC")[4] hereby submits for Commission approval proposed Reliability Standard EOP-012-3 (Extreme Cold Weather Preparedness and Operations).[5]

Multiple events since 2011 have demonstrated that the failure to prepare adequately for extreme cold weather conditions can present severe risks to reliability of the Bulk-Power System. The EOP-012 Reliability Standard comprises an important part of NERC's comprehensive framework of requirements addressing cold weather planning and operations to help address these risks and assure the reliability of the Bulk-Power System. The EOP-012 Reliability Standard addresses the specific matter of generator cold weather preparedness, with requirements consistent

3 *N. Am. Elec. Reliability Corp.*, 187 FERC ¶ 61,204 (2024) (approving Reliability Standard EOP-012-2 and directing further revisions) [hereinafter June 2024 Order].

4 The Commission certified NERC as the electric reliability organization ("ERO") in accordance with Section 215 of the FPA on July 20, 2006. *N. Am. Elec. Reliability Corp.*, 116 FERC ¶ 61,062 (2006), *order on reh'g & compliance*, 117 FERC ¶ 61,126 (2006), *aff'd sub nom. Alcoa, Inc. v. FERC*, 564 F.3d 1342 (D.C. Cir. 2009).

5 Unless otherwise indicated, all capitalized terms used in this petition shall have the meaning set forth in the *Glossary of Terms used in NERC Reliability Standards* ("NERC Glossary"), https://www.nerc.com/pa/Stand/Glossary%20of%20Terms/Glossary_of_Terms.pdf.

with the recommendations of the FERC, NERC, and Regional Entity Staff Joint Inquiry into the causes of the February 2021 cold weather event affecting Texas and the south-central United States.[6]

Proposed Reliability Standard EOP-012-3 would further improve upon the currently effective Reliability Standard EOP-012-2 through enhanced and expanded requirements that would ensure that entities are implementing corrective actions to address known issues affecting their ability to operate reliability in cold weather in a timely manner. For those circumstances in which implementing corrective actions may not be feasible, referred to in the proposed standard as "Generator Cold Weather Constraints," proposed Reliability Standard EOP-012-3 would provide an improved framework for the identification, validation, and periodic review of such constraints. Consistent with the June 2024 Order, this framework provides clear, detailed, and objective criteria so responsible entities understand the performance that is expected of them. Proposed Reliability Standard EOP-012-3 thus addresses the Commission's directives in the June 2024 Order and would advance the reliability of the Bulk-Power System in future winter seasons.

NERC requests that the Commission approve proposed Reliability Standard EOP-012-3, along with the proposed revised definitions of the term Generator Cold Weather Constraint, as shown in **Exhibit A**, as just, reasonable, not unduly discriminatory or preferential, and in the public interest. NERC also requests that the Commission approve: (i) the associated Violation Risk Factors ("VRFs") and Violation Severity Levels ("VSLs") (**Exhibit G**); (ii) the retirement of Reliability Standard EOP-012-2; and (iii) the proposed implementation plan (**Exhibit B**).

---

[6] FERC, NERC, Regional Entity Staff Report: *The February 2021 Cold Weather Outages in Texas and the South Central United States* (Nov. 2021), https://www.ferc.gov/media/february-2021-cold-weather-outages-texas-and-south-central-united-states-ferc-nerc-and [hereinafter February 2021 Event Joint Inquiry Report]. This cold weather reliability event will be referred to throughout this petition as the "February 2021 Event."

As required by Section 39.5(a)[7] of the Commission's regulations, this petition presents the technical basis and purpose of the proposed Reliability Standard, a demonstration that the proposed Reliability Standard meets the criteria identified by the Commission in Order No. 672[8] (**Exhibit F**), and a summary of the standard development history (**Exhibit H**).

The NERC Board of Trustees approved the proposed Reliability Standard on April 4, 2025 under the longstanding special rule for standards addressing regulatory directives in Section 321.5 of the NERC Rules of Procedure. As discussed more fully in **Exhibit H**, the NERC Board of Trustees found that the proposed standard was just, reasonable, not unduly discriminatory or preferential, and in the public interest, considering (among other things) whether it is practical, technically sound, technically feasible, cost-justified and serves the best interests of reliability of the Bulk Power System. In making this determination, the Board considered the development record including the comments received, the factors identified above, and the Reliability Standards approval criteria identified by the Commission in Order No. 672.

This petition is organized as follows: Section I provides an overview of this filing. Section II provides the individuals to whom notices and communications related to the filing should be provided. Section III provides relevant background regarding the regulatory structure governing the Reliability Standards approval process. Section IV provides relevant background regarding NERC's Reliability Standards framework for cold-weather preparedness and operations and the history of the EOP-012 standard. Section V provides an overview and justification for proposed Reliability Standard EOP-012-3 and the revised defined term Generator Cold Weather Constraint.

---

[7] 18 C.F.R. § 39.5(a).

[8] The Commission specified in Order No. 672 certain general factors it would consider when assessing whether a particular Reliability Standard is just and reasonable. *Rules Concerning Certification of the Electric Reliability Organization; and Procedures for the Establishment, Approval, and Enforcement of Electric Reliability Standards*, Order No. 672 [hereinafter Order No. 672], 114 FERC ¶ 61,104, at PP 262, 321-37, *order on reh'g*, Order No. 672-A, 114 FERC ¶ 61,328 (2006).

Section VI provides a summary of the proposed implementation plan. Section VII describes NERC's strategy for monitoring the implementation of proposed Reliability Standard EOP-012-3, including how NERC intends to use a two-year compliance abeyance period to address concerns and gather additional information regarding the calculation of the Extreme Cold Weather Temperature, the measure that forms the basis for the required performance under the standard.

I. SUMMARY

NERC first developed the EOP-012 Reliability Standard in 2022 to ensure that generator owners would take the appropriate actions to prepare their facilities for extreme cold weather conditions. Extreme cold weather was a major factor in Bulk-Power System reliability events in 2011,[9] 2014,[10] 2018,[11] 2021,[12] and 2022.[13] Of these events, the February 2021 cold weather reliability event affecting Texas and the south central United States proved to be exceptionally severe. Due to the exceptionally high number of generator outages combined with exceptionally high customer demand, system operators in the Electric Reliability Council of Texas ("ERCOT") Interconnection and other neighboring areas ordered what ultimately became the largest controlled firm load shed event in United States history to avoid a complete blackout. The resulting power

[12] February 2021 Event Joint Inquiry Report, *supra* note 6.

[13] FERC, NERC, and Regional Entity Staff Report, *Inquiry into Bulk-Power System Operations During December 2022 Winter Storm Elliott* (Oct. 2023) [hereinafter Winter Storm Elliot Report], https://www.ferc.gov/media/winter-storm-elliott-report-inquiry-bulk-power-system-operations-during-december-2022.

outages, combined with the historically cold temperatures gripping the region, resulted in significant human and economic impacts. Many people lost their lives.

The February 2021 Event, with its devastating human and economic toll, underscored the need for strong Reliability Standards to address the causes of this and previous cold weather reliability events and help assure the reliability of the Bulk-Power System in future winter seasons. Over the next several years, NERC made the development of these Reliability Standards a high priority. Among the Reliability Standards that NERC developed was a new Reliability Standard, Reliability Standard EOP-012, addressing generator preparedness for extreme cold weather conditions.

As discussed more fully in this Petition, proposed Reliability Standard EOP-012-3 would improve upon the currently effective Reliability Standard EOP-012-2 by providing needed clarity regarding the standard's requirements for generator cold-weather preparedness and making other improvements consistent with the Commission's directives in the June 2024 Order approving Reliability Standard EOP-012-2.

Specifically, proposed Reliability Standard EOP-012-3 would improve upon Reliability Standard EOP-012-2 by:

- Providing clear, objective, and sufficiently detailed criteria for determining the limited circumstances under which a Generator Owner could declare constraints that would preclude them implementing a specific corrective action to address freeze protection issues, referred to as Generator Cold Weather Constraints;
- Requiring each Generator Owner declaring a Generator Cold Weather Constraint to submit the declaration to its Compliance Enforcement Authority for validation in a timely manner;[14]
- Requiring that Generator Owners review their validated Generator Cold Weather Constraints at least once every 36 calendar months for continued validity, instead of at least once every five calendar years, to ensure that new technologies are

[14] As discussed herein, the EOP-012-3 Generator Cold Weather CAP Extension and Constraint Process would ensure that these submissions are reviewed by the Compliance Enforcement Authority in a timely manner.

considered and circumstances preventing implementation are reevaluated on a regular basis;

- Providing shorter deadlines for Generator Owners to implement Corrective Action Plans developed in response to Generator Cold Weather Reliability Events, so that known freezing issues are addressed more quickly;
- Requiring that any extension of a Corrective Action Plan implementation deadline beyond the maximum implementation timeframe provided by the standard be pre-approved by the Compliance Enforcement Authority;
- Reinforcing that Generator Owners must update their generating unit cold weather operating limitations while any Corrective Action Plan is pending completion;
- Requiring Generator Owners with new Bulk Electric System ("BES") generating units entering commercial operation on or after October 1, 2027 to have the required cold weather capability upon entering commercial operation, unless a Generator Cold Weather Constraint would apply; and
- Clarifying requirements for Corrective Action Plan timeline applicability, as identified by the Commission in the June 2024 Order.

As discussed more fully herein, these clarifications and improvements address the Commission's directives from the June 2024 Order. In so doing, the proposed Reliability Standard EOP-012-3 would improve the overall efficiency and efficacy of the EOP-012 standard and help advance the reliability of the Bulk-Power System in future cold weather seasons. NERC respectfully requests that the Commission approve proposed Reliability Standard EOP-012-3 as just, reasonable, not unduly discriminatory or preferential, and in the public interest.

III. REGULATORY FRAMEWORK

By enacting the Energy Policy Act of 2005,[16] Congress entrusted the Commission with the duties of approving and enforcing rules to ensure the reliability of the Bulk-Power System, and with the duties of certifying an ERO that would be charged with developing and enforcing mandatory Reliability Standards, subject to Commission approval. Section 215(b)(1)[17] of the FPA states that all users, owners, and operators of the Bulk-Power System in the United States will be subject to Commission-approved Reliability Standards. Section 215(d)(5)[18] of the FPA authorizes the Commission to order the ERO to submit a new or modified Reliability Standard. Section 39.5(a)[19] of the Commission's regulations requires the ERO to file with the Commission for its approval each new Reliability Standard that the ERO proposes should become mandatory and

[15] NERC respectfully requests a waiver of Rule 203 of the Commission's regulations, 18 C.F.R. § 385.203, to allow the inclusion of more than two persons on the service list in this proceeding.

[16] 16 U.S.C. § 824o.

[17] *Id.* § 824o(b)(1).

[18] *Id.* § 824o(d)(5).

[19] 18 C.F.R. § 39.5(a).

enforceable in the United States, and each modification to a Reliability Standard that the ERO proposes should be made effective.

The Commission is vested with the regulatory responsibility to approve Reliability Standards that protect the reliability of the Bulk-Power System and to ensure that Reliability Standards are just, reasonable, not unduly discriminatory or preferential, and in the public interest. Pursuant to Section 215(d)(2) of the FPA[20] and Section 39.5(c)[21] of the Commission's regulations, the Commission will give due weight to the technical expertise of the ERO with respect to the content of a Reliability Standard.

NERC develops Reliability Standards in accordance with Section 300 (Reliability Standards Development) of its Rules of Procedure and the NERC Standard Processes Manual.[22] In its order certifying NERC as the Commission's ERO, the Commission found that NERC's rules provide for reasonable notice and opportunity for public comment, due process, openness, and a balance of interests in developing Reliability Standards,[23] and thus satisfy the Commission's criteria.[24] The development process is open to any person or entity with a legitimate interest in the reliability of the Bulk-Power System. NERC considers the comments of all stakeholders. Under NERC's usual processes for standards development, a stakeholder ballot body must approve, and the NERC Board of Trustees must adopt, a new or revised Reliability Standard before NERC submits the Reliability Standard to the Commission for approval.

---

20 16 U.S.C. § 824o(d)(2).

21 18 C.F.R. § 39.5(c)(1).

22 The NERC Rules of Procedure, including Appendix 3A, NERC Standard Processes Manual, are available at http://www.nerc.com/AboutNERC/Pages/Rules-of-Procedure.aspx.

23 *N. Am. Elec. Reliability Corp.*, 116 FERC ¶ 61,062 at P 250 (2006).

24 Order No. 672*, supra* note 8, at PP 268, 270.

Section 321 of the NERC Rules of Procedure is a special rule that describes the alternative processes by which the NERC Board of Trustees may approve a Reliability Standard to address a directive of the Board or an applicable governmental authority, such as the Commission, where the stakeholder ballot body has failed to do so. Consistent with Section 215 of the Federal Power Act, the alternative processes described in Section 321 of the NERC Rules of Procedure provide for reasonable notice and opportunity for public comment, due process, openness, and balance of interests in developing Reliability Standards in the special circumstances to which the rule applies.[25]

IV. BACKGROUND

A. Overview of NERC's Cold Weather Reliability Standards Framework

The EOP-012 Reliability Standard is an important part of NERC's framework to assure the reliability of the Bulk-Power System during extreme cold conditions. In its summary of the key findings and causes of the February 2021 Event, the joint inquiry team identified that two causes, both triggered by cold weather, lead to the Event, and that these two causes form a recurring pattern in cold weather events over the previous ten years. The first cause was that generating units unprepared for cold weather failed in large numbers. The second cause was related to supply issues caused by the decline in natural gas production, exacerbated by the increasing reliance on natural gas fired generation.[26] The joint inquiry team identified that, despite prior recommendations that entities take steps to prepare for winter, a significant number of generating units failed to have any winterization plans.[27] The joint inquiry team further determined that 81% of the freeze-related

[25] *See* 18 U.S.C. § 39.3(b)(2)(iv) (describing requirements for ERO certification).

[26] February 2021 Event Joint Inquiry Report, *supra* note 6, at 11-12.

[27] *Id.* at 17.

generating unit outages occurred at temperatures above the unit's stated ambient design temperature.[28]

To address these and other findings, the February 2021 Event Joint Inquiry Report contained recommendations for further action in the areas of cold weather preparedness and operations. Recommendation 1 consisted of ten sub-recommendations for Reliability Standards enhancements. Key Recommendations 1a-1g related to enhanced requirements for generator cold weather preparedness, including implementing freeze protection measures, addressing the causes of freezing issues, providing cold weather plan preparedness plan training on an annual basis, and understanding the generation capacity that is available in cold weather.[29] Key Recommendations 1h-1i recommended requirements to limit the participation of critical natural gas production facilities in load shedding schemes to protect electric system reliability in cold weather.[30] Key Recommendation 1j recommended requirements to minimize the overlap of circuits used in manual and automatic load shed circuits to help maintain system frequency when operators have the best chance of doing so.[31]

Consistent with the recommendations of the February 2021 Event Joint Inquiry Report, NERC developed Reliability Standards responsive to these recommendations in two phases. The EOP-012 Reliability Standard addresses the critical matter of generator cold weather preparedness, as discussed more fully in the following sections of this filing. Other Reliability Standards address other matters necessary for assuring cold weather reliability as identified in the report. These standards are as follows:

---

28 *Id.*

29 February 2021 Event Joint Inquiry Report at 184-190.

30 *Id.* at 208-209.

31 *Id.* at 209.

Reliability Standards IRO-010-4 and TOP-003-5: developed in response to the recommendations of the joint inquiry team examining the January 2018 cold weather event affecting the south central United States,[32] Reliability Standards IRO-010-4 and TOP-003-5 address the inclusion of generator cold weather data and information in Reliability Coordinator, Transmission Operator, and Balancing Authority data specifications, including data and information regarding generator operating limitations in cold weather and the expected operating temperature of the generator. The Commission approved these Reliability Standards in 2021.[33]

Reliability Standard EOP-011-4: Reliability Standard EOP-011-4 builds upon the improvements in EOP-011-3 to improve how Transmission Operators account for the overlap of manual load shed and automatic load shed in their emergency Operating Plans.[34] This standard requires Balancing Authorities, Transmission Operators, and load shedding entities identified by Transmission Operators to limit the participation of critical natural gas infrastructure loads in the demand response and emergency load shedding programs they oversee, particularly during cold weather conditions when natural gas supply issues for generation have proven to be the most challenging. The Commission approved Reliability Standard EOP-011-4 in 2024.[35]

---

[32] See FERC and NERC Staff, *The South Central United States Cold Weather Bulk Electric System Event of January 17, 2018* (Jul. 2019), https://www.nerc.com/pa/rrm/ea/Documents/South_Central_Cold_Weather_Event_FERC-NERC-Report_20190718.pdf.

[33] The Commission approved Reliability Standards IRO-010-4 and TOP-003-5 in August 2021. In this order, the Commission also approved Reliability Standard EOP-011-2, which contained requirements for Generator Owners to implement and maintain cold weather preparedness plans addressing freeze protection measures, annual inspection and maintenance for such measures, and identification of cold weather operating parameters, including fuel considerations and operating temperatures, and for providing training on such plans to generator personnel. These requirements were later moved to Reliability Standard EOP-012-1. *See N. Am. Elec. Reliability Corp.*, 176 FERC ¶ 61,119 (2021). The Commission approved subsequent versions of the IRO-010 and TOP-003 Reliability Standards, Reliability Standards IRO-010-5 and TOP-003-6.1, in November 2023, to become effective in the United States on July 1, 2025. *N. Am. Elec. Reliability Corp.*, Docket No. RD23-6-000 (2023) (delegated letter order).

[34] The Commission approved Reliability Standards EOP-011-3 and EOP-012-1 in February 2023 with directives for further modifications to EOP-012-1. *N. Am. Elec. Reliability Corp.*, 182 FERC ¶ 61,094 [hereinafter February 2023 Order], *reh'g denied*, 183 FERC ¶ 62,034, *order addressing arguments raised on reh'g*, 183 FERC ¶ 61,222 (2023).

[35] *N. Am. Elec. Reliability Corp.*, 186 FERC ¶ 61,115 (2024).

Reliability Standard TOP-002-5: Reliability Standard TOP-002-5 advances reliability through a new requirement addressing how the Balancing Authority will prepare for operations during extreme cold weather conditions. The Commission approved Reliability Standard TOP-002-5 in 2024.[36]

For further information regarding these Reliability Standards, please refer to NERC's filings in Docket Nos. RD21-5-000, RD23-1-000, and RD24-1-000.

B. History of the EOP-012 Reliability Standard

1. Reliability Standard EOP-012-1

In October 2022, NERC submitted for Commission approval Reliability Standards EOP-011-3 and EOP-012-1, as well as three defined terms for inclusion in the NERC *Glossary*: Extreme Cold Weather Temperature, Generator Cold Weather Critical Component, and Generator Cold Weather Reliability Event.[37] Reliability Standard EOP-012-1 contained new and revised requirements intended to build on the cold weather preparedness plan and training requirements first developed in Reliability Standard EOP-011-2 for enhanced generator cold weather preparedness. Reliability Standard EOP-012-1 included requirements for freeze protection measures for both new and existing generation to provide capability to operate at the Extreme Cold Weather Temperature[38] for the location (Requirements R1 and R2, respectively); the development of enhanced cold weather preparedness plans and annual training on those plans (Requirements R3 and R5, respectively); the periodic recalculation of the Extreme Cold Weather Temperature, update of cold weather preparedness plan, and review of freeze protection measures needed to

---

[36] *Id.*

[37] *Petition of NERC for Approval of Proposed Reliability Standards EOP-011-3 and EOP-012-1 and Request for Expedited Action*, Docket No. RD23-1-000 (Oct. 28, 2022).

[38] The Extreme Cold Weather Temperature is defined as "The temperature equal to the lowest 0.2 percentile of the hourly temperatures measured in December, January, and February from 1/1/2000 through the date the temperature is calculated."

provide operational capability at that temperature (Requirement R4); and the development and implementation of Corrective Action Plans to address freezing issues or insufficiencies in freeze protection measures to operate at the Extreme Cold Weather Temperature (Requirements R6 and R7, respectively).

In February 2023, the Commission approved Reliability Standard EOP-012-1 with directives for further modifications.[39] While finding that Reliability Standard EOP-012-1 represented an improvement for reliability, the Commission expressed concern with certain aspects of Reliability Standard EOP-012-1 and the proposed implementation plan, and directed NERC to revise the standard and implementation plan as follows:

Applicability, generally: The Commission directed NERC to revise the applicability of the standard to ensure that it captures all Bulk Electric System ("BES") generation resources needed for reliable operation and excludes only those generation resources not relied upon during freezing conditions.[40]

Applicability of Cold Weather Preparedness Plan and Training Requirements: The Commission directed NERC to revise Reliability Standard EOP-012-1 to ensure cold weather operating information remains available from all generators.[41]

Generator Constraints to Implementing Winterization Measures: The Commission expressed concerns that the proposed technical, commercial, or operational constraint provisions in Requirements R1 and R7 that would allow an entity to explain in a declaration why it could not comply with winterization requirements lacked clear and auditable criteria for compliance.[42] The

39 February 2023 Order, *supra* note 34.

40 *Id.* at P 58.

41 *Id.* at P 59.

42 *Id.* at P 64-65.

Commission therefore directed NERC to develop modifications to Requirements R1 and R7 "to address concerns related to the ambiguity of generator-defined declarations of technical, commercial, or operational constraints that preclude a generator owner from implementing the appropriate freeze protection measures and to ensure that the constraint declarations may not be used to opt-out of compliance with the Standard or obligations set forth in a corrective action plan."[43] Specifically, the Commission directed NERC to "include auditable criteria on permissible constraints and to identify the appropriate entity that would receive the generator owners' constraint declarations under EOP-012-1 Requirements R1 and R7."[44]

Generator Continuous Operations Capability Requirements: The Commission directed NERC to clarify certain language regarding capability requirements to better align with the stated purpose of the Reliability Standard EOP-012-1.[45]

Corrective Action Plan deadlines: The Commission found it appropriate to include a maximum time for implementing corrective actions in a Corrective Action Plan. The Commission therefore directed NERC to revise Reliability Standard EOP-012-1 to include a deadline or maximum period for the completion of corrective action plan measures where the development of Corrective Action Plans is required.[46]

Implementation Plan: The Commission agreed with commenter concerns regarding the length of the proposed implementation period of Reliability Standard EOP-012-1.[47] The Commission therefore directed NERC to require a shorter implementation period and staggered

---

43 *Id.* at P 66.

44 *Id.*

45 *Id.* at PP 89-90.

46 *Id.* at P 79.

47 NERC's proposed implementation plan for Reliability Standard EOP-012-1 and EOP-011-3 provided a five-year implementation period for freeze protection capability requirements, with no specific deadline for the implementation of Corrective Action Plan measures.

implementation for unit(s) across a generator owner's fleet, stating that such an approach "will reduce reliability risks more quickly."[48]

In addition to the above-directed standards modifications, the Commission directed NERC to work with Commission staff to develop a plan on how it will assess and collect data periodically to monitor the implementation of new requirements for Generator Owners; particularly, the impact of the technical, commercial, or operational constraint provisions of Reliability Standard EOP-012-1. The Commission directed NERC to submit this plan, to include certain categories of enumerated data and other information that will include annual informational filings to the Commission, within 12 months of issuance of the order.[49]

C. Reliability Standard EOP-012-2

NERC developed Reliability Standard EOP-012-2 in response to the Commission's directives in the February 2023 Order. As discussed more fully in NERC's February 2024 petition for approval of Reliability Standard EOP-012-2,[50] Reliability Standard EOP-012-2 reflected the following revisions intended to address several of the Commission's directives from the February 2023 Order:

- Clarified the applicability of the standard, so that all Generator Owners would continue to be required to develop cold weather preparedness plans and train on those plans consistent with Reliability Standard EOP-011-2 (Applicability Section A.4.2);

- Clarified the limited exemption for the EOP-012 winterization requirements, so that it would be clear that the only units that would be exempted from applying freeze protection measures are those Bulk Electric System units that do not operate in

[48] February 2023 Order at P 88.

[49] *Id.* at PP 93-96. NERC submitted its informational filing on February 16, 2024 in Docket No. RD23-1-002. The Commission accepted NERC's filing on May 23, 2024. *N. Am. Elec. Reliability Corp.*, 187 FERC ¶ 61,087 (2024) (letter order).

[50] *Petition of NERC for Approval of Proposed Reliability Standard EOP-012-2 and Request for Expedited Action*, Docket No. RD24-5-000 (Feb. 16, 2024) [hereinafter EOP-012-2 Petition].

freezing conditions (except in a limited capacity, during an Emergency) (Requirements R2, R3, R6);

- Clarified that the standard would apply to new intermittent energy resources, and they must provide capability to operate for their maximum operational duration if that is less than 12 hours (e.g., solar farm in area with less than 12 hours of sunlight in winter) (Requirement R2); and

- Removed the requirement for existing generation to run for at least one hour at the Extreme Cold Weather Temperature, as this period was too short to ensure cold weather reliability (Requirement R3).

Relevant to this proceeding, NERC also made the following revisions in Reliability Standard EOP-012-2 to address other directives from the February 2024 Order:

- Abbreviated the overall timeline for implementation of the EOP-012 standard, including fixing October 1, 2027 as the date by which new generation must meet more stringent capability requirements (Implementation Plan, Requirements R2 and R3);
- Added deadlines for completing corrective actions in a Corrective Action Plan (Requirement R7);
- Replaced the phrase "technical, commercial, or operational constraints" with the defined term Generator Cold Weather Constraint,[51] to clarify the limited circumstances under which a Generator Owner could declare constraints precluding them implementing a specific corrective action contained in a Corrective Action Plan to address freeze protection issues (Requirement R7); and

[51] NERC proposed to define Generator Cold Weather Constraint as follows:

Any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components using the criteria below. Freeze protection measures are not intended to be limited to optimum practices, methods, or technologies, but are also intended to include acceptable practices, methods, or technologies generally implemented by the electric industry in areas that experience similar winter climate conditions.

Criteria used to determine a constraint include practices, methods, or technologies which, given the exercise of reasonable judgment in light of the facts known at the time the decision to declare the constraint was made:

• Were not broadly implemented at generating units for comparable unit types in regions that experience similar winter climate conditions to provide reasonable assurance of efficacy;

• Could not have been expected to accomplish the desired result; or

• Could not have been implemented at a reasonable cost consistent with good business practices, reliability, or safety. A cost may be deemed "unreasonable" when implementation of selected freeze protection measure(s) are uneconomical to the extent that they would require prohibitively expensive modifications or significant expenditures on equipment with minimal remaining life.

- Clarified the steps Generator Owners would take when they declare a Generator Cold Weather Constraint, including requirements for ongoing reviews and reporting any reliability-related impacts to reliability entities as part of ongoing generating unit cold weather data reporting specifications (Requirement R8).

In June 2024, the Commission approved Reliability Standard EOP-012-2 and the associated implementation plan, and directed further changes as discussed in the following section.

D. June 2024 Order Directs Development of Proposed EOP-012-3

In the June 2024 Order, the Commission found that Reliability Standard EOP-012-2 "improves upon…Reliability Standard EOP-012-1 by clarifying the requirements for generator cold weather preparedness and by making other improvements consistent with the Commission's directives in its February 2023 Order to help ensure that more generation is available during extreme cold weather."[52] The Commission, however, expressed continuing concerns with certain aspects of Reliability Standard EOP-012-2, and directed NERC to further revise the standard. The Commission stated, "[T]he five core directives to NERC in this order are not new issues, but rather targeted modifications necessary to fully address issues identified in the Commission's prior February 2023 Order."[53] The Commission directed NERC to revise Reliability Standard EOP-012-2 to address its concerns and to file a revised standard within nine months of the date of the order, or by March 27, 2025. Specifically, the Commission directed NERC to revise the standard as follows.

52 June 2024 Order at P 2.

53 *Id.* at P 4.

1. Address Concerns Related to the Ambiguity of the Generator Cold Weather Constraint Term and Criteria

While finding that Reliability Standard EOP-012-2 improved upon the prior version of the standard with respect to the identification of constraints that may preclude the Generator Owner from implementing freeze protection measures as required by the standard, the Commission found that NERC needed to address certain ambiguities that remained.[54]

The Commission stated that, while it agreed the EOP-012 standard should not require the implementation of unproven technologies, it believed Reliability Standard EOP-012-2 and the definition of Generator Cold Weather Constraint did not provide sufficient guidance on how widely a freeze protection technology must be deployed before it would be considered a "generally implemented" technology (and thus no longer grounds for a constraint).[55] The Commission further stated that it agreed "there may be a need to account for certain cases in which the cost of retrofitting may be unnecessarily burdensome." However, the Commission found that how NERC proposed to do so (i.e., allowing generators to exclude freeze protection measures that are not available at "reasonable cost consistent with good business practices") would create a risk of inconsistent outcomes in the application of the standard. The Commission stated that to address such circumstances, "NERC should clearly define such exceptions and present them for Commission review."[56]

---

54 *See* June 2024 Order at PP 41-46 (discussion of findings and concerns).

55 *Id.* at PP 42-43.

56 *Id.* at PP 44- 46. The Commission provided the following example of such clearly defined circumstances: "an attestation from a generator owner or generator operator that: (1) the generating unit is scheduled to retire within the next two years; (2) implementing freeze protection measures in accordance with the Reliability Standard would cause the generating unit to retire within two years; or (3) they would cancel a newly scheduled generating unit that has not yet achieved commercial operation if required to comply with the freeze protection requirements of a Standard."

To address its concerns, the Commission directed NERC "to ensure that the Generator Cold Weather Constraint declaration criteria included within the proposed Reliability Standard are objective and sufficiently detailed so that applicable entities understand what is required of them."[57] The Commission further directed NERC to revise the definition of Generator Cold Weather Constraint to remove the references to "cost," "reasonable cost," "unreasonable cost," and "good business practices" and "replace them with criteria that are objective, unambiguous, and auditable."[58] The Commission provided examples of approaches that could satisfy its directive, such as to include a "limited and discrete list of circumstances that would qualify as acceptable constraints" or to "establish a pre-approval process for all Generator Cold Weather Constraint declarations."[59]

2. Address Concerns Regarding the Need for a Timely Review and Evaluation of Declared Generator Cold Weather Constraints by NERC

The Commission stated that, while NERC proposed to use its compliance oversight and data request mechanisms to oversee implementation of the Generator Cold Weather Constraint provisions in the EOP-012 standard, "an enhanced level of oversight remains necessary to ensure that Generator Cold Weather Constraints are only declared when warranted."[60] The Commission found that Reliability Standard EOP-012-2 "does not identify an entity to receive the Generator Cold Weather Constraint declarations, the entity responsible for timely review of the generator owners' constraint declarations, or the entity responsible for ensuring that the declarations meet the objective criteria of the … Standard."[61]

---

57 *Id.* at P 47.

58 *Id.*

59 *Id.*

60 *Id.* at P 53.

61 *Id.* at P 52.

The Commission therefore directed NERC to modify the EOP-012 standard "so that NERC receives, reviews, evaluates, and confirms for validity the Generator Cold Weather Constraint declarations in a timely manner."[62] The Commission also directed NERC to include in its filing "a plan to timely review such declarations to verify compliance with proposed Reliability Standard EOP-012-2 and its successors or obligations in a corrective action plan and take corrective action where necessary."[63]

3. Address Concerns that Existing EOP-012-2 Requirement R7 Allows Too Long for Entities to Implement Corrective Actions for those Generating Units that Experience a Generator Cold Weather Reliability Event.

The Commission found that, while Reliability Standard EOP-012-2 addressed the Commission's directives to shorten deadlines for developing Corrective Action Plans for existing generating units, the Commission was concerned by the length of time provided for generators to implement Corrective Action Plans for units that experienced a Generator Cold Weather Reliability Event (e.g. freezing issue resulting in forced outage or derate).[64] Citing the known risks of generator freeze issues, the Commission stated, "For those generating units that fail to operate during an extreme cold weather reliability event, their risks must be mitigated quicker than NERC proposes regardless of whether existing or new freeze protection measures are needed on the units that experience failure."[65] The Commission further noted that these units should have already had freeze protection measures in place to operate at the Extreme Cold Weather Temperature under Requirements R2 and R3 of the standard.

---

62 *Id.* at P 54. The Commission clarified that NERC may choose to delegate this task to the relevant Regional Entities.

63 *Id.*

64 *Id.* at PP 65-67.

65 *Id.* at P 67.

Accordingly, the Commission directed NERC to revise Reliability Standard EOP-012-2 Requirement R7 to require shorter deadlines to implement corrective actions for existing or new equipment or the freeze protection measures for those generating units that experience a Generator Cold Weather Reliability Event. The Commission indicated that additional time may be acceptable to complete corrective actions for other generating units in a fleet that may be susceptible to the same freezing issue.[66]

4. Address the Commission's Finding that any Extensions of a Corrective Action Plan Implementation Deadline beyond the Maximum Implementation Timeframe provided by the EOP-012 Standard be Pre- Approved by NERC.

The Commission expressed concern with Reliability Standard EOP-012-2 Requirement R7, which allows a Generator Owner to extend the 24 and 48-month implementation timeframes for Corrective Action Plans. The Commission stated, "[W]ithout the appropriate oversight of generator owner's proposed updates to the corrective action plan implementation deadlines, the established maximum implementation deadlines in proposed Reliability Standard EOP-012-2, Requirement R7 have less meaning and allow a known reliability risk to remain on the Bulk-Power System for a longer time."[67] The Commission therefore directed NERC to revise the standard to "ensure that any extension of a corrective action plan implementation deadline beyond the maximum implementation timeframe required by the proposed Reliability Standard is pre-approved by NERC."[68]

---

66 *Id.* at P 68.

67 *Id.* at P 69.

68 *Id.* at P 70. In its introductory summary of this directive, the Commission further stated that NERC should "ensure that the generator owner informs relevant registered entities of operating limitations in extreme cold weather during the period of the extension." *Id.* at P 3.

5. Address the Commission's Finding regarding Corrective Action Plans for Generators that are First Commercially Operational on or after October 1, 2027

The Commission stated that, while it was persuaded by NERC's rationale that there needs to be allowances made for units that are well into their construction phase to complete corrective action plans for elements already designed, it was concerned that Reliability Standard EOP-012-2 did not clearly differentiate between projects in an advanced stage of construction and those in a lesser phase of construction. The Commission found that "generators that are commercially operational after October 1, 2027, should have freeze protection measures either designed into their generating systems, or, if a corrective action plan is needed, then it should be completed by the time that such generating units go into commercial operation."[69] Based on this finding, the Commission directed NERC to revise the EOP-012 standard "to clarify that any Requirement R2 corrective action plans must be completed prior to the generating unit's commercial operation date."[70]

6. Address Concerns that EOP-012 Requirement R7 has Ambiguities in the Implementation Plan Timelines that Apply to Certain Generator Owners

The Commission stated that it agreed with commenters that Reliability Standard EOP-012-2 Requirement R7 "does not provide clear direction as to the required corrective action plan implementation timeline that applies to certain generator owners," particularly where a Generator Owner had combinations of both existing and new equipment for freeze protection measures in its Corrective Action Plan. Therefore, the Commission directed NERC to clarify this aspect of the standard.[71]

---

69 *Id.* at P 72.

70 *Id.* at P 72.

71 *Id.* at P 76.

7. Address the Concern that Generator Cold Weather Constraint Declarations Should be Reviewed More Frequently than Once Every Five Years to Ensure the Constraint Remains Valid

The Commission stated that, while it acknowledged the administrative burden of more frequent reviews of Generator Cold Weather Constraint declarations, it agreed with commenters that a five-year review periodicity "could delay the identification and adoption of new freeze protection measures and does not represent the current pace of technological advancements."[72] The Commission therefore directed NERC to revise Reliability Standard EOP-012-2 to implement more frequent reviews of Generator Cold Weather Constraints to ensure the constraint remains valid.[73]

V. JUSTIFICATION FOR APPROVAL

In this petition, NERC submits for Commission approval proposed Reliability Standard EOP-012-3 – Extreme Cold Weather Preparedness and Operations as well as one revised defined term used in the proposed standard: Generator Cold Weather Constraint. The purpose of proposed Reliability Standard EOP-012-3 remains the same as approved Reliability Standard EOP-012-2: "to address the effects of operating in extreme cold weather by ensuring each Generator Owner has developed and implemented plan(s) to mitigate the reliability impacts of extreme cold weather on its applicable generating units." The proposed Reliability Standard would continue to apply to Generator Owners and Generator Operators that own or operate BES generating units, with freeze protection requirements that apply to those BES generating units that are expected to operate in freezing temperatures. The proposed Reliability Standard contains nine requirements and one attachment. Proposed Requirements R1 through R8 are carried forward from Reliability Standard EOP-012-2 with revisions necessary to address the Commission directives and provide additional

72 *Id.* at P 94.

73 *Id.*

clarifications. Proposed Requirement R9 and Attachment 1 are new in proposed Reliability Standard EOP-012-3.

Proposed Reliability Standard EOP-012-3 improves upon Reliability Standard EOP-012-2 through additional revisions intended to improve the clarity and effectiveness of the standard. Consistent with the Commission's directives in the June 2024 Order, proposed Reliability Standard EOP-012-3 would ensure that entities are implementing corrective actions to address known issues affecting their ability to operate reliably in cold weather in a timely manner. For those circumstances in which implementing corrective actions may not be feasible, referred to in the proposed standard as "Generator Cold Weather Constraints," proposed Reliability Standard EOP-012-3 would provide an improved framework for the identification, validation, and periodic review of such constraints. Consistent with the June 2024 Order, this framework provides clear, detailed, and objective criteria for identifying Generator Cold Weather Constraints. These clarifications and improvements contribute to a clearer and stronger standard for generator cold weather preparedness that would help advance the reliability of the Bulk-Power System during future cold weather seasons.

The revisions in proposed Reliability Standard EOP-012-3 and the revised definition of Generator Cold Weather Constraint are discussed more fully below. Additional discussion of the technical basis for the original requirements in the EOP-012 Reliability Standard, which are clarified and expanded upon in proposed Reliability Standard EOP-012-3, is available in NERC's petition for approval of Reliability Standards EOP-011-3 and EOP-012-1[74] and NERC's petition for approval of Reliability Standard EOP-012-2.[75]

---

74 *See* EOP-011-3/EOP-012-1 Petition, *supra* note 37.

75 *See* EOP-012-2 Petition, *supra* note 50.

NERC developed proposed Reliability Standard EOP-012-2 through Project 2024-03 Revisions to EOP-012-2. The proposed Reliability Standard was developed in an open and fair manner and in accordance with the Commission-approved development process for Reliability Standards, a process which included several public comment periods. In accordance with Section 321 of the NERC Rules of Procedure, Special Rule to Address Certain Regulatory and Board of Trustees Directives, the NERC Board of Trustees approved proposed Reliability Standard EOP-012-3 on April 4, 2025.[76] The summary of development and complete record of development for proposed Reliability Standard EOP-012-3 is attached to this petition as **Exhibit H**. This exhibit includes a consideration of each of the comments submitted during the Rule 321.5 public comment period and how they were addressed, or not addressed, in the final proposed Reliability Standard EOP-012-3.

As discussed in **Exhibits E and F**, and for the reasons stated below, proposed Reliability Standard EOP-012-3 addresses the Commission's directives from the June 2024 Order, meets the Commission's criteria for approval in Order No. 672, and is just, reasonable, not unduly discriminatory, and in the public interest. NERC respectfully requests that the Commission approve proposed Reliability Standard EOP-012-3 and the revised definition of Generator Cold Weather Constraint, to become effective in accordance with the proposed implementation plan discussed in Section VI.

[76] In approving the proposed standard under Section 321.5 of the NERC Rules of Procedure, the NERC Board of Trustees found that the proposed standard was just, reasonable, not unduly discriminatory or preferential, and in the public interest. In making this determination, the Board considered the development record, the factors identified in Section 321.5 of the NERC Rules of Procedure, and the Reliability Standards approval criteria identified by the Commission in Order No. 672.

A. Revised Definition for Inclusion in the NERC *Glossary*: Generator Cold Weather Constraint

NERC proposes a revised definition of the term Generator Cold Weather Constraint used in proposed Reliability Standard EOP-012-3 for inclusion in the NERC *Glossary*. Under the EOP-012 standard, a Generator Owner may decline to implement one or more actions in a Corrective Action Plan to address freeze protection issues on existing equipment or decline to implement freeze protection measures on new generating facilities if certain constraints on implementation are present. Reliability Standard EOP-012-1 originally referred to these constraints as "technical, operational, or commercial constraints." Reliability Standard EOP-012-2 replaced this phrase with a defined term, "Generator Cold Weather Constraints," to address the concerns raised by the Commission in the February 2023 Order that the original language lacked clear and auditable criteria for compliance.[77] In considering this defined term and the application of Generator Cold Weather Constraints generally, the Commission directed further changes in the February 2024 Order.

Reliability Standard EOP-012-3 further defines these constraints in new Attachment 1 to provide more meaningful, measurable criteria for implementation consistent with the intent of the drafting team developing prior versions of the standard. As such, NERC proposes to define Generator Cold Weather Constraint more generally, as follows:

> **Generator Cold Weather Constraint** – Any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components ~~using the criteria below~~. Freeze protection measures are not intended to be limited to optimum practices, methods, or technologies, but are also intended to include ~~acceptable~~ practices, methods, or technologies ~~generally~~ ~~implemented by the electric industry in areas that experience similar winter climate conditions~~

[77] *See* February 2023 Order at P 64-65.

that would be expected to result in improved generating unit performance during cold temperatures.

~~Criteria used to determine a constraint include practices, methods, or technologies which, given the exercise of reasonable judgment in light of the facts known at the time the decision to declare the constraint was made:~~

- ~~Were not broadly implemented at generating units for comparable unit types in regions that experience similar winter climate conditions to provide reasonable assurance of efficacy;~~
- ~~Could not have been expected to accomplish the desired result; or~~
- ~~Could not have been implemented at a reasonable cost consistent with good business practices, reliability, or safety. A cost may be deemed "unreasonable" when implementation of selected freeze protection measure(s) are uneconomical to the extent that they would require prohibitively expensive modifications or significant expenditures on equipment with minimal remaining life.~~

Consistent with the June 2024 Order, the proposed definition removes references to "cost," "reasonable cost," "unreasonable cost," and "good business practices."[78] The proposed revised definition of Generator Cold Weather Constraint is discussed in further detail in the contexts of Requirement R8, Attachment 1, and Requirement R9, in Sections V.I and V.J, below.

B. Requirement R1: Identifying Generator Cold Weather Data and Information

Proposed Reliability Standard EOP-012-3 would improve upon Reliability Standard EOP-012-2 by clarifying Requirement R1 as it relates to the calculation of the Extreme Cold Weather Temperature (or "ECWT") for an applicable generating unit. The Extreme Cold Weather Temperature is defined as "The temperature equal to the lowest 0.2 percentile of the hourly temperatures measured in December, January, and February from 01/01/2000 through the date the

[78] *See* June 2024 Order at P 47 ("Further, as part of the directive to develop and submit modifications to the Generator Cold Weather Constraint definition of proposed Reliability Standard EOP-012-2, we direct NERC, pursuant to section 215(d)(5) of the FPA, to remove the references to 'cost,' 'reasonable cost,' 'unreasonable cost,' and 'good business practices' and replace them with criteria that are objective, unambiguous, and auditable.")

temperature is calculated." The Extreme Cold Weather Temperature forms the foundation for much of the required performance under the EOP-012 standard. While the Commission did not direct further changes to this aspect of the standard in the June 2024 Order, commenters raised concerns regarding how missing hourly values should be addressed in the calculation of the Extreme Cold Weather Temperature during the standard development process for Reliability Standard EOP-012-3. To address these concerns, proposed Reliability Standard EOP-012-3 revises Requirement R1 to provide additional clarification regarding the treatment of missing or invalid hourly temperature data.

Proposed Requirement R1 is revised as follows:

R1. At least once every five calendar years, each Generator Owner shall, for each of its applicable generating unit(s):

1.1. Calculate the Extreme Cold Weather Temperature for each of its applicable generating unit(s) and identify the calculation date, ~~and~~ source(s) of temperature data, and adjustments utilized for missing or invalid hourly temperature data, if necessary; and

1.1.1. If the ~~re-calculated~~ recalculated Extreme Cold Weather Temperature is lower than the previous Extreme Cold Weather Temperature, the entity shall review and update its cold weather preparedness plan(s) under Requirement R4 within six (6) calendar months of the recalculation~~. If~~ and if new corrective actions are needed to provide the required operational capability ~~under~~ described in Requirement R2 or R3, the entity shall develop a Corrective Action Plan within six (6) calendar months of the recalculation.

1.2. Identify generating unit(s) cold weather data, to include:

1.2.1. Generating unit(s) operating limitations in cold weather to include

1.2.1.1. Capability and availability;

1.2.1.2. Fuel supply and inventory concerns;

1.2.1.3. Start-up issues;

1.2.1.4. Fuel switching capabilities; and

1.2.1.5. Environmental constraints.

1.2.2. Generating unit(s) minimum:

> • Design temperature, and if available, the concurrent wind speed and precipitation;
>
> • Historical operating temperature at least one hour in duration, and if available, the concurrent wind speed and precipitation; or
>
> • Current cold weather performance temperature determined by an engineering analysis, which includes the concurrent wind speed and precipitation.

In developing earlier versions of the EOP-012 standard, the original EOP-012 drafting team identified that there may be gaps in hourly data available from single weather stations, and that entities may need to consider data from multiple stations or use alternative measures to calculate the Extreme Cold Weather Temperature.[79] In developing proposed Reliability Standard EOP-012-3, the drafting team considered comments suggesting that entities must account for every gap in order to remain compliant with the standard as currently written, even where a statistical analysis would show that the missing values had no effect on the resulting calculated Extreme Cold Weather Temperature.[80] Based on a statistical analysis, the drafting team considered that a significant number of hourly values could be missing from a cold weather data set with no impact on the final calculated Extreme Cold Weather Temperature, assuming a random distribution of missing values in the data set. However, if the data set were missing hourly values on the coldest days, a fewer number of gaps could impact the final calculated Extreme Cold Weather

---

79 *See* EOP-012-2 Petition, *supra* note 50, Exhibit C (Technical Rationale) at 1.

80 *See* Exhibit H Complete Record of Development at item 20, December 3, 2024 Consideration of Comments at 285 (North American Generator Forum comments: "While the SDT has significantly modified the document related to calculating the ECWT, and while the NAGF supports these modifications, nothing in this document addresses the unreasonable position that some regions are taking to require a temperature reading for every hour in order to make an ECWT valid. In the vast majority of cases, the GO is not in a position to have over 54,000 data points for any location, let alone every location. The GO in most cases must gather data from third party providers, and none of the data is perfect. This issue must be addressed through either Requirement R1 or modification to the ECWT definition. The NAGF looks forward to working with the SDT to address this identified concern."). *See also* Exhibit H Complete Record of Development at item 41, January 27, 2025 Consideration of Comments at 190-191 (NAGF comments suggesting that the drafting team specify an "ECWT calculation is complete if the data source has greater than 90 percent of the expected data points and any gap greater than 168 hours is identified" and stating that the issue of missing hourly values in the ECWT calculation process "is an important issue for the NAGF membership."). In both comment periods, multiple commenters submitted comments in support of, or incorporating into their own comments, the NAGF comments.

Temperature if adjustments to address those gaps were not made.[81]

The proposed addition in Requirement R1 Part 1.1 would clarify that Generator Owners have flexibility to exercise judgment in how they address missing or invalid values in their data sets when calculating the Extreme Cold Weather Temperature. This flexibility is important, as weather data sets spanning many years are likely to contain gaps in hourly values, but not all gaps in hourly values would result in a change to the final Extreme Cold Weather Temperature calculation and thus the temperature to which the generating unit must have the capability to perform. Any data set with missing or invalid hourly temperature values recorded during the coldest periods since January 1, 2000 should be carefully evaluated to ensure that any adjustments used for those values are properly addressed in a transparent and logical way. Generator Owners would be expected to document how they accounted for any gaps in weather data, and this documentation would be reviewed during compliance monitoring activities.

NERC believes that this modest, clarifying revision will substantially address the stakeholder concerns raised during the standard development process for proposed Reliability Standard EOP-012-3 regarding the calculation of the Extreme Cold Weather Temperature. Nevertheless, because the Extreme Cold Weather Temperature calculation is foundational to the EOP-012 standard, and NERC understands that concerns may remain about how this requirement will be audited and enforced, NERC has proposed a compliance abeyance period for this requirement. Through this compliance abeyance period, NERC would monitor the implementation of this requirement and identify, to the extent necessary, any revisions to the Extreme Cold Weather Temperature formula or Requirement R1 Part 1.1 that may further improve how entities ensure reliable operations during extreme cold weather conditions. Please see Section VII for

[81] *See* Technical Rationale, Exhibit D at 3.

further discussion of this proposal.

C. Requirement R2: Implementing Freeze Protection Measures for New BES Generating Units

Proposed Reliability Standard EOP-012-3 Requirement R2 revises the cold weather operational capability requirements for new BES generating units to remove the option to develop a Corrective Action Plan to address operational capability issues. Proposed Reliability Standard EOP-012-3 Requirement R2 would revise the currently approved version as follows:

R2. Applicable to generating units ~~with a~~ that begin commercial operation[1] ~~date~~ on or after October 1, 2027[2]: Each Generator Owner, for each generating unit that has a calculated Extreme Cold Weather Temperature at or below 32 degrees Fahrenheit (zero degrees Celsius) as determined in Requirement R1, and that self-commits or is required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius),[1] shall:

- Implement freeze protection measures to protect Generator Cold Weather Critical Components that provide the capability to operate at the generating unit(s)' Extreme Cold Weather Temperature with sustained concurrent twenty (20) mph (32 km/h) wind speed for (i) a period of not less than twelve (12) continuous hours or (ii) the maximum operational duration for intermittent energy resources if less than twelve (12) continuous hours; or

- ~~Develop a Corrective Action Plan(s) to add new or modify existing or previously planned freeze protection measures to provide the capability to operate at the unit(s)' Extreme Cold Weather Temperature with a sustained concurrent twenty (20) mph wind speed for (i) a period of not less than twelve (12) continuous hours, or (ii) the maximum operational duration for intermittent energy resources if less than twelve (12) continuous hours.~~

- Document, in a declaration, with justification, if applicable, a Generator Cold Weather Constraint in accordance with Requirement R8.

Footnotes:

[fn1] Commercial operation means achievement of this designation indicating that the facility has received all approvals necessary for operation after completion of initial start-up testing.

[fn2] In non-U.S. jurisdictions, this will be the date established by the Applicable Governmental Authority.

[fn1~~3~~] Generating unit(s) that do not self-commit or are not required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), but may be called upon to operate in order to assist in the mitigation of BES Emergencies, Capacity Emergencies, or Energy Emergencies during periods at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), are exempt from this requirement.

Proposed Reliability Standard EOP-012-3 carries forward the framework of previous versions of the EOP-012 standard which would require new BES generating units to meet more stringent requirements than existing BES generating units. This difference is due to the difficulty of performing the same level of design analysis on existing generation as on new generation, the high threshold of the ECWT, and the expected availability of historical data to support sustained operations at the Extreme Cold Weather Temperature.[82]

In the June 2024 Order, the Commission directed NERC to modify EOP-012-2 to address Corrective Action Plans for new generating units. The Commission stated that, while it was persuaded by NERC's rationale that there needs to be allowances made for units that are well into their construction phase to complete Corrective Action Plans for elements already designed, it was concerned that Reliability Standard EOP-012-2 did not clearly differentiate between projects in an advanced stage of construction and those in a lesser phase of construction.[83] The Commission found that "generators that are commercially operational after October 1, 2027, should have freeze protection measures either designed into their generating systems, or, if a corrective action plan is needed, then it should be completed by the time that such generating units go into commercial operation." Based on this finding, the Commission directed NERC to revise the EOP-012 standard "to clarify that any Requirement R2 corrective action plans must be completed prior to the generating unit's commercial operation date."

---

[82] The technical basis for the original requirements is discussed in detail in NERC's petition for approval of proposed Reliability Standards EOP-011-3 and EOP-012-1. *See* EOP-011-3/EOP-012-1 Petition, *supra* note 37 at 33-37.

[83] June 2024 Order at P 72.

To address this directive, proposed Reliability Standard EOP-012-3 would revise Requirement R2 to provide that new generating units entering commercial operation on or after October 1, 2027 would either need to: (1) meet the more stringent freeze protection measures called for new generation; or (2) declare a Generator Cold Weather Constraint that prevents them from doing so in accordance with Requirement R8. As concerns were raised during the development process about requiring Generator Owners to take actions under Reliability Standards prior to being registered with NERC for mandatory compliance purposes, proposed Requirement R2 would not require Generator Owners to develop or complete Corrective Action Plans ahead of entering commercial operation. However, the practical effect is the same: unless a Generator Cold Weather Constraint would apply, the Generator Owner shall either complete any corrective measures that are needed for its new BES generating unit prior to the commercial operation date or it must delay the commercial operation date until those corrective measures are completed. Proposed Requirement R2 is therefore consistent with the Commission's June 2024 Order paragraph 72 directive and more closely resembles the original Reliability Standard EOP-012-1 requirements for new generating units. New footnote 1 clarifies what is meant by the phrase "commercial operation." New footnote 2 recognizes that, in non-U.S. jurisdictions, the Applicable Governmental Authority may have established a date other than October 1, 2027 for determining which units would be considered "new" and therefore subject to the more stringent requirements of Requirement R2.

In addition to the revisions to address the June 2024 Order directive described above, NERC proposes additional revisions to improve the readability of the requirement and add metric measurements, consistent with NERC's Metric Policy for Reliability Standards.[84]

[84] *See* NERC Rules of Procedure Appendix 3A, NERC Standard Processes Manual, at Section 1.4 (Attributes of NERC's Reliability Standards Process, Metric Policy).

D. Requirement R3: Implementing Freeze Protection Measures for Existing BES Generating Units

Proposed Requirement R3 proposes non-substantive revisions in Requirement R3, as follows:

> **R3**. Applicable to generating unit(s) in commercial operation prior to October 1, 2027[fn4]: Each Generator Owner, for each generating unit that has a calculated Extreme Cold Weather Temperature at or below 32 degrees Fahrenheit (zero degrees Celsius) as determined in Requirement R1, and that self-commits or is required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius),~~2~~5 shall:
>
> - Implement freeze protection measures to protect Generator Cold Weather Critical Components that provide the capability to operate at the generating unit(s)' Extreme Cold Weather Temperature; or
> - Develop a Corrective Action Plan to add new or modify existing freeze protection measures to provide the capability to operate at the generating unit(s)' Extreme Cold Weather Temperature.
>
> [fn4] In non-U.S. jurisdictions, this will be the date established by the Applicable Governmental Authority.
>
> [fn~~2~~5] Generating unit(s) that do not self-commit or are not required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), but may be called upon to operate in order to assist in the mitigation of BES Emergencies, Capacity Emergencies, or Energy Emergencies during periods at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), are exempt from this requirement.

Consistent with revisions made throughout the proposed standard, the word "generating" is added before the word "unit(s)" in each instance for clarity and consistency. Additionally, NERC proposes to repeat the same footnote included in Requirement R2 regarding the appropriate date for non-U.S. jurisdictions.

E. Requirement R4: Implementing and Maintaining Cold Weather Preparedness Plans

Proposed Reliability Standard EOP-012-2 Requirement R4 includes several stylistic and clarifying revisions, as follows:

> **R4.** Each Generator Owner shall implement and maintain one or more cold weather preparedness plan(s) for its generating units. The cold weather preparedness plan(s) shall include the following, at a minimum:

4.1 The lowest calculated Extreme Cold Weather Temperature for each generating unit, as determined in Requirement R1[~~3~~6];

4.2 The generating unit cold weather data, as determined in Requirement ~~R1.2~~ R1, Part 1.2;

4.3 Documentation identifying ~~the~~ Generator Cold Weather Critical Components;

4.4 Documentation of freeze protection measures implemented on Generator Cold Weather Critical Components ~~which~~ that includes measures used to reduce the cooling effects of wind determined necessary by the Generator Owner to protect against heat loss, and where applicable, the effects of freezing precipitation (e.g., sleet, snow, ice, and freezing rain); ~~and~~

4.5 Annual inspection and maintenance of generating unit(s) freeze protection measures implemented on Generator Cold Weather Critical Components.

[fn~~3~~6] Generator Owners shall include the lowest calculated Extreme Cold Weather Temperature for the unit, even where subsequent periodic re-calculations under Requirement R1 Part 1.1 cause an increase in the Extreme Cold Weather Temperature.

In addition to the stylistic revisions shown above, proposed Requirement R4 Part 4.5 would clarify the Generator Owner's obligation to ensure an annual inspection and maintenance of generating unit(s) freeze protection measures implemented on Generator Cold Weather Components. The addition of the phrase "implemented on Generator Cold Weather Components" clarifies the scope of annual inspection and maintenance required and is consistent with Requirement R4 Parts 4.3 and 4.4 which require identification of the Generator Cold Weather Critical Components and freeze protection measures implemented on those components in the cold weather preparedness plan.

F. Requirement R5: Providing Annual Training on Cold Weather Preparedness Plans

Proposed Reliability Standard EOP-012-3 Requirement R5 is an existing requirement that is carried forward substantively unchanged from Reliability Standard EOP-012-2. Minor revisions are proposed as follows:

R5. Each Generator Owner, in conjunction with its Generator Operator, shall identify the entity responsible for providing ~~the~~ generating unit-specific training, and that identified entity shall provide annual training to ~~its~~ the maintenance ~~or~~ and operations personnel, as applicable, responsible for implementing the cold weather preparedness plan(s) developed pursuant to Requirement R4.

The proposed revisions are intended to improve the readability and clarity of the requirement.

G. Requirement R6: Developing and Implementing Corrective Action Plans to Address Generator Cold Weather Reliability Events

Proposed Reliability Standard EOP-012-3 Requirement R6 would revise the requirement that each Generator Owner experiencing a Generator Cold Weather Reliability Event[85] develop a Corrective Action Plan to address the identified causes. Proposed Reliability Standard EOP-012-3 Requirement R6 would revise the currently approved requirement to address the directives from the June 2024 Order, as follows:

R6. Each Generator Owner shall, ~~for each~~ after experiencing a Generator Cold Weather Reliability Event at a generating unit that has a calculated Extreme Cold Weather Temperature at or below 32 degrees Fahrenheit (zero degrees Celsius) as determined in Requirement R1 and that self-commits or is required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius),~~[4]~~[7] develop and implement[8] a Corrective Action Plan(s) ~~when the generating unit experiences a Generator Cold Weather Reliability Event. The Corrective Action Plan shall be developed within 150 days or by July 1, whichever is earlier, and contains at a minimum~~ to address identified freezing issues as follows:

6.1 The Generator Owner shall develop a Corrective Action Plan for the generating unit that experienced a Generator Cold Weather

---

85 The NERC *Glossary* defines a Generator Cold Weather Reliability Event as follows:

One of the following events for which the apparent cause(s) is due to freezing of equipment or impacts of freezing precipitation (e.g., sleet, snow, ice, and freezing rain) on equipment within the Generator Owner's control, and the dry bulb temperature at the time of the event was at or above the Extreme Cold Weather Temperature:

(1) a forced derate of more than 10% of the total capacity of the unit, but not less than 20 MWs for longer than four hours in duration;

(2) a start-up failure where the unit fails to synchronize within a specified start-up time; or

(3) a Forced Outage.

Reliability Event no later than prior to the first day of the first December following the Generator Cold Weather Reliability Event.[9]

6.2. The Generator Owner shall conduct a review of ~~applicability to similar equipment at~~ other generating unit(s) in its fleet with the same or similar equipment as the affected generating unit to determine if any of those generating unit(s) are susceptible to the identified freezing issues. If corrective actions are needed, the Generator Owner shall develop or update a Corrective Action Plan to address the other generating unit(s). This review and, if applicable, the development or update of any Corrective Action Plan(s), shall be completed no later than 12 calendar months following the Generator Cold Weather Reliability Event.

6.3. For each Corrective Action Plan, the Generator Owner shall include at a minimum:

~~**6.1.**~~ **6.3.1.** A summary of the identified cause(s) ~~for~~ of the Generator Cold Weather Reliability Event, where applicable, and any relevant associated data;

~~**6.2** A review of applicability to similar equipment at other generating units owned by the Generator Owner; and~~

6.3.2. A list of actions to add new freeze protection measures or remedy issues with existing freeze protection measures;

6.3.3 An identification of any operating limitations on the generating unit(s), or impacts to the cold weather preparedness plan, if any, that would apply until ~~execution~~ implementation of the corrective action(s) identified in the Corrective Action Plan is completed~~.~~;

6.3.4. A description of the updates to the cold weather preparedness plan required under Requirement R4 to identify updates or additions to the Generator Cold Weather Critical Components and their freeze protection measures, if required; and

6.3.5. A timetable specifying that implementation of the Corrective Action Plan(s) shall be completed as follows:

6.3.5.1. For the generating unit experiencing the Generator Cold Weather Reliability Event, prior to the first day of the first December following the Generator Cold Weather Reliability Event.[10]

6.3.5.2. For other generating unit(s) owned by the Generator Owner, within 24 calendar months of completing the review required in Part 6.2, or no later than 36 calendar months following the Generator Cold Weather Reliability Event.

6.4 If a Generator Owner determines it will be unable to complete one or more of the actions in a Corrective Action Plan in accordance with the timetables specified in Requirement R6 Part 6.3.5 due to circumstances beyond its control, the Generator Owner shall submit a Corrective Action Plan extension request to the Compliance Enforcement Authority (CEA) for approval. The submitted Corrective Action Plan extension request shall include the following:

6.4.1. An explanation of the circumstances causing the delay and why those circumstances are beyond the control of the Generator Owner;

6.4.2. Revisions to the selected actions in Part 6.3.2, if any, including utilization of operating procedures, if applicable; and

6.4.3. Updated timetable for implementing the selected actions in Part 6.3.2.

6.5 The Generator Owner shall document in a declaration, with justification, if applicable, any Generator Cold Weather Constraint in accordance with Requirement R8, as applicable.

Footnotes

[fn47] Generating unit(s) that do not self-commit or are not required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), but may be called upon to operate in order to assist in the mitigation of BES Emergencies, Capacity Emergencies, or Energy Emergencies during periods at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), are exempt from this requirement.

[fn8] If a Generator Owner has previously experienced a Generator Cold Weather Reliability Event and developed a Corrective Action Plan for the generating unit or units under Requirement R6 Parts 6.1 or 6.2, the Generator Owner may review and update its existing plan(s) in lieu of developing a new plan.

[fn9/fn10] For events that occur in September, October, or November, the timetable shall specify completion prior to December 1 of the following calendar year.

NERC proposes to revise Requirement R6 in proposed Reliability Standard EOP-012-3 to address all aspects of Corrective Action Plans developed in response to Generator Cold Weather Reliability Events. The NERC *Glossary* defines a "Corrective Action Plan" as a "list of actions and an associated timetable for implementation to remedy a specific problem." In Reliability

Standard EOP-012-2, Requirement R6 addresses the development of Corrective Action Plans following Generator Cold Weather Reliability Events, including the timetables for developing such plans and the required contents, while Requirement R7 addresses the implementation timeframe for all Corrective Action Plans. In proposed Reliability Standard EOP-012-3, Requirement R6 would consolidate these requirements and shorten the timelines for implementing Corrective Action Plans developed in response to Generator Cold Weather Reliability Events. Proposed Requirement R6 would address the Commission's directives in paragraphs 68 and 70 of the June 2024 Order relating to the implementation of Corrective Action Plans for Generator Cold Weather Reliability Events. Proposed Requirement R6 would also address in part the Commission's directive in paragraph 76 to address ambiguities in Corrective Action Plan implementation deadlines by specifying clearly the deadlines that apply for the implementation of corrective actions depending on whether the unit experienced the Generator Cold Weather Reliability Event or is another unit in the Generator Owner's fleet that was determined to be susceptible to the same freezing issue following a review.

To address paragraph 68 of the June 2024 Order, proposed Requirement R6 Part 6.1 and Part 6.3.5.1 would provide that a Generator Owner must develop and implement a Corrective Action Plan for a generating unit that experienced a Generator Cold Weather Reliability Event by no later than the first day of the first December following the event, or for an early season event, no later than the first day of the first December of the following calendar year. These revisions are responsive to the first part of the Commission's paragraph 68 directive, directing NERC "to require shorter deadlines to implement corrective actions for existing or new equipment or the freeze protection measures for those generating units that experience a Generator Cold Weather

Reliability Event."[86] Further, these revisions are consistent with the Commission's suggestion that NERC require Generator Owners to implement corrective actions prior to the next winter season,[87] with December 1 representing the start of meteorological winter in North America. This timeline would allow Generator Owners to review multiple events holistically following a winter season and create one Corrective Action Plan for components with common failure causes. While the focus of proposed Requirement R6 is on the prompt remediation of known freezing issues, Requirement R6 Part 6.1 would specify that the Corrective Action Plan itself must be developed by no later than the implementation deadline to ensure that identified issues and the corrective actions taken to address them are memorialized.

Proposed Reliability Standard EOP-012-3 Requirement R6 Part 6.2 would carry forward the requirement from Reliability Standard EOP-012-2 for Generator Owners to conduct a review of other generating units in their fleets to determine if any of those units might be susceptible to the same freezing issues. To address concerns raised in the standard development process, this requirement is revised to provide additional clarification as to the extent of the review that is required. As the focus of Requirement R6 has shifted to the prompt remediation of freezing issues at generating units experiencing Generator Cold Weather Reliability Events, proposed Requirement R6 Part 6.2 would allow Generator Owners twelve calendar months (up from 150 days or by July 1 as in EOP-012-2) to complete their broader fleetwide reviews and develop or update Corrective Action Plans to address those other generating units as needed.

Proposed Requirement R6 Part 6.3 would specify the required contents of any Corrective Action Plan developed under Requirement R6. This section largely consolidates requirements

86 June 2024 Order at P 68.

87 *Id.*

presently in Reliability Standard EOP-012-2 Requirement R6 and R7 to create one requirement part addressing the content of Corrective Action Plans developed in response to Generator Cold Weather Reliability Events. Requirement R6 Part 6.3.1 would continue to require Generator Owners to include a summary of the identified causes of the event. Requirement R6 Part 6.3.2 would require the Generator Owner to identify the corrective actions. Requirement R6 Part 6.3.3 would require the Generator Owner to update any operating limitations or impacts to its cold weather preparedness plan that would apply until the Corrective Action Plan is implemented. Requirement R6 Part 6.3.4 would require the Generator Owner to update its cold weather preparedness plan as needed.

Proposed Requirement R6 Part 6.3.5 is a new requirement part that would establish clear timelines for the implementation of Corrective Action Plans for Generator Cold Weather Reliability Events consistent with paragraph 68 of the June 2024 Order. As noted previously, Generator Owners would be required to implement corrective actions for the generating unit experiencing the Generator Cold Weather Reliability Event prior to the start of the next winter season (Requirement R6 Part 6.3.5.1). This timeline is consistent with the Commission's suggested timeline in the June 2024 Order. For Corrective Action Plans addressing other generating units in a Generator Owner's fleet that may be susceptible to freezing issues, the Generator Owner would be required to implement corrective actions within 24 calendar months of the review required in Requirement R6 Part 6.2, or no later than 36 calendar months following the Generator Cold Weather Reliability Event (Requirement R6 Part 6.3.5.2).

In establishing the timeline provided in proposed Requirement R6 Part 6.3.5.2, NERC considered the Commission's suggestion in the June 2024 Order that the standard require Generator Owners "to complete freeze protection measures on similar equipment on all of its fleet

within 24 months of becoming aware of the freeze issue," with a "staggered 48-month corrective action plan implementation deadline" for "larger or more complicated implementations."[88] NERC also considered multiple stakeholder comments suggesting a 24 month timeframe to both complete a review and implement corrective actions may not be sufficient.[89] It was determined that developing specific requirements for staggering implementation of corrective actions across a fleet would present logistical challenges, as it is difficult to define with specificity the circumstances that would constitute a "larger or more complicated implementation" while ensuring fair and even application across Generator Owners with varying fleets. Further, a requirement to stagger implementation may not promote an orderly and efficient implementation of corrective actions depending on the issue needing to be addressed.[90] Following consideration of these factors, proposed Requirement R6 Part 6.3.5.2 would provide a uniform timeframe of 36 calendar months. Generator Owners that complete their fleet-wide reviews sooner than the 12 calendar months allowed in Requirement R6 Part 6.2 would have a longer period to implement any required corrective actions, thus incentivizing prompt action to identify the extent of condition across a fleet. NERC expects that this reasonably expeditious timeline would accommodate most circumstances; however, if a particularly complex implementation issue arises that cannot be addressed in 36 calendar months, the Generator Owner may request an extension under proposed Requirement R6 Part 6.4.

Proposed Requirement R6 Part 6.4 is a new requirement part addressing the Commission's directive in paragraph 70 of the June 2024 Order "to ensure that any extension of a corrective

88 June 2024 Order at P 68.

89 *See* Exhibit H Complete Record of Development at item 20 (December 3, 2024 Consideration of Comments) at 69-70 (expressing concern with the proposed timelines in draft 1 of the standard).

90 *See* EOP-012-2 Petition, *supra* note 50, at 67-68 (discussing considerations that precluded use of staggered implementation in Reliability Standard EOP-012-2).

action plan implementation deadline beyond the maximum implementation timeframe…is approved by NERC." Whereas Reliability Standard EOP-012-2 would allow a Generator Owner to update a Corrective Action Plan if timetables would exceed the timelines specified in the standard (Requirement R7 Part 7.3), proposed Reliability Standard EOP-012-3 would require the Generator Owner to seek approval by the Compliance Enforcement Authority (or "CEA") for any extensions needed to implement corrective actions due to circumstances beyond its control. Proposed Reliability Standard Requirement R6 Part 6.4 is similar to approved requirements in Reliability Standard TPL-007-4 requiring entities to seek Compliance Enforcement Authority approval for extensions to implement corrective actions to address issues identified through Geomagnetic Disturbance Vulnerability Assessments.[91] As part of any request, the Generator Owner must include: (1) an explanation of the circumstances causing the delay and why those circumstances are beyond its control; (2) revisions to selected corrective actions, including any use of operating procedures; and (3) an updated timetable for completion.

The Compliance Enforcement Authority, typically a Regional Entity, would review the extension request in accordance with the EOP-012-3 Generator Cold Weather CAP Extension and Constraint Process maintained by the NERC Compliance Monitoring and Enforcement Program.[92] This process would provide for the timely review of Corrective Action Plan extension requests and describes examples of circumstances that may be beyond the control of the entity, including delays resulting from regulatory or legal processes, delays resulting from stakeholder processes required by tariff, delays resulting from equipment lead times, or delays from unit outages being denied. The process also describes how the entity's due diligence in taking steps to implement

[91] *See* Reliability Standard TPL-007-4 Requirement R7 Part 7.4 and Requirement R11 Part 11.4.

[92] The draft EOP-012-3 Generator Cold Weather CAP Extension and Constraint Process is included as Exhibit C to this filing.

corrective actions will be considered as part of this determination. By limiting Corrective Action Plan extensions to circumstances beyond the control of the Generator Owner and requiring Compliance Enforcement Authority review and approval for any extension request, proposed Reliability Standard EOP-012-3 would provide for appropriate oversight of Corrective Action Plan extensions and help ensure that known reliability risks are addressed in a prompt manner and without undue delay.

Proposed Reliability Standard EOP-012-3 Requirement R6 Part 6.5 would address the declaration of Generator Cold Weather Constraints, where such constraints would preclude the implementation of one or more corrective actions in Corrective Action Plans to address issues related to Generator Cold Weather Reliability Events. This provision was previously applicable to all EOP-012 Corrective Action Plans in Reliability Standard EOP-012-2 Requirement R7 Part 7.4; it is carried forward with streamlining revisions in proposed Requirement R6 to create a complete and self-contained requirement addressing Corrective Action Plans for Generator Cold Weather Reliability Events. Please see the discussion of proposed Requirement R8 in Section V.I below for additional information regarding requirements for the declaration and Compliance Enforcement Authority validation of Generator Cold Weather Constraints.

In developing proposed Reliability Standard EOP-012-3 Requirement R6, NERC considered the Commission's statement in paragraph 3 of the June 2024 Order summarizing its directives, which directed NERC to "to ensure that the generator owner informs relevant registered entities of operating limitations in extreme cold weather during the period of [a Corrective Action Plan] extension."[93] Proposed Requirement R6 Part 6.3.3 would continue to require a Generator Owner to identify any operating limitations that would apply until it completes its Corrective

[93] *See* June 2024 Order at P 3 (summarizing directives).

Action Plan. The TOP-003 and IRO-010 Reliability Standards require the Transmission Operator, Balancing Authority, and Reliability Coordinator to maintain data specifications for their Real-time and operational planning analyses that include provisions for notification of BES generating unit(s) status during local forecasted cold weather to include operating limitations based on capability and availability, among other factors. These standards require the Generator Owner to provide the requested data. Additionally, other mechanisms that reliability entities have for obtaining up-to-date information on the status and availability of generators was discussed during the standard development process. It was also considered that, under Reliability Standard TOP-002-5 Requirement R8, each Balancing Authority is required to have an extreme cold weather Operating Process that takes into consideration capability and availability concerns, considering generating operating limitations from previous cold weather periods. After considering these standards, it was determined that no additional requirement in proposed Reliability Standard EOP-012-3 would be needed to ensure the "generator owner informs relevant registered entities of operating limitations in extreme cold weather" specifically during the period of Corrective Action Plan extension. Operating limitations should be communicated through other mechanisms regardless of whether those operating limitations apply generally, during the period provided in the Corrective Action Plan for implementation, or the period provided authorized by the Compliance Enforcement Authority for an extension. To the extent a Transmission Operator, Balancing Authority, or Reliability Coordinator would find it useful to understand whether the operating limitations apply specifically during a Corrective Action Plan extension, it may request this information as part of its data specifications, and the Generator Owner would be required to provide it. However, a requirement in proposed Reliability Standard EOP-012-3 for the Generator

Owner to provide this information through a separate mechanism, absent a communicated need from the reliability entity, would not provide any reliability benefit.

In conclusion, proposed Reliability Standard EOP-012-2 Requirement R6, with its clarified and consolidated requirements addressing all aspects of Corrective Action Plans to address Generator Cold Weather Reliability Events, represents a significant improvement over the corresponding requirements in Reliability Standard EOP-012-2 and addresses the Commission's directives in the June 2024 Order.

H. Requirement R7: Developing and Implementing Corrective Action Plans to Address Capability to Operate at the ECWT

Proposed Reliability Standard EOP-012-3 Requirement R7 would address the development of Corrective Action Plans to implement freeze protection measures to protect Generator Cold Weather Critical Components that provide the capability to operate at the ECWT under Requirement R3, or as needed to provide such capability after a periodic review of the Extreme Cold Weather Temperature (Requirement R1) or upon determining that a previously declared Generator Cold Weather Constraint is no longer valid (Requirement R9). As noted above, proposed Requirement R6 would address Corrective Action Plans to address Generator Cold Weather Reliability Events. Proposed Requirement R7 reflects several revisions to conform with the proposed revisions in Requirement R6, to address Commission directives from paragraphs 70 and 76 of the June 2024 Order, and to improve the readability of the requirement.

Proposed Reliability Standard EOP-012-3 would modify Reliability Standard EOP-012-2 Requirement R7 as follows:

> **R7.** Each Generator Owner~~, for each~~ that is required to develop a Corrective Action Plan ~~developed pursuant to~~ under Requirements R1, ~~R2,~~ R3, or ~~R6~~R9~~,~~ shall develop and implement the Corrective Action Plan in accordance with the following:

7.1 ~~Include a timetable for implementing the selected corrective action(s) that shall~~ For each Corrective Action Plan, the Generator Owner shall include at a minimum the following:

7.1.1. A ~~List~~ list of any ~~the~~ action~~(s)~~ ~~which address(es) existing equipment or~~ that require new freeze protection measures~~, if any, to be completed~~ with a timetable specifying completion of such measures within ~~24~~48 calendar months of completing development of the Corrective Action Plan;

7.1.2. A ~~List~~ list of any ~~the~~ action~~(s)~~ ~~which require(s) new equipment or~~ that remedy issues with existing freeze protection measures~~, if any, to be completed~~ with a timetable specifying completion of such measures within ~~48~~ 24 calendar months of completing development of the Corrective Action Plan (regardless of any longer timelines in the Corrective Action Plan associated with new freeze protection measures); and

7.1.3. ~~List the~~ A description of updates to the cold weather preparedness plan required under Requirement R4 to identify the updates or additions to the Generator Cold Weather Critical Components and their freeze protection measures; and

7.1.4. An identification of operating limitations on the generating unit(s), or impacts to the cold weather preparedness plan, if any, that would apply until implementation of the corrective action(s) identified in the Corrective Action Plan is completed.

~~**7.2**. Implement the Corrective Action Plan in accordance with the specified timetables in Requirement R7 Part 7.1;~~

~~**7.3** Update the Corrective Action Plan action(s) and timetable(s), with justification, if corrective action(s) change or timetable(s) exceed the timelines in Requirement R7 Part 7.1; and~~

7.2. If a Generator Owner determines it will be unable to complete one or more of the actions in a Corrective Action Plan in accordance with the timetables specified in Requirement R7 Part 7.1 due to circumstances beyond its control, the Generator Owner shall submit a Corrective Action Plan extension request to the CEA for approval. The submitted Corrective Action Plan extension request shall include the following:

7.2.1. An explanation of the circumstances causing the delay and how those circumstances are beyond the control of the Generator Owner;

7.2.2. Revisions to the selected actions in Parts 7.1, if any, including utilization of operating procedures, if applicable; and

7.2.3. Updated timetable for implementing the selected actions in Part 7.1.

7.43 The Generator Owner shall ~~D~~document in a declaration, with justification, if applicable, any Generator Cold Weather Constraint ~~that precludes the Generator Owner from implementing selected action(s) contained within the Corrective Action Plan~~in accordance with Requirement R8.

Proposed Requirement R7 would revise the main requirement to reflect the updated applicability of this requirement, to exclude Corrective Action Plans addressed under proposed Requirement R6, and to improve readability.

Proposed Requirement R7 Part 7.1 would specify the minimum contents of a Corrective Action Plan. Consistent with paragraph 76 of the June 2024 Order, proposed Requirement R7 Parts 7.1.1 and Parts 7.1.2 would clarify the implementation timeline that would apply for implementing new freeze protection measures (48 months) and the implementation timeline that would apply for remedying issues with existing freeze protection measures (24 months). Proposed Requirement R7 Part 7.1.2 would further clarify that the shorter timeframe would apply for corrective actions to remedy issues with existing freeze protection measures, even if a Generator Owner is also implementing new freeze protection measures with a longer timeframe for implementation. While the terms "new" and "existing" are intended to be read with their commonly understood meanings, the Technical Rationale for proposed Reliability Standard EOP-012-3 further elaborates on the distinction between "new" and "existing" measures for the purposes of applying these implementation timeframes. For example, if a freeze protection measure such as heat trace fails, and the corrective action would be to replace the freeze protection measure with the same, a similar, or another commonly used technology, that would be considered an action to remedy an issue with an existing freeze protection measure and subject to the shorter, 24-month timeframe.

Similarly, changing a heat trace from 40 feet to 60 feet, or making a change in the amperage capability of the heat trace, would be considered actions to remedy issues with existing freeze protection measures. New freeze protection measures may include, among other things, the construction of permanent structures not existing before or the addition of technologies that are not already present.[94] The proposed revisions and supporting Technical Rationale thus provide clear direction as to the required Corrective Action Plan implementation deadlines as directed by the Commission in paragraph 76 of the June 2024 Order.

Proposed Requirement R7 Part 7.1.3 would continue to provide that Generator Owners make the appropriate updates to their cold weather preparedness plans as part of developing and implementing Corrective Action Plans.

Proposed Requirement R7 Part 7.1.4 is a new requirement part that would require the Generator Owner to identify any operating limitations on the generating unit(s) or impacts to the cold weather preparedness plan that would apply until implementation of the corrective action(s) identified in the Corrective Action Plan is completed. This requirement is currently included in Reliability Standard EOP-012-2 Requirement R6 only for Corrective Action Plans developed in response to Generator Cold Weather Reliability Events. Adding this requirement to Requirement R7 would reinforce that Generator Owners must have generator cold weather operating parameters and cold weather preparedness plans that reflect the current state of the generating unit to facilitate the accurate exchange of generator cold weather data with reliability entities where required under other Reliability Standards.[95]

---

[94] See Technical Rationale, Exhibit D at 21.

[95] *See* discussion in Section V.G *supra* of how data regarding generator capability and availability in cold weather is addressed in other Reliability Standards.

Consistent with paragraph 70 of the June 2024 Order, proposed Requirement R7 Part 7.2 specifies that if a Generator Owner determines it would be unable to complete one or more actions in its Corrective Action Plan in accordance with the timetables specified in Requirement R7 Part 7.1, it must submit a Corrective Action Plan extension request to the Compliance Enforcement Authority for approval. Proposed Requirement R7 Part 7.2 is nearly identical to proposed Requirement R6 Part 6.2, which is discussed in detail in the preceding section. The process by which the Compliance Enforcement Authority would review Corrective Action Plan extension requests would be the same regardless of whether the request is submitted under proposed Requirement R6 or proposed Requirement R7.

Proposed Requirement R7 Part 7.3 would address the declaration of Generator Cold Weather Constraints, where such constraints would preclude the implementation of one or more corrective actions in a Corrective Action Plan. This provision is carried forward from Reliability Standard EOP-012-2 Requirement R7 Part 7.4 with streamlining revisions. Please see the discussion of proposed Requirement R8 in Section V.I below for additional information regarding requirements for the declaration and Compliance Enforcement Authority review of Generator Cold Weather Constraints.

For these reasons, proposed Reliability Standard EOP-012-2 Requirement R7 would represent a significant improvement upon the corresponding requirement for Corrective Action Plans in the approved Reliability Standard EOP-012-2 and address the relevant Commission directives from the June 2024 Order.

I. Requirement R8 and Attachment 1: Declaring Generator Cold Weather Constraints

Proposed Reliability Standard EOP-012-3 reflects a series of revisions to address the Commission's directives in the June 2024 Order regarding Generator Cold Weather Constraints;

specifically, to address ambiguities regarding the defined term Generator Cold Weather Constraint and the associated criteria[96] and to address concerns regarding the need for a timely review and evaluation of declared Generator Cold Weather Constraints by NERC.[97] These revisions consist of: (1) a revised definition of the term Generator Cold Weather Constraint; (2) a new Attachment 1 addressing the identification of Generator Cold Weather Constraints; and (3) a revised Requirement R8 providing a framework for ERO oversight of declared Generator Cold Weather Constraints.

As noted above, NERC proposes a revised definition of the term Generator Cold Weather Constraint to reflect this revised framework as follows:

> **Generator Cold Weather Constraint** – Any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components ~~using the criteria below~~. Freeze protection measures are not intended to be limited to optimum practices, methods, or technologies, but are also intended to include ~~acceptable~~ practices, methods, or technologies ~~generally implemented by the electric industry in areas that experience similar winter climate conditions~~ that would be expected to result in improved generating unit performance during cold temperatures.
>
> ~~Criteria used to determine a constraint include practices, methods, or technologies which, given the exercise of reasonable judgment in light of the facts known at the time the decision to declare the constraint was made:~~
>
> - ~~Were not broadly implemented at generating units for comparable unit types in regions that experience similar winter climate conditions to provide reasonable assurance of efficacy;~~
> - ~~Could not have been expected to accomplish the desired result; or~~
> - ~~Could not have been implemented at a reasonable cost consistent with good business practices, reliability, or safety. A cost may be deemed "unreasonable" when implementation of selected freeze protection measure(s)~~

96 See June 2024 Order at P 47.

97 *Id.* at P 54.

~~are uneconomical to the extent that they would require prohibitively expensive modifications or significant expenditures on equipment with minimal remaining life.~~

Proposed Attachment 1 would address the identification of Generator Cold Weather Constraints. In the June 2024 Order, the Commission directed NERC "to ensure that the Generator Cold Weather Constraint declaration criteria included within the proposed Reliability Standard are objective *and* sufficiently detailed so that applicable entities understand what is required of them."[98] Proposed Reliability Standard EOP-012-3 would address this directive and improve upon prior versions of the standard by expressly defining the types of circumstances that would qualify as Generator Cold Weather Constraints. In Reliability Standard EOP-012-1, these circumstances were identified more generally as "technical, commercial, or operational constraints." In Reliability Standard EOP-012-2, Generator Cold Weather Constraints are identified more specifically as circumstances calling for solutions that are not in widespread use, not thought to be effective, or could not be implemented at a reasonable cost consistent with good business practices, reliability, or safety. Proposed Reliability Standard EOP-012-3 replaces these concepts with a defined list. As such, the proposed standard provides objective and sufficiently detailed criteria so that applicable entities may understand what is required of them.

In the June 2024 Order, the Commission identified several potential approaches for addressing its directive, such as including a "limited and discrete set of circumstances that would qualify as acceptable constraints" or "establish[ing] a pre-approval process for all Generator Cold Weather Constraint declarations."[99] Proposed Attachment 1 would address the Commission's directive through a hybrid approach that would both define the circumstances that would constitute

98 June 2024 Order at P 47.

99 *Id.*

a Generator Cold Weather Constraint and the circumstances which could constitute a Generator Cold Weather Constraint, depending on the facts and circumstances. These two categories are referred to as "Known Generator Cold Weather Constraints" and "Case-by-case Determinations of Generator Cold Weather Constraints," respectively. Using as a starting point the Technical Rationale for Reliability Standard EOP-012-2,[100] proposed Attachment 1 would build upon and define with specificity what circumstances may constitute valid Generator Cold Weather Constraints. In all instances, the Compliance Enforcement Authority would be responsible for reviewing the Generator Cold Weather Constraint to confirm its validity.

In proposed Attachment 1, Known Generator Cold Weather Constraints would consist of the following circumstances:

- Individual wind turbine towers manufactured prior to October 1, 2029 that have structural limitations established by Original Equipment Manufacturers (OEMs) based on a minimum temperature that is higher than the Extreme Cold Weather Temperature calculated per Requirement R1 for generating units that began commercial operation prior to October 1, 2031.
- Application of freeze protection measures to meet the requirements of this Standard that require:
    - Replacing existing wind turbine blades with new blades solely for the purpose of adding de-icing or ice-minimizing capabilities;
    - Removal of accumulated frozen precipitation on solar panels;
    - Applying heat upstream of inlet air filters to prevent the buildup of frozen precipitation on combustion turbine inlet air filters; or
    - Implementation of heat tracing or other de-icing technologies for wind turbine blades, that, through analysis, have been shown to not be effective or not made available by the OEM for generating units of a comparable types in regions that experience similar winter climate conditions.

[100] EOP-012-2 Petition, *supra* note 50, Exhibit C, Technical Rationale, at 4-5.

As discussed in the Technical Rationale, the development of the Known Generator Cold Weather Constraints list was informed by stakeholder input provided throughout the development process, including a technical conference convened in November 2024 for this purpose.

The first category reflects limitations in the low temperature operability of wind turbine towers, with broad recognition that the EOP-012 standard should recognize and permit this limitation for existing wind turbine tower equipment. However, it was also determined that this limitation should not serve as the basis for a Generator Cold Weather Constraint indefinitely, and that wind turbine towers must be designed and constructed to meet all aspects of Reliability Standard EOP-012-3 to assure the reliability of the Bulk-Power System in the future. After consideration of the feedback from the technical conference indicating that generational technological development cycles in the industry are on the order of five to seven years, NERC determined that, for this Generator Cold Weather Constraint to apply, the wind turbine towers must have been manufactured prior to October 1, 2029 and must have been installed and entered commercial operation prior to October 1, 2031. The October 1, 2029 manufacture date would allow four years beyond the anticipated implementation date of proposed Reliability Standard EOP-012-3 (October 1, 2025) for manufacturers to select, apply, test, and begin production of wind turbine towers constructed of materials capable of lower temperature operation appropriate for those locations with Extreme Cold Weather Temperatures below the limits associated with current tower material designs. Industry participants provided feedback indicating that delivery and construction lead times for wind turbines were years into the future, providing additional support for the selected date. The October 1, 2031 commercial operation date was established to provide a reasonable timeframe for entities to receive, construct, and commission the equipment, while eliminating any potential incentive to stockpile older equipment for later installation.

The second category of Known Generator Cold Weather Constraints consists of circumstances requiring the application of freeze protection measures that have, throughout the development history of the EOP-012 standard, been determined to be impractical to implement, are not likely to provide desired operational capability, or would represent an undue burden on Generator Owners to implement. This includes freeze protection measures that would call for replacing existing wind turbine blades with new blades solely for the purpose of adding de-icing or ice-minimizing capabilities, measures that would call for the removal of accumulated frozen participation on solar panels (which could reduce the unit's capability or require the entity to station personnel at the site to manually remove participation as it accumulates), measures that would call for applying heat upstream of inlet air filters to prevent buildup of frozen precipitation on combustion turbine inlet air filters, or measures that would call for implementation of heat tracing or other de-icing technologies for wind turbine blades that, through analysis, have shown to not be effective or not made available by the original equipment manufacturer generating units of comparable types operating in comparable conditions.

While the two categories of Known Cold Weather Constraints would address many of the considerations raised throughout the development of the EOP-012 standard, it was recognized that other situations may, depending on the facts and circumstances, reasonably preclude the implementation of corrective actions on a specific generating unit. Proposed Attachment 1 therefore contains a non-exhaustive list of possible situations that may constitute a Generator Cold Weather Constraint, which would be evaluated on a case-by-case basis. These situations may include the following:

1. The implementation of a specific freeze protection measure will void an equipment warranty.
2. The implementation of a specific freeze protection measure would exceed a manufacturer's design limitation and the exceedance is expected to functionally impair or degrade the

effective operation of the impacted component or system.

3. The implementation of a specific freeze protection measure is precluded by technical or physical limitations. For example:
    a. Installing wind breaks around a cooling tower or air-cooled heat exchanger that requires free airflow for its functionality;
    b. Implementing freeze protection measures with size or weight that would require the structural re-design and re-construction of the protected equipment or its support system;
    c. Other similar circumstances as determined through operating experience or engineering analysis and supported with justification.
4. A determination, through an analysis, that the freeze protection measure would not be effective for the generating unit. Such a determination may be supported, for example, by fleet or industry operating experience (or lack thereof) with the freeze protection measure on generating unit(s) of comparable types in regions that experience similar winter climate conditions.
5. A determination, through an analysis, that the implementation of a specific freeze protection measure or measures would adversely affect the reliability of the Bulk Power System to an extent that outweighs the reliability benefit of applying the freeze protection measure(s). For example:
    a. The implementation of freeze protection measures, while feasible, would result in the accelerated premature retirement of an existing generating unit with no acceptable replacement available within the accelerated timeframe (must be accompanied by an attestation signed by an officer of the company);
    b. The implementation of freeze protection measures would cause the Generator Owner to cancel plans to finish the development of a new generating unit (must be accompanied by an attestation signed by an officer of the company);
    c. The implementation of freeze protection measures would reduce the generating unit's ability to provide Real Power or Reactive Power capability by more than three percent, or another value supported by the appropriate functional entity (e.g., Transmission Planner, Reliability Coordinator, Balancing Authority, etc.), when freeze protection measures are not in use; or
    d. The implementation of freeze protection measures would reduce the summer net dependable capacity, or net dependable capacity at Peak Demand, of the generating unit by more than three percent or another value supported by the appropriate functional entity (e.g., Transmission Planner, Reliability Coordinator, Balancing Authority, etc.);
    e. Other similar circumstances as determined through operating experience or engineering analysis and supported with justification.
6. The implementation of new freeze protection measures to an existing generating unit that has previously communicated a retirement date to the appropriate functional entity (e.g., Transmission Planner, Reliability Coordinator, Balancing Authority, etc.) that falls within

three calendar years of the Generator Cold Weather Constraint declaration;

7. The implementation of a specific freeze protection measure would introduce the risk of noncompliance with other statutory, regulatory, or health and safety requirements or standards for which relief via waiver, exemption or other means of excused noncompliance is not available during extreme cold weather.
8. A determination through an analysis that the freeze protection measure is not available on the commercial market for generating units of comparable types in regions that experience similar winter climate conditions.
9. Implementation of freeze protection measures would not increase reliability of a generating unit due to clearly delineated technical or physical reasons on fuel supply which has been communicated to its Reliability Coordinator or Balancing Authority and are not due to Fixed Fuel Supply Components, and which are outside the Generator Owner's control.
10. Other situations identified by the Generator Owner that may, based on the specific circumstances beyond the Generator Owner's control, limit its ability to apply freeze protection measures to Generator Cold Weather Critical Components.

The proposed list of possible case-by-case Generator Cold Weather Constraints provides additional clarification and guidance to entities on the types of circumstances that may preclude the implementation of freeze protection measures on their generating units. Generally, these circumstances would include safety limitations, limitations imposed by law or regulation, technical limitations on applying the freeze protection measure, or a lack of commercially available technologies that are effective to address the identified issue. Consistent with Reliability Standard EOP-012-2, proposed Reliability Standard EOP-012-3 would not require an entity to implement unproven technologies.[101] However, proposed Reliability Standard EOP-012-3 would improve upon the prior version of the standard by requiring that the Generator Owner perform an analysis that concludes that the technology is not likely to be effective for the unit. This analysis may include consideration of industry experience (or lack thereof) with the technology, along with any other relevant factors supporting the determination. However, it is the supporting analysis that the

[101] June 2024 Order at P 43. In the Order, the Commission stated that it agreed that the EOP-012 standard should not require the implementation of unproven technologies, but "in its effort to provide flexibility, [the EOP-012-2 standard] falls short of the Commission's directive to develop criteria that are objective, unambiguous, and auditable."

measure is not likely to be effective – and not the extent of industry adoption of the technology – that would determine whether a Generator Cold Weather Constraint would apply. Thus, the criterion is objective, unambiguous, and auditable.

The list of possible case-by-case Generator Cold Weather Constraints in proposed Attachment 1 includes the types of economic constraints identified by the Commission for which the cost of retrofitting may be unduly burdensome, including requiring corrective actions for generating units scheduled to retire in the near future, requiring corrective actions where that would cause the generating unit to be retired in the near future, or requiring corrective actions where that would result in the cancelation of a new generating unit.[102] This list includes consideration of reliability impacts. Two cases seemed particularly well-suited for a threshold for quantification of impacts: those that reduce a generating unit's real or reactive power when the freeze protection measure is not in place and those that would reduce net dependable capacity during summer or at Peak Demand. A value of a three (3) percent reduction as an appropriate level of impact above which the negative impact to the Bulk-Power System resulting from requiring a specific freeze protection measure may be appropriately determined to outweigh the benefits of applying the measure.[103] Recognizing that local and temporal conditions are best understood, measured and predicted by the Generator Owner and affected functional entities, it was determined that the standard should allow flexibility in the selected three percent value when a different value is

[102] *See* June 2024 Order at P 46. These types of constraints must be supported by a determination supported by an analysis, which should consider availability of cost recovery. *See id.* at n. 92. Consistent with the Commission's suggestion, NERC has also proposed to require any such constraint to be accompanied by an attestation. *See id.* ("For example, one approach could be for NERC to provide a limited set of clearly defined circumstances that could serve as constraints, *such as an attestation from* a generator owner or generator operator that…(2) implementing freeze protection measures in accordance with the Reliability Standard would cause the generating unit to retire within two years; or (3) they would cancel a newly scheduled generating unit that has not yet achieved commercial operation if required to comply with the freeze protection requirements of a Standard" (emphasis added)).

[103] As discussed in the Technical Rationale, regional Reliability Standard BAL-002-WECC-3 identifies three percent as a value for reliable operations for required Contingency Reserves. See Technical Rationale, Exhibit D at 29.

supported by the appropriate functional entity as more supportive of reliable operation of the grid. The list includes consideration of other factors that may reasonably preclude the implementation of freeze protection measures, such as the presence of fuel supply issues that would preclude the ability of the generating unit to run at the Extreme Cold Weather Temperature regardless of any freeze protection measures applied at the unit. Lastly, the list includes a general provision, intended to capture other circumstances not specifically identified that may reasonably preclude the implementation of freeze protection measures now or in the future.

While proposed Attachment 1 provides substantial additional detail and clarification to entities regarding the circumstances that may comprise a Generator Cold Weather Constraint, proposed Requirement R8 would require that any Generator Owner declaring a Generator Cold Weather Constraint submit the constraint to the Compliance Enforcement Authority for validation or case-by-case approval. This requirement would help to "ensure entities' declared Generator Cold Weather Constraints are appropriate and can be supported and defended," consistent with the Commission's guidance in the June 2024 Order.[104] To the extent the Compliance Enforcement Authority determines a Generator Cold Weather Constraint is not valid, the Generator Owner would be provided with a timely response so that it may take appropriate measures to provide the necessary operational capability for its generating unit.

Proposed Reliability Standard EOP-012-3 would revise Requirement R8 to require submission to the Compliance Enforcement Authority of all Generator Cold Weather Constraints. Proposed Requirement R9, discussed in the following section, would address requirements for the periodic review of Generator Cold Weather Constraints. Proposed Reliability Standard EOP-012-2 would revise Requirement R8 as follows:

---

[104] *See* June 2024 Order at P 47.

R8. Each Generator Owner that ~~creates~~ declares a Generator Cold Weather Constraint ~~declaration~~ in accordance with Attachment 1 shall:

~~**8.1**. Review the Generator Cold Weather Constraint declaration at least every five calendar years or as needed when a change of status to the Generator Cold Weather Constraint occurs; and~~

8.1. Submit its Generator Cold Weather Constraint declaration(s) to the CEA as follows:

- For Generator Cold Weather Constraints determined in accordance with Requirement R2 for generating unit(s) upon beginning commercial operation, submit within 15 calendar days after commercial operation; or
- For all other Generator Cold Weather Constraints, submit within 45 calendar days of determining that the Generator Cold Weather Constraint is applicable.

8.2. Update the operating limitations ~~associated with capability and availability~~ under Requirement R1 Part R1.2 if applicable~~.~~;

8.3. If the CEA determines the declared Generator Cold Weather Constraint is invalid, update its Corrective Action Plan(s) to require corrective actions be completed in accordance with Requirement R6 or Requirement R7, as applicable, subject to any extensions approved by the CEA, or implement freeze protection measures to provide the necessary capability in accordance with Requirement R2; and

8.4. Document and provide notice to the CEA, when a generating unit experiences a Generator Cold Weather Reliability Event with the same cause of a previous Generator Cold Weather Reliability Event at the same or a similar unit, and one or more corrective actions to address the cause is addressed by an existing validated Generator Cold Weather Constraint for the same or a similar unit.

Proposed Requirement R8 Part 8.1 would address the timely submission of declared Generator Cold Weather Constraints to the Compliance Enforcement Authority, which may be NERC or the relevant Regional Entity. As such, it responds to that part of the Commission's directive in the June 2024 Order to "to modify proposed Reliability Standard so that NERC *receives,* reviews, evaluates, and confirms for validity the Generator Cold Weather Constraint

declarations in a timely manner."[105] The remaining part of that directive, for NERC to review, evaluate, and confirm Generator Cold Weather Constraints, is addressed in the EOP-012-3 Generator Cold Weather CAP Extension and Constraint Process maintained by the ERO Compliance Monitoring and Enforcement Program. This process, which is included as Exhibit C to this filing, addresses entity submission of constraints, Compliance Enforcement Authority review procedures and timelines, registered entity notifications, and appeal procedures. Under this process, the Compliance Enforcement Authority would endeavor to complete its review of Known Generator Cold Weather Constraint declarations within 10 calendar days of confirming the receipt of a complete submittal, and to complete its review of other Generator Cold Weather Constraint declarations within 45 days. If additional time is needed to complete the review, the Compliance Enforcement Authority would provide notice to the submitting entity. To maintain the appropriate oversight and help promote consistency in the review of Generator Cold Weather Constraints across the ERO Enterprise, each Compliance Enforcement Authority shall provide a quarterly report to NERC that describes each Generator Cold Weather Constraint received, the disposition, and the supporting rationale. NERC may also choose to participate in any individual Generator Cold Weather Constraint review at its discretion.

Proposed Requirement R8 Part 8.3 would describe the steps a Generator Owner must take if its Generator Cold Weather Constraint is determined to be invalid: either implement the corrective actions in accordance with the applicable timeframe, subject to any approved extensions, or for new BES generating units, implement the required capability.

[105] June 2024 Order at P 54. The Commission further stated that "It is up to NERC whether it would like to delegate this task [of reviewing Generator Cold Weather Constraint declarations] the relevant Regional Entities." *See id.*

Proposed Requirement R8 Part 8.4 would require the Generator Owner to notify the Compliance Enforcement Authority if a generating unit experiences a Generator Cold Weather Reliability Event where a corrective action is already addressed by a valid Generator Cold Weather Constraint. This provision addresses concerns raised during the standard development process regarding the potential administrative burdens that would be associated with having to submit multiple Generator Cold Weather constraints for a known, repeat issue affecting one or more generating units. Providing notification to the Compliance Enforcement Authority would help maintain visibility over known reliability issues while reducing duplicative administrative burdens that would do little to advance generator cold weather reliability.

J. Requirement R9: Ongoing Obligations for Generator Owners with Generator Cold Weather Constraints

Proposed Reliability Standard EOP-012-3 Requirement R9 is a new requirement that would address the periodic review of Generator Cold Weather Constraint declarations, carrying forward the periodic review requirements in Reliability Standard EOP-012-2 Requirement R8 Part 8.1. Proposed Requirement R9 would provide as follows:

> **R9**. The Generator Owner shall review each Generator Cold Weather Constraint declaration validated by the CEA at least once every 36 calendar months to determine if it remains valid in accordance with Attachment 1.
>
> **9.1**. If a Generator Cold Weather Constraint is determined to be no longer valid, then within six (6) calendar months of such determination, the Generator Owner shall develop or update a Corrective Action Plan pursuant to Requirement R7.

Proposed Requirement R9 Part 8.1 would address the Commission's directive in the June 2024 Order to implement more frequent reviews of Generator Cold Weather Constraints than the five years provided in Reliability Standard EOP-012-2 to verify that the declaration remains

valid.[106] Proposed Requirement R9 would require Generator Owners to review all validated Generator Cold Weather Constraints at least once every 36 calendar months to ensure the constraint remains valid. This 36 calendar month timeline was based on consideration of stakeholder comments regarding the optimal timeline for such reviews, considering the pace that new technologies are brought to market. By shortening from five calendar years, the 36 calendar month timeline provides a reasonable approach to meeting the Commission's directive without creating undue administrative burden to periodically monitor if Generator Cold Weather Constraints remain valid or if new technologies have become available that invalidate the previously validated constraint.

Previous language from Reliability Standard EOP-012-2 regarding reviews "as needed when a change of status" occurs was removed due to the more frequent periodicity of the required reviews. During the development process, NERC considered a suggestion to require additional out of cycle reviews, such as following a notification from a regulatory authority.[107] NERC declined to adopt that suggestion, as it did not appear to be supported by the expected pace of technological advancements nor the expected pace at which other circumstances that would support Generator Cold Weather Constraints would change. NERC, however, has considered that other options in its reliability toolkit may be available to advance industry awareness of new freeze protection technologies that may obviate the need for certain constraints.

Proposed Requirement R9 Part 9.1 would clarify the Generator Owner's obligations in the event the Generator Cold Weather Constraint is determined to be no longer valid following this review. For example, a new freeze protection technology is developed that would address the issue, or circumstances change such that the implementation of an existing measure would no longer

106 June 2024 Order at P 94.

107 Exhibit H Complete Record of Development at item 62 (March 2025 Consideration of Comments) at 3.

cause the plant to retire prematurely. In such cases, the Generator Owner would be required to develop or update an existing Corrective Action Plan to specify implementation of the freeze protection measures according to the timelines provided in proposed Requirement R7, along with the other required elements. If another Generator Cold Weather Constraint would apply based on the facts and circumstances, the Generator Owner may submit a new constraint to the Compliance Enforcement Authority for review under Requirement R8. Proposed Requirement R9 Part 9.1 would thus ensure that entities are taking timely action if circumstances change such that a constraint is no longer appropriate under the standard.

VI. EFFECTIVE DATE OF THE PROPOSED RELIABILITY STANDARD

NERC respectfully requests that the Commission approve the implementation plan attached to this petition as **Exhibit B**. The proposed implementation plan strikes an appropriate balance between the need to implement the important protections for cold weather in proposed Reliability Standard EOP-012-3 as expeditiously as possible, while recognizing the work applicable entities may need to perform to become compliant with the revised requirements, particularly as they relate to the declaration and submission of Generator Cold Weather Constraints.[108] Approval would be just, reasonable, not unduly discriminatory or preferential, and in the public interest.

Under the proposed implementation plan for Reliability Standard EOP-012-3, Reliability Standard EOP-012-3 and the revised definition of Generator Cold Weather Constraint would become effective on the later of: (1) October 1, 2025; or (2) the first day of the first calendar quarter

[108] *See* Order No. 672, *supra* note 8, at P 333 ("In considering whether a proposed Reliability Standard is just and reasonable, the Commission will consider also the timetable for implementation of the new requirements, including how the proposal balances any urgency in the need to implement it against the reasonableness of the time allowed for those who must comply to develop the necessary procedures, software, facilities, staffing or other relevant capability.").

that is three (3) months following regulatory approval. The October 1, 2025 date was chosen because, in the United States, the last compliance date for Reliability Standard EOP-012-2 is October 1, 2025 (Requirement R3). This relatively short implementation timeframe reflects NERC's determination that the practical impact of implementing the proposed changes is not expected be significant. Entities, however, would have sufficient notice of their revised obligations. As multiple versions of the EOP-012 standard have been developed over the last several years, additional implementation information is provided to ensure an orderly transition to proposed Reliability Standard EOP-012-3.

During the development of proposed Reliability Standard EOP-012-3, NERC identified a potential concern regarding the implementation of revised Requirement R2 for a subset of new BES generating units entering commercial operation on or after October 1, 2027. Under Reliability Standard EOP-012-1 Requirement R1, Generator Owners owning new generating units would have been required to either implement the necessary capabilities or declare any "technical, commercial, or operational constraints" that precluded them from implementing the necessary capabilities. In Reliability Standard EOP-012-1, the standard specified "with a commercial operation date prior to/subsequent to [Effective Date of the requirement]," which would be determined in accordance with the EOP-012-1 Implementation Plan, as establishing which generating units would be considered existing units and subject to the less stringent requirements, and which generating units would be considered new units and subject to the more stringent requirements. In developing Reliability Standard EOP-012-2 and a shorter Implementation Plan to meet the directives of the February 2023 Order, the EOP-012-2 drafting team determined to replace "Effective Date of this requirement" with a date certain, October 1, 2027. In establishing this date, the EOP-012-2 drafting team considered the original proposed Implementation Plan for

Reliability Standard EOP-012-1 which would have had this requirement effective April 1, 2028. The drafting team also considered the Commission's directives from the February 2023 Order to shorten this plan as it related to existing generation, the need to ensure generation is prepared for cold weather, as well as the fact that new generation coming online prior to October 1, 2027 is likely to be significantly advanced past the design phase when incorporating measures to provide capability in sustained wind conditions would be most cost effective and reasonable.[109] In setting this date, Reliability Standard EOP-012-2 introduced the option for owners of new generating units to develop a Corrective Action Plan, in the event they could not meet the more stringent requirements for new generation upon entering commercial operation on or after October 1, 2027. To the extent a Generator Cold Weather Constraint would apply, it would be addressed through Requirement R7 addressing Corrective Action Plans.

In addressing the Commission's directive to remove this Corrective Action Plan option in proposed Reliability Standard EOP-012-3, it was determined that some limited allowance needed to be made for the units that were thought to be far along in the construction process, using designs that may have predated the development and approval of the EOP-012 standard and which may not meet the standard's requirements for new generating units without significant additional work. It was also considered that some of these generating units may be fully constructed but not yet in "commercial operation" by October 1, 2027 due to the varying requirements for achieving that designation in different regions. In the June 2024 Order, the Commission stated that, while it was persuaded by NERC's rationale that there needs to be allowances made for units that are well into their construction phase to complete corrective action plans for elements already designed, it was concerned that Reliability Standard EOP-012-2 did not clearly differentiate between projects in an

[109] *See* EOP-012-2 Petition, *supra* note 50, at 39-40.

advanced stage of construction and those in a lesser phase of construction.[110] The proposed implementation plan for proposed Reliability Standard EOP-012-3 would define such projects and allow them additional time to come into compliance with the standard without requiring them to delay their commercial operation date.

The proposed implementation plan would provide that Generator Owners owning BES generating units entering commercial operation on or after October 1, 2027 shall comply with Requirement R2 by the commercial operation date, with any Generator Cold Weather Constraints submitted in accordance with the timeline provided in Requirement R8 (i.e. within 15 days of entering commercial operation). However, for generating units for which the Generator Owner first contractually committed to design criteria relevant to Requirement R2 before June 29, 2023 and which enter commercial operation between October 1, 2027 and March 31, 2028, the Generator Owner shall comply with Requirement R2 relating to implementing required capability by no later than April 1, 2028.

To be eligible for this phased-in compliance option, the Generator Owner must have "first contractually committed to the design criteria" for the new generating unit before June 29, 2023, and the generating unit must first enter commercial operation between October 1, 2027 and March 31, 2028 (inclusive of the start and end dates). Proposed footnote 2 would clarify that such commitments would be demonstrated by signed contracts creating a binding legal agreement with respect to the design criteria for the unit. The June 29, 2023 date represents the date by which U.S.-based Generator Owners would have been on reasonable notice of the specific nature of their new obligations and could take the appropriate steps to change their designs to facilitate compliance

110 *See* June 2024 Order at P 71.

upon entering commercial operation.[111] While maintaining the October 1, 2027 date as the date after which new BES generating units must meet the more stringent Requirement R2, the proposed implementation plan for Reliability Standard EOP-012-3 would in effect restore the original EOP-012-1 timeline for the new BES generating units that would be most affected by the changes across standard versions.

While the scope of generating units meeting these criteria is difficult to estimate and is generally thought to be small, eliminating the ability to develop a Corrective Action Plan at this stage could place a significant burden on the affected Generator Owners. This is especially true when this change is combined with the proposed changes to the Generator Cold Weather Constraint criteria in proposed Reliability Standard EOP-012-3. If Generator Owners felt compelled to delay the commercial operation date for such units past winter 2027-2028 to meet the newly clarified and revised requirements, it could reduce new generation at a time when NERC has projected an increased risk of reserve margin shortfalls in several areas of North America.[112] Thus, NERC submits this limited phased-in compliance option is just and reasonable.

NERC's proposed implementation timeline balances the urgency in the need to implement the standards against the time allowed for those who must comply to develop necessary procedures and other relevant capabilities, including developing any requests for Corrective Action Plan

---

[111] The Commission issued its order approving EOP-012-1 and the definition of Extreme Cold Weather Temperature in February 2023; however, the EOP-012-3 drafting team considered comments stating that there was still some regulatory uncertainty past this time, as several entities had filed for rehearing on various aspects of the standard. On June 29, 2023, FERC issued an order addressing arguments raised on rehearing, resolving any remaining uncertainty regarding the standard to which new generation would be expected to perform in the future. *N. Am. Elec. Reliability Corp.*, 183 FERC ¶ 61,222 (2023). During the development process, several alternative dates and approaches were considered. *See* Technical Rationale Exhibit D at 11-14 for additional discussion and supporting rationale.

[112] *See* NERC, *2024 Long-Term Reliability Assessment* (Dec. 2024) at 6 (summarizing areas at risk in 2025-2029 in normal peak and extreme conditions), https://www.nerc.com/pa/RAPA/ra/Reliability%20Assessments%20DL/NERC_Long%20Term%20Reliability%20Assessment_2024.pdf.

extensions, preparing any Generator Cold Weather Constraint declarations for Compliance Enforcement Authority review, or for the new BES generating units identified above, implementing freeze protection measures to meet the more stringent requirements of Requirement R2.[113]

While NERC maintains that its proposed implementation period is reasonable considering the above factors, NERC continues to strongly encourage entities to prioritize implementation of proposed Reliability Standard EOP-012-3 and to comply with it, in whole or in part, as soon as circumstances allow.

VII. NERC AND REGIONAL ENTITY EFFORTS TO ENSURE EFFECTIVE RELIABILITY STANDARDS FOR COLD WEATHER

NERC is executing a comprehensive cold weather strategy for future winter seasons to monitor the implementation of the cold weather Reliability Standards, including the EOP-012 Reliability Standard. This strategy consists of several established and proposed elements intended to assess the efficacy of the standards to address cold weather reliability risks and identify opportunities to further clarify or improve the standards.

First, NERC collects data on the winterization of generating units under the EOP-012 standard. In the February 2023 Order approving Reliability Standard EOP-012-1 and directing further revisions, the Commission directed NERC to develop a plan to collect data on the winterization of generating units and to submit an annual informational filing on the analysis of the data. Specifically, the Commission directed NERC to collect data and submit analysis that will allow the Commission to understand the efficacy of, and monitor the ongoing risk posed by: (1) technical, commercial, or operational constraint provisions in EOP-012-1, Requirements R1, R6, and R7; and (2) actual performance of freeze protection measures during future extreme cold

[113] *See* Order No. 672, *supra* note 8.

weather events.[114] The Commission accepted NERC's plan on May 23, 2024.[115] Given the extensive revisions to the Generator Cold Weather Constraint framework since the approval of Reliability Standard EOP-012-1, NERC will review its cold weather data collection plan following Commission approval of proposed Reliability Standard EOP-012-3 to determine what, if any, adjustments to the plan or its implementation may be necessary to facilitate accurate and meaningful reporting and reduce duplicative reporting burdens for entities. NERC will work with Commission staff on this review and will report any adjustments made in its first annual informational filing on October 1, 2025.

Second, NERC has proposed a compliance abeyance period for proposed Reliability Standard EOP-012-3 Requirement R1 Part 1.1 with respect to the calculation of the Extreme Cold Weather Temperature. This calculation is foundational to the performance required under the EOP-012 standard; however, as discussed in Section V.B, multiple stakeholders have raised concerns about how to perform this calculation when their available data sets may have missing or invalid hourly values. It is NERC's position that Generator Owners have flexibility to determine how they will account for such gaps, taking into consideration that the overall goal of the EOP-012 standard is to improve generator preparedness for extreme cold weather conditions. Nevertheless, NERC recognizes that some concern remains about how NERC and the Regional Entities will review such determinations during compliance monitoring activities. To address this concern, NERC proposes a two—year compliance abeyance period in Section C. Compliance of the standard, that would provide as follows:

> **Compliance Abeyance Period**: From the effective date of Reliability Standard EOP-012-3 until October 1, 2027, the Compliance Enforcement Authority will not pursue an action under Sections 4A.0 or 5.0 of Appendix 4C to the Rules of

[114] February 2023 Order at P 94.

[115] *See N. Am. Elec. Reliability Corp.*, 187 FERC ¶ 61,087 (2024) (letter order).

> Procedure for a failure to comply with Reliability Standard EOP-012-3 Requirement R1 Part 1.1 with respect to the calculation of the Extreme Cold Weather Temperature for an applicable generating unit, or any other failure to comply resulting from an incorrect calculation of the Extreme Cold Weather Temperature for that generating unit, against any entity acting in good faith to comply with the standard in accordance with the relevant implementation plan. "Good faith" in this context refers to a sincere intention to comply with Reliability Standard EOP-012-3, regarding all requirements based on the calculation of the Extreme Cold Weather Temperature for each applicable generating unit, following a reasonable and serious assessment by the entity in determining how this Reliability Standard should be applied to its particular facts and circumstances. Entities shall participate in any compliance monitoring activities undertaken by the Compliance Enforcement Authority during this abeyance period and submit documentation as requested.

In NERC's November 8, 2024 supplemental filing to the Five-Year Performance Assessment required under 18 C.F.R. § 39.3(c), NERC described how it would begin using a "potential noncompliance abeyance period" to enhance NERC's standard development process agility, thereby reducing concerns over compliance risk during standards development so that the focus can be on addressing risks to reliability.[116] As NERC explained in that filing, this compliance abeyance period would encourage entities to share observations and experiences through implementation of new standards without fear of potential noncompliance (so long as they are acting in good faith) to mitigate reliability risks. This feedback loop, coupled with insights generated from more robust data collection from enforcement activities of trends, themes, and recommendations, would collectively be used to inform the standards development process after initial compliance of new standards to revise the standards prior to full enforcement.

While proposed Reliability Standard EOP-012-3 is not a "new" standard, requirements to calculate the Extreme Cold Weather Temperature have only been mandatory and enforceable in the United States for approximately six months (since October 1, 2024). Further, the calculation

[116] *Supplemental Filing of NERC to the Five-Year ERO Performance Assessment Report,* Docket No. RR24-4-000 at 3, 10 (Nov. 8, 2024). The Commission accepted NERC's five year performance assessment filings on December 19, 2024. *N. Am. Elec. Reliability Corp.*, 189 FERC ¶ 61,211 (2024).

of the Extreme Cold Weather Temperature would come into greater focus as entities begin implementing the substantially revised and clarified requirements for Generator Cold Weather Constraints and Corrective Action Plans. Considering the stakeholder concerns raised during the development of proposed Reliability Standard EOP-012-3, NERC has determined that a compliance abeyance period would serve two important benefits for reliability.

First, by removing concerns about compliance implications, it would encourage entities with concerns about their Extreme Cold Weather Temperature calculations to seek guidance from the ERO Enterprise during the two-year abeyance period. To the extent this guidance results in a lower calculated Extreme Cold Weather Temperature for a generating unit, the entity may make the necessary adjustments to ensure reliable operations at this lower temperature more quickly than if the issue had been discovered in future years, such as during a periodic compliance audit or following a reliability event.

Second, a compliance abeyance period would provide a focused means for the ERO Enterprise to gather information and feedback on this aspect of the standard. This information and feedback could inform the development of future revisions to the standard that would help ensure it remains an effective and efficient standard for improving generator cold weather reliability, as well as inform future reporting, analysis, and other follow up activities for the EOP-012 standard. In determining the appropriate length of time for the compliance abeyance period, NERC considered the urgency in the need to fully implement the EOP-012 Reliability Standard, the time that may be needed for information collection and analysis, and the time that would be needed to make any necessary standards revisions based on that analysis. Based on these considerations, NERC determined that a two-year compliance abeyance period would be appropriate.

During the proposed compliance abeyance period, NERC and the Regional Entities would focus on obtaining additional information that could be used to inform lessons learned regarding how entities are calculating the Extreme Cold Weather Temperature and accounting for gaps in their data sets. This information may be obtained during compliance monitoring activities, one-on-one discussions with entities, or small group advisory sessions specifically focused on this aspect of the EOP-012 standard. The resulting lessons learned would be used to inform future revisions to the EOP-012 standard or other guidance as appropriate. NERC and the Regional Entities would continue to process potential noncompliance for those entities that did not engage in good faith efforts to comply with the standard. Depending on the facts and circumstances, this could include failing to calculate the Extreme Cold Weather Temperature for a generating unit or failing to do so in a timely manner.

In addition to the above efforts focused on the EOP-012 Reliability Standard, NERC and the Regional Entities are performing robust compliance monitoring and enforcement of each of the currently effective and approved generator cold weather Reliability Standards, consistent with Recommendation 1(b) of the Winter Storm Elliott report.[117] NERC and the Regional Entities are currently preparing a strategy to enhance consistency and rigor in this compliance monitoring.

NERC and the Regional Entities will also continue their longstanding efforts to support entities in their cold weather preparedness through workshops and other outreach opportunities.

---

[117] Winter Storm Elliott Report, *supra* note 13, at 132:

> Recommendation 1(b): Findings from the Report support the need for robust monitoring by NERC and the Regional Entities of compliance with the currently-effective and approved generator cold weather Reliability Standards, to determine if reliability gaps exist. NERC should identify the generating units that are at the highest risk during extreme cold weather and work with the Regional Entities (and Balancing Authorities, if applicable) to perform cold weather verifications of those generating units until all of the extreme cold weather Standards proposed by the 2021 Report are approved and effective. (Verify highest risk units by Q4, 2023; implement by Q3, 2024).

Consistent with reviews performed following prior winter storms, NERC, Regional Entity, and Commission staff will also undertake an effort to review system performance during Arctic cold conditions that traversed North America in January 2025 for insights and lessons learned.[118]

To the extent these activities provide opportunities to improve or enhance any of the cold weather Reliability Standards to better achieve their reliability goals, NERC will promptly initiate the standards development process to make the needed changes.

VIII. CONCLUSION

For the reasons set forth above, NERC respectfully requests that the Commission approve:

- Proposed Reliability Standard EOP-012-3 and the associated elements, as shown in **Exhibit A;**
- the retirement of Reliability Standard EOP-012-2; and
- The implementation plan included in **Exhibit B**.

Respectfully submitted,

/s/ Lauren A. Perotti

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the Final posting pending Board approval.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	July 17, 2024
SAR posted for comment	July 18, 2024 – August 16, 2024
20-day formal comment period with initial ballot	October 17, 2024 – November 5, 2024
18-day formal comment period with additional ballot	December 3, 2024 – December 20, 2024
45-day comment period	January 27, 2025 – March 12, 2025

Anticipated Actions	Date
Board adoption	April 4, 2025

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

Generator Cold Weather Constraint – Any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components. Freeze protection measures are not intended to be limited to optimum practices, methods, or technologies, but are also intended to include practices, methods, or technologies that would be expected to result in improved generating unit performance during cold temperatures.

Previously Approved Terms

This section includes previously approved terms from EOP-012-1 and EOP-012-2. It is included to help with drafting and the posting of EOP-012-3.

Extreme Cold Weather Temperature – The temperature equal to the lowest 0.2 percentile of the hourly temperatures measured in December, January, and February from 01/01/2000 through the date the temperature is calculated.

Generator Cold Weather Critical Component – Any generating unit component or system, or associated Fixed Fuel Supply Component, that is under the Generator Owner's control, and is susceptible to freezing issues, the occurrence of which would likely lead to a Generator Cold Weather Reliability Event. This definition excludes any component or system or associated Fixed Fuel Supply Component located inside a permanent building with a heating source that regularly maintains the space at a temperature above 32 degrees Fahrenheit (0 degrees Celsius).

Fixed Fuel Supply Component – Non-mobile equipment that supports the reliable delivery of fuel to the generating unit and under the control of the Generator Owner at a plant site. Gaseous, liquid, or solid fuel handling components that are installed on site as fixed parts of the fuel delivery system that are under the Generator Owner's control are included. Mobile equipment such as trains, bulldozers, or other equipment that are not fixed in one location are excluded.

Generator Cold Weather Reliability Event – One of the following events for which the apparent cause(s) is due to freezing of equipment or impacts of freezing precipitation (e.g., sleet, snow, ice, and freezing rain) on equipment within the Generator Owner's control, and the dry bulb temperature at the time of the event was at or above the Extreme Cold Weather Temperature:

(1) a forced derate of more than 10% of the total capacity of the unit, but not less than 20 MWs for longer than four hours in duration;

(2) a start-up failure where the unit fails to synchronize within a specified start-up time; or

(3) a Forced Outage.

A. Introduction

1. **Title:** Extreme Cold Weather Preparedness and Operations

2. **Number:** EOP-012-3

3. **Purpose:** To address the effects of operating in extreme cold weather by ensuring each Generator Owner has developed and implemented plan(s) to mitigate the reliability impacts of extreme cold weather on its applicable generating units.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1. Generator Owner

   4.1.2. Generator Operator

   4.2. Facilities:

   4.2.1. Bulk Electric System (BES) generating units. For purposes of this standard, the term "generating unit" subject to these requirements refers to the following BES resources:

   4.2.1.1. A Bulk Electric System generating resource identified in the BES definition, Inclusion I2 and I4; or

   4.2.1.2. A Blackstart Resource, identified in the BES definition, Inclusion I3.

5. **Effective Date:** See Implementation Plan for Project 2024-03.

B. Requirements and Measures

R1. At least once every five (5) calendar years, each Generator Owner shall, for each of its applicable generating unit(s): [*Violation Risk Factor: Lower*] [*Time Horizon: Long-term Planning*]

1.1. Calculate the Extreme Cold Weather Temperature for each of its applicable generating unit(s) and identify the calculation date, source(s) of temperature data, and adjustments utilized for missing or invalid hourly temperature data, if necessary; and

1.1.1. If the recalculated Extreme Cold Weather Temperature is lower than the previous Extreme Cold Weather Temperature, the entity shall review and update its cold weather preparedness plan(s) under Requirement R4 within six (6) calendar months of the recalculation, and if new corrective actions are needed to provide the required operational capability described in Requirement R2 or R3, the entity shall develop a Corrective Action Plan within six (6) calendar months of the recalculation.

1.2. Identify generating unit(s) cold weather data, to include:

1.2.1. Generating unit(s) operating limitations in cold weather to include:

1.2.1.1. Capability and availability;

1.2.1.2. Fuel supply and inventory concerns;

1.2.1.3. Start-up issues;

1.2.1.4. Fuel switching capabilities; and

1.2.1.5. Environmental constraints.

1.2.2. Generating unit(s) minimum:

- Design temperature, and if available, the concurrent wind speed and precipitation;
- Historical operating temperature at least one hour in duration, and if available, the concurrent wind speed and precipitation; or
- Current cold weather performance temperature determined by an engineering analysis, which includes the concurrent wind speed and precipitation.

M1. Each Generator Owner will have evidence documenting its Extreme Cold Weather Temperature calculation, including the calculation date, source(s) of temperature data, and adjustments utilized for missing or invalid hourly temperature data, and design information, operating data, or engineering analysis that supports its generating unit minimum temperature.

R2. Applicable to generating units that begin commercial operation[1] on or after October 1, 2027[2]: Each Generator Owner, for each generating unit that has a calculated Extreme Cold Weather Temperature at or below 32 degrees Fahrenheit (zero degrees Celsius) as determined in Requirement R1, and that self-commits or is required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius),[3] shall: [*Violation Risk Factor: Medium*] [*Time Horizon: Long-term Planning, Operations Planning*]

- Implement freeze protection measures to protect Generator Cold Weather Critical Components that provide the capability to operate at the generating unit(s)' Extreme Cold Weather Temperature with sustained concurrent twenty (20) mph (32 km/h) wind speed for (i) a period of not less than twelve (12) continuous hours, or (ii) the maximum operational duration for intermittent energy resources if less than twelve (12) continuous hours; or
- Document in a declaration, with justification, if applicable, a Generator Cold Weather Constraint in accordance with Requirement R8.

M2. Each Generator Owner will have dated evidence that demonstrates it has freeze protection measures for its generating unit(s) in accordance with R2, or it has declared a Generator Cold Weather Constraint for the identified issues. Acceptable evidence may include the following (electronic or hardcopy format): Identification of generating unit(s) minimum temperature under Requirement R1 Part 1.2.2 which is equal to or less than the generating unit's Extreme Cold Weather Temperature, documentation of freeze protection measures, and Generator Cold Weather Constraints (if applicable).

R3. Applicable to generating unit(s) in commercial operation prior to October 1, 2027:[4]Each Generator Owner, for each generating unit that has a calculated Extreme Cold Weather Temperature at or below 32 degrees Fahrenheit (zero degrees Celsius) as determined in Requirement R1, and that self-commits or is required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius),[5] shall: [*Violation Risk Factor: Medium*] [*Time Horizon: Long-term Planning, Operations Planning*]

- Implement freeze protection measures to protect Generator Cold Weather Critical Components that provide the capability to operate at the generating unit(s)' Extreme Cold Weather Temperature; or

[1] Commercial operation means achievement of this designation indicating that the facility has received all approvals necessary for operation after completion of initial start-up testing.

[2] In non-U.S. jurisdictions, this will be the date established by the Applicable Governmental Authority.

[3] Generating unit(s) that do not self-commit or are not required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), but may be called upon to operate in order to assist in the mitigation of BES Emergencies, Capacity Emergencies, or Energy Emergencies during periods at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), are exempt from this requirement.

[4] In non-U.S. jurisdictions, this will be the date established by the Applicable Governmental Authority.

[5] Generating unit(s) that do not self-commit or are not required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), but may be called upon to operate in order to assist in the mitigation of BES Emergencies, Capacity Emergencies, or Energy Emergencies during periods at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), are exempt from this requirement.

- Develop a Corrective Action Plan to add new or modify existing freeze protection measures to provide the capability to operate at the generating unit(s)' Extreme Cold Weather Temperature.

M3. Each Generator Owner will have dated evidence that demonstrates it has freeze protection measures for its generating unit(s) in accordance with R3, or it has developed a Corrective Action Plan for the identified issues. Acceptable evidence may include, but is not limited to, the following (electronic or hardcopy format): Identification of generating unit(s) minimum temperature per Part 1.2.2 which is equal to or less than the unit's Extreme Cold Weather Temperature, documentation of freeze protection measures, and Corrective Action Plan(s).

R4. Each Generator Owner shall implement and maintain one or more cold weather preparedness plan(s) for its generating units. The cold weather preparedness plan(s) shall include the following, at a minimum: *[Violation Risk Factor: High] [Time Horizon: Operations Planning and Real-time Operations]*

4.1. The lowest calculated Extreme Cold Weather Temperature for each generating unit, as determined in Requirement R1;[6]

4.2. The generating unit cold weather data, as determined in Requirement R1, Part 1.2;

4.3. Documentation identifying Generator Cold Weather Critical Components;

4.4. Documentation of freeze protection measures implemented on Generator Cold Weather Critical Components that includes measures used to reduce the cooling effects of wind determined necessary by the Generator Owner to protect against heat loss, and where applicable, the effects of freezing precipitation (e.g., sleet, snow, ice, and freezing rain);

4.5. Annual inspection and maintenance of generating unit(s) freeze protection measures implemented on Generator Cold Weather Critical Components.

M4. Each Generator Owner will have evidence documenting that its cold weather preparedness plan(s) was implemented and maintained in accordance with Requirement R4. Examples of documentation to demonstrate a cold weather preparedness plan may include existing operating procedures, plans, checklists, or processes. Examples of documentation, to demonstrate inspections and maintenance have been completed, may include, but are not limited to, completed work order(s) from the Generator Owner's work management system and/or freeze protection checklists identifying the measures inspected and maintained for the Generator Cold Weather Critical Components.

R5. Each Generator Owner, in conjunction with its Generator Operator, shall identify the entity responsible for providing generating unit-specific training, and that identified entity shall provide annual training to the maintenance and operations personnel, as

[6] Generator Owners shall include the lowest calculated Extreme Cold Weather Temperature for the unit, even where subsequent periodic re-calculations under Requirement R1 Part 1.1 cause an increase in the Extreme Cold Weather Temperature.

applicable, responsible for implementing the cold weather preparedness plan(s) developed pursuant to Requirement R4. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning, Operations Planning]*

M5. Each Generator Operator or Generator Owner will have documented evidence that the applicable personnel completed annual training of the Generator Owner's cold weather preparedness plan(s). This evidence may include, but is not limited to, documents such as personnel training records, training materials, date of training, agendas or learning objectives, attendance at pre-work briefings, review of work order tasks, tailboards, attendance logs for classroom training, and completion records for computer-based training in fulfillment of Requirement R5.

R6. Each Generator Owner shall, after experiencing a Generator Cold Weather Reliability Event at a generating unit that has a calculated Extreme Cold Weather Temperature at or below 32 degrees Fahrenheit (zero degrees Celsius) as determined in Requirement R1 and that self-commits or is required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius),[7] develop and implement[8] a Corrective Action Plan(s) to address identified freezing issues as follows: *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

6.1. The Generator Owner shall develop a Corrective Action Plan for the generating unit that experienced a Generator Cold Weather Reliability Event no later than prior to the first day of the first December following the Generator Cold Weather Reliability Event.[9]

6.2. The Generator Owner shall conduct a review of other generating unit(s) in its fleet with the same or similar equipment as the affected generating unit to determine if any of those generating unit(s) are susceptible to the identified freezing issues. If corrective actions are needed, the Generator Owner shall develop or update a Corrective Action Plan to address the other generating unit(s). This review and, if applicable, the development or update of any Corrective Action Plan(s), shall be completed no later than 12 calendar months following the Generator Cold Weather Reliability Event.

6.3. For each Corrective Action Plan, the Generator Owner shall include at a minimum:

6.3.1. A summary of the identified cause(s) of the Generator Cold Weather Reliability Event, where applicable, and any relevant associated data;

[7] Generating unit(s) that do not self-commit or are not required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), but may be called upon to operate in order to assist in the mitigation of BES Emergencies, Capacity Emergencies, or Energy Emergencies during periods at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), are exempt from this requirement.

[8] If a Generator Owner has previously experienced a Generator Cold Weather Reliability Event and developed a Corrective Action Plan for the generating unit or units under Requirement R6 Parts 6.1 or 6.2, the Generator Owner may review and update its existing plan(s) in lieu of developing a new plan.

[9] For events that occur in September, October, or November, the timetable shall specify completion prior to December 1 of the following calendar year.

6.3.2. A list of actions to add new freeze protection measures or remedy issues with existing freeze protection measures;

6.3.3. An identification of operating limitations on the generating unit(s), or impacts to the cold weather preparedness plan, if any, that would apply until implementation of the corrective action(s) identified in the Corrective Action Plan is completed;

6.3.4. A description of the updates to the cold weather preparedness plan required under Requirement R4 to identify updates or additions to the Generator Cold Weather Critical Components and their freeze protection measures, if required; and

6.3.5. A timetable specifying that implementation of the Corrective Action Plan(s) shall be completed as follows:

6.3.5.1. For the generating unit experiencing the Generator Cold Weather Reliability Event, prior to the first day of the first December following the Generator Cold Weather Reliability Event.[10]

6.3.5.2. For other generating unit(s) owned by the Generator Owner, within 24 calendar months of completing the review required in Part 6.2, or no later than 36 calendar months following the Generator Cold Weather Reliability Event.

6.4 If a Generator Owner determines it will be unable to complete one or more of the actions in a Corrective Action Plan in accordance with the timetables specified in Requirement R6 Part 6.3.5 due to circumstances beyond its control, the Generator Owner shall submit a Corrective Action Plan extension request to the Compliance Enforcement Authority (CEA) for approval. The submitted Corrective Action Plan extension request shall include the following:

6.4.1. An explanation of the circumstances causing the delay and why those circumstances are beyond the control of the Generator Owner;

6.4.2. Revisions to the selected actions in Part 6.3.2, if any, including utilization of operating procedures, if applicable; and

6.4.3. Updated timetable for implementing the selected actions in Part 6.3.2.

6.5 The Generator Owner shall document in a declaration, with justification, if applicable, any Generator Cold Weather Constraint in accordance with Requirement R8, as applicable.

M6. Each Generator Owner will have dated evidence that it developed and implemented a Corrective Action Plan following a Cold Weather Reliability Event for applicable unit(s) in accordance with Requirement R6. Acceptable evidence may include, but is not limited

[10] For events that occur in September, October or November, the timetable shall specify completion prior to December 1 of the following calendar year.

to, the following dated documentation (electronic or hardcopy format): Corrective Action Plan(s), completed work orders, copies of any Corrective Action Plan extension requests and supporting documentation, updated cold weather preparedness plan(s) where indicated as needed by the Corrective Action Plan, and, where applicable, declared Generator Cold Weather Constraint(s).

R7. Each Generator Owner that is required to develop a Corrective Action Plan under Requirements R1, R3, or R9 shall develop and implement the Corrective Action Plan in accordance with the following: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

7.1. For each Corrective Action Plan, the Generator Owner shall include at a minimum the following:

7.1.1. A list of any actions that require new freeze protection measures, with a timetable specifying completion of such measures within 48 calendar months of completing development of the Corrective Action Plan;

7.1.2. A list of any actions that remedy issues with existing freeze protection measures with a timetable specifying completion of such measures within 24 calendar months of completing development of the Corrective Action Plan (regardless of any longer timelines in the Corrective Action Plan associated with new freeze protection measures);

7.1.3. A description of updates to the cold weather preparedness plan required under Requirement R4 to identify the updates or additions to the Generator Cold Weather Critical Components and their freeze protection measures; and

7.1.4. An identification of operating limitations on the generating unit(s), or impacts to the cold weather preparedness plan, if any, that would apply until implementation of the corrective action(s) identified in the Corrective Action Plan is completed.

7.2. If a Generator Owner determines it will be unable to complete one or more of the actions in a Corrective Action Plan in accordance with the timetables specified in Requirement R7 Part 7.1 due to circumstances beyond its control, the Generator Owner shall submit a Corrective Action Plan extension request to the CEA for approval. The submitted Corrective Action Plan extension request shall include the following:

7.2.1. An explanation of the circumstances causing the delay and how those circumstances are beyond the control of the Generator Owner;

7.2.2. Revisions to the selected actions in Parts 7.1, if any, including utilization of operating procedures, if applicable; and

7.2.3. Updated timetable for implementing the selected actions in Part 7.1.

7.3. The Generator Owner shall document in a declaration, with justification, if applicable, any Generator Cold Weather Constraint in accordance with Requirement R8.

M7. Each Generator Owner shall have dated evidence that it developed and implemented a Corrective Action Plan for applicable unit(s) in accordance with Requirement R7. Acceptable evidence may include, but is not limited to, the following dated documentation (electronic or hardcopy format): Corrective Action Plan(s), completed work orders, copies of any Corrective Action Plan extension requests and supporting documentation, updated cold weather preparedness plan(s) where indicated as needed by the Corrective Action Plan, and, where applicable, declared Generator Cold Weather Constraints.

R8. Each Generator Owner that declares a Generator Cold Weather Constraint in accordance with Attachment 1 shall: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

8.1. Submit its Generator Cold Weather Constraint declaration(s) to the CEA as follows:

- For Generator Cold Weather Constraints determined in accordance with Requirement R2 for generating unit(s) upon beginning commercial operation, submit within 15 calendar days after commercial operation; or
- For all other Generator Cold Weather Constraints, submit within 45 calendar days of determining that the Generator Cold Weather Constraint is applicable.

8.2. Update the operating limitations under Requirement R1 Part R1.2 if applicable;

8.3. If the CEA determines the declared Generator Cold Weather Constraint is invalid, update its Corrective Action Plan(s) to require corrective actions be completed in accordance with Requirement R6 or Requirement R7, as applicable, subject to any extensions approved by the CEA, or implement freeze protection measures to provide the necessary capability in accordance with Requirement R2;

8.4. Document and provide notice to the CEA, when a generating unit experiences a Generator Cold Weather Reliability Event with the same cause of a previous Generator Cold Weather Reliability Event at the same or a similar unit, and one or more corrective actions to address the cause is addressed by an existing validated Generator Cold Weather Constraint for the same or a similar unit.

M8. Each Generator Owner shall have dated evidence that demonstrates it performed the actions in accordance with Requirement R8. Acceptable evidence may include, but is not limited to, the following dated documentation (electronic or hardcopy format): a copy of the Generator Cold Weather Constraint declaration, evidence the declaration was provided to the CEA in accordance with the specified timeframe, records that document update(s) to the operating limitations, as needed, updates to the Corrective

Action Plan(s), if applicable, and documentation and notice to the CEA of subsequent Generator Cold Weather Reliability Events, if applicable.

R9. The Generator Owner shall review each Generator Cold Weather Constraint declaration validated by the CEA at least once every 36 calendar months to determine if it remains valid in accordance with Attachment 1. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

9.1 If a Generator Cold Weather Constraint is determined to be no longer valid, then within six (6) calendar months of such determination, the Generator Owner shall develop or update a Corrective Action Plan pursuant to Requirement R7.

M9. Each Generator Owner shall have dated evidence that demonstrates it reviewed Generator Cold Weather Constraints in accordance with Requirement R9. Acceptable evidence may include, but is not limited to, the following dated documentation (electronic or hardcopy format): records that document the performance of the review within the required timeframe, records that demonstrate that a Corrective Action Plan was developed or updated within the required timeframe (if applicable).

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation.

- The Generator Owner shall retain data or evidence to support its current Extreme Cold Weather Temperature calculation and generating unit cold weather data, plus each calculation or revision since the last audit, for Requirement R1 and Measure M1.
- The Generator Owner shall keep data or evidence to show compliance for three years, or until any Corrective Action Plan under Requirement R2 or R3 is complete, whichever timeframe is greater, for Requirements R2 and R3 and Measures M2 and M3. Generator Cold Weather Constraint data or evidence shall be retained until no longer valid.
- The Generator Owner shall retain the current cold weather preparedness plan(s), as evidence of review or revision history, plus each version issued since the last audit and evidence of compliance since the last audit for Requirement R4 and Measure M4.
- The Generator Owner or Generator Operator shall keep data or evidence to show compliance for three years for Requirement R5 and Measure M5.
- The Generator Owner shall keep data or evidence to show compliance for three years, or until any Corrective Action Plan, including extensions (if applicable), under Requirement R6 is complete, whichever timeframe is greater, for Requirement R6 and Measure M6. Generator Cold Weather Constraint data or evidence shall be retained until no longer valid.
- The Generator Owner shall keep data or evidence to show compliance for three years, or until any Corrective Action Plan, including extension (if applicable), under Requirement R7 is complete, whichever timeframe is

greater, for Requirement R7 and Measure M7. Generator Cold Weather Constraint data or evidence shall be retained until no longer valid.

- The Generator Owner shall maintain data or evidence to support its current Generator Cold Weather Constraint declaration(s), plus each revision since the last audit, for Requirement R8 and Measure M8.
- The Generator Owner shall maintain data or evidence to support that it reviewed each Generator Cold Weather Constraint declaration validated by the CEA at least once every 36 calendar months since the last audit, for Requirement R9 and Measure M9.

1.3. Compliance Monitoring and Enforcement Program: "Compliance Monitoring Enforcement Program" or "CMEP" means, depending on the context (1) the NERC Compliance Monitoring and Enforcement Program (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for performing compliance monitoring and enforcement activities with respect to Registered Entities' compliance with Reliability Standards.

1.4. Compliance Abeyance Period: From the effective date of Reliability Standard EOP-012-3 until October 1, 2027, the CEA will not pursue an action under Sections 4A.0 or 5.0 of Appendix 4C to the Rules of Procedure for a failure to comply with Reliability Standard EOP-012-3 Requirement R1 Part 1.1 with respect to the calculation of the Extreme Cold Weather Temperature for an applicable generating unit, or any other failure to comply resulting from an incorrect calculation of the Extreme Cold Weather Temperature for that generating unit, against any entity acting in good faith to comply with the standard in accordance with the relevant implementation plan. "Good faith" in this context refers to a sincere intention to comply with Reliability Standard EOP-012-3 regarding all requirements based on the calculation of the Extreme Cold Weather Temperature for each applicable generating unit, following a reasonable and serious assessment by the entity in determining how this Reliability Standard should be applied to its particular facts and circumstances. Entities shall participate in any compliance monitoring activities undertaken by the CEA during this abeyance period and submit documentation as requested.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	The Generator Owner did not calculate the Extreme Cold Weather Temperature or identify generating unit(s) cold weather data in accordance with Requirement R1 for 5% or less of its applicable units.	The Generator Owner did not calculate the Extreme Cold Weather Temperature or identify generating unit(s) cold weather data in accordance with Requirement R1 for more than 5%, but less than or equal to 10% of its applicable units.	The Generator Owner did not calculate the Extreme Cold Weather Temperature or identify generating unit(s) cold weather data in accordance with Requirement R1 for more than 10%, but less than or equal to 20% of its applicable units.	The Generator Owner did not calculate the Extreme Cold Weather Temperature or identify generating unit(s) cold weather data in accordance with Requirement R1 for more than 20% of its applicable units.
R2.	The Generator Owner did not have freeze protection measure(s) for its applicable unit(s) meeting the criteria in Requirement R2 for 5% or less of its applicable units. OR The Generator Owner did not declare a Generator Cold Weather Constraint (if applicable) to implement appropriate freeze protection measures for 5% or less of its applicable units.	The Generator Owner did not have freeze protection measure(s) for its applicable unit(s) meeting the criteria in Requirement R2 for more than 5%, but less than or equal to 10% of its applicable units. OR The Generator Owner did not declare a Generator Cold Weather Constraint (if applicable) for more than 5%, but less than or equal to 10% of its applicable units.	The Generator Owner did not have freeze protection measure(s) meeting the criteria in Requirement R2 for more than 10%, but less than or equal to 20% of its applicable units. OR The Generator Owner did not declare a Generator Cold Weather Constraint (if applicable) for more than 10%, but less than or equal to 20% of its applicable units.	The Generator Owner did not have freeze protection measure(s) meeting the criteria in Requirement R2 for more than 20% of its applicable units. OR The Generator Owner did not declare a Generator Cold Weather Constraint (if applicable) for more than 20% of its applicable units.

Implementation Plan

Calculating Extreme Cold Weather Temperature

EOP-012-3 Technical Rationale

Generator Cold Weather CAP Extension and Constraint Process

Attachment 1

Generator Owners shall determine the applicability of a Generator Cold Weather Constraint declared under Requirements R2, R6, and R7 using the criteria as described below.

The definition of a Generator Cold Weather Constraint is: "Any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components. Freeze protection measures are not intended to be limited to optimum practices, methods, or technologies, but are also intended to include practices, methods, or technologies that would be expected to result in improved generating unit performance during cold temperatures."

A Generator Cold Weather Constraint can be identified using the following criteria:

Known Generator Cold Weather Constraints

The following are circumstances which, if present and confirmed as valid by the CEA, will constitute known Generator Cold Weather Constraints:

- Individual wind turbine towers manufactured prior to October 1, 2029 that have structural limitations established by Original Equipment Manufacturers (OEMs) based on a minimum temperature that is higher than the Extreme Cold Weather Temperature calculated per Requirement R1 for generating units that began commercial operation prior to October 1, 2031.
- Application of freeze protection measures to meet the requirements of this Standard that require:
    - Replacing existing wind turbine blades with new blades solely for the purpose of adding de-icing or ice-minimizing capabilities;
    - Removal of accumulated frozen precipitation on solar panels;
    - Applying heat upstream of inlet air filters to prevent the buildup of frozen precipitation on combustion turbine inlet air filters; or
    - Implementation of heat tracing or other de-icing technologies for wind turbine blades, that, through analysis, have been shown to not be effective or not made available by the OEM for generating units of a comparable types in regions that experience similar winter climate conditions.

Case-by-case Determinations of Generator Cold Weather Constraints

The following situations may constitute a Generator Cold Weather Constraint, depending on the facts and circumstances. Only upon approval by the CEA will these circumstances constitute a valid Generator Cold Weather Constraint:

1. The implementation of a specific freeze protection measure will void an equipment warranty.
2. The implementation of a specific freeze protection measure would exceed a manufacturer's design limitation and the exceedance is expected to functionally impair or degrade the effective operation of the impacted component or system.

3. The implementation of a specific freeze protection measure is precluded by technical or physical limitations. For example:
    a. Installing wind breaks around a cooling tower or air-cooled heat exchanger that requires free airflow for its functionality;
    b. Implementing freeze protection measures with size or weight that would require the structural re-design and re-construction of the protected equipment or its support system;
    c. Other similar circumstances as determined through operating experience or engineering analysis and supported with justification.
4. A determination, through an analysis, that the freeze protection measure would not be effective for the generating unit. Such a determination may be supported, for example, by fleet or industry operating experience (or lack thereof) with the freeze protection measure on generating unit(s) of comparable types in regions that experience similar winter climate conditions.
5. A determination, through an analysis, that the implementation of a specific freeze protection measure or measures would adversely affect the reliability of the Bulk Power System to an extent that outweighs the reliability benefit of applying the freeze protection measure(s). For example:
    a. The implementation of freeze protection measures, while feasible, would result in the accelerated premature retirement of an existing generating unit with no acceptable replacement available within the accelerated timeframe (must be accompanied by an attestation signed by an officer of the company);
    b. The implementation of freeze protection measures would cause the Generator Owner to cancel plans to finish the development of a new generating unit (must be accompanied by an attestation signed by an officer of the company);
    c. The implementation of freeze protection measures would reduce the generating unit's ability to provide Real Power or Reactive Power capability by more than three percent, or another value supported by the appropriate functional entity (e.g., TP, RC, BA, etc.), when freeze protection measures are not in use; or
    d. The implementation of freeze protection measures would reduce the summer net dependable capacity[1], or net dependable capacity at Peak Demand, of the generating unit by more than three percent or another value supported by the appropriate functional entity (e.g., TP, RC, BA, etc.);
    e. Other similar circumstances as determined through operating experience or engineering analysis and supported with justification.

[1] "net dependable capacity" refers to the definition used for reporting to the NERC in Generating Availability Data System (GADS) appropriate for the generation type.

6. The implementation of new freeze protection measures to an existing generating unit that has previously communicated a retirement date to the appropriate functional entity (e.g., Transmission Planner (TP), Reliability Coordinator (RC), Balancing Authority (BA), etc.) that falls within three calendar years of the Generator Cold Weather Constraint declaration;
7. The implementation of a specific freeze protection measure would introduce the risk of noncompliance with other statutory, regulatory, or health and safety requirements or standards for which relief via waiver, exemption or other means of excused noncompliance is not available during extreme cold weather.
8. A determination through an analysis that the freeze protection measure is not available on the commercial market for generating units of comparable types in regions that experience similar winter climate conditions.
9. Implementation of freeze protection measures would not increase reliability of a generating unit due to clearly delineated technical or physical reasons on fuel supply which has been communicated to its Reliability Coordinator (RC) or Balancing Authority (BA) and are not due to Fixed Fuel Supply Components, and which are outside the Generator Owner's control.
10. Other situations identified by the Generator Owner that may, based on the specific circumstances beyond the Generator Owner's control, limit its ability to apply freeze protection measures to Generator Cold Weather Critical Components.

An approved Generator Cold Weather Constraint declaration for any specific Generator Cold Weather Critical Component does not relieve the Generator Owner of its obligation to otherwise prepare its applicable generating unit(s) to meet the requirements of EOP-012-3.

Anticipated Actions	Date
Board adoption	April 4, 2025

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

Generator Cold Weather Constraint – Any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components. ~~. using the criteria below.~~ Freeze protection measures are not intended to be limited to optimum practices, methods, or technologies, but are also intended to include ~~acceptable~~ practices, methods, or technologies ~~generally implemented by the electric industry in areas that experience similar winter climate conditions.~~ that would be expected to result in improved generating unit performance during cold temperatures.

~~Criteria used to determine a constraint include practices, methods, or technologies which, given the exercise of reasonable judgment in light of the facts known at the time the decision to declare the constraint was made:~~

~~Were not broadly implemented at generating units for comparable unit types in regions that experience similar winter climate conditions to provide reasonable assurance of efficacy;~~

~~Could not have been expected to accomplish the desired result; or~~

~~Could not have been implemented at a reasonable cost consistent with good business practices, reliability, or safety. A cost may be deemed "unreasonable" when implementation of selected freeze protection measure(s) are uneconomical to the extent that they would require prohibitively expensive modifications or significant expenditures on equipment with minimal remaining life.~~

Previously Approved Terms

This section includes previously approved terms from EOP-012-1 and EOP-012-2. It is included to help with drafting and the posting of EOP-012-3.

Extreme Cold Weather Temperature – The temperature equal to the lowest 0.2 percentile of the hourly temperatures measured in December, January, and February from 01/01/2000 through the date the temperature is calculated.

Generator Cold Weather Critical Component – Any generating unit component or system, or associated Fixed Fuel Supply Component, that is under the Generator Owner's control, and is susceptible to freezing issues, the occurrence of which would likely lead to a Generator Cold Weather Reliability Event. This definition excludes any component or system or associated Fixed

Fuel Supply Component located inside a permanent building with a heating source that regularly maintains the space at a temperature above 32 degrees Fahrenheit (0 degrees Celsius).

Fixed Fuel Supply Component – Non-mobile equipment that supports the reliable delivery of fuel to the generating unit and under the control of the Generator Owner at a plant site. Gaseous, liquid, or solid fuel handling components that are installed on site as fixed parts of the fuel delivery system that are under the Generator Owner's control are included. Mobile equipment such as trains, bulldozers, or other equipment that are not fixed in one location are excluded.

Generator Cold Weather Reliability Event – One of the following events for which the apparent cause(s) is due to freezing of equipment or impacts of freezing precipitation (e.g., sleet, snow, ice, and freezing rain) on equipment within the Generator Owner's control, and the dry bulb temperature at the time of the event was at or above the Extreme Cold Weather Temperature:

(1) a forced derate of more than 10% of the total capacity of the unit, but not less than 20 MWs for longer than four hours in duration;

(2) a start-up failure where the unit fails to synchronize within a specified start-up time; or

(3) a Forced Outage.

A. Introduction

1. **Title:** Extreme Cold Weather Preparedness and Operations

2. **Number:** EOP-~~012-2~~012-3

3. **Purpose:** To address the effects of operating in extreme cold weather by ensuring each Generator Owner has developed and implemented plan(s) to mitigate the reliability impacts of extreme cold weather on its applicable generating units.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1. Generator Owner

   4.1.2. Generator Operator

   4.2. Facilities:

   4.2.1. Bulk Electric System (BES) generating units. For purposes of this standard, the term "generating unit" subject to these requirements refers to the following ~~Bulk Electric System (~~BES~~)~~ resources:

   4.2.1.1. A Bulk Electric System generating resource identified in the BES definition, ~~inclusion~~Inclusion I2 and I4; or

   4.2.1.2. A Blackstart Resource, identified in the BES definition, ~~inclusion~~Inclusion I3.

5. **Effective Date:** See Implementation Plan for Project ~~2021-07 Phase 2~~2024-03.

B. Requirements and Measures

R1. At least once every five (5) calendar years, each Generator Owner shall, for each of its applicable generating unit(s): [*Violation Risk Factor: Lower*] [*Time Horizon: Long-term Planning*]

1.1. Calculate the Extreme Cold Weather Temperature for each of its applicable generating unit(s) and identify the calculation date ~~and~~, source(s) of temperature data, and adjustments utilized for missing or invalid hourly temperature data, if necessary; and

1.1.1. If the ~~re-calculated~~recalculated Extreme Cold Weather Temperature is lower than the previous Extreme Cold Weather Temperature, the entity shall review and update its cold weather preparedness plan(s) under Requirement R4 within six (6) calendar months of the recalculation. ~~If~~, and if new corrective actions are needed to provide the required operational capability ~~under~~described in Requirement R2 or R3, the entity shall develop a Corrective Action Plan within six (6) calendar months of the recalculation.

1.2. Identify generating unit(s) cold weather data, to include:

1.2.1. Generating unit(s) operating limitations in cold weather to include:

1.2.1.1. Capability and availability;

1.2.1.2. Fuel supply and inventory concerns;

1.2.1.3. Start-up issues;

1.2.1.4. Fuel switching capabilities; and

1.2.1.5. Environmental constraints.

1.2.2. Generating unit(s) minimum:

- Design temperature, and if available, the concurrent wind speed and precipitation;
- Historical operating temperature at least one hour in duration, and if available, the concurrent wind speed and precipitation; or
- Current cold weather performance temperature determined by an engineering analysis, which includes the concurrent wind speed and precipitation.

M1. Each Generator Owner will have evidence documenting its Extreme Cold Weather Temperature calculation, including the calculation date, source(s) of temperature data, and adjustments utilized for missing or invalid hourly temperature data, and design information, operating data, or engineering analysis that supports its generating unit minimum temperature.

R2. Applicable to generating units ~~with a~~that begin commercial operation ~~date~~ [1] on or after October 1, 2027[2]: Each Generator Owner, for each generating unit that has a calculated Extreme Cold Weather Temperature at or below 32 degrees Fahrenheit (zero degrees Celsius) as determined in Requirement R1, and that self-commits or is required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius),~~1~~[3] shall: [*Violation Risk Factor: Medium*] [*Time Horizon: Long-term Planning, Operations Planning*]

- Implement freeze protection measures to protect Generator Cold Weather Critical Components that provide the capability to operate at the generating unit(s)' Extreme Cold Weather Temperature with sustained concurrent twenty (20) mph (32 km/h) wind speed for (i) a period of not less than twelve (12) continuous hours, or (ii) the maximum operational duration for intermittent energy resources if less than twelve (12) continuous hours; or
- ~~Develop a Corrective Action Plan(s) to add new or modify existing or previously planned freeze protection measures to provide the capability to operate at the unit(s)' Extreme Cold Weather Temperature with a sustained concurrent twenty (20) mph wind speed for (i) a period of not less than twelve (12) continuous hours, or (ii) the maximum operational duration for intermittent energy resources if less than twelve (12) continuous hours.~~
- Document in a declaration, with justification, if applicable, a Generator Cold Weather Constraint in accordance with Requirement R8.

M2. Each Generator Owner will have dated evidence that demonstrates it has freeze protection measures for its generating unit(s) in accordance with R2, or it has ~~developed a Corrective Action Plan~~declared a Generator Cold Weather Constraint for the identified issues. Acceptable evidence may include the following (electronic or hardcopy format): Identification of generating unit(s) minimum temperature under Requirement R1 Part 1.2.2 which is equal to or less than the generating unit's Extreme Cold Weather Temperature, documentation of freeze protection measures, and ~~Corrective Action Plan(s~~Generator Cold Weather Constraints (if applicable).

R3. Applicable to generating unit(s) in commercial operation prior to October 1, 2027:[4] Each Generator Owner, for each generating unit that has a calculated Extreme Cold Weather Temperature at or below 32 degrees Fahrenheit (zero degrees Celsius) as determined in Requirement R1, and that self-commits or is required to operate at or below a

---

[1] Commercial operation means achievement of this designation indicating that the facility has received all approvals necessary for operation after completion of initial start-up testing.

[2] In non-U.S. jurisdictions, this will be the date established by the Applicable Governmental Authority.

~~1~~[3] Generating unit(s) that do not self-commit or are not required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), but may be called upon to operate in order to assist in the mitigation of BES Emergencies, Capacity Emergencies, or Energy Emergencies during periods at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), are exempt from this requirement.

[4] In non-U.S. jurisdictions, this will be the date established by the Applicable Governmental Authority.

temperature of 32 degrees Fahrenheit (zero degrees Celsius),[~~2~~5] shall: [*Violation Risk Factor: Medium*] [*Time Horizon: Long-term Planning, Operations Planning*]

- Implement freeze protection measures to protect Generator Cold Weather Critical Components that provide the capability to operate at the generating unit(s)' Extreme Cold Weather Temperature; or
- Develop a Corrective Action Plan to add new or modify existing freeze protection measures to provide the capability to operate at the generating unit(s)' Extreme Cold Weather Temperature.

M3. Each Generator Owner will have dated evidence that demonstrates it has freeze protection measures for its generating unit(s) in accordance with R3, or it has developed a Corrective Action Plan for the identified issues. Acceptable evidence may include, but is not limited to, the following (electronic or hardcopy format): Identification of generating unit(s) minimum temperature per Part 1.2.2 which is equal to or less than the unit's Extreme Cold Weather Temperature, documentation of freeze protection measures, and Corrective Action Plan(s).

R4. Each Generator Owner shall implement and maintain one or more cold weather preparedness plan(s) for its generating units. The cold weather preparedness plan(s) shall include the following, at a minimum: *[Violation Risk Factor: High] [Time Horizon: Operations Planning and Real-time Operations]*

4.1. The lowest calculated Extreme Cold Weather Temperature for each generating unit, as determined in Requirement R1;[~~3~~6]

4.2. The generating unit cold weather data, as determined in Requirement ~~R1.2~~R1, Part 1.2;

4.3. Documentation identifying Generator Cold Weather Critical Components;

4.4. Documentation of freeze protection measures implemented on Generator Cold Weather Critical Components ~~which~~that includes measures used to reduce the cooling effects of wind determined necessary by the Generator Owner to protect against heat loss, and where applicable, the effects of freezing precipitation (e.g., sleet, snow, ice, and freezing rain); ~~and~~

4.5. Annual inspection and maintenance of generating unit(s) freeze protection measures implemented on Generator Cold Weather Critical Components.

M4. Each Generator Owner will have evidence documenting that its cold weather preparedness plan(s) was implemented and maintained in accordance with

---

[~~2~~5] Generating unit(s) that do not self-commit or are not required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), but may be called upon to operate in order to assist in the mitigation of BES Emergencies, Capacity Emergencies, or Energy Emergencies during periods at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), are exempt from this requirement.

[~~3~~6] Generator Owners shall include the lowest calculated Extreme Cold Weather Temperature for the unit, even where subsequent periodic re-calculations under Requirement R1 Part 1.1 cause an increase in the Extreme Cold Weather Temperature.

Requirement R4. Examples of documentation to demonstrate a cold weather preparedness plan may include existing operating procedures, plans, checklists, or processes. Examples of documentation, to demonstrate inspections and maintenance have been completed, may include, but are not limited to, completed work order(s) from the Generator Owner's work management system and/or freeze protection checklists identifying the measures inspected and maintained for the Generator Cold Weather Critical Components.

R5. Each Generator Owner, in conjunction with its Generator Operator, shall identify the entity responsible for providing ~~the~~ generating unit-specific training, and that identified entity shall provide annual training to ~~its~~the maintenance ~~or~~and operations personnel, as applicable, responsible for implementing the cold weather preparedness plan(s) developed pursuant to Requirement R4. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning, Operations Planning]*

M5. Each Generator Operator or Generator Owner will have documented evidence that the applicable personnel completed annual training of the Generator Owner's cold weather preparedness plan(s). This evidence may include, but is not limited to, documents such as personnel training records, training materials, date of training, agendas or learning objectives, attendance at pre-work briefings, review of work order tasks, tailboards, attendance logs for classroom training, and completion records for computer-based training in fulfillment of Requirement R5.

R6. Each Generator Owner shall, ~~for each~~after experiencing a Generator Cold Weather Reliability Event at a generating unit that has a calculated Extreme Cold Weather Temperature at or below 32 degrees Fahrenheit (zero degrees Celsius) as determined in Requirement R1 and that self-commits or is required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius),[4][7] develop and implement[8] a Corrective Action Plan ~~when the generating unit experiences a Generator Cold Weather Reliability Event. The Corrective Action Plan shall be developed within 150 days or by July 1, whichever is earlier, and contain at a minimum~~(s) to address identified freezing issues as follows: *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

6.1. The Generator Owner shall develop a Corrective Action Plan for the generating unit that experienced a Generator Cold Weather Reliability Event no later than prior to the first day of the first December following the Generator Cold Weather Reliability Event.[9]

---

[4][7] Generating unit(s) that do not self-commit or are not required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), but may be called upon to operate in order to assist in the mitigation of BES Emergencies, Capacity Emergencies, or Energy Emergencies during periods at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), are exempt from this requirement.

[8] If a Generator Owner has previously experienced a Generator Cold Weather Reliability Event and developed a Corrective Action Plan for the generating unit or units under Requirement R6 Parts 6.1 or 6.2, the Generator Owner may review and update its existing plan(s) in lieu of developing a new plan.

[9] For events that occur in September, October, or November, the timetable shall specify completion prior to December 1 of the following calendar year.

6.2. The Generator Owner shall conduct a review of other generating unit(s) in its fleet with the same or similar equipment as the affected generating unit to determine if any of those generating unit(s) are susceptible to the identified freezing issues. If corrective actions are needed, the Generator Owner shall develop or update a Corrective Action Plan to address the other generating unit(s). This review and, if applicable, the development or update of any Corrective Action Plan(s), shall be completed no later than 12 calendar months following the Generator Cold Weather Reliability Event.

6.3. For each Corrective Action Plan, the Generator Owner shall include at a minimum:

~~**6.1**~~**6.3.1.** A summary of the identified cause(s) ~~for~~of the Generator Cold Weather Reliability Event, where applicable, and any relevant associated data;

~~**6.2.** A review of applicability to similar equipment at generating units owned by the Generator Owner; and~~

6.3.2. A list of actions to add new freeze protection measures or remedy issues with existing freeze protection measures;

~~**6.3**~~**6.3.3.** An identification of operating limitations on the generating unit(s), or impacts to the cold weather preparedness plan, if any, that would apply until ~~execution~~implementation of the corrective action(s) identified in the Corrective Action Plan~~.~~ is completed;

6.3.4. A description of the updates to the cold weather preparedness plan required under Requirement R4 to identify updates or additions to the Generator Cold Weather Critical Components and their freeze protection measures, if required; and

6.3.5. A timetable specifying that implementation of the Corrective Action Plan(s) shall be completed as follows:

6.3.5.1. For the generating unit experiencing the Generator Cold Weather Reliability Event, prior to the first day of the first December following the Generator Cold Weather Reliability Event.[10]

6.3.5.2. For other generating unit(s) owned by the Generator Owner, within 24 calendar months of completing the review required in Part 6.2, or no later than 36 calendar months following the Generator Cold Weather Reliability Event.

6.4 If a Generator Owner determines it will be unable to complete one or more of the actions in a Corrective Action Plan in accordance with the timetables specified in Requirement R6 Part 6.3.5 due to circumstances beyond its control, the Generator Owner shall submit a Corrective Action Plan extension request to the Compliance

[10] For events that occur in September, October or November, the timetable shall specify completion prior to December 1 of the following calendar year.

Enforcement Authority (CEA) for approval. The submitted Corrective Action Plan extension request shall include the following:

6.4.1. An explanation of the circumstances causing the delay and why those circumstances are beyond the control of the Generator Owner;

6.4.2. Revisions to the selected actions in Part 6.3.2, if any, including utilization of operating procedures, if applicable; and

6.4.3. Updated timetable for implementing the selected actions in Part 6.3.2.

6.5 The Generator Owner shall document in a declaration, with justification, if applicable, any Generator Cold Weather Constraint in accordance with Requirement R8, as applicable.

M6. Each Generator Owner will have ~~documented~~dated evidence that it developed and implemented a Corrective Action Plan following a Cold Weather Reliability Event ~~at an~~for applicable unit(s) in accordance with Requirement R6. Acceptable evidence may include, but is not limited to, the following dated documentation (electronic or hardcopy format): Corrective Action Plan(s) ~~and~~, completed work orders, copies of any Corrective Action Plan extension requests and supporting documentation, updated cold weather preparedness plan(s) where indicated as needed by the Corrective Action Plan, and, where applicable, declared Generator Cold Weather Constraint(s).

R7. Each Generator Owner~~, for each~~ that is required to develop a Corrective Action Plan ~~developed pursuant to~~under Requirements R1~~, R2~~, R3, or ~~R6, shall~~R9 shall develop and implement the Corrective Action Plan in accordance with the following: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

7.1. ~~Include a timetable for implementing the selected corrective action(s) that shall~~For each Corrective Action Plan, the Generator Owner shall include at a minimum the following:

7.1.1. ~~List the action(s) which address(es) existing equipment or~~A list of any actions that require new freeze protection measures, ~~if any, to be completed~~with a timetable specifying completion of such measures within ~~24~~48 calendar months of completing development of the Corrective Action Plan;

~~**7.1.2.** List the action(s) which require(s) new equipment or freeze protection measures, if any, to be completed within 48 calendar months of completing development of the Corrective Action Plan; and~~

7.1.2. A list of any actions that remedy issues with existing freeze protection measures with a timetable specifying completion of such measures within 24 calendar months of completing development of the Corrective Action Plan (regardless of any longer timelines in the Corrective Action Plan associated with new freeze protection measures);

7.1.3. ~~List the~~A description of updates to the cold weather preparedness plan required under Requirement R4 to identify the updates or additions to the Generator Cold Weather Critical Components and their freeze protection measures; and

~~**7.2.** Implement the Corrective Action Plan in accordance with the specified timetables in Requirement R7 Part 7.1;~~

~~**7.3.** Update the Corrective Action Plan action(s) and timetable(s), with justification, if corrective action(s) change or timetable(s) exceed the timelines in Requirement R7 Part 7.1; and~~

7.1.4. An identification of operating limitations on the generating unit(s), or impacts to the cold weather preparedness plan, if any, that would apply until implementation of the corrective action(s) identified in the Corrective Action Plan is completed.

7.2. If a Generator Owner determines it will be unable to complete one or more of the actions in a Corrective Action Plan in accordance with the timetables specified in Requirement R7 Part 7.1 due to circumstances beyond its control, the Generator Owner shall submit a Corrective Action Plan extension request to the CEA for approval. The submitted Corrective Action Plan extension request shall include the following:

7.2.1. An explanation of the circumstances causing the delay and how those circumstances are beyond the control of the Generator Owner;

7.2.2. Revisions to the selected actions in Parts 7.1, if any, including utilization of operating procedures, if applicable; and

7.2.3. Updated timetable for implementing the selected actions in Part 7.1.

~~**7.4.** Document~~**7.3.** The Generator Owner shall document in a declaration, with justification, if applicable, any Generator Cold Weather Constraint ~~that precludes the Generator Owner from implementing selected action(s) contained within the Corrective Action Plan~~in accordance with Requirement R8.

M7. Each Generator Owner shall have dated evidence that ~~demonstrates it~~it developed and implemented ~~each~~a Corrective Action Plan~~, including updating actions or timetables, or has explained in a declaration why corrective actions are not being implemented~~ for applicable unit(s) in accordance with Requirement ~~R8~~R7. Acceptable evidence may include, but is not limited to, the following dated documentation (electronic or hardcopy format): ~~records that document the implementation of each~~ Corrective Action Plan~~ and the completion of actions for each~~(s), completed work orders, copies of any Corrective Action Plan ~~including revision history of each Corrective Action Plan and, if applicable, justification to support any changes to corrective action(s) identified in the Corrective Action Plan or timetables exceeding the timelines in Requirement R7 Part 7.1. For each Corrective Action Plan applying to multiple generating units, the timetable shall reflect implementation at each unit addressed in the Corrective Action~~

~~Plan. Evidence may also include work management program records, work orders, and maintenance records. Any declaration shall contain dated documentation to support constraints identified by the Generator Owner.~~extension requests and supporting documentation, updated cold weather preparedness plan(s) where indicated as needed by the Corrective Action Plan, and, where applicable, declared Generator Cold Weather Constraints.

R8. Each Generator Owner that ~~creates~~declares a Generator Cold Weather Constraint ~~declaration~~in accordance with Attachment 1 shall: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

8.1. ~~Review the~~Submit its Generator Cold Weather Constraint declaration ~~at least every five calendar years or as needed when a change of status to the Generator Cold Weather Constraint occurs; and~~ (s) to the CEA as follows:

- For Generator Cold Weather Constraints determined in accordance with Requirement R2 for generating unit(s) upon beginning commercial operation, submit within 15 calendar days after commercial operation; or
- For all other Generator Cold Weather Constraints, submit within 45 calendar days of determining that the Generator Cold Weather Constraint is applicable.

8.2. Update the operating limitations ~~associated with capability and availability~~ under Requirement R1 Part R1.2 if applicable~~.~~;

8.3. If the CEA determines the declared Generator Cold Weather Constraint is invalid, update its Corrective Action Plan(s) to require corrective actions be completed in accordance with Requirement R6 or Requirement R7, as applicable, subject to any extensions approved by the CEA, or implement freeze protection measures to provide the necessary capability in accordance with Requirement R2;

8.4. Document and provide notice to the CEA, when a generating unit experiences a Generator Cold Weather Reliability Event with the same cause of a previous Generator Cold Weather Reliability Event at the same or a similar unit, and one or more corrective actions to address the cause is addressed by an existing validated Generator Cold Weather Constraint for the same or a similar unit.

M8. Each Generator Owner shall have dated evidence that demonstrates it performed the ~~review and updated operating limitations as needed~~actions in accordance with Requirement R8. Acceptable evidence may include, but is not limited to, the following dated documentation (electronic or hardcopy format): a copy of the Generator Cold Weather Constraint declaration, evidence the declaration was provided to the CEA in accordance with the specified timeframe, records that document ~~the performance of the review and~~ update(s) to the operating limitations, as needed, updates to the Corrective Action Plan(s), if applicable, and documentation and notice to the CEA of subsequent Generator Cold Weather Reliability Events, if applicable.

R9. The Generator Owner shall review each Generator Cold Weather Constraint declaration validated by the CEA at least once every 36 calendar months to determine if it remains valid in accordance with Attachment 1. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

9.1 If a Generator Cold Weather Constraint is determined to be no longer valid, then within six (6) calendar months of such determination, the Generator Owner shall develop or update a Corrective Action Plan pursuant to Requirement R7.

M9. Each Generator Owner shall have dated evidence that demonstrates it reviewed Generator Cold Weather Constraints in accordance with Requirement R9. Acceptable evidence may include, but is not limited to, the following dated documentation (electronic or hardcopy format): records that document the performance of the review within the required timeframe, records that demonstrate that a Corrective Action Plan was developed or updated within the required timeframe (if applicable).

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation.

- The Generator Owner shall retain data or evidence to support its current Extreme Cold Weather Temperature calculation and generating unit cold weather data, plus each calculation or revision since the last audit, for Requirement R1 and Measure M1.
- The Generator Owner shall keep data or evidence to show compliance for three years, or until any Corrective Action Plan under Requirement R2 or R3 is complete, whichever timeframe is greater, for Requirements R2 and R3 and Measures M2 and M3. Generator Cold Weather Constraint data or evidence shall be retained until no longer valid.
- The Generator Owner shall retain the current cold weather preparedness plan(s), as evidence of review or revision history, plus each version issued since the last audit and evidence of compliance since the last audit for Requirement R4 and Measure M4.
- The Generator Owner or Generator Operator shall keep data or evidence to show compliance for three years for Requirement R5 and Measure M5.
- The Generator Owner shall keep data or evidence to show compliance for three years, or until any Corrective Action Plan, including extensions (if applicable), under Requirement R6 is complete, whichever timeframe is greater, for Requirement R6 and Measure M6. Generator Cold Weather Constraint data or evidence shall be retained until no longer valid.
- The Generator Owner shall keep data or evidence to show compliance for three years, or until any Corrective Action Plan, including extension (if applicable), under Requirement R7 is complete, whichever ~~time~~

~~frame~~timeframe is greater, for Requirement R7 and Measure M7. Generator Cold Weather Constraint data or evidence shall be retained until no longer valid.

- The Generator Owner shall maintain data or evidence to support its current Generator Cold Weather Constraint declaration(s), plus each revision since the last audit, for Requirement R8 and Measure M8.
- The Generator Owner shall maintain data or evidence to support that it reviewed each Generator Cold Weather Constraint declaration validated by the CEA at least once every 36 calendar months since the last audit, for Requirement R9 and Measure M9.

1.3. Compliance Monitoring and Enforcement Program: ~~As defined in~~"Compliance Monitoring Enforcement Program" or "CMEP" means, depending on the context (1) the NERC ~~Rules of Procedure, "~~Compliance Monitoring and Enforcement Program~~" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated~~ (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for performing compliance monitoring and enforcement activities with respect to Registered Entities' compliance with Reliability ~~Standard~~Standards.

1.4. Compliance Abeyance Period: From the effective date of Reliability Standard EOP-012-3 until October 1, 2027, the CEA will not pursue an action under Sections 4A.0 or 5.0 of Appendix 4C to the Rules of Procedure for a failure to comply with Reliability Standard EOP-012-3 Requirement R1 Part 1.1 with respect to the calculation of the Extreme Cold Weather Temperature for an applicable generating unit, or any other failure to comply resulting from an incorrect calculation of the Extreme Cold Weather Temperature for that generating unit, against any entity acting in good faith to comply with the standard in accordance with the relevant implementation plan. "Good faith" in this context refers to a sincere intention to comply with Reliability Standard EOP-012-3 regarding all requirements based on the calculation of the Extreme Cold Weather Temperature for each applicable generating unit, following a reasonable and serious assessment by the entity in determining how this Reliability Standard should be applied to its particular facts and circumstances. Entities shall participate in any compliance monitoring activities undertaken by the CEA during this abeyance period and submit documentation as requested.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	The Generator Owner did not calculate the Extreme Cold Weather Temperature ~~and~~or identify generating unit(s) cold weather data in accordance with Requirement R1 for 5% or less of its applicable units.	The Generator Owner did not calculate the Extreme Cold Weather Temperature ~~and~~or identify generating unit(s) cold weather data in accordance with Requirement R1 for more than 5%, but less than or equal to 10% of its applicable units.	The Generator Owner did not calculate the Extreme Cold Weather Temperature ~~and~~or identify generating unit(s) cold weather data in accordance with Requirement R1 for more than 10%, but less than or equal to 20% of its applicable units.	The Generator Owner did not calculate the Extreme Cold Weather Temperature ~~and~~or identify generating unit(s) cold weather data in accordance with Requirement R1 for more than 20% of its applicable units.
R2.	The Generator Owner did not have freeze protection measure(s) for its applicable unit(s) meeting the criteria in Requirement R2 for 5% or less of its applicable units. OR The Generator Owner did not ~~develop a Corrective Action Plan~~declare a Generator Cold Weather Constraint (if applicable) to implement appropriate freeze protection measures for 5% or less of its applicable units.	The Generator Owner did not have freeze protection measure(s) for its applicable unit(s) meeting the criteria in Requirement R2 for more than 5%, but less than or equal to 10% of its applicable units. OR The Generator Owner did not ~~develop a Corrective Action Plan~~declare a Generator Cold Weather Constraint (if applicable) for more than 5%, but less than or equal to 10% of its applicable units.	The Generator Owner did not have freeze protection measure(s) meeting the criteria in Requirement R2 for more than 10%, but less than or equal to 20% of its applicable units. OR The Generator Owner did not ~~develop a Corrective Action Plan~~declare a Generator Cold Weather Constraint (if applicable) for more than 10%, but less than or equal to 20% of its applicable units.	The Generator Owner did not have freeze protection measure(s) meeting the criteria in Requirement R2 for more than 20% of its applicable units. OR The Generator Owner did not ~~develop a Corrective Action Plan~~declare a Generator Cold Weather Constraint (if applicable) for more than 20% of its applicable units.

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R3.	The Generator Owner did not have freeze protection measure(s) meeting the criteria in Requirement R3 for 5% or less of its applicable units. OR The Generator Owner did not develop a Corrective Action Plan as required by Requirement R3 for 5% or less of its applicable units.	The Generator Owner did not have freeze protection measure(s) meeting the criteria in Requirement R3 for more than 5%, but less than or equal to 10% of its applicable units. OR The Generator Owner did not develop a Corrective Action Plan as required by Requirement R3 for more than 5%, but less than or equal to 10% of its applicable units.	The Generator Owner did not have freeze protection measure(s) meeting the criteria in Requirement R3 for more than 10%, but less than or equal to 20% of its applicable units. OR The Generator Owner did not develop a Corrective Action Plan as required by Requirement R3 for more than 10%, but less than or equal to 20% of its applicable units.	The Generator Owner did not have freeze protection measure(s) meeting the criteria in Requirement R3 for more than 20% of its applicable units. OR The Generator Owner did not develop a Corrective Action Plan as required by Requirement R3 for more than 20% of its applicable units.
R4.	The Generator Owner implemented a cold weather preparedness plan(s) but failed to maintain it.	The Generator Owner's cold weather preparedness plan failed to include one of the applicable ~~Parts~~parts within Requirement R4.	The Generator Owner ~~had and~~ maintained a cold weather preparedness plan(s) but failed to implement it. OR The Generator Owner's cold weather preparedness plan failed to include two of the applicable requirement parts within Requirement R4.	The Generator Owner does not have a cold weather preparedness plan(s). OR The Generator Owner's cold weather preparedness plan failed to include three or more of the applicable requirement parts within Requirement R4.
R5.	The Generator Owner or Generator Operator failed to	The Generator Owner or Generator Operator failed to	The Generator Owner or Generator Operator failed to	The Generator Owner or Generator Operator failed to

Implementation Plan

Calculating Extreme Cold Weather Temperature

EOP-012-3 Technical Rationale

Generator Cold Weather CAP Extension and Constraint Process

Attachment 1

Generator Owners shall determine the applicability of a Generator Cold Weather Constraint declared under Requirements R2, R6, and R7 using the criteria as described below.

The definition of a Generator Cold Weather Constraint is: "Any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components. Freeze protection measures are not intended to be limited to optimum practices, methods, or technologies, but are also intended to include practices, methods, or technologies that would be expected to result in improved generating unit performance during cold temperatures."

A Generator Cold Weather Constraint can be identified using the following criteria:

Known Generator Cold Weather Constraints

The following are circumstances which, if present and confirmed as valid by the CEA, will constitute known Generator Cold Weather Constraints:

- Individual wind turbine towers manufactured prior to October 1, 2029 that have structural limitations established by Original Equipment Manufacturers (OEMs) based on a minimum temperature that is higher than the Extreme Cold Weather Temperature calculated per Requirement R1 for generating units that began commercial operation prior to October 1, 2031.
- Application of freeze protection measures to meet the requirements of this Standard that require:
  - Replacing existing wind turbine blades with new blades solely for the purpose of adding de-icing or ice-minimizing capabilities;
  - Removal of accumulated frozen precipitation on solar panels;
  - Applying heat upstream of inlet air filters to prevent the buildup of frozen precipitation on combustion turbine inlet air filters; or
  - Implementation of heat tracing or other de-icing technologies for wind turbine blades, that, through analysis, have been shown to not be effective or not made available by the OEM for generating units of a comparable types in regions that experience similar winter climate conditions.

Case-by-case Determinations of Generator Cold Weather Constraints

The following situations may constitute a Generator Cold Weather Constraint, depending on the facts and circumstances. Only upon approval by the CEA will these circumstances constitute a valid Generator Cold Weather Constraint:

1. The implementation of a specific freeze protection measure will void an equipment warranty.
2. The implementation of a specific freeze protection measure would exceed a manufacturer's design limitation and the exceedance is expected to functionally impair or degrade the effective operation of the impacted component or system.

3. The implementation of a specific freeze protection measure is precluded by technical or physical limitations. For example:
    a. Installing wind breaks around a cooling tower or air-cooled heat exchanger that requires free airflow for its functionality;
    b. Implementing freeze protection measures with size or weight that would require the structural re-design and re-construction of the protected equipment or its support system;
    c. Other similar circumstances as determined through operating experience or engineering analysis and supported with justification.
4. A determination, through an analysis, that the freeze protection measure would not be effective for the generating unit. Such a determination may be supported, for example, by fleet or industry operating experience (or lack thereof) with the freeze protection measure on generating unit(s) of comparable types in regions that experience similar winter climate conditions.
5. A determination, through an analysis, that the implementation of a specific freeze protection measure or measures would adversely affect the reliability of the Bulk Power System to an extent that outweighs the reliability benefit of applying the freeze protection measure(s). For example:
    a. The implementation of freeze protection measures, while feasible, would result in the accelerated premature retirement of an existing generating unit with no acceptable replacement available within the accelerated timeframe (must be accompanied by an attestation signed by an officer of the company);
    b. The implementation of freeze protection measures would cause the Generator Owner to cancel plans to finish the development of a new generating unit (must be accompanied by an attestation signed by an officer of the company);
    c. The implementation of freeze protection measures would reduce the generating unit's ability to provide Real Power or Reactive Power capability by more than three percent, or another value supported by the appropriate functional entity (e.g., TP, RC, BA, etc.), when freeze protection measures are not in use; or
    d. The implementation of freeze protection measures would reduce the summer net dependable capacity[1], or net dependable capacity at Peak Demand, of the generating unit by more than three percent or another value supported by the appropriate functional entity (e.g., TP, RC, BA, etc.);
    e. Other similar circumstances as determined through operating experience or engineering analysis and supported with justification.

[1] "net dependable capacity" refers to the definition used for reporting to the NERC in Generating Availability Data System (GADS) appropriate for the generation type.

6. The implementation of new freeze protection measures to an existing generating unit that has previously communicated a retirement date to the appropriate functional entity (e.g., Transmission Planner (TP), Reliability Coordinator (RC), Balancing Authority (BA), etc.) that falls within three calendar years of the Generator Cold Weather Constraint declaration;
7. The implementation of a specific freeze protection measure would introduce the risk of noncompliance with other statutory, regulatory, or health and safety requirements or standards for which relief via waiver, exemption or other means of excused noncompliance is not available during extreme cold weather.
8. A determination through an analysis that the freeze protection measure is not available on the commercial market for generating units of comparable types in regions that experience similar winter climate conditions.
9. Implementation of freeze protection measures would not increase reliability of a generating unit due to clearly delineated technical or physical reasons on fuel supply which has been communicated to its Reliability Coordinator (RC) or Balancing Authority (BA) and are not due to Fixed Fuel Supply Components, and which are outside the Generator Owner's control.
10. Other situations identified by the Generator Owner that may, based on the specific circumstances beyond the Generator Owner's control, limit its ability to apply freeze protection measures to Generator Cold Weather Critical Components.

An approved Generator Cold Weather Constraint declaration for any specific Generator Cold Weather Critical Component does not relieve the Generator Owner of its obligation to otherwise prepare its applicable generating unit(s) to meet the requirements of EOP-012-3.

Reliability Standard EOP-012-3

Applicable Standard(s)

- EOP-012-3 Extreme Cold Weather Preparedness and Operations

Requested Retirement(s)

- EOP-012-2 Extreme Cold Weather Preparedness and Operations

Applicable Entities

- Generator Owner (GO)
- Generator Operator (GOP)

Background

The purpose of Project 2024-03 is to address the directives identified by FERC in its June 27, 2024, order approving Reliability Standard EOP-012-2 and directing further modifications. *N. Am. Elec. Reliability Corp.*, 187 FERC ¶ 61,204 (2024) (June 2024 Order), available here. In that order, FERC found that further improvements are needed to address ambiguous language and other reliability gaps/implementation issues in the standard and related definitions to fully address issues first raised in the Commission's February 2023 Order approving EOP-012-1. *See N. Am. Elec. Reliability Corp.*, 182 FERC ¶ 61,094, PP 3-11 (2023) (February 2023 Order); *reh'g denied*, 183 FERC ¶ 62,034, *order on reh'g*, 183 FERC ¶ 61,222 (2023). In the June 2024 Order, FERC directed that NERC submit the modifications within nine months of the date of the order, or by March 27, 2025.

Proposed EOP-012-3 Requirement R1 is an existing EOP-012-2 requirement that consolidated and clarified requirements for each GO to calculate the Extreme Cold Weather Temperature for its generating unit location(s) and identify generating unit cold weather data, and to review these calculations and data every five years. Proposed EOP-012-3 Requirement R4 and R5 continue the current requirements under EOP-012-2 (with minimal clarifications in Requirement R4), that all GOs develop cold weather preparedness plans and that all GOs or GOPs (as appropriate) conduct annual training on those plans. Proposed EOP-012-3 clarifies which generating unit(s) are subject to the winter operations capability requirements of the standard (Requirements R2 and R3). Proposed EOP-012-3 Requirement R6 provides clarification regarding responses to a Generator Cold Weather Reliability Event that may require Corrective Action Plans (CAPs). Proposed EOP-012-3 Requirement R7 specifies timelines for the completion of CAPs, consistent with the February 2023 Order and FERC directives in its June 2024 Order. The drafting team crafted language to meet the concern of GOs regarding timelines for units under consideration or development. The language reflects

FERC's concern regarding applicability of CAPs to the correct GO. Proposed EOP-012-3 Requirement R9 requires GOs to review constraint declarations at least every 36 calendar months, or as needed, when a change of status occurs and ensures operating limitations caused by the constraints are clearly identified. The revised *Glossary* term for Generator Cold Weather Constraint, and new Attachment 1 both clarify the circumstances under which GOs may declare Generator Cold Weather Constraints.

For additional information on the FERC Order directives addressed in proposed Reliability Standard EOP-012-3, see the Consideration of Directives available on the Project 2024-03 project page.

General Considerations

This implementation plan reflects past consideration that entities need time to develop, implement, and maintain cold weather plans, identify Generator Cold Weather Critical Components, and identify freeze protection measures. The implementation plan also considers the FERC directives regarding the need for an accelerated effective date of directed changes and abbreviated implementation periods for generator winterization measures. FERC has repeatedly expressed an urgency in completing cold weather Reliability Standards and having them implemented in a timely manner to address the risks cold weather events present to the reliability of the Bulk-Power System. FERC noted the five core directives to NERC in the June 2024 Order are not new issues, but rather targeted modifications necessary to fully address issues identified in FERC's prior February 2023 Order. *See* June 2024 Order at P 30.

The drafting team determined that later phased-in compliance dates were not necessary for the revised requirements in EOP-012-3, as the practical impact of implementing the proposed changes, in light of the regulatory history described above, is not expected to be significant:

- For revised Requirement R2, units further into design or construction have separate requirements from those units in the early phases of design: the units further along in the design/construction phase are allowed to develop, implement, and complete CAPs to meet the more rigorous requirements for new generating units, whereas units in the early stages of design are expected to meet the more rigorous requirements unless a Generator Cold Weather Constraint applies. Additional time is not needed to implement this change.
- For revised Requirement R6, relating to Generator Cold Weather Reliability Events, the language reflects the FERC directives regarding CAPs, CAP extensions, and consideration of the applicability of corrective actions across a fleet for Generation Owners that had a generating unit(s) that experienced a Generator Cold Weather Reliability Event. Additional time to implement these changes is not needed, given the conditions in which a CAP Plan may be needed for a Generator Cold Weather Reliability Event.
- For revised Requirement R7, the drafting team clarified the applicability of CAP requirements and provided CAP extension request language similar to that found in

Reliability Standard TPL-007-4 to address the June 2024 Order. Additional guidance is provided below.

In consideration of these factors, and to ensure entities have sufficient notice of their revised obligations under Reliability Standard EOP-012-3, the proposed implementation plan provides that the standard shall become effective on the later of October 1, 2025, which is the date Reliability Standard EOP-012-2 will be fully enforceable in the United States, or three months following regulatory approval.

Additional guidance is provided to aid in the orderly implementation of the standard as entities transition from compliance with Reliability Standard EOP-012-2 to Reliability Standard EOP-012-3.

Effective Date

The effective dates for the proposed Reliability Standards are provided below. Where the drafting team identified or recognized the need for a longer implementation period for compliance with a particular section of a proposed Reliability Standard (i.e., an entire Requirement or a portion thereof), the additional time for compliance with that section is specified below. The phased-in compliance date for those particular sections represents the date that entities must be compliant with that particular section of the Reliability Standard, even where the Reliability Standard goes into effect at an earlier date.

EOP-012-3 and Definitions

Where approval by an applicable governmental authority is required, the standard and associated definitions shall become effective on the later of: (1) October 1, 2025; or (2) the first day of the first calendar quarter that is three (3) months after the effective date of the applicable governmental authority's order approving the standard, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is three (3) months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Additional Implementation Information and Phased-In Compliance Date

This section provides additional information of Reliability Standard EOP-012-3 in the United States. In non-U.S. jurisdictions that have not adopted prior versions of the standard or have established different dates for Requirement R2 or R3, entities shall implement the standard with dates appropriate to their jurisdiction, or as directed by the Applicable Governmental Authority.

EOP-012-3 Requirement R1

In the United States, entities were required to become compliant with Requirement R1 by the effective date of EOP-012-2 (October 1, 2024) in accordance with that implementation plan. Entities shall perform their first periodic review under Reliability Standard EOP-012-3 Requirement R1 by no more than 60 months after the effective date of **EOP-012-2**.[1]

EOP-012-3 Requirement R2 – New Generating Units entering commercial operation on/after October 1, 2027

Entities shall become compliant with Requirement R2 no later than the commercial operations date for the applicable unit, except as provided below. Any Generator Cold Weather Constraint shall be submitted in accordance with the timeline provided in Requirement R8.

For generating units for which the GO first contractually committed[2] to design criteria relevant to this Requirement before June 29, 2023, and which enter commercial operation between October 1, 2027 and March 31, 2028, the GO shall comply with Requirement R2 relating to implementing required capability by no later than April 1, 2028. If declaring a Generator Cold Weather Constraint, the Generator Cold Weather Constraint shall be submitted in accordance with the timeline provided in Requirement R8.

EOP-012-3 Requirement R3 – Existing and New Generating Units entering commercial operation before October 1, 2027

Entities beginning commercial operation after the effective date of EOP-012-3 shall become compliant with Requirement R3 no later than the commercial operations date for the applicable unit.

EOP-012-3 Requirement R8

Entities shall review all Generator Cold Weather Constraints previously declared under Reliability Standard EOP-012-2 for compliance with Reliability Standard EOP-012-3 Attachment 1 by the effective date. Each entity shall submit any previously declared Generator Cold Weather Constraints to the Compliance Enforcement Authority (CEA) no later than 45 days following the effective date of Reliability Standard EOP-012-3. Newly declared Generator Cold Weather Constraints shall be submitted in accordance with the timelines specified in Requirement R8.

EOP-012-3 Requirement R9

If applicable, entities shall review each Generator Cold Weather Constraint in accordance with Requirement R9 no later than 36 calendar months following validation by the CEA.

[1] In jurisdictions where EOP-012-2 has not become effective, entities shall perform their first periodic review under Reliability Standard EOP-012-3 Requirement R1 by no later than five calendar years following the initial calculation of the Extreme Cold Weather Temperature, or as directed by the applicable governmental authority in the jurisdiction.

[2] Such commitments would be demonstrated by signed contracts creating a binding legal agreement with respect to the design criteria for the unit.

Retirement Date of EOP-012-2

Reliability Standard EOP-012-2 shall be retired immediately prior to the effective date of Reliability Standard EOP-012-3 in the particular jurisdiction in which the revised standard is becoming effective.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

EOP-012-3

Generator Cold Weather CAP Extension and Constraint Process

Purpose

This Electric Reliability Organization (ERO) Generator Cold Weather Corrective Action Plan (CAP) Extension and Constraint Process document addresses how ERO Enterprise staff will review generator cold weather CAP extensions and Constraints developed under Reliability Standard EOP-012-3 Requirements and Attachment 1. The extension requests for a non-US Registered Entity should be implemented in a manner that is consistent with, or under the direction of, the applicable governmental authority or its agency in the non-US jurisdiction.

NERC Compliance Assurance & Certification will maintain this document under existing ERO Enterprise processes. This document will be reviewed and updated by NERC Compliance Assurance & Certification, as needed. Notification to industry on changes will occur through The North American Electric Reliability Corporation's (NERC's) normal public posting and industry announcements to maintain industry awareness. The steps outlined here will help to ensure a timely, structured, and consistent approach to CAP extension request and Generator Cold Weather Constraint submittals and processing.

Each Compliance Enforcement Authority (CEA) is responsible for providing staff to facilitate timely processing in a consistent manner. NERC Compliance Assurance & Certification will provide training, oversight, and guidance, as needed, for successful implementation of this process. A templated submittal form as well as guidance on materials that support timely and consistent processing will be provided in the appropriate format (e.g., training, outreach, guides, etc.).

CAP Extension Request Review Process

Process Overview

If a registered entity has determined that a CAP developed in accordance with EOP-012-3 Requirements R6 or R7 cannot meet the timetable provided per R6 Part 6.3 or R7 Part 7.1, then the entity will submit an extension request to the ERO Enterprise for approval no less than 60 calendar days prior to the original required CAP completion date[1]. It is the Generator Owner's (GO's) obligation and responsibility to provide clear documentation with the extension request in a timeframe that allows the ERO Enterprise to process the request effectively.

The entity will work with the Regional Entity designated as its CEA as outlined in this process. The entity submitting the extension request will be referred to as the 'submitting entity' and may represent only itself or multiple registered entities who have developed a joint extension request[2]. The submitting entity is

[1] The ERO Enterprise is aware that in certain situations the submittal timeframes may not be met due to circumstances beyond the control of a Generator Owner. The ERO Enterprise will prioritize efforts to help ensure timely processing of extension requests as these circumstances arise.

[2] As a single Corrective Action Plan may be developed for multiple sites and multiple entities, a Corrective Action Plan extension request may be done in a similar manner.

responsible for ensuring all registered entities jointly submitting the extension request are listed in the requested information below and for distributing any communications from its CEA to the other entities that are part of the joint extension request. If a joint extension request is submitted for multiple registered entities who have different Regional Entities designated as the CEA, the submitting entity's CEA will perform the steps outlined in this process and will be responsible for coordinating with the Regional Entity(ies) that are the designated CEA for the additional entities party to the joint extension request.

For entities in Coordinated Oversight, the CEA for this process is the Lead Regional Entity (LRE). The LRE will coordinate with the Affected Regional Entity(ies) (ARE) and the AREs may participate in the joint review as well.

Step 1 – Registered Entity Submittal

If an entity determines that it cannot meet the required timetable for completing a CAP, the submitting entity will submit the requisite data to their CEA through Align and the Secure Evidence Locker (SEL) or other process tools as directed by the CEA. It is expected that data will be marked in accordance with Section 1500 of the Rules of Procedure in a similar manner to the evidence provided during a Compliance Audit.

Entities are encouraged to submit the extension request as soon as they are aware they will not meet the CAP completion date, but no later than 60 calendar days before the original required completion date. The 60-day timeframe provides the submitting entity and the CEA sufficient time to have discussions, as needed, prior to the required completion date. It is the submitting entity's responsibility to ensure that all information detailed in EOP-012-3 Part 6.4 or Part 7.2 and requested in Align is provided in the entity's extension request to facilitate the review.

Step 2 – ERO Enterprise Review

The CEA will acknowledge receipt of the submission in writing (either through Align or email) within 15 calendar days and verify that all information detailed in EOP-012-3 Part 6.4 or Part 7.2 is provided in the submittal. The CEA will work with the submitting entity to provide any missing information. The CEA will notify NERC of the extension request submittal and provide all associated information when acknowledging receipt of the submission.

The CEA will then perform a review[3] of (1) the circumstances beyond the control of the entity preventing implementation of the CAP within the identified timetable; (2) the revisions to the selected actions in the CAP; and (3) the updated timetable for implementing the selected actions. Any additional information requested to support the extension request review will be coordinated with the submitting entity by the CEA. The CEA will complete the review within 45 calendar days of acknowledgement or provide notification to the submitting entity that they are extending the time needed for review.

Examples of circumstances beyond the control of the responsible entity include, but are not limited to[4]:

[3] NERC may choose to participate in any review at its own discretion or at the request of the CEA.

[4] The list provided is not exhaustive. Clear explanation of the facts and circumstances that demonstrate "beyond the control" is needed. The concept of "beyond the control" is also used in Reliability Standards FAC-003 Requirements R1 and R7, PRC-004 Requirement R5, TPL-001-5.1 Requirement R2, and TPL-007 Requirements R7 and R11.

- Delays resulting from regulatory/legal processes, such as permitting.
- Delays resulting from stakeholder processes required by tariff.
- Delays resulting from equipment lead times; or
- Delays resulting from unit outages being denied.

Due diligence (i.e., reasonable steps taken) in ordering equipment, obtaining permits, scheduling outages, etc., will be considered as part of the determination of whether a particular set of facts constitute circumstances beyond the control of the entity.

Step 3 – Registered Entity Notification

The CEA will communicate the approval or denial of the extension request or continuation of the time needed to review the extension request in writing to the submitting entity including the rationale for the determination. For any continuation of the review, the CEA will also provide the submitting entity with a revised timeline for when the determination will be provided. If an extension request is denied, the selected actions in the CAP need to be completed in accordance with the original timetables.

If a CAP extension request was denied, the submitting entity may request, within 15 calendar days of denial, a joint NERC and CEA review of the denial. The joint review should take no longer than 10 calendar days (subject to the information and resources available.) NERC and the CEA will evaluate the information provided and the submitting entity will be notified of the determination.

Step 4 – Reporting to NERC

Quarterly, the CEA will provide NERC with a report that, at a minimum, includes each extension request, whether the request was approved or denied, and the CEA's rationale for its decision. NERC will periodically provide trending and analysis of aggregated anonymized CAP extension requests for industry awareness and guidance.

Constraint Review Process

Process Overview

If a registered entity has determined that a Generator Cold Weather Constraint, developed in accordance with Reliability Standard EOP-012-3 Attachment 1, exists, the entity will work with the Regional Entity designated as its CEA to submit the Generator Cold Weather Constraint, with supporting documentation, to the CEA for review, evaluation, and validation or approval as outlined in this process.

The entity submitting the Generator Cold Weather Constraint(s) will be referred to as the 'submitting entity' and may represent itself or multiple registered entities under the same ownership with the same Generator Cold Weather Constraint. The submitting entity is responsible for ensuring all registered entities included are listed in the requested information and is for distributing any communications from its CEA to the other entities that are part of the Generator Cold Weather Constraint. If a Generator Cold Weather Constraint is submitted for multiple registered entities under the same ownership who have different Regional Entities designated as the CEA, the submitting entity's CEA will perform the steps outlined in this process and will

be responsible for coordinating with the Regional Entity(ies) that are the designated CEA for the additional entities party to the Generator Cold Weather Constraint.

For entities in Coordinated Oversight, the CEA for this process is the Lead Regional Entity (LRE). The LRE will coordinate with the Affected Regional Entity(ies) (ARE) and the AREs may participate in the joint review as well.

Step 1 – Registered Entity Submittal

If an entity determines that it meets the required Generator Cold Weather Constraint language within Attachment 1, the submitting entity will submit the requisite data to their CEA through Align and the Secure Evidence Locker or other process tools as directed by the CEA. It is expected that data will be marked in accordance with Section 1500 of the Rules of Procedure in a similar manner to the evidence provided during a Compliance Audit.

Entities are encouraged to submit the Generator Cold Weather Constraint as soon as they are aware they will meet the Generator Cold Weather Constraint language within Attachment 1 but are required to meet EOP-012-3 Requirement R8[5]. Early submittal is requested to allow the CEA time to review, evaluate, and validate or approve the Generator Cold Weather Constraint.

If an entity determines a Generator Cold Weather Constraint is required for a unit, then subsequently has another unit that requires declaration of the same Generator Cold Weather Constraint (e.g., the same issue occurred at another location with implementing a freeze protection measure) an update to the original Generator Cold Weather Constraint is allowed. Note that supporting information for the other site is needed and the submittal/review timelines (per Requirement R8 and this process) will remain the same for the "new" addition. This will allow a GO to perform the 36-calendar month review of the Generator Cold Weather Constraint for both instances at the same time.

It is the submitting entity's responsibility to ensure that all information detailed in EOP-012-3 R8 and Attachment 1 is provided in the entity's submittal to facilitate the CEA review. The submitting entity should review language within Attachment 1 and identify, in the submittal, if the Generator Cold Weather Constraint is a known Generator Cold Weather Constraint or a Generator Cold Weather Constraint requiring further review for approval.

Step 2 – ERO Enterprise Review

The CEA will acknowledge receipt of the submission in writing (either through Align or email) within 15 calendar days and verify that all information detailed in EOP-012-3 R8 and Attachment 1 is provided in the submitting entity's submittal. The CEA will work with the submitting entity to provide any missing information. The CEA will notify NERC of the Generator Cold Weather Constraint submittal (either through Align or via email) when acknowledging receipt of the submission. Indication of the Generator Cold Weather

[5] Per EOP-012-3 R8.1, the Generator Owner must submit its Generator Cold Weather Constraint declaration(s) to the CEA within 45 calendar days of determining that the Generator Cold Weather Constraint is applicable for in-service units. For Generator Cold Weather Constraints determined in accordance with Requirement R2 for generating unit(s) upon beginning commercial operation, the Generator Owner must submit the Generator Cold Weather Constraint declaration(s) no later than 15 calendar days after commercial operation.

Constraint type (e.g., "Known" or "Case-by-Case") will be included in the notification to ensure NERC has sufficient visibility and oversight in the process.

The CEA will review the Generator Cold Weather Constraint submittal and supporting information[6]. Any additional information requested to support the Generator Cold Weather Constraint review, evaluation, and validation or approval will be coordinated with the submitting entity by the CEA. The CEA will complete the review within 10 calendar days of submittal receipt confirmation for known Generator Cold Weather Constraint and 45 calendar days of submittal receipt confirmation for those Generator Cold Weather Constraint requiring further review for approval or provide notification to the submitting entity that they are extending the time needed to review[7].

The determination whether to approve the case-by-case Generator Cold Weather Constraint will be based on the specific facts and circumstances provided by the submitting entity that defends and supports the declared constraint under the identified situations in EOP-012-3 Attachment 1.

Step 3 – Registered Entity Notification

The CEA will communicate the validation, approval, or denial of the Generator Cold Weather Constraint or continuation of the time needed to review the Generator Cold Weather Constraint in writing (via Align or email) to the submitting entity including the rationale for the determination. For any continuation of the review, the CEA will also provide the submitting entity with a revised timeline for when the determination will be provided. Denial of a Generator Cold Weather Constraint requires the entity to update its CAPs with corrective actions that will be completed within the timetables in Requirement R6 Part 6.3 or Requirement R7 Part 7.1 to begin from the date the GO is notified that the Generator Cold Weather Constraint is invalid. Communication efforts between the submitting entity and the CEA related to updates of the CAP and timetables resulting from a denial of a Generator Cold Weather Constraint are strongly encouraged.

If a Generator Cold Weather Constraint was denied, the submitting entity may request, within 15 calendar days of denial, a joint NERC and CEA review of the denial. The joint review should take no longer than 10 calendar days (subject to the information and resources available.) NERC and the CEA will evaluate the information provided and the submitting entity will be notified of the determination.

Step 4 – Reporting to NERC

Quarterly, the CEA will provide NERC with a report that, at a minimum, includes each Generator Cold Weather Constraint request received, whether the request was validated, approved, or denied, and the CEA's rationale for its decision. NERC will periodically provide trending and analysis of aggregated anonymized Generator Cold Weather Constraint declarations for industry awareness and guidance.

[6] NERC may choose to participate in any review at its own discretion or at the request of the CEA.

[7] If a large number of entities submit Generator Cold Weather Constraints at the same time (especially those tied to initial performance expectations as set in the EOP-012-3 Implementation Plan), the ERO Enterprise anticipates additional time will be needed to accommodate these initial reviews.

Project 2024-03 Revisions to EOP-012-2
Reliability Standard EOP-012-3 | March 2025

EOP-012-3 – Extreme Cold Weather Preparedness and Operations

Introduction

This document explains the technical rationale and justification for the proposed Reliability Standard EOP-012-3. It provides stakeholders and the ERO Enterprise with an understanding of the technology and technical requirements in the Reliability Standard. This Technical Rationale and Justification for EOP-012-3 is not a Reliability Standard and should not be considered mandatory and enforceable.

Background

From February 8 through February 20, 2021, extreme cold weather and precipitation caused large numbers of generating units to experience outages, derates or failures to start, resulting in energy and transmission emergencies (referred to as the "Event"). The total Event firm load shed was the largest controlled firm load shed event in U.S. history and was the third largest in quantity of outaged megawatts (MW) of load after the August 2003 Northeast blackout and the August 1996 West Coast blackout. The Event was most severe from February 15 through February 18, 2021, and it contributed to power outages affecting millions of electricity customers throughout the regions of ERCOT, SPP, and MISO South. Additionally, the February 2021 event is the fourth cold weather event in the past 10 years, which jeopardized Bulk Power System (BPS) reliability. A joint inquiry was conducted to discover reliability-related findings and develop recommendations from Federal Energy Regulatory Commission (FERC), NERC, and Regional Entity staff. The FERC, NERC, and Regional Entity Staff Report about the February 2021 Cold Weather Outages[1] ("Joint Inquiry Report") was published on November 16, 2021.

Project 2021-07 was a two-phase project to address the 10 sub-recommendations in Key Recommendation 1 of the Joint Inquiry Report for new or enhanced NERC Reliability Standards. Reliability Standard EOP-012-1 was originally developed to address Recommendations 1d, 1e, and 1f of the Joint Inquiry Report through new and enhanced requirements for generator preparedness for extreme cold weather conditions. Reliability Standard EOP-012-2 was revised to address Key Recommendations 1a, 1b, and 1c as well as the FERC directives in the February 2023 Order approving the Phase 1 standards EOP-011-3 and EOP-012-1.[2] Reliability Standard EOP-012-3 is being revised to address FERC directives in the June 2024 Order approving EOP-011-4 and EOP-012-2[3].

3 *N.AM.Elec.Reliability Corp.*, 187 FERC ¶ 61,204 (FERC Order)

Defined Terms

Previous drafting teams (DTs) developed five defined terms to be added to the NERC Glossary of Terms to make the requirements easier to understand. Project 2024-03 updated the term "Generator Cold Weather Constraint" to meet the FERC directives in the June 2024 Order and provided additional language to clarify issues noted during the development of EOP-012-3, 2024 Small Group Advisory Session(s), and input received during outreach with industry. The five terms are:

Extreme Cold Weather Temperature

The temperature equal to the lowest 0.2 percentile of the hourly temperatures measured in December, January, and February from 1/1/2000 through the date the temperature is calculated.

The definition of Extreme Cold Weather Temperature (ECWT) was developed by the 2021-07 DT to provide clarity to the Generator Owner (GO) on determining what temperature triggers the requirement obligations. Each GO should select a reliable source of data from a recording location near the plant to determine their ECWT. Sources could include, for example, the National Weather Service (NWS) or National Oceanographic and Atmospheric Administration (NOAA) weather stations, Federal Aviation Administration (FAA) weather stations, or Environment and Climate Change Canada location for Canadian entities[4], etc. NOAA's National Centers for Environmental Information provides Climate Data Online (CDO) as a free resource that includes quality-controlled weather data and 30-year Climate Normals[5]. In general, GOs should use the location nearest the plant, but may select a further location if geographic or local climatic patterns make a further location more representative of the weather at the generating unit. GOs may use on-site weather stations if data, which reasonably matches reliable nearby off-site sources since January 1, 2000, is available. The starting period chosen by the 2021-07 DT to gather data to determine the lowest temperatures that occur near a facility is based on the completion of the modernization of the National Weather Service project known as MAR (Modernization and Associated Restructuring). This project was completed in the year 2000. In general, the National Weather Service modernization provides weather data to be available at most large airports. This will make it fairly accessible for companies to gather data and perform the required analysis. The December through February timeframe was selected to correspond to the meteorological winter, as defined by NOAA.[6]

The 2021-07 DT discussed methods for determining an ECWT with engineering design professionals, and it was determined that it is typical engineering practice to use a statistical approach to determine the design temperature when implementing generation facility freeze protection measures. The 2021-07 DT determined that only winter temperature values (i.e. between December and February) shall be used for the statistical approach and based on analysis of multiple weather data sites. It was determined that by using the lowest 0.2 percentile, there will be sufficient data points to ensure that a single hour at a temperature that may not be accurate, or may be a statistical anomaly, doesn't result in an overly conservative design or preclude the ability of the GO to use historical operating data to prove compliance to the requirements. The 2021-07 DT selected the 0.2 percentile of winter month temperatures since 1/1/2000 to identify a temperature which has been rarely surpassed, but which allows some margin for a

6 Meteorological Versus Astronomical Seasons | News | National Centers for Environmental Information (NCEI) (noaa.gov)

GO to have previously demonstrated successful operation. The 2021-07 DT considered using the lowest recorded hourly ambient temperature, but upon further review of the historical weather data and generally accepted design principles, determined that the statistical approach to setting the ECWT for a site's location was more reasonable.

The 2024-03 DT recognized comments and concerns raised during the 2024 Small Group Advisory Session on cold weather preparedness regarding application of the ECWT calculation if hourly temperature values were questionable. If complete data sets are not available (e.g., data is corrupt or missing) at a single weather station back to January 1, 2000, the GO should document the methodology they use to determine their ECWT, such as appending data from multiple weather stations or selecting a complete or partial data set from a weather station further away from the facility. The 2021-07 and 2024-03 DTs realized that a complete data set (i.e., all hours of every day of every year for the months of December, January, and February) may not be available due to a variety of technical reasons. To that point, the GO's approach in handling the missing/corrupt data should be documented in their methodology and available to Compliance Monitoring Enforcement Program (CMEP) staff as needed. To accommodate concerns raised by industry, the 2024-03 DT felt additional clarification was needed to address missing data and set an expectation for entities to meet when reviewing the inputs to the ECWT calculations within Requirement R1. Entities should be able to explain the reasoning behind the substitution of missing or corrupt data points.

It has been noted by the industry that there may be the possibility of missing temperature data utilized for the ECWT calculation. The 2024-03 DT discussed data completeness concerns and, after considering the likely variability in such hourly temperature data sets across North America, ultimately chose not to establish a requirement regarding the size of the data set necessary to support an accurate ECWT determination. The 2024-03 DT understands the entity may very well have an overall approach to missing data versus a generating unit-by-unit approach. By the nature of the percentile function, significant data loss may not change the ECWT value. The key is where the data is missing in relationship to the ECWT determined value. Note that compliance obligations when the ECWT is determined near 32 degrees Fahrenheit, tend to dictate the need for a more rigorous level of effort needed to help determine possible impacts of missing temperature data. Missing hourly temperature values above the ECWT has limited impact to the determination. However, missing hourly temperature values below the ECWT can impact the ECWT determination value. For example, the 0.2 percentile of 50,000 hourly values equates to 100 hourly values (in this case the lowest recorded hourly temperatures.) If there are missing hourly values that would have been included in the list of the lowest 100 hourly temperature values, those values should be explained by the entity and may warrant further review. Missing data in the lowest 100 values effectively has the potential of moving the ECWT value higher but that is dependent upon the data set. This simplified example is intended to demonstrate a principle; not establish a fixed number of lowest temperature values of concern. Any data set with missing or invalid hourly temperature values recorded during the coldest periods since January 1, 2000 should be carefully evaluated to ensure that any adjustments utilized on those particular values are properly addressed in a transparent and logical way. Please reference the Calculating Extreme Cold Weather Temperature document drafted by the 2021-07 DT and updated by the 2024-03 DT for an example of how to calculate the ECWT[7].

7 Report (nerc.com)

Generator Cold Weather Critical Component

Any generating unit component or system, or associated Fixed Fuel Supply Component, that is under the Generator Owner's control, and is susceptible to freezing issues, the occurrence of which would likely lead to a Generator Cold Weather Reliability Event. This definition excludes any component or system or associated Fixed Fuel Supply Component located inside a permanent building with a heating source that regularly maintains the space at a temperature above 32 degrees Fahrenheit (0 degrees Celsius).

The 2021-07 DT felt the best method to address where freeze protection measures should be implemented was to define a term which specifies a subset of components that may be susceptible to freezing and are critical to the operation of generating units. GOs should consider previous freeze-related issues experienced by the generating unit(s), as well as actions taken to mitigate those freeze-related issues, when establishing its list of Cold Weather Critical Components. The 2021-07 DT also felt it is appropriate to specifically exclude components that are not susceptible to freezing due to being inside heated buildings that maintain the interior temperature above freezing.

The 2021-07 DT's intent with regard to the language "that is under the Generator's Owner's control" was to clearly delineate that cold weather events external to the generation site such as loss of fuel supply or loss of auxiliary power to the site that resulted in a Generator Cold Weather Reliability Event (see definition below) would not be subject to this standard. Furthermore, ice buildup on transmission lines and/or high voltage lines between the generating station and point of interconnection with the Transmission Owner would not constitute a freezing condition in the context of this Standard, and therefore, these lines would not be considered a Generator Cold Weather Critical Component.

The 2021-07 DT's intent with the use of the phrase "permanent building" is to refer to a structure that is in place year-round, shall accommodate personnel entry, and has a heating source that regularly maintains the space at a temperature above 32 degrees Fahrenheit for the purpose of protecting components from freezing (e.g. heated container that protects inverter-based resources or battery energy systems). The 2024-03 DT recognized comments and concerns raised during the 2024 Small Group Advisory Session on cold weather preparedness regarding heating of the "permanent building." The HVAC/heating system is not a freeze protection measure in terms of being included in the cold weather preparedness plan as it is not protecting a Generator Cold Weather Critical Component (per the definition) nor is it a Generator Cold Weather Critical Component. The 2024-03 DT expects the HVAC/heating system to be part of routine maintenance and monitoring to ensure that the heated building remains above 32 degrees Fahrenheit.

Fixed Fuel Supply Component

Non-mobile equipment that supports the reliable delivery of fuel to the generating unit and under the control of the Generator Owner at a plant site. Gaseous, liquid, or solid fuel handling components that are installed on site as fixed parts of the fuel delivery system that are under the Generator Owner's control are included. Mobile equipment such as trains, bulldozers, or other equipment that are not fixed in one location are excluded.

The 2021-07 DT wanted to clarify the boundaries of responsibility for the GO as it relates to sites having fuel handling equipment within their control and responsibility to provide freeze protection. The intent of

this definition is to clarify that mobile equipment is not part of this requirement, but permanent fixed equipment impacting fuel delivery needed for generation is included.

Generator Cold Weather Reliability Event

One of the following events for which the apparent cause(s) is due to freezing of equipment or impacts of freezing precipitation (e.g., sleet, snow, ice, and freezing rain) on equipment within the Generator Owner's control, and the dry bulb temperature at the time of the event was at or above the Extreme Cold Weather Temperature:

(1) a forced derate of more than 10% of the total capacity of the unit but not less than 20 MWs for longer than four hours in duration;

(2) a start-up failure where the unit fails to synchronize within a specified start-up time; or

(3) a Forced Outage.

Key Recommendation 1d: To require Generator Owners that experience outages, failures to start, or derates due to freezing to review the generating unit's outage, failure to start, or derate and develop and implement a corrective action plan (CAP) for the identified equipment, and evaluate whether the CAP applies to similar equipment for its other generating units. Based on the evaluation, the Generator Owner will either revise its cold weather preparedness plan to apply the CAP to the similar equipment, or explain in a declaration (a) why no revisions to the cold weather preparedness plan are appropriate, and (b) that no further corrective actions will be taken. The standard drafting team should specify the specific timing for the CAP to be developed and implemented after the outage, derate, or failure to start, but the CAP should be developed as quickly as possible, and be completed by no later than the beginning of the next winter season.

The Key Recommendation from the Joint Inquiry Report recommends a Reliability Standard that requires GOs to develop a Corrective Action Plan for generating units that experience outages, failures to starts, or derates due to freezing. The Joint Inquiry Report identifies that most of the outages and derates in the February 2021 event were due to freezing of instrumentation, transmitters, sensing lines, or wind turbine blades (p 166 in the Joint Inquiry Report). As such, the 2021-07 DT followed the Joint Inquiry Report recommendation to require a Corrective Action Plan when the apparent cause of the event is freezing of equipment or impacts of freezing precipitation (e.g., sleet, snow, ice, or freezing rain) on equipment. The 2021-07 DT felt that it was important to clearly call out freezing precipitation as these events were included in the outages and derates that identified as freezing in the Joint Inquiry Report. Furthermore, Key Recommendation 1c of the report requires GOs to account for the effect of precipitation. The 2021-07 DT has developed parameters around these events to clarify a reasonable baseline of what level of derate qualifies as an event, and provide additional language to identify what constitutes a start-up failure. With the additional clarifications, the 2021-07 DT determined that the standard would benefit from a defined term, to clearly and efficiently state what constitutes an event. The result is a new defined term, Generator Cold Weather Reliability Event, that defines the circumstances for which a Corrective Action Plan is required (i.e., when a freezing event affects the equipment within the control of the GO). The defined term will make the standard easier to understand and implement by providing clear and reasonable factors to determine whether the impact of an event requires mitigation. The 2021-07 DT is

using the definition of apparent as defined in the Webster's dictionary as "clear or manifest to the understanding".

Note that the 2024-03 DT provided additional language to alleviate concerns regarding the administrative nature of developing Corrective Action Plans specifically for similar noted issues occurring at one or more locations (e.g., freezing precipitation on wind turbines). Care should be taken if updating existing Corrective Action Plans for additional units especially in terms of effectively capturing the actions and timetables applicable to the additional units.

The Corrective Action Plan requirement applies to any forced outage due to freezing, regardless of duration. Derates, which are short lived (specified as four hours by the 2021-07 DT) or of small capacity impact (specified as less than 20 MW by the 2021-07 DT, which roughly corresponds with the threshold for Bulk Electric System (BES) impacting generation units), are excluded from the Corrective Action Plan requirement to limit the administrative burden to GOs for events that are minimally impacting to the BES. Also excluded are proactive operational actions to limit the potential of forced outages or derates. It should be noted that nothing in this standard prevents a GO from taking its own corrective actions resulting from such events. Startup failures for conventional generation are defined using the Generating Availability Data System (GADS) definition with the removal of "following an outage or reserve shutdown", since reserve shutdown is defined differently by NERC in GADS than it is by some of the Regional Transmission Organizations (RTOs) and Independent System Operators (ISOs). From the GADS data reporting instructions, the startup period for each unit is determined by the operating company. It is unique for each unit and may depend on the condition of the unit at the time of startup (cold, warm, or hot). A typical unit startup occurs in three phases: warm up, synchronization, and ramp up. NERC defines a startup period to begin with the command to start and end when the unit is synchronized. A startup failure begins when a problem, preventing the unit from synchronizing, occurs. The startup failure ends when the unit is synchronized, another startup failure occurs, or the unit enters another permissible state.

The 2021-07 DT determined that Corrective Action Plans will be required for any freezing event that occurs at temperatures above the generator site's ECWT. By using the site's ECWT, as opposed to the generator unit minimum temperature as defined by the GO in Requirement R1 Part 1.2.2 as the threshold, this achieves the following:

- Provides a consistent basis for the temperature at which CAPS are required for all GOs
- Provides a consistent basis for when Corrective Action Plans are required for all generation types
- Provides a consistent basis for when Corrective Action Plans are required regardless of the level of effort that GOs may have applied to-date winterizing their generators such that they can operate to the ECWT that their sites will reasonably experience
- Removes any incentive (perceived or real) to not further winterize GOs generating sites to meet the ECWT at the GO site by not providing a window where one site might not be subject to the Corrective Action Plan requirement while sites in the same vicinity experiencing the same temperatures are subject to this requirement

- Removes any disincentive for GOs to design the units to operate well below the ECWT for a site by not requiring them to perform Corrective Action Plans while sites in the same vicinity experiencing the same temperatures are subject to this requirement

Generator Cold Weather Constraint

Any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components. Freeze protection measures are not intended to be limited to optimum practices, methods, or technologies, but are also intended to include practices, methods, or technologies that would be expected to result in improved generating unit performance during cold temperatures.

The 2024-03 DT reviewed the material from the June 2024 Order when determining how best to update the Generator Cold Weather Constraint definition. The 2024-03 DT relied upon industry and FERC guidance as a basis for updating the definition language and the process captured in Attachment 1 of EOP-012-3. The 2024-03 DT also ensured that constraint language would be fully captured within the Standard itself through Attachment 1. Based on comments received during the ROP 321 comment period, additional revisions were made to clarify the scope of freeze protection measures that may be precluded by a constraint (i.e. not just optimum solutions, but other solutions expected to improve performance).

The 2024-03 DT felt that an Attachment that included specific language further explaining Generator Cold Weather Constraints with discrete known Generator Cold Weather Constraints and other case-by-case Generator Cold Weather Constraints meets the FERC (and industry) expectations to provide unambiguous, objective, and auditable language. The 2024-03 DT discussed providing clarity with examples knowing that additional instances or conditions that may be considered a Generator Cold Weather Constraint may exist.

Per the FERC Order, NERC staff are responsible to provide a process describing the receipt, evaluation, approval (as needed), and validation of Generator Cold Weather Constraints. This process is captured in the EOP-012-3 Generator Cold Weather CAP Extension and Constraint Process ("NERC Process") document.

Attachment 1 contains a non-comprehensive list of known Generator Cold Weather Constraints as well as a list of situations, circumstances, and criteria that may constitute a Generator Cold Weather Constraint. The GO **must** submit all Generator Cold Weather Constraints to the Compliance Enforcement Authority (CEA) for approval, regardless of which category it might fall into.

Once a declaration is approved by the CEA, it is considered valid. It is the GO's responsibility to document, in the Generator Cold Weather Constraint declaration, the circumstances and reasons why the modification needed to address the freeze protection measure(s) is not being implemented. A Generator Cold Weather Constraint declaration, that no further corrective actions will be taken, is expected to be used sparingly.

The 2024-03 DT is intentionally leaving room for additional instances of Generator Cold Weather Constraints as it would be impossible to foresee every potential circumstance that could possibly necessitate a review of potential freeze protection technologies across the breadth of the United States and Canada and the breadth of generating unit types and ages that fall under this Standard. Furthermore, the 2024-03 DT wants to ensure the Standard language supports the adoption of new freeze protection measure practices, methods, or technologies while not immediately requiring a new freeze protection measure practice, method, or technology to be implemented industry-wide when a leading utility pilots a novel approach, as this would be a disincentive to utilities piloting new technologies. The 2024-03 DT encourages additional studying and implementation of freeze protection measures to remove Generator Cold Weather Constraints as appropriate over time.

In the June 2024 Order, there was a directive to change the frequency of Generator Cold Weather Constraint reviews to facilitate consideration of new freeze protection measure technologies to reduce the risk resulting from the need for a Generator Cold Weather Constraint. That change is captured in Requirement R9 discussed later in this Technical Rationale document.

Facilities

After reviewing the reference material and the efforts of the 2021-07 DT, the 2024-03 DT determined that EOP-012-3 should continue to apply to all BES generating units in order to ensure consistency in extreme cold weather preparedness. The Applicability section first defines "generating unit" as a BES resource. The NERC Glossary of Terms provides the foundation for what BES resources are included in the definition (see Inclusions I2 through I4). Additionally, Blackstart Resources are also specifically declared subject to the winterization requirements. Such Blackstart Resources, consistent with the NERC Glossary of Terms, are those units designated in the Transmission Operator's (TOP) restoration plans. Proposed EOP-012-3 clarifies which Facilities and their Generator Cold Weather Critical Components are subject to implementing freeze protection measures through specific language in Requirements R2 and R3. The 2024-03 DT briefly discussed GO Category 2 Inverter-Based Resource (IBR) applicability to EOP-012-3 but it was noted the applicability is under review as part of the Registration of IBR Work Plan so no changes were presented.

Rationale for Requirement R1

The Project 2024-03's Technical Rationale language for Requirement R1 did not substantially change from 2021-07 DT language and, as such, use of DT below is referencing 2021-07 DT. Much of the criteria of R1 is carried over from the previously approved EOP-011 Standard and requires the GO to document several cold weather performance parameters for the unit. This information is valuable and must be shared with other entities per their data specifications. For Requirement R1 Part 1.1, the GO is required to calculate the Extreme Cold Weather Temperature (ECWT) for each unit using a reliable source of data (See the supporting document "Calculating Extreme Cold Weather Temperature"). The DT believes that the GO is in the best position to select the most representative weather information relative to its generating unit. The ECWT will be updated if a new lower ECWT is determined under the periodic review requirement of R1. Defining the operating limitations in Requirement R1 Part 1.2.1 will make affected personnel more aware of unit capabilities and constraints as well as systems and practices that may be necessary to ensure reliability in cold weather, particularly when alternative fuels are involved. In addition, the unit minimum temperature identified in Requirement R1 Part 1.2.2 is used to support demonstrating compliance with Requirement R3 for existing units. The DT chose one hour of historical operating data recognizing there is extremely limited historical operating data available for a unit below their ECWT. This was not to infer the DT expects that existing generation will only reliably operate for one hour during an extreme cold weather event. The information contained within Requirement R1 Part 1.2 is required to be requested by the BAs in TOP-003 to make sure they have the most accurate unit performance information possible for their reliability analysis during the winter season. It is critical, especially if a Corrective Action Plan, extension request for a Corrective Action Plan, or a Generator Cold Weather Constraint declaration is in effect, that the GO keep Requirement R1 Part 1.2 information updated with those entities requiring said information. The 2024-03 DT did not add a notification Requirement to EOP-012-3 as TOP-003 and IRO-010 obligate the applicable entities (Balancing Authority (BA), Reliability Coordinator (RC), and Transmission Operator (TOP)) to have "*Provisions for notification of BES generating unit(s) during local*

forecasted cold weather to include" Requirement R1 Part 1.2 information. BAs, RCs, and TOPs should have already reviewed their data specifications with regards to EOP-012. The flexibility that industry has required in the determination of data specifications were limited by industry approved Standard language regarding cold weather data and attributes. BAs, RCs, and TOPs should ensure complete coverage and timeliness of Requirement R1 Part 1.2 data submission within their data specifications especially during local forecasted cold weather.

It is recognized that the determination of a single unit minimum temperature is of limited value if applied without consideration of the other ambient conditions under which it was determined, that is, wind and precipitation. Consideration of wind and precipitation, along with the minimum temperature, provides a greater understanding of the potential generating unit capability for cold weather resource planning. The Standard requires that the GO include wind and precipitation data with their generating unit minimum temperature data when the data is available. The impact of deviations from this known temperature/wind/precipitation stated point are expected to be evaluated qualitatively. For example, if the historical minimum temperature occurred at low wind and dry conditions, and actual future cold weather event expected conditions are high winds with precipitation, planning personnel will recognize that a specific unit may not achieve the minimum temperature and can arrange for additional resources. The opposite also applies, i.e., if a design minimum temperature assumes some level of wind and precipitation and actual cold weather expectations are for low wind and dry conditions, planning personnel will recognize that there is increased likelihood that a generation resource may continue to be available below its minimum temperature. If no information about wind or precipitation is known, wind and precipitation are assumed to be zero at the minimum temperature until further information is obtained. The 2024-03 DT did provide updated language within the "Defined Terms" section of this Technical Rationale document to capture concerns regarding ECWT data availability.

Rationale for Requirement R2

The Joint Inquiry Report Key Recommendation 1f referenced recommendation 12 of the 2011 report[8] suggesting that consideration should be given to designing all new generation plants and designing modifications to existing plants (unless committed solely for summer peaking purposes) to be able to perform at the lowest recorded ambient temperature for the nearest location for which historical weather data is available.

In developing the original version of the EOP-012 Reliability Standard, Reliability Standard EOP-012-1, the Project 2021-07 DT determined to impose different cold weather capability requirements for new generation compared to existing generation. Consistent with Key Recommendation 1f of the February 2021 Event Report, GOs would be required to design new units to operate to a specified ambient temperature (the ECWT) and weather conditions for the location, accounting for the cooling effects of wind. Due to the difficulty of performing the same level of design analysis on existing generation as on

8 https://www.nerc.com/pa/rrm/ea/February%202011%20Southwest%20Cold%20Weather%20Event/SW_Cold_Weather_Event_Final.pdf

new generation, the high threshold of the ECWT, and the expected availability of historical data to support sustained operations at that ECWT, the Project 2021-07 DT determined to impose less stringent requirements for retrofitting existing generating units. The Project 2021-07 DT initially specified the "effective date of the requirement," which would be determined in accordance with the EOP-012-1 Implementation Plan, as establishing which set of generators would be "grandfathered" and subject to the less stringent requirements, and which generators would be subject to the more stringent requirements for new generation.

The 2021-07 DT chose 12 hours of continuous operation because it is a typical length of the nighttime in winter in most regions of the US and Canada and typically include the hours with the coldest experienced temperatures. The 2021-07 DT was of the opinion that tying the requirement to the 12-hour period would provide a reasonable level of reliability during a cold weather event. The 2021-07 DT chose a concurrent sustained 20 mph wind speed after an evaluation using the wind chill formula developed by the NWS in the United States. Though wind chill temperature is not an exact science, it is widely understood to reflect the **non-linear increased rate of convective heat loss due to air moving at different velocities**. Commonly available charts show wind chill temperatures as a function of actual air temperature at various wind speeds. Approximately 2/3 of the wind chill temperature drop between 0–60 mph is achieved at 20 mph. Using the NWS chart, this holds true for still air temperatures starting at 40ºF and dropping in 20-degree increments to -40°F. Further, 20 mph is a wind speed commonly experienced across the ERO and yet appropriately higher than the approximate average wind speeds in the United States and Canada, 6-12 mph and 8-11 mph respectively. GOs may apply a wind chill calculation in determining their ability to meet the criteria in Requirement R2. It should be noted that solar and battery OEMs provide little guidance on their facilities capability to perform in cold weather and wind combined. Depending on how a GO approaches this, the effect of wind on generating units may play a large part in how a Generator Cold Weather Constraint may be declared. GOs should consider that wind concurrent with cold temperatures will decrease the amount of time for a unit's equipment (e.g., sensing lines, hydraulics) to reach the ambient temperature. While this may not be readily apparent in all cases, operational history of operating at a certain temperature may not equate (in terms of capability or duration of operation) to operating at that same temperature with a 20 mph (32 km/h) wind speed. Providing freeze protection measures, such as tarps or temporary wind block structures, may support the ability to operate longer during extreme cold weather. Each of these three probabilistically infrequent conditions (the ECWT, a steady 20 mph (32 km/h) wind, and a duration of 12 continuous hours at these conditions) is, in and of itself, conservative. When they have their effects combined, it results in a requirement that will significantly contribute to BES reliability during extreme cold weather conditions.

In developing Reliability Standard EOP-012-2 and a shorter Implementation Plan to meet the directives of the FERC February 2023 Order, the Project 2021-07 determined to replace "effective date of this requirement" with a date certain, October 1, 2027. In establishing this date, the 2021-07 DT considered the original proposed Implementation Plan for Reliability Standard EOP-012-1 which would have had this requirement effective April 1, 2028, FERC's directives to shorten this plan as it related to existing generation, the need to ensure generation is prepared for cold weather, as well as the fact that new generation coming online prior to October 1, 2027 is likely to be significantly advanced past the design phase when incorporating measures to provide capability in sustained wind conditions would be most

cost effective and reasonable. Reliability Standard EOP-012-2 introduced the option for owners of new generating units to develop a Corrective Action Plan (removed in EOP-012-3 efforts), in the event they could not meet the more stringent requirements for new generation upon entering commercial operation on or after October 1, 2027.

In the June 2024 Order (paragraph 72), FERC directed NERC to modify EOP-012-2 to address Corrective Action Plans for new generating units. The Commission stated that, while it was persuaded by NERC's rationale that there needs to be allowances made for units that are well into their construction phase to complete corrective action plans for elements already designed, it was concerned that Reliability Standard EOP-012-2 did not clearly differentiate between projects in an advanced stage of construction and those in a lesser phase of construction. The Commission found that "generators that are commercially operational after October 1, 2027, should have freeze protection measures either designed into their generating systems, or, if a corrective action plan is needed, then it should be completed by the time that such generating units go into commercial operation." Based on this finding, the Commission directed NERC to revise the EOP-012 standard "to clarify that any Requirement R2 corrective action plans must be completed prior to the generating unit's commercial operation date."

The Project 2024-03 DT considered several options to both address the FERC directive and account for the concern that certain generators may be too far along in the construction phase to make changes to meet the more stringent criteria readily. These options included extending the "grandfathering" date past October 1, 2027 and redefining "commercial operation" to a less specific phrase, such as "in operation". However, the Project 2024-03 DT determined that maintaining the October 1, 2027 date as the "grandfathering" date was important in the interest of raising the bar for reliability in future cold weather seasons. It did not identify any compelling reason to change either that date or the existing measure of "commercial operation" from the previous versions of the standard.

Earlier drafts of the EOP-012-3 standard included different requirements depending on when the generating unit was designed and when it entered commercial operation. It was thought that units that were coming online the first winter of the new requirements (winter 2027-2028), but that were designed prior to June 2023, would be significantly far along in development and construction, and this represented a reasonable demarcation point to allow additional time to implement required capability in accordance with a short -term Corrective Action Plan.

However, comments received during the final comment period indicated several flaws with this approach, including concerns about the potential dates and applicability in non-U.S. jurisdictions. Therefore, this issue is instead addressed in the implementation plan where the scope and applicability can be stated more plainly.

Thus, in the final draft of proposed EOP-012-3 Requirement R2, new generation entering commercial operation on or after October 1, 2027 will either need to: (1) meet the more stringent freeze protection measures called for new generation; or (2) declare a constraint that prevents them from doing so in accordance with Requirement R8. As concerns were raised about requiring Corrective Action Plans of GOs before they may be formally subject to compliance with standards, there is no requirement for GOs to

complete Corrective Action Plans ahead of entering commercial operation in Requirement R2. This is consistent with the underlying intent of the June 2024 Order and more closely resembles the original EOP-012-1 requirements for new generation.

In non-U.S. jurisdictions, entities will use the "grandfathering" date established by the Applicable Governmental Authority, if that is not October 1, 2027.

Rationale for Phased-in Compliance Date for Requirement R2 in Implementation Plan

As noted above, a concern was identified in earlier phases of the development of EOP-012-3 regarding how to account for new generating units that may be too far along in their construction phase to readily implement corrective action plans prior to entering commercial operation the first winter season those requirements would be in effect in the United States (winter 2027-2028).

Under the Implementation Plan, GOs of certain new generating units would have the option to enter commercial operation and have additional time to comply with the more stringent requirements of R2, if a constraint would not apply. For this phased-in compliance date to apply, the GO must have first contractually committed to the design criteria for the unit before June 29, 2023, and the unit must first enter commercial operation between October 1, 2027 and March 31, 2028 (inclusive of the start and end dates). This reflects consideration of NERC's original proposed effective date of EOP-012-1 requirements for new generation.[9]

The June 29, 2023 date, included in the Implementation Plan, represents the date by which the Project 2024-03 DT concluded that GOs would have had reasonable certainty regarding the freeze protection requirements for new generation under the EOP-012 standard and should have begun including them in their design criteria for new generating units. FERC issued its order approving EOP-012-1 and the definition of Extreme Cold Weather Temperature in February 2023; however, the Project 2024-03 DT considered comments stating that there was still some regulatory uncertainty past this time, as several entities had filed for rehearing on various aspects of the standard. On June 29, 2023, FERC issued an order addressing arguments raised on rehearing, resolving any remaining uncertainty regarding the standard to which new generation would be expected to perform in the future (see FERC decision).

It is important to note that this is simply an additional *option* for such GO, intended to enable them to enter commercial operation sooner and begin supplying needed power to the grid faster than if they were required to delay their commercial operation dates to provide the required capability.

In summary, the implementation plan for Requirement R2 specifies that, for certain entities that undertook efforts to finalize their designs before June 29, 2023 before the scope of new requirements became clear, those entities do not have to achieve the required capability during their first winter in

9 Under NERC's original proposed implementation plan for EOP-012-1, this requirement for new generation would have become effective April 1, 2028. In its February 2023 Order, FERC directed NERC to modify the proposed EOP-012-1 implementation plan to reflect the urgency of the need to implement the standard, including to shorten the 60-month implementation plan for existing generating units. Reliability Standard EOP-012-2 shortened these dates and established October 1, 2027 as the "grandfathering" date for new generation.

commercial operation, and instead have until April 1, 2028. (If a constraint is applicable, the entity must submit that constraint within 15 days of entering commercial operation). Entities would be expected to demonstrate that they are eligible to use the phased-in timeline, such as through dated contracts showing that it contractually committed to design criteria for the unit in question before that time. It was considered that entities would generally retain such contracts for their units under construction in the normal course of business and this would impose no additional burden.

For all new generating units entering commercial operation on or after October 1, 2027 that do not meet the above exception, those units must either implement the more stringent capability required in Requirement R2 by their commercial operation date or declare a Generator Cold Weather Constraint. **It is recognized that such generating units may need to delay their originally planned commercial operation date if they do not have the required capability and a Generator Cold Weather Constraint would not apply**. *See* June 2024 Order at P 72.

Rationale for Requirement R3

The 2021-07 Drafting Team created a requirement for existing generating units, as defined in Requirement R3, to be able to operate at their ECWT. Many existing generating units have already demonstrated this capability. An early FERC order on EOP-012-1 rejected a one-hour timing requirement, consequently the 2021-07 DT chose to forego any specific time requirement in Requirement R3. If a generating unit cannot meet the requirements of Requirement R3, it is required to develop a CAP to add new freeze protection measures or modify existing freeze protection measures to be capable of operations at the ECWT (as calculated in Requirement 1).

Rationale for Requirement R4

General Considerations

Requirement R4 requires GOs to develop and maintain cold weather preparedness plans for their unit(s) and describes the information and documentation required in such plans. It is an expansion of the cold weather preparedness plan required under Requirement R7 of EOP-011-2 and is intended to be used and reviewed regularly by the GO. Originally, Requirement R4 Part 4.5 required the GO to annually inspect and perform necessary maintenance of freeze protection measures. The 2024-03 DT added some clarifying language to ensure that annual inspection and maintenance of freeze protection measures is applied specifically to Generator Cold Weather Critical Components. While other freeze protection measures may be applied to equipment by the GO, the freeze protection measures included in the cold weather preparedness plan with annual inspections and maintenance are expected to be those applied to Generator Cold Weather Critical Components. Working in concert with other parts of EOP-012-3, including but not limited to Requirements R1, R5, R6, and R7, the substantive elements of the cold weather preparedness plan will be subject to review requirements, updated as necessary, and the responsible party (GO or GOP) is required to annually train personnel on the cold weather preparedness plan requirements.

Requirement R4 Part 4.1

In Requirement R4 Part 4.1, the GO is required to include in the cold weather preparedness plan the lowest ECWT, as calculated pursuant to Requirement R1, for each unit using reliable source(s) of data. The 2021-07 DT believed that the GO is in the best position to select the most representative weather information relative to its generating unit. The cold weather preparedness plan will be updated if a new lower ECWT is calculated under the Requirement R1 periodic review language.

Requirement R4 Part 4.2

Requirement R4 Part 4.2 is intended to capture, within the cold weather preparedness plan, the information being developed pursuant to Requirement R1 Part 1.2, which is carried over from the previously approved EOP-011 Standard and requires the GO to document several cold weather performance parameters for the unit. This information is valuable, and in some cases, must be shared with other entities consistent with the data specification requirements contained in TOP-003 and IRO-010. A requirement for the GO to document this information within the cold weather preparedness plan ensures the information is readily available and documented when the GO responds to a data specification. It should be noted that if a Corrective Action Plan extension request is approved, the underlying generator cold weather data, as called out in Requirement R1 Part 1.2, should be correctly identified by the GO and provided to the RCs, BAs, and TOPs as requested. The June 2024 Order mentions this in Paragraph 3. The 2024-03 DT believes that the data specification Reliability Standards applicable to RCs, BAs, and TOPs (e.g., IRO-010 and TOP-003) require the entities to request the information and the GO is therefore obligated to provide the most current version of the relevant information within a Corrective Action Plan. The 2024-03 DT did not believe a notification Requirement was needed in EOP-012-3 in addition to those already existing in the data specification Reliability Standards. The 2024-03 DT encourages parties to work together to ensure the most accurate and up-to-date information is provided, especially when conditions increase risk to reliable operations. See the Technical Rationale for Requirement R1 for substantive rationale regarding the operating limitations and generating unit minimum temperatures documented in the cold weather preparedness plan.

Requirement R4 Part 4.3

In Requirement R4 Part 4.3, the GO identifies the Generator Cold Weather Critical Components to help inform their decision on where to implement appropriate freeze protection measures. The NERC *Reliability Guideline, Generating Unit Winter Weather Readiness – Current Industry Practices*[10], presents a suggested list of components that GOs may choose to utilize when developing their own Generator Cold Weather Critical Component inventory. The GO shall develop and maintain a list of Generator Cold Weather Critical Components for each unit.

Requirement R4 Part 4.4

Requirement R4 Part 4.4 requires GOs to document the freeze protection measures implemented on Generator Cold Weather Critical Components. These freeze protection measures should include those to reduce the cooling effects of wind. Requirement R4 does not require GOs to install new freeze protection measures to reduce the cooling effects of wind, but rather to identify freeze protection measures for

Generator Cold Weather Critical Components that will protect against heat loss and the effect of freezing precipitation, where applicable, and document those measures (e.g., water-resistant insulation, protective shielding, insulated boxes, etc.). These measures could include temporary measures as well, such as wind breaks, but there is no expectation for entities to list all climate-controlled areas as freeze protection measures. Specifically, the freeze protection measures applied to Generator Cold Weather Critical Components must be captured in the cold weather preparedness plan.

Requirement R4 Part 4.5

Requirement R4 Part 4.5 is largely carried over from the previously approved EOP-011 Standard and requires annual inspection and maintenance of the freeze protection measures applied to Generator Cold Weather Critical Components identified in the cold weather preparedness plan. The 2024-03 DT added clarifying language to emphasize the need to effectively mitigate risk on the Generator Cold Weather Critical Components. This Requirement ensures these freeze protection measures will be ready and serviceable when needed.

Rationale for Requirement R5

The 2024-03 DT noted that there could be a combination of operations and maintenance personnel that require training, so minor adjustments were made to that extent. Additionally, the personnel may not be physically located at the generator site depending on how an entity implements their cold weather preparedness plan(s).

Rationale for Requirement R6

Key Recommendation 1d: To require Generator Owners that experience outages, failures to start, or derates due to freezing to review the generating unit's outage, failure to start, or derate and develop and implement a corrective action plan (CAP) for the identified equipment and evaluate whether the CAP applies to similar equipment for its other generating units. Based on the evaluation, the Generator Owner will either revise its cold weather preparedness plan to apply the CAP to the similar equipment or explain in a declaration (a) why no revisions to the cold weather preparedness plan are appropriate, and (b) that no further corrective actions will be taken. The standard drafting team should specify the specific timing for the CAP to be developed and implemented after the outage, derate, or failure to start, but the CAP should be developed as quickly as possible and be completed by no later than the beginning of the next winter season.

The Key Recommendation from the Joint Inquiry Report recommended a Reliability Standard that requires GOs to develop a Corrective Action Plan for generating units that experience outages, failures to starts, or derates due to freezing. The Joint Inquiry Report identifies that most of the outages and derates in the February 2021 event were due to freezing of instrumentation, transmitters, sensing lines, or wind turbine blades (p 166 in the Joint Inquiry Report). As such, the 2021-07 DT followed the Joint Inquiry Report recommendation to require a Corrective Action Plan when the apparent cause of the event is freezing.

The 2021-07 DT developed parameters around these events to clarify a reasonable baseline of what level of derate qualified as an event and provide additional language to identify what constitutes a start-up failure. With the additional clarifications, the 2021-07 DT determined that the Reliability Standard would benefit from a defined term, to clearly and efficiently state what constitutes an event. The result was a defined term, Generator Cold Weather Reliability Event, that describes the circumstances for which a Corrective Action Plan is required (i.e., when a freezing event affects the equipment within the control of the GO). The defined term made the Reliability Standard easier to understand and implement by providing clear and reasonable factors to determine whether the impact of an event requires mitigation. However, because of the June 2024 Order, the 2024-03 DT updated Requirement R6 to provide clearer timeline obligations for those units that suffer a Cold Weather Reliability Event. In general, the 2024-03 DT understands that if a Generator Cold Weather Reliability Event occurs, GOs will remediate the issue as soon as possible.

General Considerations for All Corrective Action Plans

To simplify the proposed requirements related to creating a Corrective Action Plan, the 2021-07 DT used the NERC Definition of a Corrective Action Plan. The Corrective Action Plan definition reads "A list of actions and an associated timetable for implementation to remedy a specific problem." As written, the definition requires two parts for a document to qualify as a Corrective Action Plan, i.e., a list of items to be addressed and a timeline for completion. A Corrective Action Plan without both a list of actions and the timeline to implement is not complete. The 2024-03 DT provided additional language for Corrective Action Plans to clarify expectations for those Corrective Action Plans created as a result of a Generator Cold Weather Reliability Event and other Corrective Action Plans referenced throughout the Requirement language. The resulting language kept the underlying structure developed during previous Projects but clarified and added information as needed to meet the June 2024 Order.

The Corrective Action Plan requirement applies to Generator Cold Weather Reliability Events as well as other instances of required actions to support reliable operations within the EOP-012-3 Standard Requirements. It should be noted that nothing in this Standard prevents a GO from taking its own corrective actions resulting from events that do not meet the criteria of a Generator Cold Weather Reliability Event. Startup failure criteria were based on the GADS definition with the removal of "following an outage or reserve shutdown", since the definition of reserve shutdown is different in GADS than it is in some of the Regional Transmission Organizations (RTOs).

Requirement R6 requires the GO to develop, implement, and complete a Corrective Action Plan prior to the first day of December following a Generator Cold Weather Reliability Event. Note that the 2024-03 DT, Standards Committee in the exercise of its responsibility under Section 321 of the NERC Rules of Procedure and NERC staff, considered early occurrences (e.g., September, October, or November) of Generator Cold Weather Reliability Events and provided a footnote to allow remedial activities to be completed by December 1 of the following calendar year. The December 1 date was chosen based on the guidance in the June 2024 Order and the urgency stated within the June 2024 Order regarding this risk. A number of commenters in the final posting suggested that this timeline instead be fixed, such as 12 months, to provide a uniform timeline for implementation regardless of when the event occurred. Such suggestions were considered but declined, as they were not thought to address the risk with the

timeliness identified in the FERC order, and further, corrective actions are likely to be implemented in the fall as part of winter preparations are typically performed or outages for more extensive efforts can be secured.

Requirement R6 would allow GOs to review multiple events holistically following a winter season, if that scenario occurs, and create one Corrective Action Plan for components with common failure causes. Care should be taken when developing a multi-unit or multi-event Corrective Action Plan to ensure it meets the Corrective Action Plan criteria for each unit (e.g., actions and timetables may be different.)

The 2021-07 DT determined that Corrective Action Plans would be required for any freezing event that occurs at temperatures at or above the site's ECWT in accordance with the definition of a Generator Cold Weather Reliability Event. Using the site's ECWT as the threshold, as opposed to the generator unit minimum temperature as determined by the GO, achieves the following:

- Provides a consistent basis for the temperature at which Corrective Action Plans are required for all GOs
- Provides a consistent basis for when Corrective Action Plans are required for all generation types
- Provides a consistent basis for when Corrective Action Plans are required regardless of the level of effort that GOs may have applied to-date winterizing their generators such that they can operate to the ECWT that their sites will reasonably experience
- Removes any incentive (perceived or real) to not further winterize GOs sites to meet the ECWT at the GO site by not providing a window where one site might not be subject to the Corrective Action Plans requirement while sites in the same vicinity experiencing the same temperatures are subject to this requirement
- Removes any disincentive for GOs to design the units to operate well below the ECWT for a site by not requiring them to perform Corrective Action Plans while sites in the same vicinity experiencing the same temperatures are subject to this requirement

The 2024-03 DT provided clarifying language to have Corrective Action Plans developed in response to Generator Cold Weather Reliability Events developed and completed by the first day of December of the winter season following the Generator Cold Weather Reliability Event. Allowances for events which occur in September, October, or November were provided with the expectation that more transient fixes occurring after a Generator Cold Weather Reliability Event would be applied quickly but allowing a reasonable time horizon for compliance with this Requirement (i.e., prior to December 1 of the following calendar year). A Corrective Action Plan triggered by a Generator Cold Weather Reliability Event and for which the apparent cause is the failure of relatively simple existing piece of freeze protection equipment, the scope of the Corrective Action Plan may be documented after the fact. Such prompt repairs may be completed before creation of the Corrective Action Plan, and the GO may complete the implementation of the Corrective Action Plan simply by evaluating the requirements of R6 and documenting how and when the repair work was completed. An example of this circumstance would be a freezing event caused

by a single heat trace circuit failure which would have been sufficient to prevent the event had it not failed.

The June 2024 Order also directed changes affecting the application of a Generator Cold Weather Reliability Event Corrective Action Plans to other units within a GO's fleet. The 2024-03 DT added clarifying language to provide guidance on what the extent of condition (i.e., the review of other generating units) should encompass to help alleviate concerns raised by the industry during the comment and ballot period. Each GO should already know, per Requirement R4, the freeze protection measures on Generator Cold Weather Critical Components. The GOs also have the responsibility, per Requirement R4, to annually maintain and inspect the freeze protection measures on Generator Cold Weather Critical Components. Effectively those Requirements would support quick identification of same or similar equipment susceptible to freezing.

The 2024-03 DT, and later the Standards Committee in the exercise of its responsibility under Section 321 of the NERC Rules of Procedure, established a 12-calendar month window from the time of the originating Generator Cold Weather Reliability Event to complete its fleet-wide review for similar vulnerabilities and develop or update such a Corrective Action plan to address them. In response to multiple stakeholder comments, the Standards Committee provided a 24-calendar to no later than 36-calendar month window (initiated based on the date of the Generator Cold Weather Reliability Event) to implement corrective actions. GOs that complete their fleet-wide reviews sooner than the 12 months allowed would have a longer period of time overall to implement any required corrective actions, incentivizing prompt action to identify the extent of condition across a fleet. While the FERC directive suggesting a potentially longer staggered implementation was considered for more complex implementations, it was determined that developing specific requirements for staggering often presents many logistical challenges, and it may not promote an orderly and efficient implementation depending on the issue needing to be addressed. Allowing up to 36 calendar months total to complete corrective actions would allow GOs with larger fleets to accommodate any required changes. Industry experience with Winter Storms URI and Elliott suggests that the timelines are sufficient in general to mitigate reliability risks. However, a Corrective Action Plan extension may be requested if a particularly complex implementation issue arises requiring longer time to implement.

Entities should evaluate the issue with the freeze protection measure that may have initiated the Generator Cold Weather Reliability Event to see if the maintenance and inspection efforts need to be adjusted (at the unit that suffered the Generator Cold Weather Reliability Event as well as at other similar units with similar freeze protection measures applied to Generator Cold Weather Critical Component(s)).

The existence of a Corrective Action Plan should not discourage the GO from applying any other actions necessary and feasible to prepare a unit to perform at extreme cold weather temperatures during the Corrective Action Plan implementation period.

The 2024-03 DT also created language that allows for Corrective Action Plan extension requests using the NERC Process. ERO Enterprise staff developed the NERC Process that leveraged the current TPL-007 Corrective Action Plan extension process (See ERO Enterprise Periodic Data Submittal Schedule). While

TPL-007 has not been utilized extensively, the NERC Process is flexible enough to manage the expected submittals. The DT is not in control of updates to the NERC Process but the NERC staff have been engaged and responsive to industry concerns noted during the Standard development timeline. The NERC Process will allow a thorough review in a timely manner for any Corrective Action Plan extension requests including those that go beyond the 24 or 48 calendar month timetables. While there may be actions impacting the implementation and completion of Corrective Action Plans beyond the control of GOs (e.g., supply chain issues), the GOs should accelerate completion of corrective actions as much as possible to support reliable operations.

The 2024-03 DT updated language regarding Generator Cold Weather Constraints to clarify expectations. Please review Requirements R8 and R9 and Attachment 1 for further discussions of Generator Cold Weather Constraints.

In carrying out its responsibilities under Section 321 of the NERC Rules of Procedure, the Standards Committee determined to carry forward the general framework developed by the Project 2024-03 DT, with some modifications. First, to address stakeholder concerns about the lack of a clear deadline for implementing Corrective Action Plans, the Standards Committee added a deadline to develop Corrective Action Plans for units experiencing the Generator Cold Weather Reliability Event. This deadline would be the same as the date any required Corrective Action Plans for the units must be completed – by the first day of the first December following the event (or for September, October, and November events, the first day of the first December of the following calendar year). By adding this deadline, the Standards Committee intends to add clarity as to the latest date by which such Corrective Action Plans must be developed, while recognizing that the main reliability benefit will come from completing the corrective actions in an expeditious manner. As Corrective Action Plans contain important information to document causes and corrective actions that may inform future winter operations, there is still a reliability benefit to develop these Corrective Action Plans, even if any corrective actions in the Corrective Action Plan are completed in short order.

Rationale for Requirement R7

In EOP-012-2, R7 was expanded from EOP-012-1 to provide additional definition on the requirements to implement a Corrective Action Plan, and to meet the direction for this requirement set by the February 2023 FERC Order. One such direction was to define expectations on implementation timelines for Corrective Action Plans. Under EOP-012-2 R7, Corrective Action Plans were divided into two categories: 1) those which address existing freeze protection measure(s), and 2) those which require new equipment or freeze protection measure(s). The former category required completion of the Corrective Action Plan to remedy the cause(s) within 24 months, and the latter required completion of the Corrective Action Plan within 48 months. The 2021-07 DT modeled this timeline structure after similar Corrective Action Plan implementation requirements in TPL-007. These are maximum durations and entities are expected to work diligently to correct issues and take prompt actions to mitigate future issues as soon as practical. At the same time, the 2021-07 DT recognized that the following time-consuming activities make the 24 and 48 calendar months maximum timelines reasonable: scoping applicability to similar units, freeze

protection engineering and design, project development, budgeting processes, material supply lead times, outage scheduling, skilled labor availability, and startup/commissioning. However, the June 2024 Order established directives to clarify timelines and responsibilities associated with Corrective Action Plans. The 2024-03 DT chose to specifically remove Corrective Action Plan obligations for Generator Cold Weather Reliability Events and place those in Requirement R6. For Requirement 7, the 2024-03 DT provided clarifying language regarding existing and new freeze protection measures and the associated completion timelines. Language was provided for Corrective Action Plans that may include changes to existing freeze protection measures and addition of new freeze protection measures to help clarify expectations for completing the corrective actions. The Project 2024-03 DT discussed the adjectives "new" and "existing" freeze protection measures as it is used within the Requirements. If there is the failure of a freeze protection measure (e.g., heat trace) and that freeze protection measure is replaced with the same/similar/commonly used technology that is considered "existing". The change of a heat trace from 40 foot to 60 foot or change in the amperage capability of the heat trace is not a "new" freeze protection measure. A change in lightbulb wattage in an enclosure should not be considered "new". The industry did provide some examples of "new" freeze protection measures (i.e., new permanent structures or new technologies not already applied) that may take longer to implement depending upon the nature of the freeze protection measure. A wind block made of tarps and a wooden or steel frame should not be considered "new" and require 48 months to implement even if the site did not have a wind block already. Care should be exercised by GOs in the use of "new" and "existing" freeze protection measures and the resulting Corrective Action Plan timelines. Industry experience with Winter Storms URI and Elliott suggests that the shorter timelines are sufficient in general to mitigate reliability risks. Entities are expected to work diligently to correct issues and take prompt actions to mitigate future recurrence. The 2024-03 DT updated Parts 7.1.3. and 7.1.4 for completeness to ensure updates would be made to document needed changes to the cold weather preparedness plan(s) to eliminate recurrence of issue(s) identified in the Corrective Action Plan. In clarifying these timeframes, the 2024-03 DT considered the FERC directives.

Within the revised Requirement R7, the GO is required to implement the Corrective Action Plan within a timetable defined by the GO in the Corrective Action Plan but limited by maximum durations in Part 7.1. If the GO is unable to complete the Corrective Action Plan within the time limits in Part 7.1 the GO is required to request an extension for the Corrective Action Plan with justification per Part 7.2. GOs that are unable to complete the Corrective Action Plan without an extension or if an extension does not support implementation of a freeze protection measure are required under Part 7.3 to create a declaration of the Generator Cold Weather Constraint which shall be provided to the Compliance Enforcement Authority per Requirement R8. Further requirements for the Generator Cold Weather Constraints are provided under Requirements R8 and R9.

The 2024-03 DT also created language that allows for Corrective Action Plan extension requests using the NERC Process. ERO Enterprise staff developed the NERC Process that leveraged the current TPL-007 Corrective Action Plan extension process (See ERO Enterprise Periodic Data Submittal Schedule). The NERC Process will allow a thorough review in a timely manner for any Corrective Action Plan extension requests including those that go beyond the 24 or 48 calendar months. The 2024-03 DT utilized the

precedent set by TPL-007 to ensure the unique circumstances of each request will be considered while also avoiding potential compliance burdens which may not have a corresponding reliability benefit (e.g. specific timelines for submission and approval of extension requests). While there may be actions impacting the implementation and completion of Corrective Action Plans beyond the control of GOs (e.g., supply chain issues), the GOs should accelerate completion of corrective actions as much as possible to support reliable operations. It is expected that extension requests will be limited in nature. GOs will have to provide clear justifications with supporting materials within the extension request. Due diligence in ordering equipment, obtaining permits, etc., will be considered as part of the determination of whether a particular set of facts constitute circumstances beyond the control of the entity. Denials of extension requests will be minimized if GOs work diligently to correct issues and take prompt actions. Denial of an extension means the initial timelines for corrective actions must be met. As a result of comments received during the ROP 321 comment period, NERC staff updated the NERC Process. Several entities submitted comments emphasizing the need for consistency and transparency in Generator Cold Weather Constraint evaluations across the ERO Enterprise, or offering suggestions to improve the appeal process. These comments were shared with NERC Compliance Monitoring and Enforcement Program staff during the ROP 321 comment evaluation. NERC agreed that ensuring consistency and transparency in these determinations will be of the utmost importance. NERC has revised the draft EOP-012-3 Generator Cold Weather CAP Extension and Constraint Process to provide additional information on how this will be accomplished. NERC staff informed the Standards Committee that the ERO Enterprise is planning additional outreach efforts in the early implementation period to provide guidance to entities on the types of Generator Cold Weather Constraints that are and are not being validated. Guidance will include the types of documentation that would be most helpful to the entity and the ERO Enterprise to making these determinations in a timely manner.

The 2024-03 DT updated language regarding Generator Cold Weather Constraints to clarify expectations. Please review Requirements R8 and R9 for further discussions of Generator Cold Weather Constraints.

If one or more actions within a Corrective Action Plan fall under a Generator Cold Weather Constraint declaration, it is the intent of the DT that only those Generator Cold Weather Constraint affected actions would not be implemented as part of the Corrective Action Plan. The remaining corrective actions should be implemented per the timelines provided unless dependent upon the corrective action triggering the Generator Cold Weather Constraint declaration.

Rationale for Requirement R8

In the February 2023 FERC Order, the Commission expressed concern that a GO may make a Generator Cold Weather Constraint declaration without informing planning and operational entities (e.g., the BA) that are expecting the reliable operation of the generating unit to its ECWT. An additional concern was that the Generator Cold Weather Constraint declarations may be used by a functional entity as an opt-out of compliance with requirements set forth in the standards or in a corrective action plan. To mitigate the concern, the Commission directed NERC to work with Commission staff and submit a data collection and assessment plan that contains information related to GO constraint declarations and explanations

thereof. The 2021-07 DT expected that ERO Enterprise compliance staff will be responsible for reviewing declared Generator Cold Weather Constraints and assessing compliance with the Generator Cold Weather Constraint definition criteria in accordance with established processes. The June 2024 Order directives included more direct language that required NERC to receive, review, evaluate, and confirm the validity of each Generator Cold Weather Constraint in a timely manner. Additionally, the June 2024 Order directives required an increase in the frequency of reviews of Generator Cold Weather Constraints.

Matters regarding the specifics of such reviews are addressed in the EOP-012-3 Generator Cold Weather CAP Extension and Constraint Process, which is maintained separately from the standard as a compliance process. If a Corrective Action Plan extension request is denied by the CEA, then the GO may request a joint CEA/NERC review of the denial. The time to request a joint review was extended in the NERC Process based on comments received during the ROP 321 comment period.

The 2024-03 DT updated Requirement R8 to require the GO to submit, to the Compliance Enforcement Authority, a Generator Cold Weather Constraint in accordance with Attachment 1 under specific timelines. The ERO Enterprise staff have developed the EOP-012-3 Generator Cold Weather CAP Extension and Constraint Process ("NERC Process") that leveraged the current TPL-007 Corrective Action Plan extension process (See ERO Enterprise Periodic Data Submittal Schedule) as a foundation for the Generator Cold Weather Constraint process. The NERC Process will allow a thorough review in a timely manner for any Generator Cold Weather Constraint submitted. The 2024-03 DT created Attachment 1 to provide clear expectations on Generator Cold Weather Constraint conditions. Attachment 1 contains some known Generator Cold Weather Constraint conditions as well as examples of other case-by-case Generator Cold Weather Constraint conditions that may also be considered valid. To be clear, all Generator Cold Weather Constraint declarations require submittal per the NERC Process. The 2024-03 DT could not create an exhaustive list of Generator Cold Weather Constraint conditions but provided language that allows professional judgement to be utilized. The 2024-03 DT believes the NERC Process in conjunction with Requirement R8 and Attachment 1 effectively meets the FERC directive regarding receiving, reviewing, evaluating, and confirming the validity of Generator Cold Weather Constraints.

To address concerns about potential administrative burdens associated with repeated, known issues at generating unit(s) with a valid Generator Cold Weather Constraint, the Project 2024-03 DT developed Part 8.4. Part 8.4 provides that, in such a case, the GO will provide notice to the CEA. This helps maintain visibility over known reliability issues while reducing the administrative burdens associated with repeating requirements in this case.

The 2021-07 DT believed that Generator Cold Weather Constraint declarations would be the exception, but it is clear to the 2024-03 DT that certain conditions may exist (based on general weather patterns) that will increase the amount of Generator Cold Weather Constraint declarations and subsequent submittals. In anticipation of that scenario, and following the June 2024 Order, the 2024-03 DT considers the NERC Process a valuable tool to capture data that may help future understanding of the effectiveness of the ECWT. The February 2023 FERC Order and subsequent NERC filing require the collection of data to evaluate the effectiveness of the EOP-012-3 Reliability Standard.

Updated Generator Cold Weather Constraint declarations would also require an update to the operating limitations provided via data specifications to the entities overseeing reliability (e.g., BA, TOP, or RC). In this manner, information relevant to valid Generator Cold Weather Constraint declarations are made available to the planning and operational entities pursuant to their data collection authority contained in TOP-003 and IRO-010. BAs, RCs, and TOPs should ensure complete coverage and timeliness of cold weather-related data submission within their data specifications especially during local forecasted cold weather.

Rationale for Requirement R9

Based on multiple comments regarding Requirement R8, the FERC directive regarding periodicity of reviews, and what a GO should do if a Generator Cold Weather Constraint is determined to be no longer valid, the 2024-03 DT developed a separate new Requirement R9.

Initially EOP-012-1 required an annual review of Generator Cold Weather Constraints. That frequency of reviews was subsequently changed to five calendar years in EOP-012-2. The June 2024 Order directed that the review frequency be increased from the five-year periodicity. While GOs should perform a review and update any Generator Cold Weather Constraint declarations as needed, the 2024-03 DT has developed language requiring a review of validated Generator Cold Weather Constraints every 36 calendar months.

Initially, the Project 2024-03 proposed that reviews be conducted every 24 calendar months. There were multiple concerns raised about the 24 calendar month periodicity. Based on consideration of these concerns, the 2024-03 DT chose, and the Standards Committee, in carrying out its responsibilities under Section 321 of the NERC Rules of Procedure, determined to carry forward the decision, to extend it to 36 calendar months. Reliability Standard CIP-014, a Reliability Standard addressing another significant risk, is proposing a review every 36 calendar months. Based on information shared at the Technical Conference held on November 12, 2024, changes to some technologies that may affect Generator Cold Weather Constraints may take a significant amount of time (well in excess of 36 months) to become available. By shortening from the five calendar years, the 36 calendar month timeline provides a reasonable approach to meeting the Commission's directives without creating undue administrative burden to periodically monitor if Generator Cold Weather Constraints remain valid or if new technologies have become available that effectively obviate the originally validated Generator Cold Weather Constraint.

Part 9.1 addresses what a GO must do if it finds that a declared Generator Cold Weather Constraint is no longer valid. For example, a new technology exists that would address the freezing issue, and no other Generator Cold Weather Constraint criteria would apply. In that case, the GO must develop a Corrective Action Plan or update an existing Corrective Action Plan (if applicable), in accordance with the requirements for Corrective Action Plans in Requirement R7. This would include timetables specifying completion of the corrective actions in accordance with that requirement.

Attachment 1

In the development of Attachment 1, the 2024-03 DT started with a list of Generator Cold Weather Constraint examples developed by the 2021-07 DT in the EOP-012-2 Technical Rationale. The foundational scenarios were presented in a way that were supportive of efforts but based on comments received the 2024-03 DT felt inclusion in the Standard to be a more effective way of memorializing the scenarios. The 2024-03 DT chose to utilize a limited and discrete list of known Generator Cold Weather Constraints as well as a description of other case-by-case situational descriptions that may constitute Generator Cold Weather Constraints. All declared Generator Cold Weather Constraints must be confirmed as valid by the Compliance Enforcement Authority. Nevertheless, the limited and discrete list is intended to describe specific circumstances that, if met, would have a very high probability of being approved. The 2024-03 DT discussed providing clarity with examples (as noted by FERC Order Paragraph 47) knowing that additional instances or conditions that may be considered a Generator Cold Weather Constraint may exist.
Per the FERC Order, NERC staff are responsible to provide a process describing the receipt, evaluation, approval (as needed), and validation of Generator Cold Weather Constraints. This process is captured in the EOP-012-3 Generator Cold Weather CAP Extension and Constraint Process ("NERC Process") document.

Once a declaration is approved by the CEA it is considered valid. Changes to valid Generator Cold Weather Constraints must be re-submitted to the CEA to remain valid. Regardless of a Generator Cold Weather Constraint being of the "known" type, a GO is still required to submit known Generator Cold Weather Constraints for approval. There were some comments received during the ROP 321 comment period that suggested automatic or limited review of "known" Generator Cold Weather Constraints. No changes were made to the Standrad or the NERC Process as those did not support directives within the June 2024 Order.

The 2024-03 DT is intentionally leaving room for additional instances of Generator Cold Weather Constraints to be presented as it would be impossible to foresee every potential set of circumstances that could possibly constitute a constraint. Several conversations occurred during public meetings that were captured within Attachment 1. The determination to include specific examples of Generator Cold Weather Constraints really depended upon industry interaction on what prevalent and reasonable issues were being presented. Some issues, such as voiding equipment warranties, may initially be considered case-by-case until such time there are clear indications from the industry (or OEMs) that application of a specific freeze protection measure would violate a warranty. No specific examples were provided by industry to label voiding a warranty as a known Generator Cold Weather Constraint. Furthermore, the 2024-03 DT wants to ensure that the Standard language supports the development and adoption of new freeze protection measures, practices, methods, or technologies while not immediately requiring that the new freeze protection measures, practices, methods, or technologies be implemented industry-wide. The 2024-03 DT encourages additional study and implementation of freeze protection measures to remove Generator Cold Weather Constraints, as appropriate, over time.

The 2024-03 DT updated the definition of Generator Cold Weather Constraints to provide clarity as directed by FERC. Additional updates to the definition were provided based on comments received during the ROP 321 comment period. In addition to modifying the definition, the 2024-03 DT developed Attachment 1 which was updated during the ROP 321 comment period. Requirement R8 provides entities a clear understanding of what is expected when managing Generator Cold Weather Constraints and directly references use of Attachment 1. The DT broadly categorized Generator Cold Weather Constraints into two types; known and those that would be determined on a case-by-case basis.

The first of the known Generator Cold Weather Constraints, addressing low temperature operability of wind turbine towers, was debated at length in the 2024-03 DT meetings. Discussion among the Drafting Team, observers, and in the Technical Conference indicated a typical limit of -22°F for operation of wind turbines. This typical limit may apply specifically to heated areas or equipment within the nacelle and not be associated with other known ductile-to-brittle transition temperatures for specific mild steel alloys used in turbine towers. Nevertheless, unless a tower is constructed of Austenitic stainless steel or other face-centered cubic atomic structure materials, such a transition temperature generally will exist. The dynamic stresses of operating the wind turbine below such transition temperatures could imperil the structure itself. Anecdotally, it was noted that this limit would cause this Constraint to apply to a portion of the north-central United States and central Canada. It was broadly recognized that the standard needs to recognize and allow this limitation for existing wind turbine tower equipment, and the DT sought to determine an appropriate date beyond which it should be expected that industry can meet low temperature operating capability. Ultimately, October 1, 2029 was established as the manufacturing limit date for compliance of new wind turbine towers. This was determined based on an accelerated interpretation of general feedback from the 2024-03 Technical Conference indicating that generational technological development cycles in the industry are on the order of 5-7 years. The October 1, 2029 date would allow four years beyond the anticipated implementation date of EOP-012-3 (October 1, 2025) for manufacturers to select, apply, test, and begin production of wind turbine towers constructed of materials capable of lower temperature operation appropriate for those locations with Extreme Cold Weather Temperatures below the limits associated with current tower material designs[10]. In addition, the 2024-03 DT also received feedback through industry outreach from participants indicating delivery and construction lead times for wind turbines were years into the future, providing additional support for the selected dates. The language in the Standard also requires those units to enter commercial operation before October 1, 2031, which prevents an entity from simply procuring an abundance of equipment prior to the manufacturing date limit (October 1, 2029) and constructing them over a long period of time in the future. The two-year gap was established to give a reasonable timeframe for entities to receive, construct, and commission the equipment. The DT felt that these dates would appropriately allow projects that are currently in different phases of planning or execution to be completed while also creating end dates beyond which wind turbine towers must be designed and erected to meet all aspects of EOP-012-3 and

[10] The DT also consulted with a representative from a wind OEM with experience in operations in Northern Europe, United States, and Canada, all areas that can experience extremely low temperatures. This representative indicated that there were no wind turbine tower designs in their current and projected future global portfolio that operate at temperatures colder than -30 degrees Celsius (-22 degrees Fahrenheit). The OEM follows IEC 61400-1 Ed 2019 (Chapter 14 Cold Climate)(https://webstore.iec.ch/en/publication/26423) and when operations as low as -30 degrees Celsius is desired, low temperature environmental modification kits are added.

this particular known Generator Cold Weather Constraint would no longer be considered valid. During the ROP 321 comment period there were a few comments regarding the timeframe to consider for wind turbines to meet the lower ECWT. One comment that might be considered in the future was that the wind turbine tower "known" Generator Cold Weather Constraint be changed to October 1, 2035, and October 1, 2037, respectively to better reflect the likely longer duration development cycle for new towers using specialty steel. The Standards Committee in the exercise of its responsibility under Section 321 of the NERC Rules of Procedure did not feel compelled to make the suggested change. The need for urgency reflected in the FERC directives in the June 2024 Order and the nature of the directives supported the decision.
The list for known Generator Cold Weather Constraints included a section devoted to the application of freeze protection measures to meet the Requirements of EOP-012. The Project 2024-03 DT initially had individually listed the scenarios but felt capturing the issues under a single scenario, the application of freeze protection measures, was better suited for the Attachment 1 material. A key to inclusion on the list was reasonableness in light of what may be available to use within the industry. Replacing wind turbine blades solely for the purpose of adding de-icing or ice-minimizing capabilities was not consider a reasonable approach. While the lack of solar-related Generator Cold Weather Constraints received a few comments during the ROP 321 comment period, no industry supplied examples were provided outside the removal of frozen precipitation provided to the Project 2024-03 DT. The Project 2024-03 DT did discuss types or techniques of removal (e.g., tilting panels if applicable, heat applications, or sweepers) and came to an understanding that some suggestions could damage the solar panel itself. Industry could supply case-by-case examples of solar-related Generator Cold Weather Constraints that may be captured in the future. Applying heat upstream of inlet air filters was noted as a particular issue for plants to incorporate. Wind turbine heat tracing or de-icing are in very early stages of use and were considered as known Generator Cold Weather Constraints by the Project 2024-03 DT. No additional comments received during the ROP 321 comment period required changes to the known list.

The case-by-case situations and circumstances that may constitute a Generator Cold Weather Constraint are described separately. The enumerated list in Attachment 1 is not intended to be exhaustive but rather to provide clear descriptions of circumstances that may constitute Generator Cold Weather Constraints depending on the facts and circumstances presented by the GO. Generator Operators bear the burden of defending and supporting their declared constraints while the ERO bears the burden of confirming them as valid, or not. While some comments received during the ROP 321 comment period noted lack of guidance provided in Attachment 1, no substantial changes were provided or discretely requested by industry. The flexibility provided in the case-by-case determinations will allow a GO to reasonably present its facts for consideration of a valid Generator Cold Weather Constraint. NERC staff updated the NERC Process, based on comments received, to support provision of information to the industry on Generator Cold Weather Constraint validation efforts.

The Project 2024-03 DT received a few examples of issues that were incorporated into the case-by-case list. It is not known how pervasive some of the case-by-case Generator Cold Weather Constraints may be in the industry. NERC committed to providing information on what the CEAs may be seeing as validation

of Generator Cold Weather Constraints occur. This may shed some light on what a more pervasive issue may be than one-off cases of Generator Cold Weather Constraints.

While the Project 2024-03 DT supports the idea that voiding an equipment warranty is an approach to applying freeze protection measures that should be avoided, no specific instances were provided to the team. To allow for the possibility that such a condition may exist, the situation was listed in the case-by-case section.
Exceeding a design limitation that would impair or degrade the effective operation of any unit is a situation that should be actively avoided. During the Project 2024-03 public discussions, the idea was brought up a few times but no specific issues were noted. Solar and battery OEMs appear to not include wind speed when determining the temperature range for operations. If issues are discovered with any type of facility, the validation efforts of the CEAs may reveal a trend worth noting to the industry.

Physical limitations for the application of freeze protection measures was discussed by the Project 2024-03 DT with the few examples provided noted in the case-by-case list. The discussions appeared to limit the population for the application of the freeze protection measures but it was important to capture.

The Project 2024-03 DT discussed analysis of freeze protection measures to determine effectiveness. There was concern by the industry that if one Generator Owner applied a particular freeze protection measure that there might be an assumption that it should be applied broadly. Innovation of freeze protection measures should not be stifled by regulatory Requirements nor should there be an assumption that the freeze protection measures will work effectively for every location. To that point the Project 2024-03 DT felt that an analysis was required to support the actions of a Generator Owner. There were a few comments received in the ROP 321 comment period regarding clarity around “generating unit(s) of comparable types in regions that experience similar winter climate conditions.” The Project 2024-03 DT included that phrasing with the understanding that entity’s would be able to clearly demonstrate why a freeze protection measure may not be effective for their unit(s). The Standards Committee in the exercise of its responsibility under Section 321 of the NERC Rules of Procedure did not feel compelled to make any changes to the phrasing. NERC may provide further guidance in the future but entities are encouraged not to over analyze the phrasing in the support of reliable operations.
Among these circumstances, the DT recognized the need to balance potential adverse effects to the Bulk Power System reliability caused by requiring implementation of a freeze protection measure with the beneficial effects of doing the same. Because such circumstances can and do change by location and over time, this weighing process is best done on a localized basis and ideally interactively between the GO and other affected functional entities while broadly considering immediate and potential future impacts of a declared constraint.

“Case-by-Case Determinations of Generator Cold Weather Constraints” 5a and 5b (accelerated premature retirement, cancellation of a planned unit) were revised based on comments received during the ROP 321 comment period. Language to require the Generator Owner to have an attestation signed by an officer

of the company to accompany its determination, made through an analysis, that the constraint applies was added. A company officer is a high-ranking individual within a corporation responsible for managing specific areas of the business. This addition was intended to address a concern about potentially questionable economic constraint declarations being submitted for CEA review. The change is not expected to meaningfully increase the administrative burden for affected Generator Owners seeking to make such a declaration.

Two additional cases seemed particularly well-suited for a threshold for quantification of impacts: those that reduce a generating unit's real or reactive power when the freeze protection measure is not in place and those that would reduce net dependable capacity during summer or at Peak Demand. These two cases are addressed in sections 5.c. and 5.d. of Attachment 1. In them, the DT has selected a value of three (3) percent, reduction as an appropriate level of impact above which the deleterious impact to the Bulk Power System resulting from requiring a specific freeze protection measure may be appropriately determined to outweigh the benefits of applying the measure. Recognizing that local and temporal conditions are best understood, measured and predicted by the GO and affected functional entities, the DT chose to allow flexibility in the selected three percent value when a different value is supported by the appropriate functional entity as more supportive of reliable operation of the grid.

In addition to being a sensible threshold, use of a three (3) percent value has precedent in BAL-002-WECC-3 where it is used as a barometer for reliable operations in terms of Contingency Reserve.

The language provided in both the known and case-by-case portions of Attachment 1 is meant to describe criteria that are objective, unambiguous, and auditable. Guidance on the Generator Cold Weather Constraints could be supported by the industry, NERC, and the Regions through various methods. It is important to work collaboratively to understand the conditions presented and be able to support validation of the Generator Cold Weather Constraints as EOP-012-3 is implemented

In all cases, when submitting a Generator Cold Weather Constraint declaration to the CEA per Requirement R8, the GO must include documentation that defends and supports the declared constraint and also describes other compensating or mitigating freeze protection measures, if applicable, that the GO will apply. If a Generator Cold Weather Constraint declaration indicates that the application of a specific freeze protection measure or measures would adversely affect the reliability of the Bulk-Power System to an extent that outweighs the reliability benefit of applying the freeze protection measure(s), the documentation that defends and supports the constraint could properly include any assessment that the applicable functional entity (e.g., BA or RC) might agree to provide concerning the impact to the reliability of the Bulk-Power System if the constraint were to be deemed invalid by the CEA. Such an assessment, or other means of demonstrating agreement from an appropriate functional entity, would serve to strengthen the Generator Cold Weather Constraint declaration.

It should also be emphasized, as written in Attachment 1, that an approved Generator Cold Weather Constraint declaration for any specific Generator Cold Weather Critical Component does not relieve the GO of its obligation to otherwise prepare its applicable generating unit(s) to meet the requirements of EOP-012-3.

With all Generator Cold Weather Constraints, it is the responsibility of the GO to provide supporting materials to facilitate approval and validation of the Generator Cold Weather Constraint by the ERO Enterprise. NERC staff has provided that additional guidance will be provided moving forward to support industry efforts in understanding the NERC Process. As mentioned in the Requirement R8 Technical Rational discussion, the NERC Process was developed to support the FERC directives in the June 2024 Order. The 2024-03 DT believes the new definition of Generator Cold Weather Constraint, updated language throughout the Standard with emphasis on Requirement R8, and the contents of Attachment 1 provide significant clarity to industry on what is expected for Generator Cold Weather Constraints to be considered valid.

Consideration of Directives from FERC June 2024 Order Approving EOP-012-2 and Directing Further Revisions

Project 2024-03 Revisions to EOP-012-2

Summary

This mapping document summarizes how the Project 2024-03 drafting team (DT), and the Standards Committee in carrying out its responsibilities under Section 321 of The North American Electric Reliability Corporation (NERC) Rules of Procedure, considered The Federal Energy Regulatory Commission's (FERC's) directives for further revisions to Reliability Standard EOP-012-2 in its June 27, 2024 approval order[1] when drafting proposed EOP-012-3.

Paragraph 47 – Address Ambiguities Regarding the term Generator Cold Weather Constraint and Criteria

Directive

"Accordingly, we direct NERC, pursuant to section 215(d)(5) of the FPA, to develop and submit to the Commission for approval modifications to proposed Reliability Standard EOP-012-2 that address concerns related to the ambiguity of the newly defined Generator Cold Weather Constraint term and criteria. Specifically, we direct NERC to ensure that the Generator Cold Weather Constraint declaration criteria included within the proposed Reliability Standard are objective *and* sufficiently detailed so that applicable entities understand what is required of them. One approach to satisfy this directive could be to incorporate into the proposed Reliability Standard a limited and discrete list of circumstances that would qualify as acceptable constraints. We note that NERC's technical rationale document, created by NERC's Standard Drafting Team(SDT) and included in NERC's filing, includes a list of technical constraints that could serve as a starting point for a list of circumstances that would qualify as acceptable constraints. To the extent that NERC continues to believe that the extent of industry adoption for winterization technologies should be a criterion for declaring a constraint, NERC should clearly explain in its filing how it will assess the extent of such adoption in a way that provides for consistent compliance and enforcement outcomes. Alternatively, NERC could establish a pre-approval process for all Generator Cold Weather Constraint declarations. While a clearly defined list may be preferable, a pre-approval

[1] *N. Am. Elec. Reliability Corp.*., 187 FERC ¶ 61,204 (2024) ("June 2024 Order"). In this document, internal citations included within the cited text of the FERC order are omitted.

process could be established to ensure entities' declared Generator Cold Weather Constraints are appropriate and can be supported and defended. Further, as part of the directive to develop and submit modifications to the Generator Cold Weather Constraint definition of proposed Reliability Standard EOP-012-2, we direct NERC, pursuant to section 215(d)(5) of the FPA, to remove the references to "cost," "reasonable cost," "unreasonable cost," and "good business practices" and replace them with criteria that are objective, unambiguous, and auditable. NERC may propose to develop modifications that address the Commission's concerns in an equally efficient and effective manner, however, NERC must explain how its proposal addresses the Commission's concerns."

Consideration of Directive

Consideration of Directive in EOP-012-3		
Approved Definition/Standard	**Revisions in Definition/Standard or Other Action**	**Description and Change Justification**
Generator Cold Weather Constraint - Any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components using the criteria below. Freeze protection measures are not intended to be limited to optimum practices, methods, or technologies, but are also intended to include acceptable practices, methods, or technologies generally implemented by the electric industry in areas that experience similar winter climate conditions. Criteria used to determine a constraint include practices, methods, or technologies which, given the exercise of reasonable judgment in light of the facts known at the time the decision to declare the constraint was made: • Were not broadly implemented at generating units for comparable unit types in regions that	**Generator Cold Weather Constraint** - Any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components. Freeze protection measures are not intended to be limited to optimum practices, methods, or technologies, but are also intended to include practices, methods, or technologies that would be expected to result in improved generating unit performance during cold temperatures. **** **R8.** Each Generator Owner that declares a Generator Cold Weather Constraint in accordance with Attachment 1 shall: **8.1.** Submit its Generator Cold Weather Constraint declaration(s) to the CEA as follows:	Proposed EOP-012-3 along with the modified definition of Generator Cold Weather Constraint removes all of the references to "reasonable cost," "unreasonable cost," "cost," and "good business practices" consistent with the FERC directive. The definition of Generator Cold Weather Constraint now refers generally to a condition that would preclude implementing freeze protection measures, clarifying that freeze protection measures are not limited to just optimum solutions but any solution that may be effective for improving performance. Proposed EOP-012-3 adds Attachment 1, referenced in Requirement R8 and R9, to define the criteria by which a valid Generator Cold Weather Constraint may exist. Attachment 1 consists of:

Consideration of Directive in EOP-012-3		
Approved Definition/Standard	**Revisions in Definition/Standard or Other Action**	**Description and Change Justification**
experience similar winter climate conditions to provide reasonable assurance of efficacy; • Could not have been expected to accomplish the desired result; or Could not have been implemented at a reasonable cost consistent with good business practices, reliability, or safety. A cost may be deemed "unreasonable" when implementation of selected freeze protection measure(s) are uneconomical to the extent that they would require prohibitively expensive modifications or significant expenditures on equipment with minimal remaining life. *** **R8.** Each Generator Owner that creates a Generator Cold Weather Constraint declaration shall: **8.1**. Review the Generator Cold Weather Constraint declaration at least every five calendar years or as needed when a change of status to the Generator Cold Weather Constraint occurs; and **8.2**. Update the operating limitations associated with capability and availability under Requirement R1 Part R1.2 if applicable.	• For Generator Cold Weather Constraints determined in accordance with Requirement R2 for generating unit(s) upon beginning commercial operation, submit within 15 calendar days after commercial operation; or • For all other Generator Cold Weather Constraints, submit within 45 calendar days of determining that the Generator Cold Weather Constraint is applicable. **8.2.** Update the operating limitations under Requirement R1 Part R1.2 if applicable; **8.3.** If the CEA determines the declared Generator Cold Weather Constraint is invalid, update its Corrective Action Plan(s) to require corrective actions be completed in accordance with Requirement R6 or Requirement R7, as applicable, subject to any extensions approved by the CEA, or implement freeze protection measures to provide the necessary capability in accordance with Requirement R2;	1. Known Generator Cold Weather Constraints, consisting of circumstances which, if present and confirmed as valid by the Compliance Enforcement Authority, would constitute Generator Cold Weather Constraints; and 2. Case-by-case Determinations of Generator Cold Weather Constraints, consisting of situations which may constitute Generator Cold Weather Constraints, depending on the specific facts and circumstances. Only upon approval by the Compliance Enforcement Authority would these circumstances comprise a valid Generator Cold Weather Constraint under Requirement R8. Attachment 1 provides significant clarity on the conditions or issues that may constitute a valid Generator Cold Weather Constraint. The criteria are intended to be objective, unambiguous, and auditable. The standard retains flexibility to address potentially valid constraints that are not specifically defined in the standard through the Compliance Enforcement Authority review process. Please refer to the Technical Rationale for additional supporting information.

	8.4. Document and provide notice to the CEA, when a generating unit experiences a Generator Cold Weather Reliability Event with the same cause of a previous Generator Cold Weather Reliability Event at the same or a similar unit, and one or more corrective actions to address the cause is addressed by an existing validated Generator Cold Weather Constraint for the same or a similar unit. **** **Attachment 1** (criteria for determining the applicability of a Generator Cold Weather Constraint) (*see standard*)	

Paragraph 54: Address Concerns Regarding the Need for a Timely Review and Evaluation of Declared Generator Cold Weather Constraints by NERC

Directive

"Accordingly, we again direct NERC, pursuant to section 215(d)(5) of the FPA, to modify proposed Reliability Standard so that NERC receives, reviews, evaluates, and confirms for validity the Generator Cold Weather Constraint declarations in a timely manner. We also direct NERC to include in its compliance filing, a plan to timely review such declarations to verify compliance with proposed Reliability Standard EOP-012-2 and its successors or obligations in a corrective action plan and take corrective action where necessary. For example, modifying Standard to require the generator owners to provide declarations (or changes to the declarations) to NERC within 45 days. It is up to NERC whether it would like to delegate this task to the relevant Regional Entities. NERC may propose to develop modifications that address the Commission's concerns in an equally efficient and effective manner, however, NERC must explain how its proposal addresses the Commission's concerns."

Consideration of Directive

	Generator Cold Weather Constraint for the same or a similar unit. **** **Attachment 1** (criteria for determining the applicability of a Generator Cold Weather Constraint) (*see standard*)	

Paragraph 68 - Address Concerns that Existing EOP-012-2 Requirement R7 Allows Too Long for Entities to Implement Corrective Actions for Existing or New Equipment or Freeze Protection Measures for those Generating Units that Experience a Generator Cold Weather Reliability Event

Directive

"Accordingly, we direct NERC, pursuant to section 215(d)(5) of the FPA, to develop and submit modifications to Requirement R7 of proposed Reliability Standard EOP-012-2 to require shorter deadlines to implement corrective actions for existing or new equipment or the freeze protection measures for those generating units that experience a Generator Cold Weather Reliability Event. Based on compliance with Requirements R2 and R3, those generating units should have already had appropriate freeze protection measures implemented to be capable of operating at the generating units' respective Extreme Cold Weather Temperature. Therefore, we find that a shorter timeframe to implement corrective actions that address existing or new equipment or freeze protection measures is appropriate. For example, to satisfy this directive, NERC could require generator owners to implement corrective actions prior to the next winter season for generating units that experience a Cold Weather Reliability Event and to complete freeze protection measures on similar equipment on all of its fleet within 24 months of becoming aware of the freeze issue. For corrective action plans that involve larger and more complicated implementations, NERC could incorporate a staggered 48-month corrective action plan implementation deadline."

Consideration of Directive

Consideration of Directive in EOP-012-3		
Approved Definition/Standard	**Revisions in Definition/Standard or Other Action**	**Description and Change Justification**
R6. Each Generator Owner shall, for each generating unit that has a calculated Extreme Cold Weather Temperature at or below 32 degrees Fahrenheit (zero degrees Celsius) as determined in Requirement R1 and that self-commits or is required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), develop a Corrective Action Plan when the generating unit experiences a Generator Cold Weather Reliability Event. The Corrective Action Plan shall be developed	**R6.** Each Generator Owner shall, when experiencing a Generator Cold Weather Reliability Event at a generating unit that has a calculated Extreme Cold Weather Temperature at or below 32 degrees Fahrenheit (zero degrees Celsius) as determined in Requirement R1 and that self-commits or is required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), develop	To address this directive, proposed EOP-012-3 revises Requirement R6 to specify shorter implementation timeframes at generating units experiencing a Generator Cold Weather Event, and removes references to this requirement under Requirement R7, which previously addressed all Corrective Action Plans developed under the EOP-012-2 standard. For Generator Owners experiencing a Generator Cold Weather Event, Corrective Action Plans

Consideration of Directive in EOP-012-3		
Approved Definition/Standard	**Revisions in Definition/Standard or Other Action**	**Description and Change Justification**
within 150 days or by July 1, whichever is earlier, and contain at a minimum: **6.1.** A summary of the identified cause(s) for the Generator Cold Weather Reliability Event, where applicable, and any relevant associated data; **6.2.** A review of applicability to similar equipment at generating units owned by the Generator Owner; and **6.3.** An identification of operating limitations or impacts to the cold weather preparedness plan that would apply until execution of the corrective action(s) identified in the Corrective Action Plan. **R7**. Each Generator Owner, for each Corrective Action Plan developed pursuant to Requirements R1, R2, R3, or R6, shall: **7.1**. Include a timetable for implementing the selected corrective action(s) that shall: **7.1.1**. List the action(s) which address(es) existing equipment or freeze protection measures, if any, to be completed within 24 calendar months of completing development of the Corrective Action Plan; **7.1.2**. List the action(s) which require(s) new equipment or freeze protection measures, if any, to be completed within 48 calendar months of completing development of the Corrective Action Plan; and	and implement a Corrective Action Plan(s) to address identified issues as follows: **6.1**. The Generator Owner shall develop a Corrective Action Plan for the generating unit that experienced a Generator Cold Weather Reliability Event no later than prior to the first day of the first December following the Generator Cold Weather Reliability Event.[Fn9] **6.2.** The Generator Owner shall conduct a review of the other generating unit(s) in its fleet with the same or similar equipment as the affected generating unit to determine if any of those generating unit(s) are susceptible to the identified freezing issues. If corrective actions are needed, the Generator Owner shall develop or update a Corrective Action Plan to address the other generating unit(s). This review and, if applicable, the development or update of any Corrective Action Plan(s), shall be completed no later than 12 calendar months following the Generator Cold Weather Reliability Event.	must specify implementation of corrective actions at the affected unit (i.e. the one experiencing the event) by no later than the first day of the first December following the event. For events occurring in September, October or November (i.e. prior to December 1), corrective actions shall be implemented prior to the first day of December in the following calendar year. The focus of revised EOP-012-3 Requirement R6 is on the timely completion of corrective actions addressing known freezing issues, rather than the timely development of the Corrective Action Plan document itself. However, for clarity, Requirement R6 Part 6.1 specifies that the Corrective Action Plan(s) itself must be developed by no later than the implementation deadline to ensure that identified issues and the corrective actions taken to address them are memorialized. Recognizing that similar units may be subject to similar issues, Generator Owners must perform a review of applicability to similar equipment at their other units. This review must be completed within 12 months of the Generator Cold Weather Reliability Event. Requirement R6 Part 6.3.5.2 would provide that entities must implement any corrective measures within 24 calendar months of completing this review, or

Consideration of Directive in EOP-012-3		
Approved Definition/Standard	**Revisions in Definition/Standard or Other Action**	**Description and Change Justification**
7.1.3. List the updates to the cold weather preparedness plan required under Requirement R4 to identify the updates or additions to the Generator Cold Weather Critical Components and their freeze protection measures; **7.2**. Implement the Corrective Action Plan in accordance with the specified timetables in Requirement R7 Part 7.1; **7.3**. Update the Corrective Action Plan action(s) and timetable(s), with justification, if corrective action(s) change or timetable(s) exceed the timelines in Requirement R7 Part 7.1; and **7.4**. Document in a declaration, with justification, any Generator Cold Weather Constraint that precludes the Generator Owner from implementing selected action(s) contained within the Corrective Action Plan.	**6.3.** For each Corrective Action Plan, the Generator Owner shall include at a minimum: **6.3.1.** A summary of the identified cause(s) of the Generator Cold Weather Reliability Event, where applicable, and any relevant associated data; **6.3.2.** A list of actions to add new freeze protection measures or remedy issues with existing freeze protection measures; **6.3.3.** An identification of operating limitations on the generating unit(s), or impacts to the cold weather preparedness plan, if any, that would apply until implementation of the corrective action(s) identified in the Corrective Action Plan is completed; **6.3.4.** A description of the updates to the cold weather preparedness plan required under Requirement R4 to identify updates or additions to the Generator Cold Weather Critical Components	by no later than 36 months following the Generator Cold Weather Reliability Event. In developing these timelines, the drafting team and the Standards Committee considered multiple stakeholder comments suggesting that a 24-month timeline to implement corrective actions measured from the date of the event for similarly affected units would not be practical and may be unduly burdensome. The drafting team and the Standards Committee also considered the difficulties of defining, with specificity, the circumstances that would constitute "larger and more complicated implementations" – which FERC suggested may warrant a longer implementation period than provided in draft EOP-012-3 (e.g. 48 months compared to up to 36 months in EOP-012-3). To address these considerations, EOP-012-3 provides a uniform implementation period that incentivizes entities to understand the extent of condition across their fleets as soon as possible after the event and provides a definitive and reasonably expeditious timeline for completion. To the extent circumstances beyond the control of the Generator Owner prevent implementation within these timeframes, Requirement R6 Part 6.4 provides a process by which the Generator Owner may seek an

	[Fn9/Fn10]: For events that occur in September, October or November, the timetable shall specify completion prior to December 1 of the following calendar year. **** **R7.** Each Generator Owner that is required to develop a Corrective Action Plan under Requirements R1, R3, or R9 shall develop and implement the Corrective Action Plan in accordance with the following:	

Paragraph 70: Address the Finding that Any Extensions of a Corrective Action Plan Implementation Deadline Beyond the Maximum Implementation Timeframe Provided by the Standard be Pre-Approved by NERC

Directive

"Therefore, we direct NERC, pursuant to section 215(d)(5) of the FPA, to develop and submit modifications to Requirement R7 of proposed Reliability Standard EOP-012-2 to ensure that any extension of a corrective action plan implementation deadline beyond the maximum implementation timeframe required by the proposed Reliability Standard is pre-approved by NERC. This approach is consistent with prior Commission action in Order No. 851 where the Commission directed NERC to require pre-approval for extensions beyond the timelines required in the Reliability Standard. In Order No. 851, the Commission explained that although case-by-case extension determinations may be more uncertain or have associated burdens, the more compelling imperative is that automatic extensions have the potential for abuse by unduly delaying mitigation, and would lead to delayed visibility for NERC."

See also P 3 (summarizing directives): "[W]e direct NERC to:… develop and submit modifications to Requirement R7 of proposed Reliability Standard EOP-012-2 to ensure that any extension of a corrective action plan implementation deadline beyond the maximum implementation timeframe required by the Standard is pre-approved by NERC and to ensure that the generator owner informs relevant registered entities of operating limitations in extreme cold weather during the period of the extension."

Event. The Corrective Action Plan shall be developed within 150 days or by July 1, whichever is earlier, and contain at a minimum: **6.1.** A summary of the identified cause(s) for the Generator Cold Weather Reliability Event, where applicable, and any relevant associated data; **6.2.** A review of applicability to similar equipment at generating units owned by the Generator Owner; and **6.3.** An identification of operating limitations or impacts to the cold weather preparedness plan that would apply until execution of the corrective action(s) identified in the Corrective Action Plan. **** **R7**. Each Generator Owner, for each Corrective Action Plan developed pursuant to Requirements R1, R2, R3, or R6, shall: **7.1**. Include a timetable for implementing the selected corrective action(s) that shall: **7.1.1**. List the action(s) which address(es) existing equipment or freeze protection measures, if any, to be completed within 24 calendar months of completing development of the Corrective Action Plan; **7.1.2**. List the action(s) which require(s) new equipment or freeze protection measures, if any, to be completed within 48 calendar	approval. The submitted Corrective Action Plan extension request shall include the following: **6.4.1.** An explanation of the circumstances causing the delay and why those circumstances are beyond the control of the Generator Owner; **6.4.2.** Revisions to the selected actions in Part 6.3.2, if any, including utilization of operating procedures, if applicable; and **6.4.3.** Updated timetable for implementing the selected actions in Part 6.3.2. **** **7.1.** For each Corrective Action Plan, the Generator Owner shall include at a minimum the following: *** **7.1.4.** An identification of operating limitations on the generating unit(s), or impacts to the cold weather preparedness plan, if any, that would apply until implementation of the corrective	the TPL-007 standard, and the ERO Enterprise would follow a similar review process. With respect to that part of Paragraph 3 relating to "ensuring the generator owner informs relevant registered entities of operating limitations in extreme cold weather during the period of the extension": Under EOP-012-3 Requirement R6 Part 6.3.3, pertaining to units experiencing a Generator Cold Weather Event, the Generator Owner would be required to identify operating limitations that would apply until execution of the Corrective Action Plan. Under EOP-012-3 Requirements R2 and R3, a Corrective Action Plan would be required where the Generator Owner cannot meet the required operational capability for its unit. Requirement R7 Part 7.1 addresses what generators must include in their Corrective Action Plans, including operating limitations that apply until implementation of the corrective actions is completed (Part 7.1.4). The TOP-003 and IRO-010 standards require the Transmission Operator, Balancing Authority, and Reliability Coordinator to maintain data specifications for their real-time and operational

months of completing development of the Corrective Action Plan; and **7.1.3**. List the updates to the cold weather preparedness plan required under Requirement R4 to identify the updates or additions to the Generator Cold Weather Critical Components and their freeze protection measures; **7.2**. Implement the Corrective Action Plan in accordance with the specified timetables in Requirement R7 Part 7.1; **7.3**. Update the Corrective Action Plan action(s) and timetable(s), with justification, if corrective action(s) change or timetable(s) exceed the timelines in Requirement R7 Part 7.1; and **7.4**. Document in a declaration, with justification, any Generator Cold Weather Constraint that precludes the Generator Owner from implementing selected action(s) contained within the Corrective Action Plan.	action(s) identified in the Corrective Action Plan is completed. **7.2.** If a Generator Owner determines it will be unable to complete one or more of the actions in a Corrective Action Plan in accordance with the timetables specified in Requirement R7 Part 7.1 due to circumstances beyond its control, the Generator Owner shall submit a Corrective Action Plan extension request to the CEA for approval. The submitted Corrective Action Plan extension request shall include the following: **7.2.1.** An explanation of the circumstances causing the delay and how those circumstances are beyond the control of the Generator Owner; **7.2.2.** Revisions to the selected actions in Parts 7.1, if any, including utilization of operating procedures, if applicable; and **7.2.3.** Updated timetable for implementing the selected actions in Part 7.1.	planning analyses that include provisions for notification of BES generating unit(s) status during local forecasted cold weather to include operating limitations based on capability and availability, among other factors. These standards require the Generator Owner to provide the requested data. Additionally, other mechanisms that reliability entities have for obtaining up-to-date information on the status and availability of generators was discussed during the development process. It was also considered that, under Reliability Standard TOP-002-5 Requirement R8, each Balancing Authority is required to have an extreme cold weather Operating Process that takes into consideration capability and availability concerns, considering generating operating limitations from previous cold weather periods. After considering these standards, it was determined that no additional requirement would be needed to ensure the “generator owner informs relevant registered entities of operating limitations in extreme cold weather” specifically during the period of Corrective Action Plan extension. Operating limitations should be communicated through other mechanisms regardless of whether those

Consideration of Directive in EOP-012-3		
Approved Definition/Standard	**Revisions in Definition/Standard or Other Action**	**Description and Change Justification**
		operating limitations apply generally, during the time period provided in the Corrective Action Plan for implementation, or the period provided authorized by the CEA for an extension. To the extent a Transmission Operator, Balancing Authority, or Reliability Coordinator would find the additional detail useful (i.e. that the operating limitation applies during a Corrective Action Plan extension), it may request this information as part of its data specifications, and the Generator Owner would be required to provide it. However, a requirement in EOP-012-3 for the Generator Owner to provide this information through a separate mechanism, absent a communicated need, may not provide any reliability benefit.

Paragraph 72: Address the Finding that Generators that are First Commercially Operational on or after October 1, 2027, Should Have Freeze Protection Measures Either Designed into Their Generating Systems, or, if a Corrective Action Plan is Needed, then It Should be Completed by the Time that Such Generating Units Go into Commercial Operation.

Directive

"We thus find that generators that are commercially operational after October 1, 2027, should have freeze protection measures either designed into their generating systems, or, if a corrective action plan is needed, then it should be completed by the time that such generating units go into commercial operation. Accordingly, we direct NERC, pursuant to section 215(d)(5) of the FPA, to develop and submit modifications to Requirement R7 of proposed Reliability Standard EOP-012-2 to clarify that any Requirement R2 corrective action plans must be completed prior to the generating unit's commercial operation date."

Consideration of Directive

Approved Definition/Standard	**Revisions in Definition/Standard or Other Action**	**Description and Change Justification**
R2. Applicable to generating units with a commercial operation date on or after October 1, 2027: Each Generator Owner, for each generating unit that has a calculated Extreme Cold Weather Temperature at or below 32 degrees Fahrenheit (zero degrees Celsius) as determined in Requirement R1, and that self-commits or is required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), shall: • Implement freeze protection measures to protect Generator Cold Weather Critical Components that provide the capability to operate at the unit(s)' Extreme Cold Weather Temperature with sustained concurrent twenty (20) mph wind speed for (i) a period of not less than twelve (12) continuous hours, or (ii) the maximum	**R2.** Applicable to generating units that begin commercial operation on or after October 1, 2027[fn2]: Each Generator Owner, for each generating unit that has a calculated Extreme Cold Weather Temperature at or below 32 degrees Fahrenheit (zero degrees Celsius) as determined in Requirement R1, and that self-commits or is required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), shall: • Implement freeze protection measures to protect Generator Cold Weather Critical Components that provide the capability to operate at the generating unit(s)'	To address this directive, proposed EOP-012-3 revises Requirement R2 which pertains to units going into commercial operation after October 1, 2027. Requirement R2 would require that a Generator Owner with a generating unit entering commercial operation on or after October 1, 2027 shall either implement the required capability or declare a Generator Cold Weather Constraint, if applicable. A new footnote is added to clarify that the October 1, 2027 date may be different in non-U.S. jurisdictions.

Consideration of Directive in EOP-012-3		
Approved Definition/Standard	**Revisions in Definition/Standard or Other Action**	**Description and Change Justification**
operational duration for intermittent energy resources if less than twelve (12) continuous hours; or • Develop a Corrective Action Plan(s) to add new or modify existing or previously planned freeze protection measures to provide the capability to operate at the unit(s)' Extreme Cold Weather Temperature with a sustained concurrent twenty (20) mph wind speed for (i) a period of not less than twelve (12) continuous hours, or (ii) the maximum operational duration for intermittent energy resources if less than twelve (12) continuous hours.	Extreme Cold Weather Temperature with sustained concurrent twenty (20) mph (32 km/h) wind speed for (i) a period of not less than twelve (12) continuous hours, or (ii) the maximum operational duration for intermittent energy resources if less than twelve (12) continuous hours; or • Document in a declaration, with justification, if applicable, a Generator Cold Weather Constraint in accordance with Requirement R8. [fn2]: In non-U.S. jurisdictions, this will be the date established by the Applicable Governmental Authority.	There is no requirement to implement a Corrective Action Plan prior to entering commercial operation, as there were concerns raised about potential retroactive applicability of such a requirement (i.e. applying standards prior to registration for mandatory compliance purposes). However, the practical effect is the same: the entity must either implement the required capability or delay its commercial operation date until it is able to do so. Prior EOP-012 drafting teams believed that there needs to be allowances made for units that are far along in the development process, but do not expect to achieve commercial operation prior to October 1, 2027. It was discussed that some plants may take five years or more to complete construction and enter commercial operation, with significant investments in design occurring early in the process. After a certain point, changing such designs (if allowed) may subject the entity to significant added costs, delays, or both. While not changing the October 1, 2027 date as the date after which new units must meet the more stringent requirements for new generation, the implementation plan for proposed EOP-012-3 provides a slightly longer

Consideration of Directive in EOP-012-3		
Approved Definition/Standard	**Revisions in Definition/Standard or Other Action**	**Description and Change Justification**
		phased-in compliance deadline for units meeting certain criteria. This phased-in compliance date would help accommodate the units that are thought to be much further along in the process of development and for whom the revised requirement might represent a significant hardship, while overall raising the bar for reliability. . Additional information and background are available in the Technical Rationale for proposed EOP-012-3.

Paragraph 76: To Address Concerns that EOP-012-2 Requirement R7 has Ambiguities in the Implementation Plan Timelines that Apply to Certain Generator Owners

Directive

"We believe that proposed Reliability Standard EOP-012-2, Requirement R7's corrective action plan implementation deadlines have remaining ambiguities that need to be addressed. As noted above, the Commission has previously expressed similar concerns regarding the vagueness and enforceability of Reliability Standards language. Specifically, we agree with the concerns raised by the ISO/RTO Council that Requirement R7 of proposed Reliability Standard EOP-012-2 does not provide clear direction as to the required corrective action plan implementation timeline that applies to certain generator owners. For example, it is unclear how the corrective action plan implementation timeline would apply if a generator owner had combinations of both existing and new equipment for freeze protection measures. Accordingly, we direct NERC, pursuant to section 215(d)(5) of the FPA, to develop and submit modifications to Requirement R7 of proposed Reliability Standard EOP-012-2 to address these ambiguities by expanding on Requirement R7.1.1 and 7.1.2 to make it clear which corrective action plan implementation deadline applies to which generator owner."

Consideration of Directive

Consideration of Directive in EOP-012-3		
Approved Definition/Standard	**Revisions in Definition/Standard or Other Action**	**Description and Change Justification**
R7. Each Generator Owner, for each Corrective Action Plan developed pursuant to Requirements R1, R2, R3, or R6, shall: **7.1**. Include a timetable for implementing the selected corrective action(s) that shall: **7.1.1**. List the action(s) which address(es) existing equipment or freeze protection measures, if any, to be completed within 24 calendar months of completing development of the Corrective Action Plan; **7.1.2**. List the action(s) which require(s) new equipment or freeze protection measures, if any, to be completed within 48 calendar	**6.3.5.** A timetable specifying that implementation of the Corrective Action Plan(s) shall be completed as follows **6.3.5.1.** For the generating unit experiencing the Generator Cold Weather Reliability Event, prior to the first day of the first December following the Generator Cold Weather Reliability Event.[fn10] **6.3.5.2.** For other generating unit(s) owned by the Generator Owner,	To address this directive, proposed EOP-012-3 includes Corrective Action Plan timelines in Requirement R6 Part 6.3.5 for Corrective Action Plans developed due to experiencing a Generator Cold Weather Reliability Event which require corrective actions be completed no later than the first day of the first December following the event. For events occurring early in the season (i.e. prior to December 1), corrective actions shall be implemented prior to December 1 of the next calendar year following the event.

Consideration of Directive in EOP-012-3		
Approved Definition/Standard	**Revisions in Definition/Standard or Other Action**	**Description and Change Justification**
months of completing development of the Corrective Action Plan; and **7.1.3**. List the updates to the cold weather preparedness plan required under Requirement R4 to identify the updates or additions to the Generator Cold Weather Critical Components and their freeze protection measures;	within 24 calendar months of completing the review required in Part 6.2, or no later than 36 months following the Generator Cold Weather Reliability Event. **** **R7.** Each Generator Owner that is required to develop a Corrective Action Plan under Requirements R1, R3, or R9 shall develop and implement the Corrective Action Plan in accordance with the following: **7.1.** For each Corrective Action Plan, the Generator Owner shall include at a minimum the following: **7.1.1.** A list of any actions that require new freeze protection measures, with a timetable specifying completion of such measures within 48 calendar months of completing development of the Corrective Action Plan; **7.1.2.** A list of any actions that remedy issues with existing freeze protection measures with a timetable specifying completion of such measures within 24 calendar months of	Recognizing that similar units may be subject to similar issues, Generator Owners must perform a review of applicability to similar equipment at their other units. Revised Requirement R6 Part 6.3.5.2 would allow the entity to perform this review within 12 calendar months and implement any corrective measures within 24 calendar months of completing this review, or no later than 36 months following the Generator Cold Weather Reliability Event. These revisions provide enhanced specificity regarding the timelines for completing corrective actions in a Corrective Action Plan, with more urgent deadlines to address freezing issues that were identified following a reliability event. Additionally in Requirement R7 Part 7.1.2, the phrase “regardless of any longer timelines in the Corrective Action Plan associated with new freeze protection measures” was added to clarify that actions to address issues with existing freeze protection measures must still be completed within 24 months, even if separate actions to implement new freeze protection measures have a longer timeframe. Additional information regarding what may be considered a “new” freeze protection measure and what may be considered an “existing” freeze protection measure is provided in the

Consideration of Directive in EOP-012-3		
Approved Definition/Standard	**Revisions in Definition/Standard or Other Action**	**Description and Change Justification**
	completing development of the Corrective Action Plan (regardless of any longer timelines in the Corrective Action Plan associated with new freeze protection measures); ***	Technical Rationale. In summary, if there is a failure of a freeze protection measure (e.g., heat trace) and that freeze protection measure is replaced with the same/similar/commonly used technology, that would be considered "existing". Similarly, replacing a component of an existing system would be considered addressing issues with "existing" freeze protection measures. Examples of "new" freeze protection measures may include new permanent structures or new technologies not already applied. It is thought that the industry generally understands the distinction between "new" and "existing" in this context, but the additional support in the Technical Rationale should further clarify the matter consistent with the FERC directive and help ensure that the longer timeframes are only used where appropriate to the scope of work required for implementation.

Paragraph 94: To address the concern that Generator Cold Weather Constraint Declarations Should be Reviewed More Frequently than Once Every Five Years to Ensure the Constraint Remains Valid

Directive

"We agree with the ISO/RTO Council that the proposed five-year review period for the declared Generator Cold Weather Constraints in Requirement R8.1 could delay the identification and adoption of new freeze protection measures and does not represent the current pace of technological advancements. We acknowledge that a more frequent review does impose some additional administrative burden to the generator owner to review the technological advancements that hindered its ability to winterize; nonetheless, a lengthy period between a Generator Cold Weather Constraint declaration review by the generator owner offers little incentive to timely adopt new freeze protection technologies. Accordingly, we direct NERC, pursuant to section 215(d)(5) of the FPA, to develop and submit modifications to Requirement R8, Part 8.1 of proposed Reliability Standard EOP 012-2 to implement more frequent reviews of Generator Cold Weather Constraint declarations to verify that the declaration remains valid. NERC may propose to develop modifications that address the Commission's concerns in an equally efficient and effective manner, however, NERC must explain how its proposal addresses the Commission's concerns."

Consideration of Directive

Consideration of Directive in EOP-012-3		
Approved Definition/Standard	**Revisions in Definition/Standard or Other Action**	**Description and Change Justification**
R8. Each Generator Owner that creates a Generator Cold Weather Constraint declaration shall: **8.1**. Review the Generator Cold Weather Constraint declaration at least every five calendar years or as needed when a change of status to the Generator Cold Weather Constraint occurs; and **8.2**. Update the operating limitations associated with capability and availability under Requirement R1 Part R1.2 if applicable.	**R9.** The Generator Owner shall review each Generator Cold Weather Constraint declaration validated by the CEA at least once every 36 calendar months to determine if it remains valid in accordance with Attachment 1. **9.1** If a Generator Cold Weather Constraint is determined to be no longer valid, then within six (6) calendar months of such determination, the Generator Owner shall develop or update a Corrective	To address this directive, proposed EOP-012-3 adds Requirement R9 to require review of all validated Generator Cold Weather Constraints at least once every 36 calendar months to ensure the constraint remains valid. Language regarding reviews "as needed when a change of status" occurs was removed due to the more frequent periodicity. This timeline was based on consideration of stakeholder comments regarding the optimal timeframe for such reviews, considering the pace that new technologies are brought to market. By shortening from five calendar years, the 36

Consideration of Directive in EOP-012-3		
Approved Definition/Standard	**Revisions in Definition/Standard or Other Action**	**Description and Change Justification**
	Action Plan pursuant to Requirement R7. **** **Attachment 1** (criteria for determining the applicability of a Generator Cold Weather Constraint) (*see draft standard*)	calendar month timeline provides a reasonable approach to meeting the Commission's directives without creating undue administrative burden to periodically monitor if Generator Cold Weather Constraints remain valid or if new technologies have become available that effectively obviate the originally validated constraint. Part 9.1 clarifies the Generator Owner's obligations in the event the constraint is determined to be no longer valid. For example, a new freeze protection technology is developed that would address the issue, or circumstances change such that the implementation of an existing measure would no longer cause the plant to retire prematurely. The Generator Owner must then develop or update an existing Corrective Action Plan to specify implementation of the freeze protection measures according to the timelines provided in Requirement R7, along with the other required elements. This provision helps ensure that entities are taking timely action, if circumstances change, such that a constraint is no longer appropriate under the standard. If an entity determines that another category of Generator Cold Weather Constraint would apply based on the facts and circumstances, it may declare that constraint and submit it to the

		Compliance Enforcement Authority for review as if it were a new constraint.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Exhibit F
Order No. 672 Criteria

EXHIBIT F

Order No. 672 Criteria

In Order No. 672,[1] the Commission identified a number of criteria it will use to analyze Reliability Standards proposed for approval to ensure they are just, reasonable, not unduly discriminatory or preferential, and in the public interest. The discussion below identifies these factors and explains how the proposed Reliability Standard has met or exceeded the criteria.

1. Proposed Reliability Standards must be designed to achieve a specified reliability goal and must contain a technically sound means to achieve that goal.[2]

Proposed Reliability Standard EOP-012-3 would advance the reliability of the Bulk-Power System ("BPS") through improved generator cold weather preparedness requirements. NERC initially developed the EOP-012 Reliability Standard to address recommendations from the FERC, NERC, and Regional Entity Staff report examining the causes of the February 2021 cold weather event affecting the south central United States.[3] One of the key causes of this event was that generators, unprepared for cold weather, failed in large numbers.[4] The proposed Reliability

---

[2] *See* Order No. 672, *supra* note 1, at P 321 ("The proposed Reliability Standard must address a reliability concern that falls within the requirements of section 215 of the FPA. That is, it must provide for the reliable operation of Bulk-Power System facilities. It may not extend beyond reliable operation of such facilities or apply to other facilities. Such facilities include all those necessary for operating an interconnected electric energy transmission network, or any portion of that network, including control systems. The proposed Reliability Standard may apply to any design of planned additions or modifications of such facilities that is necessary to provide for reliable operation. It may also apply to Cybersecurity protection.").

See Order No. 672, *supra* note 1, at P 324 ("The proposed Reliability Standard must be designed to achieve a specified reliability goal and must contain a technically sound means to achieve this goal. Although any person may propose a topic for a Reliability Standard to the ERO, in the ERO's process, the specific proposed Reliability Standard should be developed initially by persons within the electric power industry and community with a high level of technical expertise and be based on sound technical and engineering criteria. It should be based on actual data and lessons learned from past operating incidents, where appropriate. The process for ERO approval of a proposed Reliability Standard should be fair and open to all interested persons.").

[4] *Id.* at 11-12.

Standard includes a comprehensive framework of requirements addressing generator cold weather preparedness. This framework includes requirements for: (i) freeze protection measures for both new and existing BES generating units that operate on a routine basis in freezing temperatures; (ii) the development of enhanced cold weather preparedness plans and annual training on those plans for all BES generating units; and (iii) the development and implementation of Corrective Action Plans to address known freezing issues or issues with applying the required freeze protections to provide the capability to operate. The Commission has previously approved this general framework with directives for further revisions in its orders approving Reliability Standards EOP-012-1[5] and EOP-012-2.[6]

Proposed Reliability Standard EOP-012-3 would further improve upon the currently effective Reliability Standard EOP-012-2 through enhanced and expanded requirements that would ensure that entities are implementing corrective actions to address known issues affecting their ability to operate reliability in cold weather in a timely manner. For those circumstances in which implementing corrective actions may not be feasible, referred to in the proposed standard as "Generator Cold Weather Constraints," proposed Reliability Standard EOP-012-3 would provide an improved framework for the identification, validation, and periodic review of such constraints. Consistent with the Commission's directives in its June 2024 Order, this framework provides clear, detailed, and objective criteria so responsible entities understand the performance that is expected of them.

Reliability Corp.*, 182 FERC ¶ 61,094 [hereinafter February 2023 Order], *reh'g denied*, 183 FERC ¶ 62,034, *order addressing arguments raised on reh'g*, 183 FERC ¶ 61,222 (2023).

[6] *N. Am. Elec. Reliability Corp.*, 187 FERC ¶ 61,204 (2024) (approving Reliability Standard EOP-012-2 and directing further revisions) [hereinafter June 2024 Order].

For the reasons stated more fully in the main filing, the proposed Reliability Standard is designed to achieve a specific reliability goal (improved cold weather preparedness), and it contains a technically sound means to achieve that goal through requirements addressing the implementation of freeze protection measures to provide capability to operate at a statistically extreme cold weather temperature, requirements to address any freezing-related issues that later occur, and requirements to develop a cold weather preparedness plan and provide training on that plan to relevant personnel.

2. Proposed Reliability Standards must be applicable only to users, owners, and operators of the bulk power system, and must be clear and unambiguous as to what is required and who is required to comply.[7]

The proposed Reliability Standard is clear and unambiguous as to what is required and who is required to comply, in accordance with Order No. 672. Proposed Reliability Standard EOP-012-3 would apply to Generator Owners and Generator Operators owning or operating applicable Facilities. As with currently effective Reliability Standard EOP-012-2, where BES generating units that do not generally operate in freezing conditions are exempted from requirements to implement freeze protection measures, proposed Reliability Standard EOP-012-3 provides clear language to that effect in the specific requirements.

The proposed Reliability Standard clearly articulates the actions that applicable entities must take to comply with the standard. Consistent with the Commission's directives in the June 2024 Order, proposed Reliability Standard EOP-012-3 would improve and clarify upon requirements addressing the timing of completing Corrective Action Plans where required under

[7] *See* Order No. 672, *supra* note 1, at P 322 ("The proposed Reliability Standard may impose a requirement on any user, owner, or operator of such facilities, but not on others.").

See Order No. 672, *supra* note 1, at P 325 ("The proposed Reliability Standard should be clear and unambiguous regarding what is required and who is required to comply. Users, owners, and operators of the Bulk-Power System must know what they are required to do to maintain reliability.").

the standard. Proposed Reliability Standard EOP-012-3 would also further define the circumstances under which a Generator Owner may declare constraints that preclude them from implementing one or more corrective actions to address freezing issues (Generator Cold Weather Constraints).

3. A proposed Reliability Standard must include clear and understandable consequences and a range of penalties (monetary and/or non-monetary) for a violation.[8]

The Violation Risk Factors ("VRFs") and Violation Severity Levels ("VSLs") for the proposed Reliability Standard comport with NERC and Commission guidelines related to their assignment, as discussed further in Exhibit G. The assignment of the severity level for each VSL is consistent with the corresponding requirement, and the VSLs should ensure uniformity and consistency in the determination of penalties. The VSLs do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations. For these reasons, the proposed Reliability Standard includes clear and understandable consequences in accordance with Order No. 672.

[8] *See* Order No. 672, *supra* note 1, at P 326 ("The possible consequences, including range of possible penalties, for violating a proposed Reliability Standard should be clear and understandable by those who must comply.").

4. A proposed Reliability Standard must identify clear and objective criteria or measures for compliance, so that it can be enforced in a consistent and non-preferential manner.[9]

The proposed Reliability Standard contains measures that support each requirement by clearly identifying what is required and how the requirement will be enforced. These measures help provide clarity regarding how the requirements would be enforced and help ensure that the requirements would be enforced in a clear, consistent, and non-preferential manner and without prejudice to any party.

5. Proposed Reliability Standards should achieve a reliability goal effectively and efficiently, but do not necessarily have to reflect "best practices" without regard to implementation cost or historical regional infrastructure design.[10]

The proposed Reliability Standard achieves its reliability goals effectively and efficiently in accordance with Order No. 672. Proposed Reliability Standard EOP-012-3 would achieve the reliability goal of improving generator preparedness for cold weather, while recognizing that what constitutes "cold weather" varies across the North American continent and that generators may take different actions to meet the performance requirements of the standard. Like prior versions of the EOP-012 standard, the proposed Reliability Standard accommodates regional differences in the temperature that constitutes "extreme cold," and it provides flexibility to entities on the measures they may take to ensure capability to operate at that temperature.

Consistent with the Commission's directives in the June 2024 Order, proposed Reliability Standard EOP-012-3 would further define the circumstances under which a Generator Owner may

---

[9] *See* Order No. 672, *supra* note 1, at P 327 ("There should be a clear criterion or measure of whether an entity is in compliance with a proposed Reliability Standard. It should contain or be accompanied by an objective measure of compliance so that it can be enforced and so that enforcement can be applied in a consistent and non-preferential manner.").

[10] *See* Order No. 672, *supra* note 1, at P 328 ("The proposed Reliability Standard does not necessarily have to reflect the optimal method, or 'best practice,' for achieving its reliability goal without regard to implementation cost or historical regional infrastructure design. It should however achieve its reliability goal effectively and efficiently.").

declare that constraints preclude them from implementing one or more corrective actions to address freezing issues and would improve and clarify requirements for implementing corrective actions in a Corrective Action Plan so known reliability risks are addressed more quickly. These clarifications and improvements contribute to a clearer and stronger standard for generator cold weather preparedness that would help advance the reliability of the Bulk-Power System during future cold weather seasons.

6. Proposed Reliability Standards cannot be "lowest common denominator," i.e., cannot reflect a compromise that does not adequately protect Bulk-Power System reliability. Proposed Reliability Standards can consider costs to implement for smaller entities, but not at consequences of less than excellence in operating system reliability.[11]

The proposed Reliability Standard does not reflect a "lowest common denominator" approach. As with currently effective Reliability Standard EOP-012-2, the proposed Reliability Standard would require all owners or operators of BES generating units to identify cold weather data, calculate an Extreme Cold Weather Temperature for their generating unit(s), and develop and provide training annually on a comprehensive cold weather preparedness plan for the unit(s). For BES generating units that operate in freezing conditions, proposed Reliability Standard EOP-012-3 would carry forward requirements to help ensure that the generating unit has the appropriate freeze protection measures to operate reliably at the Extreme Cold Weather Temperature. Prior versions of the EOP-012 standard recognized that, in limited instances, freeze protection measures

[11] *See* Order No. 672, *supra* note 1, at P 329 ("The proposed Reliability Standard must not simply reflect a compromise in the ERO's Reliability Standard development process based on the least effective North American practice—the so-called 'lowest common denominator'—if such practice does not adequately protect Bulk-Power System reliability. Although the Commission will give due weight to the technical expertise of the ERO, we will not hesitate to remand a proposed Reliability Standard if we are convinced it is not adequate to protect reliability.").

See Order No. 672, *supra* note 1, at P 330 ("A proposed Reliability Standard may take into account the size of the entity that must comply with the Reliability Standard and the cost to those entities of implementing the proposed Reliability Standard. However, the ERO should not propose a 'lowest common denominator' Reliability Standard that would achieve less than excellence in operating system reliability solely to protect against reasonable expenses for supporting this vital national infrastructure. For example, a small owner or operator of the Bulk-Power System must bear the cost of complying with each Reliability Standard that applies to it.").

to provide full capability may not be able to be implemented at all or except at a prohibitive cost; in such cases, Generator Owners may consider whether a Generator Cold Weather Constraint would apply. In the interest of advancing operating system reliability, the criteria for what constitutes a Generator Cold Weather Constraint is limited, and Generator Owners declaring such a constraint must account for their limitations in the generating unit cold weather data provided to reliability entities and review these constraints periodically for continued applicability.

Consistent with the June 2024 Order, proposed Reliability Standard EOP-012-3 would improve upon prior versions of the standard by further defining the Generator Cold Weather Constraint criteria, providing for proactive ERO Enterprise oversight over constraint declarations, and requiring entities to perform more frequent reviews of their declared constraints to ensure they remain valid. The periodicity for these more frequent reviews strikes an appropriate balance between concerns about the administrative burden posed by more frequent reviews with the need to consider changed circumstances, including advancements in freeze protection technologies, that may eliminate the need for the constraint. The proposed standard also clarifies and improves upon Corrective Action Plan implementation deadlines, to help ensure that known reliability issues are addressed more quickly.

7. Proposed Reliability Standards must be designed to apply throughout North America to the maximum extent achievable with a single Reliability Standard while not favoring one geographic area or regional model. It should take into account regional variations in the organization and corporate structures of transmission owners and operators, variations in generation fuel type and ownership patterns, and regional variations in market design if these affect the proposed Reliability Standard.[12]

The proposed Reliability Standard would apply consistently throughout North America and does not favor one geographic area or regional model. The proposed Reliability Standard would

[12] *See* Order No. 672, *supra* note 1, at P 331 ("A proposed Reliability Standard should be designed to apply throughout the interconnected North American Bulk-Power System, to the maximum extent this is achievable with a

provide sufficient flexibility to accommodate regional/geographic variations, including climate, generation type, market issues, state rules, and other considerations.

8. Proposed Reliability Standards should cause no undue negative effect on competition or restriction of the grid beyond any restriction necessary for reliability.[13]

The proposed Reliability Standard would have no undue negative effect on competition and would not unreasonably restrict the available transmission capacity or limit the use of the BPS in a preferential manner. The proposed standard would require the same performance by each of the applicable entities. While the Generator Cold Weather Constraint criteria identify some circumstances that would apply only to specific generation types (i.e. specific freeze protection measures on specific types of generation), all types of generation are accounted for in the proposed standard.

9. The implementation time for the proposed Reliability Standard is reasonable.[14]

The proposed effective date for the proposed Reliability Standard is just and reasonable and appropriately balances the urgency in the need to implement the standard against the reasonableness of the time allowed for those who must comply to develop necessary procedures or other relevant capability. Under the proposed implementation plan for Reliability Standard

---

single Reliability Standard. The proposed Reliability Standard should not be based on a single geographic or regional model but should take into account geographic variations in grid characteristics, terrain, weather, and other such factors; it should also take into account regional variations in the organizational and corporate structures of transmission owners and operators, variations in generation fuel type and ownership patterns, and regional variations in market design if these affect the proposed Reliability Standard.").

[13] *See* Order No. 672, *supra* note 1, at P 332 ("As directed by section 215 of the FPA, the Commission itself will give special attention to the effect of a proposed Reliability Standard on competition. The ERO should attempt to develop a proposed Reliability Standard that has no undue negative effect on competition. Among other possible considerations, a proposed Reliability Standard should not unreasonably restrict available transmission capability on the Bulk-Power System beyond any restriction necessary for reliability and should not limit use of the Bulk-Power System in an unduly preferential manner. It should not create an undue advantage for one competitor over another.").

[14] *See* Order No. 672, *supra* note 1, at P 333 ("In considering whether a proposed Reliability Standard is just and reasonable, the Commission will consider also the timetable for implementation of the new requirements, including how the proposal balances any urgency in the need to implement it against the reasonableness of the time allowed for those who must comply to develop the necessary procedures, software, facilities, staffing or other relevant capability.").

EOP-012-3, Reliability Standard EOP-012-3 and the revised definition of Generator Cold Weather Constraint would become effective on the later of: (1) October 1, 2025; or (2) the first day of the first calendar quarter that is three (3) months following regulatory approval. The October 1, 2025 date was chosen because, in the United States, the last compliance date for Reliability Standard EOP-012-2 is October 1, 2025 (Requirement R3). This relatively short implementation timeframe reflects NERC's determination that the practical impact of implementing the proposed changes is not expected to be significant. Entities, however, would have sufficient notice of their revised obligations. As multiple versions of the EOP-012 standard have been developed over the last several years, additional implementation information is provided to ensure an orderly transition to proposed Reliability Standard EOP-012-3. As discussed more fully in Section VI of the main filing, NERC has identified a potential concern regarding the implementation of revised Requirement R2 for a subset of new BES generating units entering commercial operation on or soon after October 1, 2027. To address this concern, NERC proposes to allow these entities additional time to comply with Requirement R2. The proposed implementation plan is attached as **Exhibit B** to this petition.

10. The Reliability Standard was developed in an open and fair manner and in accordance with the Commission-approved Reliability Standard development process.[15]

The proposed Reliability Standard was developed in accordance with NERC's Commission-approved processes for developing and approving Reliability Standards. **Exhibit H**

[15] *See* Order No. 672, *supra* note 1, at P 334 ("Further, in considering whether a proposed Reliability Standard meets the legal standard of review, we will entertain comments about whether the ERO implemented its Commission-approved Reliability Standard development process for the development of the particular proposed Reliability Standard in a proper manner, especially whether the process was open and fair. However, we caution that we will not be sympathetic to arguments by interested parties that choose, for whatever reason, not to participate in the ERO's Reliability Standard development process if it is conducted in good faith in accordance with the procedures approved by the Commission.").

includes a summary of the Reliability Standard development proceedings, and details the processes followed to develop the proposed Reliability Standard. These processes included, among other things, comment periods, pre-ballot review periods, and balloting periods. Additionally, all meetings of the standard drafting team were properly noticed and open to the public.

Following the initiation of Section 321.5 of the NERC Rules of Procedure by the NERC Board of Trustees, NERC posted a revised draft EOP-012-3 standard for a 45-day public comment period. The draft was revised considering the comments received. The proposed Reliability Standard was approved by the Board of Trustees on April 4, 2025. In approving the standard, the Board of Trustees considered the factors identified in Section 321.5 of the NERC Rules of Procedure, the Order No. 672 criteria, the June 2024 Order directives, the record of development including the comments received during the final posting, the consideration of those comments, and the recommendations of NERC management.

11. NERC must explain any balancing of vital public interests in the development of proposed Reliability Standards.[16]

NERC has identified no competing public interests regarding the request for approval of the proposed Reliability Standard.

12. Proposed Reliability Standards must consider any other appropriate factors.[17]

No other negative factors relevant to whether the proposed Reliability Standard is just and reasonable were identified.

---

[16] *See* Order No. 672, *supra* note 1, at P 335 ("Finally, we understand that at times development of a proposed Reliability Standard may require that a particular reliability goal must be balanced against other vital public interests, such as environmental, social and other goals. We expect the ERO to explain any such balancing in its application for approval of a proposed Reliability Standard.").

[17] *See* Order No. 672, *supra* note 1, at P 323 ("In considering whether a proposed Reliability Standard is just and reasonable, we will consider the following general factors, as well as other factors that are appropriate for the particular Reliability Standard proposed.").

Violation Risk Factor and Violation Severity Level Justifications

Project 2024-03 Revisions to EOP-012-2

This document provides the drafting team's (DT's) justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in EOP-012-3. Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the Electric Reliability Organizations (ERO) Sanction Guidelines. The DT applied the following NERC criteria and FERC Guidelines when developing the VRFs and VSLs for the requirements.

NERC Criteria for Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

FERC Guidelines for Violation Risk Factors

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

FERC seeks to ensure that VRFs assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System (BPS). In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the BPS:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard
FERC expects a rational connection between the sub-Requirement VRF assignments and the main Requirement VRF assignment.

Guideline (3) – Consistency among Reliability Standards
FERC expects the assignment of VRFs corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular VRF level conforms to NERC's definition of that risk level.

Guideline (5) – Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC Criteria for Violation Severity Levels

VSLs define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

VSLs should be based on NERC's overarching criteria shown in the table below:

Lower VSL	Moderate VSL	High VSL	Severe VSL
The performance or product measured almost meets the full intent of the requirement.	The performance or product measured meets the majority of the intent of the requirement.	The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.	The performance or product measured does not substantively meet the intent of the requirement.

FERC Order of Violation Severity Levels

The FERC VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

Guideline (1) – Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline (2) – Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.
Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline (3) – Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline (4) – Violation Severity Level Assignment Should Be Based on a Single Violation, Not on a Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VRF Justification for EOP-012-3, Requirement R1

The VRF did not change from the previously FERC approved EOP-012-2 Reliability Standard.

VSLs for EOP-012-3, Requirement R1			
Lower	**Moderate**	**High**	**Severe**
The Generator Owner did not calculate the Extreme Cold Weather Temperature or identify generating unit(s) cold weather data in accordance with Requirement R1 for 5% or less of its applicable units.	The Generator Owner did not calculate the Extreme Cold Weather Temperature or identify generating unit(s) cold weather data in accordance with Requirement R1 for more than 5%, but less than or equal to 10% of its applicable units.	The Generator Owner did not calculate the Extreme Cold Weather Temperature or identify generating unit(s) cold weather data in accordance with Requirement R1 for more than 10%, but less than or equal to 20% of its applicable units.	The Generator Owner did not calculate the Extreme Cold Weather Temperature or identify generating unit(s) cold weather data in accordance with Requirement R1 for more than 20% of its applicable units.

VSL Justifications for EOP-012-3, Requirement R1	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	There is a clarifying word change from “and” to “or” in all the VSL levels which did not have the unintended consequence of lowering the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VRF Justification for EOP-012-3, Requirement R2

The VRF did not change from the previously FERC approved EOP-012-2 Reliability Standard.

VSLs for EOP-012-3, Requirement R2			
Lower	**Moderate**	**High**	**Severe**
The Generator Owner did not have freeze protection measure(s) for its applicable unit(s) meeting the criteria in Requirement R2 for 5% or less of its applicable units. OR The Generator Owner did not declare a Generator Cold Weather Constraint (if applicable) to implement appropriate freeze protection measures for 5% or less of its applicable units.	The Generator Owner did not have freeze protection measure(s) for its applicable unit(s) meeting the criteria in Requirement R2 for more than 5%, but less than or equal to 10% of its applicable units. OR The Generator Owner did not declare a Generator Cold Weather Constraint (if applicable) for more than 5%, but less than or equal to 10% of its applicable units. units.	The Generator Owner did not have freeze protection measure(s) meeting the criteria in Requirement R2 for more than 10%, but less than or equal to 20% of its applicable units. OR The Generator Owner did not declare a Generator Cold Weather Constraint (if applicable) for more than 10%, but less than or equal to 20% of its applicable units.	The Generator Owner did not have freeze protection measure(s) meeting the criteria in Requirement R2 for more than 20% of its applicable units. OR The Generator Owner did not declare a Generator Cold Weather Constraint (if applicable) for more than 20% of its applicable units.

VSL Justifications for EOP-012-3, Requirement R2	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement was modified to capture the difference for generating units for which the Generator Owner first contractually committed to design criteria relevant to this Requirement on or before/after June 29, 2023. The VSL was modified to add Generator Cold Weather Constraint and did not have the unintended consequence of lowering the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VRF Justification for EOP-012-3, Requirement R3

The VRF did not change from the previously FERC approved EOP-012-2 Reliability Standard.

VSL Justification for EOP-012-3, Requirement R3

The Drafting Team made non-substantial changes to this Requirement. The VSL did not change from the previously FERC approved EOP-012-2 Reliability Standard.

VRF Justification for EOP-012-3, Requirement R4

The VRF did not change from the previously FERC approved EOP-012-2 Reliability Standard.

VSLs for EOP-012-3, Requirement R4			
Lower	**Moderate**	**High**	**Severe**
The Generator Owner implemented a cold weather preparedness plan(s) but failed to maintain it.	The Generator Owner's cold weather preparedness plan failed to include one of the applicable parts within Requirement R4.	The Generator Owner maintained a cold weather preparedness plan(s) but failed to implement it. OR The Generator Owner's cold weather preparedness plan failed to include two of the applicable requirement parts within Requirement R4.	The Generator Owner does not have a cold weather preparedness plan(s). OR The Generator Owner's cold weather preparedness plan failed to include three or more of the applicable requirement parts within Requirement R4.

VSL Justifications for EOP-012-3, Requirement R4	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The clarifying change in the High VSL to remove “had and” to align with the requirement language which did not have the unintended consequence of lowering the current level of compliance. There are no changes to other levels of the VSLs.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VRF Justification for EOP-012-3, Requirement R5

The VRF did not change from the previously FERC approved EOP-012-2 Reliability Standard.

VSLs for EOP-012-3, Requirement R5			
Lower	**Moderate**	**High**	**Severe**
The Generator Owner or Generator Operator failed to provide annual generating unit-specific training as described in Requirement R5 to the greater of: • one applicable personnel for a single generating unit; or • 5% or less of its total applicable personnel.	The Generator Owner or Generator Operator failed to provide annual generating unit-specific training as described in Requirement R5 to the greater of: • two applicable personnel for a single generating unit; or • more than 5%, but less than or equal to 10% of its total applicable personnel.	The Generator Owner or Generator Operator failed to provide annual generating unit-specific training as described in Requirement R5 to the greater of: • three applicable personnel for a single generating unit; or • more than 10%, but less than or equal to 15% of its total applicable personnel.	The Generator Owner or Generator Operator failed to provide annual generating unit-specific training as described in Requirement R5 to the greater of: • four or more applicable personnel for a single generating unit; or • more than 15% of its total applicable personnel.

VSL Justifications for EOP-012-3, Requirement R5	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	There is a word change from “at” to “for” in reference to personnel supporting generating units in all the VSL which did not have the unintended consequence of lowering the current level of compliance. This edit clarifies that individuals needing unit-specific training may support many plant locations and not be specifically assigned at one plant. There are no changes to other levels of the VSLs.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VRF Justification for EOP-012-3, Requirement R6

The VRF did not change from the previously FERC approved EOP-012-2 Reliability Standard.

VSLs for EOP-012-3, Requirement R6			
Lower	**Moderate**	**High**	**Severe**
The Generator Owner conducted a review of applicability to freeze protection measures at other unit(s) owned by the Generator Owner in accordance with Requirement R6, Part 6.2, but it was conducted more than 12 but fewer than 15 calendar months after the Generator Cold Weather Reliability Event.	The Generator Owner conducted a review of applicability to freeze protection measures at other unit(s) owned by the Generator Owner in accordance with Requirement R6, Part 6.2, but it was conducted more than 15 but fewer than 18 calendar months after the Generator Cold Weather Reliability Event. OR The Generator Owner developed and implemented a Corrective Action Plan where required under Requirement R6, but it failed to contain one of the elements in Requirement R6, Part 6.3.	The Generator Owner conducted a review of applicability to freeze protection measures at other unit(s) owned by the Generator Owner in accordance with Requirement R6, Part 6.2, but it was conducted more than 18 but fewer than 24 calendar months after the Generator Cold Weather Reliability Event. OR The Generator Owner developed and implemented a Corrective Action Plan where required under Requirements R6, but it failed to contain two of the elements in Requirement R6, Part 6.3. OR The Generator Owner submitted a Corrective Action Plan extension request in accordance with Requirement R6, Part 6.4 (if applicable), but it did not include one of the required elements.	The Generator Owner failed to develop a Corrective Action Plan where required under Requirement R6. OR The Generator Owner developed a Corrective Action Plan where required under Requirement R6, but failed to implement it. OR The Generator Owner failed to conduct a review of applicability to freeze protection measures at other unit(s) owned by the Generator Owner in accordance with Requirement R6, Part 6.2, or the Generator Owner conducted the review, but it was conducted more than 24 calendar months after the Generator Cold Weather Reliability Event. OR The Generator Owner developed and implemented a Corrective Action Plan, but failed to contain

			three or more of the elements in Requirement R6, Part 6.3. OR The Generator Owner exceeded the timetables specified for completion in Requirement R6, Part 6.3.5, but did not submit a Corrective Action Plan extension request in accordance with Requirement R6, Part 6.4 (if applicable). OR The Generator Owner submitted a Corrective Action Plan extension request in accordance with Part 6.4 (if applicable), but it did not include two or more of the elements in Requirement R6, Part 6.4.

VSL Justifications for EOP-012-3, Requirement R6	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement was modified to ensure that there is a process in place when developing and implementing Corrective Action Plans as well timelines on when Corrective Action Plans should be complete. The proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VRF Justification for EOP-012-3, Requirement R7

The VRF did not change from the previously FERC approved EOP-012-2 Reliability Standard.

VSLs for EOP-012-3, Requirement R7			
Lower	**Moderate**	**High**	**Severe**
N/A	The Generator Owner developed and implemented a Corrective Action Plan in accordance with Requirement R7, but it failed to include a description of updates to the cold weather preparedness plan and identification of operating limits as required in Requirement R7, Parts 7.1.3 and 7.1.4.	The Generator Owner developed and implemented a Corrective Action Plan in accordance with Requirement R7, but it failed to include one of the required elements under Requirement R7 Parts 7.1.1 and 7.1.2. OR The Generator Owner submitted a Corrective Action Plan extension request in accordance with Requirement R7, Part 7.2 (if applicable), but it did not include one of the required elements.	The Generator Owner developed and implemented a Corrective Action Plan in accordance with Requirement R7, but it failed to include two or more of the required elements under Requirement R7 Parts 7.1.1 and 7.1.2. OR The Generator Owner submitted a Corrective Action Plan extension request in accordance with Requirement R7, Part 7.2 (if applicable), but it did not include two or more of the required elements. OR The Generator Owner failed to submit a Corrective Action Plan extension request where the timetables for completing selected actions were projected to exceed the timelines in Part 7.1 (if applicable). OR The Generator Owner failed to implement corrective action(s)

			identified in a Corrective Action Plan, and did not document in a declaration any Generator Cold Weather Constraint(s) in accordance with Requirement R7 Part 7.3. OR The Generator Owner failed to complete corrective action(s) described in the Corrective Action Plan, and did not document in a declaration any Generator Cold Weather Constraint(s) that preclude the Generator Owner from implementing selected action(s) contained within the Corrective Action Plan.

VSL Justifications for EOP-012-3, Requirement R7	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement was modified to ensure that each Generator Owner shall have dated evidence that demonstrates it implemented each Corrective Action Plan, including updating actions or timetables, or has explained in a declaration why corrective actions are not being implemented in accordance with Requirement R7. The proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VRF Justification for EOP-012-3, Requirement R8

The VRF did not change from the previously FERC approved EOP-012-2 Reliability Standard.

VSLs for EOP-012-3, Requirement R8			
Lower	**Moderate**	**High**	**Severe**
The Generator Owner declared a Generator Cold Weather Constraint and submitted it to the Compliance Enforcement Authority but it did not do so within the timeframe provided in Requirement R8 Part 8.1.	The Generator Owner declared a Generator Cold Weather Constraint, but failed to update its operating limitations as required under Requirement R8, Part 8.2 (if applicable).	The Generator Owner declared a Cold Weather Constraint, but failed to update its Corrective Action Plan following a determination by the Compliance Enforcement Authority that the constraint is invalid in accordance with Requirement R8 Part 8.3 (as applicable). OR The Generator Owner failed to document and provide the required notice to the CEA under Requirement R8 Part 8.4 (if applicable).	The Generator Owner declared a Generator Cold Weather Constraint but failed to submit it to the Compliance Enforcement Authority. OR The Generator Owner failed to implement freeze protection measures to provide the necessary capability in accordance with Requirement R8 Part 8.3.

VSL Justifications for EOP-012-3, Requirement R8	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The Drafting Team added Lower VSL and Moderate VSL to enforce that the Generator Owner should submit a Generator Cold Weather Constraint in accordance with Requirement R8, Part 8.1 within the specified timeframe and must comply with Requirement R8, Parts 8.2 through 8.3. An additional level in the high VSL was added to cover new language in Requirement R8 Part 8.4 that was added to the standard covering the scenario that would allow a Generator Owner to document a new Generator Cold Weather Constraint that under an existing Generator Cold Weather Constraint that was previously validated and provide notice to the Compliance Enforcement Authority. The proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VRF Justification for EOP-012-3, Requirement R9

VRF Justifications for EOP-012-3, Requirement R9	
Proposed VRF	**Lower**
NERC VRF Discussion	A VRF of Lower is appropriate due to the fact that reviewing each Generator Cold Weather Constraint declaration validated by the Compliance Enforcement Authority at least once every 36 calendar months is administrative in nature. Failure to review the declaration in the timeframe would not under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Therefore, it is consistent with the definition of a Lower VRF.
FERC VRF G1 Discussion Guideline 1- Consistency with Blackout Report	This VRF is consistent with the identified areas from the FERC list of critical areas in the Final Blackout Report.
FERC VRF G2 Discussion Guideline 2- Consistency within a Reliability Standard	This requirement has only a main VRF and no different sub-requirement VRFs.
FERC VRF G3 Discussion Guideline 3- Consistency among Reliability Standards	This VRF is consistent with other VRFs that address similar reliability goals in different Reliability Standards.
FERC VRF G4 Discussion Guideline 4- Consistency with NERC Definitions of VRFs	This VRF is consistent with the definition of a lower VRF requirement per the criteria filed with FERC as part of the ERO's Sanctions Guidelines.
FERC VRF G5 Discussion Guideline 5- Treatment of Requirements that Co-mingle More than One Obligation	This requirement does not mingle a higher risk reliability objective and a lesser risk reliability objective. Therefore, the VRF reflects the risk of the whole requirement.

VSLs for EOP-012-3, Requirement R9			
Lower	**Moderate**	**High**	**Severe**
The Generator Owner reviewed a Generator Cold Weather Constraint declaration validated by the Compliance Enforcement Authority to determine if it remains valid in accordance with Requirement R9, but this review was conducted more than 36 but fewer than 38 calendar months after CEA validation or after the previous Generator Owner review.	The Generator Owner reviewed a Generator Cold Weather Constraint declaration validated by the Compliance Enforcement Authority to determine if it remains valid in accordance with Requirement R9, but this review was conducted more than 38 but fewer than 40 calendar months after CEA validation or after the previous Generator Owner review.	The Generator Owner reviewed a Generator Cold Weather Constraint declaration validated by the Compliance Enforcement Authority to determine if it remains valid in accordance with Requirement R9, but this review was conducted more than 40 but fewer than 42 calendar months after CEA validation or after the previous Generator Owner review.	The Generator Owner reviewed a Generator Cold Weather Constraint declaration validated by the Compliance Enforcement Authority to determine if it remains valid in accordance with Requirement R9, but this review was performed more than 42 calendar months after CEA validation or after the previous Generator Owner review. OR The Generator Owner failed to review a Generator Cold Weather Constraint declaration validated by the Compliance Enforcement Authority to determine if it remains valid in accordance with Requirement R9. OR The Generator Owner failed to develop or update a Corrective Action Plan where required by Requirement R9, Part 9.1 (if applicable).

VSL Justifications for EOP-012-3, Requirement R9	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The Drafting Team drafted Requirement R9 to enforce that the Generator Owner review a Generator Cold Weather Constraint declaration validated by the Compliance Enforcement Authority to determine if it remains valid at least once every 36 months. If the constraint is no longer valid, Requirement R9, Part 9.1 requires the Generator Owner to develop or update a Corrective Action Plan pursuant to Requirement R7 within six (6) calendar months. The proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Exhibit H
Summary of Development and Complete Record of Development

Summary of Development History

The following is a summary of the development record for proposed Reliability Standard EOP-012-3.

I. Overview of the Standard Drafting Team

When evaluating a proposed Reliability Standard, the Commission is expected to give "due weight" to the technical expertise of the ERO.[1] The first two drafts of proposed Reliability Standard EOP-012-3 were developed by the standard drafting team ("SDT") selected to lead this project in accordance with Section 4.3 of the NERC Standard Processes Manual.[2] The SDT consisted of industry experts, all with a diverse set of experiences. A roster of the Project 2024-03 Revisions to EOP-012-2 SDT members is included in **Exhibit I**. Following the initiation of Section 321.5 of the NERC Rules of Procedure, the third and final drafts of proposed Reliability Standard EOP-012-3 were developed by volunteers from the NERC Standards Committee, working with NERC Staff. In developing these drafts, the group considered the Federal Energy Regulatory Commission ("FERC" or "Commission" directives), the recommendations of the Project 2024-03 SDT, and industry comments from prior postings and the Section 321.5 45-day public comment period.

II. Standard Development History

A. History of the EOP-012 Standard

NERC developed Reliability Standard EOP-012-1 to address reliability related findings from the 2021 FERC, NERC, and Regional Entity Joint Staff Report, *The February 2021 Cold*

[1] Section 215(d)(2) of the Federal Power Act; 16 U.S.C. § 824(d)(2).

[2] The NERC *Standard Processes Manual* is available at https://www.nerc.com/AboutNERC/Pages/Rules-of-Procedure.aspx.

Weather Outages in Texas and the South Central United States.[3] On February 16, 2023, FERC issued an order approving Reliability Standards EOP-011-3 and EOP-012-1 and directing modification of Reliability Standard EOP-012-1. In response, NERC developed Reliability Standard EOP-012-2 and submitted it for Commission approval in February 2024. On June 27, 2024, FERC issued an order approving Reliability Standard EOP-012-2 and directing further modifications.

B. Standard Authorization Request Development

On July 17, 2024, the Standards Committee accepted the Project 2024-03 Revisions to EOP-012-2 Standards Authorization Request ("SAR"), authorized an informal comment period of at least 15 days from July 18, 2024 through August 16, 2024 in accordance with the procedural waiver discussed in the following section, and authorized the solicitation of SDT members for a period of at least 15 days.[4] The Standards Committee authorized drafting revisions to the Reliability Standard as identified in the SAR on September 6, 2024.[5]

C. Standards Committee Authorizes Procedural Waiver

On July 17, 2024, the Standards Committee Executive Committee authorized a waiver of Sections 4.8, 4.9, 4.12 and 4.13 of the Standard Processes Manual to reduce the informal comment period the SAR from 30 days to as little as 15 days, reduce the initial formal comment and ballot periods from 45 days to as little as 20 days with additional formal comment and ballot periods

[3] FERC, NERC, Regional Entity Staff Report: *The February 2021 Cold Weather Outages in Texas and the South Central United States* (Nov. 2021), https://www.ferc.gov/media/february-2021-cold-weather-outages-texas-and-south-central-united-states-ferc-nerc-and [hereinafter February 2021 Event Joint Inquiry Report].

[4] NERC, *Standards Committee Meeting Minutes* (July 17, 2021), https://www.nerc.com/comm/SC/Agenda%20Highlights%20and%20Minutes/Meeting_Minutes-July_2024.pdf.

[5] NERC, *Standards Committee Executive Committee Agenda Package September 6, 2024*, https://www.nerc.com/comm/SC/Agenda%20Highlights%20and%20Minutes/SCEC_Call_September_6_2024.pdf.

reduced from 30 days to as little as 15 days, and final ballot periods reduced from 10 days to as little as 5 days.

D. First Posting - Comment Period, Initial Ballot, and Non-binding Poll

On October 16, 2024, the Standards Committee authorized the initial posting of proposed Reliability Standard EOP-012-3 and the associated Implementation Plan and other associated documents for a 20-day formal comment period.[6] The initial posting took place from October 17, 2024 through November 5, 2024, with a parallel initial ballot and non-binding poll on the Violation Risk Factors ("VRFs") and Violation Severity Levels ("VSLs") held during the last 5 days of the comment period from October 31, 2024 through November 5, 2024.[7] The initial ballot for proposed Reliability Standard EOP-012-3 received 42.29 percent approval, reaching quorum at 90.98 percent of the ballot pool, and the initial ballot for the associated Implementation Plan received 45.86 percent approval with 91.25 percent quorum.[8] The non-binding poll for the associated VRFs and VSLs received 40.83 percent supportive opinions, reaching quorum at 91.56 percent of the ballot pool.[9] There were 60 sets of responses, including comments from approximately 165 different individuals and approximately 109 companies, representing all 10 industry segments.[10]

E. Second Posting - Comment Period, Additional Ballot, and Non-binding Poll

The second draft of proposed Reliability Standard EOP-012-3, the associated Implementation Plan, and other associated documents were posted for an 18-day formal comment period from December 3, 2024 through December 20, 2024, with a parallel additional ballot and

non-binding poll held from December 16, 2024 through December 20, 2024.[11] The additional ballot for proposed Reliability Standard EOP-012-3 received 44.54 percent approval, reaching quorum at 88.93 percent of the ballot pool, and the additional ballot for the associated Implementation Plan received 59.7 percent approval with 89.58 percent quorum.[12] The non-binding poll for the associated VRFs and VSLs received 48.1 percent supportive opinions, reaching quorum at 88 percent of the ballot pool.[13] There were 66 sets of responses, including comments from approximately 171 different individuals and approximately 109 companies, representing all 10 industry segments.[14]

F. Proceedings under Section 321 of NERC Rules of Procedure

Following the failure of the ballot body to approve two successive drafts of revised Reliability Standard EOP-012-2, the NERC Board of Trustees took action at its January 10, 2025 meeting to invoke its special authority under Section 321 of the NERC Rules of Procedure.[15] Finding that the ballot body for draft Reliability Standard EOP-012-3 has not approved a proposed Reliability Standard that contains provisions to adequately address specific matters identified in directives issued by the Commission in its June 27, 2024 Order, the Board directed the following in accordance with NERC Rules of Procedure Section 321.5:

- Standards Committee, to work with NERC staff and stakeholders to prepare a draft Reliability Standard responsive to the directives in FERC's June 27, 2024 Order to

be posted for a 45-day public comment period in accordance with section 321.5.1 of the NERC Rules of Procedure, by no later than January 29, 2025;

- NERC Management present the draft Reliability Standard to the Board for its consideration, along with the entire record of development and any comments received, by no later than the open meeting to be convened for this purpose.

G. Third Posting – Comment Period

As directed by the NERC Board of Trustees, the third draft of proposed Reliability Standard EOP-012-3 was posted for a 45-day comment period from January 27, 2025 through March 12, 2025. There was no ballot associated with this comment period.[16] There were 43 sets of responses, including comments from approximately 108 different individuals and approximately 77 companies, representing 7 industry segments.[17]

H. Final Posting

Following the comment period, volunteers from the Standards Committee and NERC staff worked to develop recommendations for additional standards modifications considering the comments received during the 45-day public comment period. The final draft of proposed Reliability Standard EOP-012-3 and the supporting materials were posted to the NERC website on March 25, 2025. [18]

I. Board of Trustees Approval

On April 4, 2025, the NERC Board of Trustees approved proposed Reliability Standard EOP-012-3 as just, reasonable, not unduly discriminatory or preferential, and in the public interest in accordance with Section 321.5 of the NERC Rules of Procedure.[19] In making this determination,

[19] *Id.*

the Board considered the developmental record for the draft EOP-012-3 standard, including the comments received during the final posting, and the recommendations for further modifications following that posting in light of the comments received. The Board of Trustees also considered that the proposed Reliability Standard EOP-012-3 is practical, technically sound, technically feasible, cost justified, and serves the best interests of the reliability of the Bulk-Power System.

Complete Record of Development

Project 2024-03 Revisions to EOP-012-2

Related Files

Status

In June 2024, the Federal Energy Regulatory Commission (FERC) approved Reliability Standard EOP-012-2 and directed NERC to submit a revised version to address and clarify several aspects within nine months of the date of the order.

In consideration of FERC's deadline and the importance of this standard, the Board invoked its authority under Section 321.5 of NERC's Rules of Procedure. Under this authority, the Board directed the Standards Committee, with the assistance of stakeholders and NERC staff, to prepare a responsive standard, which was then posted for a 45-day public comment period. This comment period concluded March 12, 2025.

Based on comments received, revisions have been made to the standard. The final documents that will be presented to the NERC Board of Trustees are posted below.

The NERC Board of Trustees will convene a special meeting on April 4, 2025 to review the standard and the complete record of developing, including the comments submitted during the public comment period, to determine next steps.

Background

NERC developed the original version of the generator cold weather preparedness Reliability Standard, Reliability Standard EOP-012-1, in 2022 under Project 2021-07 Extreme Cold Weather Grid Operations, Preparedness, and Coordination. The purpose of this project was to address standards-related recommendations from the Federal Energy Regulatory Commission (FERC)/NERC/Regional Entity staff review of operations during the February 2021 Winter Storm Uri event.

NERC developed Reliability Standard EOP-012-2 in 2023-2024 to address Commission directives from the February 2023 order approving Reliability Standards EOP-012-1 and EOP-011-3. In the February 2023 Order, the Commission directed that NERC revise EOP-012-1 to clarify the applicability of the standard's requirements for generator cold weather preparedness, further define the circumstances under which a Generator Owner may declare that constraints preclude them from implementing one or more corrective actions to address freezing issues, and to shorten the implementation timeline so cold weather reliability risks would be addressed more quickly.

On June 27, 2024, FERC issued an order approving Reliability Standard EOP-012-2. While finding Reliability Standard EOP-012-2 represented an improvement over the prior version and addressed many of its concerns, FERC found the standard requires further improvement to address certain concerns remaining from its February 2023 order. FERC therefore directed NERC to revise the standard in five areas and to submit a revised standard within nine (9) months of the date of the order, or by March 27, 2025.

Standard Affected: EOP-012-2

Purpose/Industry Need

The purpose of this project is to address the directives identified by FERC in its June 27, 2024 order approving Reliability Standard EOP-012-2 and directing further modifications. *N. Am. Elec. Reliability Corp.*, 187 FERC ¶ 61,204 (2024), available here. In that order, FERC found that further improvements needed to be made to address ambiguous language and address other reliability gaps/implementation issues in the standard and related definitions to fully address issues first raised in the Commission's February 2023 Order approving EOP-012-1. FERC directed that NERC submit the modifications within 9 months of the date of the order, or by March 27, 2025.

Proposed Project Timeline

The project timeline is listed below for industry awareness. This table will be updated with any changes as the project progresses.

Process Steps	Dates	Notes
Drafting Team members seated	08/21/2024	Standards Committee (SC) August meeting
Standards Committee Executive Committee (SCEC) authorize revisions	09/05/2024	SCEC Special Call
SC approval of initial ballot	10/16/2024	SC October Meeting
Initial Ballot	10/17/24–11/05/24	20-day initial ballot and comment period per waiver approved at July SC meeting
First Additional Ballot	12/3/24–12/20/24	18-day additional ballot and comment period per waiver
321 Action Considered	01/02/25–01/08/25	Based on additional ballot results, NERC staff will consider the comments received and if 321 action should be proposed to the NERC Board to meet the FERC deadline.
Board Special Call	01/10/25	The NERC Board decided to take action as detailed in Section 321.5 of the NERC Rules of Procedure
Special 321 Team	01/13/25–01/21/25	Review and finalize redlined Standard and associated documents.
SC Meeting	01/22/2025	NERC staff will provide updates to the SC
Quality Review	01/23/25 - 01/24/25	Quality Review process
Posting Date	01/27/25 - 03/12/25	45 day posting for industry comments (no ballot)
Board Action	03/20/2025	Board special call on submitting Standard for adoption
FERC Order DUE Date	03/27/25

Unofficial Nomination Form

Project 2024-03 Revisions to EOP-012-2

Do not use this form for submitting nominations. Use the electronic form to submit nominations for **Project 2024-03 Revisions to EOP-012-2** drafting team members by **8 p.m. Eastern, August 1, 2024.** This unofficial version is provided to assist nominees in compiling the information necessary to submit the electronic form.

Additional information about this project is available on the project page. If you have questions, contact Senior Standards Developer, Ben Wu (via email), or at 470-542-6882.

By submitting a nomination form, you are indicating your willingness and agreement to actively participate in face-to-face meetings and conference calls. Previous drafting or Standard review team experience is beneficial, but not required.

Project Information

Project Purpose

The purpose of this project is to address the directives identified by FERC in its June 27, 2024 order approving Reliability Standard EOP-012-2 and directing further modifications. *N. Am. Elec. Reliability Corp., 187* FERC ¶ 61,204 (2024), available here. In that order, FERC found that further improvements needed to be made to address ambiguous language and address other reliability gaps/implementation issues in the standard and related definitions to fully address issues first raised in the Commission's February 2023 Order approving EOP-012-1. FERC directed that NERC submit the modifications within 9 months of the date of the order, or by March 27, 2025.

Standards Affected

EOP-012-2

Nominee Expertise Requested

For this project, NERC is seeking individuals who possess experience with cold weather preparation, such as through performing or developing processes to address the following tasks:

- Performing inspection and identification of critical components on generating units that are susceptible to freezing and retrofitting generating units to operate at extreme temperatures;
- Conducting winter-specific and plant-specific operator awareness and preparedness training;
- Determining the causes of outages, failure to start or derates for generating units during cold weather conditions, and developing and implementing corrective action plans;
- Determining and communicating with the appropriate entities a generating unit's capacity during forecasted cold weather, including the accelerated cooling effect of wind;

- Developing or implementing Balancing Authority operating plans for contingency reserves and to mitigate capacity and energy emergencies;
- Developing or implementing load shed procedures of Transmission Operators, Transmission Owners, Distribution Providers and Balancing Authorities;
- Other tasks for the reliable planning and operation of the BPS during cold weather conditions.

Time Commitment Expectations

Time commitments for most projects include up to two face-to-face meetings per quarter (on average two full working days each meeting) with conference calls scheduled as needed. Team members can agree to individual or subgroup assignments, hold separate meetings, and present to the full drafting team for discussion and review. Another important component of quality reviews and drafting team efforts is outreach. Members of the team will be expected to conduct industry outreach during the development process to support a successful project outcome.

Project Priority

Each project will be developed according to that project's priority status. While each standard project addresses particular industry needs, some will be identified as a higher priority. A high priority project can include a strict timeline, which may be needed to effectively respond to a FERC Directive or other factors determined by the NERC Board of Trustees. A high priority project may also need to increase the frequency of meetings at any time throughout the development process to account for project timeline needs. Similarly, low priority projects may adjust to less frequent meetings to reallocate resources to high priority projects.

This project has been identified as high priority at this time.

Name:

E-mail:	
Please briefly describe your experience and qualifications to serve on the requested Standard Drafting Team (Bio):	
If you are currently a member of any NERC drafting team, please list each team here:	

☐ Not currently on any active SAR or standard drafting team. ☐ Currently a member of the following SAR or standard drafting team(s):
If you previously worked on any NERC drafting team please identify the team(s): ☐ No prior NERC SAR or standard drafting team. ☐ Prior experience on the following team(s):
Acknowledgement that the nominee has read and understands both the *NERC Participant Conduct Policy* and the *Standard Drafting Team Scope* documents, available on NERC Standards Resources. ☐ Yes, the nominee has read and understands these documents.

Select each NERC Region in which you have experience relevant to the Project for which you are volunteering:		
☐ MRO ☐ NPCC ☐ RF	☐ SERC ☐ Texas RE ☐ WECC	☐ NA – Not Applicable

Select each Industry Segment that you represent:	
☐	1 — Transmission Owners
☐	2 — RTOs, ISOs
☐	3 — Load-serving Entities
☐	4 — Transmission-dependent Utilities
☐	5 — Electric Generators
☐	6 — Electricity Brokers, Aggregators, and Marketers
☐	7 — Large Electricity End Users
☐	8 — Small Electricity End Users
☐	9 — Federal, State, and Provincial Regulatory or other Government Entities
☐	10 — Regional Reliability Organizations and Regional Entities
☐	NA – Not Applicable
Select each Function in which you have current or prior expertise:	

☐ Balancing Authority ☐ Compliance Enforcement Authority ☐ Distribution Provider ☐ Generator Operator ☐ Generator Owner ☐ Interchange Authority ☐ Load-serving Entity ☐ Market Operator ☐ Planning Coordinator	☐ Transmission Operator ☐ Transmission Owner ☐ Transmission Planner ☐ Transmission Service Provider ☐ Purchasing-selling Entity ☐ Reliability Coordinator ☐ Reliability Assurer ☐ Resource Planner

Provide the names and contact information for two references who could attest to your technical qualifications and your ability to work well in a group:

Standards Announcement

Project 2024-03 Revisions to EOP-012-2

Drafting Team Nomination Period Open through August 1, 2024

Now Available

Nominations are being sought for drafting team members through **8 p.m. Eastern, Thursday, August 1, 2024**.

Use the electronic form to submit a nomination. Contact Cindy Jackson regarding issues using the electronic form. An unofficial Word version of the nomination form is posted on the Standard Drafting Team Vacancies page and the project page.

By submitting a nomination form, you are indicating your willingness and agreement to actively participate in face-to-face meetings and conference calls.

The time commitment for this project is expected to be two face-to-face meetings per quarter (on average two full working days each meeting) with conference calls scheduled as needed to meet the agreed upon timeline the team sets forth. Team members may also have side projects, either individually or by sub-group, to present for discussion and review. Lastly, an important component of the drafting team effort is outreach. Members of the team will be expected to conduct industry outreach during the development process to support a successful ballot.

Previous drafting team experience is beneficial but not required. See the nomination form and project page for additional information.

Next Steps

The Standards Committee is expected to appoint members to the drafting team in August 2024. Nominees will be notified shortly after they have been appointed.

For more information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer, Ben Wu (via email) or at 470-542-6882. Subscribe to this project's observer mailing list by selecting "NERC Email Distribution Lists" from the "Service" drop-down menu and specify “Project 2024-03 Revisions to EOP-012-2” in the Title and Description Boxes.

Justification for this proposed standard development project (Check all that apply to help NERC prioritize development)			
☒ Regulatory Initiation ☐ Emerging Risk (Reliability Issues Steering Committee) Identified ☐ Reliability Standard Development Plan		☐ NERC Standing Committee Identified ☐ Enhanced Periodic Review Initiated ☐ Industry Stakeholder Identified	
What is the risk to the Bulk Electric System (What Bulk Electric System (BES) reliability benefit does the proposed project provide?):			
Multiple winter storm events since 2011 have demonstrated the risk to the Bulk Power System when generators fail to prepare adequately for extreme cold weather conditions. The EOP-012 Reliability Standard provides a comprehensive framework of requirements for generator cold weather preparedness to ensure that more generators are available during extreme cold weather conditions and not forced offline due to foreseeable freezing issues. FERC, however, has identified several ambiguities and other reliability issues which could reduce the effectiveness of this standard. FERC directed NERC to revise EOP-012-2 and associated definitions to address these issues by March 2025.			
Purpose or Goal (What are the reliability gap(s) or risk(s) to the Bulk Electric System being addressed, and how does this proposed project provide the reliability-related benefit described above?):			
The purpose of this project is to address the directives identified by FERC in its June 27, 2024 order approving Reliability Standard EOP-012-2 and directing further modifications. *N. Am. Elec. Reliability Corp.*, 187 FERC ¶ 61,204 (2024). In that order, FERC found that further improvements needed to be made to address ambiguous language and address other reliability gaps/implementation issues in the			

Requested information
standard and related definitions to fully address issues first raised in the Commission's February 2023 Order approving EOP-012-1. *See N. Am. Elec. Reliability Corp.*, 182 FERC ¶ 61,094, PP 3-11 (2023) (February 2023 Order); *reh'g denied*, 183 FERC ¶ 62,034, *order on reh'g*, 183 FERC ¶ 61,222 (2023). FERC directed that NERC submit the modifications within 9 months of the date of the order, or by March 27, 2025.
Project Scope (Define the parameters of the proposed project):
The scope of this project will be to revise the EOP-012-2 standard and its associated *Glossary* definitions to address the directives for further modifications identified by FERC in its June 2024 Order approving EOP-012-2. The drafting team will have flexibility to address the directives in the manner it deems best, which may include revising existing requirements and *Glossary* definitions or drafting new ones. Issues related to compliance monitoring approaches will be addressed by NERC Staff. Although it is not believed to be necessary to address the directives, to the extent a drafting team determines creating a new standard or revising another existing standard would provide the optimal approach for addressing one or more of these directives, the drafting team should have the flexibility to pursue that approach. The drafting team will be charged with addressing the standards modification directives from the June 2024 order, which include: *Directives to Revise the Definition of Generator Cold Weather Constraint and Clarify Requirements for Declared Constraints* P 47: Accordingly, we direct NERC, pursuant to section 215(d)(5) of the FPA, to develop and submit to the Commission for approval modifications to proposed Reliability Standard EOP-012-2 that address concerns related to the ambiguity of the newly defined Generator Cold Weather Constraint term and criteria. Specifically, we direct NERC to ensure that the Generator Cold Weather Constraint declaration criteria included within the proposed Reliability Standard are objective and sufficiently detailed so that applicable entities understand what is required of them. One approach to satisfy this directive could be to incorporate into the proposed Reliability Standard a limited and discrete list of circumstances that would qualify as acceptable constraints. We note that NERC's technical rationale document, created by NERC's Standard Drafting Team and included in NERC's filing, includes a list of technical constraints that could serve as a starting point for a list of circumstances that would qualify as acceptable constraints. To the extent that NERC continues to believe that the extent of industry adoption for winterization technologies should be a criterion for declaring a constraint, NERC should clearly explain in its filing how it will assess the extent of such adoption in a way that provides for consistent compliance and enforcement outcomes. Alternatively, NERC could establish a pre-approval process for all Generator Cold Weather Constraint declarations. While a clearly defined list may be preferable, a pre-approval process could be established to ensure entities' declared Generator Cold Weather Constraints are appropriate and can be supported and defended. Further, as part of the directive to develop and submit modifications to the Generator Cold Weather Constraint definition of proposed Reliability Standard EOP-012-2, we direct NERC, pursuant to section 215(d)(5) of the FPA, to remove the

Requested information
references to "cost," "reasonable cost," "unreasonable cost," and "good business practices" and replace them with criteria that are objective, unambiguous, and auditable. NERC may propose to develop modifications that address the Commission's concerns in an equally efficient and effective manner, however, NERC must explain how its proposal addresses the Commission's concerns. P 54: Accordingly, we again direct NERC, pursuant to section 215(d)(5) of the FPA, to modify proposed Reliability Standard so that NERC receives, reviews, evaluates, and confirms for validity the Generator Cold Weather Constraint declarations in a timely manner. We also direct NERC to include in its compliance filing, a plan to timely review such declarations to verify compliance with proposed Reliability Standard EOP-012-2 and its successors or obligations in a corrective action plan and take corrective action where necessary. For example, modifying Standard to require the generator owners to provide declarations (or changes to the declarations) to NERC within 45 days. It is up to NERC whether it would like to delegate this task to the relevant Regional Entities. NERC may propose to develop modifications that address the Commission's concerns in an equally efficient and effective manner, however, NERC must explain how its proposal addresses the Commission's concerns. *Revisions to Corrective Action Plan Requirements* P 68: Accordingly, we direct NERC, pursuant to section 215(d)(5) of the FPA, to develop and submit modifications to Requirement R7 of proposed Reliability Standard EOP-012-2 to require shorter deadlines to implement corrective actions for existing or new equipment or the freeze protection measures for those generating units that experience a Generator Cold Weather Reliability Event. Based on compliance with Requirements R2 and R3, those generating units should have already had appropriate freeze protection measures implemented to be capable of operating at the generating units' respective Extreme Cold Weather Temperature. Therefore, we find that a shorter timeframe to implement corrective actions that address existing or new equipment or freeze protection measures is appropriate. For example, to satisfy this directive, NERC could require generator owners to implement corrective actions prior to the next winter season for generating units that experience a Cold Weather Reliability Event and to complete freeze protection measures on similar equipment on all of its fleet within 24 months of becoming aware of the freeze issue. For corrective action plans that involve larger and more complicated implementations, NERC could incorporate a staggered 48-month corrective action plan implementation deadline. P 70: [W]e direct NERC, pursuant to section 215(d)(5) of the FPA, to develop and submit modifications to Requirement R7 of proposed Reliability Standard EOP-012-2 to ensure that any extension of a corrective action plan implementation deadline beyond the maximum implementation timeframe required by the proposed Reliability Standard is pre-approved by NERC… P 72: We…find that generators that are commercially operational after October 1, 2027, should have freeze protection measures either designed into their generating systems, or, if a corrective action plan is needed, then it should be completed by the time that such generating units go into commercial operation. Accordingly, we direct NERC, pursuant to section 215(d)(5) of the FPA, to develop and submit modifications to Requirement R7 of proposed Reliability Standard EOP-012-2 to clarify that any

Requested information
Requirement R2 corrective action plans must be completed prior to the generating unit's commercial operation date. P 76: We believe that proposed Reliability Standard EOP-012-2, Requirement R7's corrective action plan implementation deadlines have remaining ambiguities that need to be addressed. As noted above, the Commission has previously expressed similar concerns regarding the vagueness and enforceability of Reliability Standards language. Specifically, we agree with the concerns raised by the ISO/RTO Council that Requirement R7 of proposed Reliability Standard EOP-012-2 does not provide clear direction as to the required corrective action plan implementation timeline that applies to certain generator owners. For example, it is unclear how the corrective action plan implementation timeline would apply if a generator owner had combinations of both existing and new equipment for freeze protection measures. Accordingly, we direct NERC, pursuant to section 215(d)(5) of the FPA, to develop and submit modifications to Requirement R7 of proposed Reliability Standard EOP-012-2 to address these ambiguities by expanding on Requirement R7.1.1 and 7.1.2 to make it clear which corrective action plan implementation deadline applies to which generator owner. *Periodic Review of Generator Cold Weather Constraint Declarations* P 94: We agree with the ISO/RTO Council that the proposed five-year review period for the declared Generator Cold Weather Constraints in Requirement R8.1 could delay the identification and adoption of new freeze protection measures and does not represent the current pace of technological advancements. We acknowledge that a more frequent review does impose some additional administrative burden to the generator owner to review the technological advancements that hindered its ability to winterize; nonetheless, a lengthy period between a Generator Cold Weather Constraint declaration review by the generator owner offers little incentive to timely adopt new freeze protection technologies. Accordingly, we direct NERC, pursuant to section 215(d)(5) of the FPA, to develop and submit modifications to Requirement R8, Part 8.1 of proposed Reliability Standard EOP 012-2 to implement more frequent reviews of Generator Cold Weather Constraint declarations to verify that the declaration remains valid. NERC may propose to develop modifications that address the Commission's concerns in an equally efficient and effective manner, however, NERC must explain how its proposal addresses the Commission's concerns.
Detailed Description (Describe the proposed deliverable(s) with sufficient detail for a drafting team to execute the project. If you propose a new or substantially revised Reliability Standard or definition, provide: (1) a technical justification[1] of developing a new or revised Reliability Standard or definition, which includes a discussion of the risk and impact to reliability-of the BES, and (2) a technical foundation document (*e.g.,* research paper) to guide development of the Standard or definition):

[1] The NERC Rules of Procedure require a technical justification for new or substantially revised Reliability Standards. Please attach pertinent information to this form before submittal to NERC.

Requested information
The drafting team should propose standards modifications responding to the above-listed FERC directives, either as directed by FERC or in an equally effective and efficient manner as supported by the standard drafting team. In addressing these directives, the drafting team should familiarize itself with June 2024 Order approving EOP-012-2 and the February 2023 Order approving EOP-012-1, which discuss the directives and the underlying rationale for those directives. The drafting team should also familiarize itself with the records of development for EOP-012-1 and EOP-012-2, as well as the *FERC/NERC/Regional Entity Staff Report: The February 2021 Cold Weather Outages in Texas and the South Central United States* (Nov. 2021) that prompted the development of the EOP-012 standard.
Cost Impact Assessment, if known (Provide a paragraph describing the potential cost impacts associated with the proposed project):
Cost impacts are unknown at this time.
Please describe any unique characteristics of the BES facilities that may be impacted by this proposed standard development project (*e.g.*, Dispersed Generation Resources):
BES generating facilities
To assist the NERC Standards Committee in appointing a drafting team with the appropriate members, please indicate to which Functional Entities the proposed standard(s) should apply (*e.g.*, Transmission Operator, Reliability Coordinator, etc. See the NERC Rules of Procedure Appendix 5A:
The Generator Owner and Generator Operator are the applicable entities; however, the standard drafting team should also include other Functional Entities that ensure the reliability of the Bulk-Power System during extreme cold weather conditions (e.g., Balancing Authority, Reliability Coordinator, Transmission Operator).
Do you know of any consensus building activities[2] in connection with this SAR? If so, please provide any recommendations or findings resulting from the consensus building activity.
None
Are there any related standards or SARs that should be assessed for impact as a result of this proposed project? If so, which standard(s) or project number(s)?
None
Are there alternatives (e.g., guidelines, white paper, alerts, etc.) that have been considered or could meet the objectives? If so, please list the alternatives with the benefits of using them.
FERC directed that NERC revise the EOP-012 standard; other alternatives would not meet the objectives of this project.

[2] Consensus building activities are occasionally conducted by NERC and/or project review teams. They typically are conducted to obtain industry inputs prior to proposing any standard development project to revise, or develop a standard or definition.

Reliability Principles	
Does this proposed standard development project support at least one of the following Reliability Principles (Reliability Principles)? Please check all those that apply.	
☒	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☒	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☒	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.
☐	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.
☒	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☐	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Market Interface Principles	
Does the proposed standard development project comply with all of the following Market Interface Principles?	Enter (yes/no)
1. A reliability standard shall not give any market participant an unfair competitive advantage.	Yes
2. A reliability standard shall neither mandate nor prohibit any specific market structure.	Yes
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard.	YEs
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards.	Yes

Identified Existing or Potential Regional or Interconnection Variances

SAR Comment Form

Project 2024-03 Revisions to EOP-012-2

Do not use this form for submitting comments. Use the Standards Balloting and Commenting System (SBS) to submit comments on **Project 2024-03 Revisions to EOP-012-2** by **8 p.m. Eastern, Friday, August 16, 2024.**

Additional information is available on the project page. If you have questions, contact Senior Standards Developer, Ben Wu (via email), or at 470-542-6882.

Background Information

NERC developed the original version of the generator cold weather preparedness Reliability Standard EOP-012-1 in 2022, under Project 2021-07 Extreme Cold Weather Grid Operations, Preparedness, and Coordination. The purpose of this project was to address standards-related recommendations from the Federal Energy Regulatory Commission (FERC)/NERC/Regional Entity staff review of operations during the February 2021 Winter Storm Uri event.

NERC developed Reliability Standard EOP-012-2 in 2023-2024 to address Commission directives from the February 2023 order approving Reliability Standards EOP-012-1 and EOP-011-3.[1] In the February 2023 Order, the Commission directed that NERC revise EOP-012-1 to clarify the applicability of the standard's requirements for generator cold weather preparedness, further define the circumstances under which a Generator Owner may declare that constraints preclude them from implementing one or more corrective actions to address freezing issues, and to shorten the implementation timeline so cold weather reliability risks would be addressed more quickly.

On June 27, 2024, FERC issued an order approving Reliability Standard EOP-012-2.[2] While finding Reliability Standard EOP-012-2 represented an improvement over the prior version and addressed many of its concerns, FERC found the standard requires further improvement to address certain concerns remaining from its February 2023 order. FERC therefore directed NERC to revise the standard in five areas and to submit a revised standard within nine (9) months of the date of the order, or by March 27, 2025.

1 *N. Am. Elec. Reliability Corp.*, 182 ¶ 61,094 (2023) ("February 2023 Order").

2 *N. Am. Elec. Reliability Corp.*, 187 FERC ¶ 61, 204 (2024) ("June 2024 Order").

Questions

1. In paragraph 47 of the June 2024 Order, FERC directs NERC to revise EOP-012-2 to "ensure that the Generator Cold Weather Constraint declaration criteria included within the proposed Reliability Standard are objective and sufficiently detailed so that applicable entities understand what is required of them." FERC provides several examples of how NERC may meet directives in this paragraph and explains that NERC may address these concerns in an equally efficient and effective manner, provided NERC explains how it addresses FERC's concerns.

   Do you agree with any of the examples provided by FERC in how it may meet the directives? If so, please explain. If you do not agree, but believe the directive can be addressed in an equally effective and efficient manner, please provide your suggestions for the drafting team.
   ☐ Yes
   ☐ No

   Comments:

2. In paragraph 47 of the June 2024 Order, FERC directs NERC to develop and submit modifications to the Generator Cold Weather Constraint definition of Reliability Standard EOP-012-2, to remove the references to "cost," "reasonable cost," "unreasonable cost," and "good business practices" and replace them with criteria that are objective, unambiguous, and auditable. FERC further explains that NERC may address these concerns in an equally efficient and effective manner, provided NERC explains how it addresses FERC's concerns. Do you believe there are alternative criteria that are objective, unambiguous, and auditable? If so, please provide your suggestions for the drafting team. If you do not believe there are alternative criteria, or believe the directive can be addressed in an equally effective and efficient manner, please provide your suggestions for the drafting team.

   ☐ Yes
   ☐ No

   Comments:

3. In paragraph 54 of the June 2024 Order, FERC directs NERC to modify EOP-012-2 so that NERC receives, reviews, evaluates, and confirms for validity the Generator Cold Weather Constraint declarations in a timely manner. FERC further explains that NERC may address its concerns in an equally efficient and effective manner, provided NERC explains how it addresses FERC's concerns. Would you recommend the drafting team modify EOP-012-2 to provide for an ERO pre-review process for constraint declarations? If not, please provide your suggestions that would address FERC's concerns in an equally efficient and effective manner.

☐ Yes
☐ No

Comments:

4. In paragraph 68 of the June 2024 Order, FERC directs NERC to modify Requirement R7 of EOP-012-2 to require shorter deadlines to implement corrective actions for existing or new equipment or the freeze protection measures for those generating units that experience a Generator Cold Weather Reliability Event. FERC provides an example for how to address this directive, such as to require shorter timeframes for those units that have experienced issues and allow longer timeframes to address similar potential issues across a fleet for those units that have not experienced issues. Do you agree with modifying Requirement R7 of EOP-012-2 to require shorter deadlines to implement corrective actions for existing or new equipment or the freeze protection measures for those generating units that experience a Generator Cold Weather Reliability Event? If so, please provide your suggestions for alternative timeframes. If you do not agree, or believe the directive may be addressed in an equally effective and efficient manner, please provide your suggestions for the drafting team.

   ☐ Yes
   ☐ No

   Comments:

5. In paragraph 70 of the June 2024 Order, FERC directs NERC to develop and submit modifications to Requirement R7 of Reliability Standard EOP-012-2 to ensure that any extension of a corrective action plan implementation deadline beyond the maximum implementation timeframe required by the proposed Reliability Standard is pre-approved by NERC. Do you agree with this approach? If so, please provide your suggestions for standards revisions for the drafting team. If not, please provide your suggestions for addressing this directive in an equally effective and efficient manner.

   ☐ Yes
   ☐ No

   Comments:

6. In paragraph 72 of the June 2024 Order, FERC directs NERC to develop and submit modifications to Requirement R7 of Reliability Standard EOP-012-2 to clarify that any Requirement R7 corrective action plans for new generation (i.e. commercially operational after October 1, 2027) must be completed prior to the generating unit's commercial operation date. Do you agree that revisions to Requirement R7 would best address this directive? If not, please provide your suggestions for addressing this directive in an equally effective and efficient manner.

   ☐ Yes
   ☐ No

   Comments:

7. In paragraph 76 of the June 2024 Order, FERC directs NERC to develop and submit modifications to Requirement R7 of Reliability Standard EOP-012-2 to address certain ambiguities by expanding on Requirement R7.1.1 and 7.1.2 to make it clear which corrective action plan implementation deadline applies to which generator owner, explaining that it is not clear which timeline applies when a generator owner must implement both existing and new equipment for freeze protection measures. Do you agree with this approach? If so, please provide your suggestions for the drafting team. If not, please provide your suggestions for addressing this directive in an equally effective and efficient manner.

   ☐ Yes
   ☐ No

   Comments:

8. In paragraph 94 of the June 2024 Order, FERC directs NERC to develop and submit modifications to Requirement R8, Part 8.1 of Reliability Standard EOP-012-2 to implement more frequent reviews of Generator Cold Weather Constraint declarations (than every five years) to verify that the declaration remains valid. NERC may propose to develop modifications that address the Commission's concerns in an equally efficient and effective manner, however, NERC must explain how its proposal addresses the Commission's concerns. Do you agree with revising Requirement R8, Part 8.1 of Reliability Standard EOP-012-2 to require more frequent reviews to address this directive? If so, please provide your suggestions for an alternative timeframe, along with supporting rationale. If not, please provide your suggestions for addressing this directive in an equally effective and efficient manner.

   ☐ Yes
   ☐ No

   Comments:

9. In the June 2024 Order, FERC directs NERC to submit the directed modifications within nine (9) months of the date of the order, or by March 27, 2025. If you have any recommendations for how the drafting team may best conduct consensus building activities within the directed timeframe and in consideration of the shorter-than-typical comment periods meeting this timeframe will require, please provide and explain your suggestions below.

Standards Announcement

Project 2024-03 Revisions to EOP-012-2 Standard Authorization Request

Informal Comment Period Open through August 16, 2024

Now Available

A 30-day informal comment period for the **Project 2024-03 Revisions to EOP-012-2** Standard Authorization Request (SAR), is open through **8 p.m. Eastern, Friday, August 16, 2024**.

Commenting

Use the Standards Balloting and Commenting System (SBS) to submit comments. An unofficial Word version of the comment form is posted on the project page.

- *Contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern) for problems regarding accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out.*
- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

The drafting team will review all responses received during the comment period and determine the next steps of the project.

For information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer, Ben Wu (via email) or at 470-542-6882. Subscribe to this project's observer mailing list by selecting "NERC Email Distribution Lists" from the "Service" drop-down menu and specify “Project 2024-03 Revisions to EOP-012-2 observer list” in the Description Box.

Revisions to EOP-012-2
Standard Authorization Request and Project Waivers

Action

- Accept the Revisions to EOP-012-2 Standard Authorization Request (SAR);
- Approve the following waiver of provisions of the Standard Processes Manual (SPM) for Project 2024-02 Revisions to EOP-012-2:
  - Informal comment period for SAR reduced from 30 days to as few as 15 days (Section 4.2);
  - Initial formal comment and ballot period(s) reduced from 45 days to as little as 20 days, with the ballot pool formed concurrently during the first 10 days of the initial formal comment period, and with the ballot and non-binding poll of Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) conducted concurrently during the last 5 days of the comment period (Sections 4.8 and 4.9);
  - Additional formal comment and ballot period(s) reduced from 30 days to as little as 15 days, with the ballot and non-binding poll of VRFs and VSLs conducted concurrently during the last 5 days of the comment period (Sections 4.9 and 4.12);
  - Final ballot period(s) reduced from 10 days to as little as 5 days (Section 4.13);
- Authorize posting of the SAR for an informal comment period of at least 15 days;
- Authorize solicitation of the drafting team (DT) members for a period of at least 15 days; and
- Delegate to Standards Committee Executive Committee (SCEC) authority to act on the following actions:
  - Appoint members, chair, and vice chair to the DT for this project as recommended by NERC Staff;
  - Accept a revised Revisions to EOP-012-2 SAR; and
  - Authorize drafting the proposed Reliability Standard or revisions to the standard.

Background

NERC developed the original version of the generator cold weather preparedness Reliability Standard, Reliability Standard EOP-012-1, in 2022 under Project 2021-07 Extreme Cold Weather Grid Operations, Preparedness, and Coordination. The purpose of this project was to address standards-related recommendations from the Federal Energy Regulatory Commission (FERC)/NERC/Regional Entity staff review of operations during the February 2021 Winter Storm Uri event.

NERC developed Reliability Standard EOP-012-2 in 2023-2024 to address Commission directives from the February 2023 order approving Reliability Standards EOP-012-1 and EOP-011-3.[1] In the February 2023 Order, the Commission directed that NERC revise EOP-012-1 to clarify the applicability of the standard's requirements for generator cold weather preparedness, further define the circumstances under which a Generator Owner may declare that constraints preclude them from implementing one or more corrective actions to address freezing issues, and to

[1] *N. Am. Elec. Reliability Corp*., 182 ¶ 61,094 (2023) ("February 2023 Order").

shorten the implementation timeline so cold weather reliability risks would be addressed more quickly. Due to FERC's one-year deadline, the Standards Committee (SC) authorized two sets of SPM waivers to ensure a timely completion. Nevertheless, due to the complex nature of the issues presented, the development process was not complete until approximately seven days prior to the FERC filing deadline.

On June 27, 2024, FERC issued an order approving Reliability Standard EOP-012-2.[2] While finding Reliability Standard EOP-012-2 represented an improvement over the prior version, and addressed many of its concerns, FERC found the standard requires further improvement to address certain concerns remaining from its February 2023 order. FERC, therefore, directed NERC to revise the standard in five areas, and to submit a revised standard within nine (9) months of the date of the order, or by **March 27, 2025.**

As work under Project 2021-07 has concluded, NERC Management submitted a SAR to form a new project to address the directives from FERC's June 2024 order.

Section 4.2 of the SPM, SAR Posting, provides as follows:

- When the SC determines it is ready to initiate a new project, the SC shall direct NERC Staff to post the project's SAR in accordance with the following:
  - For SARs that are limited to addressing regulatory directives, or revisions to Reliability Standards that have had some vetting in the industry as determined by the SC, authorize posting of the SAR for a 30-day informal comment period, with no requirement to provide a formal response to the comments received.

***

Section 16.0 of the SPM, Waiver, states: "The Standards Committee may waive any of the provisions contained in this manual for good cause shown, but limited to the following circumstances...where necessary to meet regulatory deadlines."

Under Chapter 7 of the SC Charter, the SCEC is authorized by the SC to act on its behalf, between regular meetings on matters where urgent actions are crucial and full SC discussions are not practical. The SCEC has the authority to, among other things, act on the SC's behalf to authorize postings of Reliability Standards, and to take any other actions not specified in the Charter that are delegated by the SC.

Summary

Due to the complex nature of the issues to be addressed in this round of development, which have been considered at length in two phases before, the history of EOP-012 development, and the nine-month deadline for submission, this project will be classified as high priority and NERC Staff recommends the SC afford all procedural flexibilities available to ensure the DT and NERC's stakeholders have sufficient time to develop a consensus standard addressing the FERC directives.

NERC Staff recommends the SC authorize an informal comment period for the SAR, as required by the SPM, as it is limited to addressing the FERC directives from the June 2024 Order.

---

[2] *N. Am. Elec. Reliability Corp.*, 187 FERC ¶ 61, 204 (2024) ("June 2024 Order").

NERC Staff recommends the SC authorize procedural waivers under Section 16.0 of the SPM at the outset of the project. Many of the issues remaining to be addressed in the proposed project were discussed at length in the prior proceedings, and in the FERC approval proceedings. Nevertheless, procedural flexibilities will be needed to allow for as fulsome a consideration of the issues as is possible under the circumstances. NERC will endeavor to provide as much time as is reasonably possible for industry to comment on each draft, which may be longer than the minimum periods recommended above.

NERC Staff also recommends the SC delegate authority to take certain intermediate actions to the SCEC. Consistent with prior SCEC authorizations and the SC Charter, the SCEC would be asked to consider any actions delegated to it in a properly noticed, public session, with the results publicly reported. To the extent the schedule permits consideration of these items by the full Committee, NERC Staff will endeavor to do so.

Should the SC accept the SAR and authorize its posting for an informal comment period as required by the SPM, NERC Staff would prepare a suite of questions intended to solicit stakeholder feedback on how to best address the FERC directives. This feedback would be presented to the DT so it may be taken into consideration when preparing the first draft of a revised EOP-012-3 standard. NERC Staff believes that adopting such an approach is most likely to benefit the consensus process over general questions about scope and reliability need, as the "need" for the project has already been established by the June 2024 Order, and the scope for the project is limited to addressing the directives from that order.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Standard Authorization Request (SAR)

Complete and submit this form, with attachment(s) to the NERC Help Desk. Upon entering the Captcha, please type in your contact information, and attach the SAR to your ticket. Once submitted, you will receive a confirmation number which you can use to track your request.

The North American Electric Reliability Corporation (NERC) welcomes suggestions to improve the reliability of the bulk power system through improved Reliability Standards.

Justification for this proposed standard development project (Check all that apply to help NERC prioritize development)	
☒ Regulatory Initiation ☐ Emerging Risk (Reliability Issues Steering Committee) Identified ☐ Reliability Standard Development Plan	☐ NERC Standing Committee Identified ☐ Enhanced Periodic Review Initiated ☐ Industry Stakeholder Identified

What is the risk to the Bulk Electric System (What Bulk Electric System (BES) reliability benefit does the proposed project provide?):

Multiple winter storm events since 2011 have demonstrated the risk to the Bulk Power System when generators fail to prepare adequately for extreme cold weather conditions. The EOP-012 Reliability Standard provides a comprehensive framework of requirements for generator cold weather preparedness to ensure that more generators are available during extreme cold weather conditions and not forced offline due to foreseeable freezing issues. FERC, however, has identified several ambiguities and other reliability issues which could reduce the effectiveness of this standard. FERC directed NERC to revise EOP-012-2 and associated definitions to address these issues by March 2025.

Purpose or Goal (What are the reliability gap(s) or risk(s) to the Bulk Electric System being addressed, and how does this proposed project provide the reliability-related benefit described above?):

The purpose of this project is to address the directives identified by FERC in its June 27, 2024 order approving Reliability Standard EOP-012-2 and directing further modifications. *N. Am. Elec. Reliability Corp.*, 187 FERC ¶ 61,204 (2024). In that order, FERC found that further improvements needed to be

Requested information
made to address ambiguous language and address other reliability gaps/implementation issues in the standard and related definitions to fully address issues first raised in the Commission's February 2023 Order approving EOP-012-1. *See N. Am. Elec. Reliability Corp.*, 182 FERC ¶ 61,094, PP 3-11 (2023) (February 2023 Order); *reh'g denied*, 183 FERC ¶ 62,034, *order on reh'g*, 183 FERC ¶ 61,222 (2023). FERC directed that NERC submit the modifications within 9 months of the date of the order, or by March 27, 2025.
Project Scope (Define the parameters of the proposed project):
The drafting team is charged with addressing the standards modification directives from the June 2024 FERC order approving EOP-012-2. The FERC order directives are provided in the Detailed Description section below. The drafting team should propose standards modifications responding to the FERC directives, either as directed by FERC or in an equally effective and efficient manner as supported by the drafting team. In addition, the drafting team will have flexibility to address the directives in the manner it deems best, which may include revising existing requirements or *Glossary* definitions or drafting new ones. The drafting team will also have flexibility to make minor clarifying modifications, in addition to the FERC directives, to EOP-012-2 or the supporting documentation as the team sees appropriate. Issues related to compliance monitoring approaches will be addressed by NERC Staff. The drafting team should coordinate with NERC Staff when developing standards modifications to leverage existing NERC processes and tools to the extent feasible. Although it is not believed to be necessary to address the directives, to the extent a drafting team determines creating a new standard or revising another existing standard would provide the optimal approach for addressing one or more of these directives, the drafting team should have the flexibility to pursue that approach. Summarizing the June 2024 FERC Order, the drafting team's scope is: • To address concerns related to the ambiguity of the Generator Cold Weather Constraint term and criteria (P 47); • To address concerns regarding the need for a timely review and evaluation of declared Generator Cold Weather Constraints by NERC (P 54); • To address concerns that existing EOP-012-2 Requirement R7 allows too long for entities to implement corrective actions for existing or new equipment or freeze protection measures for those generating units that experience a Generator Cold Weather Reliability Event (P 68); • To address the finding that any extensions of a Corrective Action Plan implementation deadline beyond the maximum implementation timeframe provided by the standard be pre-approved by NERC (P 70); • To address the finding that generators that are first commercially operational on or after October 1, 2027, should have freeze protection measures either designed into their generating

Requested information
systems, or, if a corrective action plan is needed, then it should be completed by the time that such generating units go into commercial operation (P 72); • To address concerns that EOP-012-2 Requirement R7 has ambiguities in the implementation plan timelines that apply to certain generator owners (P 76); and, To address the concern that Generator Cold Weather Constraint declarations should be reviewed more frequently than once every five years to ensure the constraint remains valid (P
Detailed Description (Describe the proposed deliverable(s) with sufficient detail for a drafting team to execute the project. If you propose a new or substantially revised Reliability Standard or definition, provide: (1) a technical justification[1] of developing a new or revised Reliability Standard or definition, which includes a discussion of the risk and impact to reliability-of the BES, and (2) a technical foundation document (*e.g.,* research paper) to guide development of the Standard or definition):
The drafting team is charged with addressing the standards modification directives from the June 2024 order and making other minor clarifying revisions as it deems appropriate and supported by stakeholder consensus. It is noted that the FERC Order includes tasks outside the purview of the drafting team. Those portions of the order that will not be addressed by the drafting team are italicized below for clarity. **Directives to Revise the Definition of Generator Cold Weather Constraint and Clarify Requirements for Declared Constraints** P 47: Accordingly, we direct NERC, pursuant to section 215(d)(5) of the FPA, to develop and submit to the Commission for approval modifications to proposed Reliability Standard EOP-012-2 that address concerns related to the ambiguity of the newly defined Generator Cold Weather Constraint term and criteria. Specifically, we direct NERC to ensure that the Generator Cold Weather Constraint declaration criteria included within the proposed Reliability Standard are objective and sufficiently detailed so that applicable entities understand what is required of them. One approach to satisfy this directive could be to incorporate into the proposed Reliability Standard a limited and discrete list of circumstances that would qualify as acceptable constraints. We note that NERC's technical rationale document, created by NERC's Standard Drafting Team and included in NERC's filing, includes a list of technical constraints that could serve as a starting point for a list of circumstances that would qualify as acceptable constraints. To the extent that NERC continues to believe that the extent of industry adoption for winterization technologies should be a criterion for declaring a constraint, NERC should clearly explain in its filing how it will assess the extent of such adoption in a way that provides for consistent compliance and enforcement outcomes. Alternatively, NERC could establish a pre-approval process for all Generator Cold Weather Constraint declarations. While a clearly defined list may be preferable, a pre-approval process could be established to ensure entities' declared Generator Cold Weather Constraints are appropriate and can be supported and defended. Further, as part of the directive to develop and

[1] The NERC Rules of Procedure require a technical justification for new or substantially revised Reliability Standards. Please attach pertinent information to this form before submittal to NERC.

Requested information
submit modifications to the Generator Cold Weather Constraint definition of proposed Reliability Standard EOP-012-2, we direct NERC, pursuant to section 215(d)(5) of the FPA, to remove the references to "cost," "reasonable cost," "unreasonable cost," and "good business practices" and replace them with criteria that are objective, unambiguous, and auditable. NERC may propose to develop modifications that address the Commission's concerns in an equally efficient and effective manner, however, NERC must explain how its proposal addresses the Commission's concerns. P 54: Accordingly, we again direct NERC, pursuant to section 215(d)(5) of the FPA, to modify proposed Reliability Standard so that NERC receives, reviews, evaluates, and confirms for validity the Generator Cold Weather Constraint declarations in a timely manner. *We also direct NERC to include in its compliance filing, a plan to timely review such declarations to verify compliance with proposed Reliability Standard EOP-012-2 and its successors or obligations in a corrective action plan and take corrective action where necessary.* For example, modifying Standard to require the generator owners to provide declarations (or changes to the declarations) to NERC within 45 days. *It is up to NERC whether it would like to delegate this task to the relevant Regional Entities.* NERC may propose to develop modifications that address the Commission's concerns in an equally efficient and effective manner, however, NERC must explain how its proposal addresses the Commission's concerns. **Revisions to Corrective Action Plan Requirements** P 68: Accordingly, we direct NERC, pursuant to section 215(d)(5) of the FPA, to develop and submit modifications to Requirement R7 of proposed Reliability Standard EOP-012-2 to require shorter deadlines to implement corrective actions for existing or new equipment or the freeze protection measures for those generating units that experience a Generator Cold Weather Reliability Event. Based on compliance with Requirements R2 and R3, those generating units should have already had appropriate freeze protection measures implemented to be capable of operating at the generating units' respective Extreme Cold Weather Temperature. Therefore, we find that a shorter timeframe to implement corrective actions that address existing or new equipment or freeze protection measures is appropriate. For example, to satisfy this directive, NERC could require generator owners to implement corrective actions prior to the next winter season for generating units that experience a Cold Weather Reliability Event and to complete freeze protection measures on similar equipment on all of its fleet within 24 months of becoming aware of the freeze issue. For corrective action plans that involve larger and more complicated implementations, NERC could incorporate a staggered 48-month corrective action plan implementation deadline. P 70: [W]e direct NERC, pursuant to section 215(d)(5) of the FPA, to develop and submit modifications to Requirement R7 of proposed Reliability Standard EOP-012-2 to ensure that any extension of a corrective action plan implementation deadline beyond the maximum implementation timeframe required by the proposed Reliability Standard is pre-approved by NERC… P 72: We…find that generators that are commercially operational after October 1, 2027, should have freeze protection measures either designed into their generating systems, or, if a corrective action plan is needed, then it should be completed by the time that such generating units go into commercial

Requested information
operation. Accordingly, we direct NERC, pursuant to section 215(d)(5) of the FPA, to develop and submit modifications to Requirement R7 of proposed Reliability Standard EOP-012-2 to clarify that any Requirement R2 corrective action plans must be completed prior to the generating unit's commercial operation date. P 76: We believe that proposed Reliability Standard EOP-012-2, Requirement R7's corrective action plan implementation deadlines have remaining ambiguities that need to be addressed. As noted above, the Commission has previously expressed similar concerns regarding the vagueness and enforceability of Reliability Standards language. Specifically, we agree with the concerns raised by the ISO/RTO Council that Requirement R7 of proposed Reliability Standard EOP-012-2 does not provide clear direction as to the required corrective action plan implementation timeline that applies to certain generator owners. For example, it is unclear how the corrective action plan implementation timeline would apply if a generator owner had combinations of both existing and new equipment for freeze protection measures. Accordingly, we direct NERC, pursuant to section 215(d)(5) of the FPA, to develop and submit modifications to Requirement R7 of proposed Reliability Standard EOP-012-2 to address these ambiguities by expanding on Requirement R7.1.1 and 7.1.2 to make it clear which corrective action plan implementation deadline applies to which generator owner. **Periodic Review of Generator Cold Weather Constraint Declarations** P 94: We agree with the ISO/RTO Council that the proposed five-year review period for the declared Generator Cold Weather Constraints in Requirement R8.1 could delay the identification and adoption of new freeze protection measures and does not represent the current pace of technological advancements. We acknowledge that a more frequent review does impose some additional administrative burden to the generator owner to review the technological advancements that hindered its ability to winterize; nonetheless, a lengthy period between a Generator Cold Weather Constraint declaration review by the generator owner offers little incentive to timely adopt new freeze protection technologies. Accordingly, we direct NERC, pursuant to section 215(d)(5) of the FPA, to develop and submit modifications to Requirement R8, Part 8.1 of proposed Reliability Standard EOP 012-2 to implement more frequent reviews of Generator Cold Weather Constraint declarations to verify that the declaration remains valid. NERC may propose to develop modifications that address the Commission's concerns in an equally efficient and effective manner, however, NERC must explain how its proposal addresses the Commission's concerns. In addressing these directives, the drafting team should familiarize itself with June 2024 Order approving EOP-012-2 and the February 2023 Order approving EOP-012-1, which discuss the directives and the underlying rationale for those directives. The drafting team should also familiarize itself with the records of development for EOP-012-1 and EOP-012-2, as well as the *FERC/NERC/Regional Entity Staff Report: The February 2021 Cold Weather Outages in Texas and the South Central United States* (Nov. 2021) that prompted the development of the EOP-012 standard.

Requested information
Cost Impact Assessment, if known (Provide a paragraph describing the potential cost impacts associated with the proposed project):
Cost impacts are unknown at this time.
Please describe any unique characteristics of the BES facilities that may be impacted by this proposed standard development project (*e.g.*, Dispersed Generation Resources):
BES generating facilities
To assist the NERC Standards Committee in appointing a drafting team with the appropriate members, please indicate to which Functional Entities the proposed standard(s) should apply (*e.g.*, Transmission Operator, Reliability Coordinator, etc. See the NERC Rules of Procedure Appendix 5A:
The Generator Owner and Generator Operator are the applicable entities; however, the standard drafting team should also include other Functional Entities that ensure the reliability of the Bulk-Power System during extreme cold weather conditions (e.g., Balancing Authority, Reliability Coordinator, Transmission Operator).
Do you know of any consensus building activities[2] in connection with this SAR? If so, please provide any recommendations or findings resulting from the consensus building activity.
None
Are there any related standards or SARs that should be assessed for impact as a result of this proposed project? If so, which standard(s) or project number(s)?
None
Are there alternatives (e.g., guidelines, white paper, alerts, etc.) that have been considered or could meet the objectives? If so, please list the alternatives with the benefits of using them.
FERC directed that NERC revise the EOP-012 standard; other alternatives would not meet the objectives of this project.

Reliability Principles	
Does this proposed standard development project support at least one of the following Reliability Principles (Reliability Principles)? Please check all those that apply.	
☒	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☒	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☒	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.

[2] Consensus building activities are occasionally conducted by NERC and/or project review teams. They typically are conducted to obtain industry inputs prior to proposing any standard development project to revise, or develop a standard or definition.

Reliability Principles	
☐	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.
☒	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☐	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Market Interface Principles	
Does the proposed standard development project comply with all of the following Market Interface Principles?	Enter (yes/no)
1. A reliability standard shall not give any market participant an unfair competitive advantage.	Yes
2. A reliability standard shall neither mandate nor prohibit any specific market structure.	Yes
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard.	Yes
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards.	Yes

Identified Existing or Potential Regional or Interconnection Variances

What is the risk to the Bulk Electric System (What Bulk Electric System (BES) reliability benefit does the proposed project provide?):			
Multiple winter storm events since 2011 have demonstrated the risk to the Bulk Power System when generators fail to prepare adequately for extreme cold weather conditions. The EOP-012 Reliability Standard provides a comprehensive framework of requirements for generator cold weather preparedness to ensure that more generators are available during extreme cold weather conditions and not forced offline due to foreseeable freezing issues. FERC, however, has identified several ambiguities and other reliability issues which could reduce the effectiveness of this standard. FERC directed NERC to revise EOP-012-2 and associated definitions to address these issues by March 2025.			
Purpose or Goal (What are the reliability gap(s) or risk(s) to the Bulk Electric System being addressed, and how does this proposed project provide the reliability-related benefit described above?):			
The purpose of this project is to address the directives identified by FERC in its June 27, 2024 order approving Reliability Standard EOP-012-2 and directing further modifications. *N. Am. Elec. Reliability Corp.*, 187 FERC ¶ 61,204 (2024). In that order, FERC found that further improvements needed to be			

Requested information
made to address ambiguous language and address other reliability gaps/implementation issues in the standard and related definitions to fully address issues first raised in the Commission's February 2023 Order approving EOP-012-1. *See N. Am. Elec. Reliability Corp.*, 182 FERC ¶ 61,094, PP 3-11 (2023) (February 2023 Order); *reh'g denied*, 183 FERC ¶ 62,034, *order on reh'g*, 183 FERC ¶ 61,222 (2023). FERC directed that NERC submit the modifications within 9 months of the date of the order, or by March 27, 2025.
Project Scope (Define the parameters of the proposed project):
~~The scope of this project will be to revise the EOP-012-2 standard and its associated *Glossary* definitions to address the directives for further modifications identified by FERC in its June 2024 Order approving EOP-012-2.~~ The drafting team is charged with addressing the standards modification directives from the June 2024 FERC order approving EOP-012-2. The FERC Order directives are provided in the Detailed Description section below. The drafting team should propose standards modifications responding to the FERC directives, either as directed by FERC or in an equally effective and efficient manner as supported by the drafting team. In addition, ~~T~~the drafting team will have flexibility to address the directives in the manner it deems best, which may include revising existing requirements or ~~and~~ *Glossary* definitions or drafting new ones. The drafting team will also have flexibility to make minor clarifying modifications, in addition to the FERC directives, to EOP-012-2 or the supporting documentation as the team sees appropriate. Issues related to compliance monitoring approaches will be addressed by NERC Staff. The drafting team should coordinate with NERC Staff when developing standards modifications to leverage existing NERC processes and tools to the extent feasible. Although it is not believed to be necessary to address the directives, to the extent a drafting team determines creating a new standard or revising another existing standard would provide the optimal approach for addressing one or more of these directives, the drafting team should have the flexibility to pursue that approach. Summarizing the June 2024 FERC Order, the drafting team's scope is: • To address concerns related to the ambiguity of the Generator Cold Weather Constraint term and criteria (P 47); • To address concerns regarding the need for a timely review and evaluation of declared Generator Cold Weather Constraints by NERC (P 54); • To address concerns that existing EOP-012-2 Requirement R7 allows too long for entities to implement corrective actions for existing or new equipment or freeze protection measures for those generating units that experience a Generator Cold Weather Reliability Event (P 68); • To address the finding that any extensions of a Corrective Action Plan implementation deadline beyond the maximum implementation timeframe provided by the standard be pre-approved by NERC (P 70);

Requested information

- To address the finding that generators that are first commercially operational on or after October 1, 2027, should have freeze protection measures either designed into their generating systems, or, if a corrective action plan is needed, then it should be completed by the time that such generating units go into commercial operation (P 72);

- To address concerns that EOP-012-2 Requirement R7 has ambiguities in the implementation plan timelines that apply to certain generator owners (P 76); and,
- To address the concern that Generator Cold Weather Constraint declarations should be reviewed more frequently than once every five years to ensure the constraint remains valid (P 94).

~~The drafting team will be charged with addressing the standards modification directives from the June 2024 order, which include:~~

~~*Directives to Revise the Definition of Generator Cold Weather Constraint and Clarify Requirements for Declared Constraints*~~

~~P 47: Accordingly, we direct NERC, pursuant to section 215(d)(5) of the FPA, to develop and submit to the Commission for approval modifications to proposed Reliability Standard EOP-012-2 that address concerns related to the ambiguity of the newly defined Generator Cold Weather Constraint term and criteria. Specifically, we direct NERC to ensure that the Generator Cold Weather Constraint declaration criteria included within the proposed Reliability Standard are objective and sufficiently detailed so that applicable entities understand what is required of them. One approach to satisfy this directive could be to incorporate into the proposed Reliability Standard a limited and discrete list of circumstances that would qualify as acceptable constraints. We note that NERC's technical rationale document, created by NERC's Standard Drafting Team and included in NERC's filing, includes a list of technical constraints that could serve as a starting point for a list of circumstances that would qualify as acceptable constraints. To the extent that NERC continues to believe that the extent of industry adoption for winterization technologies should be a criterion for declaring a constraint, NERC should clearly explain in its filing how it will assess the extent of such adoption in a way that provides for consistent compliance and enforcement outcomes. Alternatively, NERC could establish a pre-approval process for all Generator Cold Weather Constraint declarations. While a clearly defined list may be preferable, a pre-approval process could be established to ensure entities' declared Generator Cold Weather Constraints are appropriate and can be supported and defended. Further, as part of the directive to develop and submit modifications to the Generator Cold Weather Constraint definition of proposed Reliability Standard EOP-012-2, we direct NERC, pursuant to section 215(d)(5) of the FPA, to remove the references to "cost," "reasonable cost," "unreasonable cost," and "good business practices" and replace them with criteria that are objective, unambiguous, and auditable. NERC may propose to develop~~

Requested information

~~modifications that address the Commission's concerns in an equally efficient and effective manner, however, NERC must explain how its proposal addresses the Commission's concerns.~~

~~P 54: Accordingly, we again direct NERC, pursuant to section 215(d)(5) of the FPA, to modify proposed Reliability Standard so that NERC receives, reviews, evaluates, and confirms for validity the Generator Cold Weather Constraint declarations in a timely manner. We also direct NERC to include in its compliance filing, a plan to timely review such declarations to verify compliance with proposed Reliability Standard EOP-012-2 and its successors or obligations in a corrective action plan and take corrective action where necessary. For example, modifying Standard to require the generator owners to provide declarations (or changes to the declarations) to NERC within 45 days. It is up to NERC whether it would like to delegate this task to the relevant Regional Entities. NERC may propose to develop modifications that address the Commission's concerns in an equally efficient and effective manner, however, NERC must explain how its proposal addresses the Commission's concerns.~~

~~*Revisions to Corrective Action Plan Requirements*~~
~~P 68: Accordingly, we direct NERC, pursuant to section 215(d)(5) of the FPA, to develop and submit modifications to Requirement R7 of proposed Reliability Standard EOP-012-2 to require shorter deadlines to implement corrective actions for existing or new equipment or the freeze protection measures for those generating units that experience a Generator Cold Weather Reliability Event. Based on compliance with Requirements R2 and R3, those generating units should have already had appropriate freeze protection measures implemented to be capable of operating at the generating units' respective Extreme Cold Weather Temperature. Therefore, we find that a shorter timeframe to implement corrective actions that address existing or new equipment or freeze protection measures is appropriate. For example, to satisfy this directive, NERC could require generator owners to implement corrective actions prior to the next winter season for generating units that experience a Cold Weather Reliability Event and to complete freeze protection measures on similar equipment on all of its fleet within 24 months of becoming aware of the freeze issue. For corrective action plans that involve larger and more complicated implementations, NERC could incorporate a staggered 48-month corrective action plan implementation deadline.~~

~~P 70: [W]e direct NERC, pursuant to section 215(d)(5) of the FPA, to develop and submit modifications to Requirement R7 of proposed Reliability Standard EOP-012-2 to ensure that any extension of a corrective action plan implementation deadline beyond the maximum implementation timeframe required by the proposed Reliability Standard is pre-approved by NERC…~~

~~P 72: We…find that generators that are commercially operational after October 1, 2027, should have freeze protection measures either designed into their generating systems, or, if a corrective action plan is needed, then it should be completed by the time that such generating units go into commercial operation. Accordingly, we direct NERC, pursuant to section 215(d)(5) of the FPA, to develop and submit modifications to Requirement R7 of proposed Reliability Standard EOP-012-2 to clarify that any Requirement R2 corrective action plans must be completed prior to the generating unit's commercial operation date.~~

Requested information
~~P 76: We believe that proposed Reliability Standard EOP-012-2, Requirement R7's corrective action plan implementation deadlines have remaining ambiguities that need to be addressed. As noted above, the Commission has previously expressed similar concerns regarding the vagueness and enforceability of Reliability Standards language. Specifically, we agree with the concerns raised by the ISO/RTO Council that Requirement R7 of proposed Reliability Standard EOP-012-2 does not provide clear direction as to the required corrective action plan implementation timeline that applies to certain generator owners. For example, it is unclear how the corrective action plan implementation timeline would apply if a generator owner had combinations of both existing and new equipment for freeze protection measures. Accordingly, we direct NERC, pursuant to section 215(d)(5) of the FPA, to develop and submit modifications to Requirement R7 of proposed Reliability Standard EOP-012-2 to address these ambiguities by expanding on Requirement R7.1.1 and 7.1.2 to make it clear which corrective action plan implementation deadline applies to which generator owner.~~ ~~*Periodic Review of Generator Cold Weather Constraint Declarations*~~ ~~P 94: We agree with the ISO/RTO Council that the proposed five-year review period for the declared Generator Cold Weather Constraints in Requirement R8.1 could delay the identification and adoption of new freeze protection measures and does not represent the current pace of technological advancements. We acknowledge that a more frequent review does impose some additional administrative burden to the generator owner to review the technological advancements that hindered its ability to winterize; nonetheless, a lengthy period between a Generator Cold Weather Constraint declaration review by the generator owner offers little incentive to timely adopt new freeze protection technologies. Accordingly, we direct NERC, pursuant to section 215(d)(5) of the FPA, to develop and submit modifications to Requirement R8, Part 8.1 of proposed Reliability Standard EOP-012-2 to implement more frequent reviews of Generator Cold Weather Constraint declarations to verify that the declaration remains valid. NERC may propose to develop modifications that address the Commission's concerns in an equally efficient and effective manner, however, NERC must explain how its proposal addresses the Commission's concerns.~~
Detailed Description (Describe the proposed deliverable(s) with sufficient detail for a drafting team to execute the project. If you propose a new or substantially revised Reliability Standard or definition, provide: (1) a technical justification[1] of developing a new or revised Reliability Standard or definition, which includes a discussion of the risk and impact to reliability-of the BES, and (2) a technical foundation document (*e.g.,* research paper) to guide development of the Standard or definition):
The drafting team is charged with addressing the standards modification directives from the June 2024 order and making other minor clarifying revisions as it deems appropriate and supported by stakeholder consensus. It is noted that the FERC Order includes tasks outside the purview of the drafting team.

[1] The NERC Rules of Procedure require a technical justification for new or substantially revised Reliability Standards. Please attach pertinent information to this form before submittal to NERC.

Requested information

Those portions of the order that will not be addressed by the drafting team are italicized below for clarity.

Directives to Revise the Definition of Generator Cold Weather Constraint and Clarify Requirements for Declared Constraints

P 47: Accordingly, we direct NERC, pursuant to section 215(d)(5) of the FPA, to develop and submit to the Commission for approval modifications to proposed Reliability Standard EOP-012-2 that address concerns related to the ambiguity of the newly defined Generator Cold Weather Constraint term and criteria. Specifically, we direct NERC to ensure that the Generator Cold Weather Constraint declaration criteria included within the proposed Reliability Standard are objective and sufficiently detailed so that applicable entities understand what is required of them. One approach to satisfy this directive could be to incorporate into the proposed Reliability Standard a limited and discrete list of circumstances that would qualify as acceptable constraints. We note that NERC's technical rationale document, created by NERC's Standard Drafting Team and included in NERC's filing, includes a list of technical constraints that could serve as a starting point for a list of circumstances that would qualify as acceptable constraints. To the extent that NERC continues to believe that the extent of industry adoption for winterization technologies should be a criterion for declaring a constraint, NERC should clearly explain in its filing how it will assess the extent of such adoption in a way that provides for consistent compliance and enforcement outcomes. Alternatively, NERC could establish a pre-approval process for all Generator Cold Weather Constraint declarations. While a clearly defined list may be preferable, a pre-approval process could be established to ensure entities' declared Generator Cold Weather Constraints are appropriate and can be supported and defended. Further, as part of the directive to develop and submit modifications to the Generator Cold Weather Constraint definition of proposed Reliability Standard EOP-012-2, we direct NERC, pursuant to section 215(d)(5) of the FPA, to remove the references to "cost," "reasonable cost," "unreasonable cost," and "good business practices" and replace them with criteria that are objective, unambiguous, and auditable. NERC may propose to develop modifications that address the Commission's concerns in an equally efficient and effective manner, however, NERC must explain how its proposal addresses the Commission's concerns.

P 54: Accordingly, we again direct NERC, pursuant to section 215(d)(5) of the FPA, to modify proposed Reliability Standard so that NERC receives, reviews, evaluates, and confirms for validity the Generator Cold Weather Constraint declarations in a timely manner. *We also direct NERC to include in its compliance filing, a plan to timely review such declarations to verify compliance with proposed Reliability Standard EOP-012-2 and its successors or obligations in a corrective action plan and take corrective action where necessary.* For example, modifying Standard to require the generator owners to provide declarations (or changes to the declarations) to NERC within 45 days. *It is up to NERC whether it would like to delegate this task to the relevant Regional Entities.* NERC may propose to develop modifications that address the Commission's concerns in an equally efficient and effective manner, however, NERC must explain how its proposal addresses the Commission's concerns.

Revisions to Corrective Action Plan Requirements

P 68: Accordingly, we direct NERC, pursuant to section 215(d)(5) of the FPA, to develop and submit modifications to Requirement R7 of proposed Reliability Standard EOP-012-2 to require shorter deadlines to implement corrective actions for existing or new equipment or the freeze protection measures for those generating units that experience a Generator Cold Weather Reliability Event. Based on compliance with Requirements R2 and R3, those generating units should have already had appropriate freeze protection measures implemented to be capable of operating at the generating units' respective Extreme Cold Weather Temperature. Therefore, we find that a shorter timeframe to implement corrective actions that address existing or new equipment or freeze protection measures is appropriate. For example, to satisfy this directive, NERC could require generator owners to implement corrective actions prior to the next winter season for generating units that experience a Cold Weather Reliability Event and to complete freeze protection measures on similar equipment on all of its fleet within 24 months of becoming aware of the freeze issue. For corrective action plans that involve larger and more complicated implementations, NERC could incorporate a staggered 48-month corrective action plan implementation deadline.

P 70: [W]e direct NERC, pursuant to section 215(d)(5) of the FPA, to develop and submit modifications to Requirement R7 of proposed Reliability Standard EOP-012-2 to ensure that any extension of a corrective action plan implementation deadline beyond the maximum implementation timeframe required by the proposed Reliability Standard is pre-approved by NERC…

P 72: We…find that generators that are commercially operational after October 1, 2027, should have freeze protection measures either designed into their generating systems, or, if a corrective action plan is needed, then it should be completed by the time that such generating units go into commercial operation. Accordingly, we direct NERC, pursuant to section 215(d)(5) of the FPA, to develop and submit modifications to Requirement R7 of proposed Reliability Standard EOP-012-2 to clarify that any Requirement R2 corrective action plans must be completed prior to the generating unit's commercial operation date.

P 76: We believe that proposed Reliability Standard EOP-012-2, Requirement R7's corrective action plan implementation deadlines have remaining ambiguities that need to be addressed. As noted above, the Commission has previously expressed similar concerns regarding the vagueness and enforceability of Reliability Standards language. Specifically, we agree with the concerns raised by the ISO/RTO Council that Requirement R7 of proposed Reliability Standard EOP-012-2 does not provide clear direction as to the required corrective action plan implementation timeline that applies to certain generator owners. For example, it is unclear how the corrective action plan implementation timeline would apply if a generator owner had combinations of both existing and new equipment for freeze protection measures. Accordingly, we direct NERC, pursuant to section 215(d)(5) of the FPA, to develop and submit modifications to Requirement R7 of proposed Reliability Standard EOP-012-2 to address these ambiguities by expanding on Requirement R7.1.1 and 7.1.2 to make it clear which corrective action plan implementation deadline applies to which generator owner.

Periodic Review of Generator Cold Weather Constraint Declarations P 94: We agree with the ISO/RTO Council that the proposed five-year review period for the declared Generator Cold Weather Constraints in Requirement R8.1 could delay the identification and adoption of new freeze protection measures and does not represent the current pace of technological advancements. We acknowledge that a more frequent review does impose some additional administrative burden to the generator owner to review the technological advancements that hindered its ability to winterize; nonetheless, a lengthy period between a Generator Cold Weather Constraint declaration review by the generator owner offers little incentive to timely adopt new freeze protection technologies. Accordingly, we direct NERC, pursuant to section 215(d)(5) of the FPA, to develop and submit modifications to Requirement R8, Part 8.1 of proposed Reliability Standard EOP 012-2 to implement more frequent reviews of Generator Cold Weather Constraint declarations to verify that the declaration remains valid. NERC may propose to develop modifications that address the Commission's concerns in an equally efficient and effective manner, however, NERC must explain how its proposal addresses the Commission's concerns. ~~The drafting team should propose standards modifications responding to the above-listed FERC directives, either as directed by FERC or in an equally effective and efficient manner as supported by the standard drafting team.~~ In addressing these directives, the drafting team should familiarize itself with June 2024 Order approving EOP-012-2 and the February 2023 Order approving EOP-012-1, which discuss the directives and the underlying rationale for those directives. The drafting team should also familiarize itself with the records of development for EOP-012-1 and EOP-012-2, as well as the *FERC/NERC/Regional Entity Staff Report: The February 2021 Cold Weather Outages in Texas and the South Central United States* (Nov. 2021) that prompted the development of the EOP-012 standard.
Cost Impact Assessment, if known (Provide a paragraph describing the potential cost impacts associated with the proposed project):
Cost impacts are unknown at this time.
Please describe any unique characteristics of the BES facilities that may be impacted by this proposed standard development project (*e.g.*, Dispersed Generation Resources):
BES generating facilities
To assist the NERC Standards Committee in appointing a drafting team with the appropriate members, please indicate to which Functional Entities the proposed standard(s) should apply (*e.g.*, Transmission Operator, Reliability Coordinator, etc. See the NERC Rules of Procedure Appendix 5A:
The Generator Owner and Generator Operator are the applicable entities; however, the standard drafting team should also include other Functional Entities that ensure the reliability of the Bulk-Power

Requested information
System during extreme cold weather conditions (e.g., Balancing Authority, Reliability Coordinator, Transmission Operator).
Do you know of any consensus building activities[2] in connection with this SAR? If so, please provide any recommendations or findings resulting from the consensus building activity.
None
Are there any related standards or SARs that should be assessed for impact as a result of this proposed project? If so, which standard(s) or project number(s)?
None
Are there alternatives (e.g., guidelines, white paper, alerts, etc.) that have been considered or could meet the objectives? If so, please list the alternatives with the benefits of using them.
FERC directed that NERC revise the EOP-012 standard; other alternatives would not meet the objectives of this project.

Reliability Principles	
Does this proposed standard development project support at least one of the following Reliability Principles (Reliability Principles)? Please check all those that apply.	
☒	1. Interconnected bulk power systems shall be planned and operated in a coordinated manner to perform reliably under normal and abnormal conditions as defined in the NERC Standards.
☒	2. The frequency and voltage of interconnected bulk power systems shall be controlled within defined limits through the balancing of real and reactive power supply and demand.
☒	3. Information necessary for the planning and operation of interconnected bulk power systems shall be made available to those entities responsible for planning and operating the systems reliably.
☐	4. Plans for emergency operation and system restoration of interconnected bulk power systems shall be developed, coordinated, maintained and implemented.
☐	5. Facilities for communication, monitoring and control shall be provided, used and maintained for the reliability of interconnected bulk power systems.
☒	6. Personnel responsible for planning and operating interconnected bulk power systems shall be trained, qualified, and have the responsibility and authority to implement actions.
☐	7. The security of the interconnected bulk power systems shall be assessed, monitored and maintained on a wide area basis.
☐	8. Bulk power systems shall be protected from malicious physical or cyber attacks.

Market Interface Principles	
Does the proposed standard development project comply with all of the following Market Interface Principles?	Enter (yes/no)
1. A reliability standard shall not give any market participant an unfair competitive advantage.	Yes

[2] Consensus building activities are occasionally conducted by NERC and/or project review teams. They typically are conducted to obtain industry inputs prior to proposing any standard development project to revise, or develop a standard or definition.

Market Interface Principles	
2. A reliability standard shall neither mandate nor prohibit any specific market structure.	Yes
3. A reliability standard shall not preclude market solutions to achieving compliance with that standard.	YeEs
4. A reliability standard shall not require the public disclosure of commercially sensitive information. All market participants shall have equal opportunity to access commercially non-sensitive information that is required for compliance with reliability standards.	Yes

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the initial draft of the proposed standard for a formal 20-day comment and ballot period.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	July 17, 2024
SAR posted for comment	July 18, 2024 – August 16, 2024

Anticipated Actions	Date
20-day formal comment period with ballot	October 17, 2024 – November 5, 2024
18-day formal or informal comment period with additional ballot	December 3, 2024 – December 20, 2024
15-day formal or informal comment period with additional ballot	January 29, 2025 – February 12, 2025
Board adoption	TBD

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

Generator Cold Weather Constraint – Any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components.

Previously Approved Terms

This section includes previously approved terms from EOP-012-1 and EOP-012-2. It is included to help with drafting and the posting of EOP-012-3.

Extreme Cold Weather Temperature – The temperature equal to the lowest 0.2 percentile of the hourly temperatures measured in December, January, and February from 01/01/2000 through the date the temperature is calculated.

Generator Cold Weather Critical Component – Any generating unit component or system, or associated Fixed Fuel Supply Component, that is under the Generator Owner's control, and is susceptible to freezing issues, the occurrence of which would likely lead to a Generator Cold Weather Reliability Event. This definition excludes any component or system or associated Fixed Fuel Supply Component located inside a permanent building with a heating source that regularly maintains the space at a temperature above 32 degrees Fahrenheit (0 degrees Celsius).

Fixed Fuel Supply Component – Non-mobile equipment that supports the reliable delivery of fuel to the generating unit and under the control of the Generator Owner at a plant site. Gaseous, liquid, or solid fuel handling components that are installed on site as fixed parts of the fuel delivery system that are under the Generator Owner's control are included. Mobile equipment such as trains, bulldozers, or other equipment that are not fixed in one location are excluded.

Generator Cold Weather Reliability Event – One of the following events for which the apparent cause(s) is due to freezing of equipment or impacts of freezing precipitation (e.g., sleet, snow, ice, and freezing rain) on equipment within the Generator Owner's control, and the dry bulb temperature at the time of the event was at or above the Extreme Cold Weather Temperature:

(1) a forced derate of more than 10% of the total capacity of the unit, but not less than 20 MWs for longer than four hours in duration;

(2) a start-up failure where the unit fails to synchronize within a specified start-up time; or

(3) a Forced Outage.

A. Introduction

1. **Title:** **Extreme Cold Weather Preparedness and Operations**

2. **Number:** EOP-012-3

3. **Purpose:** To address the effects of operating in extreme cold weather by ensuring each Generator Owner has developed and implemented plan(s) to mitigate the reliability impacts of extreme cold weather on its applicable generating units.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1. Generator Owner

   4.1.2. Generator Operator

   4.2. Facilities:

   4.2.1. Bulk Electric System (BES) generating units. For purposes of this standard, the term "generating unit" subject to these requirements refers to the following Bulk Electric System (BES) resources:

   4.2.1.1. A Bulk Electric System generating resource identified in the BES definition, inclusion I2 and I4; or

   4.2.1.2. A Blackstart Resource, identified in the BES definition, inclusion I3.

5. **Effective Date:** See Implementation Plan for Project 2024-03.

B. Requirements and Measures

R1. At least once every five calendar years, each Generator Owner shall, for each of its applicable generating unit(s): [*Violation Risk Factor: Lower*] [*Time Horizon: Long-term Planning*]

1.1. Calculate the Extreme Cold Weather Temperature for each of its applicable unit(s) and identify the calculation date and source of temperature data; and

1.1.1. If the re-calculated Extreme Cold Weather Temperature is lower than the previous Extreme Cold Weather Temperature, the entity shall review and update its cold weather preparedness plan(s) under Requirement R4 within six (6) calendar months of the recalculation. If new corrective actions are needed to provide the required operational capability under Requirement R2 or R3, the entity shall develop a Corrective Action Plan within six (6) months of the recalculation.

1.2. Identify generating unit(s) cold weather data, to include:

1.2.1. Generating unit(s) operating limitations in cold weather to include:

1.2.1.1. Capability and availability;

1.2.1.2. Fuel supply and inventory concerns;

1.2.1.3. Start-up issues;

1.2.1.4. Fuel switching capabilities; and

1.2.1.5. Environmental constraints.

1.2.2. Generating unit(s) minimum:

- Design temperature, and if available, the concurrent wind speed and precipitation;
- Historical operating temperature at least one hour in duration, and if available, the concurrent wind speed and precipitation; or
- Current cold weather performance temperature determined by an engineering analysis, which includes the concurrent wind speed and precipitation.

M1. Each Generator Owner will have evidence documenting its Extreme Cold Weather Temperature calculation and design information, operating data, or engineering analysis that supports its generating unit minimum temperature.

R2. Applicable to generating units which begin commercial operation[1] on or after October 1, 2027: Each Generator Owner, for each generating unit that has a calculated Extreme Cold Weather Temperature at or below 32 degrees Fahrenheit (zero degrees

[1] Commercial operation means achievement of this designation indicating that the facility has received all approvals necessary for operation after completion of initial start-up testing.

Celsius) as determined in Requirement R1, and that self-commits or is required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius),[2] shall: [*Violation Risk Factor: Medium*] [*Time Horizon: Long-term Planning, Operations Planning*]

2.1 For generating units for which the Generator Owner first contractually committed to design criteria[3] relevant to this Requirement before February 16, 2023[4]:

- Implement freeze protection measures to protect Generator Cold Weather Critical Components that provide the capability to operate at the unit(s)' Extreme Cold Weather Temperature with sustained concurrent twenty (20) mph wind speed for (i) a period of not less than twelve (12) continuous hours, or (ii) the maximum operational duration for intermittent energy resources if less than twelve (12) continuous hours; or

- Have a Corrective Action Plan(s) in place (to include any applicable Generator Cold Weather Constraint(s) upon beginning commercial operation, to add new or modify existing or previously planned freeze protection measures to provide the capability to operate at the unit(s)' Extreme Cold Weather Temperature with a sustained concurrent twenty (20) mph wind speed for (i) a period of not less than twelve (12) continuous hours, or (ii) the maximum operational duration for intermittent energy resources if less than twelve (12) continuous hours.

2.2 For generating units for which the Generator Owner first contractually committed to design criteria[5] relevant to this Requirement on or after February 16, 2023[6:]

- Implement freeze protection measures to protect Generator Cold Weather Critical Components that provide the capability to operate at the unit(s)' Extreme Cold Weather Temperature with sustained concurrent twenty (20) mph wind speed for (i) a period of not less than twelve (12) continuous hours, or (ii) the maximum operational duration for intermittent energy resources if less than twelve (12) continuous hours; or

- Document in a declaration, with justification, as applicable, a Generator Cold Weather Constraint in accordance with Requirement R8.

---

[2] Generating unit(s) that do not self-commit or are not required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), but may be called upon to operate in order to assist in the mitigation of BES Emergencies, Capacity Emergencies, or Energy Emergencies during periods at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), are exempt from this requirement.

[3] Such commitments would be demonstrated by signed contractual commitments, emailed correspondence agreeing to thermal design criteria, or other similar documented evidence.

[4] Or the date the definition of Extreme Cold Weather Temperature was approved in the relevant jurisdiction.

[5] Such commitments would be demonstrated by signed contractual commitments, emailed correspondence agreeing to thermal design criteria, or other similar documented evidence.

[6] Or the date the definition of Extreme Cold Weather Temperature was approved in the relevant jurisdiction.

M2. Each Generator Owner will have dated evidence that demonstrates it has freeze protection measures for its unit(s) in accordance with R2, or it has developed a Corrective Action Plan or declared a Generator Cold Weather Constraint for the identified issues. Acceptable evidence may include the following (electronic or hardcopy format): Identification of generating unit(s) minimum temperature under Requirement R1 Part 1.2.2 which is equal to or less than the unit's Extreme Cold Weather Temperature, documentation of freeze protection measures, Corrective Action Plan(s) (if applicable), and Generator Cold Weather Constraints (if applicable).

R3. Applicable to generating unit(s) in commercial operation prior to October 1, 2027: Each Generator Owner, for each generating unit that has a calculated Extreme Cold Weather Temperature at or below 32 degrees Fahrenheit (zero degrees Celsius) as determined in Requirement R1, and that self-commits or is required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius),[7] shall: [*Violation Risk Factor: Medium*] [*Time Horizon: Long-term Planning, Operations Planning*]

- Implement freeze protection measures to protect Generator Cold Weather Critical Components that provide the capability to operate at the unit(s)' Extreme Cold Weather Temperature; or
- Develop a Corrective Action Plan to add new or modify existing freeze protection measures to provide the capability to operate at the unit(s)' Extreme Cold Weather Temperature.

M3. Each Generator Owner will have dated evidence that demonstrates it has freeze protection measures for its unit(s) in accordance with R3, or it has developed a Corrective Action Plan for the identified issues. Acceptable evidence may include, but is not limited to, the following (electronic or hardcopy format): Identification of generating unit(s) minimum temperature per Part 1.2.2 which is equal to or less than the unit's Extreme Cold Weather Temperature, documentation of freeze protection measures, and Corrective Action Plan(s).

R4. Each Generator Owner shall implement and maintain one or more cold weather preparedness plan(s) for its generating units. The cold weather preparedness plan(s) shall include the following, at a minimum: *[Violation Risk Factor: High] [Time Horizon: Operations Planning and Real-time Operations]*

[7] Generating unit(s) that do not self-commit or are not required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), but may be called upon to operate in order to assist in the mitigation of BES Emergencies, Capacity Emergencies, or Energy Emergencies during periods at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), are exempt from this requirement.

4.1. The lowest calculated Extreme Cold Weather Temperature for each unit, as determined in Requirement R1;[8]

4.2. The generating unit cold weather data, as determined in Requirement R1.2;

4.3. Documentation identifying Generator Cold Weather Critical Components;

4.4. Documentation of freeze protection measures implemented on Generator Cold Weather Critical Components which includes measures used to reduce the cooling effects of wind determined necessary by the Generator Owner to protect against heat loss, and where applicable, the effects of freezing precipitation (e.g., sleet, snow, ice, and freezing rain); and

4.5. Annual inspection and maintenance of generating unit(s) freeze protection measures implemented on Generator Cold Weather Critical Components.

M4. Each Generator Owner will have evidence documenting that its cold weather preparedness plan(s) was implemented and maintained in accordance with Requirement R4. Examples of documentation to demonstrate a cold weather preparedness plan may include existing operating procedures, plans, checklists, or processes. Examples of documentation, to demonstrate inspections and maintenance have been completed, may include, but are not limited to, completed work order(s) from the Generator Owner's work management system and/or freeze protection checklists identifying the measures inspected and maintained for the Generator Cold Weather Critical Components.

R5. Each Generator Owner in conjunction with its Generator Operator shall identify the entity responsible for providing the generating unit-specific training, and that identified entity shall provide annual training to its maintenance or operations personnel responsible for implementing the cold weather preparedness plan(s) developed pursuant to Requirement R4. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning, Operations Planning]*

M5. Each Generator Operator or Generator Owner will have documented evidence that the applicable personnel completed annual training of the Generator Owner's cold weather preparedness plan(s). This evidence may include, but is not limited to, documents such as personnel training records, training materials, date of training, agendas or learning objectives, attendance at pre-work briefings, review of work order tasks, tailboards, attendance logs for classroom training, and completion records for computer-based training in fulfillment of Requirement R5.

R6. Each Generator Owner shall, for each generating unit that has a calculated Extreme Cold Weather Temperature at or below 32 degrees Fahrenheit (zero degrees Celsius) as determined in Requirement R1 and that self-commits or is required to operate at

[8] Generator Owners shall include the lowest calculated Extreme Cold Weather Temperature for the unit, even where subsequent periodic re-calculations under Requirement R1 Part 1.1 cause an increase in the Extreme Cold Weather Temperature.

or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius),[9] develop and implement a Corrective Action Plan when the generating unit experiences a Generator Cold Weather Reliability Event. The Corrective Action Plan shall be developed before the first day of July, but not more than 150 days after the Generator Cold Weather Reliability Event. The Generator Owner shall: *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

6.1. Ensure the Corrective Action Plan contains at a minimum:

6.1.1. A summary of the identified cause(s) for the Generator Cold Weather Reliability Event, where applicable, and any relevant associated data;

6.1.2. A list of actions to add new or remedy issues with existing freeze protection measures;

6.1.3. An identification of operating limitations or impacts to the cold weather preparedness plan that would apply until execution of the corrective action(s) identified in the Corrective Action Plan;

6.1.4. A description of the updates to the cold weather preparedness plan required under Requirement R4 to identify updates or additions to the Generator Cold Weather Critical Components and their freeze protection measures, if required;

6.1.5. A timetable specifying that implementation of the Corrective Action Plan shall be completed prior to the first day of December following the Generator Cold Weather Reliability Event[10]; and

6.1.6. A review of applicability to similar equipment freeze protection measures at generating units owned by the Generator Owner, with a specified timetable for corrective actions to be completed within 24 calendar months of the Generator Cold Weather Reliability Event;

6.2. Update the Corrective Action Plan action(s) and timetable(s), with justification, and submit a Corrective Action Plan extension request to the Compliance Enforcement Authority (CEA)[11] for approval where the timetable(s) for completing selected actions are projected to exceed the timelines in Part 6.1. The submitted Corrective Action Plan extension request shall include the following;

[9] Generating unit(s) that do not self-commit or are not required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), but may be called upon to operate in order to assist in the mitigation of BES Emergencies, Capacity Emergencies, or Energy Emergencies during periods at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), are exempt from this requirement.

[10] For events that occur early in the season, such as in October or November, the timetable shall specify completion prior to December 1 of the next calendar year.

[11] Extension requests will be received and evaluated in accordance with the NERC process. The extension requests for a non-US Registered Entity should be implemented in a manner that is consistent with, or under the direction of, the applicable governmental authority or its agency in the non-US jurisdiction.

6.2.1. Circumstances causing the delay and how those circumstances are beyond the control of the Generator Owner;

6.2.2. Revisions to the selected actions in Part 6.1, if any, including utilization of Operating Procedures, if applicable; and

6.2.3. Updated timetable for implementing the selected actions in Part 6.1.

6.3. Document in a declaration, with justification, any Generator Cold Weather Constraint in accordance with Requirement R8, if applicable, that precludes the Generator Owner from implementing selected action(s) contained within the Corrective Action Plan.

M6. Each Generator Owner will have documented evidence that it developed and implemented a Corrective Action Plan following a Cold Weather Reliability Event at an applicable unit in accordance with Requirement R6. Acceptable evidence may include, but is not limited to, the following dated documentation (electronic or hardcopy format): Corrective Action Plan(s), Generator Cold Weather Constraint(s), completed work orders, copies of any Corrective Action Plan extension requests and supporting documentation, and updated cold weather preparedness plan(s) where indicated as needed by the Corrective Action Plan.

R7. Each Generator Owner, for each Corrective Action Plan developed pursuant to Requirements R1, R2, or R3 shall, as applicable: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

7.1. Include a timetable for implementing the selected corrective action(s) that shall:

7.1.1. List the action(s) which remedy(ies) issues with existing freeze protection measures, if any, to be completed within 24 calendar months of completing development of the Corrective Action Plan, regardless of any longer timelines in the Corrective Action Plan associated with new freeze protection measures;

7.1.2. List the action(s) which require(s) new freeze protection measures, if any, to be completed within 48 calendar months of completing development of the Corrective Action Plan; and

7.1.3. Describe the updates to the cold weather preparedness plan required under Requirement R4 to identify the updates or additions to the Generator Cold Weather Critical Components and their freeze protection measures.

7.2. Complete all actions described in the Corrective Action Plan in accordance with the specified timetables in Part 7.1.

7.3. Submit a Corrective Action Plan extension request, for the approval of the CEA[12], where the timetable(s) for completing selected actions are projected to exceed the timelines in Part 7.1. The submitted request shall:

7.3.1 Explain the circumstances causing the delay and how those circumstances are beyond the control of the Generator Owner;

7.3.2 Include, as applicable, revisions to the selected actions in Part 7.1, including utilization of Operating Procedures; and

7.3.3 Include an updated timetable for implementing the selected actions in Part 7.1.

7.4. Document in a declaration, with justification, any Generator Cold Weather Constraint in accordance with Requirement R8 that precludes the Generator Owner from implementing selected action(s) contained within the Corrective Action Plan.

M7. Each Generator Owner shall have dated evidence that demonstrates it implemented each Corrective Action Plan, including updating actions or timetables, or has explained in a declaration why corrective actions are not being implemented in accordance with Requirement R7. Acceptable evidence may include, but is not limited to, the following dated documentation (electronic or hardcopy format): records that document the implementation of each Corrective Action Plan and the completion of actions for each Corrective Action Plan including revision history of each Corrective Action Plan, documentation from the Compliance Enforcement Authority indicating that a Corrective Action Plan extension request was granted and, if applicable, justification to support any changes to corrective action(s) identified in the Corrective Action Plan or any Corrective Action Plan extension requests when timetables exceeding the timelines in Requirement R7 Part 7.1. For each Corrective Action Plan applying to multiple generating units, the timetable shall reflect implementation at each unit addressed in the Corrective Action Plan. Evidence may also include work management program records, work orders, and maintenance records. Any declaration shall contain dated documentation to support constraints identified by the Generator Owner.

R8. Each Generator Owner that declares a Generator Cold Weather Constraint in accordance with Attachment 1 shall: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

8.1. Submit its Generator Cold Weather Constraint declaration(s) to the CEA within 45 days of determining that the Generator Cold Weather Constraint is applicable. For Generator Cold Weather Constraints determined in accordance with Requirement R2 for generating unit(s) upon beginning commercial

[12] Extension requests will be received and evaluated in accordance with the NERC process. The extension requests for a non-US Registered Entity should be implemented in a manner that is consistent with, or under the direction of, the applicable governmental authority or its agency in the non-US jurisdiction.

operation, submit the Generator Cold Weather Constraint declaration(s) no later than 15 days after commercial operation;

8.2. Review any Generator Cold Weather Constraint declaration validated by the CEA every 24 calendar months to determine if it remains valid under Attachment 1;

8.3 Update the operating limitations associated with capability and availability under Requirement R1 Part R1.2 if applicable; and

8.4 If the CEA determines the declared Generator Cold Weather Constraint is invalid, update its Corrective Action Plan(s) to require corrective actions be completed in accordance with the timetables in Requirement R6 Part 6.1 or Requirement R7 Part 7.1, to begin from the date the Generator Owner is notified that the Generator Cold Weather Constraint is invalid.

M8. Each Generator Owner shall have dated evidence that demonstrates it performed the actions in accordance with Requirement R8. Acceptable evidence may include, but is not limited to, the following dated documentation (electronic or hardcopy format): records that document the performance of the review and update to the operating limitations, as needed.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation.

- The Generator Owner shall retain data or evidence to support its current Extreme Cold Weather Temperature calculation and generating unit cold weather data, plus each calculation or revision since the last audit, for Requirement R1 and Measure M1.
- The Generator Owner shall keep data or evidence to show compliance for three years, or until any Corrective Action Plan under Requirement R2 or R3 is complete, whichever timeframe is greater, for Requirements R2 and R3 and Measures M2 and M3. Generator Cold Weather Constraint data or evidence shall be retained until no longer valid.
- The Generator Owner shall retain the current cold weather preparedness plan(s), as evidence of review or revision history, plus each version issued since the last audit and evidence of compliance since the last audit for Requirement R4 and Measure M4.
- The Generator Owner or Generator Operator shall keep data or evidence to show compliance for three years for Requirement R5 and Measure M5.
- The Generator Owner shall keep data or evidence to show compliance for three years, or until any Corrective Action Plan under Requirement R6 is complete, whichever timeframe is greater, for Requirement R6 and Measure M6.
- The Generator Owner shall keep data or evidence to show compliance for three years, or until any Corrective Action Plan is complete, whichever time frame is greater, for Requirement R7 and Measure M7. Generator Cold Weather Constraint data or evidence shall be retained until no longer valid.

- The Generator Owner shall maintain data or evidence to support its current Generator Cold Weather Constraint declaration, plus each revision since the last audit, for Requirement R8 and Measure M8.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	The Generator Owner did not calculate the Extreme Cold Weather Temperature and identify generating unit(s) cold weather data in accordance with Requirement R1 for 5% or less of its applicable units.	The Generator Owner did not calculate the Extreme Cold Weather Temperature and identify generating unit(s) cold weather data in accordance with Requirement R1 for more than 5%, but less than or equal to 10% of its applicable units.	The Generator Owner did not calculate the Extreme Cold Weather Temperature and identify generating unit(s) cold weather data in accordance with Requirement R1 for more than 10%, but less than or equal to 20% of its applicable units.	The Generator Owner did not calculate the Extreme Cold Weather Temperature and identify generating unit(s) cold weather data in accordance with Requirement R1 for more than 20% of its applicable units.
R2.	The Generator Owner did not have freeze protection measure(s) for its applicable unit(s) meeting the criteria in Requirement R2 for 5% or less of its applicable units. OR The Generator Owner did not have a Corrective Action Plan or a Generator Cold Weather Constraint (if applicable) to implement appropriate freeze protection measures for 5% or less of its applicable units.	The Generator Owner did not have freeze protection measure(s) for its applicable unit(s) meeting the criteria in Requirement R2 for more than 5%, but less than or equal to 10% of its applicable units. OR The Generator Owner did not have a Corrective Action Plan or a Generator Cold Weather Constraint (if applicable) for more than 5%, but less than or equal to 10% of its applicable units.	The Generator Owner did not have freeze protection measure(s) meeting the criteria in Requirement R2 for more than 10%, but less than or equal to 20% of its applicable units. OR The Generator Owner did not have a Corrective Action Plan or a Generator Cold Weather Constraint (if applicable) for more than 10%, but less than or equal to 20% of its applicable units.	The Generator Owner did not have freeze protection measure(s) meeting the criteria in Requirement R2 for more than 20% of its applicable units. OR The Generator Owner did not have a Corrective Action Plan or a Generator Cold Weather Constraint (if applicable) for more than 20% of its applicable units.

E. Associated Documents

Implementation Plan

Attachment 1

Generator Owners shall determine the applicability of a Generator Cold Weather Constraint declared under Requirements R2, R6, and R7 using the criteria as described below.

A Generator Cold Weather Constraint is any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components using the following criteria:

Pre-Approved Generator Cold Weather Constraints

The following are circumstances which, if present and confirmed as valid by the Compliance Enforcement Authority, will constitute Generator Cold Weather Constraints:

- Wind turbine towers that have structural limitations established by Original Equipment Manufacturers (OEMs) based on a minimum temperature that is higher than the Extreme Cold Weather Temperature calculated per Requirement R1.
- Heat tracing or other de-icing technologies for wind turbine blades that are not available in the Generator Owner's location.
- Replacing existing wind turbine blades with new blades solely for the purpose of adding de-icing or ice-minimizing capabilities.
- Applying heat to remove accumulated frozen precipitation on solar panels.
- Applying heat upstream of inlet air filters to prevent the buildup of frozen precipitation on combustion turbine inlet air filters.

Case-by-case Determinations of Generator Cold Weather Constraints

The following situations may constitute a Generator Cold Weather Constraint, depending on the facts and circumstances. Only upon approval by the Compliance Enforcement Authority will these circumstances comprise a valid Generator Cold Weather Constraint:

1. The application of a specific freeze protection measure will void an equipment warranty.
2. The application of a specific freeze protection measure is precluded by technical or physical limitations. For example:
    a. Installing wind breaks around a cooling tower or air-cooled heat exchanger which requires free airflow for its functionality;
    b. Applying freeze control measures with size or weight that would require the structural re-design and re-construction of the protected equipment or its support system.
    c. Other similar circumstances as determined through operating experience or engineering analysis and supported with justification.
3. The application of a specific freeze protection measure or measures would adversely affect the reliability of the Bulk Power System to an extent that outweighs the reliability benefit of applying the freeze protection measure(s). For example:

a. The application of freeze protection measures would result in the premature retirement of an existing dispatchable generating unit with no acceptable replacement currently available;
b. The freeze protection measures would be applied to a generating unit that has a previously published retirement date within three years of the Generator Cold Weather Constraint declaration;
c. The application of freeze protection measures would cause the Generator Owner to cancel plans to finish the development of a new generating unit(s);
d. The application of freeze protection measures would reduce the generating unit's ability to provide Real Power or Reactive Power by more than three percent; or
e. The application of freeze protection measures would reduce the summer net dependable capacity[1] of the generating unit by more than three percent.
f. Other similar circumstances as determined through operating experience or engineering analysis and supported with justification.

4. The application of a specific freeze protection measure would introduce the risk of noncompliance with other statutory, regulatory, or health and safety requirements or standards for which relief via waiver, exemption or other means of excused noncompliance is not available during extreme cold weather.
5. Other situations identified by the Generator Owner that may, based on the specific circumstances beyond the Generator Owner's control, limit its ability to apply freeze protection measures to Generator Cold Weather Critical Components.

When submitting a Generator Cold Weather Constraint declaration to the CEA per Requirement R8, the Generator Owner must include documentation that defends and supports the declared constraint and also describes other compensating or mitigating freeze protection measures, if applicable, that the Generator Owner will apply. An approved Generator Cold Weather Constraint declaration for any specific Generator Cold Weather Critical Component does not relieve the Generator Owner of its obligation to otherwise prepare its applicable generating unit(s) to meet the requirements of EOP-012-3.

[1] "net dependable capacity" refers to the definition used for reporting to the NERC in Generating Availability Data System (GADS) appropriate for the generation type.

Version History

Version	Date	Action	Change Tracking
1	October 1, 2022	Drafted by Project 2021-07	New
2	February 16, 2023	Revisions drafted by Project 2021-07 due to FERC Order and inquiry Recommendations.	Revisions
2	February 15,2024	Board Adopted	
2	June 27, 2024	FERC Approved	
3	October 17, 2024	Drafted by Project 2024-03	As directed by the June 2024 FERC Order

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the initial draft of the proposed standard for a formal 20-day comment and ballot period.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	July 17, 2024
SAR posted for comment	July 18, 2024 – August 16, 2024

Anticipated Actions	Date
20-day formal comment period with ballot	October 17, 2024 – November 5, 2024
18-day formal or informal comment period with additional ballot	December 3, 2024 – December 20, 2024
15-day formal or informal comment period with additional ballot	January 29, 2025 – February 12, 2025
Board adoption	TBD

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

Generator Cold Weather Constraint – Any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components. ~~using the criteria below. Freeze protection measures are not intended to be limited to optimum practices, methods, or technologies, but are also intended to include acceptable practices, methods, or technologies generally implemented by the electric industry in areas that experience similar winter climate conditions.~~

~~Criteria used to determine a constraint include practices, methods, or technologies which, given the exercise of reasonable judgment in light of the facts known at the time the decision to declare the constraint was made:~~

~~Were not broadly implemented at generating units for comparable unit types in regions that experience similar winter climate conditions to provide reasonable assurance of efficacy;~~

~~Could not have been expected to accomplish the desired result; or~~

~~Could not have been implemented at a reasonable cost consistent with good business practices, reliability, or safety. A cost may be deemed "unreasonable" when implementation of selected freeze protection measure(s) are uneconomical to the extent that they would require prohibitively expensive modifications or significant expenditures on equipment with minimal remaining life.~~

Previously Approved Terms

This section includes previously approved terms from EOP-012-1 and EOP-012-2. It is included to help with drafting and the posting of EOP-012-3.

Extreme Cold Weather Temperature – The temperature equal to the lowest 0.2 percentile of the hourly temperatures measured in December, January, and February from 1/1/2000 through the date the temperature is calculated.

Generator Cold Weather Critical Component – Any generating unit component or system, or associated Fixed Fuel Supply Component, that is under the Generator Owner's control, and is susceptible to freezing issues, the occurrence of which would likely lead to a Generator Cold Weather Reliability Event. This definition excludes any component or system or associated Fixed Fuel Supply Component located inside a permanent building with a heating source that

regularly maintains the space at a temperature above 32 degrees Fahrenheit (0 degrees Celsius).

Fixed Fuel Supply Component – Non-mobile equipment that supports the reliable delivery of fuel to the generating unit and under the control of the Generator Owner at a plant site. Gaseous, liquid, or solid fuel handling components that are installed on site as fixed parts of the fuel delivery system that are under the Generator Owner's control are included. Mobile equipment such as trains, bulldozers, or other equipment that are not fixed in one location are excluded.

Generator Cold Weather Reliability Event – One of the following events for which the apparent cause(s) is due to freezing of equipment or impacts of freezing precipitation (e.g., sleet, snow, ice, and freezing rain) on equipment within the Generator Owner's control, and the dry bulb temperature at the time of the event was at or above the Extreme Cold Weather Temperature:

(1) a forced derate of more than 10% of the total capacity of the unit, but not less than 20 MWs for longer than four hours in duration;

(2) a start-up failure where the unit fails to synchronize within a specified start-up time; or

(3) a Forced Outage.

A. Introduction

1. **Title:** **Extreme Cold Weather Preparedness and Operations**

2. **Number:** EOP-012-32

3. **Purpose:** To address the effects of operating in extreme cold weather by ensuring each Generator Owner has developed and implemented plan(s) to mitigate the reliability impacts of extreme cold weather on its applicable generating units.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1. Generator Owner

   4.1.2. Generator Operator

   4.2. Facilities:

   4.2.1. Bulk Electric System (BES) generating units. For purposes of this standard, the term "generating unit" subject to these requirements refers to the following Bulk Electric System (BES) resources:

   4.2.1.1. A Bulk Electric System generating resource identified in the BES definition, inclusion I2 and I4; or

   4.2.1.2. A Blackstart Resource, identified in the BES definition, inclusion I3.

5. **Effective Date:** See Implementation Plan for Project 20241-037 Phase 2.

B. Requirements and Measures

R1. At least once every five calendar years, each Generator Owner shall, for each of its applicable generating unit(s): [*Violation Risk Factor: Lower*] [*Time Horizon: Long-term Planning*]

1.1. Calculate the Extreme Cold Weather Temperature for each of its applicable unit(s) and identify the calculation date and source of temperature data; and

1.1.1. If the re-calculated Extreme Cold Weather Temperature is lower than the previous Extreme Cold Weather Temperature, the entity shall review and update its cold weather preparedness plan(s) under Requirement R4 within six (6) calendar months of the recalculation. If new corrective actions are needed to provide the required operational capability under Requirement R2 or R3, the entity shall develop a Corrective Action Plan within six (6) months of the recalculation.

1.2. Identify generating unit(s) cold weather data, to include:

1.2.1. Generating unit(s) operating limitations in cold weather to include:

1.2.1.1. Capability and availability;

1.2.1.2. Fuel supply and inventory concerns;

1.2.1.3. Start-up issues;

1.2.1.4. Fuel switching capabilities; and

1.2.1.5. Environmental constraints.

1.2.2. Generating unit(s) minimum:

- Design temperature, and if available, the concurrent wind speed and precipitation;
- Historical operating temperature at least one hour in duration, and if available, the concurrent wind speed and precipitation; or
- Current cold weather performance temperature determined by an engineering analysis, which includes the concurrent wind speed and precipitation.

M1. Each Generator Owner will have evidence documenting its Extreme Cold Weather Temperature calculation and design information, operating data, or engineering analysis that supports its generating unit minimum temperature.

R2. Applicable to generating units ~~with a~~which begin commercial operation[1] ~~date~~ on or after October 1, 2027: Each Generator Owner, for each generating unit that has a calculated Extreme Cold Weather Temperature at or below 32 degrees Fahrenheit

[1] Commercial operation means achievement of this designation indicating that the facility has received all approvals necessary for operation after completion of initial start-up testing.

(zero degrees Celsius) as determined in Requirement R1, and that self-commits or is required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius),[2] shall: [*Violation Risk Factor: Medium*] [*Time Horizon: Long-term Planning, Operations Planning*]

2.1 For generating units for which the Generator Owner first contractually committed to design criteria[3] relevant to this Requirement before February 16, 2023[4]:

- Implement freeze protection measures to protect Generator Cold Weather Critical Components that provide the capability to operate at the unit(s)' Extreme Cold Weather Temperature with sustained concurrent twenty (20) mph wind speed for (i) a period of not less than twelve (12) continuous hours, or (ii) the maximum operational duration for intermittent energy resources if less than twelve (12) continuous hours; or

- ~~Develop~~ Have a Corrective Action Plan(s) in place (to include any applicable Generator Cold Weather Constraint(s) upon beginning commercial operations~~.~~, to add new or modify existing or previously planned freeze protection measures to provide the capability to operate at the unit(s)' Extreme Cold Weather Temperature with a sustained concurrent twenty (20) mph wind speed for (i) a period of not less than twelve (12) continuous hours, or (ii) the maximum operational duration for intermittent energy resources if less than twelve (12) continuous hours.

2.2 For generating units for which the Generator Owner first contractually committed to design criteria[5] relevant to this Requirement on or after February 16, 2023[6]:

- Implement freeze protection measures to protect Generator Cold Weather Critical Components that provide the capability to operate at the unit(s)' Extreme Cold Weather Temperature with sustained concurrent twenty (20) mph wind speed for (i) a period of not less than twelve (12) continuous hours, or (ii) the maximum operational duration for intermittent energy resources if less than twelve (12) continuous hours; or~~.~~

[2] Generating unit(s) that do not self-commit or are not required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), but may be called upon to operate in order to assist in the mitigation of BES Emergencies, Capacity Emergencies, or Energy Emergencies during periods at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), are exempt from this requirement.

[3] Such commitments would be demonstrated by signed contractual commitments, emailed correspondence agreeing to thermal design criteria, or other similar documented evidence.

[4] Or the date the definition of Extreme Cold Weather Temperature was approved in the relevant jurisdiction.

[5] Such commitments would be demonstrated by signed contractual commitments, emailed correspondence agreeing to thermal design criteria, or other similar documented evidence.

[6] Or the date the definition of Extreme Cold Weather Temperature was approved in the relevant jurisdiction.

- Document in a declaration, with justification, as applicable, a Generator Cold Weather Constraint in accordance with Requirement R8.

M2. Each Generator Owner will have dated evidence that demonstrates it has freeze protection measures for its unit(s) in accordance with R2, or it has developed a Corrective Action Plan or declared a Generator Cold Weather Constraint for the identified issues. Acceptable evidence may include the following (electronic or hardcopy format): Identification of generating unit(s) minimum temperature under Requirement R1 Part 1.2.2 which is equal to or less than the unit's Extreme Cold Weather Temperature, documentation of freeze protection measures, ~~and~~ Corrective Action Plan(s) (if applicable), and Generator Cold Weather Constraints (if applicable).

R3. Applicable to generating unit(s) in commercial operation prior to October 1, 2027: Each Generator Owner, for each generating unit that has a calculated Extreme Cold Weather Temperature at or below 32 degrees Fahrenheit (zero degrees Celsius) as determined in Requirement R1, and that self-commits or is required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius),[7] shall: [*Violation Risk Factor: Medium*] [*Time Horizon: Long-term Planning, Operations Planning*]

- Implement freeze protection measures to protect Generator Cold Weather Critical Components that provide the capability to operate at the unit(s)' Extreme Cold Weather Temperature; or
- Develop a Corrective Action Plan to add new or modify existing freeze protection measures to provide the capability to operate at the unit(s)' Extreme Cold Weather Temperature.

M3. Each Generator Owner will have dated evidence that demonstrates it has freeze protection measures for its unit(s) in accordance with R3, or it has developed a Corrective Action Plan for the identified issues. Acceptable evidence may include, but is not limited to, the following (electronic or hardcopy format): Identification of generating unit(s) minimum temperature per Part 1.2.2 which is equal to or less than the unit's Extreme Cold Weather Temperature, documentation of freeze protection measures, and Corrective Action Plan(s).

R4. Each Generator Owner shall implement and maintain one or more cold weather preparedness plan(s) for its generating units. The cold weather preparedness plan(s)

[7] Generating unit(s) that do not self-commit or are not required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), but may be called upon to operate in order to assist in the mitigation of BES Emergencies, Capacity Emergencies, or Energy Emergencies during periods at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), are exempt from this requirement.

shall include the following, at a minimum: *[Violation Risk Factor: High] [Time Horizon: Operations Planning and Real-time Operations]*

4.1. The lowest calculated Extreme Cold Weather Temperature for each unit, as determined in Requirement R1;[8]

4.2. The generating unit cold weather data, as determined in Requirement R1.2;

4.3. Documentation identifying Generator Cold Weather Critical Components;

4.4. Documentation of freeze protection measures implemented on Generator Cold Weather Critical Components which includes measures used to reduce the cooling effects of wind determined necessary by the Generator Owner to protect against heat loss, and where applicable, the effects of freezing precipitation (e.g., sleet, snow, ice, and freezing rain); and

4.5. Annual inspection and maintenance of generating unit(s) freeze protection measures implemented on Generator Cold Weather Critical Components.

M4. Each Generator Owner will have evidence documenting that its cold weather preparedness plan(s) was implemented and maintained in accordance with Requirement R4. Examples of documentation to demonstrate a cold weather preparedness plan may include existing operating procedures, plans, checklists, or processes. Examples of documentation to demonstrate inspections and maintenance have been completed may include, but are not limited to, completed work order(s) from the Generator Owner's work management system and/or freeze protection checklists identifying the measures inspected and maintained for the Generator Cold Weather Critical Components.

R5. Each Generator Owner in conjunction with its Generator Operator shall identify the entity responsible for providing the generating unit-specific training, and that identified entity shall provide annual training to its maintenance or operations personnel responsible for implementing the cold weather preparedness plan(s) developed pursuant to Requirement R4. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning, Operations Planning]*

M5. Each Generator Operator or Generator Owner will have documented evidence that the applicable personnel completed annual training of the Generator Owner's cold weather preparedness plan(s). This evidence may include, but is not limited to, documents such as personnel training records, training materials, date of training, agendas or learning objectives, attendance at pre-work briefings, review of work order tasks, tailboards, attendance logs for classroom training, and completion records for computer-based training in fulfillment of Requirement R5.

[8] Generator Owners shall include the lowest calculated Extreme Cold Weather Temperature for the unit, even where subsequent periodic re-calculations under Requirement R1 Part 1.1 cause an increase in the Extreme Cold Weather Temperature.

R6. Each Generator Owner shall, for each generating unit that has a calculated Extreme Cold Weather Temperature at or below 32 degrees Fahrenheit (zero degrees Celsius) as determined in Requirement R1 and that self-commits or is required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius),[9] develop and implement a Corrective Action Plan when the generating unit experiences a Generator Cold Weather Reliability Event. The Corrective Action Plan shall be developed ~~within 150 days or by July 1, whichever is earlier, and contain at a minimum:~~ before the first day of July, but not more than 150 days after the Generator Cold Weather Reliability Event. The Generator Owner shall: *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

6.1. Ensure the Corrective Action Plan contains at a minimum:

6.1.1. A summary of the identified cause(s) for the Generator Cold Weather Reliability Event, where applicable, and any relevant associated data;

6.1.2. A list of actions to add new or remedy issues with existing freeze protection measures;

~~**6.2** A review of applicability to similar equipment at generating units owned by the Generator Owner; and~~

6.1.3. An identification of operating limitations or impacts to the cold weather preparedness plan that would apply until execution of the corrective action(s) identified in the Corrective Action Plan~~.~~;

6.1.4. A description of the updates to the cold weather preparedness plan required under Requirement R4 to identify updates or additions to the Generator Cold Weather Critical Components and their freeze protection measures, if required;

6.1.5. A timetable specifying that implementation of the Corrective Action Plan shall be completed prior to the first day of December following the Generator Cold Weather Reliability Event[10]; and

6.1.6. A review of applicability to similar equipment freeze protection measures at generating units owned by the Generator Owner, with a specified timetable for corrective actions to be completed within 24 calendar months of the Generator Cold Weather Reliability Event;

[9] Generating unit(s) that do not self-commit or are not required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), but may be called upon to operate in order to assist in the mitigation of BES Emergencies, Capacity Emergencies, or Energy Emergencies during periods at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), are exempt from this requirement.

[10] For events that occur early in the season, such as in October or November, the timetable shall specify completion prior to December 1 of the next calendar year.

6.2. Update the Corrective Action Plan action(s) and timetable(s), with justification, and submit a Corrective Action Plan extension request to the Compliance Enforcement Authority (CEA)[11] for approval where the timetable(s) for completing selected actions are projected to exceed the timelines in Part 6.1. The submitted Corrective Action Plan extension request shall include the following;

6.2.1. Circumstances causing the delay and how those circumstances are beyond the control of the Generator Owner;

6.2.2. Revisions to the selected actions in Part 6.1, if any, including utilization of Operating Procedures, if applicable; and

6.2.3. Updated timetable for implementing the selected actions in Part 6.1.

6.3. Document in a declaration, with justification, any Generator Cold Weather Constraint in accordance with Requirement R8, if applicable, -that precludes the Generator Owner from implementing selected action(s) contained within the Corrective Action Plan.

M6. Each Generator Owner will have documented evidence that it developed and implemented a Corrective Action Plan following a Cold Weather Reliability Event at an applicable unit in accordance with Requirement R6. Acceptable evidence may include, but is not limited to, the following dated documentation (electronic or hardcopy format): Corrective Action Plan(s), Generator Cold Weather Constraint(s), completed work orders, copies of any Corrective Action Plan extension requests and supporting documentation, and updated cold weather preparedness plan(s) where indicated as needed by the Corrective Action Plan.

R7. Each Generator Owner, for each Corrective Action Plan developed pursuant to Requirements R1, R2, or R3~~, or R6,~~ shall, as applicable: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

7.1. Include a timetable for implementing the selected corrective action(s) that shall:

7.1.1. List the action(s) which remedy~~address~~(ies) issues with existing ~~equipment or~~ freeze- protection measures, if any, to be completed within 24 calendar months of completing development of the Corrective Action Plan, regardless of any longer timelines in the Corrective Action Plan associated with new freeze protection measures;

[11] Extension requests will be received and evaluated in accordance with the NERC process. The extension requests for a non-US Registered Entity should be implemented in a manner that is consistent with, or under the direction of, the applicable governmental authority or its agency in the non-US jurisdiction.

7.1.2. List the action(s) which require(s) new ~~equipment or~~ freeze protection measures, if any, to be completed within 48 calendar months of completing development of the Corrective Action Plan; and

7.1.3. ~~List~~ Describe the updates to the cold weather preparedness plan required under Requirement R4 to identify the updates or additions to the Generator Cold Weather Critical Components and their freeze protection measures.~~;~~

7.2. ~~Implement~~ Complete all actions described in the Corrective Action Plan in accordance with the specified timetables in ~~Requirement R7~~ Part 7.1;

7.3. ~~Update the Corrective Action Plan action(s) and timetable(s),~~ Submit a Corrective Action Plan extension request, for the approval of the CEA[12], where the timetable(s) for completing selected actions are projected to exceed the timelines in Part 7.1. The submitted request shall:~~with justification, if corrective action(s) change or timetable(s) exceed the timelines in Requirement R7 Part 7.1; and~~

7.3.1 Explain the ~~C~~circumstances causing the delay and how those circumstances are beyond the control of the Generator Owner;

7.3.2 Include, as applicable, revisions to the selected actions in Part 7.1, including utilization of Operating Procedures; and

7.3.3 Include an updated timetable for implementing the selected actions in Part 7.1.

7.4. Document in a declaration, with justification, any Generator Cold Weather Constraint in accordance with Requirement R8 that precludes the Generator Owner from implementing selected action(s) contained within the Corrective Action Plan.

M7. Each Generator Owner shall have dated evidence that demonstrates it implemented each Corrective Action Plan, including updating actions or timetables, or has explained in a declaration why corrective actions are not being implemented in accordance with Requirement ~~R8~~R7. Acceptable evidence may include, but is not limited to, the following dated documentation (electronic or hardcopy format): records that document the implementation of each Corrective Action Plan and the completion of actions for each Corrective Action Plan including revision history of each Corrective Action Plan, documentation from the Compliance Enforcement Authority indicating that a Corrective Action Plan extension request was granted and, if applicable, justification to support any changes to corrective action(s) identified in the Corrective Action Plan or any Corrective Action Plan extension requests when timetables exceeding the timelines in Requirement R7 Part 7.1. For each Corrective Action Plan

[12] Extension requests will be received and evaluated in accordance with the NERC process. The extension requests for a non-US Registered Entity should be implemented in a manner that is consistent with, or under the direction of, the applicable governmental authority or its agency in the non-US jurisdiction.

applying to multiple generating units, the timetable shall reflect implementation at each unit addressed in the Corrective Action Plan. Evidence may also include work management program records, work orders, and maintenance records. Any declaration shall contain dated documentation to support constraints identified by the Generator Owner.

R8. Each Generator Owner that ~~creates~~ declares a Generator Cold Weather Constraint in accordance with Attachment 1 ~~declaration~~ shall: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

8.1. Submit its Generator Cold Weather Constraint declaration(s) to the CEA within 45 days of determining that the Generator Cold Weather Constraint is applicable. For Generator Cold Weather Constraints determined in accordance with Requirement R2 for generating unit(s) upon beginning commercial operation, submit the Generator Cold Weather Constraint declaration(s) no later than 15 days after commercial operation;

~~Review the Generator Cold Weather Constraint declaration at least every five calendar years or as needed when a change of status to the Generator Cold Weather Constraint occurs; and~~

8.2. Review any Generator Cold Weather Constraint declaration validated by the CEA every 24 calendar months to determine if it remains valid under Attachment 1;

8.3 Update the operating limitations associated with capability and availability under Requirement R1 Part R1.2 if applicable; and

8.4 If the CEA determines the declared Generator Cold Weather Constraint is invalid, update its Corrective Action Plan(s) to require corrective actions be completed in accordance with the timetables in Requirement R6 Part 6.1 or Requirement R7 Part 7.1, to begin from the date the Generator Owner is notified that the Generator Cold Weather Constraint is invalid.

M8. Each Generator Owner shall have dated evidence that demonstrates it performed the actions in accordance with Requirement R8~~the review and updated operating limitations as needed~~. Acceptable evidence may include, but is not limited to the following dated documentation (electronic or hardcopy format): records that document the performance of the review and update to the operating limitations, as needed.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation.

- The Generator Owner shall retain data or evidence to support its current Extreme Cold Weather Temperature calculation and generating unit cold weather data, plus each calculation or revision since the last audit, for Requirement R1 and Measure M1.
- The Generator Owner shall keep data or evidence to show compliance for three years, or until any Corrective Action Plan under Requirement R2 or R3 is complete, whichever timeframe is greater, for Requirements R2 and R3 and Measures M2 and M3. Generator Cold Weather Constraint data or evidence shall be retained until no longer valid.
- The Generator Owner shall retain the current cold weather preparedness plan(s), as evidence of review or revision history, plus each version issued since the last audit and evidence of compliance since the last audit for Requirement R4 and Measure M4.
- The Generator Owner or Generator Operator shall keep data or evidence to show compliance for three years for Requirement R5 and Measure M5.
- The Generator Owner shall keep data or evidence to show compliance for three years, or until any Corrective Action Plan under Requirement R6 is complete, whichever timeframe is greater, for Requirement R6 and Measure M6.
- The Generator Owner shall keep data or evidence to show compliance for three years, or until any Corrective Action Plan is complete, whichever time frame is greater, for Requirement R7 and Measure M7. Generator Cold Weather Constraint data or evidence shall be retained until no longer valid.

- The Generator Owner shall maintain data or evidence to support its current Generator Cold Weather Constraint declaration, plus each revision since the last audit, for Requirement R8 and Measure M8.

1.3. Compliance Monitoring and Enforcement Program: As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	The Generator Owner did not calculate the Extreme Cold Weather Temperature and identify generating unit(s) cold weather data in accordance with Requirement R1 for 5% or less of its applicable units.	The Generator Owner did not calculate the Extreme Cold Weather Temperature and identify generating unit(s) cold weather data in accordance with Requirement R1 for more than 5%, but less than or equal to 10% of its applicable units.	The Generator Owner did not calculate the Extreme Cold Weather Temperature and identify generating unit(s) cold weather data in accordance with Requirement R1 for more than 10%, but less than or equal to 20% of its applicable units.	The Generator Owner did not calculate the Extreme Cold Weather Temperature and identify generating unit(s) cold weather data in accordance with Requirement R1 for more than 20% of its applicable units.
R2.	The Generator Owner did not have freeze protection measure(s) for its applicable unit(s) meeting the criteria in Requirement R2 for 5% or less of its applicable units. OR The Generator Owner did not ~~develop~~ have a Corrective Action Plan or a Generator Cold Weather Constraint (if applicable) to implement appropriate freeze protection measures for 5% or less of its applicable units.	The Generator Owner did not have freeze protection measure(s) for its applicable unit(s) meeting the criteria in Requirement R2 for more than 5%, but less than or equal to 10% of its applicable units. OR The Generator Owner did not ~~develop~~ have a Corrective Action Plan or a Generator Cold Weather Constraint (if applicable) for more than 5%, but less than or equal to 10% of its applicable units.	The Generator Owner did not have freeze protection measure(s) meeting the criteria in Requirement R2 for more than 10%, but less than or equal to 20% of its applicable units. OR The Generator Owner did not ~~develop~~ have a Corrective Action Plan or a Generator Cold Weather Constraint (if applicable) for more than 10%, but less than or equal to 20% of its applicable units.	The Generator Owner did not have freeze protection measure(s) meeting the criteria in Requirement R2 for more than 20% of its applicable units. OR The Generator Owner did not ~~develop~~ have a Corrective Action Plan or a Generator Cold Weather Constraint (if applicable) for more than 20% of its applicable units.

Implementation Plan

Attachment 1

Generator Owners shall determine the applicability of a Generator Cold Weather Constraint declared under Requirements R2, R6, and R7 using the criteria as described below.

A Generator Cold Weather Constraint is any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components using the following criteria:

Pre-Approved Generator Cold Weather Constraints

The following are circumstances which, if present and confirmed as valid by the Compliance Enforcement Authority, will constitute Generator Cold Weather Constraints:

- Wind turbine towers that have structural limitations established by Original Equipment Manufacturers (OEMs) based on a minimum temperature that is higher than the Extreme Cold Weather Temperature calculated per Requirement R1.
- Heat tracing or other de-icing technologies for wind turbine blades that are not available in the Generator Owner's location.
- Replacing existing wind turbine blades with new blades solely for the purpose of adding de-icing or ice-minimizing capabilities.
- Applying heat to remove accumulated frozen precipitation on solar panels.
- Applying heat upstream of inlet air filters to prevent the buildup of frozen precipitation on combustion turbine inlet air filters.

Case-by-case Determinations of Generator Cold Weather Constraints

The following ~~s~~situations may constitute a Generator Cold Weather Constraint, depending on the facts and circumstances. Only upon approval by the Compliance Enforcement Authority will these circumstances comprise a valid Generator Cold Weather Constraint:

1. The application of a specific freeze protection measure will void an equipment warranty.
2. The application of a specific freeze protection measure is precluded by technical or physical limitations. For example:
    a. Installing wind breaks around a cooling tower or air-cooled heat exchanger which requires free airflow for its functionality;
    b. Applying freeze control measures with size or weight that would require the structural re-design and re-construction of the protected equipment or its support system.
    c. Other similar circumstances as determined through operating experience or engineering analysis and supported with justification.

3. The application of a specific freeze protection measure or measures would adversely affect the reliability of the Bulk Power System to an extent that outweighs the reliability benefit of applying the freeze protection measure(s). For example:
    a. The application of freeze protection measures would result in the premature retirement of an existing dispatchable generating unit with no acceptable replacement currently available;
    b. The freeze protection measures would be applied to a generating unit that has a previously published retirement date within three years of the Generator Cold Weather Cconstraint declaration;
    c. The application of freeze protection measures would cause the Generator Owner to cancel plans to finish the development of a new generating unit(s);
    d. The application of freeze protection measures would reduce the generating unit's ability to provide Real Power or Reactive Power by more than three percent; or
    e. The application of freeze protection measures would reduce the summer net dependable capacity[1] of the generating unit by more than three percent.
    f. Other similar circumstances as determined through operating experience or engineering analysis and supported with justification.

4. The application of a specific freeze protection measure would introduce the risk of noncompliance with other statutory, regulatory, or health and safety requirements or standards for which relief via waiver, exemption or other means of excused noncompliance is not available during extreme cold weather.

5. Other situations identified by the Generator Owner that may, based on the specific circumstances beyond the Generator Owner's control, limit its ability to apply freeze protection measures to Generator Cold Weather Critical Components.

When submitting a Generator Cold Weather Constraint declaration to the CEA per Requirement R8, the Generator Owner must include documentation that defends and supports the declared constraint and also describes other compensating or mitigating freeze protection measures, if applicable, that the Generator Owner will apply. An approved Generator Cold Weather Constraint declaration for any specific Generator Cold Weather Critical Component does not relieve the Generator Owner of its obligation to otherwise prepare its applicable generating unit(s) to meet the requirements of EOP-012-3.

[1] "net dependable capacity" refers to the definition used for reporting to the NERC in Generating Availability Data System (GADS) appropriate for the generation type.

Background

The purpose of this project is to address the directives identified by FERC in its June 27, 2024 order approving Reliability Standard EOP-012-2 and directing further modifications. *N. Am. Elec. Reliability Corp.*, 187 FERC ¶ 61,204 (2024) (June 2024 Order), available here. In that order, FERC found that further improvements needed to address ambiguous language and other reliability gaps/implementation issues in the standard and related definitions to fully address issues first raised in the Commission's February 2023 Order approving EOP-012-1. FERC directed that NERC submit the modifications within nine months of the date of the order, or by March 27, 2025.

Project 2024-03

Project 2024-03 is a project to address FERC directives in the June 2024 Order approving EOP-012-2.

Proposed Reliability Standard EOP-012-3 revises the EOP-012-2 standard by providing and clarifying further improvements needed to be made to address ambiguous language and address other reliability gaps/implementation issues in the standard and related definitions to fully address issues first raised in the Commission's February 2023 Order approving EOP-012-1. *See N. Am. Elec. Reliability Corp.*, 182 FERC ¶ 61,094, PP 3-11 (2023) (February 2023 Order); *reh'g denied*, 183 FERC ¶ 62,034, *order on reh'g*, 183 FERC ¶ 61,222 (2023). In the June 2024 Order approving EOP-012-2, FERC directed that NERC submit the directed modifications within nine months of the date of the order, or by March 27, 2025.

Proposed EOP-012-3 Requirement R1 is an existing EOP-012-2 requirement that consolidated and clarified requirements for each Generator Owner to calculate the Extreme Cold Weather Temperature for its generating unit location(s) and identify generating unit cold weather data, and

to review these calculations and data every five years. Proposed EOP-012-3 Requirement R4 and R5 continue the current requirements under EOP-012-2 (with minimal clarifications in Requirement R4), that all Generator Owners develop cold weather preparedness plans and that all Generator Owners or Generator Operators (as appropriate) conduct annual training on those plans. Proposed EOP-012-3 clarifies which generating unit(s) are subject to the winter operations capability requirements of the standard (Requirements R2 and R3). Proposed EOP-012-3 Requirement R6 provides clarification regarding responses to a Generator Cold Weather Reliability Event that may require Corrective Action Plans (CAP). Proposed EOP-012-3 Requirement R7 specifies timelines for the completion of Corrective Action Plans, consistent with the February 2023 Order and FERC directives in the June 2024 FERC Order. The drafting team crafted language to meet the concern of Generator Owners regarding timelines for units under consideration or development. The language reflects FERC's concern regarding applicability of Corrective Action Plans to the correct Generator Owner. Proposed EOP-012-3 Requirement R8 requires Generator Owners to review declarations at least every 24 calendar months, or as needed, when a change of status occurs and ensures operating limitations caused by the constraints are clearly identified. The revised *Glossary* term for Generator Cold Weather Constraint, and new Attachment 1, provides clarity to the circumstances under which Generator Owners may declare Generator Cold Weather Constraints and thus further clarifies the requirements of the standard.

For additional information on the FERC Order directives addressed in proposed Reliability Standard EOP-012-3, see the Consideration of Directives, available on the Project 2024-03 project page.

General Considerations

This implementation plan reflects past consideration that entities needed time to develop, implement, and maintain cold weather plans, identify Generator Cold Weather Critical Components, and identify freeze protection measures. The implementation plan also considers the FERC directives regarding the need for an accelerated effective date of directed changes and abbreviated implementation periods for generator winterization measures. FERC has repeatedly expressed an urgency in completing cold weather Reliability Standards and having them implemented in a timely manner to address the risks presented by cold weather events on the reliability of the Bulk-Power System. FERC noted the five core directives to NERC in the June 2024 Order are not new issues, but rather targeted modifications necessary to fully address issues identified in FERC's prior February 2023 Order. *See* June 2024 Order at P 30.

In consideration of these factors, and to ensure entities have sufficient notice of their revised obligations under Reliability Standard EOP-012-3, the proposed implementation plan provides that the standard shall become effective on the later of October 1, 2025, which is the date Reliability Standard EOP-012-2 will be fully enforceable in the United States, or three months following regulatory approval.

The drafting team determined that later phased-in compliance dates were not necessary for the revised requirements in EOP-012-3, as the practical impact of implementing the proposed changes, in light of the regulatory history described above, is not expected to be significant:

- For revised Requirement R2, units further into design or construction have separate requirements from those units in the early phases of design: the units further in the design/construction phase are allowed to develop Corrective Action Plans to meet the more rigorous requirements for new generating units, whereas units in the early stages of design are expected to meet the more rigorous requirements unless a Generator Cold Weather Constraint applies. Additional time is not needed to implement this change.
- For revised Requirement R6, relating to Generator Cold Weather Reliability Events, the language reflects the FERC directives regarding Corrective Action Plans, Corrective Action Plan extensions, and consideration of applicability of Corrective Action Plan corrective actions across a fleet for Generation Owners that had a generating unit(s) that experienced a Generator Cold Weather Reliability Event. Additional time to implement these changes is not needed, given the conditions in which a Corrective Action Plan may be needed for a Generator Cold Weather Reliability Event.
- For revised Requirement R7, the drafting team clarified the applicability of Corrective Action Plan requirements and implemented a Corrective Action Plan extension process similar to that found in Reliability Standard TPL-007-4 to address the June 2024 Order. Additional guidance is provided below.

Additional guidance is provided to aid in the orderly implementation of the standard as entities transition from compliance with Reliability Standard EOP-012-2 to Reliability Standard EOP-012-3.

Effective Date

The effective dates for the proposed Reliability Standards are provided below. Where the drafting team identified or recognized the need for a longer implementation period for compliance with a particular section of a proposed Reliability Standard (i.e., an entire Requirement or a portion thereof), the additional time for compliance with that section is specified below. The phased-in compliance date for those particular sections represents the date that entities must be compliant with that particular section of the Reliability Standard, even where the Reliability Standard goes into effect at an earlier date.

EOP-012-3 and Definitions

Where approval by an applicable governmental authority is required, the standard and associated definitions shall become effective on the later of: (1) October 1, 2025; or (2) the first day of the first calendar quarter that is three (3) months after the effective date of the applicable governmental authority's order approving the standard, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is three (3) months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Effective Date and Phased-In Compliance Dates

Compliance Date for EOP-012-3 Requirement R1

Entities were required to become compliant with Requirement R1 by the effective date of EOP-012-2 in accordance with that implementation plan. Entities shall perform their first periodic review under Reliability Standard EOP-012-3 Requirement R1 by no more than 60 months after the effective date of **EOP-012-2**.

Compliance Date for EOP-012-3 Requirement R2 – New Generating Units

Entities shall become compliant with Requirement R2 no later than the commercial operations date for the applicable unit. Any Generator Cold Weather Constraint shall be submitted in accordance with the timeline provided in Requirement R8.

Compliance Date for EOP-012-3 Requirement R3 – New Generating Units

Entities beginning commercial operation after the effective date of EOP-012-3 shall become compliant with Requirement R3 no later than the commercial operations date for the applicable unit.

Compliance Date for EOP-012-3 Requirement R6

Entities shall comply with Requirement R6 within the timeframes listed within the requirement if a Generator Cold Weather Reliability Event has occurred.

Compliance Date for EOP-012-3 Requirement R7

Entities shall comply with Requirement R7 within the timeframes listed within the requirement if a Corrective Action Plan is required.

Compliance Date for EOP-012-3 Requirement R8

Each entity shall review all Generator Cold Weather Constraints previously declared under Reliability Standard EOP-012-2 for compliance with Reliability Standard EOP-012-3 Attachment 1 by the effective date. The entity shall submit any previously declared Generator Cold Weather Constraints no later than 45 days following the effective date of Reliability Standard EOP-012-3. Newly declared Generator Cold Weather Constraints shall be submitted in accordance with the timelines specified in Requirement R8.

Retirement Date of EOP-012-2

Reliability Standard EOP-012-2 shall be retired immediately prior to the effective date of Reliability Standard EOP-012-3 in the particular jurisdiction in which the revised standard is becoming effective.

Technical Rationale for Reliability Standard EOP-012-3

October 2024

EOP-012-3 – Extreme Cold Weather Preparedness and Operations

Introduction

This document explains the technical rationale and justification for the proposed Reliability Standard EOP-012-3. It provides stakeholders and the ERO Enterprise with an understanding of the technology and technical requirements in the Reliability Standard. This Technical Rationale and Justification for EOP-012-3 is not a Reliability Standard and should not be considered mandatory and enforceable.

Background

From February 8 through February 20, 2021, extreme cold weather and precipitation caused large numbers of generating units to experience outages, derates or failures to start, resulting in energy and transmission emergencies (referred to as the "Event"). The total Event firm load shed was the largest controlled firm load shed event in U.S. history and was the third largest in quantity of outaged megawatts (MW) of load after the August 2003 Northeast blackout and the August 1996 West Coast blackout. The Event was most severe from February 15 through February 18, 2021, and it contributed to power outages affecting millions of electricity customers throughout the regions of ERCOT, SPP, and MISO South. Additionally, the February 2021 event is the fourth cold weather event in the past 10 years, which jeopardized BPS reliability. A joint inquiry was conducted to discover reliability-related findings and develop recommendations from Federal Energy Regulatory Commission (FERC), NERC, and Regional Entity staff. The FERC, NERC, and Regional Entity Staff Report into the February 2021 Cold Weather Outages[1] ("Joint Inquiry Report") was published on November 16, 2021.

Project 2021-07 was a two-phase project to address the 10 sub-recommendations in Key Recommendation 1 of the Joint Inquiry Report for new or enhanced NERC Reliability Standards. Reliability Standard EOP-012-1 was originally developed to address Recommendations 1d, 1e, and 1f of the Joint Inquiry Report through new and enhanced requirements for generator preparedness for extreme cold weather conditions. Reliability Standard EOP-012-2 was revised to address Key Recommendations 1a, 1b, and 1c as well as the FERC directives in the February 2023 Order approving the Phase 1 standards EOP-011-3 and EOP-012-1.[2]

1 The February 2021 Cold Weather Outages in Texas and the South Central United States | FERC, NERC and Regional Entity Staff Report | Federal Energy Regulatory Commission

2 *N. Am. Elec. Reliability Corp.*, 182 FERC ¶ 61,094 (2023) (FERC Order), *notice denying reh'g and providing for further consideration*, 183 FERC ¶ 62,034 (2023).

Reliability Standard EOP-012-3 is being revised to address FERC directives in the June 2024 order approving EOP-011-4 and EOP-012-2[3].

Defined Terms

Previous DTs developed five defined terms to be added to the NERC Glossary of Terms to make the requirements easier to read and understand. Project 2024-03 updated one term (Generator Cold Weather Constraint) to meet the FERC directives in the June 2024 Order and provided additional language to clarify issues noted during the development of EOP-012-3, 2024 Small Group Advisory Session(s), and input received during outreach with industry. These five terms are:

Extreme Cold Weather Temperature

The temperature equal to the lowest 0.2 percentile of the hourly temperatures measured in December, January, and February from 1/1/2000 through the date the temperature is calculated.

The definition of Extreme Cold Weather Temperature (ECWT) was developed by the 2021-07 Drafting Team (DT) to provide clarity to the Generator Owner (GO) on determining what temperature triggers the requirement obligations. Each GO should select a reliable source of data from a recording location near the plant to determine their ECWT. Sources could include, for example, the National Weather Service (NWS) or National Oceanographic and Atmospheric Administration (NOAA) weather stations, Federal Aviation Administration (FAA) weather stations, or Environment and Climate Change Canada location for Canadian entities[4], etc. NOAA's National Centers for Environmental Information provides Climate Data Online (CDO) as a free resource that includes quality-controlled weather data and 30-year Climate Normals[5]. In general, GOs should use the location nearest the plant, but may select a further location if geographic or local climatic patterns make a further location more representative of the weather at the generating unit. GOs may use on-site weather stations if data, which reasonably matches reliable nearby off-site sources since January 1, 2000, is available. The starting period chosen by the 2021-07 DT to gather data to determine the lowest temperatures that occur near a facility is based on the completion of the modernization of the National Weather Service project known as MAR (Modernization and Associated Restructuring). This project was completed in the year 2000. In general, the National Weather Service modernization provides weather data to be available at most large airports. This will make it fairly accessible for companies to gather data and perform the required analysis. The December through February timeframe was selected to correspond to the meteorological winter, as defined by NOAA.[6]

The 2021-07 DT discussed methods for determining an ECWT with engineering design professionals, and it was determined that it is typical engineering practice to use a statistical approach to determine the design temperature when implementing generation facility freeze protection measures. The 2021-07 DT determined that only winter temperature values (i.e. between December and February) shall be used for the statistical approach and based on analysis of multiple weather data sites, it was determined that by using the lowest 0.2 percentile, there will be sufficient data points to ensure that a single hour at a temperature that may not be accurate, or may be a statistical anomaly, doesn't result in an overly

[6] Report (nerc.com)

conservative design or preclude the ability of the GO to use historical operating data to prove compliance to the requirements. The 2021-07 DT selected the 0.2 percentile of winter month temperatures since 1/1/2000 to identify a temperature which has been rarely surpassed, but which allows some margin for a GO to have previously demonstrated successful operation. The 2021-07 DT considered using the lowest recorded hourly ambient temperature, but upon further review of the historical weather data and generally accepted design principles, determined that the statistical approach to setting the ECWT for a site's location was more reasonable.

The 2024-03 DT recognized comments and concerns raised during the 2024 Small Group Advisory Session on cold weather preparedness regarding application of the ECWT calculation if hourly temperature values were questionable. If complete data sets are not available (e.g., data is corrupt or missing) at a single weather station back to January 1, 2000, the GO should document the methodology they use to determine their ECWT, such as appending data from multiple weather stations or selecting a complete or partial data set from a weather station further away from the facility. The 2021-07 and 2024-03 DTs realized that a complete data set (i.e., all hours of every day of every year for the months of December, January, and February) may not be available due to a variety of technical reasons. To that point, the Generator Owner's approach in handling the missing/corrupt data should be documented in their methodology and available to Compliance Monitoring Enforcement Program (CMEP) staff as needed. Please reference the Calculating Extreme Cold Weather Temperature document drafted by the 2021-07 DT and updated by the 2024-03 DT for an example of how to calculate the ECWT.

Generator Cold Weather Critical Component

Any generating unit component or system, or associated Fixed Fuel Supply Component, that is under the Generator Owner's control, and is susceptible to freezing issues, the occurrence of which would likely lead to a Generator Cold Weather Reliability Event. This definition excludes any component or system or associated Fixed Fuel Supply Component located inside a permanent building with a heating source that regularly maintains the space at a temperature above 32 degrees Fahrenheit (0 degrees Celsius).

The 2021-07 DT felt the best method to address where freeze protection measures should be implemented was to define a term which specifies a subset of components that may be susceptible to freezing and are critical to the operation of generating units. GOs should consider previous freeze-related issues experienced by the generating unit(s), as well as actions taken to mitigate those freeze-related issues, when establishing its list of Cold Weather Critical Components. The 2021-07 DT also felt it is appropriate to specifically exclude components that are not susceptible to freezing due to being inside heated buildings that maintain the interior temperature above freezing.

The 2021-07 DT's intent with regard to the language "that is under the Generator's Owner's control" was to clearly delineate that cold weather events external to the generation site such as loss of fuel supply or loss of auxiliary power to the site that resulted in a Generator Cold Weather Reliability Event (see definition below) would not be subject to this standard. Furthermore, ice buildup on transmission lines and/or high voltage lines between the generating station and point of interconnection with the Transmission Owner would not constitute a freezing condition in the context of this Standard, and therefore, these lines would not be considered a Generator Cold Weather Critical Component.

The 2021-07 DT's intent with the use of the phrase "permanent building" is to refer to a structure that is in place year round, shall accommodate personnel entry, and has a heating source that regularly maintains the space at a temperature above 32 degrees Fahrenheit for the purpose of protecting components from freezing (e.g. heated container that protects inverter-based resources or battery energy systems). The 2024-03 DT recognized comments and concerns raised during the 2024 Small Group Advisory Session on cold weather preparedness regarding heating of the "permanent building." The HVAC/heating system is not a freeze protection measure in terms of being included in the cold weather preparedness plan as it is not protecting a Generator Cold Weather Critical Component (per the definition) nor is it a Generator Cold Weather Critical Component. The 2024-03 DT expects the HVAC/heating system to be part of routine maintenance and monitoring to ensure that the heated building remains above 32 degrees Fahrenheit.

Fixed Fuel Supply Component

Non-mobile equipment that supports the reliable delivery of fuel to the generating unit and under the control of the Generator Owner at a plant site. Gaseous, liquid, or solid fuel handling components that are installed on site as fixed parts of the fuel delivery system that are under the Generator Owner's control are included. Mobile equipment such as trains, bulldozers, or other equipment that are not fixed in one location are excluded.

The 2021-07 DT wanted to clarify the boundaries of responsibility for the GO as it relates to sites having fuel handling equipment within their control and responsibility to provide freeze protection. The intent of this definition is to clarify that mobile equipment is not part of this requirement, but permanent fixed equipment impacting fuel delivery needed for generation is included.

Generator Cold Weather Reliability Event

One of the following events for which the apparent cause(s) is due to freezing of equipment or impacts of freezing precipitation (e.g., sleet, snow, ice, and freezing rain) on equipment within the Generator Owner's control, and the dry bulb temperature at the time of the event was at or above the Extreme Cold Weather Temperature:

(1) a forced derate of more than 10% of the total capacity of the unit but not less than 20 MWs for longer than four hours in duration;

(2) a start-up failure where the unit fails to synchronize within a specified start-up time; or

(3) a Forced Outage.

<u>Key Recommendation 1d:</u> To require Generator Owners that experience outages, failures to start, or derates due to freezing to review the generating unit's outage, failure to start, or derate and develop and implement a corrective action plan (CAP) for the identified equipment, and evaluate whether the CAP applies to similar equipment for its other generating units. Based on the evaluation, the Generator Owner will either revise its cold weather preparedness plan to apply the CAP to the similar equipment, or explain in a declaration (a) why no revisions to the cold weather preparedness plan are appropriate, and (b) that no further corrective actions will be taken. The standard drafting team should specify the specific timing for the CAP to be developed and implemented after the outage, derate, or failure to start, but the CAP should be developed as quickly as possible, and be completed by no later than the beginning of the next winter season.

The Key Recommendation from the Joint Inquiry Report recommends a Reliability Standard that requires GOs to develop a Corrective Action Plan for generating units that experience outages, failures to starts, or derates due to freezing. The Joint Inquiry Report identifies that most of the outages and derates in the February 2021 event were due to freezing of instrumentation, transmitters, sensing lines, or wind turbine blades (p 166 in the Joint Inquiry Report). As such, the 2021-07 DT followed the Joint Inquiry Report recommendation to require a Corrective Action Plan when the apparent cause of the event is freezing of equipment or impacts of freezing precipitation (e.g., sleet, snow, ice, or freezing rain) on equipment. The 2021-07 DT felt that it was important to clearly call out freezing precipitation as these events were included in the outages and derates that identified as freezing in the Joint Inquiry Report. Furthermore, Key Recommendation 1c of the report requires GOs to account for the effect of precipitation. The 2021-07 DT has developed parameters around these events to clarify a reasonable baseline of what level of derate qualifies as an event, and provide additional language to identify what constitutes a start-up failure. With the additional clarifications, the 2021-07 DT determined that the standard would benefit from a defined term, to clearly and efficiently state what constitutes an event. The result is a new defined term, Generator Cold Weather Reliability Event, that defines the circumstances for which a Corrective Action Plan is required (i.e., when a freezing event affects the equipment within the control of the GO). The defined term will make the standard easier to understand and implement by providing clear and reasonable factors to determine whether the impact of an event requires mitigation. The 2021-07 DT is using the definition of apparent as defined in the Webster's dictionary as "clear or manifest to the understanding".

The Corrective Action Plan requirement applies to any forced outage due to freezing, regardless of duration. Derates, which are short lived (specified as four hours by the 2021-07 DT) or of small capacity impact (specified as less than 20 MW by the 2021-07 DT, which corresponds with the threshold for Bulk Electric System (BES) impacting generation units), are excluded from the Corrective Action Plan requirement to limit the administrative burden to GOs for events that are minimally impacting to the BES. Also excluded are proactive operational actions to limit the potential of forced outages or derates. It should be noted that nothing in this standard prevents a GO from taking its own corrective actions resulting from such events. Startup failures for conventional generation are defined using the GADS definition with the removal of "following an outage or reserve shutdown", since the definition of reserve shutdown is different in GADS than it is in some of the Regional Transmission Organizations (RTO's) and Independent System Operators (ISOs). From the GADS data reporting instructions, the startup period for each unit is determined by the operating company. It is unique for each unit and depends on the condition of the unit at the time of startup (cold, warm, or hot). A typical unit startup occurs in three phases: warm up, synchronization, and ramp up. NERC defines a startup period to begin with the command to start and end when the unit is synchronized. A startup failure begins when a problem preventing the unit from synchronizing occurs. The startup failure ends when the unit is synchronized, another startup failure occurs, or the unit enters another permissible state.

The 2021-07 DT determined that Corrective Action Plans will be required for any freezing event that occurs at temperatures above the generator site's ECWT. By using the site's ECWT, as opposed to the generator unit minimum temperature as defined by the GO in Requirement R1 Part 1.2.2 as the threshold, this achieves the following:

- Provides a consistent basis for the temperature at which CAPS are required for all GOs

- Provides a consistent basis for when Corrective Action Plans are required for all generation types
- Provides a consistent basis for when Corrective Action Plans are required regardless of the level of effort that GOs may have applied to-date winterizing their generators such that they can operate to the ECWT that their sites will reasonably experience
- Removes any incentive (perceived or real) to not further winterize GOs generating sites to meet the ECWT at the GO site by not providing a window where one site might not be subject to the Corrective Action Plan requirement while sites in the same vicinity experiencing the same temperatures are subject to this requirement
- Removes any disincentive for GOs to design the units to operate well below the ECWT for a site by not requiring them to perform Corrective Action Plans while sites in the same vicinity experiencing the same temperatures are subject to this requirement

Generator Cold Weather Constraint

A condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components

The 2024-03 DT reviewed the material from the June 2024 FERC Order when determining how best to update the Generator Cold Weather Constraint definition. The 2024-03 DT relied upon industry and FERC guidance as a basis for updating the definition language and the process captured in Attachment 1 of EOP-012-3. The 2024-03 DT also ensured that constraint language would be fully captured within the Standard itself through Attachment 1.

The 2024-03 DT felt that an Attachment that included specific language further explaining Generator Cold Weather Constraints with discrete pre-approved Generator Cold Weather Constraints and other Generator Cold Weather Constraints requiring pre-approval meets the FERC (and industry) expectations to provide unambiguous, objective, and auditable language. The 2024-03 DT discussed providing clarity with examples knowing that additional instances or conditions that may be considered a Generator Cold Weather Constraint may exist.

Per the FERC Order, NERC staff is responsible to provide a process describing the receipt, evaluation, approval (as needed), and validation of Generator Cold Weather Constraints. This process is captured in the Generator Cold Weather CAP Extension and Constraint Process document.

Attachment 1 contains a non-comprehensive list of preapproved Generator Cold Weather Constraints as well as a list of situations, circumstances, and criteria that may constitute a Generator Cold Weather Constraint that a Generator Owner must submit to the CEA for approval.

Once a declaration is approved by the CEA it is considered valid. It is the GO's responsibility to document in the Generator Cold Weather Constraint declaration the circumstances and reasons why the modification needed to address the freeze protection measure(s) is not being implemented. A Generator Cold Weather Constraint declaration that no further corrective actions will be taken is expected to be used sparingly.

The 2024-03 DT is intentionally leaving room for additional instances of Generator Cold Weather Constraints as it would be impossible to foresee every potential circumstance that could possibly necessitate a review of potential freeze protection technologies across the breadth of the US and Canada and the breadth of generating unit types and ages that fall under this Standard. Furthermore, the 2024-03 DT wants to ensure that the Standard language supports the adoption of new freeze protection measure practices, methods, or technologies while not immediately requiring a new freeze protection measure practice, method, or technology to be implemented industry-wide when a leading utility pilots a novel approach, as this would be a disincentive to utilities piloting new technologies. The 2024-03 DT encourages additional studying and implementation of freeze protection measures to remove Generator Cold Weather Constraints as appropriate over time.

In the June 27, 2024, FERC Order, there was a directive to change the frequency of Generator Cold Weather Constraint reviews to facilitate consideration of new freeze protection measure technologies to reduce the risk resulting from the need for a Generator Cold Weather Constraint. That change is capture in Requirement R8 discussed later in this Technical Rationale document.

Facilities

4.1. *Facilities:*

4.1.1. *Bulk Electric System (BES) generating units. For purposes of this standard, the term "generating unit" subject to these requirements refers to the following BES resources:*

4.1.1.1. *A BES generating resource identified in the BES definition, Inclusion I2 and I4; or*

4.1.1.2. *A Blackstart Resource, identified in the BES definition, Inclusion I3.*

After reviewing this reference material and the efforts of the 2021-07 DT, the 2024-03 DT determined that EOP-012-3 should continue to apply to all Bulk Electric System (BES) generating units in order to ensure consistency in extreme cold weather preparedness. The Applicability section first defines "generating unit" as a BES resource. The NERC Glossary of Terms provides the foundation for what BES resources are included in the definition (see Inclusions I2 through I4). Additionally, Blackstart Resources are also specifically declared subject to the winterization requirements. Such Blackstart Resources, consistent with the NERC Glossary of Terms, are those units designated in the Transmission Operator's restoration plans. Proposed EOP-012-3 clarifies which Facilities and their Generator Cold Weather Critical Components are subject to implementing freeze protection measures through specific language in Requirements R2 and R3. The 2024-03 DT briefly discussed Generator Owner Category 2 Inverter-Based Resource applicability to EOP-012-3 but it was noted the applicability is under review per the Order 901 NERC Plan so no changes were presented.

Requirement R1

R1. *At least once every five calendar years, each Generator Owner shall, for each of its applicable generating unit(s): [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

1.1. *Calculate the Extreme Cold Weather Temperature for each of its applicable unit(s) and identify the calculation date and source of temperature data; and*

1.1.1. *If the re-calculated Extreme Cold Weather Temperature is lower than the previous Extreme Cold Weather Temperature, the entity shall review and update its cold weather preparedness plan under Requirement R4 within six (6) calendar months of the recalculation. If new corrective actions are needed to provide the required operational capability under Requirement R2 or R3, the entity shall develop a Corrective Action Plan within 6 calendar months of the recalculation.*

1.2. *Identify generating unit(s) cold weather data, to include:*

1.2.1. *Generating unit(s) operating limitations in cold weather to include:*

1.2.1.1. *Capability and availability;*

1.2.1.2. *Fuel supply and inventory concerns;*

1.2.1.3. *Start-up issues;*

1.2.1.4. *Fuel switching capabilities; and*

1.2.1.5. *Environmental constraints.*

1.2.2. *Generating unit(s) minimum:*

- *Design temperature and if available, the concurrent wind speed and precipitation;*
- *Historical operating temperature at least one hour in duration, and if available, the concurrent wind speed and precipitation; or*
- *Current cold weather performance temperature determined by an engineering analysis, which includes the concurrent wind speed and precipitation.*

The Project 2024-03's Technical Rationale language for Requirement R1 did not substantially change from 2021-07 DT language and, as such, use of DT below is referencing 2021-07 DT. Much of the criteria of R1 is carried over from the previously approved EOP-011 Standard and requires the GO to document several cold weather performance parameters for the unit. This information is valuable, and in some cases, must be shared with other entities. For Requirement R1 Part 1.1, the GO is required to calculate the Extreme Cold Weather Temperature (ECWT) for each unit using a reliable source of data (See the supporting document "Calculating Extreme Cold Weather Temperature"). The DT believes that the GO is in the best position to select the most representative weather information relative to its generating unit. The ECWT will be updated if a new lower ECWT is determined under the periodic review requirement of R1. Defining

the operating limitations in Requirement R1 Part 1.2.1 will make affected personnel more aware of unit capabilities and constraints as well as systems and practices that may be necessary to ensure reliability in cold weather, particularly when alternative fuels are involved. In addition, the unit minimum temperature identified in Requirement R1 Part 1.2.2 is used to demonstrate compliance with Requirement R3 for existing units. The DT chose one hour of historical operating data recognizing that there is extremely limited historical operating data available for a unit below their ECWT. This was not to infer that the DT expects that existing generation will only reliably operate for one hour during an extreme cold weather event. The information contained within Requirement R1 Part 1.2 is required to be requested by the Balancing Authorities in TOP-003 to make sure they have the most accurate unit performance information possible for their reliability analysis during the winter season. It is critical, especially if a Corrective Action Plan, extension request for a Corrective Action Plan, or a Generator Cold Weather Constraint declaration is in effect, that the Generator Owner keep Requirement R1 Part 1.2 information updated with those entities requiring said information. The 2024-03 DT did not add a notification Requirement to EOP-012-3 as TOP-003 and IRO-010 obligate the applicable entities (Balancing Authority, Reliability Coordinator, and Transmission Operator) to have "*Provisions for notification of BES generating unit(s) during local forecasted cold weather to include*" Requirement R1 Part 1.2 information. Balancing Authority(ies), Reliability Coordinators, and Transmission Operators should ensure complete coverage and timeliness of Requirement R1 Part 1.2 data submission within their data specifications.

It is recognized that the determination of a single unit minimum temperature is of limited value if applied without consideration of the other ambient conditions under which it was determined, that is, wind and precipitation. Consideration of wind and precipitation, along with the minimum temperature, provides a greater understanding of the potential generating unit capability for cold weather resource planning. The Standard requires that the GO include wind and precipitation data with their generating unit minimum temperature data when the data is available. The impact of deviations from this known temperature/wind/precipitation stated point are expected to be evaluated qualitatively. For example, if the historical minimum temperature occurred at low wind and dry conditions, and actual future cold weather event expected conditions are high winds with precipitation, planning personnel will recognize that a specific unit may not achieve the minimum temperature and can arrange for additional resources. The opposite also applies, i.e., if a design minimum temperature assumes some level of wind and precipitation and actual cold weather expectations are for low wind and dry conditions, planning personnel will recognize that there is increased likelihood that a generation resource may continue to be available below its minimum temperature. If no information about wind or precipitation is known, wind and precipitation are assumed to be zero at the minimum temperature until further information is obtained. The 2024-03 DT did provide updated language within the "Defined Terms" section of this Technical Rationale document to capture concerns regarding ECWT data availability.

Requirement R2

R2. *Applicable to generating units which begin commercial operation[7] on or after October 1, 2027: Each Generator Owner, for each generating unit that has a calculated Extreme Cold Weather Temperature at or below 32 degrees Fahrenheit (zero degrees Celsius) as determined in Requirement R1, and that self-commits or is required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius),[8] shall: [Violation Risk Factor: Medium] [Time Horizon: Long-term Planning, Operations Planning]*

2.1 *For generating units for which the Generator Owner first contractually committed to design criteria[9] relevant to this Requirement before February 16, 2023[10]:*

- *Implement freeze protection measures to protect Generator Cold Weather Critical Components that provide the capability to operate at the unit(s)' Extreme Cold Weather Temperature with sustained concurrent twenty (20) mph wind speed for (i) a period of not less than twelve (12) continuous hours, or (ii) the maximum operational duration for intermittent energy resources if less than twelve (12) continuous hours; or*

- *Have a Corrective Action Plan(s) in place (to include any applicable Generator Cold Weather Constraint(s) upon beginning commercial operation, to add new or modify existing or previously planned freeze protection measures to provide the capability to operate at the unit(s)' Extreme Cold Weather Temperature with a sustained concurrent twenty (20) mph wind speed for (i) a period of not less than twelve (12) continuous hours, or (ii) the maximum operational duration for intermittent energy resources if less than twelve (12) continuous hours.*

2.2 *For generating units for which the Generator Owner first contractually committed to design criteria[11] relevant to this Requirement on or after February 16, 2023[12]:*

- *Implement freeze protection measures to protect Generator Cold Weather Critical Components that provide the capability to operate at the unit(s)' Extreme Cold Weather Temperature with sustained concurrent twenty (20) mph wind speed for (i) a period of not less than twelve (12) continuous hours, or (ii) the maximum operational duration for intermittent energy resources if less than twelve (12) continuous hours; or*

Document in a declaration, with justification, as applicable, a Generator Cold Weather Constraint in accordance with Requirement R8.

---

[7] Commercial operation means achievement of this designation indicating that the facility has received all approvals necessary for operation after completion of initial start-up testing.
[8] Generating unit(s) that do not self-commit or are not required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), but may be called upon to operate in order to assist in the mitigation of BES Emergencies, Capacity Emergencies, or Energy Emergencies during periods at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), are exempt from this requirement.
[9] Such commitments would be demonstrated by signed contractual commitments, emailed correspondence agreeing to thermal design criteria, or other similar documented evidence.
[10] Or the date the definition of Extreme Cold Weather Temperature was approved in the relevant jurisdiction.
[11] Such commitments would be demonstrated by signed contractual commitments, emailed correspondence agreeing to thermal design criteria, or other similar documented evidence.
[12] Or the date the definition of Extreme Cold Weather Temperature was approved in the relevant jurisdiction.

The Joint Inquiry Report Key Recommendation 1f referenced recommendation 12 of the 2011 report[8] suggesting that consideration should be given to designing all new generation plants and designing modifications to existing plants (unless committed solely for summer peaking purposes) to be able to perform at the lowest recorded ambient temperature for the nearest location for which historical weather data is available.

The 2021-07 DT believed and 2024-03 DT believes that there needs to be allowances made for units that are in the development process, and for which the design phase may have already commenced. The 2021-07 DT recommended this requirement apply to generation going into service three (3) years after the effective date of EOP-012-1 (i.e., October 1, 2027, based on an effective date of October 1, 2024). The 2024-03 DT edited Requirement R2 in response to the June 2024 FERC Order Paragraph 72 to create differentiation among units based on when the ECWT definition became effective (February 16, 2023). The ECWT definition date was selected as it is a specific point in time where Generator Owners had clear direction for design implications as well as being unambiguous and auditable. The changes proposed recognize the potential conditions that exist in terms of generators under consideration or construction, but removes the means of achieving compliance through a Corrective Action Plan for units establishing their design criteria on or after February 16, 2023. Allowances for Corrective Action Plans to achieve the required design criteria were maintained as a means of compliance, but only for units which established design criteria prior to February 16, 2023. Additionally, the 2024-03 DT identified that Generator Owners may need to declare a Generator Cold Weather Constraint for units that commit to design criteria on or after the February 16, 2023 date under certain circumstances. Generation that begins commercial operation before October 1, 2027 would be subject to Requirement R3.

GOs with generating units that enter commercial operation on or after October 1, 2027 that contractually committed to design criteria before the ECWT definition approval date (February 16, 2023) and cannot operate for twelve (12) continuous hours at the ECWT taking into account a concurrent twenty (20) mph wind speed shall have a Corrective Action Plan upon beginning commercial operations. The GO then must implement the Corrective Action Plan according to Requirement R7. It is recognized that Generator Cold Weather Constraints may exist that prevent a new generating unit(s) from being capable of twelve (12) continuous hours of operation at their identified ECWT. Thus, the 2021-07 DT included, in Requirement R7 Part 7.4, the option for the GO to make a declaration supporting why Generator Cold Weather Constraints preclude the ability to implement appropriate freeze protection measures.

GOs with generating units that enter commercial operation on or after October 1, 2027 that contractually committed to design criteria on or after the ECWT definition approval date (February 16, 2023) that are not able to comply with Requirement R2 would be required to declare a Generator Cold Weather Constraint in accordance with Requirement R8.

The 2021-07 DT chose 12 hours of continuous operation because it is a typical length of the nighttime in winter in most regions of the US and Canada and typically include the hours with the coldest experienced temperatures. The 2021-07 DT was of the opinion that tying the requirement to the 12-hour period would

provide a reasonable level of reliability during a cold weather event. The 2021-07 DT chose a concurrent sustained 20 mph wind speed after an evaluation using the wind chill formula developed by the NWS in the United States. Though wind chill temperature is not an exact science, it is widely understood to reflect the non-linear increased rate of convective heat loss due to air moving at different velocities. Commonly available charts show wind chill temperatures as a function of actual air temperature at various wind speeds. Approximately 2/3 of the wind chill temperature drop between 0–60 mph is achieved at 20 mph. Using the NWS chart, this holds true for still air temperatures starting at 40 F and dropping in 20-degree increments to -40 F. Further, 20 mph is a wind speed commonly experienced across the ERO and yet appropriately higher than the approximate average wind speeds in the United States and Canada, 6-12 mph and 8-11 mph respectively. Each of these three probabilistically infrequent conditions (the ECWT, a steady 20 mph wind, and a duration of 12 continuous hours at these conditions) is in and of itself conservative. When they have their effects combined, it results in a requirement that will significantly contribute to BES reliability during extreme cold weather conditions.

Requirement R3

The Drafting Team did not make any changes to this Requirement. Therefore, the technical rationales are not provided here.

Requirement R4

R4. *Each Generator Owner shall implement and maintain one or more cold weather preparedness plan(s) for its generating units. The cold weather preparedness plan(s) shall include the following, at a minimum:*
[Violation Risk Factor: High] [Time Horizon: Operations Planning and Real-time Operations]

4.1 *The lowest calculated Extreme Cold Weather Temperature for each unit, as determined in Requirement R1;*

4.2 *The generating unit cold weather data, as determined in Part 1.2;*

4.3 *Documentation identifying Generator Cold Weather Critical Components;*

4.4 *Documentation of freeze protection measures implemented on Generator Cold Weather Critical Components which may include measures used to reduce the cooling effects of wind determined necessary by the Generator Owner to protect against heat loss, and where applicable, the effects of freezing precipitation (e.g., sleet, snow, ice, and freezing rain); and*

4.5 *Annual inspection and maintenance of generating unit(s) freeze protection measures implemented on Generator Cold Weather Critical Components.*

General Considerations

Requirement R4 requires GOs to develop and maintain cold weather preparedness plans for their unit(s) and describes the information and documentation required in such plans. It is an expansion of the cold weather preparedness plan required under Requirement R7 of EOP-011-2 and is intended to be used and reviewed regularly by the GO. Originally, Requirement R4 Part 4.5 required the GO to annually inspect and perform necessary maintenance of freeze protection measures. The 2024-03 DT added some clarifying language to ensure that annual inspection and maintenance of freeze protection measures is applied specifically to Generator Cold Weather Critical Components. While other freeze protection measures may be applied to equipment by the Generator Owner, the freeze protection measures included in the cold weather preparedness plan with annual inspections and maintenance are expected to be those applied to Generator Cold Weather Critical Components. Working in concert with other parts of EOP-012-3, including but not limited to Requirements R1, R5, R6, and R7, the substantive elements of the cold weather preparedness plan will be subject to review requirements, updated as necessary, and the GO is required to annually train personnel on its requirements.

Requirement R4 Part 4.1

In Requirement R4 Part 4.1, the GO is required to include in the cold weather preparedness plan the lowest ECWT, as calculated pursuant to Requirement R1, for each unit using reliable source(s) of data. The 2021-07 DT believed that the GO is in the best position to select the most representative weather information relative to its generating unit. The cold weather preparedness plan will be updated if a new lower ECWT is calculated under the Requirement R1 periodic review language.

Requirement R4 Part 4.2

Requirement R4 Part 4.2 is intended to capture within the cold weather preparedness plan the information being developed pursuant to Requirement R1 Part 1.2, which is carried over from the previously approved EOP-011 Standard, and requires the GO to document several cold weather performance parameters for the unit. This information is valuable, and in some cases, must be shared with other entities consistent with the data specification requirements contained in TOP-003 and IRO-010. A requirement for the GO to document this information within the cold weather preparedness plan ensures the information is readily available and documented when the GO responds to a data specification. It should be noted that if a Corrective Action Plan extension request is approved, the underlying generator cold weather data as called out in Requirement R1 Part 1.2 should be correctly identified by the Generator Owner and provided to the Reliability Coordinators, Balancing Authorities, and Transmission Operators as requested. The June 2024 FERC Order mentions this in Paragraph 3. The 2024-03 DT believes that the data specification Reliability Standards applicable to Reliability Coordinators, Balancing Authorities, and Transmission Operators (e.g., IRO-010 and TOP-003) require the entities to request the information and the GO is therefore obligated to provide the most current version of the Corrective Action Plan. The 2024-03 DT did not believe a notification Requirement was needed in EOP-012-3 in addition to those already existing in the data specification Reliability Standards. The 2024-03 DT encourages parties to work together to ensure the most accurate and up to date information is provided especially when conditions increase risk to reliable operations. See the Technical Rationale for Requirement R1 for substantive rationale regarding the operating limitations and generating unit minimum temperatures documented in the cold weather preparedness plan.

Requirement R4 Part 4.3
In Requirement R4 Part 4.3, the GO identifies the Generator Cold Weather Critical Components to help inform their decision on where to implement appropriate freeze protection measures. The NERC *Reliability Guideline, Generating Unit Winter Weather Readiness – Current Industry Practices*[10], presents a suggested list of components that GOs may choose to utilize when developing their own Generator Cold Weather Critical Component inventory. The GO shall develop and maintain a list of Generator Cold Weather Critical Components for each unit.

Requirement R4 Part 4.4
Requirement R4 Part 4.4 requires GOs to document the freeze protection measures implemented on Generator Cold Weather Critical Components. These freeze protection measures should include those to reduce the cooling effects of wind. Requirement R4 does not require GOs to install new freeze protection measures to reduce the cooling effects of wind, but rather to identify freeze protection measures for Generator Cold Weather Critical Components that will protect against heat loss and the effect of freezing precipitation, where applicable, and document those measures (e.g., water-resistant insulation, protective shielding, insulated boxes, etc.). These measures could include temporary measures as well, such as wind breaks, but there is no expectation for entities to list all climate-controlled areas as freeze protection measures. Specifically, the freeze protection measures applied to Generator Cold Weather Critical Components must be captured in the cold weather preparedness plan.

Requirement R4 Part 4.5
Requirement R4 Part 4.5 is largely carried over from the previously approved EOP-011 Standard and requires annual inspection and maintenance of the freeze protection measures applied to Generator Cold Weather Critical Components identified in the cold weather preparedness plan. The 2024-03 DT added clarifying language to emphasize the need to effectively mitigate risk on the Generator Cold Weather Critical Components. This Requirement ensures these freeze protection measures will be ready and serviceable when needed.

Requirement R5

The Drafting Team did not make any changes to this Requirement. Therefore, the technical rationales are not provided here.

Requirement R6

R6. *Each Generator Owner shall, for each generating unit that has a calculated Extreme Cold Weather Temperature at or below 32 degrees Fahrenheit (zero degrees Celsius) as determined in Requirement R1 and that self-commits or is required to operate at or below a temperature of 32*

degrees Fahrenheit (zero degrees Celsius),[13] *develop and implement a Corrective Action Plan when the generating unit experiences a Generator Cold Weather Reliability Event. The Corrective Action Plan shall be developed before the first day of July, but not more than 150 days after the Generator Cold Weather Reliability Event. The Generator Owner shall: [Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

6.1. *Ensure the Corrective Action Plan contains at a minimum:*

6.1.1. *A summary of the identified cause(s) for the Generator Cold Weather Reliability Event, where applicable, and any relevant associated data;*

6.1.2 *A list of actions to add new or remedy existing freeze protection measures*;

6.1.3. *An identification of operating limitations or impacts to the cold weather preparedness plan that would apply until execution of the corrective action(s) identified in the Corrective Action Plan;*

6.1.4 *A description of the updates to the cold weather preparedness plan required under Requirement R4 to identify updates or additions to the Generator Cold Weather Critical Components and their freeze protection measures, if required;*

6.1.5 *A timetable specifying that implementation of the Corrective Action Plan shall be* completed prior to the first day of December following the Generator Cold Weather Reliability Event; and*;*

6.1.6 *A review of applicability to similar freeze protection measures at generating units owned by the Generator Owner, with a specified timetable for corrective actions to be completed within 24 calendar months of the Generator Cold Weather Reliability Event;*

6.2. *Update the Corrective Action Plan action(s) and timetable(s), with justification, and submit a Corrective Action Plan extension request to the Compliance Enforcement Authority (CEA) for approval where the timetable(s) for completing selected actions are projected to exceed the timelines in Part 6.1. The submitted Corrective Action Plan extension request shall include the following;*

6.2.1. *Circumstances causing the delay and how those circumstances are beyond the control of the Generator Owner;*

6.2.2. *Revisions to the selected actions in Part 6.1, if any, including utilization of Operating Procedures, if applicable; and*

6.2.3. *Updated timetable for implementing the selected actions in Part 6.1.*

6.3. *Document in a declaration, with justification, any Generator Cold Weather Constraint in accordance with Requirement R8 , if applicable, that precludes the Generator Owner from implementing selected action(s) contained within the Corrective Action Plan.*

[13] Generating unit(s) that do not self-commit or are not required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), but may be called upon to operate in order to assist in the mitigation of BES Emergencies, Capacity Emergencies, or Energy Emergencies during periods at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), are exempt from this requirement.

Key Recommendation 1d: To require Generator Owners that experience outages, failures to start, or derates due to freezing to review the generating unit's outage, failure to start, or derate and develop and implement a corrective action plan (CAP) for the identified equipment and evaluate whether the CAP applies to similar equipment for its other generating units. Based on the evaluation, the Generator Owner will either revise its cold weather preparedness plan to apply the CAP to the similar equipment or explain in a declaration (a) why no revisions to the cold weather preparedness plan are appropriate, and (b) that no further corrective actions will be taken. The standard drafting team should specify the specific timing for the CAP to be developed and implemented after the outage, derate, or failure to start, but the CAP should be developed as quickly as possible and be completed by no later than the beginning of the next winter season.

The Key Recommendation from the Joint Inquiry Report recommended a Reliability Standard that requires GOs to develop a Corrective Action Plan for generating units that experience outages, failures to starts, or derates due to freezing. The Joint Inquiry Report identifies that most of the outages and derates in the February 2021 event were due to freezing of instrumentation, transmitters, sensing lines, or wind turbine blades (p 166 in the Joint Inquiry Report). As such, the 2021-07 DT followed the Joint Inquiry Report recommendation to require a Corrective Action Plan when the apparent cause of the event is freezing. The 2021-07 DT developed parameters around these events to clarify a reasonable baseline of what level of derate qualified as an event and provide additional language to identify what constitutes a start-up failure. With the additional clarifications, the 2021-07 DT determined that the Reliability Standard would benefit from a defined term, to clearly and efficiently state what constitutes an event. The result was a defined term, Generator Cold Weather Reliability Event, that describes the circumstances for which a Corrective Action Plan is required (i.e., when a freezing event affects the equipment within the control of the GO). The defined term made the Reliability Standard easier to understand and implement by providing clear and reasonable factors to determine whether the impact of an event requires mitigation. However, because of the June 2024 FERC Order, the development and implementation of a Corrective Action Plan was required to be updated by the 2024-03 DT to provide clearer obligations for those units that suffer a Cold Weather Reliability Event. In general, the 2024-03 DT understands that if a Generator Cold Weather Reliability Event occurs, Generator Owners will remediate the issue as soon as possible.

General Considerations for All Corrective Action Plans

To simplify the proposed requirements related to creating a Corrective Action Plan, the 2021-07 DT used the NERC Definition of a Corrective Action Plan. The Corrective Action Plan definition reads "A list of actions and an associated timetable for implementation to remedy a specific problem." As written, the definition requires two parts for a document to qualify as a Corrective Action Plan, i.e., a list of items to be addressed and a timeline for completion. A Corrective Action Plan without both a list of actions and the timeline to implement is not complete. The 2024-03 DT provided additional language for Corrective Action Plans to clarify expectations for those Corrective Action Plans created as a result of a Generator Cold Weather Reliability Event and other Corrective Action Plans referenced throughout the Requirement language. The resulting language kept the underlying structure developed during previous Projects but clarified and added information as needed to meet the June 2024 FERC Order.

The Corrective Action Plan requirement applies to Generator Cold Weather Reliability Events. It should be noted that nothing in this standard prevents a GO from taking its own corrective actions resulting from events that do not meet the criteria of a Generator Cold Weather Reliability Event. Startup failure criteria were based on the GADS definition with the removal of "following an outage or reserve shutdown", since the definition of reserve shutdown is different in GADS than it is in some of the Regional Transmission Organizations (RTO's).

R6 requires the GO to develop a Corrective Action Plan by the first of July or within 150 days of the Generator Cold Weather Reliability Event. These timeframe options were chosen by the 2021-07 DT and maintained by the 2024-03 DT to allow GOs to review multiple events holistically following a winter season, if that scenario occurs, and create one Corrective Action Plan for components with common failure causes. Care should be taken when developing a multi-unit or multi-event Corrective Action Plan to ensure it meets the Corrective Action Plan criteria for each unit (e.g., actions and timetables may be different.)

The 2021-07 DT determined that Corrective Action Plans would be required for any freezing event that occurs at temperatures at or above the site's ECWT in accordance the definition of Generator Cold Weather Reliability Event. Using the site's ECWT as the threshold, as opposed to the generator unit minimum temperature as determined by the GO, achieves the following:

- Provides a consistent basis for the temperature at which Corrective Action Plans are required for all GOs
- Provides a consistent basis for when Corrective Action Plans are required for all generation types
- Provides a consistent basis for when Corrective Action Plans are required regardless of the level of effort that GOs may have applied to-date winterizing their generators such that they can operate to the ECWT that their sites will reasonably experience
- Removes any incentive (perceived or real) to not further winterize GOs sites to meet the ECWT at the GO site by not providing a window where one site might not be subject to the Corrective Action Plans requirement while sites in the same vicinity experiencing the same temperatures are subject to this requirement
- Removes any disincentive for GOs to design the units to operate well below the ECWT for a site by not requiring them to perform Corrective Action Plans while sites in the same vicinity experiencing the same temperatures are subject to this requirement

If a Corrective Action Plan extension is denied by the CEA, then the GO's Correction Action Plan completion date to meet compliance will be equal to the CEA's evaluation time period added to the original due date.
The 2024-03 DT provided clarifying language to have Corrective Action Plans developed in response to Generator Cold Weather Reliability Events completed by the first day of December of the winter season following the Generator Cold Weather Reliability Event. Allowances for events which occur early winter season, which varies across the North American continent, were provided with the expectation that more

transient fixes occurring after a Generator Cold Weather Reliability Event would be applied quickly but allowing a reasonable time horizon for compliance with this Requirement. A Corrective Action Plan triggered by a Generator Cold Weather Reliability Event and for which the apparent cause is the failure of relatively simple existing piece of freeze protection equipment, the scope of the Corrective Action Plan may be documented after the fact. Such prompt repairs may be completed before creation of the Corrective Action Plan, and the GO may complete the implementation of the Corrective Action Plan simply by evaluating the requirements of R6 and documenting how and when the repair work was completed. An example of this circumstance would be a freezing event caused by a single heat trace circuit failure which would have been sufficient to prevent the event had it not failed. Just to be clear, a Corrective Action Plan is required for Generator Cold Weather Reliability Events. The June 2024 FERC Order also directed changes affecting the application of a Generator Cold Weather Reliability Event Corrective Action Plans with regards to other units within a Generator Owner's fleet. The 2024-03 DT followed the FERC example and allowed a 24-calendar month window to address corrective actions on other units. This timeframe would allow Generator Owners with larger fleets to accommodate the changes if needed.

The 2024-03 DT also created language that allows for Corrective Action Plan extension requests using an ERO Enterprise process. ERO Enterprise staff have developed a process that leveraged the current TPL-007 Corrective Action Plan extension process (See ERO Enterprise Periodic Data Submittal Schedule). The process will allow a thorough review in a timely manner for any Corrective Action Plan extension requests including those that go beyond the 24 or 48 calendar month timetables. While there may be actions impacting the implementation and completion of Corrective Action Plans beyond the control of Generator Owners (e.g., supply chain issues), the Generator Owners should accelerate completion of corrective actions as much as possible to support reliable operations.

The 2024-03 DT updated language regarding Generator Cold Weather Constraints to clarify expectations. Please review Requirement R8 and Attachment 1 for further discussions of Generator Cold Weather Constraints.

Requirement R7

R7. *Each Generator Owner, for each Corrective Action Plan developed pursuant to Requirements R1, R2, or R3, shall, as applicable: [Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

7.1. *Include a timetable for implementing the selected corrective action(s) that shall:*

7.1.1. *List the action(s) which remedy(ies) issues with existing freeze protection measures, if any, to be completed within 24 calendar months of completing development of the Corrective Action Plan, regardless of any longer timelines in the Corrective Action Plan associated with new freeze protection measures;*

7.1.2. *List the action(s) which require(s) new freeze protection measures, if any, to be completed within 48 calendar months of completing development of the Corrective Action Plan; and*

7.1.3. *Describe the updates to the cold weather preparedness plan required under Requirement R4 to identify the updates or additions to the Generator Cold Weather Critical Components and their freeze protection measures.*

7.2. *Complete all the actions described in Corrective Action Plan in accordance with the specified timetables in Part 7.1;*

7.3. *Submit a Corrective Action Plan extension request, for the approval of the CEA, where the timetable(s) exceed the timelines for completing selected actions are projected to exceed the timelines in Part 7.1. The submitted request shall:*

7.3.1 *Explain the circumstances causing the delay and how those circumstances are beyond the control of the Generator Owner;*

7.3.2 *Include, as applicable, revisions to the selected actions in Part 7.1, including utilization of Operating Procedures; and*

7.3.3 *Include an updated timetable for implementing the selected actions in Part 7.1.*

7.4. *Document in a declaration, with justification, any Generator Cold Weather Constraint in accordance with Requirement R8 that precludes the Generator Owner from implementing selected action(s) contained within the Corrective Action Plan.*

In EOP-012-2, R7 was expanded from EOP-012-1 to provide additional definition on the requirements to implement a Corrective Action Plan, and to meet the direction for this requirement set by the February 2023 FERC Order. One such direction was to define expectations on implementation timelines for Corrective Action Plans. Under EOP-012-2 R7, Corrective Action Plans were divided into two categories: 1) those which address existing freeze protection measure(s), and 2) those which require new equipment or freeze protection measure(s). The former category required completion of the Corrective Action Plan to remedy the cause(s) within 24 months, and the latter required completion of the Corrective Action Plan within 48 months. The 2021-07 DT modeled this timeline structure after similar Corrective Action Plan implementation requirements in TPL-007. These are maximum durations and entities are expected to work diligently to correct issues and take prompt actions to mitigate future issues as soon as practical. At the same time, the 2021-07 DT recognized that the following time consuming activities make the 24 and 48 calendar months maximum timelines reasonable: scoping applicability to similar units, freeze protection engineering and design, project development, annual budgeting process, material supply lead times, outage scheduling, skilled labor availability, and startup/commissioning. However, the June 2024 FERC Order, established directives to clarify timelines and responsibilities associated with Corrective Action Plans. The 2024-03 DT chose to specifically remove Corrective Action Plan obligations for Generator Cold Weather Reliability Events and place those in Requirement R6. For Requirement 7, the 2024-03 DT provided clarifying language regarding existing and new freeze protection measures and the

associated completion timelines. Language was provided for Corrective Action Plans that may include changes to existing freeze protection measures and addition of new freeze protection measures to help clarify expectations for completing the corrective actions. Entities are expected to work diligently to correct issues and take prompt actions to mitigate future recurrence. The 2024-03 DT updated Part 7.1.3. for completeness to ensure updates would be made to document needed changes to the cold weather preparedness plan(s) to eliminate recurrence of issue(s) identified in the Corrective Action Plan. In clarifying these timeframes, the 2024-03 DT considered the FERC directives.

Within the revised Requirement R7, the GO is required to implement the Corrective Action Plan within a timetable defined by the GO in the Corrective Action Plan but limited by maximum durations in Part 7.1. If the GO is unable to complete the Corrective Action Plan within the time limits in Part 7.1, or the corrective action(s) change, the GO is required to update the Corrective Action Plan with justification. GOs that are unable to complete the Corrective Action Plan due to a Generator Cold Weather Constraint are required under Part 7.4 to create a declaration of the Generator Cold Weather Constraint which shall be provided to the Compliance Enforcement Authority per Requirement R8. Further requirements for the Generator Cold Weather Constraints are provided under Requirement R8.

The 2024-03 DT also created language that allows for Corrective Action Plan extension requests using an ERO Enterprise process. ERO Enterprise staff developed a process that leveraged the current TPL-007 Corrective Action Plan extension process (See ERO Enterprise Periodic Data Submittal Schedule). The process will allow a thorough review in a timely manner for any Corrective Action Plan extension requests including those that go beyond the 24 or 48 calendar months. The 2024-03 DT utilized the precedent set by TPL-007 to ensure the unique circumstances of each request will be considered while also avoiding potential compliance burdens which may not have a corresponding reliability benefit (e.g. specific timelines for submission & approval of extension requests). While there may be actions impacting the implementation and completion of Corrective Action Plans beyond the control of Generator Owners (e.g., supply chain issues), the Generator Owners should accelerate completion of corrective actions as much as possible to support reliable operations. It is expected that extension requests will be limited in nature. Generator Owners will have to provide clear justifications with supporting materials within the extension request. Due diligence in ordering equipment, obtaining permits, etc., will be considered as part of the determination of whether a particular set of facts constitute circumstances beyond the control of the entity. Denials of extension requests will be minimized if Generator Owners work diligently to correct issues and take prompt actions. Denial of an extension means the initial timelines for corrective actions must be met.

The 2024-03 DT updated language regarding Generator Cold Weather Constraints to clarify expectations. Please review Requirement R8 for further discussions of Generator Cold Weather Constraints.

If one or more actions within a Corrective Action Plan fall under a Generator Cold Weather Constraint declaration, it is the intent of the DT that only those affected actions would not be implemented as part of the Corrective Action Plan. The remaining corrective actions should be implemented per the timelines

provided unless dependent upon the corrective action triggering the Generator Cold Weather Constraint declaration.

Requirement R8

R8. *Each Generator Owner that declares a Generator Cold Weather Constraint in accordance with Attachment 1 shall: [Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

8.1 *Submit its Generator Cold Weather Constraint declaration(s) to the CEA within 45 days of determining that the Generator Cold Weather Constraint is applicable. For Generator Cold Weather Constraints determined in accordance with Requirement R2 for generating unit(s) upon beginning commercial operation, submit the Generator Cold Weather Constraint declaration(s) no later than 15 days after commercial operation;*

8.2 *Review any Generator Cold Weather Constraint declaration validated by the CEA every 24 calendar months to determine if it remains valid under Attachment 1*;

8.3 *Update the operating limitations associated with capability and availability under Requirement R1 Part 1.2 if applicable; and*

8.4 *If the CEA determines the declared Generator Cold Weather Constraint is invalid, update its Corrective Action Plan(s) to require corrective actions be completed in accordance with the timetables in Requirement R6 Part 6.1 or Requirement R7 Part 7.1, to begin from the date the Generator Owner is notified that the Generator Cold Weather Constraint is invalid*.

In the February 2023 FERC Order, the Commission expressed concern that a GO may make a Generator Cold Weather Constraint declaration without informing planning and operational entities (e.g., the Balancing Authority) that are expecting the reliable operation of the generating unit to its ECWT.[1] An additional concern was that the Generator Cold Weather Constraint declarations may be used by a functional entity as an opt-out of compliance with requirements set forth in the standards or in a corrective action plan.[2] To mitigate the concern, the Commission directed NERC to work with Commission staff and submit a data collection and assessment plan that contains information related to GO constraint declarations and explanations thereof.[3] The 2021-07 DT expected that ERO Enterprise compliance staff will be responsible for reviewing declared Generator Cold Weather Constraints and assessing compliance with the Generator Cold Weather Constraint definition criteria in accordance with established processes. The June 2024 FERC Order directives included more discrete language that required NERC to receive, review, evaluate, and confirm the validity of each Generator Cold Weather Constraint in a timely manner. Additionally, the June 2024 FERC Order directives required an increase in the frequency of reviews of Generator Cold Weather Constraints. If a Corrective Action Plan extension is denied by the CEA, then the GO's Correction Action Plan completion date to meet compliance will be equal to the CEA's evaluation time period added to the original due date.

The 2024-03 DT updated Requirement R8 to require the GO to submit, to the Compliance Enforcement Authority, a Generator Cold Weather Constraint in accordance with Attachment 1 under specific timelines. The ERO Enterprise staff have developed a process that leveraged the current TPL-007 Corrective Action Plan extension process (See ERO Enterprise Periodic Data Submittal Schedule) as a foundation for the Generator Cold Weather Constraint process. The process will allow a thorough review in a timely manner for any Generator Cold Weather Constraint submitted. The 2024-03 DT created Attachment 1 to provide clear expectations on Generator Cold Weather Constraint conditions. Attachment 1 contains some "pre-approved" Generator Cold Weather Constraint conditions as well as examples of other possible Generator Cold Weather Constraint conditions that may be considered valid. To be clear, the "pre-approved" Generator Cold weather Constraints require submittal per the ERO Enterprise process. The 2024-03 DT could not create an exhaustive list of Generator Cold Weather Constraint conditions but provided language that allows professional judgement to be utilized. The 2024-03 DT believes this process in conjunction with Requirement R8 and Attachment 1 effectively meets the FERC directive regarding receiving, reviewing, evaluating, and confirming the validity of Generator Cold Weather Constraints.

Initially EOP-012-1 required an annual review of Generator Cold Weather Constraints that was subsequently changed to five years in EOP-012-2. The June 2024 FERC Order directed that the review frequency be increased. While Generator Owners should perform a review and update any constraint declarations as needed, the 2024-03 DT developed language to require a review of validated Generator Cold Weather Constraints every 24 calendar months. The 2024-03 DT did send a survey out during the development of Requirement R8 language asking for stakeholder input and leveraged the results in the determination of 24 calendar months.
The 2021-07 DT believed that Generator Cold Weather Constraint declarations would be the exception but it is clear to the 2024-03 DT that certain conditions may exist (based on general weather patterns) that will increase the amount of Generator Cold Weather Constraint declarations and subsequent submittals. In anticipation of that scenario and following the June 2024 FERC Order the 2024-03 DT considers the ERO Enterprise process a valuable tool to capture data that may help future understanding of the effectiveness of the ECWT (which is required by the February 2023 FERC Order and subsequent NERC filing regarding cold weather data collection.)

Updated Generator Cold Weather Constraint declarations would also require an update to the operating limitations provided via data specifications to the entities overseeing reliability (e.g., Balancing Authority, Transmission Operator, or Reliability Coordinator). In this manner, information relevant to valid Generator Cold Weather Constraint declarations are made available to the planning and operational entities pursuant to their data collection authority contained in TOP-003 and IRO-010.

Attachment 1

Generator Owners shall determine the applicability of a Generator Cold Weather Constraint declared under Requirements R2, R6, and R7 as described below.

A Generator Cold Weather Constraint is any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components using the following criteria:

Pre-Approved Generator Cold Weather Constraints

The following are circumstances which, if present and confirmed as valid by the Compliance Enforcement Authority, will constitute Generator Cold Weather Constraints:

- *Wind turbine towers that have structural limitations established by Original Equipment Manufacturers (OEMs) based on a minimum temperature that is higher than the Extreme Cold Weather Temperature calculated per Requirement R1.*
- *Heat tracing or other de-icing technologies for wind turbine blades that are not available in the Generator Owner's location.*
- *Replacing existing wind turbine blades with new blades solely for the purpose of adding de-icing or ice-minimizing capabilities.*
- *Applying heat to remove accumulated frozen precipitation on solar panels.*
- *Applying heat upstream of inlet air filters to prevent the buildup of frozen precipitation on combustion turbine inlet air filters.*

Case-by-case Determinations

The following situations may constitute a Generator Cold Weather Constraint, depending on the facts and circumstances. Only upon approval by the Compliance Enforcement Authority will these circumstances comprise a valid Generator Cold Weather Constraint:

1. *The application of a specific freeze protection measure will void an equipment warranty.*
2. *The application of a specific freeze protection measure is precluded by technical or physical limitations. For example:*
    a. *Installing wind breaks around a cooling tower or air-cooled heat exchanger which requires free airflow for its functionality;*
    b. *Applying freeze control measures with size or weight that would require the structural re-design and re-construction of the protected equipment or its support system.*
    c. *Other similar circumstances as determined through operating experience or engineering analysis and supported with justification.*

3. *The application of a specific freeze protection measure or measures would adversely affect the reliability of the Bulk Power System to an extent that outweighs the reliability benefit of applying the freeze protection measure(s). For example:*
    a. *The application of freeze protection measures would result in the premature retirement of an existing dispatchable generating unit with no acceptable replacement currently available;*
    b. *The freeze protection measures would be applied to a generating unit that has a previously published retirement date within three years of the Generator Cold Weather Constraint declaration;*

   c. *The application of freeze protection measures would cause the Generator Owner to cancel plans to finish the development of a new generating unit(s);*
   d. *The application of freeze protection measures would reduce the generating unit's ability to provide Real Power and Reactive Power by more than three percent; or*
   e. *The application of freeze protection measures would reduce the summer net dependable capability[14] of the generating unit by more than three percent.*
4. *The application of a specific freeze protection measure would introduce the risk of noncompliance with other statutory, regulatory, or health and safety requirements or standards for which relief via waiver, exemption or other means of excused noncompliance is not available during extreme cold weather.*
5. *Other situations identified by the Generator Owner that may, based on the specific circumstances beyond the Generator Owner's control, limit its ability to apply freeze protection measures to Cold Weather Critical Components.*

When submitting a Generator Cold Weather Constraint declaration to the CEA per Requirement R8, the Generator Owner must include documentation that defends and supports the declared constraint and also describes other compensating or mitigating freeze protection measures, if applicable, that the Generator Owner will apply. An approved Generator Cold Weather Constraint declaration for any specific Generator Cold Weather Critical Component does not relieve the Generator Owner of its obligation to otherwise prepare its applicable generating unit(s) to meet the requirements of EOP-012-3.

The 2024-03 DT chose to utilize a limited and discrete list of pre-approved Generator Cold Weather Constraints as well as a description of other case-by-case situational descriptions that may constitute Generator Cold Weather Constraints. All declared Generator Cold Weather Constraints must be confirmed as valid by the Compliance Enforcement Authority. Nevertheless, the limited and discrete list is intended to describe specific circumstances that, if met, would have a very high probability of being approved. The 2024-03 DT discussed providing clarity with examples (as noted by FERC Order Paragraph 47) knowing that additional instances or conditions that may be considered a Generator Cold Weather Constraint may exist.

Per the FERC Order, NERC staff is responsible to provide a process describing the receipt, evaluation, approval (as needed), and validation of Generator Cold Weather Constraints. This process is captured in the "Generator Cold Weather CAP Extension and Constraint Process" document.

In summary, Attachment 1 contains a list of circumstances that, if confirmed valid by the Compliance Enforcement Authority, are considered to constitute pre-approved Generator Cold Weather Constraints as well as a list of additional situations, circumstances, and criteria that may constitute a Generator Cold Weather Constraint. In utilizing this second list, a Generator Owner must submit to the Compliance Enforcement Authority documentation that defends and supports its declared constraint and describes

[14] "Net dependable capability" refers to the definition used for reporting to the NERC Generating Availability Data System (GADS).

other compensating or mitigating freeze protection measures, if applicable, that the Generator Owner will apply.

Once a declaration is approved by the CEA it is considered valid.

The 2024-03 DT is intentionally leaving room for additional instances of Generator Cold Weather Constraints to be presented as it would be impossible to foresee every potential set of circumstances that could possibly constitute a constraint. Furthermore, the 2024-03 DT wants to ensure that the Standard language supports the development and adoption of new freeze protection measures, practices, methods, or technologies while not immediately requiring that the new freeze protection measures, practices, methods, or technologies be implemented industry-wide. The 2024-03 DT encourages additional study and implementation of freeze protection measures to remove Generator Cold Weather Constraints, as appropriate, over time.

The 2024-03 DT updated the definition of Generator Cold Weather Constraints to provide clarity as directed by FERC. In addition to modifying the definition, the 2024-03 DT developed Attachment 1. Requirement R8 provides entities a clear understanding of what is expected when managing Generator Cold Weather Constraints and directly references use of Attachment 1. The list of "pre-approved" Generator Cold Weather Constraints focuses on technical issues or conditions that are known to exist which may have limited-to-no freeze protection measures available to implement. A Generator Owner is still required to submit "pre-approved" Generator Cold Weather Constraints. The case-by-case determination section of Attachment 1 provides examples of conditions or issues that may constitute a valid Generator Cold Weather Constraint depending on the facts and circumstances. The language provided is meant to be objective, unambiguous, and auditable.

With all Generator Cold Weather Constraints, it is the responsibility of the Generator Owner to provide supporting materials to facilitate approval and validation of the Generator Cold Weather Constraint by the ERO Enterprise. As mentioned in the Requirement R8 Technical Rational discussion, an ERO Enterprise process has been developed to support the FERC directives in the June 2024 FERC Order. The 2024-03 DT believes the new definition of Generator Cold Weather Constraint, updated language throughout the Standard with emphasis on Requirement R8, and the contents of Attachment 1 provides significant clarity to industry on what is expected for Generator Cold Weather Constraints to be considered valid.

Unofficial Comment Form

Project 2024-03 Revisions to EOP-012-2

Do not use this form for submitting comments. Use the Standards Balloting and Commenting System (SBS) to submit comments on draft one of **EOP-012-3 Extreme Cold Weather Preparedness and Operations** by **8 p.m. Eastern, Tuesday, November 5, 2024.**

Additional information is available on the project page. If you have questions, contact Senior Standards Developer, Ben Wu (via email), or at 470-542-6882.

Background Information

NERC developed the original version of the generator cold weather preparedness Reliability Standard EOP-012-1 in 2022, under Project 2021-07 Extreme Cold Weather Grid Operations, Preparedness, and Coordination. The purpose of this project was to address standards-related recommendations from the Federal Energy Regulatory Commission (FERC)/NERC/Regional Entity staff review of operations during the February 2021 Winter Storm Uri event.

NERC developed Reliability Standard EOP-012-2 in 2023-2024 to address Commission directives from the February 2023 order approving Reliability Standards EOP-012-1 and EOP-011-3.[1] In the February 2023 Order, the Commission directed that NERC revise EOP-012-1 to clarify the applicability of the standard's requirements for generator cold weather preparedness, further define the circumstances under which a Generator Owner may declare that constraints preclude them from implementing one or more corrective actions to address freezing issues, and to shorten the implementation timeline so cold weather reliability risks would be addressed more quickly.

On June 27, 2024, FERC issued an order approving Reliability Standard EOP-012-2.[2] While finding Reliability Standard EOP-012-2 represented an improvement over the prior version and addressed many of its concerns, FERC found the standard requires further improvement to address certain concerns remaining from its February 2023 order. FERC therefore directed NERC to revise the standard in five areas and to submit a revised standard within nine (9) months of the date of the order, or by March 27, 2025.

1 *N. Am. Elec. Reliability Corp.*, 182 ¶ 61,094 (2023) ("February 2023 Order").

2 *N. Am. Elec. Reliability Corp.*, 187 FERC ¶ 61, 204 (2024) ("June 2024 Order").

Questions

1. In paragraph 47 of the June 2024 Order, FERC directed NERC to revise EOP-012-2 to "ensure that the Generator Cold Weather Constraint declaration criteria included within the proposed Reliability Standard are objective and sufficiently detailed so that applicable entities understand what is required of them." In paragraph 47 of the June 2024 Order, FERC directed NERC to develop and submit modifications to the Generator Cold Weather Constraint definition of Reliability Standard EOP-012-2, to remove the references to "cost," "reasonable cost," "unreasonable cost," and "good business practices" and replace them with criteria that are objective, unambiguous, and auditable. In paragraph 54 of the June 2024 Order, FERC directs NERC to modify EOP-012-2 so that NERC receives, reviews, evaluates, and confirms for validity the Generator Cold Weather Constraint declarations in a timely manner. In paragraph 94 of the June 2024 Order, FERC directs NERC to develop and submit modifications to Requirement R8, Part 8.1 of Reliability Standard EOP-012-2 to implement more frequent reviews of Generator Cold Weather Constraint declarations (more than every five years) to verify that the declaration remains valid.

   The drafting team has done the following to address the FERC directives:
   1. Provided an updated definition of Generator Cold Weather Constraint
   2. Updated language within Requirement R8
   3. Provided EOP-012-3 Attachment 1 for clarity on expectations for registered entities

   Do you agree with the approach and associated language the drafting team chose to meet the directives? Please provide any additional comments to consider. If you do not agree but believe the directives can be addressed in an equally effective and efficient manner, please provide your suggestions in the form of specific language changes for the drafting team.

   ☐ Yes
   ☐ No

   Comments:

2. In paragraph 68 of the June 2024 Order, FERC directed NERC to modify Requirement R7 of EOP-012-2 to require shorter deadlines to implement corrective actions for existing or new equipment or the freeze protection measures for those generating units that experience a Generator Cold Weather Reliability Event. FERC provided an example for how to address this directive, such as to require shorter timeframes for those units that have experienced issues and allow longer timeframes to address similar potential issues across a fleet for those units that have not experienced issues.

   The drafting team modified Requirement R6 of EOP-012-2 to require a shorter deadline to implement corrective actions for those generating units that experience a Generator Cold Weather Reliability Event. Do you agree with the revised timelines? Please provide any additional

comments to consider. If you do not agree but believe the directive can be addressed in an equally effective and efficient manner, please provide your suggestions in the form of specific language changes for the drafting team. Please review the posted draft ERO Enterprise document, EOP-012-3 Generator Cold Weather CAP Extension and Constraint Process.

☐ Yes
☐ No

Comments:

3. In paragraph 70 of the June 2024 Order, FERC directed NERC to develop and submit modifications to Requirement R7 of Reliability Standard EOP-012-2 to ensure that any extension of a corrective action plan implementation deadline beyond the maximum implementation timeframe required by the proposed Reliability Standard is pre-approved by NERC.

   The drafting team provided language changes in Requirements R6 and R7 for a Corrective Action Plan extension process. Do you believe that the proposed language changes meet the intent of paragraph 70 of the FERC Order? Please provide any additional comments to consider. If you do not agree but believe the directive can be addressed in an equally effective and efficient manner, please provide your suggestions in the form of specific language changes for the drafting team.

   ☐ Yes
   ☐ No

   Comments:

4. In paragraph 72 of the June 2024 Order, FERC directed NERC to develop and submit modifications to Requirement R7 of Reliability Standard EOP-012-2 to clarify that any Requirement R7 corrective action plans for new generation (i.e. commercially operational after October 1, 2027) must be completed prior to the generating unit's commercial operation date.

   The drafting team provided updated language in Requirement R2 Part 2.1 to address the issue of units in different stages of design and construction. February 16, 2023 was chosen as a date of demarcation as that was the date the Extreme Cold Weather Temperature was approved by FERC. Do you agree that revisions to Requirement R2 Part 2.1 address this directive? If you do not agree but believe the directive can be addressed in an equally effective and efficient manner, please provide your suggestions in the form of specific language changes for the drafting team.

☐ Yes
☐ No

Comments:

5. In paragraph 72 of the June 2024 Order, FERC directed NERC to develop and submit modifications to Requirement R7 of Reliability Standard EOP-012-2 to clarify that any Requirement R7 corrective action plans for new generation (i.e. commercially operational after October 1, 2027) must be completed prior to the generating unit's commercial operation date.

   The drafting team provided updated language in Requirement R2 Part 2.2 to address the issue of units in newer stages of design and construction. February 16, 2023 was chosen as a date of demarcation as that was the date the Extreme Cold Weather Temperature was approved by FERC. Units committed to design criteria on or after February 16, 2023 do not have the option to utilize a Corrective Action Plan but may still declare a Generator Cold Weather Constraint. Do you agree that revisions to Requirement R2 Part 2.2 address this directive? If you do not agree but believe the directive can be addressed in an equally effective and efficient manner, please provide your suggestions in the form of specific language changes for the drafting team.

   ☐ Yes
   ☐ No

   Comments:

6. In paragraph 76 of the June 2024 Order, FERC directs NERC to develop and submit modifications to Requirement R7 of Reliability Standard EOP-012-2 to address certain ambiguities by expanding on Requirement R7.1.1 and 7.1.2 to make it clear which corrective action plan implementation deadline applies when a generator owner must implement both remedying issues with existing and installing new freeze protection measures.

   The drafting team clarified Requirement R7 for Corrective Action Plans developed in accordance with Requirements R1, R2, or R3. Do you agree that revisions to Requirement R7 address this directive to differentiate between the existing and new freeze protection measures? If you do not agree but believe the directive can be addressed in an equally effective and efficient manner, please provide your suggestions in the form of specific language changes for the drafting team.

   ☐ Yes
   ☐ No

   Comments:

7. The drafting team provided language in the Implementation Plan to address parts 3 through 5 of paragraph 4 of the June 2024 Order addressing FERC's concerns regarding urgency. The Standard language updates were written to meet the core directives in an effective and efficient manner while providing language that is objective, unambiguous, and auditable. With EOP-012-2 already effective October 1, 2024 (with the exception of Requirement R3), the changes made were intended to meet the FERC Directives without adding significantly to the efforts already in progress. Do you agree that the associated Implementation Plan meets the Directives? If you do not agree but believe the Directives can be addressed in an equally effective and efficient manner, please provide your suggestions in the form of specific language changes for the drafting team.

   ☐ Yes
   ☐ No

   Comments:

8. Do you agree with the Implementation Plan for EOP-012-3? If you do not agree, please propose an alternate implementation plan with a detailed explanation.

   ☐ Yes
   ☐ No

   Comments:

9. Do you agree that EOP-012-3 is cost effective to address the Directives in the FERC Order? If you do not agree, or if you agree but have suggestions for improvement to enable more cost-effective approaches, please provide your recommendation and, if appropriate, technical, or procedural justification.

   ☐ Yes
   ☐ No

   Comments:

10. Please provide any additional comments for the standard drafting team to consider, if desired.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Violation Risk Factor and Violation Severity Level Justifications

Project 2024-03 Revisions to EOP-012-2

This document provides the drafting team's (DT's) justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in EOP-012-3. Each requirement is assigned a VRF and a VSL. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the Electric Reliability Organizations (ERO) Sanction Guidelines. The DT applied the following NERC criteria and FERC Guidelines when developing the VRFs and VSLs for the requirements.

NERC Criteria for Violation Risk Factors

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures, or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System, or the ability to effectively monitor, control, or restore the Bulk Electric System.

FERC Guidelines for Violation Risk Factors

Guideline (1) – Consistency with the Conclusions of the Final Blackout Report

FERC seeks to ensure that VRFs assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System. In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief.

Guideline (2) – Consistency within a Reliability Standard
FERC expects a rational connection between the sub-Requirement VRF assignments and the main Requirement VRF assignment.

Guideline (3) – Consistency among Reliability Standards
FERC expects the assignment of VRFs corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) – Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular VRF level conforms to NERC's definition of that risk level.

Guideline (5) – Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

NERC Criteria for Violation Severity Levels

VSLs define the degree to which compliance with a requirement was not achieved. Each requirement must have at least one VSL. While it is preferable to have four VSLs for each requirement, some requirements do not have multiple "degrees" of noncompliant performance and may have only one, two, or three VSLs.

VSLs should be based on NERC's overarching criteria shown in the table below:

Lower VSL	Moderate VSL	High VSL	Severe VSL
The performance or product measured almost meets the full intent of the requirement.	The performance or product measured meets the majority of the intent of the requirement.	The performance or product measured does not meet the majority of the intent of the requirement, but does meet some of the intent.	The performance or product measured does not substantively meet the intent of the requirement.

FERC Order of Violation Severity Levels

The FERC VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in the standard meet the FERC Guidelines for assessing VSLs:

Guideline (1) – Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline (2) – Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.
Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline (3) – Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline (4) – Violation Severity Level Assignment Should Be Based on a Single Violation, Not on a Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VRF Justification for EOP-012-3, Requirement R1

The VRF did not change from the previously FERC approved EOP-012-2 Reliability Standard.

VSL Justification for EOP-012-3, Requirement R1

The Drafting Team made non-substantial changes to this Requirement. The VSL did not change from the previously FERC approved EOP-012-2 Reliability Standard.

VRF Justification for EOP-012-3, Requirement R2

The VRF did not change from the previously FERC approved EOP-012-2 Reliability Standard.

VSLs for EOP-012-3, Requirement R2			
Lower	**Moderate**	**High**	**Severe**
The Generator Owner did not have freeze protection measure(s) for its applicable unit(s) meeting the criteria in Requirement R2 for 5% or less of its applicable units. OR The Generator Owner did not have a Corrective Action Plan or a Generator Cold Weather Constraint (if applicable) to implement appropriate freeze protection measures for 5% or	The Generator Owner did not have freeze protection measure(s) for its applicable unit(s) meeting the criteria in Requirement R2 for more than 5%, but less than or equal to 10% of its applicable units. OR The Generator Owner did not have a Corrective Action Plan or a Generator Cold Weather Constraint (if applicable) for more than 5%, but less than or	The Generator Owner did not have freeze protection measure(s) meeting the criteria in Requirement R2 for more than 10%, but less than or equal to 20% of its applicable units. OR The Generator Owner did not have a Corrective Action Plan or a Generator Cold Weather Constraint (if applicable) for more than 10%, but less than or	The Generator Owner did not have freeze protection measure(s) meeting the criteria in Requirement R2 for more than 20% of its applicable units. OR The Generator Owner did not have a Corrective Action Plan or a Generator Cold Weather Constraint (if applicable) for more than 20% of its applicable units.

less of its applicable units.	equal to 10% of its applicable units.	equal to 20% of its applicable units.	

VSL Justifications for EOP-012-3, Requirement R2	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This requirement was modified to capture the difference for generating units for which the Generator Owner first contractually committed to design criteria relevant to this Requirement on or before/after February 16, 2023. The VSL was modified to add Generator Cold Weather Constraint and did not have the unintended consequence of lowering the current level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single	Each VSL is based on a single violation and not cumulative violations.

VSL Justifications for EOP-012-3, Requirement R2	
Violation, Not on A Cumulative Number of Violations	

VRF Justification for EOP-012-3, Requirement R3
The VRF did not change from the previously FERC approved EOP-012-2 Reliability Standard.

VSL Justification for EOP-012-3, Requirement R3
There is no change to this Requirement. The VSL did not change from the previously FERC approved EOP-012-2 Reliability Standard.

VRF Justification for EOP-012-3, Requirement R4
The VRF did not change from the previously FERC approved EOP-012-2 Reliability Standard.

VSLs for EOP-012-3, Requirement R4			
Lower	**Moderate**	**High**	**Severe**
The Generator Owner created a cold weather preparedness plan(s) but failed to maintain it.	The Generator Owner's cold weather preparedness plan failed to include one of the applicable Parts within Requirement R4.	The Generator Owner had and maintained a cold weather preparedness plan(s) but failed to implement it. OR The Generator Owner's cold weather preparedness plan failed to include two of the applicable requirement parts within Requirement R4.	The Generator Owner does not have a cold weather preparedness plan(s). OR The Generator Owner's cold weather preparedness plan failed to include three or more of the applicable requirement parts within Requirement R4.

VSL Justifications for EOP-012-3, Requirement R4	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	There is a word change from "implemented" to "created" in the Lower VSL which did not have the unintended consequence of lowering the current level of compliance. There are no changes to other levels of the VSLs.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VRF Justification for EOP-012-3, Requirement R5

The VRF did not change from the previously FERC approved EOP-012-2 Reliability Standard.

VSL Justification for EOP-012-3, Requirement R5

There is no change to this Requirement. The VSL did not change from the previously FERC approved EOP-012-2 Reliability Standard.

VRF Justification for EOP-012-3, Requirement R6

The VRF did not change from the previously FERC approved EOP-012-2 Reliability Standard.

VSLs for EOP-012-3, Requirement R6			
Lower	**Moderate**	**High**	**Severe**
The Generator Owner developed and implemented a Corrective Action Plan for a Generator Cold Weather Reliability Event, but it was not developed in accordance with the timeline specified in Requirement R6.	The Generator Owner developed and implemented a Corrective Action Plan for a Generator Cold Weather Reliability Event, but it failed to contain one of the elements in Requirement R6, Part 6.1.	The Generator Owner developed and implemented a Corrective Action Plan for a Generator Cold Weather Reliability Event, but it failed to contain two of the elements in Requirement R6, Part 6.1. The Generator Owner developed a Corrective Action Plan for a Generator Cold Weather Reliability Event, but failed to implement it. OR The Generator Owner developed and implemented a Corrective Action Plan, but failed to contain three or more of the elements in Requirement R6, Part 6.1. OR The Generator Owner did not submit a Corrective Action Plan extension request in accordance with Requirement R6, Part 6.2 (if applicable). OR The Generator Owner submitted a Corrective Action Plan extension request in accordance with Part 6.2

			(if applicable), but it did not include two or more of the elements in Requirement R6, Part 6.2. OR The Generator Owner did not document in a declaration any Generator Cold Weather Constraint(s), as required by Requirement R6, Part 6.3.

VSL Justifications for EOP-012-3, Requirement R6	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	This Requirement is modified to ensure the that there is a process in place when develop and implement Corrective Action Plans. The proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VSL Justifications for EOP-012-3, Requirement R6	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VRF Justification for EOP-012-3, Requirement R7

The VRF did not change from the previously FERC approved EOP-012-2 Reliability Standard.

VSLs for EOP-012-3, Requirement R7			
Lower	**Moderate**	**High**	**Severe**
The Generator Owner completed selected corrective action(s) in accordance with the 24 and 48 calendar month timelines provided in Requirement R7, Part 7.1 (Part 7.2), but failed to include in its Corrective Action Plan a timetable listing such action(s) in accordance with Requirement R7, Parts 7.1.1-7.1.2.	The Generator Owner included a timetable for implementing the selected corrective action(s) in its Corrective Action Plan in accordance with Requirement R7, Part 7.1 and completed actions in accordance with that timetable (Part 7.2), but it failed to list the updates to the cold weather preparedness plan as required in Requirement R7, Part 7.1.3.	The Generator Owner included in its Corrective Action Plan a timetable for implementing the selected corrective actions, completed actions in accordance with that timetable (Part 7.2), and submitted a Corrective Action Plan extension request in accordance with Requirement R7, Part 7.3 when the timetables for completion were projected to exceed the timelines in Part 7.1, but its request did not include one	The Generator Owner included in its Corrective Action Plan a timetable for implementing the selected corrective actions, completed actions in accordance with that timetable (Part 7.2), and submitted a Corrective Action Plan extension request in accordance with Requirement R7, Part 7.3 when the timetables for completion were projected to exceed the timelines in Part 7.1, but its request did not

		of the elements in Requirement R7, Part 7.3.	include two or more of the elements in Requirement R7, Part 7.3. OR The Generator Owner included in its Corrective Action Plan a timetable for implementing the selected corrective actions, and completed actions in accordance with that timetable (Part 7.2), but failed to submit a Corrective Action Plan extension request where the timetables for completing selected actions were projected to exceed the timelines in Part 7.1 (if applicable). OR The Generator Owner failed to complete corrective action(s) described in the Corrective Action Plan, and did not document in a declaration any Generator Cold Weather Constraint(s) that preclude the Generator Owner from implementing selected action(s) contained within the Corrective Action Plan.

VSL Justifications for EOP-012-3, Requirement R7	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended	The modification to make sure that Each Generator Owner shall have dated evidence that demonstrates it implemented each Corrective Action Plan, including updating actions or timetables, or has explained in a declaration why corrective actions are not being implemented in accordance with Requirement R7. The proposed VSLs do not have the unintended consequence of lowering the level of compliance.

VSL Justifications for EOP-012-3, Requirement R7	
Consequence of Lowering the Current Level of Compliance	
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

VRF Justification for EOP-012-3, Requirement R8

The VRF did not change from the previously FERC approved EOP-012-2 Reliability Standard.

VSLs for EOP-012-3, Requirement R8			
Lower	**Moderate**	**High**	**Severe**
The Generator Owner submitted a Generator Cold Weather Constraint in accordance with Requirement R8, Part 8.1, but did not do so within the specified timeframe.	The Generator Owner failed to comply with one of the elements in Requirement R8, Parts 8.2 through 8.4.	The Generator Owner failed to comply with two of the elements in Requirement R8, Parts 8.2 through 8.4.	The Generator Owner failed to comply with three of the elements in Requirement R8, Parts 8.2 through 8.4. OR The Generator Owner declared but failed to submit a Generator Cold Weather Constraint in accordance with Requirement R8, Part 8.1.

VSL Justifications for EOP-012-3, Requirement R8	
FERC VSL G1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	The Drafting Team added Lower VSL and Moderate VSL to enforce that the Generator Owner should submit a Generator Cold Weather Constraint in accordance with Requirement R8, Part 8.1 within the specified timeframe and must comply with Requirement R8, Parts 8.2 through 8.4. The proposed VSLs do not have the unintended consequence of lowering the level of compliance.
FERC VSL G2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity	The proposed VSLs are not binary and do not use any ambiguous terminology, thereby supporting uniformity and consistency in the determination of similar penalties for similar violations.

VSL Justifications for EOP-012-3, Requirement R8	
Level Assignments that Contain Ambiguous Language	
FERC VSL G3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	The proposed VSLs use the same terminology as used in the associated requirement and are, therefore, consistent with the requirement.
FERC VSL G4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations	Each VSL is based on a single violation and not cumulative violations.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Consideration of Directives from FERC June 2024 Order Approving EOP-012-2 and Directing Further Revisions

Project 2024-03 Revisions to EOP-012-2

Summary

This mapping document summarizes how the drafting team considered FERC's directives for further revisions to Reliability Standard EOP-012-2 in its June 27, 2024 approval order[1] when drafting proposed EOP-012-3.

Paragraph 47 – Address Ambiguities Regarding the term Generator Cold Weather Constraint and Criteria

Directive:

"Accordingly, we direct NERC, pursuant to section 215(d)(5) of the FPA, to develop and submit to the Commission for approval modifications to proposed Reliability Standard EOP-012-2 that address concerns related to the ambiguity of the newly defined Generator Cold Weather Constraint term and criteria. Specifically, we direct NERC to ensure that the Generator Cold Weather Constraint declaration criteria included within the proposed Reliability Standard are objective *and* sufficiently detailed so that applicable entities understand what is required of them. One approach to satisfy this directive could be to incorporate into the proposed Reliability Standard a limited and discrete list of circumstances that would qualify as acceptable constraints. We note that NERC's technical rationale document, created by NERC's Standard Drafting Team and included in NERC's filing, includes a list of technical constraints that could serve as a starting point for a list of circumstances that would qualify as acceptable constraints. To the extent that NERC continues to believe that the extent of industry adoption for winterization technologies should be a criterion for declaring a constraint, NERC should clearly explain in its filing how it will assess the extent of such adoption in a way that provides for consistent compliance and enforcement outcomes. Alternatively, NERC could establish a pre-approval process for all Generator Cold Weather Constraint declarations. While a clearly defined list may be preferable, a pre-approval process could be established to ensure entities' declared Generator Cold Weather Constraints are appropriate and can be supported and defended. Further, as part of the directive to develop and submit modifications to the Generator Cold Weather Constraint definition of proposed Reliability Standard

[1] *N. Am. Elec. Reliability Corp.*., 187 FERC ¶ 61,204 (2024) ("June 2024 Order"). In this document, internal citations included within the cited text of the FERC order are omitted.

EOP-012-2, we direct NERC, pursuant to section 215(d)(5) of the FPA, to remove the references to "cost," "reasonable cost," "unreasonable cost," and "good business practices" and replace them with criteria that are objective, unambiguous, and auditable. NERC may propose to develop modifications that address the Commission's concerns in an equally efficient and effective manner, however, NERC must explain how its proposal addresses the Commission's concerns."

Consideration of Directive

Consideration of Directive in EOP-012-3		
Approved Definition/Standard	**Revisions in Definition/Standard or Other Action**	**Description and Change Justification**
Generator Cold Weather Constraint - Any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components using the criteria below. Freeze protection measures are not intended to be limited to optimum practices, methods, or technologies, but are also intended to include acceptable practices, methods, or technologies generally implemented by the electric industry in areas that experience similar winter climate conditions. Criteria used to determine a constraint include practices, methods, or technologies which, given the exercise of reasonable judgment in light of the facts known at the time the decision to declare the constraint was made: • Were not broadly implemented at generating units for comparable unit types in regions that experience similar winter climate conditions to provide reasonable assurance of efficacy;	**Generator Cold Weather Constraint** - Any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components. *** **R8.** Each Generator Owner that declares a Generator Cold Weather Constraint in accordance with Attachment 1 shall: **8.1.** Submit its Generator Cold Weather Constraint declaration(s) to the CEA within 45 days of determining that the Generator Cold Weather Constraint is applicable. For Generator Cold Weather Constraints determined in accordance with Requirement R2 for generating unit(s) upon beginning commercial operation, submit the Generator Cold Weather Constraint declaration(s) no later than 15 days after commercial operation; **8.2.** Review any Generator Cold Weather Constraint declaration validated by the CEA	The DT removed all of the references to "reasonable cost," "unreasonable cost," "cost," and "good business practices" within the definition of Generator Cold Weather Constraint. The definition of Generator Cold Weather Constraint now refers generally to a condition that would preclude implementing freeze protection measures. Instead, the DT developed Attachment 1, referenced in Requirement R8, to define the criteria by which a valid Generator Cold Weather Constraint may exist. Attachment 1 consists of: 1. Pre-Approved Generator Cold Weather Constraints, consisting of circumstances which, if present and confirmed as valid by the Compliance Enforcement Authority, would constitute Generator Cold Weather Constraints; and 2. Case-by-case Determinations of Generator

Consideration of Directive in EOP-012-3		
Approved Definition/Standard	**Revisions in Definition/Standard or Other Action**	**Description and Change Justification**
• Could not have been expected to accomplish the desired result; or Could not have been implemented at a reasonable cost consistent with good business practices, reliability, or safety. A cost may be deemed "unreasonable" when implementation of selected freeze protection measure(s) are uneconomical to the extent that they would require prohibitively expensive modifications or significant expenditures on equipment with minimal remaining life. *** **R8.** Each Generator Owner that creates a Generator Cold Weather Constraint declaration shall: **8.1**. Review the Generator Cold Weather Constraint declaration at least every five calendar years or as needed when a change of status to the Generator Cold Weather Constraint occurs; and **8.2**. Update the operating limitations associated with capability and availability under Requirement R1 Part R1.2 if applicable.	every 24 calendar months to determine if it remains valid under Attachment 1; **8.3** Update the operating limitations associated with capability and availability under Requirement R1 Part R1.2 if applicable; and **8.4** If the CEA determines the declared Generator Cold Weather Constraint is invalid, update its Corrective Action Plan(s) to require corrective actions be completed in accordance with the timetables in Requirement R6 Part 6.1 or Requirement R7 Part 7.1, to begin from the date the Generator Owner is notified that the Generator Cold Weather Constraint is invalid. *** **Attachment 1** (criteria for determining the applicability of a Generator Cold Weather Constraint) (*see draft standard*)	Cold Weather Constraints, consisting of situations which may constitute Generator Cold Weather Constraints, depending on the specific facts and circumstances. Only upon approval by the Compliance Enforcement Authority would these circumstances comprise a valid Generator Cold Weather Constraint under Requirement R8. Attachment 1 provides significant clarity on the conditions or issues that may constitute a valid Generator Cold Weather Constraint. The criteria are intended to be objective, unambiguous, and auditable. The standard retains flexibility to address potentially valid constraints that are not specifically defined in the standard through the Compliance Enforcement Authority review process.

Paragraph 54: Address Concerns Regarding the Need for a Timely Review and Evaluation of Declared Generator Cold Weather Constraints by NERC

Directive

"Accordingly, we again direct NERC, pursuant to section 215(d)(5) of the FPA, to modify proposed Reliability Standard so that NERC receives, reviews, evaluates, and confirms for validity the Generator Cold Weather Constraint declarations in a timely manner. We also direct NERC to include in its compliance filing, a plan to timely review such declarations to verify compliance with proposed Reliability Standard EOP-012-2 and its successors or obligations in a corrective action plan and take corrective action where necessary. For example, modifying Standard to require the generator owners to provide declarations (or changes to the declarations) to NERC within 45 days. It is up to NERC whether it would like to delegate this task to the relevant Regional Entities. NERC may propose to develop modifications that address the Commission's concerns in an equally efficient and effective manner, however, NERC must explain how its proposal addresses the Commission's concerns."

Consideration of Directive

Consideration of Directive in EOP-012-3		
Approved Definition/Standard	**Revisions in Definition/Standard or Other Action**	**Description and Change Justification**
R8. Each Generator Owner that creates a Generator Cold Weather Constraint declaration shall: **8.1**. Review the Generator Cold Weather Constraint declaration at least every five calendar years or as needed when a change of status to the Generator Cold Weather Constraint occurs; and **8.2**. Update the operating limitations associated with capability and availability under Requirement R1 Part R1.2 if applicable.	**R8.** Each Generator Owner that declares a Generator Cold Weather Constraint in accordance with Attachment 1 shall: **8.1.** Submit its Generator Cold Weather Constraint declaration(s) to the CEA within 45 days of determining that the Generator Cold Weather Constraint is applicable. For Generator Cold Weather Constraints determined in accordance with Requirement R2 for generating unit(s) upon beginning commercial operation, submit the Generator Cold Weather Constraint declaration(s) no later than 15 days after commercial operation;	Requirement R8 would require the Generator Owner declaring a Generator Cold Weather Constraint in accordance with Attachment 1 to submit that constraint to its Compliance Enforcement Authority within 45 days of determining that a Generator Cold Weather Constraint is applicable (for new units, this time is within 15 days of entering commercial operation). This requirement helps ensure the timely submission of constraints to the Compliance Enforcement Authority, which may be NERC or the Regional Entity, for review and approval.

Consideration of Directive in EOP-012-3		
Approved Definition/Standard	**Revisions in Definition/Standard or Other Action**	**Description and Change Justification**
	8.2. Review any Generator Cold Weather Constraint declaration validated by the CEA every 24 calendar months to determine if it remains valid under Attachment 1; **8.3** Update the operating limitations associated with capability and availability under Requirement R1 Part R1.2 if applicable; and **8.4** If the CEA determines the declared Generator Cold Weather Constraint is invalid, update its Corrective Action Plan(s) to require corrective actions be completed in accordance with the timetables in Requirement R6 Part 6.1 or Requirement R7 Part 7.1, to begin from the date the Generator Owner is notified that the Generator Cold Weather Constraint is invalid. *** **Attachment 1** (criteria for determining the applicability of a Generator Cold Weather Constraint) (*see draft standard*)	Attachment 1 contains a list of pre-approved Generator Cold Weather Constraints as well as a list of situations, circumstances, and criteria that may constitute a Generator Cold Weather Constraint for which a Generator Owner must include documentation that defends and supports the declared constraint and also describes other compensating or mitigating freeze protection measures, if applicable, that the Generator Owner will apply to the CEA for approval. If the Generator Cold Weather Constraint is determined to be invalid by the CEA, the Generator Owner must update its Corrective Action Plan and implement according to the standard timelines, beginning from the date of notification. As NERC and the Regional Entities are not users, owners, nor operators of the BPS, provisions for the timeliness of CEA review are not included in EOP-012-3. Additional support and detail for how the CEA will review constraints in a timely manner consistent with the FERC directive is provided in the constraint review process.

Paragraph 68 - Address Concerns that Existing EOP-012-2 Requirement R7 Allows Too Long for Entities to Implement Corrective Actions for Existing or New Equipment or Freeze Protection Measures for those Generating Units that Experience a Generator Cold Weather Reliability Event

Directive:
"Accordingly, we direct NERC, pursuant to section 215(d)(5) of the FPA, to develop and submit modifications to Requirement R7 of proposed Reliability Standard EOP-012-2 to require shorter deadlines to implement corrective actions for existing or new equipment or the freeze protection measures for those generating units that experience a Generator Cold Weather Reliability Event. Based on compliance with Requirements R2 and R3, those generating units should have already had appropriate freeze protection measures implemented to be capable of operating at the generating units' respective Extreme Cold Weather Temperature. Therefore, we find that a shorter timeframe to implement corrective actions that address existing or new equipment or freeze protection measures is appropriate. For example, to satisfy this directive, NERC could require generator owners to implement corrective actions prior to the next winter season for generating units that experience a Cold Weather Reliability Event and to complete freeze protection measures on similar equipment on all of its fleet within 24 months of becoming aware of the freeze issue. For corrective action plans that involve larger and more complicated implementations, NERC could incorporate a staggered 48-month corrective action plan implementation deadline."

Consideration of Directive

Consideration of Directive in EOP-012-3		
Approved Definition/Standard	**Revisions in Definition/Standard or Other Action**	**Description and Change Justification**
R6. Each Generator Owner shall, for each generating unit that has a calculated Extreme Cold Weather Temperature at or below 32 degrees Fahrenheit (zero degrees Celsius) as determined in Requirement R1 and that self-commits or is required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), develop a Corrective Action Plan when the generating unit experiences a Generator Cold Weather Reliability Event. The Corrective Action Plan shall be developed	**R6.** Each Generator Owner shall, for each generating unit that has a calculated Extreme Cold Weather Temperature at or below 32 degrees Fahrenheit (zero degrees Celsius) as determined in Requirement R1 and that self-commits or is required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), develop and implement a Corrective Action Plan when the generating unit experiences a Generator Cold Weather Reliability Event. The Corrective Action Plan shall be developed before the first day	To address this directive, the drafting team revised Requirement R6 to specify shorter implementation timeframes at generating units experiencing a Generator Cold Weather Event, and removed references to this requirement under Requirement R7, which previously addressed all Corrective Action Plans developed under the EOP-012 standard. For Generator Owners experiencing a Generator Cold Weather Event, Corrective Action Plans

Consideration of Directive in EOP-012-3		
Approved Definition/Standard	**Revisions in Definition/Standard or Other Action**	**Description and Change Justification**
within 150 days or by July 1, whichever is earlier, and contain at a minimum: **6.1.** A summary of the identified cause(s) for the Generator Cold Weather Reliability Event, where applicable, and any relevant associated data; **6.2.** A review of applicability to similar equipment at generating units owned by the Generator Owner; and **6.3.** An identification of operating limitations or impacts to the cold weather preparedness plan that would apply until execution of the corrective action(s) identified in the Corrective Action Plan. **R7**. Each Generator Owner, for each Corrective Action Plan developed pursuant to Requirements R1, R2, R3, or R6, shall: **7.1**. Include a timetable for implementing the selected corrective action(s) that shall: **7.1.1**. List the action(s) which address(es) existing equipment or freeze protection measures, if any, to be completed within 24 calendar months of completing development of the Corrective Action Plan; **7.1.2**. List the action(s) which require(s) new equipment or freeze protection measures, if any, to be completed within 48 calendar months of completing development of the Corrective Action Plan; and	of July, but not more than 150 days after the Generator Cold Weather Reliability Event. The Generator Owner shall: **6.1**. Ensure the Corrective Action Plan contains at a minimum: **6.1.1.**A summary of the identified cause(s) for the Generator Cold Weather Reliability Event, where applicable, and any relevant associated data; **6.1.2.** A list of actions to add new or remedy issues with existing freeze protection measures; **6.1.3.** An identification of operating limitations or impacts to the cold weather preparedness plan that would apply until execution of the corrective action(s) identified in the Corrective Action Plan; **6.1.4.** A description of the updates to the cold weather preparedness plan required under Requirement R4 to identify updates or additions to the Generator Cold Weather Critical Components and their freeze protection measures, if required; **6.1.5.** A timetable specifying that implementation of the Corrective Action Plan shall be completed prior to the first day of December following the Generator Cold Weather Reliability Event[fn10]; and **6.1.6.** A review of applicability to similar equipment freeze protection measures at	must specify implementation of corrective actions at the affected unit (i.e. the one experiencing the event) by no later of December 1 following the event. For events occurring early in the season (i.e. prior to December 1), corrective actions shall be implemented prior to December 1 of the year following the event. Recognizing that similar units may be subject to similar issues, Generator Owners must still perform a review of applicability to similar equipment at their other units. Revised Requirement R7 would allow the entity to perform this review and implement any corrective measures within 24 calendar months of the Generator Cold Weather Reliability Event. To the extent circumstances beyond the control of the Generator Owner prevent implementation within these timeframes, Requirement R6 Part 6.2 provides a process by which the Generator Owner may seek an extension from the CEA. This process is similar to that included in Requirement R7, discussed more fully in the following section.

Consideration of Directive in EOP-012-3		
Approved Definition/Standard	**Revisions in Definition/Standard or Other Action**	**Description and Change Justification**
7.1.3. List the updates to the cold weather preparedness plan required under Requirement R4 to identify the updates or additions to the Generator Cold Weather Critical Components and their freeze protection measures; **7.2**. Implement the Corrective Action Plan in accordance with the specified timetables in Requirement R7 Part 7.1; **7.3**. Update the Corrective Action Plan action(s) and timetable(s), with justification, if corrective action(s) change or timetable(s) exceed the timelines in Requirement R7 Part 7.1; and **7.4**. Document in a declaration, with justification, any Generator Cold Weather Constraint that precludes the Generator Owner from implementing selected action(s) contained within the Corrective Action Plan.	generating units owned by the Generator Owner, with a specified timetable for corrective actions to be completed within 24 calendar months of the Generator Cold Weather Reliability Event; **6.2.** Update the Corrective Action Plan action(s) and timetable(s), with justification, and submit a Corrective Action Plan extension request to the Compliance Enforcement Authority (CEA) for approval where the timetable(s) for completing selected actions are projected to exceed the timelines in Part 6.1. The submitted Corrective Action Plan extension request shall include the following; **6.2.1.**Circumstances causing the delay and how those circumstances are beyond the control of the Generator Owner; **6.2.2.**Revisions to the selected actions in Part 6.1, if any, including utilization of Operating Procedures, if applicable; and **6.2.3.**Updated timetable for implementing the selected actions in Part 6.1. **6.3.** Document in a declaration, with justification, any Generator Cold Weather Constraint in accordance with Requirement R8, if applicable, that precludes the Generator Owner from implementing selected action(s) contained within the Corrective Action Plan.

	[10]: For events that occur early in the season, such as in October or November, the timetable shall specify completion prior to December 1 of the next calendar year. **R7.** Each Generator Owner, for each Corrective Action Plan developed pursuant to Requirements R1, R2, or R3 shall, as applicable: **7.1.** Include a timetable for implementing the selected corrective action(s) that shall: ****	

Paragraph 70: Address the Finding that Any Extensions of a Corrective Action Plan Implementation Deadline Beyond the Maximum Implementation Timeframe Provided by the Standard be Pre-Approved by NERC

Directive

"Therefore, we direct NERC, pursuant to section 215(d)(5) of the FPA, to develop and submit modifications to Requirement R7 of proposed Reliability Standard EOP-012-2 to ensure that any extension of a corrective action plan implementation deadline beyond the maximum implementation timeframe required by the proposed Reliability Standard is pre-approved by NERC. This approach is consistent with prior Commission action in Order No. 851 where the Commission directed NERC to require pre-approval for extensions beyond the timelines required in the Reliability Standard. In Order No. 851, the Commission explained that although case-by-case extension determinations may be more uncertain or have associated burdens, the more compelling imperative is that automatic extensions have the potential for abuse by unduly delaying mitigation, and would lead to delayed visibility for NERC."

See also P 3 (summarizing directives): "[W]e direct NERC to:… develop and submit modifications to Requirement R7 of proposed Reliability Standard EOP-012-2 to ensure that any extension of a corrective action plan implementation deadline beyond the maximum implementation timeframe required by the Standard is pre-approved by NERC and to ensure that the generator owner informs relevant registered entities of operating limitations in extreme cold weather during the period of the extension."

Approved Definition/Standard	**Revisions in Definition/Standard or Other Action**	**Description and Change Justification**
Event. The Corrective Action Plan shall be developed within 150 days or by July 1, whichever is earlier, and contain at a minimum: **6.1.** A summary of the identified cause(s) for the Generator Cold Weather Reliability Event, where applicable, and any relevant associated data; **6.2.** A review of applicability to similar equipment at generating units owned by the Generator Owner; and **6.3.** An identification of operating limitations or impacts to the cold weather preparedness plan that would apply until execution of the corrective action(s) identified in the Corrective Action Plan. *** **R7**. Each Generator Owner, for each Corrective Action Plan developed pursuant to Requirements R1, R2, R3, or R6, shall: **7.1**. Include a timetable for implementing the selected corrective action(s) that shall: **7.1.1**. List the action(s) which address(es) existing equipment or freeze protection measures, if any, to be completed within 24 calendar months of completing development of the Corrective Action Plan; **7.1.2**. List the action(s) which require(s) new equipment or freeze protection measures, if any, to be completed within 48 calendar	Cold Weather Reliability Event. The Corrective Action Plan shall be developed before the first day of July, but not more than 150 days after the Generator Cold Weather Reliability Event. The Generator Owner shall: **6.1**. Ensure the Corrective Action Plan contains at a minimum: **6.1.1.**A summary of the identified cause(s) for the Generator Cold Weather Reliability Event, where applicable, and any relevant associated data; **6.1.2.** A list of actions to add new or remedy issues with existing freeze protection measures; **6.1.3.** An identification of operating limitations or impacts to the cold weather preparedness plan that would apply until execution of the corrective action(s) identified in the Corrective Action Plan; **6.1.4.** A description of the updates to the cold weather preparedness plan required under Requirement R4 to identify updates or additions to the Generator Cold Weather Critical Components and their freeze protection measures, if required; **6.1.5.** A timetable specifying that implementation of the Corrective Action Plan shall be completed prior to the first day of December following the Generator Cold Weather Reliability Event[fn10]; and	the TPL-007 standard, and the ERO Enterprise would follow a similar review process. With respect to that part of Paragraph 3 relating to "ensuring the generator owner informs relevant registered entities of operating limitations in extreme cold weather during the period of the extension": Under EOP-012-3 Requirement R6 Part 6.1.3, pertaining to units experiencing a Generator Cold Weather Event, the Generator Owner would be required to identify operating limitations that would apply until execution of the Corrective Action Plan. Under EOP-012-3 Requirements R2 and R3, a Corrective Action Plan would be required where the Generator Owner cannot meet the required operational capability for its unit. The TOP-003 and IRO-010 standards require the Transmission Operator, Balancing Authority, and Reliability Coordinator to maintain data specifications for their real-time and operational planning analyses that include provisions for notification of BES generating unit(s) status during local forecasted cold weather to include operating limitations based on capability and availability, among other factors. These

months of completing development of the Corrective Action Plan; and **7.1.3**. List the updates to the cold weather preparedness plan required under Requirement R4 to identify the updates or additions to the Generator Cold Weather Critical Components and their freeze protection measures; **7.2**. Implement the Corrective Action Plan in accordance with the specified timetables in Requirement R7 Part 7.1; **7.3**. Update the Corrective Action Plan action(s) and timetable(s), with justification, if corrective action(s) change or timetable(s) exceed the timelines in Requirement R7 Part 7.1; and **7.4**. Document in a declaration, with justification, any Generator Cold Weather Constraint that precludes the Generator Owner from implementing selected action(s) contained within the Corrective Action Plan.	**6.1.6.** A review of applicability to similar equipment freeze protection measures at generating units owned by the Generator Owner, with a specified timetable for corrective actions to be completed within 24 calendar months of the Generator Cold Weather Reliability Event; **6.2.** Update the Corrective Action Plan action(s) and timetable(s), with justification, and submit a Corrective Action Plan extension request to the Compliance Enforcement Authority (CEA) for approval where the timetable(s) for completing selected actions are projected to exceed the timelines in Part 6.1. The submitted Corrective Action Plan extension request shall include the following; **6.2.1.**Circumstances causing the delay and how those circumstances are beyond the control of the Generator Owner; **6.2.2.**Revisions to the selected actions in Part 6.1, if any, including utilization of Operating Procedures, if applicable; and **6.2.3.**Updated timetable for implementing the selected actions in Part 6.1. **6.3.** Document in a declaration, with justification, any Generator Cold Weather Constraint in accordance with Requirement R8, if applicable, that precludes the Generator Owner from implementing selected action(s) contained within the Corrective Action Plan.	standards require the Generator Owner to provide the requested data. After considering these standards, the drafting team determined that no additional requirement would be needed to ensure the "generator owner informs relevant registered entities of operating limitations in extreme cold weather" specifically during the period of Corrective Action Plan extension. To the extent a Transmission Operator, Balancing Authority, or Reliability Coordinator would find the additional detail useful, it may request this information as part of its data specifications, and the Generator Owner would be required to provide it.

Paragraph 72: Address the Finding that Generators that are First Commercially Operational on or after October 1, 2027, Should Have Freeze Protection Measures Either Designed into Their Generating Systems, or, if a Corrective Action Plan is Needed, then It Should be Completed by the Time that Such Generating Units Go into Commercial Operation.

Directive

"We thus find that generators that are commercially operational after October 1, 2027, should have freeze protection measures either designed into their generating systems, or, if a corrective action plan is needed, then it should be completed by the time that such generating units go into commercial operation. Accordingly, we direct NERC, pursuant to section 215(d)(5) of the FPA, to develop and submit modifications to Requirement R7 of proposed Reliability Standard EOP-012-2 to clarify that any Requirement R2 corrective action plans must be completed prior to the generating unit's commercial operation date."

Consideration of Directive

Consideration of Directive in EOP-012-3		
Approved Definition/Standard	**Revisions in Definition/Standard or Other Action**	**Description and Change Justification**
R2. Applicable to generating units with a commercial operation date on or after October 1, 2027: Each Generator Owner, for each generating unit that has a calculated Extreme Cold Weather Temperature at or below 32 degrees Fahrenheit (zero degrees Celsius) as determined in Requirement R1, and that self-commits or is required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), shall: • Implement freeze protection measures to protect Generator Cold Weather Critical Components that provide the capability to operate at the unit(s)' Extreme Cold Weather Temperature with sustained concurrent twenty (20) mph wind speed for (i) a period of not less than twelve (12) continuous hours, or (ii) the maximum	**R2.** Applicable to generating units which begin commercial operation on or after October 1, 2027: Each Generator Owner, for each generating unit that has a calculated Extreme Cold Weather Temperature at or below 32 degrees Fahrenheit (zero degrees Celsius) as determined in Requirement R1, and that self-commits or is required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), shall: **2.1** For generating units for which the Generator Owner first contractually committed to design criteria relevant to this Requirement before February 16, 2023:	To address this directive, the drafting team revised Requirement R2 which pertains to units going into commercial operation after October 1, 2027 to separate requirements for units that are truly "new" and should have more robust capabilities designed in without need for corrective actions, and units that may have already been significantly far along in the design phase and for whom full compliance at the time of entering commercial operation (which may be after the in-service date) would represent a significant hardship. In considering this directive, the drafting team considered that the 2021-07 drafting team recommended this requirement apply to

Consideration of Directive in EOP-012-3		
Approved Definition/Standard	**Revisions in Definition/Standard or Other Action**	**Description and Change Justification**
operational duration for intermittent energy resources if less than twelve (12) continuous hours; or • Develop a Corrective Action Plan(s) to add new or modify existing or previously planned freeze protection measures to provide the capability to operate at the unit(s)' Extreme Cold Weather Temperature with a sustained concurrent twenty (20) mph wind speed for (i) a period of not less than twelve (12) continuous hours, or (ii) the maximum operational duration for intermittent energy resources if less than twelve (12) continuous hours.	• Implement freeze protection measures to protect Generator Cold Weather Critical Components that provide the capability to operate at the unit(s)' Extreme Cold Weather Temperature with sustained concurrent twenty (20) mph wind speed for (i) a period of not less than twelve (12) continuous hours, or (ii) the maximum operational duration for intermittent energy resources if less than twelve (12) continuous hours; or • Have a Corrective Action Plan(s) in place (to include any applicable Generator Cold Weather Constraint(s) upon beginning commercial operation, to add new or modify existing or previously planned freeze protection measures to provide the capability to operate at the unit(s)' Extreme Cold Weather Temperature with a sustained concurrent twenty (20) mph wind speed for (i) a period of not less than twelve (12) continuous hours, or (ii) the maximum operational duration for intermittent energy resources if less than twelve (12) continuous hours. **2.2** For generating units for which the Generator Owner first contractually committed to design criteria relevant to this Requirement on or after February 16, 2023:	generation going into service three (3) years after the effective date of EOP-012-1 (i.e., based on October 1, 2024 that date is October 1, 2027). The 2021-07 drafting team believed, and the Project 2024-03 agrees, that there needs to be allowances made for units that are far along in the development process. While not changing the October 1, 2027 date, the drafting team has proposed a means to accommodate these units while overall raising the bar for reliability. For units that were designed prior to February 2023, which is when the definition of ECWT was approved in EOP-012-1, entities may implement a Corrective Action Plan to meet the more stringent capability requirements applicable to new generation in Requirement R2. Prior to this time, entities would not have been on notice of their future obligations, and thus may not have accounted for it in their designs. A Corrective Action Plan would allow them to enter commercial operation and meet the more stringent requirements in accordance with the implementation timeframes in Requirement R7. For units that are or were designed after that point, entities must either meet the requirements or, if meeting the requirements is not possible, declare a Generator Cold Weather Constraint in accordance with Requirement R8.

Consideration of Directive in EOP-012-3		
Approved Definition/Standard	**Revisions in Definition/Standard or Other Action**	**Description and Change Justification**
	• Implement freeze protection measures to protect Generator Cold Weather Critical Components that provide the capability to operate at the unit(s)' Extreme Cold Weather Temperature with sustained concurrent twenty (20) mph wind speed for (i) a period of not less than twelve (12) continuous hours, or (ii) the maximum operational duration for intermittent energy resources if less than twelve (12) continuous hours; or • Document in a declaration, with justification, as applicable, a Generator Cold Weather Constraint in accordance with Requirement R8.	

Paragraph 76: To Address Concerns that EOP-012-2 Requirement R7 has Ambiguities in the Implementation Plan Timelines that Apply to Certain Generator Owners

Directive

"We believe that proposed Reliability Standard EOP-012-2, Requirement R7's corrective action plan implementation deadlines have remaining ambiguities that need to be addressed. As noted above, the Commission has previously expressed similar concerns regarding the vagueness and enforceability of Reliability Standards language. Specifically, we agree with the concerns raised by the ISO/RTO Council that Requirement R7 of proposed Reliability Standard EOP-012-2 does not provide clear direction as to the required corrective action plan implementation timeline that applies to certain generator owners. For example, it is unclear how the corrective action plan implementation timeline would apply if a generator owner had combinations of both existing and new equipment for freeze protection measures. Accordingly, we direct NERC, pursuant to section 215(d)(5) of the FPA, to develop and submit modifications to Requirement R7 of proposed Reliability Standard EOP-012-2 to address these ambiguities by expanding on Requirement R7.1.1 and 7.1.2 to make it clear which corrective action plan implementation deadline applies to which generator owner."

Consideration of Directive

Consideration of Directive in EOP-012-3		
Approved Definition/Standard	**Revisions in Definition/Standard or Other Action**	**Description and Change Justification**
R7. Each Generator Owner, for each Corrective Action Plan developed pursuant to Requirements R1, R2, R3, or R6, shall: **7.1**. Include a timetable for implementing the selected corrective action(s) that shall: **7.1.1**. List the action(s) which address(es) existing equipment or freeze protection measures, if any, to be completed within 24 calendar months of completing development of the Corrective Action Plan; **7.1.2**. List the action(s) which require(s) new equipment or freeze protection measures, if any, to be completed within 48 calendar	**R7.** Each Generator Owner, for each Corrective Action Plan developed pursuant to Requirements R1, R2, or R3 shall, as applicable: **7.1.** Include a timetable for implementing the selected corrective action(s) that shall: **7.1.1.** List the action(s) which remedy(ies) issues with existing freeze protection measures, if any, to be completed within 24 calendar months of completing development of the Corrective Action Plan, regardless of any longer timelines in the Corrective Action Plan associated with new freeze protection measures;	To address this directive, the drafting team added "regardless of any longer timelines in the Corrective Action Plan associated with new freeze protection measures" at the end of Requirement R7 Part 7.1.1.

Approved Definition/Standard	**Revisions in Definition/Standard or Other Action**	**Description and Change Justification**
months of completing development of the Corrective Action Plan; and **7.1.3**. List the updates to the cold weather preparedness plan required under Requirement R4 to identify the updates or additions to the Generator Cold Weather Critical Components and their freeze protection measures; ***	**7.1.2**. List the action(s) which require(s) new freeze protection measures, if any, to be completed within 48 calendar months of completing development of the Corrective Action Plan; and **7.1.3**. Describe the updates to the cold weather preparedness plan required under Requirement R4 to identify the updates or additions to the Generator Cold Weather Critical Components and their freeze protection measures. ***	

Paragraph 94: To address the concern that Generator Cold Weather Constraint Declarations Should be Reviewed More Frequently than Once Every Five Years to Ensure the Constraint Remains Valid

Directive

"We agree with the ISO/RTO Council that the proposed five-year review period for the declared Generator Cold Weather Constraints in Requirement R8.1 could delay the identification and adoption of new freeze protection measures and does not represent the current pace of technological advancements. We acknowledge that a more frequent review does impose some additional administrative burden to the generator owner to review the technological advancements that hindered its ability to winterize; nonetheless, a lengthy period between a Generator Cold Weather Constraint declaration review by the generator owner offers little incentive to timely adopt new freeze protection technologies. Accordingly, we direct NERC, pursuant to section 215(d)(5) of the FPA, to develop and submit modifications to Requirement R8, Part 8.1 of proposed Reliability Standard EOP 012-2 to implement more frequent reviews of Generator Cold Weather Constraint declarations to verify that the declaration remains valid. NERC may propose to develop modifications that address the Commission's concerns in an equally efficient and effective manner, however, NERC must explain how its proposal addresses the Commission's concerns."

Consideration of Directive

Consideration of Directive in EOP-012-3		
Approved Definition/Standard	**Revisions in Definition/Standard or Other Action**	**Description and Change Justification**
R8. Each Generator Owner that creates a Generator Cold Weather Constraint declaration shall: **8.1**. Review the Generator Cold Weather Constraint declaration at least every five calendar years or as needed when a change of status to the Generator Cold Weather Constraint occurs; and **8.2**. Update the operating limitations associated with capability and availability under Requirement R1 Part R1.2 if applicable.	**R8.**Each Generator Owner that declares a Generator Cold Weather Constraint in accordance with Attachment 1 shall: **8.1.**Submit its Generator Cold Weather Constraint declaration(s) to the CEA within 45 days of determining that the Generator Cold Weather Constraint is applicable. For Generator Cold Weather Constraints determined in accordance with Requirement R2 for generating unit(s) upon beginning commercial operation, submit the Generator Cold Weather Constraint declaration(s) no later than 15 days after commercial operation;	To address this directive, the drafting team revised Requirement R8 to require review of all validated Generator Cold Weather Constraints at least once every 24 calendar months to ensure the constraint remains valid. Language regarding reviews "as needed when a change of status" occurs was removed due to the more frequent periodicity.

Consideration of Directive in EOP-012-3		
Approved Definition/Standard	**Revisions in Definition/Standard or Other Action**	**Description and Change Justification**
	8.2. Review any Generator Cold Weather Constraint declaration validated by the CEA every 24 calendar months to determine if it remains valid under Attachment 1; *** **Attachment 1** (criteria for determining the applicability of a Generator Cold Weather Constraint) (*see draft standard*)	

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

EOP-012-3

Generator Cold Weather CAP Extension and Constraint Process

Background

This Electric Reliability Organization (ERO) Generator Cold Weather Corrective Action Plan (CAP) Extension and Constraint Process document addresses how ERO Enterprise staff will review generator cold weather CAP extensions and Constraints developed under Reliability Standard EOP-012-3 Requirements R6, R7, R8 and Attachment 1 to ensure a timely, structured, and consistent approach to CAP extension and Constraint submittals and processing.

NERC Compliance Assurance & Certification will maintain this document under existing ERO Enterprise processes. This document will be reviewed and updated by NERC Compliance Assurance & Certification, as needed.

CAP Extension Request Review Process

Process Overview

If a registered entity (entity) has determined that a Corrective Action Plan (CAP) developed in accordance With EOP-012-3 Requirements R6 or R7 cannot meet the timetable provided per R6 Part 6.1 or R7 Part 7.1, then the entity will submit an extension request to the ERO Enterprise for approval no less than 60 days prior to the original required CAP completion date.

The steps outlined here should be followed to ensure a timely, structured, and consistent approach to extension request submittals and processing.

The entity will work with the Regional Entity designated as its Compliance Enforcement Authority (CEA) as outlined in this process. The entity submitting the extension request will be referred to as the 'submitting entity' and may represent only itself or multiple registered entities who have developed a joint extension request. The submitting entity is responsible for ensuring all registered entities who are jointly submitting the extension request are listed in the requested information below and for distributing any communications from its CEA to the other entities that are part of the joint extension request. If a joint extension request is submitted for multiple registered entities who have different Regional Entities designated as the CEA, the submitting entity's CEA will perform the steps outlined in this process and will be responsible for coordinating with the Regional Entity(ies) that are the designated CEA for the additional entities party to the joint extension request.

For entities in Coordinated Oversight, the CEA for this process is the Lead Regional Entity (LRE). The LRE will coordinate with the Affected Regional Entity(ies) (ARE) and the AREs may participate in the joint review as well.

Step 1 – Registered Entity Submittal

If an entity determines that it cannot meet the required timetable for completing a CAP, the submitting entity will contact their CEA to coordinate submittal of an extension request. The submitting entity will submit the requisite data to their CEA through Align and the Secure Evidence Locker (SEL) as needed or other process tools as determined by the CEA.

Entities are encouraged to submit the extension request as soon as they are aware they will not meet the CAP completion date but no later than 60 days before the original required completion date. It is the submitting entity's responsibility to ensure that all information detailed in EOP-012-3 Part 6.2 or Part 7.3 and requested in Align is provided in the entity's extension request to facilitate the review.

Step 2 – ERO Enterprise Review

The CEA will acknowledge receipt of the submission in writing (either through ALIGN or email) within 15 days and verify that all information detailed in EOP-012-3 Part 6.2 or Part 7.3 as required is provided in the submitting entity's extension request submittal. The CEA will work with the submitting entity to provide any missing information. The CEA will notify NERC of the extension request submittal and provide all associated information when acknowledging receipt of the submission.

The CEA will then perform a joint review of (1) the circumstances beyond the control of the entity preventing implementation of the CAP within the identified timetable; (2) the revisions to the selected actions in the CAP; and (3) the updated timetable for implementing the selected actions[1]. Any additional information requested to support the extension request review will be coordinated with the submitting entity by the CEA. The CEA will complete the review within 45 days of acknowledgement or provide notification to the submitting entity that they are extending the time needed for review.

Examples of circumstances beyond the control of the responsible entity include, but are not limited to:

- Delays resulting from regulatory/legal processes, such as permitting.
- Delays resulting from stakeholder processes required by tariff.
- Delays resulting from equipment lead times; or
- Delays resulting from unit outages being denied.

Due diligence in ordering equipment, obtaining permits, scheduling outages, etc., will be considered as part of the determination of whether a particular set of facts constitute circumstances beyond the control of the entity.

Step 3 – Registered Entity Notification

The CEA will communicate the approval or denial of the extension request or continuation of the time needed to review the extension request in writing to the submitting entity including the rationale for the determination. For any continuation of the review, the CEA will also provide the submitting entity with a

[1] NERC may choose to participate in any review at its own discretion or at the request of the CEA.

revised timeline for when the determination will be provided. If an extension request is denied, the selected actions in the Corrective Action Plan need to be completed in accordance with the original timetables.

Step 4 – Reporting to NERC

Quarterly, the CEA will send NERC a report that, at a minimum, includes each extension request, whether the request was approved or denied, and the CEA's rationale for its decision.

Constraint Review Process

Process Overview

If a registered entity (entity) has determined that a Generator Cold Weather Constraint, developed in accordance with Standard EOP-012-3 Attachment 1, is required this process shall be followed to ensure a timely, structured, and consistent approach.

The entity will work with the Regional Entity designated as its CEA to submit the Generator Cold Weather Constraint, with supporting documentation, to the ERO Enterprise for review, evaluation, approval (as needed), and validation as outlined in this process. The entity submitting the Generator Cold Weather Constraint(s) will be referred to as the 'submitting entity' and may represent itself or multiple registered entities under the same ownership with the same Generator Cold Weather Constraint. The submitting entity is responsible for ensuring all registered entities included are listed in the requested information and is for distributing any communications from its CEA to the other entities that are part of the Generator Cold Weather Constraint. If a Generator Cold Weather Constraint is submitted for multiple registered entities under the same ownership who have different Regional Entities designated as the CEA, the submitting entity's CEA will perform the steps outlined in this process and will be responsible for coordinating with the Regional Entity(ies) that are the designated CEA for the additional entities party to the Generator Cold Weather Constraint.

For entities in Coordinated Oversight, the CEA for this process is the Lead Regional Entity (LRE). The LRE will coordinate with the Affected Regional Entity(ies) (ARE) and the AREs may participate in the joint review as well.

Step 1 – Registered Entity Submittal

If an entity determines that it meets the required Generator Cold Weather Constraint language within Attachment 1, the submitting entity will contact their CEA to coordinate submittal of the Generator Cold Weather Constraint. The submitting entity will submit the requisite data to their CEA through Align and the Secure Evidence Locker or other process tools as determined by the CEA.

Entities are encouraged to submit the Generator Cold Weather Constraint as soon as they are aware they will meet the Generator Cold Weather Constraint language within Attachment 1 but are required to meet

EOP-012-3 Requirement R8[2]. Early submittal is requested to allow the ERO Enterprise time to review, evaluate, and validate or approve the Generator Cold Weather Constraint.

It is the submitting entity's responsibility to ensure that all information detailed in EOP-012-3 R8 and Attachment 1 is provided in the entity's submittal to facilitate the ERO Enterprise review. The submitting entity should review language within Attachment 1 and identify, in the submittal, if the Generator Cold Weather Constraint is a pre-approved Generator Cold Weather Constraint or a Generator Cold Weather Constraint requiring further review for approval.

Step 2 – ERO Enterprise Review

The CEA will acknowledge receipt of the submission in writing (either through Align or email) within 15 business days and verify that all information detailed in EOP-012-3 R8 and Attachment 1 is provided in the submitting entity's submittal. The CEA will work with the submitting entity to provide any missing information. The CEA will notify NERC of the Generator Cold Weather Constraint submittal (either through Align or via email) when acknowledging receipt of the submission.

The CEA will review the Generator Cold Weather Constraint submittal and supporting information[3]. Any additional information requested to support the Generator Cold Weather Constraint review, evaluation, and validation or approval will be coordinated with the submitting entity by the CEA. The CEA will complete the review within 10 business days of submittal receipt confirmation for pre-approved Generator Cold Weather Constraint and 45 business days of submittal receipt confirmation for those Generator Cold Weather Constraint requiring further review for approval or provide notification to the submitting entity that they are extending the time needed to review[4].

The determination whether to approve the case-by-case Generator Cold Weather Constraint will be based on the specific facts and circumstances provided by the submitting entity that defends and supports the declared constraint under one of the five identified situations in EOP-012-3 Attachment 1.

Step 3 – Registered Entity Notification

The CEA will communicate the validation, approval, or denial of the Generator Cold Weather Constraint or continuation of the time needed to review the Generator Cold Weather Constraint in writing (via Align or email) to the submitting entity including the rationale for the determination. For any continuation of the review, the CEA will also provide the submitting entity with a revised timeline for when the determination will be provided. Denial of a Generator Cold Weather Constraint requires the entity to update its Corrective Action Plan(s) with corrective actions that will be completed within the timetables in Requirement R6 Part 6.1 or Requirement R7 Part 7.1 to begin from the date the Generator Owner is notified that the Generator

[2] Per EOP-012-3 R8.1, the Generator Owner must submit its Generator Cold Weather Constraint declaration(s) to the CEA within 45 days of determining that the Generator Cold Weather Constraint is applicable for in-service units. For Generator Cold Weather Constraints determined in accordance with Requirement R2 for generating unit(s) upon beginning commercial operation, the Generator Owner must submit the Generator Cold Weather Constraint declaration(s) no later than 15 days after commercial operation.

[3] NERC may choose to participate in any review at its own discretion or at the request of the CEA.

[4] If a large number of entities submit Generator Cold Weather Constraints at the same time (especially those tied to initial performance expectations as set in the EOP-012-3 Implementation Plan), the ERO Enterprise anticipates additional time will be needed to accommodate these initial reviews.

Cold Weather Constraint is invalid. Communication efforts between the submitting entity and the CEA related to updates of the Corrective Action Plan and timetables resulting from a denial of a Generator Cold Weather Constraint are strongly encouraged.

Step 4 – Reporting to NERC

Quarterly, the CEA will send NERC a report that, at a minimum, includes each Generator Cold Weather Constraint request received, whether the request was validated, approved, or denied, and the CEA's rationale for its decision.

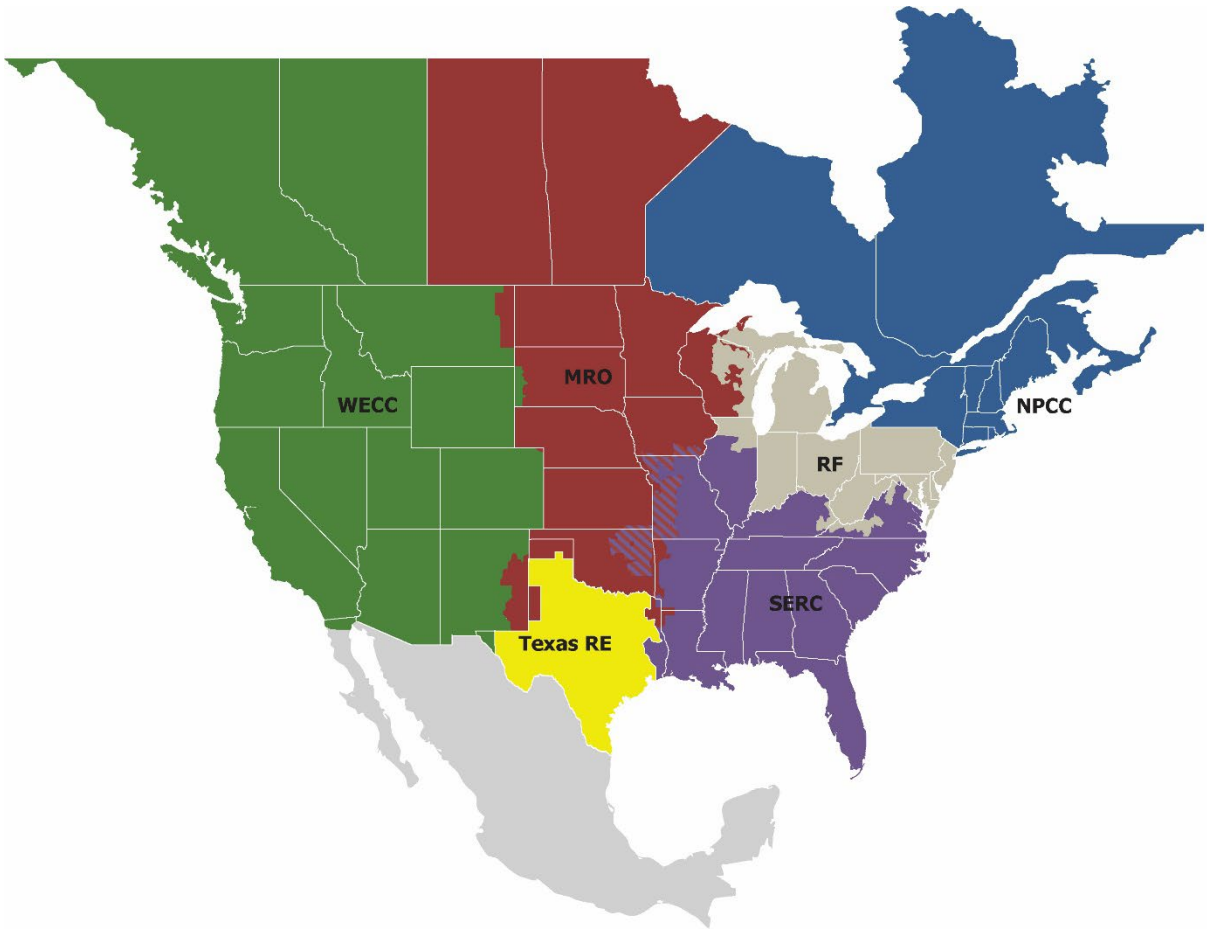
Table of Contents

Preface

Electricity is a key component of the fabric of modern society and the Electric Reliability Organization (ERO) Enterprise serves to strengthen that fabric. The vision for the ERO Enterprise, which is comprised of NERC and the six Regional Entities, is a highly reliable, resilient, and secure North American bulk power system (BPS). Our mission is to assure the effective and efficient reduction of risks to the reliability and security of the grid.

Reliability | Resilience | Security
Because nearly 400 million citizens in North America are counting on us

The North American BPS is made up of six Regional Entity boundaries as shown in the map and corresponding table below. The multicolored area denotes overlap as some load-serving entities participate in one Regional Entity while associated Transmission Owners/Operators participate in another.



MRO	Midwest Reliability Organization
NPCC	Northeast Power Coordinating Council
RF	ReliabilityFirst
SERC	SERC Reliability Corporation
Texas RE	Texas Reliability Entity
WECC	WECC

Introduction

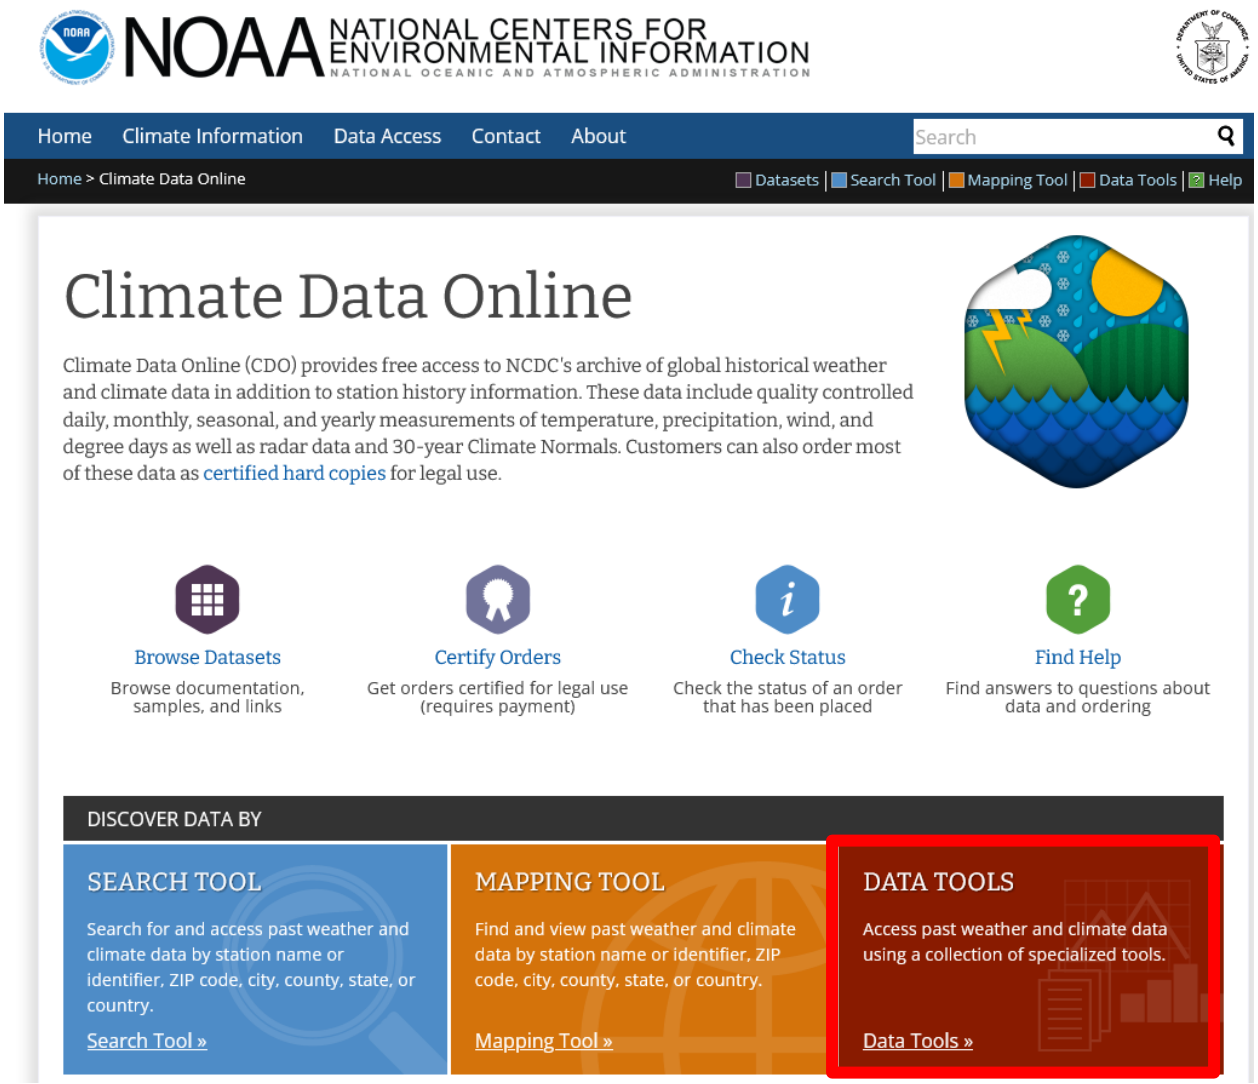
This document demonstrates two methods for acquiring data for a given location and a method of performing the statistical analysis of the data to determine the Extreme Cold Weather Temperature for a given location. These examples are focused on United States and will use data obtained from NOAA's Climate Data Online database and Automated Surface Observing Systems (ASOS). Performance of the statistical analysis with Microsoft Excel is demonstrated as well. The method shown in this document only shows the collection of data and two methods of analyzing this data, both using Microsoft Excel. Note that other data sources may be available for use. Although not addressed here, offshore installations may be able to use National Data Buoy Center (noaa.gov) but data is limited. It is understood that a complete single source data set may not always be available due to a variety of reasons. There may be ways to gather a more complete data set than described below. Document your approach when identifying and addressing suspect data.

Determination of Location's Extreme Cold Weather Temperature

Gathering the Data From NOAA

Navigate to https://www.ncdc.noaa.gov/cdo-web/

1. Select **Data Tools.**



2. Scroll down if necessary and select **Local Climatological Data (LCD).**

Find a Station

Locate weather observing stations using a variety of parameters such as address, ZIP code, date, and data type with filters by observation type

Select a Location

Order data by weather observing stations or by geographic locations using a simplified drill-down interface with data from U.S. and other countries

Search Within a Single Dataset

The following search tools access data from within a specific dataset. Use these tools to view or order data from within each respectiv dataset. Data will be in a more standard format across stations or locations.

Climate Normals

View temperature and precipitation Climate Normals for over 9,800 stations across the United States and a selection of other territories

Daily Weather Records

Access summaries of recent global and U.S. daily weather records with options to view monthly, annual, all-time or selected records

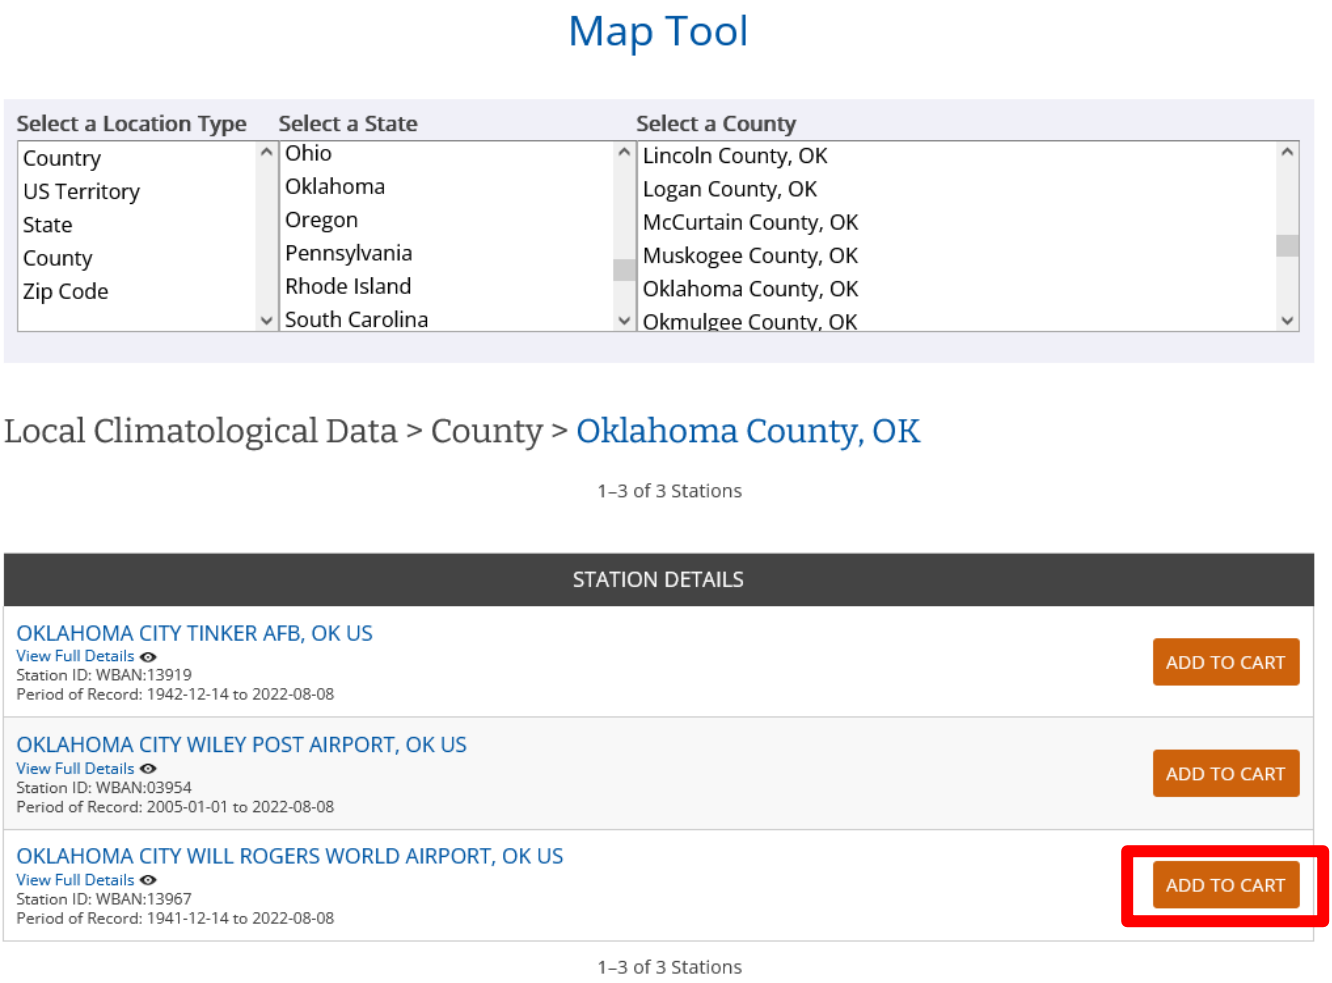
Local Climatological Data (LCD)

View and order hourly, daily, and monthly data from nearly 2400 locations within the U.S., surrounding territories, and other selected areas

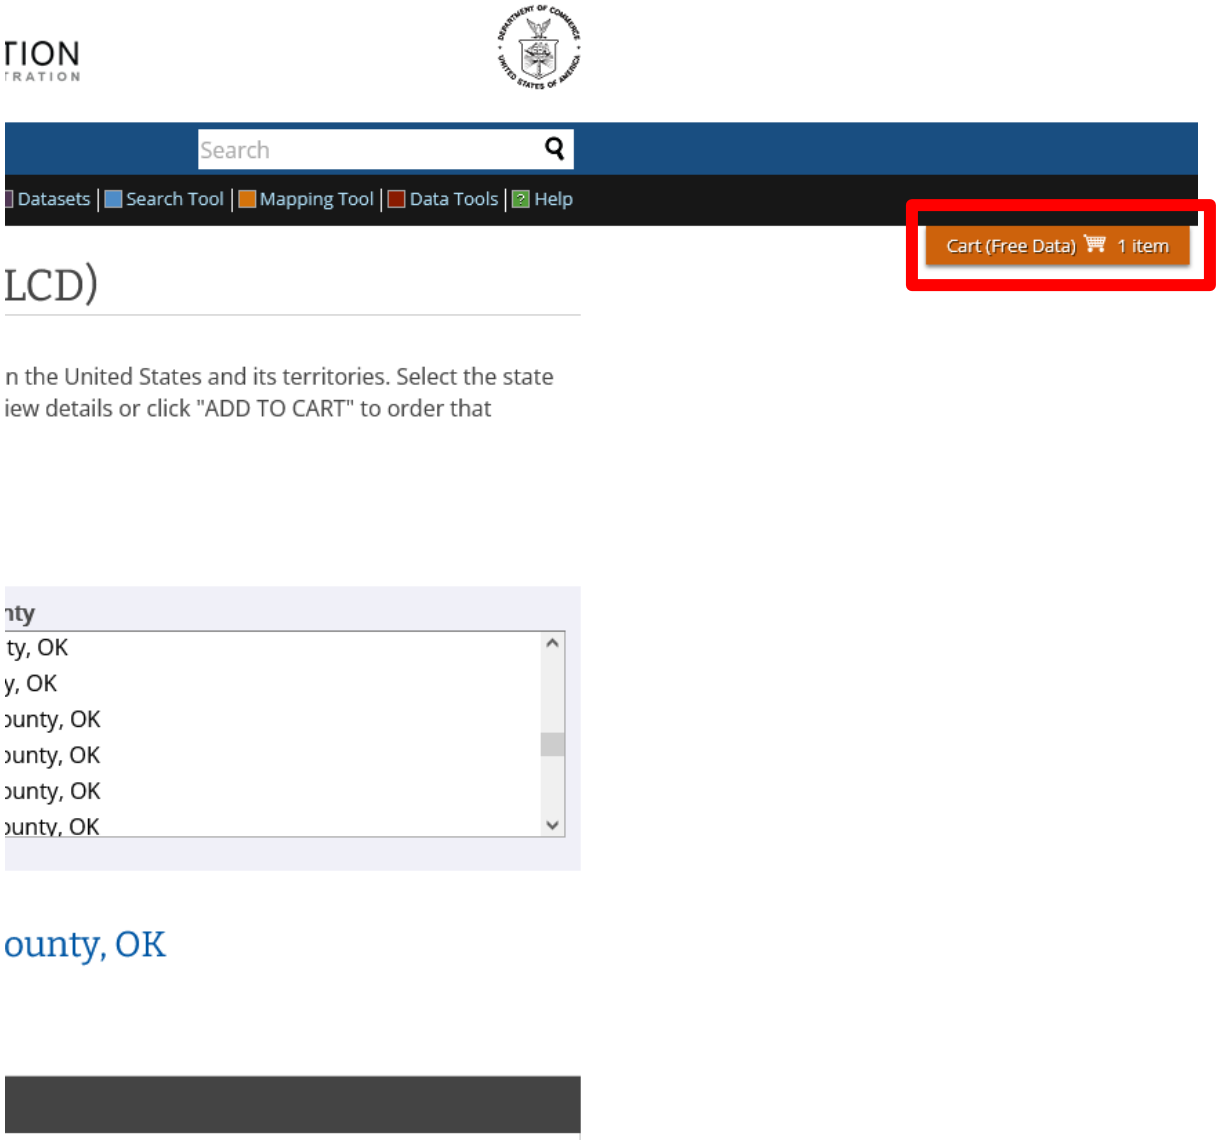
Marine Data

View and order historical marine data which is comprised of ship, buoy, and platform observations from 1662 to present.

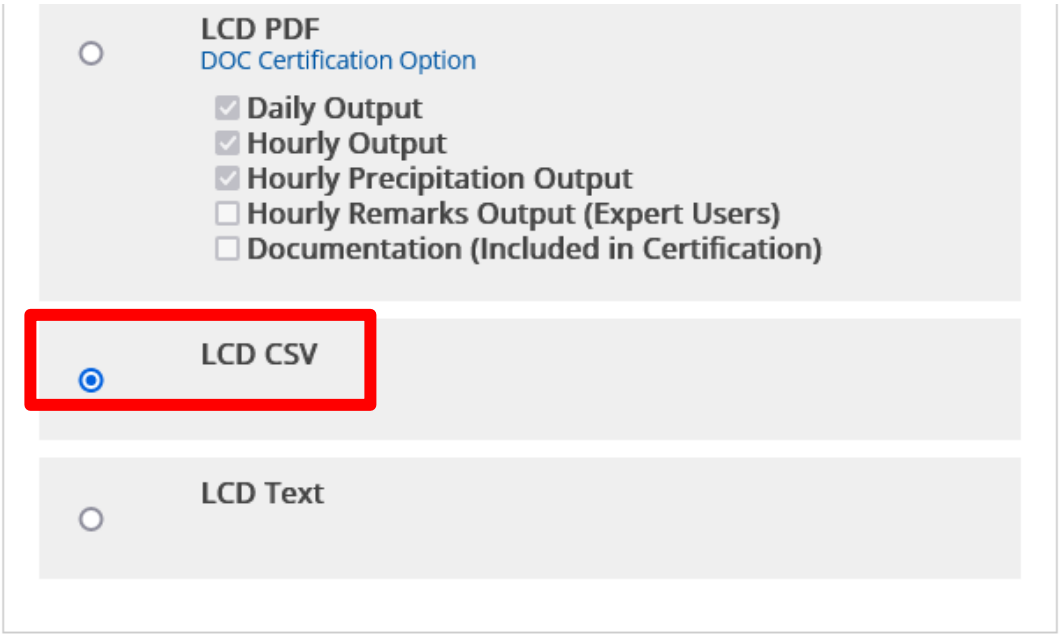
3. Use the selection tool to find a weather station appropriate for your location and click ADD TO CART.

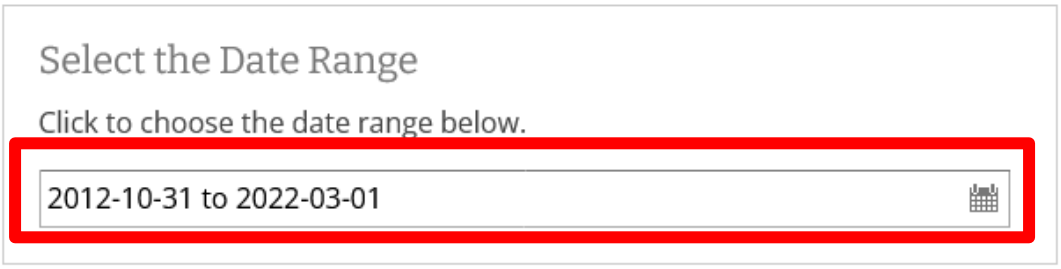


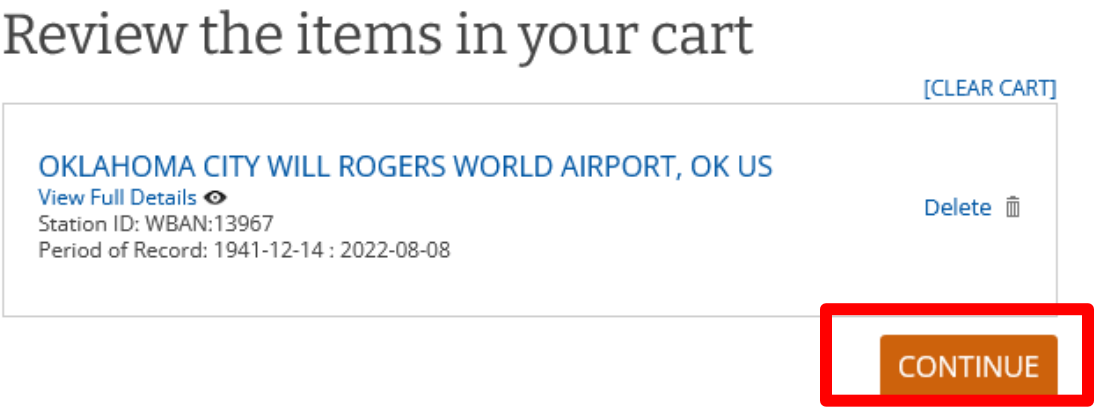
4. Click on the **cart icon** in the upper right-hand portion of the page.



5. Select LCD CSV, your desired date range, and then click continue. (Note: date ranges must be less than 10 years, so this process might have to be repeated several times and multiple files combined into one in order to get all data necessary to perform the analysis to determine the Extreme Cold Weather Temperature)







6. Enter and verify your email address and click **Submit Order.** You will receive an email when your request has been processed and is ready to download.

REQUESTED DATA REVIEW	
Dataset	Local Climatological Data
Order Start Date	2012-10-31 00:00
Order End Date	2022-03-01 23:59
Output Format	LCD CSV
Stations/Locations	OKLAHOMA CITY WILL ROGERS WORLD AIRPORT, OK US (Station ID: WBAN:13967)

Enter email address

Please enter your email address. This is the address to which your data links and information regarding this order will be sent. Please read NOAA's Privacy Policy if you have any concerns.

Email Address

email@address.com

Verify Email Address

email@address.com

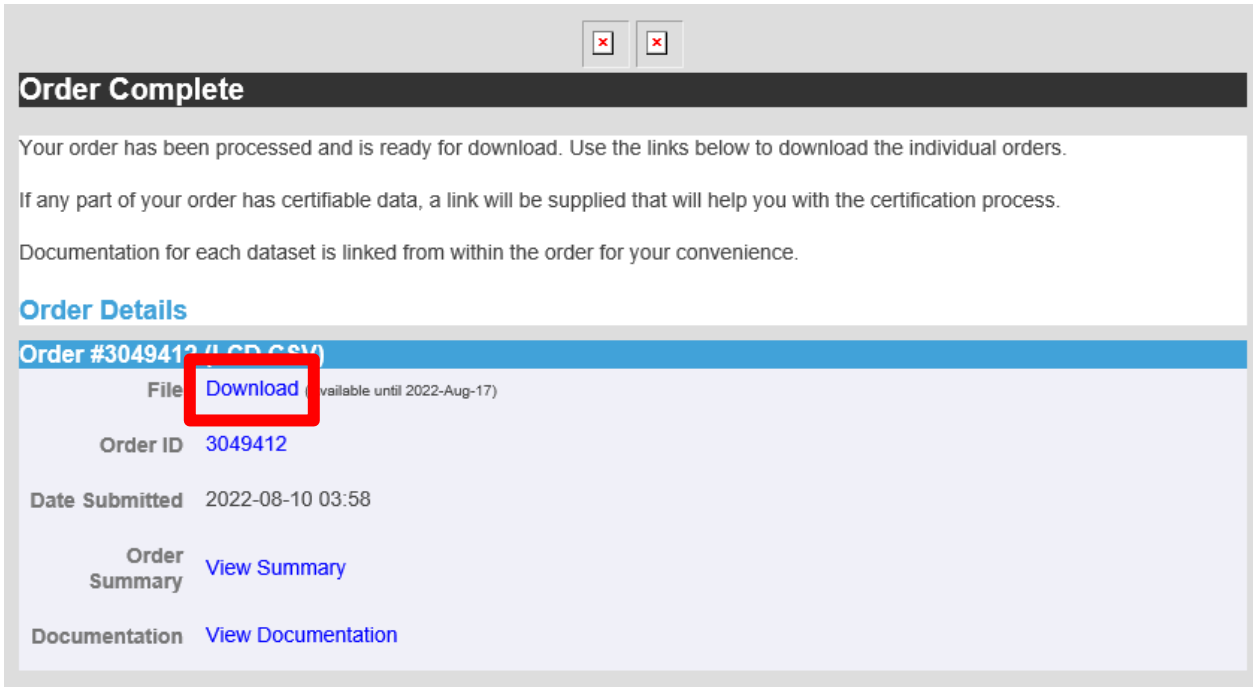
Remember my email address

[Uncheck to forget]

NOAA will not share your email address with anyone. The email address will not be used for any purpose other than communicating the order status.

EDIT ORDER SUBMIT ORDER

7. Click **Download** in the email that you will receive from NOAA to download your dataset.



Analyzing the Data

Option 1

1. Open the .csv file that was downloaded using the previous steps (and combine with other .csv files as necessary to cover the required date range).

2. Add filters to the first row and filter on "Report Type", column C, to only show report type FM-15, this is the standard METAR data.

72353013967	2012-11-01T05:52:00	FM-15	7									

3. Select the Date column, column B, by clicking on the column, scroll over to the Hourly Dry Bulb Temperature column, column AS, and holding down the CTRL key, select that column. Copy and paste both columns into a new sheet named "Clean and Filter".

DATE	HourlyDryBulbTemperature		
2012-10-31T00:52:00	52		
2012-10-31T01:52:00	51

2012-10-31T18:52:00	62		
2012-10-31T19:52:00	59		
2012-10-31T20:52:00	54		
2012-10-31T21:52:00	51		
2012-10-31T22:52:00	52		
2012-10-31T23:52:00	52		
2012-11-01T00:52:00	53		

4. Using the data on the "Clean and Filter" sheet, type **Month** in column C1, type the formula "=mid(A2,6,2)" in cell C2, and copy that formula in column C to the last row of the data set. Then Filter month to only show months 1, 2, 12 (January, February, and December).

5. You can then filter by Hourly Dry Bulb Temperature (Column B) to find and address bad data as appropriate. Bad data may consist of corrupt or missing values. It is beneficial to document information about the bad data to support the calculation of ECWT. If there are other sources that are similar to the source selected that has more complete data or the data can be used, consider that option and document accordingly. It is understood that complete single source data sets may not be the norm due to a variety of reasons- technology, maintenance on monitoring devices, failure to record, instrument failure, instrument testing, etc. You may not have the reason for the corrupt or missing data and documenting the raw data and its source is recommended. Now Select, Copy, and Paste the remaining data to a new sheet named ECWT

	A	B	C	D
1	DATE	HourlyDryBulbTemperatur	Month

775	2012-12-02T04:52:00	44	12	
776	2012-12-02T05:52:00	43	12	

6. Using Excel's built in Percentile function, the Extreme Cold Weather Temperature (ECWT) can now be determined. While on the ECWT sheet, in a blank cell use the function "=PERCENTILE.INC()" and select all temperature data in Column B (Hourly Dry Bulb Temperature) on the "ECWT" sheet and use 0.002 for the percentile value. The formula will look similar to this, "=PERCENTILE.INC(B:B,0.002)" (using 0.002 for the second argument in this function returns the two-tenths percentile temperature of the hourly temperatures measured in the dataset used).

   <u>This value should be representative of the Extreme Cold Weather Temperature based on the given dataset.</u>

E5 =PERCENTILE.INC(B:B,0.002)

	A	B	C	D	E	F	G

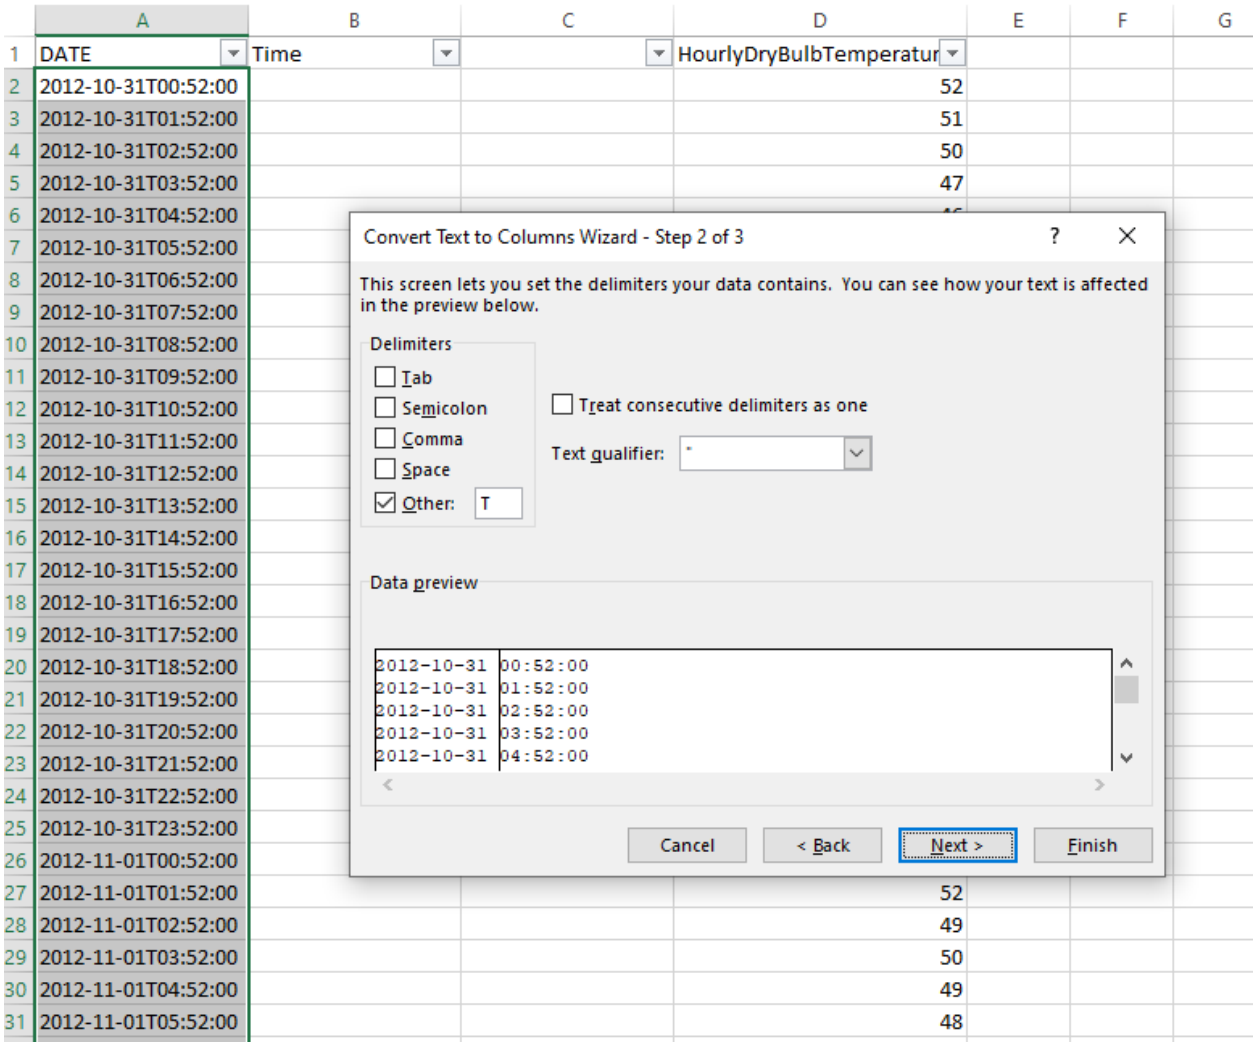
19	2012-12-01T17:52:00	67	12				

Option 2

These next few steps demonstrate how to view the distribution of temperatures from the data set and obtain the Extreme Cold Weather Temperature by a slightly different method.

1. On the "Clean and Filter" sheet, insert two new columns between column A and column B. Select column A and use Excel's *Text to Columns* feature and selected the delimited option and use the letter "T" to split the date data into a date component and a time component by hitting "Next" and "Finish". (Note: You can also do a "Find and Replace, finding the letter T and replacing it with a space to change the information in the Date column to a numerical value that can then be used for calculations.)

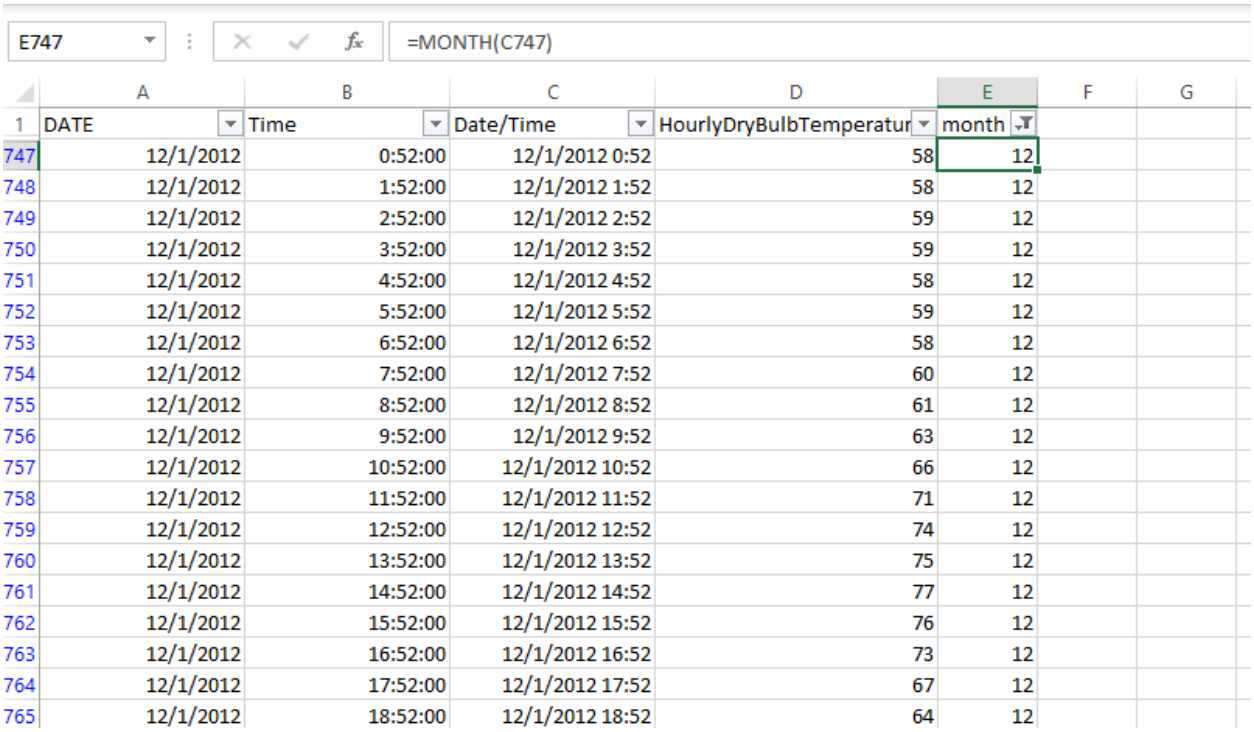


2. Add in column C, add the date in column A to time in column B, and copy this formula for all rows of the data set.

C2 =A2+B2

	A	B	C	D
1	DATE	Time	Date/Time	HourlyDryBulbTemperatur
2	10/31/2012	0:52:00	10/31/2012 0:52	52
3	10/31/2012	1:52:00	10/31/2012 1:52	51
4	10/31/2012	2:52:00	10/31/2012 2:52	50
5	10/31/2012	3:52:00	10/31/2012 3:52	47
6	10/31/2012	4:52:00	10/31/2012 4:52	46
7	10/31/2012	5:52:00	10/31/2012 5:52	46
8	10/31/2012	6:52:00	10/31/2012 6:52	44
9	10/31/2012	7:52:00	10/31/2012 7:52	48
10	10/31/2012	8:52:00	10/31/2012 8:52	52
11	10/31/2012	9:52:00	10/31/2012 9:52	57
12	10/31/2012	10:52:00	10/31/2012 10:52	61
13	10/31/2012	11:52:00	10/31/2012 11:52	65
14	10/31/2012	12:52:00	10/31/2012 12:52	67
15	10/31/2012	13:52:00	10/31/2012 13:52	68
16	10/31/2012	14:52:00	10/31/2012 14:52	71
17	10/31/2012	15:52:00	10/31/2012 15:52	71
18	10/31/2012	16:52:00	10/31/2012 16:52	70
19	10/31/2012	17:52:00	10/31/2012 17:52	66
20	10/31/2012	18:52:00	10/31/2012 18:52	62
21	10/31/2012	19:52:00	10/31/2012 19:52	59
22	10/31/2012	20:52:00	10/31/2012 20:52	54
23	10/31/2012	21:52:00	10/31/2012 21:52	51

3. Type Month in cell E1, and in cell E2 use the formula "=month(C2)". Copy the formula for all rows of the data set, then filter based on month, only selecting 1,2,12 for the desired months. Then copy remaining data from column C and column D to a sheet named Histogram.



E747 =MONTH(C747)

	A	B	C	D	E	F	G
1	DATE	Time	Date/Time	HourlyDryBulbTemperatur	month		
747	12/1/2012	0:52:00	12/1/2012 0:52	58	12		
748	12/1/2012	1:52:00	12/1/2012 1:52	58	12		
749	12/1/2012	2:52:00	12/1/2012 2:52	59	12

757	12/1/2012	10:52:00	12/1/2012 10:52	66	12		
758	12/1/2012	11:52:00	12/1/2012 11:52	71	12		
759	12/1/2012	12:52:00	12/1/2012 12:52	74	12		
760	12/1/2012	13:52:00	12/1/2012 13:52	75	12		
761	12/1/2012	14:52:00	12/1/2012 14:52	77	12		
762	12/1/2012	15:52:00	12/1/2012 15:52	76	12		
763	12/1/2012	16:52:00	12/1/2012 16:52	73	12		
764	12/1/2012	17:52:00	12/1/2012 17:52	67	12		
765	12/1/2012	18:52:00	12/1/2012 18:52	64	12		

4. On the Histogram sheet, enter "=min(B:B)" in cell C1, and "=max(B:B)" in cell C2. This will give you the minimum and maximum temperatures in the dataset. We will use the temperatures to set range for this histogram. In Column D start with a value, a few degrees below the min, then list every degree to a few degrees above the max.

Date/Time	HourlyDryBulbTemperature	-11	-15	
12/1/2012 0:52	58	88	-14	
12/1/2012 1:52	58		-13

6. The output from this will provide a listing of percentile rankings for the listed temperatures, as well as a graph output of the distribution of temperatures contained in this dataset. The "Bin" column shows the temperature, "Frequency" shows how many times that temperature occurred within the dataset, and "Cumulative %" shows the percentile ranking for each temperature. Choose the temperature at or closest to the 0.2 percentile level.

Bin	*Frequency*	*umulative %*
-15	0	0.00%
-14	0	0.00%
-13	0	0.00%

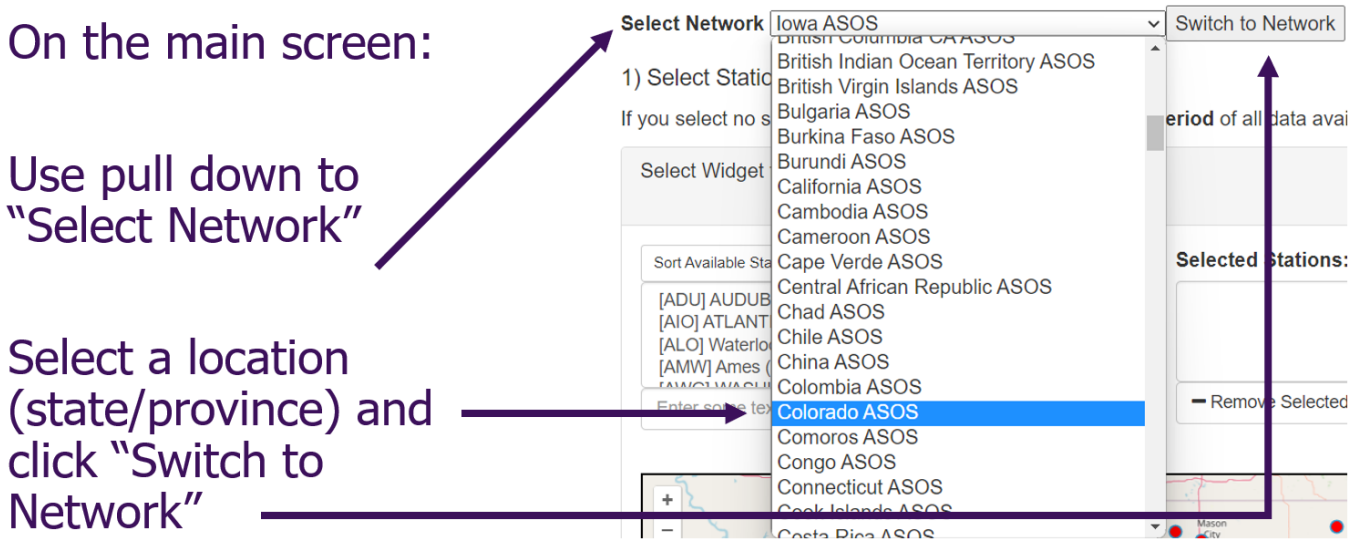
Gathering Data From ASOS

The Automated Surface Observing System (ASOS) program is a joint effort between the National Weather Service (NWS), the Federal Aviation Administration (FAA), and the Department of Defense (DOD). The primary function of ASOS stations is to take minute-by-minute observations and generate weather reports for use. The National Center for Environmental Information (NCEI) provides an archive of one-minute internal observations for many US ASOS sites back to the year 2000. Data is not available for all sites back to the year 2000.

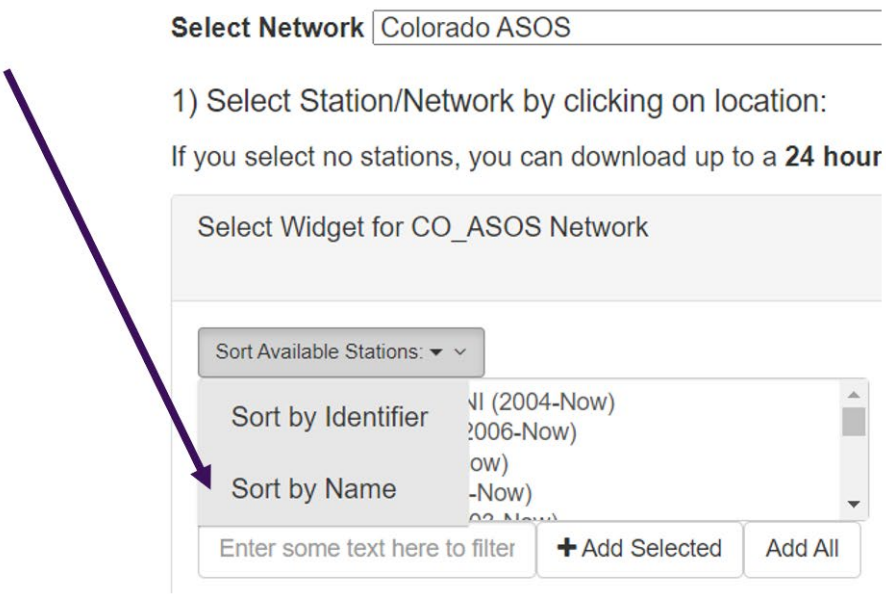
Each ASOS station is designed to provide observations every minute of every hour of every day. In general, ASOS stations are located at airports so may limit some use for ECWT calculations depending upon the Generator Owner selection process. Sensors measure wind speed and direction, dew point, air temperature, and station pressure. The vast majority also measure precipitation type and amount, visibility, and cloud height and thickness. Data is available for Canadian airports. More information is available at IEM :: ASOS/AWOS Network (iastate.edu) and https://mesonet.agron.iastate.edu/request/download.phtml where the example graphics were gathered. Additional information is available at ASOS (weather.gov).

1. Selecting Data
   ASOS uses "Network" to describe particular locations. From the main screen you would use the pulldown for "Select Network" and then select a particular location.



Sorting the data is available by an "identifier" (the airport code) or "name" (city or airport name normally) with "name" probably providing the easier way to identify the location needed to facilitate ECWT calculation efforts. This is needed to support the weather station selection. When downloading the information, the "identifier" will be included in the data set, so it is recommended that you ensure you are getting the correct location by both name and identifier.

Select "Sort by Identifier" or "Sort by Name" on the "Sort Available Stations" drop down.



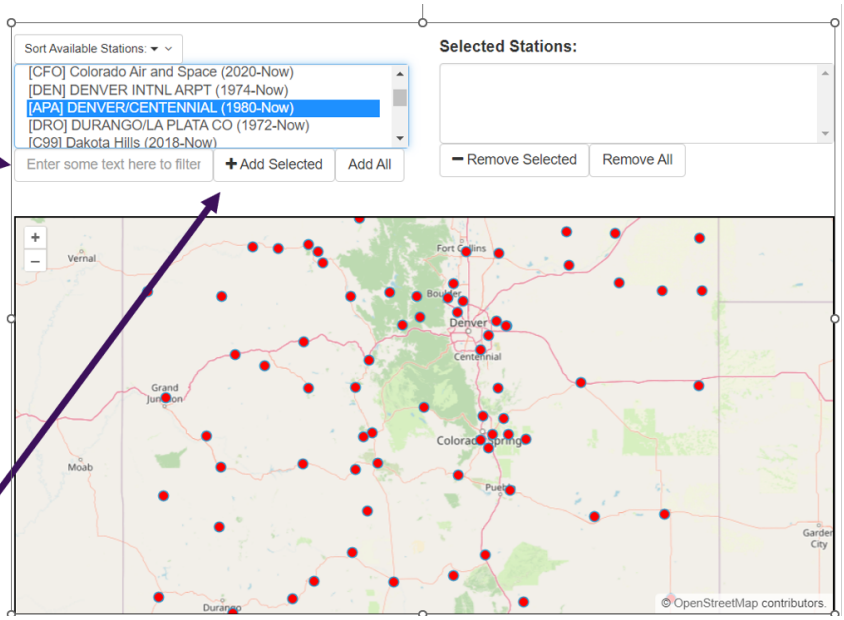
A map of available weather stations is provided along with options to select a particular weather station. Make sure you select "+ADD Selected" toggle button to capture the weather station.

Text search

Or can use the map to find a station name/ID

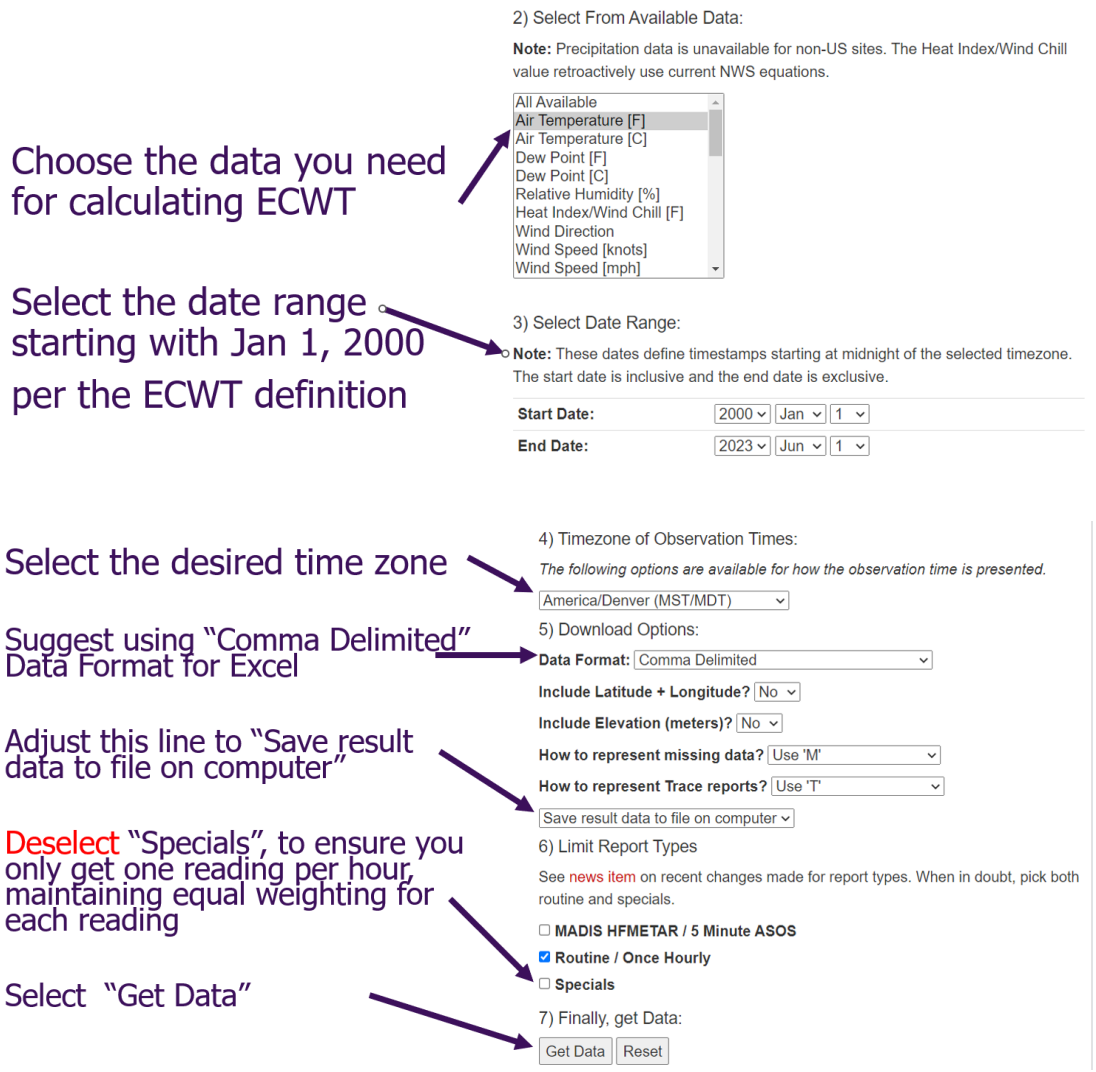
Or can just scroll and choose the station desired.

Select "+Add Selected"



At this point you can select data types, date ranges, time zones, data formats, download options, and report types. Note that some data types may not be available for the location. As discussed with the NOAA example, if hourly values for temperature are not available, document in your methodology or support documents how that is managed. It is important to note what may be missing/corrupt and how you approach that condition. As of yet, no criteria has been set to indicate how much can be missing (or present) to be considered an appropriate calculation of ECWT. Use professional judgement and present it in the best way possible if asked.

Make sure you understand the "Notes" ASOS provides when selecting data.



Note the "Deselection" verbiage as this could lead to possible erroneous ECWT calculations if left selected. By removing the Specials, the data set will have fewer duplicate readings in the data set.

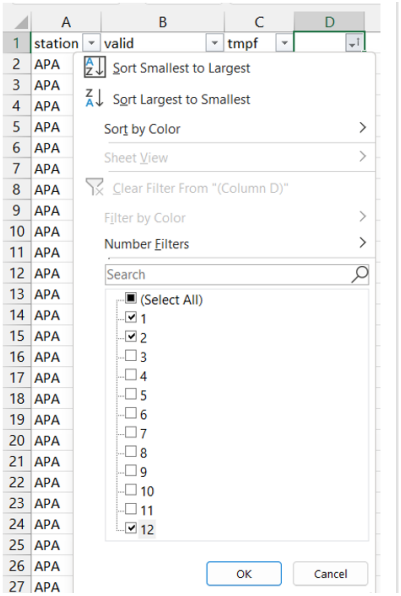
After selecting "Get Data" you should receive a download with the filtered data. It is important to retain this raw file. The file should conatin every hour for every month for the Date Range selected. This helps preserve the documentation to demonstrate the means by which you arrived at the ECWT you determine.
The ECWT definition only requires the months of December, January, and February to be selected. Once you have the comma delimited file, save it as an Excel worksheet. Then use the "MONTH" function to provie a simple numeric value (e.g., January = 1, February = 2, etc) and then filter on 1, 2, and 12 to get the three months required by the ECWT definition.

ECWT only uses the months of January, February and December.

Use the MONTH function to get a numeric value in an empty column and then copy that formula down through the end of the data set. Other filtering options can be used.

	A	B	C	D
1	station	valid	tmpf	
2	APA	1/1/2000 0:53	35.96	=month(B2)
3	APA	1/1/2000 1:53	33.08	
4	APA	1/1/2000 2:53	30.02	
5	APA	1/1/2000 3:53	30.92	
6	APA	1/1/2000 4:53	28.04	
7	APA	1/1/2000 5:53	28.04	
8	APA	1/1/2000 6:53	26.96	
9	APA	1/1/2000 7:53	26.96	
10	APA	1/1/2000 8:53	39.02	

Once a numeric value is produced you can simply use excel filters.



It is suggested that you highlight and copy the filtered data to another worksheet or file. Again, if moving the data to a separate spreadsheet be sure to maintain this original file for documentation.

When you paste the data into the new worksheet, you will have the the data from December, Janauary and February from all years needed to caculate ECWT. Add the Microsoft Excel function "PERCENTILE" to a new cell with the proper percentile value from the ECWT definition (i.e. "0.2 percentile" which for Excel is .002)). Make sure you capture your complete data set. (Example: =PERCENTILE(B:B,.002))

Compute the ECWT using the PERCENTILE function in Excel:

=PERCENTILE(range,0.002)

Ensure your range includes all the data points (e.g., B2:B51113 in the example)

	A	B	C	D	E
1	valid	tmpf	ECWT		
2	1/1/2000 0:53	35.96	-8		
3	1/1/2000 1:53	33.08			
4	1/1/2000 2:53	30.02			
5	1/1/2000 3:53	30.92			
6	1/1/2000 4:53	28.04			
7	1/1/2000 5:53	28.04			
8	1/1/2000 6:53	26.96			
9	1/1/2000 7:53	26.96			
10	1/1/2000 8:53	39.02			
11	1/1/2000 9:53	44.96			
12	1/1/2000 10:53	48.02			
13	1/1/2000 11:53	50			
14	1/1/2000 12:53	51.98			
15	1/1/2000 13:53	48.02			
16	1/1/2000 14:53	46.04			
17	1/1/2000 15:53	42.98			
18	1/1/2000 16:53	39.02			
19	1/1/2000 17:53	35.96			

In the above example, the ECWT is -8 (cell C1) based on the data in column B. Essentially you have completed your ECWT at this point, but it is important to do a quality check or other validation effort. You want to make sure you have the most complete set of data that is as free of errors as possible to determine the ECWT.

To help ensure data quality assurance you should evaluate how many hours of data you might expect for the given year an ECWT is being calculated. Using the "COUNTA" Excel function and the data range will provide a value but a check on that value is encouraged. The basic premise is to calculate the number of "full" years by 90 (the number of days i.e., January and December have 31 and February has 28) by 24 (number of hours in a day) plus the number of past leap years (years with 29 days in February) by 24 (number of hours in a day) plus the number of days in January and February for the current year by 24 (number of hours in a day). Note: "Full" years is inclusive of 2000. It is not stated in the Standard but when recalculating the ECWT, you are encouraged to recalculate ***after*** February has passed and before December of the year in which you are recalculating to provide the most up to date information.

Effectively, if this example is used, the calculation for March 2024 would look like:

(24X90X24) + (6X24) + (60X24) = 53424 data points where "full" years is 24 for 2000-2023, leap years included in the calculation is 7 (2000, 20004, 2008, 2012, 2016, 2020 and 2024), and days in the current year is 59 (January is 31 and February is 28 with February 29 accounted for in the leap years). Other methods can be used of course but make sure you retain how you came up with the value.

If you noticed ASOS provides filters for missing data but may not capture missing hours. You can use Excel in a variety of ways to verify if the number of hours accounted for in the data range selected. To the point made earlier, all hours may not be available for an ECWT calculation due to a variety of issues. If a large number of hours are missing, consider using other weather stations within close proximity or the combination of NWS/NOAA and ASOS data (regardless of what your primary data source is) in an attempt to capture a fuller data set. The key is

documenting what is missing and what you did with your approach. To date there has not been an approach to determine the statistical significance "margin" for ECWT.

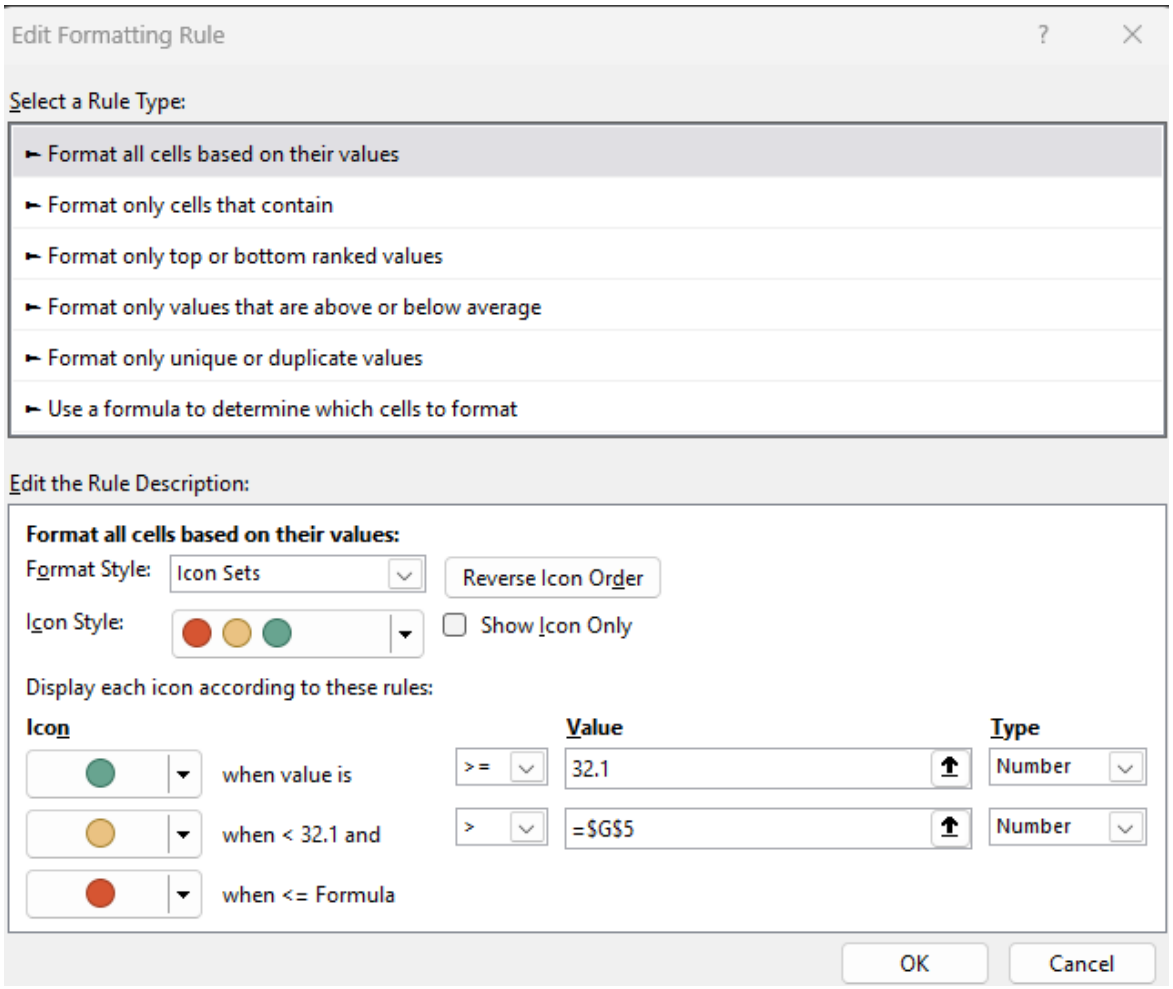
Excel also provides the ability to visualize when temperatures drop below ECWT, hover around ECWT, or exceed ECWT if more analysis is needed. This visualization, in conjunction with your efforts to find missing hours may provide insight for your approach to missing data. In any case, document what you have done.

valid	Month	tmpf	Time Check	ECWT	Data Points	Missing Data Points
1/1/2000 8:56	1	42.8		**6.000**	53247	177
1/1/2000 9:56	1	46	1.00			
1/1/2000 10:56	1	57	1.00	Reord low temp		-17
1/1/2000 11:56	1	68	1.00	Maximum		
1/1/2000 12:56	1	72	1.00	6,603.00		
1/1/2000 13:56	1	72	1.00	Minimum		
1/1/2000 14:56	1	72	1.00	0.05		
1/1/2000 15:56	1	71	1.00			
1/1/2000 16:56	1	69	1.00			
1/1/2000 17:56	1	65	1.00			

This picture shows one way that can be used to verify the data is reasonably complete. The Data Points of 53,247 is compared to the total number of hours that are included from January 1, 2000 through February 29, 2024 of 53, 424. The Data Points number is found by using the =COUNT function and highlighting the data in the "tmpf" column.

To evaluate the missing data points, the Time Check column compares the time shown on the row above with the time on that row. The formula for this is =(B6-B5)*24. If the results of this formula is less than 1, there is possibly duplicate readings for that hour. If the result is 2 or more, it indicates that there are missing data points. Note that the first hour each December will be 6601 or greater since we do not use any hours March through November. Use Conditional Formatting in the Time Check column to highlight cells with numbers less than 0.9 and greater than 1.1 to quickly identify missing or duplicate data points.

You can also use Conditional Formatting to identify hours that are above freezing, below freezing but above the ECWT and temperatures equal to or below the ECWT. This can help determine if the missing data points are likely to cause a change in the ECWT. This shows the Conditional Formatting rule assuming the ECWT is shown in cell G5:



Edit Formatting Rule
Select a Rule Type:
Format all cells based on their values
Format only cells that contain
Format only top or bottom ranked values
Format only values that are above or below average
Format only unique or duplicate values
Use a formula to determine which cells to format

Standards Announcement

Project 2024-03 Revisions to EOP-012-2

Formal Comment Period Open through November 5, 2024
Ballot Pools Forming through October 28, 2024

Now Available

A 20-day formal comment period for draft one of **EOP-012-3 Extreme Cold Weather Preparedness and Operations** is open through **8 p.m. Eastern, Tuesday, November 5, 2024**.

The Standards Committee approved the following waiver of provisions of the Standard Processes Manual (SPM) for Project 2024-03 Revisions to EOP-012-2:

- Informal comment period for SAR reduced from 30 days to as few as 15 days (Section 4.2);
- Initial formal comment and ballot period(s) reduced from 45 days to as little as 20 days, with the ballot pool formed concurrently during the first 10 days of the initial formal comment period, and with the ballot and non-binding poll of Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) conducted concurrently during the last 5 days of the comment period (Sections 4.8 and 4.9);
- Additional formal comment and ballot period(s) reduced from 30 days to as little as 15 days, with the ballot and non-binding poll of VRFs and VSLs conducted concurrently during the last 5 days of the comment period (Sections 4.9 and 4.12);
- Final ballot period(s) reduced from 10 days to as little as 5 days (Section 4.13).

Commenting

Use the Standards Balloting and Commenting System (SBS) to submit comments. An unofficial Word version of the comment form is posted on the project page.

Reminder Regarding Corporate RBB Memberships

Under the NERC Rules of Procedure, each entity and its affiliates is collectively permitted one voting membership per Registered Ballot Body Segment. Each entity that undergoes a change in corporate structure (such as a merger or acquisition) that results in the entity or affiliated entities having more than the one permitted representative in a particular Segment must withdraw the duplicate membership(s) prior to joining new ballot pools or voting on anything as part of an existing ballot pool. Contact ballotadmin@nerc.net to assist with the removal of any duplicate registrations.

Ballot Pools

Ballot pools are being formed through **8 p.m. Eastern, Monday, October 28, 2024.** Registered Ballot Body members can join the ballot pools here.

- *Contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern) for problems regarding accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out.*
- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

Initial ballots for the standard and implementation plan, as well as a non-binding poll of the associated Violation Risk Factors and Violation Severity Levels will be conducted **October 31 – November 5, 2024**.

For information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer, Ben Wu (via email) or at 470-542-6882. Subscribe to this project's observer mailing list by selecting "NERC Email Distribution Lists" from the "Service" drop-down menu and specify “Project 2024-03 Revisions to EOP-012-2 observer list” in the Description Box.

Comment Report

Project Name:	2024-03 Revisions to EOP-012-2 | Draft 1
Comment Period Start Date:	10/17/2024
Comment Period End Date:	11/5/2024
Associated Ballots:	2024-03 Revisions to EOP-012-2 | Draft 1 EOP-012-3 IN 1 ST 2024-03 Revisions to EOP-012-2 | Draft 1 Implementation Plan IN 1 OT

There were 60 sets of responses, including comments from approximately 165 different people from approximately 109 companies representing 10 of the Industry Segments as shown in the table on the following pages.

Questions

1. In paragraph 47 of the June 2024 Order, FERC directed NERC to revise EOP-012-2 to "ensure that the Generator Cold Weather Constraint declaration criteria included within the proposed Reliability Standard are objective and sufficiently detailed so that applicable entities understand what is required of them." In paragraph 47 of the June 2024 Order, FERC directed NERC to develop and submit modifications to the Generator Cold Weather Constraint definition of Reliability Standard EOP-012-2, to remove the references to "cost," "reasonable cost," "unreasonable cost," and "good business practices" and replace them with criteria that are objective, unambiguous, and auditable. In paragraph 54 of the June 2024 Order, FERC directs NERC to modify EOP-012-2 so that NERC receives, reviews, evaluates, and confirms for validity the Generator Cold Weather Constraint declarations in a timely manner. In paragraph 94 of the June 2024 Order, FERC directs NERC to develop and submit modifications to Requirement R8, Part 8.1 of Reliability Standard EOP-012-2 to implement more frequent reviews of Generator Cold Weather Constraint declarations (more than every five years) to verify that the declaration remains valid.

The drafting team has done the following to address the FERC directives:

1. Provided an updated definition of Generator Cold Weather Constrain

2. Updated language within Requirement R8

3. Provided EOP-012-3 Attachment 1 for clarity on expectations for registered entities

Do you agree with the approach and associated language the drafting team chose to meet the directives? Please provide any additional comments to consider. If you do not agree but believe the directives can be addressed in an equally effective and efficient manner, please provide your suggestions in the form of specific language changes for the drafting team.

2. In paragraph 68 of the June 2024 Order, FERC directed NERC to modify Requirement R7 of EOP-012-2 to require shorter deadlines to implement corrective actions for existing or new equipment or the freeze protection measures for those generating units that experience a Generator Cold Weather Reliability Event. FERC provided an example for how to address this directive, such as to require shorter timeframes for those units that have experienced issues and allow longer timeframes to address similar potential issues across a fleet for those units that have not experienced issues.

The drafting team modified Requirement R6 of EOP-012-2 to require a shorter deadline to implement corrective actions for those generating units that experience a Generator Cold Weather Reliability Event. Do you agree with the revised timelines? Please provide any additional comments to consider. If you do not agree but believe the directive can be addressed in an equally effective and efficient manner, please provide your suggestions in the form of specific language changes for the drafting team. Please review the posted draft ERO Enterprise document, EOP-012-3 Generator Cold Weather CAP Extension and Constraint Process.

3. In paragraph 70 of the June 2024 Order, FERC directed NERC to develop and submit modifications to Requirement R7 of Reliability Standard EOP-012-2 to ensure that any extension of a corrective action plan implementation deadline beyond the maximum implementation timeframe required by the proposed Reliability Standard is pre-approved by NERC.

The drafting team provided language changes in Requirements R6 and R7 for a Corrective Action Plan extension process. Do you believe that the proposed language changes meet the intent of paragraph 70 of the FERC Order? Please provide any additional comments to consider. If you do not agree but believe the directive can be addressed in an equally effective and efficient manner, please provide your suggestions in the form of specific language changes for the drafting team.

4. In paragraph 72 of the June 2024 Order, FERC directed NERC to develop and submit modifications to Requirement R7 of Reliability Standard EOP-012-2 to clarify that any Requirement R7 corrective action plans for new generation (i.e. commercially operational after October 1, 2027) must be completed prior to the generating unit's commercial operation date.

The drafting team provided updated language in Requirement R2 Part 2.1 to address the issue of units in different stages of design and construction. February 16, 2023 was chosen as a date of demarcation as that was the date the Extreme Cold Weather Temperature was approved by FERC. Do you agree that revisions to Requirement R2 Part 2.1 address this directive? If you do not agree but believe the directive can be addressed in an equally effective and efficient manner, please provide your suggestions in the form of specific language changes for the drafting team.

5. In paragraph 72 of the June 2024 Order, FERC directed NERC to develop and submit modifications to Requirement R7 of Reliability Standard EOP-012-2 to clarify that any Requirement R7 corrective action plans for new generation (i.e. commercially operational after October 1, 2027) must be completed prior to the generating unit's commercial operation date.

The drafting team provided updated language in Requirement R2 Part 2.2 to address the issue of units in newer stages of design and construction. February 16, 2023 was chosen as a date of demarcation as that was the date the Extreme Cold Weather Temperature was approved by FERC. Units committed to design criteria on or after February 16, 2023 do not have the option to utilize a Corrective Action Plan but may still declare a Generator Cold Weather Constraint. Do you agree that revisions to Requirement R2 Part 2.2 address this directive? If you do not agree but believe the directive can be addressed in an equally effective and efficient manner, please provide your suggestions in the form of specific language changes for the drafting team.

6. In paragraph 76 of the June 2024 Order, FERC directs NERC to develop and submit modifications to Requirement R7 of Reliability Standard EOP-012-2 to address certain ambiguities by expanding on Requirement R7.1.1 and 7.1.2 to make it clear which corrective action plan implementation deadline applies when a generator owner must implement both remedying issues with existing and installing new freeze protection measures.

The drafting team clarified Requirement R7 for Corrective Action Plans developed in accordance with Requirements R1, R2, or R3. Do you agree that revisions to Requirement R7 address this directive to differentiate between the existing and new freeze protection measures? If you do not agree but believe the directive can be addressed in an equally effective and efficient manner, please provide your suggestions in the form of specific language changes for the drafting team.

7. The drafting team provided language in the Implementation Plan to address parts 3 through 5 of paragraph 4 of the June 2024 Order addressing FERC's concerns regarding urgency. The Standard language updates were written to meet the core directives in an effective and efficient manner while providing language that is objective, unambiguous, and auditable. With EOP-012-2 already effective October 1, 2024 (with the exception of Requirement R3), the changes made were intended to meet the FERC Directives without adding significantly to the efforts already in progress. Do you agree that the associated Implementation Plan meets the Directives? If you do not agree but believe the Directives can be addressed in an equally effective and efficient manner, please provide your suggestions in the form of specific language changes for the drafting team.

8. Do you agree with the Implementation Plan for EOP-012-3? If you do not agree, please propose an alternate implementation plan with a detailed explanation.

9. Do you agree that EOP-012-3 is cost effective to address the Directives in the FERC Order? If you do not agree, or if you agree but have suggestions for improvement to enable more cost-effective approaches, please provide your recommendation and, if appropriate, technical, or procedural justification.

10. Please provide any additional comments for the standard drafting team to consider, if desired.

1. In paragraph 47 of the June 2024 Order, FERC directed NERC to revise EOP-012-2 to "ensure that the Generator Cold Weather Constraint declaration criteria included within the proposed Reliability Standard are objective and sufficiently detailed so that applicable entities understand what is required of them." In paragraph 47 of the June 2024 Order, FERC directed NERC to develop and submit modifications to the Generator Cold Weather Constraint definition of Reliability Standard EOP-012-2, to remove the references to "cost," "reasonable cost," "unreasonable cost," and "good business practices" and replace them with criteria that are objective, unambiguous, and auditable. In paragraph 54 of the June 2024 Order, FERC directs NERC to modify EOP-012-2 so that NERC receives, reviews, evaluates, and confirms for validity the Generator Cold Weather Constraint declarations in a timely manner. In paragraph 94 of the June 2024 Order, FERC directs NERC to develop and submit modifications to Requirement R8, Part 8.1 of Reliability Standard EOP-012-2 to implement more frequent reviews of Generator Cold Weather Constraint declarations (more than every five years) to verify that the declaration remains valid.

The drafting team has done the following to address the FERC directives:

1. Provided an updated definition of Generator Cold Weather Constrain

2. Updated language within Requirement R8

3. Provided EOP-012-3 Attachment 1 for clarity on expectations for registered entities

Do you agree with the approach and associated language the drafting team chose to meet the directives? Please provide any additional comments to consider. If you do not agree but believe the directives can be addressed in an equally effective and efficient manner, please provide your suggestions in the form of specific language changes for the drafting team.

R8.2 should be its own requirement. R8.4 timing is too restrictive. Suggest adding a statement with a timeframe (150 days). A CEA rejection of a CAP could force an unplanned maintenance outage and be longer than expected timeframes.

Andy Thomas - Duke Energy - 1,3,5,6 - SERC,RF	
Answer	No
Document Name	
Comment	

Duke Energy agrees with and supports NAGF's position on modifications to the wording of R8 and their stance on the lack of CEA obligations related to the approval process.

Duke Energy agrees in general with changes to the definition of a Generator Cold Weather Constraint and the use of Attachment 1. Attachment 1 does not though provide sufficient guidance for freeze protection modifications that are unsustainable due to cost. While Attachment Sections 3a through 3c does offer guidance, it provides no guidance for modifications that are financially unfeasible. Please provide additional guidance regarding unsustainability due to cost.

Duke Energy does not support the pre-approval requirement for declarations. The declaration process should be driven by clear criteria and the acceptability of declarations should be evaluated as part of the audit process. Please provide clear guidance and criteria for declarations as stated.

The status of the CEA in the declaration process is an area of concern. The CEA by statute, perform the enforcement role for standards published by NERC. The preapproval process places the CEA in the position of a performer or approver on implementation of the standard. The SDT should modify the process to reflect a more amiable solution that excludes the CEA.

HQ supports BC Hydro's comment: "BC Hydro is supportive of the revisions to the revised Generator Cold Weather Constraint definition. However, to add clarity on Freeze Protection Measures, BC Hydro recommends retaining the following wording "Freeze protection measures are not intended to be limited to optimum practices, methods, or technologies, but are also intended to include acceptable practices, methods, or technologies generally implemented by the electric industry in areas that experience similar winter climate conditions" in EOP-012-3 associated documentation, such as the Technical Rationale." And "Please also clarify in the language of the Requirement whether these are calendar or business days.".

HQ supports NBPower's comment: "The pre-approved Generator Cold Weather Constraints (GCWCs) in Attachment 1 could be problematic in some jurisdictions, since Requirement R8 and Attachment 1 are referenced for Requirement R2 Part 2.2 for new designs on a go-forward basis. In particular, the pre-approved GCWC should not be set up in such a way as to exempt generating unit developers from doing proper due diligence. At least for future designs (Requirement R2 Part 2.2) all Generator Cold Weather Constraints should be assessed on a case-by-case basis. Pre-approved GCWCs should be avoided, or if used at all, limited to existing or already committed designs, since technology and the needs of the grid may be expected to change in the future and existing pre-approvals may no longer be appropriate."

HQ supports OPG's comments "Additional clarification is required regarding GCWC CEA applicability/validity confirmation & determination implications for unit present/future operation.

Please clarify the role of CEA – review for constraint presence, validity confirmation, or approval, and the requirements the CEA need to satisfy to perform it's role.

Attachment 1 bullet #3 appears to be the BA purview and not the CEA.

In the context of this standard a freeze protection measure can negatively impact the revenue of a market participant, yet still be required to be implemented for compliance purposes. Please explain how was derived the "more than three percent" criterion and the justification for argument that it will fit all the market participants, from any geographical location.

Attachment 1 last paragraph state that "An approved Generator Cold Weather Constraint declaration for any specific Generator Cold Weather Critical Component does not relieve the Generator Owner of its obligation to otherwise prepare its applicable generating unit(s) to meet the requirements of EOP-012-3.".

The overall intent of the Extreme Cold Weather Preparedness and Operations standard is to:" Implement freeze protection measures to protect Generator Cold Weather Critical Components that provide the capability to operate at the unit(s)' Extreme Cold Weather Temperature;"

By definition, the "**Generator Cold Weather Constraint** – Any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components.". As written this appears to be an actual requirement to operate at the ECWT, which cannot be reconciled with an approved Generator Cold Weather Constraint declaration."

There is a risk for future generation designs introduced by Attachment 1 via geographical limitation for specific technologies in the Pre-Approved Generator Cold Weather Constraints list.

NRG is in concurrence that the direction that the SDT has taken to address the ambiguity of the language of the constraints is sound as it has allowed for acceptance of known technical constraints that the industry has identified. It also has provided sound examples of those examples that may be presented on case by case basis. However, strict guidance should be provided to reviewers to ensure consistency of acceptance of these constraints for the case by case basis. The process may also need to be modified that if an Extreme Cold Weather Reliability event continually occurs due to same mechanism-say wind turbine blade icing or PV icing- that a single declaration for the year should suffice and not required for each event and filed through the required approval process.

While AES US Renewables agrees with the approach of updating definition of Generator Cold Weather Constraint, we believe there are still some gaps in the proposed R8 as well as Attachment 1 that need to be addressed:

- The 24 calendar month timeline for reviewing GCWC declaration that has been validated by CEA is too frequent. We believe that at a minimum, it should be set to 36 calendar months. We prefer 60 months if possible since a lot of the pre-approved constraints listed in Attachment 1 for renewable generators are likely not going to be alleviated anytime soon as OEMs are not actively working to address them (unlike the IEEE 2800 requirements where various ISO/RTOs are driving the change requirements due to being perceived as more impactful and urgent).
    - It was mentioned during the 10/24/2024 webinar that 24-calendar month reviews do not require submittal to CEA for reviews and approvals. However, it is currently not clear on what the process entails when a constraint declaration is no longer valid. Is the GO required to notify the CEA that the constraint declaration that was approved is no longer valid due to solutions being available to mitigate the constraint? Since the Constraint and CAP Process document stated that NERC will be sending NERC a quarterly report, we are assuming that NERC/CEA will have to keep track of retirement of constraint declarations in addition to what they have approved/denied.

- Neither R8 nor Attachment 1 addresses the timeline for implementing the mitigation if the declared constraint is no longer valid. We have concerns about situations where one vendor or OEM has developed a solution for the constraint, but the amount of investment needed to incorporate that solution is too high and impacts revenue and profitability negatively in operating the generation facility. How will this type of scenario be taken into account under the proposed Attachment 1 criteria?
- Will the pre-approved list in Attachment 1 be revised if new constraints are identified in the future? Or if commercially viable solutions to those constraints appear in the future, will those constraints be removed from the pre-approved list? We are concerned about the static nature of the pre-approved list as it can greatly impact the ability to declare constraints for projects that are in the interconnection queue at various ISO/RTOs currently.
- In the Constraint and CAP Process document provided along with EOP-012-3 proposed draft and Implementation Plan, there is no mention on what registered entities can do if their constraint declaration is denied related to R2.2. The current language only focused on updating CAPs related to R6.1 and R7.1. As written currently, R2.2 does not have the option to create a corrective action plan.
- Under the proposed Attachment 1, item 3 (c) allows constraint declaration if application of freeze protection measures would cause the Generator Owner to cancel plans to finish the development of a new generating unit. We would like to find out if further guidance can be provided either in Attachment 1 or Technical Rationale for this constraint criteria in regards to financial/cost impacts. This question was posed during the 10/24/2024 webinar and the answer provided was not clear and it was suggested that it can be evaluated on a case-by-case basis.
- More clarification is needed on a few constraints listed under Attachment 1:
- "*Wind turbine towers that have structural limitations established by Original Equipment Manufacturers (OEMs) based on a minimum temperature that is higher than the Extreme Cold Weather Temperature calculated per Requirement R1.*"
- Does structural limitations imply design limitations? Please clarify that or include clarification in the Technical Rationale document.
- "*Heat tracing or other de-icing technologies for wind turbine blades that are not available in the Generator Owner's location.*"
- Does the phrase "not available" also mean not effective? There is a difference between both. There are currently some not-so-effective methods to prevent icing (like spraying the blades with anti-icing coatings). Are Generator Owners required to use solutions that are not effective or can it be part of constraint declaration?
- Does the phrase "Generator Owner's location" mean regionally? For example, does it mean if a wind turbine uses a solution that is available in New York, and the solution is not used in Texas, the Generator Owner can declare constraint that it is not available for wind turbines in Texas? Or should the constraint be modified to: "*Heat tracing or other de-icing technologies for wind turbine blades that are not available in **all NERC regions***"? Our rationale is that if it is not available in the US, but available in Europe, then, we are allowed to declare constraint. It should be based on availability within each country.

Wayne Sipperly - North American Generator Forum - 5 - MRO,WECC,Texas RE,NPCC,SERC,RF

Answer	No
Document Name	

Comment

The NAGF recommends that R8 be modified to address the following issues:

a. Requirement 8.2 should not be part of R8 as it is a separate requirement and requires actions different than R8;

b. The language used in 8.4, specifically as it relates to R6, is not clear, or it may require an entity to have a CAP implemented on the day they are notified that the declaration has been rejected;

c.The time stated in 8.1 does not agree with the process document posted in support of the standard. In addition, the document requires an entity to coordinate with the CEA before filing a declaration, without any obligation on the CEA to respond in a timely manner. These two documents, the requirement in the standard and the process document, must be coordinated before Requirement R8 is clear, unambiguous and enforceable.

To address these issues, the NAGF recommends the following language be used:

R8. Each Generator Owner that declares a Generator Cold Weather Constraint in accordance with Attachment 1 shall: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

8.1. Submit its Generator Cold Weather Constraint declaration(s) to the CEA within 45 days of determining that the Generator Cold Weather Constraint is applicable. For Generator Cold Weather Constraints determined in accordance with Requirement R2 for generating unit(s) upon beginning commercial operation, submit the Generator Cold Weather Constraint declaration(s) no later than 15 days after commercial operation;

8.2 Update the operating limitations associated with capability and availability under Requirement R1 Part R1.2 if applicable; and

8.3 If the CEA determines the declared Generator Cold Weather Constraint is invalid, update its Corrective Action Plan(s) to require corrective actions be completed;

8.3.1 Within 150 days or longer as agreed to by the CEA to meet compliance with R6 to begin the date the Generator Owner is notified that the Generator Cold Weather Constraint is invalid, or

8.3.2 Consistent with Requirement R7 Part 7.1 or longer as agreed to by the CEA, to begin from the date the Generator Owner is notified that the Generator Cold Weather Constraint is invalid.

R9. Review any Generator Cold Weather Constraint declaration validated by the CEA every 24 calendar months to determine if it remains valid under Attachment 1.

The NAGF has significant concerns related to the requirement to modify or repair equipment within an extremely confined period under these requirements. This issue is discussed in further detail under question 2.

The NAGF does not see any process that will be followed in the event the review of the declaration determines that it is now possible to correct, there are no timelines or other process. Is it the intent to allow the GO to determine when this will be implemented without any notifications to the CEA?

The NAGF also has concerns about situations where one vendor or OEM has developed a solution for the constraint, but the amount of investment needed to incorporate that solution is too high and impacts revenue and profitability negatively for operating the generation facility. How will this type of scenario be considered under the proposed Attachment 1 criteria?

The NAGF requests additional clarification regarding the constraints in Attachment 1:

As an example, for the constraint “Wind turbine towers that have structural limitations established by Original Equipment Manufacturers (OEMs) based on a minimum temperature that is higher than the Extreme Cold Weather Temperature calculated per Requirement R1.” Do structural limitations imply design limitations? Please clarify that or include clarification in the Technical Rationale document.

As another example for the constraint “Heat tracing or other de-icing technologies for wind turbine blades that are not available in the Generator Owner’s location.” Does the phrase “not available” also mean not effective? There is a difference between both. There are currently some not-so-effective methods to prevent icing (like spraying the blades with anti-icing coatings). Since cost is not to be considered, are Generator Owners required to use solutions that are not effective if they are available, or can it be part of constraint declaration?

Does the phrase “Generator Owner’s location” mean regionally? For example, does it mean if a wind turbine uses a solution that is available in New York, and the solution is not used in Texas, the Generator Owner can declare a constraint that it is not available for wind turbines in Texas? Or should the constraint be modified to: “Heat tracing or other de-icing technologies for wind turbine blades that are not available in all NERC regions”? Our rationale is that if it is not available in the US, but available in Europe, then, we are allowed to declare constraint. It should be based on availability within each country.

The NAGF looks forward to working with the SDT to address these issues and concerns.

Robert Follini - Avista - Avista Corporation - 3	
Answer	No
Document Name	
Comment	

While Avista supports in part the approach that the Drafting Team has taken to address FERC Commission Directives contained in the June 27, 2024 FERC Order, Approving Extreme Cold Weather Reliability Standard EOP-012-2 And Directing Modifications, we do not support the proposed definition for Generator Cold Weather Constraint. The definition for Generator Cold Weather Constraints contained in the previous version provided the industry with useful criteria that has been lost in the revised version. And while we see value in the information provided in Attachment 1, that information could be contained in another technical document supporting this standard (i.e., Technical Rationale or Implementation Guidance), if the definition and criteria were revised to more closely align to the directives contained in the Order. To address our concerns, we offer the following edits (in boldface) to the Generator Cold Weather Constraints definition:

Generator Cold Weather Constraint – Any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components using the criteria below. Freeze protection measures are not intended to be limited to optimum practices, methods, or technologies, but are also intended to include acceptable practices, methods, or technologies generally implemented by the electric industry in areas that experience similar winter climate conditions. (*Strikethroughs have been omitted for clarity*)

Criteria used to determine a **Generator Cold Weather Constraint shall consider the following:**

{C}· **A determination through an engineering analysis that the freeze protection measures lack reasonable assurances of efficacy and there is no record that such protections have been effectively utilized on** generating units **of a** comparable types in regions that experience similar winter climate conditions;

{C}· **A determination through engineering analysis that there are no available freeze protection measures, commercially available, that have been proven to be effective at mitigating the effects of the Extreme Cold Weather Temperature identified in the region where the resource is installed**; or

{C}· **A determination through an engineering economic analysis has been made that determines that the implementation of freeze protection measures necessary to mitigate the effects of the Extreme Cold Weather Temperature, while feasible, would result in the early retirement of the resource.**

NB Power supports BC Hydro's comment: "BC Hydro is supportive of the revisions to the revised Generator Cold Weather Constraint definition. However, to add clarity on Freeze Protection Measures, BC Hydro recommends retaining the following wording "Freeze protection measures are not intended to be limited to optimum practices, methods, or technologies, but are also intended to include acceptable practices, methods, or technologies generally implemented by the electric industry in areas that experience similar winter climate conditions" in EOP-012-3 associated documentation, such as the Technical Rationale." And "Please also clarify in the language of the Requirement whether these are calendar or business days.".

The pre-approved Generator Cold Weather Constraints (GCWCs) in Attachment 1 could be problematic in some jurisdictions, since Requirement R8 and Attachment 1 are referenced for Requirement R2 Part 2.2 for new designs on a go-forward basis. In particular, the pre-approved GCWC should not be set up in such a way as to exempt generating unit developers from doing proper due diligence. At least for future designs (Requirement R2 Part 2.2) all Generator Cold Weather Constraints should be assessed on a case-by-case basis. Pre-approved GCWCs should be avoided, or if used at all, limited to existing or already committed designs, since technology and the needs of the grid may be expected to change in the future and existing pre-approvals may no longer be appropriate.

Additional clarification is required regarding GCWC CEA applicability/validity confirmation & determination implications for unit present/future operation.

Please clarify the role of CEA – review for constraint presence, validity confirmation, or approval, and the requirements the CEA need to satisfy to perform it's role.

Attachment 1 bullet #3 appears to be the BA purview and not the CEA.

In the context of this standard a freeze protection measure can negatively impact the revenue of a market participant, yet still be required to be implemented for compliance purposes. Please explain how was derived the "more than three percent" criterion and the justification for argument that it will fit all the market participants, from any geographical location.

Attachment 1 last paragraph state that "An approved Generator Cold Weather Constraint declaration for any specific Generator Cold Weather Critical Component does not relieve the Generator Owner of its obligation to otherwise prepare its applicable generating unit(s) to meet the requirements of EOP-012-3.".

The overall intent of the Extreme Cold Weather Preparedness and Operations standard is to:" Implement freeze protection measures to protect Generator Cold Weather Critical Components that provide the capability to operate at the unit(s)' Extreme Cold Weather Temperature;"

By definition, the "**Generator Cold Weather Constraint** – Any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components.". As written this appears to be an actual requirement to operate at the ECWT, which cannot be reconciled with an approved Generator Cold Weather Constraint declaration."

There is a risk for future generation designs introduced by Attachment 1 via geographical limitation for specific technologies in the Pre-Approved Generator Cold Weather Constraints list.

While we support in part the approach that the Drafting Team has taken to address FERC Commission Directives contained in the June 27, 2024 FERC Order, Approving Extreme Cold Weather Reliability Standard EOP-012-2 And Directing Modifications, we do not support the proposed definition for Generator Cold Weather Constraint. The definition for Generator Cold Weather Constraints contained in the previous version provided the industry with useful criteria that has been lost in the revised version. And while we see value in the information provided in Attachment 1, that information could be contained in another technical document supporting this standard (i.e., Technical Rationale or Implementation Guidance), if the definition and criteria were revised to more closely align to the directives contained in the Order. To address our concerns, we offer the following edits (in boldface) to the Generator Cold Weather Constraints definition:

Generator Cold Weather Constraint – Any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components using the criteria below. Freeze protection measures are not intended to be limited to optimum practices, methods, or technologies, but are also intended to include acceptable practices, methods, or technologies generally implemented by the electric industry in areas that experience similar winter climate conditions. (*Strikethroughs have been omitted for clarity*)

Criteria used to determine a **Generator Cold Weather Constraint shall consider the following:**

1}· **A determination through an engineering analysis that the freeze protection measures lack reasonable assurances of efficacy and there is no record that such protections have been effectively utilized on** generating units **of a** comparable types in regions that experience similar winter climate conditions;

2}· **A determination through engineering analysis that there are no available freeze protection measures, commercially available, that have been proven to be effective at mitigating the effects of the Extreme Cold Weather Temperature identified in the region where the resource is installed**; or

3}· **A determination through an engineering economic analysis has been made that determines that the implementation of freeze protection measures necessary to mitigate the effects of the Extreme Cold Weather Temperature, while feasible, would result in the early retirement of the resource.**

Most of the definition on Page 2 of the redlined document removes Generator Cold Weather Constraint without directing to Attachment 1. Also, depending on the CEA, a constraint may be applicable to the facility but disagreed upon by the CEA, in which the facility would have to update its corrective action plan without being able to contest the analysis of the CEA. Recommend that any Constraint that is requested be handled by a single senior management official with overall authority and responsibility for leading and managing implementation of and continuing adherence to the requirements within the NERC EOP-012 cold weather standards and not at the Compliance Enforcement Authority (CEA).

MP agrees with several aspects of Attachment 1 but aligns more closely with the edits EEI provided for the Cold Weather Constraint definition. EEI refers to effective freeze protections on units of comparable types in regions with similar winter climate conditions, commercially available and effective freeze protection for the region, and evaluation of where freeze protection installation could force early retirement. Early retirement of units will not support overall grid reliability.

Kennedy Meier - Electric Reliability Council of Texas, Inc. - 2, Group Name ISO/RTO Council Standards Review Committee (SRC)	

Answer	No
Document Name	

Comment

The ISO/RTO Council (IRC) Standards Review Committee (SRC) (consisting, for purposes of these comments, of CAISO, ERCOT, IESO, ISO-NE, PJM, MISO, NYISO, and SPP) generally agrees with the updated definition of Generator Cold Weather Constraint, the updated language within Requirement R8, and the provision of Attachment 1 to provide further detail on constraints. However, the SRC recommends the following revisions to Attachment 1:

-- Rename the first list of constraints “Potential Generator Cold Weather Constraints that Would be Candidates for Accelerated Approval” to better reflect the CEA review that is required for these constraints.

-- Revise the second constraint on the accelerated approval list to read as follows to clarify that it is not intended to address shipping difficulties: “Heat tracing or other de-icing technologies for wind turbine blades that the supplier will not sell or otherwise provide to the Generator Owner.”

-- Revise the fourth constraint on the accelerated approval list to read as follows to allow for the possibility of the future development of technically feasible solar panel de-icing technology: “Applying heat to remove accumulated frozen precipitation on solar panels when generating the heat would require 50% or more of the amount of energy the solar panels would produce in the absence of the accumulated frozen precipitation.”

The SRC recommends that items 3.a and 3.b of the case-by-case constraint list be consolidated into a single item that reads as follows: “The application of freeze protection measures would result in the imminent premature retirement of an existing generating unit.” This would help clarify that (for example) changing a unit’s planned retirement date from a day 20 years in the future to a day 19 years in the future does not justify a constraint, while also avoiding any potential ambiguity regarding what constitutes proper publication of a retirement date.

The SRC recommends that the three percent threshold used in items 3.d and 3.e of the case-by-case constraint list be replaced with language that would allow the CEA to determine the appropriate threshold for the particular region or portion of a region that would be impacted by the requested constraint. This would allow the CEA to consider whether, for example, a reduction in summer net dependable capacity is likely to have a more significant reliability impact the farther south a generating unit is located.

Regardless of the threshold that is ultimately selected, the SRC recommends that item 3.d be modified by adding language limiting item 3.d to performance reductions that occur “during weather conditions other than extreme cold weather conditions.” This would help clarify that no constraint exists if a freeze protection measure would cause a performance reduction only during extreme cold weather conditions.

The SRC recommends that the last paragraph in Attachment 1 be revised to read as follows to clarify that the relevant Reliability Coordinator or Balancing Authority may provide information that would assist the CEA in evaluating certain types of constraints and to clarify that a valid constraint declaration does not necessarily carry any weight for purposes of any non-EOP-012 regulatory regimes that may apply to the unit in question:

When submitting a Generator Cold Weather Constraint declaration to the CEA per Requirement R8, the Generator Owner must include documentation that defends and supports the declared constraint and also describes other compensating or mitigating freeze protection measures, if applicable, that the Generator Owner will apply. ***If a Generator Cold Weather Constraint declaration indicates that the application of a specific freeze protection measure or measures would adversely affect the reliability of the Bulk-Power System to an extent that outweighs the reliability benefit of applying the freeze protection measure(s), the documentation that defends and supports the constraint should include any assessment that the applicable Balancing Authority or Reliability Coordinator might agree to provide concerning the impact to the reliability of the Bulk-Power System if the constraint were to be granted.*** An approved Generator Cold Weather Constraint declaration for any specific Generator Cold Weather

Critical Component does not relieve the Generator Owner of its obligation to otherwise prepare its applicable generating unit(s) to meet the requirements of EOP-012-3***, and does not in any way purport to relieve the Generator Owner of any other legal obligations or requirements outside of the requirements of EOP-012-3, including tariff, regulatory, or statutory obligations or requirements***.

The SRC also recommends that Part 8.1 of Requirement R8 be revised to require units beginning commercial operations to submit constraint declarations on or before the commercial operation date rather than 15 days after commercial operation. This would help minimize the amount of time between the commercial operation date and the CEA determination regarding the validity of the constraint.

Additionally, the SRC recommends that Part 8.2 be revised as follows to require Generator Owners to react to knowledge of changed circumstances outside of the 24-month review cycle: "Review any Generator Cold Weather Constraint declaration validated by the CEA every 24 calendar months ***and upon gaining actual knowledge of a material change in the circumstances that formed the basis for the Generator Cold Weather Constraint declaration*** to determine . . ."

Finally, the SRC recommends that Part 8.4 be clarified by ending the first sentence at "Part 7.1" and turning the remaining language into a separate sentence, as follows: " . . . Part 7.1. The deadlines from the Part 6.1 and Part 7.1 timetables shall be calculated based on the date the Generator Owner is notified that the Generator Cold Weather Constraint is invalid."

Colin Chilcoat - Invenergy LLC - 6	
Answer	No
Document Name	
Comment	

Invenergy appreciates the SDT's approach to addressing the FERC directives and we believe the changes in EOP-012-3 work toward meeting those directives. Still, we have concerns regarding the administrative burden placed upon Generator Owners and we would like to offer the recommendations below that provide additional clarity and/or address the directives in an equally effective manner.

Definition:

Consider revising the definition to read, "Any condition, subject to validation by the Compliance Enforcement Authority, that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components." This clarifies that certain criteria must be validated for a condition to be considered a Generator Cold Weather Constraint.

R8:

Invenergy recommends simplifying R8.1 to read, "Submit its Generator Cold Weather Constraint declaration(s) to the CEA within 45 days of determining that the Generator Cold Weather Constraint is applicable." As drafted, the multiple constraint declaration tracks introduce confusion for no real reliability gain.

Invenergy recommends allowing 36 months for the revalidation of any constraint declaration. Constraint declarations are unlikely to change frequently. Additionally, please clarify in R8.2 if the revalidation of constraint declarations is to occur 24 calendar months following the date of CEA validation. It may be beneficial to create a separate requirement for the actions currently prescribed in R8.2.

Attachment 1:

If the intent of the standard is that all Generator Cold Weather Constraint declarations must be submitted to the CEA for validation, then Invenergy recommends replacing "Pre-Approved Generator Cold Weather Constraints" with "Known Generator Cold Weather Constraints."

The final two bullets under the Pre-Approved Generator Cold Weather Constraint header seem to refer more to possible solutions to a constraint, rather than the circumstances that constitute the constraint. Consider reframing the bullets to reference the lack of deployable solutions to remove accumulated frozen precipitation on solar panels or on combustion turbine inlet air filters.

Invenergy is worried that the disregard in Attachment 1 of commercial concerns that do not rise to the level of premature retirement of an existing facility places unreasonable expectations on the Generator Owner to procure equipment or apply freeze protection measures that, based on the Generator Owner's operating experience or analysis, may not suit the needs of the Generator Owner. We recommend that the language make more accommodations for Generator Owners to be able to pursue reliable generation in a manner that best fits their unique circumstances.

We recommend striking the final sentence of Attachment 1 as it does not provide any additional criteria relevant to the declaration of a constraint.

OPG supports BC Hydro's comment: "BC Hydro is supportive of the revisions to the revised Generator Cold Weather Constraint definition. However, to add clarity on Freeze Protection Measures, BC Hydro recommends retaining the following wording "Freeze protection measures are not intended to be limited to optimum practices, methods, or technologies, but are also intended to include acceptable practices, methods, or technologies generally implemented by the electric industry in areas that experience similar winter climate conditions" in EOP-012-3 associated documentation, such as the Technical Rationale." And "Please also clarify in the language of the Requirement whether these are calendar or business days.".

OPG supports NBPower's comment: "The pre-approved Generator Cold Weather Constraints (GCWCs) in Attachment 1 could be problematic in some jurisdictions, since Requirement R8 and Attachment 1 are referenced for Requirement R2 Part 2.2 for new designs on a go-forward basis. In particular, the pre-approved GCWC should not be set up in such a way as to exempt generating unit developers from doing proper due diligence. At least for future designs (Requirement R2 Part 2.2) all Generator Cold Weather Constraints should be assessed on a case-by-case basis. Pre-approved GCWCs should be avoided, or if used at all, limited to existing or already committed designs, since technology and the needs of the grid may be expected to change in the future and existing pre-approvals may no longer be appropriate."

OPG has the following comments: Additional clarification is required regarding GCWC CEA applicability/validity confirmation & determination implications for unit present/future operation.

Please clarify the role of CEA – review for constraint presence, validity confirmation, or approval, and the requirements the CEA need to satisfy to perform it's role.

Attachment 1 bullet #3 appears to be the BA purview and not the CEA.

In the context of this standard a freeze protection measure can negatively impact the revenue of a market participant, yet still be required to be implemented for compliance purposes. Please explain how was derived the "more than three percent" criterion and the justification for argument that it will fit all the market participants, from any geographical location.

Attachment 1 last paragraph state that "An approved Generator Cold Weather Constraint declaration for any specific Generator Cold Weather Critical Component does not relieve the Generator Owner of its obligation to otherwise prepare its applicable generating unit(s) to meet the requirements of EOP-012-3.".

The overall intent of the Extreme Cold Weather Preparedness and Operations standard is to:" Implement freeze protection measures to protect Generator Cold Weather Critical Components that provide the capability to operate at the unit(s)' Extreme Cold Weather Temperature;"

By definition, the "**Generator Cold Weather Constraint** – Any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components.". As written this appears to be an actual requirement to operate at the ECWT, which cannot be reconciled with an approved Generator Cold Weather Constraint declaration."

There is a risk for future generation designs introduced by Attachment 1 via geographical limitation for specific technologies in the Pre-Approved Generator Cold Weather Constraints list.

Texas RE has some concerns regarding the proposed definition of Generator Cold Weather Constraint, consistency between Requirements R1 and R8, and to whom annual training shall be given in Requirement R5.

Definition

Texas RE is concerned that the definition of Generator Cold Weather Constraint proposed under the terms is inconsistent with the description of Generator Cold Weather Constraint in Attachment 1. The definition states that a Generator Cold Weather Constraint is "Any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components." The description in Attachment 1, however, says "A Generator Cold Weather Constraint is any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components using the following criteria:" and lists out pre-approved Generator Cold Weather Constraints and case-by-case Generator Cold Weather Constraints. The proposed definition cannot be read without the additional information in Attachment 1, yet the proposed definition does not reference Attachment 1.

Texas RE proposes that either the proposed NERC Glossary definition include all of the information in Attachment 1, an explicit reference to Attachment 1, or eliminate the proposed NERC Glossary definition altogether and simply use the term as part of the requirements that is described in Attachment 1 and noted as such in the requirement language.

Consistency between Requirements R1 and R8

For verbiage consistency in Requirement R1, Texas RE recommends adding the word 'calendar' to Requirement 1.1.1 for developing new corrective actions after recalculation (in bold):

1.1.1 If the re-calculated Extreme Cold Weather Temperature (ECWT) is lower than the previous Extreme Cold Weather Temperature, the entity shall review and update its cold weather preparedness plan(s) under Requirement R4 within six (6) calendar months of the recalculation. If new corrective actions are needed to provide the required operational capability under Requirement R2 or R3, the entity shall develop a Corrective Action Plan within six (6) **calendar** months of the recalculation.

Although Requirement R8 requires shorter timeframe for timely review and evaluation of declared Generator Cold Weather Constraints, the calculation timeframe used in Requirement R1 for identifying Extreme Cold Weather Temperature to review and identify new corrective actions to provide the required operational capability remains five calendar years. Texas RE suggests revising Requirement R1 for Generator Owner to perform the ECWT calculations every 24 calendar months instead of every five calendar years, to be consistent with Requirement R8 and to ensure that most recent information is used to prepare unit's cold weather preparedness plan. Performing the ECWT calculations biennially could also help to include any 'Lessons Learned' from the latest weather event and reviewing/updating any operating limitations in the Generator Cold Weather Constraint declaration under Requirement R8. Texas RE recommends the following revision (in bold):

R1. At least once every **24 calendar months five calendar years**, each Generator Owner shall, for each of its applicable generating unit(s): [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]

Requirement R5

Current language for Requirement R5 states that annual training shall be provided to maintenance or operations personnel responsible for implementing the cold weather preparedness plan(s). In many cases maintenance personnel implementing the plans and operational personnel responsible for implementing the plans in real-time could be different individuals. Therefore, it is important to provide training for both maintenance and operations personnel responsible for implementing the cold weather preparedness plan(s). Texas RE recommends the following revision (in bold):

R5. Each Generator Owner in conjunction with its Generator Operator shall identify the entity responsible for providing the generating unit-specific training, and that identified entity shall provide annual training to its maintenance **or and** operations personnel responsible for implementing the cold weather preparedness plan(s) developed pursuant to Requirement R4.

2. In paragraph 68 of the June 2024 Order, FERC directed NERC to modify Requirement R7 of EOP-012-2 to require shorter deadlines to implement corrective actions for existing or new equipment or the freeze protection measures for those generating units that experience a Generator Cold Weather Reliability Event. FERC provided an example for how to address this directive, such as to require shorter timeframes for those units that have experienced issues and allow longer timeframes to address similar potential issues across a fleet for those units that have not experienced issues.

The drafting team modified Requirement R6 of EOP-012-2 to require a shorter deadline to implement corrective actions for those generating units that experience a Generator Cold Weather Reliability Event. Do you agree with the revised timelines? Please provide any additional comments to consider. If you do not agree but believe the directive can be addressed in an equally effective and efficient manner, please provide your suggestions in the form of specific language changes for the drafting team. Please review the posted draft ERO Enterprise document, EOP-012-3 Generator Cold Weather CAP Extension and Constraint Process.

Wayne Sipperly - North American Generator Forum - 5 - MRO,WECC,Texas RE,NPCC,SERC,RF	
Answer	No
Document Name	EOP-012-3 Constraint and CAP Process 10172024 - NAGF comments final.pdf

Comment

The NAGF notes that the timelines for the CAPs may create a significant burden since the GO cannot simply take outages to address these issues. It is unclear if these outages will take priority over other outages due to the very short timelines required for compliance or if other outages, many of which are probably more important for reliability all year long, will take priority. As an example of this concern, in PJM planned outages are not allowed from the 24th week to the 36th week of each calendar year. In 2024, this means that an outage cannot be scheduled from June 10th to September 9th. The NAGF's experience with project planning and execution shows that a CAP for Cold Weather Reliability Events is unlikely to be developed, equipment purchased and delivered and labor lined up to perform the installation between the date of the event, say mid-January and June 10th, particularly if widespread failures due to extreme winter weather create such demand for retrofit equipment and installation services that supply chains simply cannot keep up. This means the GO will have 11 weeks between September 9 and December 1 to schedule an outage to perform the needed tasks. (And determine within the first 17 days of these 11 weeks if an extension may be needed under the proposed 60-day filing requirement in the process document.) The fall season is often filled to the maximum with planned outage work, and the resources needed to add massive new tasks at the last minute do not exist. Has NERC or FERC or any Balancing Authorities performed any review to see how many additional outages can be scheduled in these 11 weeks? Or is it possible that NERC and FERC (and the RTO/ISO Council that submitted the comments FERC based their order on) are going to create an unreasonable expectation?

Regardless of this concern, the Process document has many areas that raise concerns to the NAGF. The NAGF has provided a copy of the process document with comments to help the SDT understand the concerns. Some areas of concern raised by the process document includes a deadline to submit a request for CAP extension that does not take into account issues beyond the GO's control, a statement that the GO must first work with the CEA before filing the request, which effectively moves the deadline back even further, the statement requiring "due diligence in ordering" without defining exactly what the CEA may consider due diligence,

Another issue of concern is the requirement to file a constraint declaration for the same recurring event types. As an example, if a wind farm has blade icing occur in the winter of 2025, it must create a CAP, make a declaration, file the declaration and then every other year review that declaration. If the same wind farm (or different wind farm owned by the same entity) has a blade icing event in 2026, the same CAP, declaration and review will be required again. In the course of 10 years, this owner is likely to have 10 declarations for the same thing, reviewing 5 of them each year. This is not a mere theoretical concern; ice storms are quite common in the southern US, and having to make new filings for each one would constitute mere regulatory churn. This process will not improve reliability and will take time away from entities' ability to actually provide more reliable service to the grid. This process should be revised to address the need to process duplicative reports by generators.

Finally, it is unclear how the timelines proposed in the process document posted with the standard may impact compliance. As an example, if a Generator Owner files for a CAP extension 30 days before the CAP deadline, does this cause a violation? Or does the request get immediately denied

without review because it does not meet the timeline specified in the document and therefore the Generator Owner will be deemed to have violated the standard when they cannot complete the CAP by the deadline?

OPG supports HQ comments: 'The Generator Cold Weather CAP Extension and Constraint Process document should be updated to reflect Canadian-specific language regarding applicable governmental authorities, for example, similar to the language used in the footnote 11." OPG supports Manitoba Hydro's comment recommending that for non-US Registered Entities: Prior to the implementation of any element of a Corrective Action Plan developed in accordance with this Requirement all applicable corporate, regulatory, provincial, and federal evaluations and approvals must be completed and obtained. The applicable timeline for implementation of a Corrective Action Plan shall be determined by the Registered Entities Generator Owner. OPG supports BC Hydro's comment (freezing precipitation in Québec can and has occurred in March and April months) regarding Requirement "R6: Similar to previously submitted comments, in Québec, Canada, Generator Cold Weather Reliability Events such as freezing precipitation, can and have happened well into the Spring calendar months (including April and May). The requirement to develop a CAP within 150-days of the Event is reasonable. However, the first day of July deadline will considerably reduce the CAP development timeline for late Spring Events. Worst case scenario, for a May Event, identification of common failure causes, solution identification and CAP development would need to be done in less than 45 days, which may result in an inadequate CAP. The addition of the December 1 deadline to implement a CAP (R6 Part 6.1.5) would ensure that adequate CAPs are developed and implemented before the next Winter season. With the addition of the December 1 deadline, HQ recommends deleting "the first day of July" language. "

If the expectation is that Generator Owners are to monitor for Generator Cold Weather Reliability Events throughout the year, rather than only during the winter season, then please consider the following revisions:

1. Strike “before the first day of July” from Requirement R6 and simply require that Corrective Action Plans be developed no more than 150 days after the Generator Cold Weather Reliability Event. This ensures that each event receives the same amount of time, regardless of when it occurs.

2. Consider revising Requirement R6.1.5 to read, “A timetable specifying that implementation of the Corrective Action Plan shall be completed prior to the first day of December of the next calendar year following the Generator Cold Weather Reliability Event; and”

These revisions would provide greater flexibility to the Generator Owner to schedule any needed maintenance outages in a manner that better supports reliability and keeps generators online.

Jodirah Green - ACES Power Marketing - 1,3,4,5,6 - MRO,WECC,Texas RE,SERC,RF, Group Name ACES Collaborators

Answer	No
Document Name	

Comment

We at ACES greatly appreciate the monumental effort put forth by the drafting team in developing the proposed updates to EOP-012-2 in accordance with the FERC directives.

From the perspective of ACES, the proposed modifications to Requirement R6, while a good start, would benefit from further refinement. We believe that, as written, the timelines identified in Requirement R6 are too elastic and unduly discriminate against the GO based solely upon the date the generating unit(s) experienced a Generator Cold Weather Reliability event.

It is our opinion that the required compliance timeline would be best defined by removing the inherent obscurity associated with using specific calendar days. In short, we recommend using a timeline based solely on a defined quantity of calendar days and removing all references to explicit months and days. Please consider the following example scenarios as an illustration:

- Generating Unit 1 belonging to Entity A experiences a Generator Cold Weather reliability event on November 1st, 2024. Per the currently proposed version of Requirement R6, Entity A has until April 1st, 2025, to develop a CAP (150 days after).
- Generating Unit 2 belonging to Entity B experiences a Generator Cold Weather reliability event on March 17th, 2025. Per the currently proposed version of Requirement R6, Entity B has until June 30th, 2025, to develop a CAP (before the first day of July).
- In the above examples, Entity A is allowed 150 days after their event to develop a CAP whereas, Entity B is only allowed 90 days after the same event type to do the same.
    - This results in an unequal application of the Reliability Standard by granting Entity A an additional 60 calendar days to complete the same compliance activities as Entity B.
    - Assuming both entities develop a CAP within 100 calendar days of the event date:
        - Entity A would be compliant with Requirement R6.
        - Conversely, Entity B would be in violation of Requirement R6 and would potentially be subject to a compliance Penalty.

It is the viewpoint of ACES that entities should be provided with the **same** length of time to complete compliance activities required by a Reliability Standard. We recommend that the timeline be modified to 120 calendar days regardless of when the Generator Cold Weather Event occurs.

By examining NOAA Annual/Seasonal Climate Normals data, we were able to determine that almost all areas of the lower 48 US states experience the last spring freeze on or before May 28th (90% probability) and the first fall freeze on or after September 18th (90% probability). As there are 113 days between these two dates, we believe that a strict 120 calendar day metric is a reasonable alternative.

Additionally, it is our opinion that the timeline to address similar potential issues across a fleet for those units that have not experienced issues is too short. We are concerned that a GO with either a large generating fleet (large IOU) or limited resources (small electric cooperative), may not be able to complete all corrective actions on all applicable units within 24 calendar months. We believe that 36 calendar months is more appropriate to allow for variability between GOs across the industry.

Thus, we recommend modifying Requirement R6 as follows (note: for the sake of brevity, the requirement text for any sections without recommended changes has been omitted):

R6 Each Generator Owner shall, for each generating unit that has a calculated Extreme Cold Weather Temperature at or below 32 degrees Fahrenheit (zero degrees Celsius) as determined in Requirement R1 and that self-commits or is required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), develop and implement a Corrective Action Plan when the generating unit experiences a Generator Cold Weather Reliability Event. The Corrective Action Plan shall be developed no more than 120 calendar days after the Generator Cold Weather Reliability Event. The Generator Owner shall:

6.1.5. A timetable specifying that implementation of the Corrective Action Plan shall be completed within 12 calendar months of the Generator Cold Weather Reliability Event; and

6.1.6. A review of applicability to similar equipment freeze protection measures at generating units owned by the Generator Owner, with a specified timetable for corrective actions to be completed within 36 calendar months of the Generator Cold Weather Reliability Event.

Recent changes to Southwest Power Pool (SPP) policy require all planned outages for the summer season to be submitted by February 15th. With the proposed shortened timeline to implement and complete a Corrective Action Plan and the associated freeze protection measures, a late season Generator Cold Weather Reliability Event could require scheduling an outage that has not been authorized by SPP to implement required corrective actions by the proposed December 1st deadline. This would negatively impact an entity's Performance Based Accreditation (PBA) SPRM recommends an exception or preapproved extension for instances when implementing corrective actions would require an outage not authorized by an entity's Balancing Authority.

Reclamation does not agree. Shortening time frames does not alleviate the burden of lack of material, contracting resources or other schedulable items. Cost and timeframe are always intertwined. For example, government bid processes are often time consuming and shortening corrective action timeframe requirements could cause the entity to become non-compliant.

EEI does not object to the proposed shortened deadlines except for the language in Requirement R6, subpart 6.1.6. We understand 6.1.6 to mean that a GO is to complete freeze protection CAPs on similar equipment vulnerabilities within 24 months, however, we disagree that this is what the Commission directed in Paragraph 68 of the order. What they directed was that corrective actions needed to be taken on "similar equipment on all of its fleet within 24 months of becoming **aware of the freeze issue**." In other words, the clock should start after the GO has confirmed similar vulnerabilities on similar equipment on other generating resources. To address this issue, EEI suggests adding the following clarifying language to 6.1.6 as suggested below in boldface: **6.1.6.** A review of applicability **of** similar **freeze protection** equipment **installed on similar generating units within 12 calendar months of the of the Generator Cold Weather Reliability event** by the Generator Owner, with a specified timetable for corrective actions to be completed within 24 calendar months of **confirming a generating unit has similar equipment vulnerabilities**;

The Generator Cold Weather CAP Extension and Constraint Process document should be updated to reflect Canadian-specific language regarding applicable governmental authorities, for example, similar to the language used in the footnote 11.

Prior to the implementation of any element of a Corrective Action Plan developed in accordance with this Requirement all applicable corporate, regulatory, provincial, and federal evaluations and approvals must be completed and obtained. The applicable timeline for implementation of a Corrective Action Plan shall be determined by the Registered Entities Generator Owner.

NB Power supports BC Hydro's comment (freezing precipitation in Québec can and has occurred in March and April months) regarding Requirement "R6: Similar to previously submitted comments, in Québec, Canada, Generator Cold Weather Reliability Events such as freezing precipitation, can and have happened well into the Spring calendar months (including April and May). The requirement to develop a CAP within 150-days of the Event is reasonable. However, the first day of July deadline will considerably reduce the CAP development timeline for late Spring Events. Worst case scenario, for a May Event, identification of common failure causes, solution identification and CAP development would need to be done in less than 45 days, which may result in an inadequate CAP. The addition of the December 1 deadline to implement a CAP (R6 Part 6.1.5) would ensure that adequate CAPs are developed and implemented before the next Winter season. AES US Renewables are in agreement that any corrective actions needed to mitigate root cause(s) resulting from a Generator Cold Weather Reliability Event should be completed as expeditiously as possible. However, we have real concerns about the ability to complete the CAP by December 1 if the	

Generator Cold Weather Reliability Event (GCWRE) occurred in the same year. For example, winter storms in the northeast can still occur as late as in March. With that in mind, it will be difficult to develop a CAP, implement the CAP and complete the CAP within 7-8 months if a generating facility located in northeast is impacted by the GCWRE. This time constraint will be reduced even further if there is extension request involved since it requires submittal of the extension at least 60 days in advance of the due date (December 1).

Additionally, we have concerns that corrective actions need to be completed within 24 months of the GCWRE at other sites owned by the Generator Owner for same equipment or freeze protection measures implicated in the root cause analysis for a site that experienced a GCWRE. This proposal may work for GOs that don't own a lot of sites. However, for IPPs that have generating assets in multiple regions, 24 months is not a realistic timeframe to complete the corrective actions. It will require time to send out RFPs to multiple contractors and then for internal review of the contractor proposals as well as negotiations involved. This could take up several months in best case scenario. And depending on the work that needs to be done, it will

require coordination with site-level personnel and outage coordination with other entities (eg: BAs, TOPs). So, we strongly suggest modifying the 24 calendar months to at least 36 calendar months.

Current proposed R6 requirement language does not specify when the extension requests need to be made. However, a companion document (*EOP-012-3 Constraint and CAP Process 10172024.pdf*) indicated that "*Entities are encouraged to submit the extension request as soon as they are aware they will not meet the CAP completion date but no later than **60 days** before the original required completion date.*" We would like to understand if the 60 days timeline is enforceable if it is not used within the R6 language. Furthermore, R6 language does not state what happens when the extension request is denied. Only the companion document specifies that *(If an extension request is denied, the selected actions in the Corrective Action Plan need to be completed in accordance with the original timetables.*). Again, we would like to understand if the language in the companion document is enforceable.

It is stated in the companion document that if the extension request is denied, the CAP will need to be completed in accordance to its original timetable. This will not be feasible if the CAP extension request is submitted close to the December 1 deadline. The CEA is allowed minimum of 60 days for the whole extension approval process (15 days to acknowledge receipt and verify all information has been provided + 45 days of review before providing notification to registered entity on whether their request is approved or denied). There is potentially the need for the CEA to extend beyond the 45 days to perform their review. That will further reduce the length of time for the GO to complete the CAP based on original timeline if the CAP extension is denied. So, for a registered entity to implement the CAP prior to December 1, the time for CEA to review will eat into the time that registered entities have to investigate the GCWRE, develop CAP and implement CAP. Using the example for a GCWRE that occurs in March, this extension review process can reduce the time registered entity has from 7-8 months down to 5-6 months (which can be further reduced if certain ISO/RTO regions do not allow planned outages during certain times of the year like peak summer time). We request the drafting team to look into all possible scenarios to ensure that reasonable amount of time is allocated for developing CAP, implementing CAP and requesting CAP extension (if applicable). Currently, the timeline listed in R6 is not reasonable.

Under the proposed 6.1.5, there may be cases where remedies to correct results from an Extreme Cold Weather Reliability event may not be feasible to be completed by December due to vendor or supply chain issues. There should be some flexibility to allow for mitigation activities with longer lead times for complete resolution without going through a formal corrective action plan extension.

The additional approval process needed for an extension is very inefficient and builds in potential delays that, if an extension is not approved, can set back the timing of a plan, creating a potential violation itself. Approval decisions would need to be mandated to be made in a short timeframe if they are still included in the standard.

Finally, within the section, footnote 10 speaks to freeze events occurring outside a winter period, such as October and November. Please clarify what is the designated winter period as it relates to this standard.

Worst case scenario, for a May Event, identification of common failure causes, solution identification and CAP development would need to be done in less than 45 days, which may result in an inadequate CAP. The addition of the December 1 deadline to implement a CAP (R6 Part 6.1.5) would ensure that adequate CAPs are developed and implemented before the next Winter season. With the addition of the December 1 deadline, HQ recommends deleting "the first day of July" language. "

Dominion Energy supports EEI comments and further stipulates that the SDT has gone beyond the language and intent of the FERC Order. For larger generation entities with a diverse fleet, time for reviewing the specs for its fleet and identifiying potential cold weather issues should not be included in the 24 calendar month timeframe. Once the issue has been identified in a specific unit the clock should begin.

The 3 types of items required to complete a Corrective Action Plan (CAP) under R1, R2 and R3 are the same 3 types of items required to complete a Corrective Action Plan under R6, qualified personnel, proper materials, and the required plant conditions. Any repair or modification that can reasonably be completed before December 1st in fact should be completed, however any repair or modification that needs an outage or if qualified materials and people are not available CAP completion may have to wait until the next planned outage. Planned outages are scheduled to maintain reliability. Adding unplanned outages either postpones scheduled outages or forces outages into periods of time when demand is high therefore reducing the reliability to satisfy load requirements. The expertise for making decisions regarding the timing repairs is best left with the GOs, GOPs, and BAs. Any event after February 2nd will be due by July 1st. If the CEA takes 60 days to make a decision on an extension it is now August 30th. If that decision is NO, there are only 93 days until December 1st. Forcing completion of a CAP needing an extension will require either unqualified personnel, improper materials, or and Unplanned Outage. All of which impact BES reliability. Instead of requiring CEA approval, require the entity to keep evidence justifying the decision to make the repair later than December 1st. This is appropriate for audit during a subsequent audit.

Duke Energy does not support the language used in requirement R6.1.5 which requires the resolution of all winter event corrective actions by December 1st of the following year. This interval is too restrictive to allow for evaluation and correction on many freeze protection repairs or for the installation of new freeze protection measures. The inadequacies of this time interval are compounded when the effects of a major winter storm are considered. Large storms, like Elliott or a Polar Vortex, impact multiple units across multiple utilities. It would be difficult for a GO to address multiple events in this timeframe with available vendor support, and competing against other utilities for these vendors will only make this situation worse. Maintaining R6.1.5 as proposed will also result in higher levels of extension approvals for CEAs to process. Duke Energy recommends the requirement be modified to a period of 24 calendar months.

Manitoba Hydro recommends that for non-US Registered Entities: Prior to the implementation of any element of a Corrective Action Plan developed in accordance with this Requirement all applicable corporate, regulatory, provincial, and federal evaluations and approvals must be completed and obtained. The applicable timeline for implementation of a Corrective Action Plan shall be determined by the Registered Entities Generator Owner.	

Manitoba Hydro supports Hydro Quebec's comment: "The Generator Cold Weather CAP Extension and Constraint Process document should be updated to reflect Canadian-specific language regarding applicable governmental authorities, for example, similar to the language used in the footnote 11."

Manitoba Hydro supports BC Hydro's comment (freezing precipitation in Manitoba can and has occurred in March and April months): "Requirement R6: Similar to previously submitted comments, in British Columbia, Canada, Generator Cold Weather Reliability Events such as freezing precipitation, can and have happened well into the Spring calendar months (including April and May). The requirement to develop a CAP within 150-days of the Event is reasonable. However, the first day of July deadline will considerably reduce the CAP development timeline for late Spring Events. Worst case scenario, for a May Event, identification of common failure causes, solution identification and CAP development would need to be done in less than 45 days, which may result in an inadequate CAP. The addition of the December 1 deadline to implement a CAP (R6 Part 6.1.5) would ensure that adequate CAPs are developed and implemented before the next Winter season. With the addition of the December 1 deadline, BC Hydro recommends deleting "the first day of July" language. "

Answer	No
Document Name	

Comment

Taking unplanned maintenance outages to meet a CAP deadline or pivot from a rejected CAP extension could be overburdensome to the GO. Clarity around timeliness expectations and exceptions could help alleviate pressure. Additionally, maintenance outages are typically planned during off-peak times. This limits availability to schedule last minute changes prior to the winter period.

1. Requirement R6: Similar to previously submitted comments, in British Columbia, Canada, Generator Cold Weather Reliability Events (Events) such as freezing precipitation, can and have happened well into the Spring calendar months (including April and May). The requirement to develop a Corrective Action Plan (CAP) within 150 days of the Event is reasonable. However, the July 1 deadline will considerably reduce the CAP development timeline for late Spring Events. Worst case scenario, for a May Event, identification of common failure causes, solution identification and CAP development would need to be done in less than 45 days, which may result in an inadequate CAP. The addition of the December 1 deadline to implement a CAP (R6 Part 6.1.5) would ensure that adequate CAPs are developed and implemented before the next Winter season. With the addition of the December 1 deadline, BC Hydro recommends deleting "the first day of July" language.
2. Requirement R6 Part 6.1.6 requires corrective actions be implemented to similar equipment freeze protection measures (FPMs) within 24 calendar months of a GCWRE. BC Hydro interprets "similar equipment freeze protection measures" as existing FPMs, and therefore the Part 6.1.6 timeline of 24 calendar months only applies to existing FPMs. Any identified need for new FPMs will follow a similar timeline to R7.1.2 which is up to 48 calendar months. Given the BC Hydro fleet size and possible differing design solutions for the same cause at different locations throughout the fleet, a longer implementation timeline (36 calendar months to 48 calendar months) may be required for new FPMs. BC Hydro requests that the DT confirm this understanding or clarify the timeline expectation for new FPMs implementation.
3. BC Hydro recommends that R6 Part 6.2.1 be revised to replace "how" with "why" for which better explains the rationale for circumstances beyond an entity's control.
4. Requirement R6 Part 6.1. "Ensure the Corrective Action Plan contains at a minimum:". BC Hydro notes that this wording does not align with other Standard Requirements that list what must be in a Procedure, Plan, etc. BC Hydro recommends revising the wording in R6 as appropriate so Part 6.1 would be: "6.1 The Corrective Action Plan shall include:"

Comment	

PNM agrees with the comments of EEI:

EEI does not object to the proposed shortened deadlines except for the language in Requirement R6, subpart 6.1.6. We understand 6.1.6 to mean that a GO is to complete freeze protection CAPs on similar equipment vulnerabilities within 24 months, however, we disagree that this is what the Commission directed in Paragraph 68 of the order. What they directed was that corrective actions needed to be taken on "similar equipment on all of its fleet within 24 months of becoming ***aware of the freeze issue****." In other words, the clock should start after the GO has confirmed similar vulnerabilities on similar equipment on other generating resources. To address this issue, EEI suggests adding the following clarifying language to 6.1.6 as suggested below in boldface:*

6.1.6. *A review of applicability* ***to of*** *similar* ***freeze protection*** *equipment* ***installed on similar generating units within 12 calendar months of the of the Generator Cold Weather Reliability event freeze protection measures at generating units owned*** *by the Generator Owner, with a specified timetable for corrective actions to be completed within 24 calendar months of* ***the Generator Cold Weather Reliability Event confirming a generating unit has similar equipment vulnerabilities****;*

Section 6.2 adequately addresses this situation, and Section 7.3 provides clarity on what needs to be submitted. From a Generator Owner (GO) perspective, here is some background on the likely reasoning for CAP extension requests and what the GO should be briefed on regarding expected deliverables: If an engineering study or similar activity is required to assess the balance of freeze protection measures, the GO may need to request a CAP extension. This is because such activities can take considerable time, depending on non-recurring O&M budgeting and implementation policies. The GO should be prepared to file a CAP extension request with a plan and timeline as soon as practicable, based on the known implementation timeline for assessing similar freeze protection measures.

NERC needs to provide more clarity about where the CAP Extension and Constraint Process documents will be posted on NERC's website to make them easy to access. Also, if these processes are to be done through NERC's ERO Portal, and Registered Entities must file these through a Regional Entity, a contact for each Region should be established and published so Registered Entities will have a contact to address any process or access issues with the ERO Portal.

While AEP agrees with the overall substance of R6, we recommend that it be revised to indicate what it means to properly "implement" a Corrective Action Plan. Does it perhaps mean to complete what is later specified and required in R6.1, or something else entirely? If so, the phrase "complete the obligations of R6.1" may be preferable to "implement the Corrective Action Plan." AEP requests this clarity be provided in the obligation.

R6 states, “develop and implement” a Corrective Action Plan…”, with “and implement” being added in this version. For the situation where a CAP is not being developed but a Generator Cold Weather Constraint is being submitted, the “and implement” does not seem to fit this scenario.

Also, Southern believes the intent for R6 is to require 6.1 and 6.2, **or** 6.3 and not to require all items in R6.1. For example, a timetable as mentioned in R6.1.5. If a Generator Cold Weather Constraint is declared, then a timetable obviously should not be required.

In addition, then requirement in R6.1.5 could be a very aggressive goal especially if outages, manpower, or material limitations arise. Assuming these types of problems are deemed valid, then an extension would have to be approved.

In addition, Southern agrees with the comments from NAGF related to the short timelines and potential difficulty scheduling outages for CAPS that involve taking a unit off for the necessary work. Southern does not agree that a Compliance Enforcement Authority's (CEA) approval of a CAP is consistent with a risk-based action that improves reliability. The insertion of the CEA into a registered entity's process of mitigating a reliability concern adds unneeded and burdensome administrative layers. The NERC standard should solely focus on identifying the problem and implementation of mitigating actions, both of which are in the registered entity's purview. The provision of an entity's mitigation plan to the CEA should be required, but only for compliance enforcement purposes. Actions that allow the CEA to go beyond an audit of the implementation plan are out of scope of the standard.

3. In paragraph 70 of the June 2024 Order, FERC directed NERC to develop and submit modifications to Requirement R7 of Reliability Standard EOP-012-2 to ensure that any extension of a corrective action plan implementation deadline beyond the maximum implementation timeframe required by the proposed Reliability Standard is pre-approved by NERC.

The drafting team provided language changes in Requirements R6 and R7 for a Corrective Action Plan extension process. Do you believe that the proposed language changes meet the intent of paragraph 70 of the FERC Order? Please provide any additional comments to consider. If you do not agree but believe the directive can be addressed in an equally effective and efficient manner, please provide your suggestions in the form of specific language changes for the drafting team.

Anna Martinson - MRO - 1,2,3,4,5,6 - MRO, Group Name MRO Group	
Answer	No
Document Name	
Comment	

MRO NSRF recommends that dates for which a registered entity is to be held to must be in the Requirement.

MRO NSRF recommends there be an “approval by default” if the CEA does not respond within a given period, for example 30 days after submittal to CEA.

MRO NSRF recommends that the existing 60-day corrective action plan extension request have caveats for scenarios when it is not determined until within in the 60 day period that an extension is required. There are various obvious scenarios where this is a real and realized risk, with causes outside of the control of the entity, and must be addressed.

Does the R6.2 footnote 11 exclude Canadian entities from having to request CAP extensions. Is this interpretation correct? Please advise. R6 and R7 requirements regarding pre-approval of CAPs by NERC use language that is similar to the TPL-007 standard. TPL-007 has a Canadian Variance where implementation of Corrective Action Plan(s) that require capital investment must be approved by the applicable provincial regulatory authority. This project should consider whether Canadian-specific language is needed in Requirements R6, R7 and R8 to align with the regulatory practices/processes in Canada for approving Corrective Action Plan(s) requiring capital investments. HQ supports Manitoba Hydro's comment "Manitoba Hydro recommends that for non-US Registered Entities, this additional language/guidance be added to footnote 11 and 12: Prior to the implementation of any element of a Corrective Action Plan developed in accordance with this Requirement all applicable corporate, regulatory, provincial, and federal evaluations and approvals must be completed and obtained. Similar to the comment on proposed R6, current proposed R7.3 requirement language does not specify when the extension requests need to be made. However, a companion document (*EOP-012-3 Constraint and CAP Process 10172024.pdf*) indicated that "*Entities are encouraged to submit the extension request as soon as they are aware they will not meet the CAP completion date but no later than **60 days** before the original required completion date.*" We would like to understand if the 60 days timeline is enforceable if it is not used within the R7 language. Furthermore, R7 language does not state what happens when the extension request is denied. Only the companion document specifies that *(If an extension request is denied, the selected actions in the Corrective Action Plan need to be completed in accordance with the original timetables.*). Again, we would like to understand if the language in the companion document is enforceable.

Additionally, the reference to R2 in R7's language needs to be more specific. R2 is split into two parts – R2.1 and R2.2. Only R2.1 is allowed to have CAP. Recommend modifying the R7 language as following:

*Each Generator Owner, for each Corrective Action Plan developed pursuant to Requirements R1, **R2 Part 2.1**, or R3 shall, as applicable:*

Although the changes made to Requirements R6 and R7 comply with the intent of the FERC Order, there needs to be more detail defining the timelines associated with the CEA reviews and determinations. We further ask that consideration be given to including an appeals process for a denial of a Corrective Action Plan extension. While we understand that NERC is not bound to Requirements contained in Reliability Standards, determinations that represent the denial of a CAP extension may be caused by a misunderstanding or missing information that can be resolved through an appeals process.

EEI additionally questions the value of Footnotes 11 and 12, which state that extension requests will be evaluated in accordance with NERC processes and extension requests for non US-Registered entities should be implemented in a manner consistent with the responsible government authority. Given NERC or applicable governmental authorities or agencies in non-US jurisdiction are not subject to Requirements within NERC Reliability Standards, these footnotes have no utility and should be removed.

As stated above, the timelines for the CAPs may create a significant burden since the GO cannot simply take outages to address these issues or may face other barriers. It would be highly counterproductive regarding reliability assurance for NERC to insist that these outages must take priority over other outage work that has long been planned and is critically needed. This issue needs clarification to ensure the standard is clear and unambiguous. The NAGF also recommends that the R7 language be modified to only refer to R2, Part 2.1 since CAP is not allowed under 2.2.

R6 and R7 requirements regarding pre-approval of CAPs by NERC use language that is similar to the TPL-007 standard. TPL-007 has a Canadian Variance where implementation of Corrective Action Plan(s) that require capital investment must be approved by the applicable provincial regulatory	

authority. This project should consider whether Canadian-specific language is needed in Requirements R6, R7 and R8 to align with the regulatory practices/processes in Canada for approving Corrective Action Plan(s) requiring capital investments.

NB Power supports Manitoba Hydro's comment "Manitoba Hydro recommends that for non-US Registered Entities, this additional language/guidance be added to footnote 11 and 12: Prior to the implementation of any element of a Corrective Action Plan developed in accordance with this Requirement all applicable corporate, regulatory, provincial, and federal evaluations and approvals must be completed and obtained. The applicable timeline for implementation of a Corrective Action Plan shall be determined by the Registered Entities Generator Owner.

Although the changes made to Requirements R6 and R7 comply with the intent of the FERC Order, there needs to be more detail defining the timelines associated with the CEA reviews and determinations. We further ask that consideration be given to including an appeals process for a denial of a Corrective Action Plan extension. While we understand that NERC is not bound to Requirements contained in Reliability Standards, determinations that represent the denial of a CAP extension may be caused by a misunderstanding or missing information that can be resolved through an appeals process.

We additionally question the value of Footnotes 11 and 12, which state that extension requests will be evaluated in accordance with NERC processes and extension requests for non US-Registered entities should be implemented in a manner consistent with the responsible government authority. Given NERC or applicable governmental authorities or agencies in non-US jurisdiction are not subject to Requirements within NERC Reliability Standards, these footnotes have no utility and should be removed.

Recommend that any corrective action plan approval and extension that is requested be handled by a single senior management official with overall authority and responsibility for leading and managing implementation of and continuing adherence to the requirements within the NERC EOP-012 cold weather standards and not at the Compliance Enforcement Authority (CEA). The CEA will then be able to audit the process as required.

Given NERC or applicable governmental authorities or agencies in non-US jurisdiction are not subject to Requirements within NERC Reliability Standards, these footnotes have no utility and should be removed.	

Additionally, NV Energy recommends that dates for which a registered entity is to be held to must be in the Requirement.

NV Energy also recommends there be an “approval by default” if the CEA does not respond within a given period, for example 30 days after submittal to CEA.

Lastly, NV Energy recommends that the existing 60-day corrective action plan extension request have caveats for scenarios when it is not determined until within in the 60-day period that an extension is required. There are various obvious scenarios where this is a real and realized risk, with causes outside of the control of the entity, and must be addressed.

PNM agrees with the comments of Texas RE:

In Requirement Part 6.1.6, Texas RE recommends the SDT take a similar approach to PRC-004-6 Requirement R5 to ensure that applicable entities will conduct an evaluation of all similar equipment, document which equipment needs a CAP to be completed within 24 hours and which equipment does not need a CAP. Texas RE recommends the following revision:

6.1.6 An evaluation of applicability to similar equipment freeze protection measures at generating units owned by the Generator Owner:

Develop a Corrective Action Plan (CAP) for the identified similar equipment freeze protection measures to be completed within 24 calendar months of the Generator Cold Weather Reliability Event; or

Explain in a declaration why corrective actions are beyond the entity's control or would not improve BES reliability, and that no further corrective actions will be taken.

M6 Each Generator Owner will have documented evidence that it developed and implemented a Corrective Action Plan following a Cold Weather Reliability Event at an applicable unit in accordance with Requirement R6. Acceptable evidence may include, but is not limited to, the following dated documentation (electronic or hardcopy format): Corrective Action Plan(s), Generator Cold Weather Constraint(s), completed work orders, copies of any Corrective Action Plan extension requests and supporting documentation, and updated cold weather preparedness plan(s) where indicated as needed by the Corrective Action Plan. ***Each Generator owner shall have dated evidence that demonstrates it developed a CAP and an evaluation of the CAP's applicability to other equipment freeze protection measures, or a declaration in accordance with Requirement Part 6.1.6.***

Comment
The SRC generally agrees with the drafting team's proposed language, and recommends the following additional revisions. First, the SRC recommends that the deadline for developing a CAP in Requirement R6 be revised from "before the first day of July" to "before the first day of ***the following*** July" to help minimize potential ambiguity regarding the CAP development deadline. Second, the SRC recommends that Part 6.2 of Requirement R6 be revised to clarify that CEA review and approval is not needed in scenarios in which the actions in the CAP need to be updated, but the updates will not require extension of the timelines in Part 6.1. The SRC therefore recommends that the beginning of Part 6.2 be revised to read as follows: "If it determines that it may need to exceed a timeline in Part 6.1, update the Corrective Action Plan . . ." Third, the SRC recommends including a timeline for submitting extension requests (for example, 60 days before the first deadline that would be impacted by the extension request). This would help reduce last-minute extension requests and ensure the CEA has adequate time to review and process extension requests. Finally, the SRC recommends that the beginning of Part 6.2.1 be revised to read "an explanation of the circumstances . . ." to better fit the overall structure of the list of elements of Part 6.2.

OPG supports HQ comments: "The Generator Cold Weather CAP Extension and Constraint Process document should be updated to reflect Canadian-specific language regarding applicable governmental authorities, for example, similar to the language used in the footnote 11." OPG supports Manitoba Hydro's comment recommending that for non-US Registered Entities: Prior to the implementation of any element of a Corrective Action Plan developed in accordance with this Requirement all applicable corporate, regulatory, provincial, and federal evaluations and approvals must be completed and obtained. The applicable timeline for implementation of a Corrective Action Plan shall be determined by the Registered Entities Generator Owner. OPG supports BC Hydro's comment (freezing precipitation in Québec can and has occurred in March and April months) regarding Requirement "R6: Similar to previously submitted comments, in Québec, Canada, Generator Cold Weather Reliability Events such as freezing precipitation, can and have happened well into the Spring calendar months (including April and May). The requirement to develop a CAP within 150-days of the Event is reasonable. However, the first day of July deadline will considerably reduce the CAP development timeline for late Spring Events. Worst case scenario, for a May Event, identification of common failure causes, solution identification and CAP development would need to be done in less than 45 days, which may result in an inadequate CAP. The addition of the December 1 deadline to implement a CAP (R6 Part 6.1.5) would ensure that adequate CAPs are developed and implemented before the next Winter season. With the addition of the December 1 deadline, HQ recommends deleting "the first day of July" language. "

4. In paragraph 72 of the June 2024 Order, FERC directed NERC to develop and submit modifications to Requirement R7 of Reliability Standard EOP-012-2 to clarify that any Requirement R7 corrective action plans for new generation (i.e. commercially operational after October 1, 2027) must be completed prior to the generating unit's commercial operation date.

The drafting team provided updated language in Requirement R2 Part 2.1 to address the issue of units in different stages of design and construction. February 16, 2023 was chosen as a date of demarcation as that was the date the Extreme Cold Weather Temperature was approved by FERC. Do you agree that revisions to Requirement R2 Part 2.1 address this directive? If you do not agree but believe the directive can be addressed in an equally effective and efficient manner, please provide your suggestions in the form of specific language changes for the drafting team.

Comment

Invenergy disagrees that the revisions to Requirement 2 address the FERC directive. If the intent is for corrective action plans to be completed prior to the generating unit's commercial operation date and for the entity to have the capability to operate at the unit's ECWT for at least 12 hours, then it is unnecessary to divide this requirement into separate tracks based on the approval date of the ECWT definition. As such, we recommend returning to the language of EOP-012-2 and replacing the CAP language with constraint declaration language.

If two tracks are to be pursued, then we disagree that February 16, 2023, is the most reasonable date of demarcation to address the issue of units in different stages of design and construction and instead proposes October 1, 2024.

The effective date of EOP-012-2 presents as a more reasonable alternative by which industry would have received sufficient notice of the approval of the ECWT definition and had an opportunity to calculate that value for incorporation in the design criteria of new generating units.

Jeffrey Streifling - NB Power Corporation - 1	
Answer	No
Document Name	
Comment	
There is no reason to split the language into two parts around February 16, 2023. Requirement R2 will only apply once the unit is in commercial operation, and a corrective action plan for freeze protection measures that is required to be completed prior to commercial operation is not really different from simply requiring the freeze protection measures to be in place as of the date of commercial operation. The language in R2 should be updated to provide 32 km/hr as an equivalent wind speed to 20 mph." NB Power supports BC Hydro's comments: "Under Requirement R2, BC Hydro recommends that instead of referencing the February 16, 2023 date in the Requirement and having a footnote, remove the date in the Requirement and add the wording "date on which the definition of Extreme Cold Weather Temperature was approved in the relevant jurisdiction." This will help with the process of standard adoption in non-FERC regulated jurisdictions, such as Canada." The date of February 16, 2023, when the definition of Extreme Cold Weather Temperature was approved by FERC it is not equivalent with a compliance requirement, unless accompanied by an applicable effective standard. The recommendation is to use instead the effective date for the new EOP-012-3 to be enforceable for non-US entities, as applicability criteria for the Generator Owner first contractual commitment to design criteria.

As drafted, it is unclear if a unit constructed after 2027 would be in violation of R2 if it experiences a Generator Cold Weather Reliability Event. As an example, if the new unit is built with the design specified to be to -10 deg F and a 20-mph wind where the ECWT is 0, is there a violation if a GCWRE occurs and the cause is determined to be an error in the calculation made by the construction engineer? Or is the fact that you have a document that says the design should meet the ECWT plus 20 mph wind sufficient for compliance with R2, regardless of performance?

Comment

AES US Renewables believe the February 16, 2023 date should not be used as demarcation. Typically, once FERC approves a standard, there is a period prior to the standard becoming enforceable. Using the FERC approval date does not follow the typical implementation process and is unreasonable. Instead it should follow the EOP-012-1 Implementation Plan that was part of the package that was approved by FERC on 2/16/2023. Per the Implementation Plan, EOP-012-1 along with the definitions of three new terms were supposed to become effective on 10/1/2024. We strongly recommend using 10/1/2024 as the demarcation date.

Manitoba Hydro support Hydro Quebec's comment: "There is no reason to split the language into two parts around February 16, 2023. Requirement R2 will only apply once the unit is in commercial operation, and a corrective action plan for freeze protection measures that is required to be completed prior to commercial operation is not really different from simply requiring the freeze protection measures to be in place as of the date of commercial operation. As an aside, the language in R2 should be updated to provide 32 km/hr as an equivalent wind speed to 20 mph."

Manitoba Hydro supports BC Hydro's comments: "Under Requirement R2, BC Hydro recommends that instead of referencing the February 16, 2023 date in the Requirement and having a footnote, remove the date in the Requirement and add the wording "date on which the definition of Extreme Cold Weather Temperature was approved in the relevant jurisdiction." This will help with the process of standard adoption in non-FERC regulated jurisdictions, such as Canada."

NRG does not have any concern with the designation of Feb 16, 2023 as the date of demarcation for when the corrective actions would be required for units that achieve commercial operation after Oct 1, 2027. NRG believes that the sub bullet for documenting a declaration with justification for a Generator Cold Weather Constraint should be applicable to R2.1 as well as R2.2.

OPG support NB Power's comment: "There is no reason to split the language into two parts around February 16, 2023. Requirement R2 will only apply once the unit is in commercial operation, and a corrective action plan for freeze protection measures that is required to be completed prior to commercial operation is not really different from simply requiring the freeze protection measures to be in place as of the date of commercial operation. As an aside, the language in R2 should be updated to provide 32 km/hr as an equivalent wind speed to 20 mph." OPG support HQ comment: "Under Requirement R2, we recommends that instead of referencing the February 16, 2023 date in the Requirement and having a footnote, remove the date in the Requirement and add the wording "date on which ECWT definition becomes effective in the relevant jurisdiction." This will help with the process of standard adoption in non-FERC regulated jurisdictions, such as Canada." OPG has the following alternative comment: The date of February 16, 2023, when the definition of Extreme Cold Weather Temperature was approved by FERC it is not equivalent with a compliance requirement, unless accompanied by an applicable effective standard. The recommendation is to use instead the effective date for the new EOP-012-3 to be enforceable for non-US entities, as applicability criteria for the Generator Owner first contractual commitment to design criteria.

Texas RE has the following comments on Requirement R2:

Texas RE suggests a grammatical review be conducted for the second bullet in Requirement Part 2.1. It looks like there either a misplaced parenthetical or it needs a closing parenthetical, or it needs an “or” or an “and” after the first comma.

Texas RE is concerned that the measures do not require dated evidence for demonstrating contractual design criteria commitment before February 16, 2023. Texas RE recommends the following revision to the measure (in bold):

M2. Each Generator Owner will have dated evidence that demonstrates it has freeze protection measures for its unit(s) in accordance with R2, or it has developed a Corrective Action Plan or declared a Generator Cold Weather Constraint for the identified issues. **Each GO shall have dated evidence that demonstrates the signed contractual design criteria commitments in accordance with 2.1 and/or 2.2.** Acceptable evidence may include the following (electronic or hardcopy format): Identification of generating unit(s) minimum temperature under Requirement R1 Part 1.2.2 which is equal to or less than the unit’s Extreme Cold Weather Temperature, documentation of freeze protection measures, Corrective Action Plan(s) (if applicable), and Generator Cold Weather Constraints (if applicable).

5. In paragraph 72 of the June 2024 Order, FERC directed NERC to develop and submit modifications to Requirement R7 of Reliability Standard EOP-012-2 to clarify that any Requirement R7 corrective action plans for new generation (i.e. commercially operational after October 1, 2027) must be completed prior to the generating unit's commercial operation date.

The drafting team provided updated language in Requirement R2 Part 2.2 to address the issue of units in newer stages of design and construction. February 16, 2023 was chosen as a date of demarcation as that was the date the Extreme Cold Weather Temperature was approved by FERC. Units committed to design criteria on or after February 16, 2023 do not have the option to utilize a Corrective Action Plan but may still declare a Generator Cold Weather Constraint. Do you agree that revisions to Requirement R2 Part 2.2 address this directive? If you do not agree but believe the directive can be addressed in an equally effective and efficient manner, please provide your suggestions in the form of specific language changes for the drafting team.

Invenergy disagrees that the revisions to Requirement 2 address the FERC directive. If the intent is for corrective action plans to be completed prior to the generating unit's commercial operation date and for the entity to have the capability to operate at the unit's ECWT for at least 12 hours, then it is unnecessary to divide this requirement into separate tracks based on the approval date of the ECWT definition. As such, we recommend returning to the language of EOP-012-2 and replacing the CAP language with constraint declaration language. If two tracks are to be pursued, then we disagree that February 16, 2023, is the most reasonable date of demarcation to address the issue of units in different stages of design and construction and instead proposes October 1, 2024. The effective date of EOP-012-2 presents as a more reasonable alternative by which industry would have received sufficient notice of the approval of the ECWT definition and had an opportunity to calculate that value for incorporation in the design criteria of new generating units.

Kennedy Meier - Electric Reliability Council of Texas, Inc. - 2, Group Name ISO/RTO Council Standards Review Committee (SRC)

Answer	Yes
Document Name	

Comment

The SRC recommends that the upcoming technical conference include discussion of the extent to which it is appropriate to allow constraints under Part 2.2 of Requirement R2, as the units described in Part 2.2 should generally be designed and constructed to achieve the necessary level of extreme cold weather performance, and the standard should incentivize the development of more effective freeze protection measures over the course of time. If the discussion indicates that there is a technical basis for allowing constraints for this category of units, it should also address whether these units should qualify for all of the constraint criteria listed in Attachment 1 or only a subset of the criteria.

Subject to any additional information that may become available at the technical conference, the SRC recommends that if constraints are allowed for the units described in Part 2.2 of Requirement R2, these units should only be eligible to declare constraints under item 5 of the case-by-case constraint list. In light of the goal of incentivizing development of more effective freeze protection measures, the SRC believes the accelerated review process used for the accelerated approval constraint list is not appropriate for the units described in Part 2.2. Any constraint declared by a Part 2.2 unit should be reviewed under item 5 of the case-by-case constraint list, even if the constraint might otherwise fall under the accelerated approval constraint list.

Texas RE recommends clarifying some of the footnotes: • Footnote 1 - Reword to remove “this designation”. Texas RE suggests the following verbiage: “COD means that the facility has received all approvals necessary for operation after completion of initial start-up testing.” • Footnotes 3 and 5 - Include the word “dated”. Texas RE suggests the following verbiage: “Such commitments would be demonstrated by dated and signed contractual commitments, **dated** emailed correspondence agreeing to thermal design criteria, or other similar dated documented evidence.” • In Footnotes 4 and 6, Texas RE recommends the date be clearer. As it is currently written, it is referring to the date of the governmental authority’s order. Is this the intent? If the intent is to refer to the effective date of the definitions, it should state that and reference the implementation plan.

OPG supports BC Hydro's comments: "Under Requirement R2, BC Hydro recommends that instead of referencing the February 16, 2023 date in the Requirement and having a footnote, remove the date in the Requirement and add the wording "date on which the definition of Extreme Cold Weather Temperature was approved in the relevant jurisdiction." This will help with the process of standard adoption in non-FERC regulated jurisdictions, such as Canada." OPG supports NB Power's comment: "The second option in Part 2.2 opens the possibility of a Generator Cold Weather Constraint, including a pre-approving constraints based on criteria in Attachment 1 that may not be appropriate in the future. Future units should simply be engineered to provide	

the required freeze protection measures. If there is any need for exceptions, they should be handled on a case-by-case basis. As an aside, the language in R2 should be updated to provide 32 km/hr as an equivalent wind speed to 20 mph." OPG has the following alternative comment: The date of February 16, 2023, when the definition of Extreme Cold Weather Temperature was approved by FERC it is not equivalent with a compliance requirement, unless accompanied by an applicable effective standard. The recommendation is to use instead the effective date for the new EOP-012-3 to be enforceable for non-US entities, as applicability criteria for the Generator Owner first contractual commitment to design criteria.

6. In paragraph 76 of the June 2024 Order, FERC directs NERC to develop and submit modifications to Requirement R7 of Reliability Standard EOP-012-2 to address certain ambiguities by expanding on Requirement R7.1.1 and 7.1.2 to make it clear which corrective action plan implementation deadline applies when a generator owner must implement both remedying issues with existing and installing new freeze protection measures.

The drafting team clarified Requirement R7 for Corrective Action Plans developed in accordance with Requirements R1, R2, or R3. Do you agree that revisions to Requirement R7 address this directive to differentiate between the existing and new freeze protection measures? If you do not agree but believe the directive can be addressed in an equally effective and efficient manner, please provide your suggestions in the form of specific language changes for the drafting team.

Jodirah Green - ACES Power Marketing - 1,3,4,5,6 - MRO,WECC,Texas RE,SERC,RF, Group Name ACES Collaborators

Answer	No

Comment

We at ACES understand the difficulty faced by the drafting team in complying with this FERC directive. We especially appreciate the effort taken by the drafting team to limit the scope of the changes while also complying with the FERC directive. However, we feel as though the addition to the language of part 7.1.1 creates more confusion than it remedies. We recommend that the drafting team consider other alternatives such as adding an additional sub-part to both Part 7.1.1 and Part 7.1.2.

We recommend modifying Requirement R7, Part 7.1as follows:

R7. Each Generator Owner, for each Corrective Action Plan developed pursuant to Requirements R1, R2, or R3 shall, as applicable:

7.1 Include a timetable for implementing the applicable type(s) of corrective action(s) that shall:

7.1.1. List modification(s) to existing (or previously planned pursuant to Requirement 2, Part 2.1) freeze protection measures, if any;

7.1.1.1. Any item listed in accordance with Part 7.1.1 shall be completed within 24 calendar months of completing development of the Corrective Action Plan.

7.1.2. List new freeze protection measures, if any, and

7.1.2.1 Any item listed in accordance with Part 7.1.2 shall be completed within 48 calendar months of completing development of the Corrective Action Plan.

7.1.3. Describe the updates to the cold weather preparedness plan required under Requirement R4 to identify the updates or additions to the Generator Cold Weather Critical Components and their freeze protection measures.

The 3 types of items required to complete a Corrective Action Plan (CAP) under R1, R2 and R3 are the same 3 types of items required to complete a Corrective Action Plan under R6, qualified personnel, proper materials, and the required plant conditions. A Cold Weather Reliability Event does not change the circumstances required to correct the cause. Evidence to support implementation timelines should be retained for following audits of the Standard.

Comment

Requirement R7: in Parts 7.1.1 and 7.1.2 the current wording " list the action(s) … to be completed" can be seen as ambiguous as to which actions need to be listed, i.e. whether all actions need to be planned for completion within in the specified timeframe, or whether only those actions planned to be completed in the timeframe would need to be listed.

As well, in Part 7.1.1 adding the "regardless of any longer timelines in … associated with new freeze protection measures;" may add ambiguity, i.e. 7.1.2 is for new FPM so adding this to existing FPM could cause confusion on expectations. As well, in Part 7.1.2, the wording "List the action(s) which require(s) new freeze protection measures …" is ambiguous and could be interpreted as listing items such as, Needing a CAP due to a recalculated Temperature per Part 1.1.1, as opposed to actions to implement such as, Select vendor to supply new FPM.

BC Hydro recommends revising R7 and Parts 7.1 with its subparts 7.1.1 through 7.1.3 for clarity. Please see suggested wording below:

R7. Each Generator Owner, for each Corrective Action Plan developed pursuant to Requirements R1, R2, or R3, shall:

7.1. Include a timetable for implementing the Corrective Action Plan that:

7.1.1. For remediating issues with existing freeze protection measures, if any, the corrective actions shall be completed within 24 calendar months of completing development of the Corrective Action Plan; and

7.1.2. For adding new freeze protection measures, if any, the corrective actions shall be completed within 48 calendar months of completing development of the Corrective Action Plan; and

7.2. Contain a description of the updates to the cold weather preparedness plan required under Requirement R4 to identify updates or additions to the Generator Cold Weather Critical Components and their freeze protection measures, if required.

7. The drafting team provided language in the Implementation Plan to address parts 3 through 5 of paragraph 4 of the June 2024 Order addressing FERC's concerns regarding urgency. The Standard language updates were written to meet the core directives in an effective and efficient manner while providing language that is objective, unambiguous, and auditable. With EOP-012-2 already effective October 1, 2024 (with the exception of Requirement R3), the changes made were intended to meet the FERC Directives without adding significantly to the efforts already in progress. Do you agree that the associated Implementation Plan meets the Directives? If you do not agree but believe the Directives can be addressed in an equally effective and efficient manner, please provide your suggestions in the form of specific language changes for the drafting team.

Jennifer Weber - Tennessee Valley Authority - 1,3,5,6 - SERC

Answer	No
Document Name	

Comment

The current implementation plan would require a resubmission of any declaration under EOP-012-2. This would create redundant work and confusion around tracking. Suggest adding language a "grandfathering" process for existing units.

Comment

AES US Renewables support NAGF comments for this question NAGF comments:

The NAGF is concerned with the potential confusion related to declaration made under EOP-012-2 and how these will be addressed under EOP-012-3. More information is needed related to the process to be used to address these declarations made under the current standard, including the expectations for these existing declarations, timelines related to rejected declarations and any other obligations related to these declarations. Additional support for this position is provided under question 9.

Next, the NAGF believes that the requirement to create duplicative CAPs and declarations over the years and have them approved for an approved event is extremely inefficient for both the registered entities and NERC and the regions. This issue should be addressed through modifications to R6 or the definition of Generator Cold Weather Reliability Event. Prior to the requirement to request approval for these declarations, the repetition was likely manageable. But with the additional requirements related to both the filing process and the requirements, this is likely to become a documentation issue that detracts from the reliable operation of the grid.

MP feels more clarity is needed on items in Question #1 and #3, therefore is unable to support the Implementation Plan at this time. Additionally, MP supports NAGF comments on Question #7 response related to the requirements to complete duplicative CAPs and declarations over the years and have them approved is extremely inefficient for registered entities and NERC. The addition of the approvals process greatly increases the inefficiencies related to minor refinements that may be needed to the Generator Cold Weather Reliability Event definition.

: It is the opinion of ACES that the effective date language for Requirements R2, R6, R7, and R8 is overly verbose and ambiguous. We recommend modifying the Implementation Plan as follows:

Effective Date and Phased-In Compliance Dates

Compliance Date for EOP-012-3 Requirement R2 – New Generating Units

Entities beginning commercial operation after the effective date of EOP-012-3 shall become compliant with Requirement R3 no later than the commercial operations date for the applicable unit. Any Generator Cold Weather Constraint shall be submitted in accordance with the timeline provided in Requirement R8.

Compliance Date for EOP-012-3 Requirement R6

Entities shall comply with Requirement R6 by the effective date of the Standard.

Compliance Date for EOP-012-3 Requirement R7

Entities shall comply with Requirement R7 by the effective date of the Standard.

Compliance Date for EOP-012-3 Requirement R8

Entities shall comply with Requirement R8 by the effective date of the Standard.

Any entity that previously declared one or more Generator Cold Weather Constraint(s) under Reliability Standard EOP-012-2 shall perform a review of any such declaration(s) for compliance with Reliability Standard EOP-012-3 Attachment 1 by the effective date. The entity shall submit any previously declared Generator Cold Weather Constraint(s) no later than 45 days following the effective date of Reliability Standard EOP-012-3.

AES US Renewables is concerned with the current implementation plan which requires an entity to submit previously declared constraint under EOP-012-2 for compliance with EOP-012-3 no later than 45 days following the effective date of EOP-012-3. While the 45-day timeline is not a major concern, we have questions for the drafting team to consider:

- Cost constraints that are allowed in EOP-012-2 are no longer allowed in EOP-012-3. If this constraint is denied by the CEA under EOP-012-3, what is the process and associated timelines that entities need to follow for recourse?
- Is there a possibility for entities to make changes to the constraint declared under EOP-012-2 before submittal to CEA under EOP-012-3 to conform to the Attachment 1 criteria?

AES US Renewables support NAGF comments for this question. NAGF comments: *As identified above, as proposed, the modifications requiring multiple filings for what is likely to be annual events is unreasonable and extremely inefficient while not providing any improvement to reliability. Ultimately, this is a documentation requirement that falls under paragraph 81. Efforts should be made to minimize the time and effort required to address the FERC order while trying to minimize the burden to industry. This can be done by modifying R6, to allow for the identification of the event being the same as a previous event and therefore the event falls under the already approved declaration. As one way to address this, Section 6.1.1 could have language added to allow the GO to state, once a review of the event is completed, that this event is similar or the same as the event addressed under the CAP dated XX/XX/XX that addresses the event that occurred on XX/XX/XXXX. This would end the process at that point and no further actions would be required, including creation of a new CAP, new constraint and a new filing to NERC to have them tell the GO they are correct.* *The NAGF recognizes that FERC has ordered that all reference to cost be removed. In discussions with OEM providers related to doing an engineering study the cost of the study to determine what it would take to improve the capability of generators is more than reasonable. In other words, the cost to do the study to determine the cost is very expensive, before any effort to improve the capability is made. The NAGF asks for the SDT to address with the CEA how cost will be considered when the generation of documentation is excessive.*

With the removal of the cost component in the Definition of the “Generator Cold Weather Constraint” it is very difficult to evaluate the cost effectiveness of the standard. Please retain the cost component in the definition of the “Generator Cold Weather Constraint” to ensure the Generation Owner has the ability to evaluate cold weather protections against reliability and availability impacts.

As identified above, as proposed, the modifications requiring multiple filings for what is likely to be annual events is unreasonable and extremely inefficient while providing no improvement to reliability. Ultimately, this is a documentation requirement that falls under paragraph 81. Efforts should be made to minimize the time and effort required to address the FERC order while trying to minimize the burden to industry. This can be done by modifying R6, to allow for the identification of the event being the same as a previous event and therefore the event falls under the already approved declaration. As one way to address this, Section 6.1.1 could have language added to allow the GO to state, once a review of the event is completed, that this event is similar or the same as the event addressed under the CAP dated XX/XX/XX that addresses the event that occurred on XX/XX/XXXX. This would end the process at that point and no further actions would be required, including creation of a new CAP, new constraint and a new filing to NERC to have them tell the GO they are correct.

The NAGF recognizes that FERC has ordered that all reference to cost be removed. In discussions with OEM providers related to doing an engineering study, especially for increasing the tower strength of wind turbines, the cost of the study to determine what it would take to improve the capability of generators is such that they are unwilling to offer the service. In other words, the cost to do the study to determine the cost is very expensive, before any effort to improve the capability is made. The NAGF asks for the SDT to address with the CEA how cost will be considered when the generation of documentation is excessive.

OPG supports HQ comments: "R2 High and Severe VSL: The Lower VSL and Moderate VSL's text "The Generator Owner did not have freeze protection measure(s) for its applicable unit(s) …." Is not reflected in the R2 High and Severe VSL. For consistency throughout the R2 VSLs, we suggest adding "for its applicable unit(s)" before "meeting the criteria in R2 …"

E2 Lower VSL: we suggest removing "to implement appropriate freeze protection measures" from the E2 Lower VSL to ensure consistency with the wording of the Moderate, High and Severe VSLs."

OPG supports Manitoba's comment regarding the wording around extremely low ECWTs: "Some of our ECWT is below -40 degree C. In discussions with our design team, many components only have a rating down to -40 degrees C. There should be some wording around extremely low ECWTs where it is not readily available (or economically possible to pursue) the purchase of equipment with that low of a temperature rating. (To clarify: we are talking about ECWTs around -43 degrees C and ratings of -40 degrees C. We are not suggesting equipment ratings of -15 degrees C vs -43 degree ECWT)."

OPG supports Manitoba Hydro's comment : "For R3 Manitoba Hydro recommends instead of referencing the October 1, 2027 date in the Requirement remove the date in the Requirement and add the wording "date on which the definition of Extreme Cold Weather Temperature was approved in the relevant jurisdiction."

OPG has the following comments:

NERC definition uses the concept of apparent cause(s), which is different from the Root Cause.

OPG suggest that SDT be consistent with other standards terminology (PRC-004-6 and PRC-010-2, where they are using the term “Root Cause”)

Please clarify, in the case of the Canadian entities that routinely and for extensive durations are operating at temperatures close to their respective ECWT (i.e. -40◦C), through what meteorological phenomenon it is possible to have freezing precipitation (e.g., sleet, snow, ice, and freezing rain) at that ECWT (i.e. -40◦C) that could impact equipment within the Generator Owner’s control. If rain will find it’s way to an equipment operating at -40◦C will actually warm-up that equipment. Basically, there could be only a very low probability of exacerbating cooling effect, involving the latent heat related to energy involved in water phase changes. Water vapors would release latent heat of fusion in the atmosphere long before reaching the BES Generation Units equipment, and unless they aggregate into falling chunks of ice it would most likely not be the root cause of “Generator Cold Weather Reliability Event”

We propose that impacts of freezing precipitation (e.g., sleet, snow, ice, and freezing rain) on equipment within the Generator Owner’s control, should be excluded for equipment with ECWT of -10◦C or below.

Comment	

We at ACES appreciate the effort put forth by the SDT to modify EOP-012 under such an abbreviated timeline. It is our understanding that the specific intent of this project is to consider and implement the directives in the FERC Order; however, we believe that one additional modification should be considered by the SDT. Requirement 1, Part 1.1.1 contains an overlapping timeline for updating the entities' cold weather preparedness plan(s) and developing a Corrective Action Plan (CAP). As written, both actions require completion within six (6) calendar months of the recalculation of the Extreme Cold Weather Temperature (ECWT).

It is our contention that corrective actions will likely not be identified until after a cold weather preparedness plan is reviewed/updated. Thus, we believe that requiring both actions to be completed concurrently effectively shortens the time allowed for a cold weather preparedness plan to be reviewed and updated. Therefore, we contend that nine (9) calendar months is a more appropriate deadline for developing a CAP.

We recommend the following modification to Requirement R1 Part 1.1.1:

R1. At least once every five calendar years, each Generator Owner shall, for each of its applicable generating unit(s):

1.1. Calculate the Extreme Cold Weather Temperature for each of its applicable unit(s) and identify the calculation date and source of temperature data; and

1.1.1. If the re-calculated Extreme Cold Weather Temperature is lower than the previous Extreme Cold Weather Temperature, the entity shall:

1.1.1.1. Review and update its cold weather preparedness plan(s) under Requirement R4 within six (6) calendar months of the recalculation.

1.1.1.2. Develop a Corrective Action Plan for any new corrective actions needed to provide the required operational capability under Requirement R2 or R3 within nine (9) calendar months of the recalculation.

Thank you for the opportunity to comment.

Kennedy Meier - Electric Reliability Council of Texas, Inc. - 2, Group Name ISO/RTO Council Standards Review Committee (SRC)	
Answer	
Document Name	
Comment	

The SRC recommends that the CAP extension and Constraint processes each be revised to include a Step 5 – NERC Reporting to Industry. Under this step 5, NERC would publish an annual report to provide industry insight into the types of constraints CEAs have approved and disapproved during the year, discuss lessons learned from the review and approval process, and provide Reliability Coordinators and Balancing Authorities insight into the cumulative impact of constraint approvals across fleets of resource types. This report would not include any confidential unit-specific information, and could coincide with or otherwise leverage NERC's annual report to FERC on Generator Cold Weather Constraint declarations.

Additionally, the SRC recommends that the Generator Cold Weather CAP Extension and Constraint Process be referenced in EOP-012-3, Section E, Associated Documents, since footnote 11 appears to reference this process.

The SRC also recommends that Requirement R7 be revised as follows to include a new Part 7.5 that clarifies that the existence of a CAP does not excuse a Generator Owner from taking such technically feasible steps as it can to improve the extreme cold weather performance of a unit while the CAP is being implemented:

7.5. Continue to otherwise prepare its applicable generating unit(s) to meet the requirements of EOP-012-3.

Comment

In Requirement R1 Part 1.1.1- Consider adding “calendar” in later part of language to be consistent with added language. Consider “If new corrective actions are needed to provide the required operational capability under Requirement R2 or R3, the entity shall develop a Corrective Action Plan within six (6) **calendar** months of the recalculation.”

Measure M3 : The phrase “Identification of generating unit(s) minimum temperature per Part 1.2.2 which is equal to or less than the unit’s Extreme Cold Weather Temperature” needs to drop the latter part “which is equal to or less than the unit’s Extreme Cold Weather Temperature” as that statement could be incorrect. A unit’s minimum temperature might be above an ECWT due to a Generator Cold Weather Constraint or simply the geographical location of the unit.

Requirement R7 could be sharpened by removing “as applicable” to read as “Each Generator Owner, for each Corrective Action Plan developed pursuant to Requirements R1, R2, or R3 shall:, as applicable”. Requirement R7 requires a Corrective Action Plan condition to be evident and “as applicable” is not needed to differentiate if it is a R1, R2, or R3 Corrective Action Plan.

Suggest that language in Requirement R6 Part 6.2 and Requirement R7 Part 7.3 should be mirrored:

Requirement R6 Part 6.2 states: ”6.2 Update the Corrective Action Plan action(s) and timetable(s), with justification, and submit a Corrective Action Plan extension request to the Compliance Enforcement Authority (CEA) for approval where the timetable(s) for completing selected actions are projected to exceed the timelines in Part 6.1. The submitted Corrective Action Plan extension request shall include the following:

6.2.1. Circumstances causing the delay and how those circumstances are beyond the control of the Generator Owner;

6.2.2. Revisions to the selected actions in Part 6.1, if any, including utilization of Operating Procedures, if applicable; and

6.2.3. Updated timetable for implementing the selected actions in Part 6.1.”

Requirement R7 Part 7.3 states: “7.3 Submit a Corrective Action Plan extension request, for the approval of the CEA, where the timetable(s) for completing selected actions are projected to exceed the timelines in Part 7.1. The submitted request shall:

7.3.1 Explain the circumstances causing the delay and how those circumstances are beyond the control of the Generator Owner;

7.3.2 Include, as applicable, revisions to the selected actions in Part 7.1, including utilization of Operating Procedures; and

7.3.3 Include an updated timetable for implementing the selected actions in Part 7.1”

Suggest changing Requirement R7 Part 7.3 to mirror 6.2 and read as :

“7.3 Update the Corrective Action Plan action(s) and timetable(s), with justification, and submit a Corrective Action Plan extension request to the Compliance Enforcement Authority (CEA) for approval where the timetable(s) for completing selected actions are projected to exceed the timelines in Part 7.1. The submitted Corrective Action Plan extension request shall include the following:

7.3.1. Circumstances causing the delay and how those circumstances are beyond the control of the Generator Owner;

7.3.2. Revisions to the selected actions in Part 7.1, if any, including utilization of Operating Procedures, if applicable; and

7.3.3. Updated timetable for implementing the selected actions in Part 7.1.”

Need to mirror language in Requirement 6 Part 6.3 and Requirement R7 Part 7.4. Requirement R6 Part 6.3 contains “if applicable” after “Requirement R8”. If the DT believes “if applicable” is appropriate it should be added (with appropriate punctuation) to Requirement R7 Part 7.4 to read “Document in a declaration, with justification, any Generator Cold Weather Constraint in accordance with Requirement R8**, if applicable**, that precludes the Generator Owner from implementing selected action(s) contained within the Corrective Action Plan.”

In Attachment 1, the phrase ”Heat tracing or other de-icing technologies for wind turbine blades that are not available in the Generator Owner’s location” may need some clarification. Is the DT’s thought the blades are “not available to the Generator Owner for the Generators Owner’s location” or simply “not available for the Generator Owner’s location.”?

For “Case-by-Case” criteria 3a- What does the DT consider as “premature” and does it vary based on generator type (e.g., wind versus natural gas unit)? Is “replacement” meant to reference the unit being retired? To be auditable a timetable such as “3 or more years” should be incorporated into the language. While conditions may vary for consideration of retirement there can not be a consideration for a replacement unit without the unit signaling to a TP/PC/BA that it was retiring

Consider updating the “Case-by-Case” criteria 3b to state: “The freeze protection measures would be applied to a generating unit that has a previously published retirement date **slated to occur** within three years of the Generator Cold Weather Constraint declaration; “

The definition provided in the Standard (to be included in the Glossary of Terms) for Generator Cold Weather Constraint and the definition language in the Technical Rationale for same term needs updated. The Standard states the definition as “Any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components.” but the Technical Rationale states “A Generator Cold Weather Constraint is any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components using the following criteria.” Suggest changing the Technical Rationale to “A Generator Cold Weather Constraint is defined as “Any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components.” The following criteria should be used in the development of Generator Cold Weather Constraints:”

The NERC process should add some clarifying language to line up with SGAS FAQ regarding use of Corrective Action Plans to cover multiple entities and locations within a single Corrective Action Plan even in cases where the entities are not in Coordinated Oversight.

Richard Jackson - U.S. Bureau of Reclamation - 1	
Answer	
Document Name	
Comment	

Reclamation recommends removing requirement R1.1 as the calculations being required by NERC/FERC do not provide a proper long-term analysis of the temperature conditions for industry. An “average” over 24 years does not properly reflect the extreme weather conditions that have been recorded in history.

Reclamation strongly recommends revising R1.2.2 in its entirety to:

- Ensure bullets are in an “OR” statement. It is misleading now which bullets are required to be met.
- Remove concurrent wind speed and precipitation, as this data is not tracked as detailed as weather temperatures and also does not affect equipment the same across industry, thus is subjective to interpretation. See previous comment on wind speed.
- Reword or provide guidance on “historical operating temperature at least one hour in duration”. Temperature tracking is performed hourly or daily, and not recorded by the minute, thus “at least one hour in duration” is misleading.
- Remove the bullet containing engineering analysis. This is not feasible to meet this requirement for existing sites as contracting an engineering firm for an analysis could take years. An engineering analysis could be performed on certain industries, but would be a no value added on others (hydropower).

R2 High and Severe VSL: The Lower VSL and Moderate VSL’s text “The Generator Owner did not have freeze protection measure(s) for its applicable unit(s) ….” Is not reflected in the R2 High and Severe VSL. For consistency throughout the R2 VSLs, we suggest adding “for its applicable unit(s)” before “meeting the criteria in R2 …”

E2 Lower VSL: we suggest removing “to implement appropriate freeze protection measures” from the E2 Lower VSL to ensure consistency with the wording of the Moderate, High and Severe VSLs.

NB Power supports Manitoba’s comment regarding the wording around extremely low ECWTs: “Some of our ECWT is below -40 degree C. In discussions with our design team, many components only have a rating down to -40 degrees C. There should be some wording around extremely low ECWTs where it is not readily available (or economically possible to pursue) the purchase of equipment with that low of a temperature rating. (To clarify: we are talking about ECWTs around -43 degrees C and ratings of -40 degrees C. We are not suggesting equipment ratings of -15 degrees C vs -43 degree ECWT).”

NB Power supports Manitoba Hydro’s comment : “For R3 Manitoba Hydro recommends instead of referencing the October 1, 2027 date in the Requirement remove the date in the Requirement and add the wording “date on which the definition of Extreme Cold Weather Temperature was approved in the relevant jurisdiction.”

NERC definition uses the concept of apparent cause(s), which is different from the Root Cause. Unless there is an obvious situation, the CAP resulting from the apparent cause(s) related to Generator Cold Weather Reliability Event, may require a longer time for implementation, however we can avoid rework and use instead the Root Cause Analysis, which is better suited for the CAP determination

Please clarify, in the case of the Canadian entities that routinely and for extensive durations are operating at temperatures close to their respective ECWT (i.e. -40◦C), through what meteorological phenomenon it is possible to have freezing precipitation (e.g., sleet, snow, ice, and freezing rain) at that ECWT (i.e. -40◦C) that could impact equipment within the Generator Owner's control. If rain will find it's way to an equipment operating at -40◦C will actually warm-up that equipment. Basically, there could be only a very low probability of exacerbating cooling effect, involving the latent heat related to energy involved in water phase changes. Water vapors would release latent heat of fusion in the atmosphere long before reaching the BES Generation Units equipment, and unless they aggregate into falling chunks of ice it would most likely not be the root cause of "Generator Cold Weather Reliability Event"

We propose that impacts of freezing precipitation (e.g., sleet, snow, ice, and freezing rain) on equipment within the Generator Owner's control, should be excluded for equipment with ECWT of -10◦C or below.

The NAGF identified two issues that the SDT must address based on implementation issues seen with EOP-012-2. The first was related to freeze protection measures not associated with Generator Cold Weather Critical Components. The SDT addresses this issue in the revised standard and the NAGF thanks the SDT for that modification.

The second issue is related to the individual regions looking at the ECWT calculations differently, with different expectations related to the data used for determining the ECWT for a plant. While the SDT has significantly modified the document related to calculating the ECWT, and while the NAGF supports these modifications, nothing in this document addresses the unreasonable position that some regions are taking to require a temperature reading for every hour in order to make an ECWT valid. In the vast majority of cases, the GO is not in a position to have over 54,000 data points for any location, let alone every location. The GO in most cases must gather data from third party providers, and none of the data is perfect. This issue must be addressed through either Requirement R1 or modification to the ECWT definition. The NAGF looks forward to working with the SDT to address this identified concern.

Since the NAGF members likely have a great deal more experience making these calculations, determining issues with the data and addressing these issues, the NAGF recommends that time be spent by the SDT to first understand the issues and the impact to entities before rushing this standard through the process without addressing this concern.

Under R2, there is a great deal of confusion related to incorporating the 20 MPH wind speed into the ECWT calculation process. The NAGF is requesting that the SDT add language to the technical reference document explaining how Generator Owners should accommodate the wind speed into their design criteria.

The NAGF has several concerns with language in Attachment 1. These are identified below:

1. In the second bullet under pre-approved constraints, the NAGF recommends adding “or unlikely to provide sufficient impact on blade icing events”

2.Under section 3 of Case-by-case Determination, the majority of the identified issues will come down to cost. As currently structured, it is unclear how the CEA will ensure consistency between regions or even within a single region. More details must be provided in the attachment or proposed process document to allow the Generator Owners to understand what is expected of them.

3. Under Bullet 3.a, the word dispatchable should be removed. Based on the evaluations from NERC, the unplanned retirement of any generator will likely reduce the reliability of the grid since a new generator will not be available to replace it for several years.

4. The NAGF would like the SDT to provide justification for the three years used in bullet 3.b. Based on current industry trends; it is more likely that a new unit to replace generators retiring early will not be available for 5 to 7 years. The NAGF believes that three-year period is much shorter than reasonable.

5. Bullet 3.e. is duplicative of bullet 3.d.

6. The pre-approved cold weather constraints in Attachment 1 should be re-worded for consistency. Item 1 for example is, “Wind turbine towers that have structural limitations...,” so the last one should be, “Combustion turbine inlet air filters that are vulnerable to the buildup of frozen precipitation, such that applying heat upstream of inlet air filters would be required.”

7. The last of the pre-approved GCWCs should be expanded to cover CTGs that do have inlet air heating but would require upsizing to ride through worst-possible snowstorms without tripping or derating.

8. A pre-approved GCWC should be added for derates or being forced offline due to freezing of items not under the GO’s control, e.g. having to reduce load at a combined cycle plant under adverse wind direction conditions so that the cooling tower plume does not create hazardous icing on adjacent roadways.

AES US Renewables strongly recommend the drafting team to develop further guidance on how to account both ECWT and 20mph wind speed for new generators (specifically for IBRs) as required in R2. Currently, the technical rationale does not provide much guidance on how determination can be made and our OEMs do not provide information concerning equipment's minimum operating temperature at certain wind speeds. Using wind chill temperature formula to determine what the minimum design temperature can be misleading. In fact, on the National Weather Service webpage, it specifically states that "wind chill temperature is how cold people and animals feel when outside". Additionally, we request that the drafting team provide guidance in the Technical Rationale concerning the need for Solar facilities to meet ECWT since the lowest temperatures normally occur during night time when Solar facilities are not generating. Should ECWT be calculated differently for Solar generators? We also recommend adding the flow chart that was provided during the 10/24/2024 webinar in the Technical Rationale. It is a good reference to include in the Technical Rationale.

1. There should be a process for Registered Entities to be able to submit consideration of additional constraints to be added to the EOP-012-3 Attachment 1 Pre-Approved Generator Cold Weather Constraints in the future after EOP-012-3 is approved by FERC.

2. What documentation will NERC require for submitting a constraint declaration? Suggest NERC develop a form and required evidence (e.g., photos, narrative, OEM pre-existing limitations, engineering analysis, etc.).

3. If the Regional Entities do not have the technical expertise to evaluate constraint declarations, and rely on third-party 'experts' this needs to be made transparent to the Registered Entities.

4. If a Registered Entity has previously received an approval of a Pre-Approved Generator Cold Weather Constraint (per Attachment 1 of EOP-012-3) due to one cold weather event, do they need to resubmit the constraint declaration for every similar cold weather event during that particular winter season that causes the same constraint? Suggest requiring constraint declarations of a similar nature just once per winter season.

5. Regarding the ECWT calculation, suggest adding guidance regarding combining data from different weather data resources, so that the frequency sampling is the same. For example, if one weather data source gathers temperature data three times per hour and another weather data source gathers weather data one time per hour, this will skew the 0.2 percentile in favor of the more frequent weather data source. Suggest adding guidance with a threshold such as at least 66% of the hours for each year from each weather data source must have hourly data.

As currently structured, it is unclear how the CEA will ensure consistency between regions or even within a single region. More details must be provided in the attachment or proposed process document to allow the Generator Owners to understand what is expected of them.

Comment

R2 High and Severe VSL: The Lower VSL and Moderate VSL's text "The Generator Owner did not have freeze protection measure(s) for its applicable unit(s) …." Is not reflected in the R2 High and Severe VSL. For consistency throughout the R2 VSLs, we suggest adding "for its applicable unit(s)" before "meeting the criteria in R2 …"

E2 Lower VSL: we suggest removing "to implement appropriate freeze protection measures" from the E2 Lower VSL to ensure consistency with the wording of the Moderate, High and Severe VSLs.

HQ supports Manitoba's comment regarding the wording around extremely low ECWTs: "Some of our ECWT is below -40 degree C. In discussions with our design team, many components only have a rating down to -40 degrees C. There should be some wording around extremely low ECWTs where it is not readily available (or economically possible to pursue) the purchase of equipment with that low of a temperature rating. (To clarify: we are talking about ECWTs around -43 degrees C and ratings of -40 degrees C. We are not suggesting equipment ratings of -15 degrees C vs -43 degree ECWT)."

HQ supports Manitoba Hydro's comment : "For R3 Manitoba Hydro recommends instead of referencing the October 1, 2027 date in the Requirement remove the date in the Requirement and add the wording "date on which the definition of Extreme Cold Weather Temperature was approved in the relevant jurisdiction."

Andy Thomas - Duke Energy - 1,3,5,6 - SERC,RF	
Answer	
Document Name	
Comment	
Duke Energy believes guidance should be provided on the process to retire declarations that have a resolution and declarations that are no longer required. EOP-012-3 as currently written provides no details on the method of retirement and does not provide a timeframe for the implementation of actions to address the declaration. In Attachment 1, item 3, Duke Energy suggest additional criteria be provided. Duke Energy suggest the SDT clarify if declarations created under EOP-012-2 need to be transitioned to meet the requirements of EOP-012-3. If a transition is required, please provide expectations on performing the transitions and the timetable for performing these activities.

TVA committed to an implementation date for EOP-012-2 on 10/01/2024. This commitment required site procedure revisions, updated training, and numerous stakeholder reviews. It is recommended to go through at least one, suggest two, cold weather periods to address lessons learned prior to revising EOP-012-2. Implementation should be pushed to March 2026.

1. BC Hydro requests that the Technical Rationale documented by the 2021-07 Drafting Team be consolidated with the Technical Rationale developed under this 2024-03 project under a single document for consistency and easy reference. 2. BC Hydro recommend that the draft standard be reviewed for consistent use of timelines, e.g. days/months vs. calendar days/months. 3. The Requirement R8 Part 8.4 wording is ambiguous “If the CEA determines the declared Generator Cold Weather Constraint is invalid, update its Corrective Action Plan(s) to require corrective actions be completed in accordance with the timetables in Requirement R6 Part 6.1 or Requirement R7 Part 7.1, to begin from the date the Generator Owner is notified that the Generator Cold Weather Constraint is invalid”. Would an entity interpret this as the Corrective Action Plan(s) need to be updated within six months for R7 (per R1.1.1) or be updated within 150 days for R6 (per R6) as applicable? 4. The Generator Cold Weather CAP Extension and Constraint Process is a standalone document, which therefore may not be enforceable. As this document sets timeline expectations for CAP extensions, including for CEA, that are either not in the Requirements and/or impact the	

Requirements, there could be situations where if the CEA exceeds the 45-day expectation to approve an extension, the submitting GO would be in potential noncompliance to EOP-012-3. Examples include requiring an entity to submit extension requests within 60 days prior to the original CAP completion date. The actual Requirements R6 and R7 don't include timelines for submitting extension requests. Therefore, an entity could submit the extension request at any time up to the completion date and still be in compliance. BC Hydro recommends revising the process and Requirements and including any timelines in the Requirements if the entity will be expected to meet them. As well, in Step 3 of the process, the CEA could take up to 45 days to approve (or more) and therefore the entity could be past the originally proposed completion date with no approved extension request. Step 3 also says "If an extension request is denied, the selected actions in the Corrective Action Plan need to be completed in accordance with the original timetables". However, the entity may be well beyond the original timelines if the review takes more than 45 days and therefore not able to meet the original timetables. As there is no maximum time for the CEA to review and this may lead to very long review times, this will be challenging for an entity. BC Hydro recommends there be an "approval by default" if the CEA does not respond within a given period after entity's submittal to CEA.

5. BC Hydro suggests that, similar to the pre-approved Generator Cold Weather Constraints in Attachment 1, it would be helpful to also include pre-approved circumstances deemed acceptable as beyond the Generator Owner control for CAP extensions.
6. Requirements R2, R6 and R7 reference "documentation of a declaration" of an identified Generator Cold Weather Constraint in accordance with R8. Should these requirements reference the Attachment 1 instead?

Scott Langston - Tallahassee Electric (City of Tallahassee, FL) - 1,5

Answer	
Document Name	

Comment

The values for wind speed and duration of ECWT that are used in R2 could be more tailored to each GO location. The guidance provided by NERC on how to calculate the ECWT (2021-07 Calculating Extreme Cold Weather Temperature_082022.pdf) was very helpful, and the fact that it used statistical analysis of real-world data seem to be a good compromise between reliability and cost.

The same approach should be used to calculate the wind speed and duration of ECWT that should be used as the design criteria for new units. Otherwise, new units could be designed with overly conservative ECWT, which could lead to increased cost of construction, and ongoing O&M costs. Additionally, if a GO is in a windier than average area of the U.S., the 20-mph wind speed may not be an accurate representation of the winds they may experience during the ECWT event.

Thomas Foltz - AEP - 5

Answer	
Document Name	

Comment

The obligation in R6.1.6 states the CAP needs to include a timetable for implementing freeze protection measure to “similar” generating units owned by the Generator Owner. It is unclear how the term “similar” is to be applied, as some Generator Operators operate in a large footprint. Does the term “similar” refer to the generating unit design, the generating unit’s geographical location, or perhaps even both? Likewise, “similar equipment freeze protection measures” is problematic, because the word “similar” could be understood as being tied to either the equipment or the measures. Rather than stating “A review of applicability to similar equipment freeze protection measures”, AEP recommends instead using “A review of the freeze protection measures used for similar critical components.”

The R6.1.6 obligation to perform “A review of applicability to similar equipment freeze protection measures at generating units owned by the Generator Owner” needs further clarification. A Generator Cold Weather Reliability Event may be the result of either a failed equipment freeze protection measure or due to inadequate freeze protection measures. The obligation to perform an applicability review should only be required due to a Generator Cold Weather Reliability Event resulting from inadequate freeze protection measures.

Project Name:	2024-03 Revisions to EOP-012-2 | Draft 1
Comment Period Start Date:	10/17/2024
Comment Period End Date:	11/5/2024
Associated Ballot(s):	2024-03 Revisions to EOP-012-2 | Draft 1 EOP-012-3 IN 1 ST 2024-03 Revisions to EOP-012-2 | Draft 1 Implementation Plan IN 1 OT

There were 60 sets of responses, including comments from approximately 165 different people from approximately 109 companies representing 10 of the Industry Segments as shown in the table on the following pages.

All comments submitted can be reviewed in their original format on the project page.

If you feel that your comment has been overlooked, let us know immediately. Our goal is to give every comment serious consideration in this process. If you feel there has been an error or omission, contact Director, Standards Development Jamie Calderon (via email) or at (404) 446-9647.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Questions

1. In paragraph 47 of the June 2024 Order, FERC directed NERC to revise EOP-012-2 to "ensure that the Generator Cold Weather Constraint declaration criteria included within the proposed Reliability Standard are objective and sufficiently detailed so that applicable entities understand what is required of them." In paragraph 47 of the June 2024 Order, FERC directed NERC to develop and submit modifications to the Generator Cold Weather Constraint definition of Reliability Standard EOP-012-2, to remove the references to "cost," "reasonable cost," "unreasonable cost," and "good business practices" and replace them with criteria that are objective, unambiguous, and auditable. In paragraph 54 of the June 2024 Order, FERC directs NERC to modify EOP-012-2 so that NERC receives, reviews, evaluates, and confirms for validity the Generator Cold Weather Constraint declarations in a timely manner. In paragraph 94 of the June 2024 Order, FERC directs NERC to develop and submit modifications to Requirement R8, Part 8.1 of Reliability Standard EOP-012-2 to implement more frequent reviews of Generator Cold Weather Constraint declarations (more than every five years) to verify that the declaration remains valid.

The drafting team has done the following to address the FERC directives:

1. Provided an updated definition of Generator Cold Weather Constraint

2. Updated language within Requirement R8

3. Provided EOP-012-3 Attachment 1 for clarity on expectations for registered entities

Do you agree with the approach and associated language the drafting team chose to meet the directives? Please provide any additional comments to consider. If you do not agree but believe the directives can be addressed in an equally effective and efficient manner, please provide your suggestions in the form of specific language changes for the drafting team.

2. In paragraph 68 of the June 2024 Order, FERC directed NERC to modify Requirement R7 of EOP-012-2 to require shorter deadlines to implement corrective actions for existing or new equipment or the freeze protection measures for those generating units that experience a Generator Cold Weather Reliability Event. FERC provided an example for how to address this directive, such as to require shorter timeframes for those units that have experienced issues and allow longer timeframes to address similar potential issues across a fleet for those units that have not experienced issues.

The drafting team modified Requirement R6 of EOP-012-2 to require a shorter deadline to implement corrective actions for those generating units that experience a Generator Cold Weather Reliability Event. Do you agree with the revised timelines? Please provide any additional comments to consider. If you do not agree but believe the directive can be addressed in an equally effective and efficient manner, please provide your suggestions in the form of specific language changes for the drafting team. Please review the posted draft ERO Enterprise document, EOP-012-3 Generator Cold Weather CAP Extension and Constraint Process.

3. In paragraph 70 of the June 2024 Order, FERC directed NERC to develop and submit modifications to Requirement R7 of Reliability Standard EOP-012-2 to ensure that any extension of a corrective action plan implementation deadline beyond the maximum implementation timeframe required by the proposed Reliability Standard is pre-approved by NERC.

The drafting team provided language changes in Requirements R6 and R7 for a Corrective Action Plan extension process. Do you believe that the proposed language changes meet the intent of paragraph 70 of the FERC Order? Please provide any additional comments to consider. If you do not agree but believe the directive can be addressed in an equally effective and efficient manner, please provide your suggestions in the form of specific language changes for the drafting team.

4. In paragraph 72 of the June 2024 Order, FERC directed NERC to develop and submit modifications to Requirement R7 of Reliability Standard EOP-012-2 to clarify that any Requirement R7 corrective action plans for new generation (i.e. commercially operational after October 1, 2027) must be completed prior to the generating unit's commercial operation date.

The drafting team provided updated language in Requirement R2 Part 2.1 to address the issue of units in different stages of design and construction. February 16, 2023 was chosen as a date of demarcation as that was the date the Extreme Cold Weather Temperature was approved by FERC. Do you agree that revisions to Requirement R2 Part 2.1 address this directive? If you do not agree but believe the directive can be addressed in an equally effective and efficient manner, please provide your suggestions in the form of specific language changes for the drafting team.

5. In paragraph 72 of the June 2024 Order, FERC directed NERC to develop and submit modifications to Requirement R7 of Reliability Standard EOP-012-2 to clarify that any Requirement R7 corrective action plans for new generation (i.e. commercially operational after October 1, 2027) must be completed prior to the generating unit's commercial operation date.

The drafting team provided updated language in Requirement R2 Part 2.2 to address the issue of units in newer stages of design and construction. February 16, 2023 was chosen as a date of demarcation as that was the date the Extreme Cold Weather Temperature was approved by FERC. Units committed to design criteria on or after February 16, 2023 do not have the option to utilize a Corrective Action Plan but may still declare a Generator Cold Weather Constraint. Do you agree that revisions to Requirement R2 Part 2.2 address this directive? If you do not agree but believe the directive can be addressed in an equally effective and efficient manner, please provide your suggestions in the form of specific language changes for the drafting team.

6. In paragraph 76 of the June 2024 Order, FERC directs NERC to develop and submit modifications to Requirement R7 of Reliability Standard EOP-012-2 to address certain ambiguities by expanding on Requirement R7.1.1 and 7.1.2 to make it clear which corrective action plan implementation deadline applies when a generator owner must implement both remedying issues with existing and installing new freeze protection measures.

The drafting team clarified Requirement R7 for Corrective Action Plans developed in accordance with Requirements R1, R2, or R3. Do you agree that revisions to Requirement R7 address this directive to differentiate between the existing and new freeze protection measures? If you do not agree but believe the directive can be addressed in an equally effective and efficient manner, please provide your suggestions in the form of specific language changes for the drafting team.

7. The drafting team provided language in the Implementation Plan to address parts 3 through 5 of paragraph 4 of the June 2024 Order addressing FERC's concerns regarding urgency. The Standard language updates were written to meet the core directives in an effective and efficient manner while providing language that is objective, unambiguous, and auditable. With EOP-012-2 already effective October 1, 2024 (with the exception of Requirement R3), the changes made were intended to meet the FERC Directives without adding significantly to the efforts already in progress. Do you agree that the associated Implementation Plan meets the Directives? If you do not agree but believe the Directives can be addressed in an equally effective and efficient manner, please provide your suggestions in the form of specific language changes for the drafting team.

8. Do you agree with the Implementation Plan for EOP-012-3? If you do not agree, please propose an alternate implementation plan with a detailed explanation.

9. Do you agree that EOP-012-3 is cost effective to address the Directives in the FERC Order? If you do not agree, or if you agree but have suggestions for improvement to enable more cost-effective approaches, please provide your recommendation and, if appropriate, technical, or procedural justification.

10. Please provide any additional comments for the standard drafting team to consider, if desired.

R8.2 should be its own requirement. R8.4 timing is too restrictive. Suggest adding a statement with a timeframe (150 days). A CEA rejection of a CAP could force an unplanned maintenance outage and be longer than expected timeframes.

Manitoba Hydro supports BC Hydro's comment: "BC Hydro is supportive of the revisions to the revised Generator Cold Weather Constraint definition. However, to add clarity on Freeze Protection Measures, BC Hydro recommends retaining the following wording "Freeze protection measures are not intended to be limited to optimum practices, methods, or technologies, but are also intended to include acceptable practices, methods, or technologies generally implemented by the electric industry in areas that experience similar winter climate conditions" in EOP-012-3 associated documentation, such as the Technical Rationale." And "Please also clarify in the language of the Requirement whether these are calendar or business days."

Duke Energy agrees with and supports NAGF's position on modifications to the wording of R8 and their stance on the lack of CEA obligations related to the approval process.	

Duke Energy agrees in general with changes to the definition of a Generator Cold Weather Constraint and the use of Attachment 1. Attachment 1 does not though provide sufficient guidance for freeze protection modifications that are unsustainable due to cost. While Attachment Sections 3a through 3c does offer guidance, it provides no guidance for modifications that are financially unfeasible. Please provide additional guidance regarding unsustainability due to cost. Duke Energy does not support the pre-approval requirement for declarations. The declaration process should be driven by clear criteria and the acceptability of declarations should be evaluated as part of the audit process. Please provide clear guidance and criteria for declarations as stated. The status of the CEA in the declaration process is an area of concern. The CEA by statute, perform the enforcement role for standards published by NERC. The preapproval process places the CEA in the position of a performer or approver on implementation of the standard. The SDT should modify the process to reflect a more amiable solution that excludes the CEA.

HQ supports BC Hydro's comment: "BC Hydro is supportive of the revisions to the revised Generator Cold Weather Constraint definition. However, to add clarity on Freeze Protection Measures, BC Hydro recommends retaining the following wording "Freeze protection measures are not intended to be limited to optimum practices, methods, or technologies, but are also intended to include acceptable practices, methods, or technologies generally implemented by the electric industry in areas that experience similar winter climate conditions" in EOP-012-3 associated documentation, such as the Technical Rationale." And "Please also clarify in the language of the Requirement whether these are calendar or business days.".

HQ supports NBPower's comment: "The pre-approved Generator Cold Weather Constraints (GCWCs) in Attachment 1 could be problematic in some jurisdictions, since Requirement R8 and Attachment 1 are referenced for Requirement R2 Part 2.2 for new designs on a go-forward basis. In particular, the pre-approved GCWC should not be set up in such a way as to exempt generating unit developers from doing proper due diligence. At least for future designs (Requirement R2 Part 2.2) all Generator Cold Weather Constraints should be assessed on a case-by-case basis. Pre-approved GCWCs should be avoided, or if used at all, limited to existing or already committed designs, since technology and the needs of the grid may be expected to change in the future and existing pre-approvals may no longer be appropriate."

HQ supports OPG's comments "Additional clarification is required regarding GCWC CEA applicability/validity confirmation & determination implications for unit present/future operation.

Please clarify the role of CEA – review for constraint presence, validity confirmation, or approval, and the requirements the CEA need to satisfy to perform its role.

Attachment 1 bullet #3 appears to be the BA purview and not the CEA.

In the context of this standard a freeze protection measure can negatively impact the revenue of a market participant, yet still be required to be implemented for compliance purposes. Please explain how was derived the “more than three percent” criterion and the justification for argument that it will fit all the market participants, from any geographical location. Attachment 1 last paragraph state that “An approved Generator Cold Weather Constraint declaration for any specific Generator Cold Weather Critical Component does not relieve the Generator Owner of its obligation to otherwise prepare its applicable generating unit(s) to meet the requirements of EOP-012-3.”. The overall intent of the Extreme Cold Weather Preparedness and Operations standard is to:” Implement freeze protection measures to protect Generator Cold Weather Critical Components that provide the capability to operate at the unit(s)' Extreme Cold Weather Temperature;” By definition, the “**Generator Cold Weather Constraint** – Any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components.”. As written, this appears to be an actual requirement to operate at the ECWT, which cannot be reconciled with an approved Generator Cold Weather Constraint declaration.” There is a risk for future generation designs introduced by Attachment 1 via geographical limitation for specific technologies in the Pre-Approved Generator Cold Weather Constraints list.

NRG is in concurrence that the direction that the SDT has taken to address the ambiguity of the language of the constraints is sound as it has allowed for acceptance of known technical constraints that the industry has identified. It also has provided sound examples of those examples that may be presented on case by case basis. However, strict guidance should be provided to reviewers to ensure consistency of acceptance of these constraints for the case by case basis. The process may also need to be modified that if an Extreme Cold Weather Reliability event continually occurs due to same mechanism-say wind turbine blade icing or PV icing- that a single declaration for the year should suffice and not required for each event and filed through the required approval process.

While AES US Renewables agrees with the approach of updating definition of Generator Cold Weather Constraint, we believe there are still some gaps in the proposed R8 as well as Attachment 1 that need to be addressed: • The 24 calendar month timeline for reviewing GCWC declaration that has been validated by CEA is too frequent. We believe that at a minimum, it should be set to 36 calendar months. We prefer 60 months if possible since a lot of the pre-approved constraints listed in Attachment 1 for renewable generators are likely not going to be alleviated anytime soon as OEMs are not actively working to address them (unlike the IEEE 2800 requirements where various ISO/RTOs are driving the change requirements due to being perceived as more impactful and urgent). o It was mentioned during the 10/24/2024 webinar that 24-calendar month reviews do not require submittal to CEA for reviews and approvals. However, it is currently not clear on what the process entails when a constraint declaration is no longer valid. Is the GO required to notify the CEA that the constraint declaration that was approved is no longer valid due to solutions being available to mitigate the constraint? Since the Constraint and CAP Process document stated that NERC will be sending NERC a quarterly report, we are assuming that NERC/CEA will have to keep track of retirement of constraint declarations in addition to what they have approved/denied. • Neither R8 nor Attachment 1 addresses the timeline for implementing the mitigation if the declared constraint is no longer valid. We have concerns about situations where one vendor or OEM has developed a solution for the constraint, but the amount of investment needed to incorporate that solution is too high and impacts revenue and profitability negatively in operating the generation facility. How will this type of scenario be taken into account under the proposed Attachment 1 criteria? • Will the pre-approved list in Attachment 1 be revised if new constraints are identified in the future? Or if commercially viable solutions to those constraints appear in the future, will those constraints be removed from the pre-approved list? We are concerned about the static nature of the pre-approved list as it can greatly impact the ability to declare constraints for projects that are in the interconnection queue at various ISO/RTOs currently. • In the Constraint and CAP Process document provided along with EOP-012-3 proposed draft and Implementation Plan, there is no mention on what registered entities can do if their constraint declaration is denied related to R2.2. The current language only focused on updating CAPs related to R6.1 and R7.1. As written currently, R2.2 does not have the option to create a corrective action plan. • Under the proposed Attachment 1, item 3 (c) allows constraint declaration if application of freeze protection measures would cause the Generator Owner to cancel plans to finish the development of a new generating unit. We would like to find out if further guidance can be provided either in Attachment 1 or Technical Rationale for this constraint criteria in regards toin regard to

financial/cost impacts. This question was posed during the 10/24/2024 webinar and the answer provided was not clear and it was suggested that it can be evaluated on a case-by-case basis.

- More clarification is needed on a few constraints listed under Attachment 1:
- "*Wind turbine towers that have structural limitations established by Original Equipment Manufacturers (OEMs) based on a minimum temperature that is higher than the Extreme Cold Weather Temperature calculated per Requirement R1.*"
- Does structural limitations imply design limitations? Please clarify that or include clarification in the Technical Rationale document.
- "*Heat tracing or other de-icing technologies for wind turbine blades that are not available in the Generator Owner's location.*"
- Does the phrase "not available" also mean not effective? There is a difference between both. There are currently some not-so-effective methods to prevent icing (like spraying the blades with anti-icing coatings). Are Generator Owners required to use solutions that are not effective or can it be part of constraint declaration?
- Does the phrase "Generator Owner's location" mean regionally? For example, does it mean if a wind turbine uses a solution that is available in New York, and the solution is not used in Texas, the Generator Owner can declare constraint that it is not available for wind turbines in Texas? Or should the constraint be modified to: "*Heat tracing or other de-icing technologies for wind turbine blades that are not available in* ***all NERC regions***"? Our rationale is that if it is not available in the US, but available in Europe, then, we are allowed to declare constraint. It should be based on availability within each country.

Comment

The NAGF recommends that R8 be modified to address the following issues:

a. Requirement 8.2 should not be part of R8 as it is a separate requirement and requires actions different than R8;

b. The language used in 8.4, specifically as it relates to R6, is not clear, or it may require an entity to have a CAP implemented on the day they are notified that the declaration has been rejected;

c.The time stated in 8.1 does not agree with the process document posted in support of the standard. In addition, the document requires an entity to coordinate with the CEA before filing a declaration, without any obligation on the CEA to respond in a timely manner. These two documents, the requirement in the standard and the process document, must be coordinated before Requirement R8 is clear, unambiguous and enforceable.

To address these issues, the NAGF recommends the following language be used:

R8. Each Generator Owner that declares a Generator Cold Weather Constraint in accordance with Attachment 1 shall: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

8.1. Submit its Generator Cold Weather Constraint declaration(s) to the CEA within 45 days of determining that the Generator Cold Weather Constraint is applicable. For Generator Cold Weather Constraints determined in accordance with Requirement R2 for generating unit(s) upon beginning commercial operation, submit the Generator Cold Weather Constraint declaration(s) no later than 15 days after commercial operation;

8.2 Update the operating limitations associated with capability and availability under Requirement R1 Part R1.2 if applicable; and

8.3 If the CEA determines the declared Generator Cold Weather Constraint is invalid, update its Corrective Action Plan(s) to require corrective actions be completed;

8.3.1 Within 150 days or longer as agreed to by the CEA to meet compliance with R6 to begin the date the Generator Owner is notified that the Generator Cold Weather Constraint is invalid, or

8.3.2 Consistent with Requirement R7 Part 7.1 or longer as agreed to by the CEA, to begin from the date the Generator Owner is notified that the Generator Cold Weather Constraint is invalid.

R9. Review any Generator Cold Weather Constraint declaration validated by the CEA every 24 calendar months to determine if it remains valid under Attachment 1.

The NAGF has significant concerns related to the requirement to modify or repair equipment within an extremely confined period under these requirements. This issue is discussed in further detail under question 2.

The NAGF does not see any process that will be followed in the event the review of the declaration determines that it is now possible to correct, there are no timelines or other process. Is it the intent to allow the GO to determine when this will be implemented without any notifications to the CEA?

The NAGF also has concerns about situations where one vendor or OEM has developed a solution for the constraint, but the amount of investment needed to incorporate that solution is too high and impacts revenue and profitability negatively for operating the generation facility. How will this type of scenario be considered under the proposed Attachment 1 criteria?

The NAGF requests additional clarification regarding the constraints in Attachment 1:

As an example, for the constraint "Wind turbine towers that have structural limitations established by Original Equipment Manufacturers (OEMs) based on a minimum temperature that is higher than the Extreme Cold Weather Temperature calculated per Requirement R1." Do structural limitations imply design limitations? Please clarify that or include clarification in the Technical Rationale document.

As another example for the constraint "Heat tracing or other de-icing technologies for wind turbine blades that are not available in the Generator Owner's location." Does the phrase "not available" also mean not effective? There is a difference between both. There are currently some not-so-effective methods to prevent icing (like spraying the blades with anti-icing coatings). Since cost is not to be considered, are Generator Owners required to use solutions that are not effective if they are available, or can it be part of constraint declaration?

Does the phrase "Generator Owner's location" mean regionally? For example, does it mean if a wind turbine uses a solution that is available in New York, and the solution is not used in Texas, the Generator Owner can declare a constraint that it is not available for wind turbines in Texas? Or should the constraint be modified to: "Heat tracing or other de-icing technologies for wind turbine blades that are not available in all NERC regions"? Our rationale is that if it is not available in the US, but available in Europe, then, we are allowed to declare constraint. It should be based on availability within each country.

The NAGF looks forward to working with the SDT to address these issues and concerns.

While Avista supports in part the approach that the Drafting Team has taken to address FERC Commission Directives contained in the June 27, 2024 FERC Order, Approving Extreme Cold Weather Reliability Standard EOP-012-2 And Directing Modifications, we do not support the proposed definition for Generator Cold Weather Constraint. The definition for Generator Cold Weather Constraints contained in the previous version provided the industry with useful criteria that has been lost in the revised version. And while we see value in the information provided in Attachment 1, that information could be contained in another technical document supporting this standard (i.e., Technical Rationale or Implementation Guidance), if the definition and criteria were revised to more closely align to the directives contained in the Order. To address our concerns, we offer the following edits (in boldface) to the Generator Cold Weather Constraints definition:

Generator Cold Weather Constraint – Any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components using the criteria below. Freeze protection measures are not intended to be limited to optimum practices, methods, or technologies, but are also intended to include acceptable practices, methods, or technologies generally implemented by the electric industry in areas that experience similar winter climate conditions. (*Strikethroughs have been omitted for clarity*)

Criteria used to determine a **Generator Cold Weather Constraint shall consider the following:**

{C}· **A determination through an engineering analysis that the freeze protection measures lack reasonable assurances of efficacy and there is no record that such protections have been effectively utilized on** generating units **of a** comparable types in regions that experience similar winter climate conditions;

{C}· **A determination through engineering analysis that there are no available freeze protection measures, commercially available, that have been proven to be effective at mitigating the effects of the Extreme Cold Weather Temperature identified in the region where the resource is installed**; or {C}· **A determination through an engineering economic analysis has been made that determines that the implementation of freeze protection measures necessary to mitigate the effects of the Extreme Cold Weather Temperature, while feasible, would result in the early retirement of the resource.**

Most of the definition on Page 2 of the redlined document removes Generator Cold Weather Constraint without directing to Attachment 1. Also, depending on the CEA, a constraint may be applicable to the facility but disagreed upon by the CEA, in which the facility would have to update its corrective action plan without being able to contest the analysis of the CEA. Recommend that any Constraint that is requested be handled by a single senior management official with overall authority and responsibility for leading and managing implementation of and continuing adherence to the requirements within the NERC EOP-012 cold weather standards and not at the Compliance Enforcement Authority (CEA).

MP agrees with several aspects of Attachment 1 but aligns more closely with the edits EEI provided for the Cold Weather Constraint definition. EEI refers to effective freeze protections on units of comparable types in regions with similar winter climate conditions, commercially available and effective freeze protection for the region, and evaluation of where freeze protection installation could force early retirement. Early retirement of units will not support overall grid reliability.

Kennedy Meier - Electric Reliability Council of Texas, Inc. - 2, Group Name ISO/RTO Council Standards Review Committee (SRC)	
Answer	No
Document Name	
Comment	
The ISO/RTO Council (IRC) Standards Review Committee (SRC) (consisting, for purposes of these comments, of CAISO, ERCOT, IESO, ISO-NE, PJM, MISO, NYISO, and SPP) generally agrees with the updated definition of Generator Cold Weather Constraint, the updated language within Requirement R8, and the provision of Attachment 1 to provide further detail on constraints. However, the SRC recommends the following revisions to Attachment 1:	

-- Rename the first list of constraints “Potential Generator Cold Weather Constraints that Would be Candidates for Accelerated Approval” to better reflect the CEA review that is required for these constraints.

-- Revise the second constraint on the accelerated approval list to read as follows to clarify that it is not intended to address shipping difficulties: “Heat tracing or other de-icing technologies for wind turbine blades that the supplier will not sell or otherwise provide to the Generator Owner.”

-- Revise the fourth constraint on the accelerated approval list to read as follows to allow for the possibility of the future development of technically feasible solar panel de-icing technology: “Applying heat to remove accumulated frozen precipitation on solar panels when generating the heat would require 50% or more of the amount of energy the solar panels would produce in the absence of the accumulated frozen precipitation.”

The SRC recommends that items 3.a and 3.b of the case-by-case constraint list be consolidated into a single item that reads as follows: “The application of freeze protection measures would result in the imminent premature retirement of an existing generating unit.” This would help clarify that (for example) changing a unit’s planned retirement date from a day 20 years in the future to a day 19 years in the future does not justify a constraint, while also avoiding any potential ambiguity regarding what constitutes proper publication of a retirement date.

The SRC recommends that the three percent threshold used in items 3.d and 3.e of the case-by-case constraint list be replaced with language that would allow the CEA to determine the appropriate threshold for the particular region or portion of a region that would be impacted by the requested constraint. This would allow the CEA to consider whether, for example, a reduction in summer net dependable capacity is likely to have a more significant reliability impact the farther south a generating unit is located.

Regardless of the threshold that is ultimately selected, the SRC recommends that item 3.d be modified by adding language limiting item 3.d to performance reductions that occur “during weather conditions other than extreme cold weather conditions.” This would help clarify that no constraint exists if a freeze protection measure would cause a performance reduction only during extreme cold weather conditions.

The SRC recommends that the last paragraph in Attachment 1 be revised to read as follows to clarify that the relevant Reliability Coordinator or Balancing Authority may provide information that would assist the CEA in evaluating certain types of constraints and to clarify that a valid constraint declaration does not necessarily carry any weight for purposes of any non-EOP-012 regulatory regimes that may apply to the unit in question:

When submitting a Generator Cold Weather Constraint declaration to the CEA per Requirement R8, the Generator Owner must include documentation that defends and supports the declared constraint and also describes other compensating or mitigating freeze protection measures, if applicable, that the Generator Owner will apply. ***If a Generator Cold Weather Constraint declaration indicates that the application of a specific freeze protection measure or measures would adversely affect the reliability of the Bulk-Power System to an extent that outweighs the reliability benefit of applying the freeze protection measure(s), the documentation that defends and supports the constraint should include any assessment that the applicable Balancing Authority or Reliability Coordinator might agree to provide concerning the impact to the reliability of the Bulk-Power System if the constraint were to be granted.*** An approved Generator Cold Weather Constraint declaration for any specific Generator Cold Weather Critical Component does not relieve the Generator Owner of its obligation to otherwise prepare its applicable generating unit(s) to meet the requirements of EOP-012-3***, and does not in any way purport to relieve the Generator Owner of any other legal obligations or requirements outside of the requirements of EOP-012-3, including tariff, regulatory, or statutory obligations or requirements***.

The SRC also recommends that Part 8.1 of Requirement R8 be revised to require units beginning commercial operations to submit constraint declarations on or before the commercial operation date rather than 15 days after commercial operation. This would help minimize the amount of time between the commercial operation date and the CEA determination regarding the validity of the constraint.

Additionally, the SRC recommends that Part 8.2 be revised as follows to require Generator Owners to react to knowledge of changed circumstances outside of the 24-month review cycle: “Review any Generator Cold Weather Constraint declaration validated by the CEA every 24 calendar months ***and upon gaining actual knowledge of a material change in the circumstances that formed the basis for the Generator Cold Weather Constraint declaration*** to determine . . .”

Finally, the SRC recommends that Part 8.4 be clarified by ending the first sentence at “Part 7.1” and turning the remaining language into a separate sentence, as follows: “ . . . Part 7.1. The deadlines from the Part 6.1 and Part 7.1 timetables shall be calculated based on the date the Generator Owner is notified that the Generator Cold Weather Constraint is invalid.”

While NV Energy supports in part the approach that the DT has taken to address FERC Commission Directives contained in the June 27, 2024 FERC Order, Approving Extreme Cold Weather Reliability Standard EOP-012-2 And Directing Modifications, we do not support the proposed definition for Generator Cold Weather Constraint. The definition for Generator Cold Weather Constraints contained in the previous version provided the industry with useful criteria that has been lost in the revised version. And while we see value in the information provided in Attachment 1, that information could be contained in another technical document supporting this standard (i.e., Technical Rationale or Implementation Guidance), if the definition and criteria was revised to more closely aligned to the directives contained in the Order. To address our concerns, we offer the following edits (in boldface) to the Generator Cold Weather Constraints definition: **Generator Cold Weather Constraint –** Any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components using the criteria below. Freeze protection measures are not intended to be limited to optimum practices, methods, or technologies, but are also intended to include acceptable practices, methods,	

or technologies generally implemented by the electric industry in areas that experience similar winter climate conditions. (*Strikethroughs have been omitted for clarity*)

Criteria used to determine a **Generator Cold Weather Constraint shall consider the following:**

- **A determination through an engineering analysis that the freeze protection measures lack reasonable assurances of efficacy and there is no record that such protections have been effectively utilized on** generating units **of a** comparable types in regions that experience similar winter climate conditions;
- **A determination through engineering analysis that there are no available freeze protection measures, commercially available, that have been proven to be effective at mitigating the effects of the Extreme Cold Weather Temperature identified in the region where the resource is installed**; or
- **A determination through an engineering economic analysis has been made that determines that the implementation of freeze protection measures necessary to mitigate the effects of the Extreme Cold Weather Temperature, while feasible, would result in the early retirement of the resource.**

NV Energy also recommends there be an "approval by default" if the CEA does not respond within a given period, for example 30 days after submittal to CEA.

Response
Thank you for your comments. The Drafting Team appreciates the constructive input, particularly as it relates to the Generator Cold Weather Constraint definition and has modified the standard language to improve clarity. The "approval by default" approach does not meet the FERC directive for NERC to receive, review, evaluate and confirm the validity of a Generator Cold Weather Constraint.

PNM agrees with the comments of EEI:

While EEI supports in part the approach that the DT has taken to address FERC Commission Directives contained in the June 27, 2024 FERC Order, Approving Extreme Cold Weather Reliability Standard EOP-012-2 And Directing Modifications, we do not support the proposed definition for Generator Cold Weather Constraint. The definition for Generator Cold Weather Constraints contained in the previous version provided the industry with useful criteria that has been lost in the revised version. And while we see value in the information provided in Attachment 1, that information could be contained in another technical document supporting this standard (i.e., Technical Rationale or Implementation Guidance), if the definition and criteria were revised to more closely align to the directives contained in the Order. To address our concerns, we offer the following edits (in boldface) to the Generator Cold Weather Constraints definition:

Generator Cold Weather Constraint – *Any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components using the criteria below. Freeze protection measures are not intended to be limited to optimum practices, methods, or technologies, but are also intended to include acceptable practices, methods, or technologies generally implemented by the electric industry in areas that experience similar winter climate conditions. (Strikethroughs have been omitted for clarity)*

Criteria used to determine a ***Generator Cold Weather Constraint shall consider the following:***

A determination through an engineering analysis that the freeze protection measures lack reasonable assurances of efficacy and there is no record that such protections have been effectively utilized on *generating units* ***of a*** *comparable types in regions that experience similar winter climate conditions;*

A determination through engineering analysis that there are no available freeze protection measures, commercially available, that have been proven to be effective at mitigating the effects of the Extreme Cold Weather Temperature identified in the region where the resource is installed*; or*

{C}· ***A determination through an engineering economic analysis has been made that determines that the implementation of freeze protection measures necessary to mitigate the effects of the Extreme Cold Weather Temperature, while feasible, would result in the early retirement of the resource.***

Comment	

Invenergy appreciates the SDT's approach to addressing the FERC directives and we believe the changes in EOP-012-3 work toward meeting those directives. Still, we have concerns regarding the administrative burden placed upon Generator Owners and we would like to offer the recommendations below that provide additional clarity and/or address the directives in an equally effective manner.

Definition:

Consider revising the definition to read, "Any condition, subject to validation by the Compliance Enforcement Authority, that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components." This clarifies that certain criteria must be validated for a condition to be considered a Generator Cold Weather Constraint.

R8:

Invenergy recommends simplifying R8.1 to read, "Submit its Generator Cold Weather Constraint declaration(s) to the CEA within 45 days of determining that the Generator Cold Weather Constraint is applicable." As drafted, the multiple constraint declaration tracks introduce confusion for no real reliability gain.

Invenergy recommends allowing 36 months for the revalidation of any constraint declaration. Constraint declarations are unlikely to change frequently. Additionally, please clarify in R8.2 if the revalidation of constraint declarations is to occur 24 calendar months following the date of CEA validation. It may be beneficial to create a separate requirement for the actions currently prescribed in R8.2.

Attachment 1:

If the intent of the standard is that all Generator Cold Weather Constraint declarations must be submitted to the CEA for validation, then Invenergy recommends replacing "Pre-Approved Generator Cold Weather Constraints" with "Known Generator Cold Weather Constraints."

The final two bullets under the Pre-Approved Generator Cold Weather Constraint header seem to refer more to possible solutions to a constraint, rather than the circumstances that constitute the constraint. Consider reframing the bullets to reference the lack of deployable solutions to remove accumulated frozen precipitation on solar panels or on combustion turbine inlet air filters. Invenergy is worried that the disregard in Attachment 1 of commercial concerns that do not rise to the level of premature retirement of an existing facility places unreasonable expectations on the Generator Owner to procure equipment or apply freeze protection measures that, based on the Generator Owner's operating experience or analysis, may not suit the needs of the Generator Owner. We recommend that the language make more accommodations for Generator Owners to be able to pursue reliable generation in a manner that best fits their unique circumstances. We recommend striking the final sentence of Attachment 1 as it does not provide any additional criteria relevant to the declaration of a constraint.

OPG supports BC Hydro's comment: "BC Hydro is supportive of the revisions to the revised Generator Cold Weather Constraint definition. However, to add clarity on Freeze Protection Measures, BC Hydro recommends retaining the following wording "Freeze protection measures are not intended to be limited to optimum practices, methods, or technologies, but are also intended to include acceptable practices, methods, or technologies generally implemented by the electric industry in areas that experience similar winter climate conditions" in EOP-012-3 associated documentation, such as the Technical Rationale." And "Please also clarify in the language of the Requirement whether these are calendar or business days.".	

OPG supports NBPower's comment: "The pre-approved Generator Cold Weather Constraints (GCWCs) in Attachment 1 could be problematic in some jurisdictions, since Requirement R8 and Attachment 1 are referenced for Requirement R2 Part 2.2 for new designs on a go-forward basis. In particular, the pre-approved GCWC should not be set up in such a way as to exempt generating unit developers from doing proper due diligence. At least for future designs (Requirement R2 Part 2.2) all Generator Cold Weather Constraints should be assessed on a case-by-case basis. Pre-approved GCWCs should be avoided, or if used at all, limited to existing or already committed designs, since technology and the needs of the grid may be expected to change in the future and existing pre-approvals may no longer be appropriate."

OPG has the following comments: Additional clarification is required regarding GCWC CEA applicability/validity confirmation & determination implications for unit present/future operation.

Please clarify the role of CEA – review for constraint presence, validity confirmation, or approval, and the requirements the CEA need to satisfy to perform its role.

Attachment 1 bullet #3 appears to be the BA purview and not the CEA.

In the context of this standard a freeze protection measure can negatively impact the revenue of a market participant, yet still be required to be implemented for compliance purposes. Please explain how was derived the "more than three percent" criterion and the justification for argument that it will fit all the market participants, from any geographical location.

Attachment 1 last paragraph state that "An approved Generator Cold Weather Constraint declaration for any specific Generator Cold Weather Critical Component does not relieve the Generator Owner of its obligation to otherwise prepare its applicable generating unit(s) to meet the requirements of EOP-012-3.".

The overall intent of the Extreme Cold Weather Preparedness and Operations standard is to:" Implement freeze protection measures to protect Generator Cold Weather Critical Components that provide the capability to operate at the unit(s)' Extreme Cold Weather Temperature;"

By definition, the "**Generator Cold Weather Constraint** – Any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components.". As written, this appears to be an actual requirement to operate at the ECWT, which cannot be reconciled with an approved Generator Cold Weather Constraint declaration."

There is a risk for future generation designs introduced by Attachment 1 via geographical limitation for specific technologies in the Pre-Approved Generator Cold Weather Constraints list.

BC Hydro appreciates the drafting team's efforts and the opportunity to comment, and offers the following comments and suggestions:

1. BC Hydro is supportive of the revisions to the revised Generator Cold Weather Constraint definition. However, to add clarity on Freeze Protection Measures, BC Hydro recommends retaining the following wording "*Freeze protection measures are not intended to be limited to optimum practices, methods, or technologies, but are also intended to include acceptable practices, methods, or technologies generally implemented by the electric industry in areas that experience similar winter climate conditions"* in EOP-012-3 associated documentation, such as the Technical Rationale. Please also clarify in the language of the Requirement whether these are calendar or business days.
2. For Requirement R8 Part 8.1 BC Hydro recommends adding "or" after "is applicable" to further clarify the two separate timeline requirements.

Texas RE has some concerns regarding the proposed definition of Generator Cold Weather Constraint, consistency between Requirements R1 and R8, and to whom annual training shall be given in Requirement R5.

Definition

Texas RE is concerned that the definition of Generator Cold Weather Constraint proposed under the terms is inconsistent with the description of Generator Cold Weather Constraint in Attachment 1. The definition states that a Generator Cold Weather Constraint is "Any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components." The description in Attachment 1, however, says "A Generator Cold Weather Constraint is any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components using the following criteria:" and lists out pre-approved Generator Cold Weather Constraints and case-by-case Generator

Cold Weather Constraints. The proposed definition cannot be read without the additional information in Attachment 1, yet the proposed definition does not reference Attachment 1.

Texas RE proposes that either the proposed NERC Glossary definition include all of the information in Attachment 1, an explicit reference to Attachment 1, or eliminate the proposed NERC Glossary definition altogether and simply use the term as part of the requirements that is described in Attachment 1 and noted as such in the requirement language.

Consistency between Requirements R1 and R8

For verbiage consistency in Requirement R1, Texas RE recommends adding the word 'calendar' to Requirement 1.1.1 for developing new corrective actions after recalculation (in bold):

1.1.1 If the re-calculated Extreme Cold Weather Temperature (ECWT) is lower than the previous Extreme Cold Weather Temperature, the entity shall review and update its cold weather preparedness plan(s) under Requirement R4 within six (6) calendar months of the recalculation. If new corrective actions are needed to provide the required operational capability under Requirement R2 or R3, the entity shall develop a Corrective Action Plan within six (6) **calendar** months of the recalculation.

Although Requirement R8 requires shorter timeframe for timely review and evaluation of declared Generator Cold Weather Constraints, the calculation timeframe used in Requirement R1 for identifying Extreme Cold Weather Temperature to review and identify new corrective actions to provide the required operational capability remains five calendar years. Texas RE suggests revising Requirement R1 for Generator Owner to perform the ECWT calculations every 24 calendar months instead of every five calendar years, to be consistent with Requirement R8 and to ensure that most recent information is used to prepare unit's cold weather preparedness plan. Performing the ECWT calculations biennially could also help to include any 'Lessons Learned' from the latest weather event and reviewing/updating any operating limitations in the Generator Cold Weather Constraint declaration under Requirement R8. Texas RE recommends the following revision (in bold):

R1. At least once every **24 calendar months five calendar years**, each Generator Owner shall, for each of its applicable generating unit(s): [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]

Requirement R5 Current language for Requirement R5 states that annual training shall be provided to maintenance or operations personnel responsible for implementing the cold weather preparedness plan(s). In many cases maintenance personnel implementing the plans and operational personnel responsible for implementing the plans in real-time could be different individuals. Therefore, it is important to provide training for both maintenance and operations personnel responsible for implementing the cold weather preparedness plan(s). Texas RE recommends the following revision (in bold): R5. Each Generator Owner in conjunction with its Generator Operator shall identify the entity responsible for providing the generating unit-specific training, and that identified entity shall provide annual training to its maintenance **or and** operations personnel responsible for implementing the cold weather preparedness plan(s) developed pursuant to Requirement R4.

2. In paragraph 68 of the June 2024 Order, FERC directed NERC to modify Requirement R7 of EOP-012-2 to require shorter deadlines to implement corrective actions for existing or new equipment or the freeze protection measures for those generating units that experience a Generator Cold Weather Reliability Event. FERC provided an example for how to address this directive, such as to require shorter timeframes for those units that have experienced issues and allow longer timeframes to address similar potential issues across a fleet for those units that have not experienced issues.

The drafting team modified Requirement R6 of EOP-012-2 to require a shorter deadline to implement corrective actions for those generating units that experience a Generator Cold Weather Reliability Event. Do you agree with the revised timelines? Please provide any additional comments to consider. If you do not agree but believe the directive can be addressed in an equally effective and efficient manner, please provide your suggestions in the form of specific language changes for the drafting team. Please review the posted draft ERO Enterprise document, EOP-012-3 Generator Cold Weather CAP Extension and Constraint Process.

Wayne Sipperly - North American Generator Forum - 5 - MRO,WECC,Texas RE,NPCC,SERC,RF	
Answer	No
Document Name	EOP-012-3 Constraint and CAP Process 10172024 - NAGF comments final.pdf

Comment

The NAGF notes that the timelines for the CAPs may create a significant burden since the GO cannot simply take outages to address these issues. It is unclear if these outages will take priority over other outages due to the very short timelines required for compliance or if other outages, many of which are probably more important for reliability all year long, will take priority. As an example of this concern, in PJM planned outages are not allowed from the 24th week to the 36th week of each calendar year. In 2024, this means that an outage cannot be scheduled from June 10th to September 9th. The NAGF's experience with project planning and execution shows that a CAP for Cold Weather Reliability Events is unlikely to be developed, equipment purchased and delivered and labor lined up to perform the installation between the date of the event, say mid-January and June 10th, particularly if widespread failures due to extreme winter weather create such demand for retrofit equipment and installation services that supply chains simply cannot keep up. This means the GO will have 11 weeks between September 9 and December 1 to schedule an outage to perform the needed tasks. (And determine within the first 17 days of these 11 weeks if an extension may be needed under the proposed 60-day filing requirement in the process document.) The fall season is often filled to the maximum with planned outage work, and the resources needed to add massive new tasks at the last minute do not exist. Has NERC or FERC or any Balancing Authorities performed any review to see how many additional outages

can be scheduled in these 11 weeks? Or is it possible that NERC and FERC (and the RTO/ISO Council that submitted the comments FERC based their order on) are going to create an unreasonable expectation? Regardless of this concern, the Process document has many areas that raise concerns to the NAGF. The NAGF has provided a copy of the process document with comments to help the SDT understand the concerns. Some areas of concern raised by the process document includes a deadline to submit a request for CAP extension that does not take into account issues beyond the GO's control, a statement that the GO must first work with the CEA before filing the request, which effectively moves the deadline back even further, the statement requiring "due diligence in ordering" without defining exactly what the CEA may consider due diligence, Another issue of concern is the requirement to file a constraint declaration for the same recurring event types. As an example, if a wind farm has blade icing occur in the winter of 2025, it must create a CAP, make a declaration, file the declaration and then every other year review that declaration. If the same wind farm (or different wind farm owned by the same entity) has a blade icing event in 2026, the same CAP, declaration and review will be required again. In the course of 10 years, this owner is likely to have 10 declarations for the same thing, reviewing 5 of them each year. This is not a mere theoretical concern; ice storms are quite common in the southern US, and having to make new filings for each one would constitute mere regulatory churn. This process will not improve reliability and will take time away from entities' ability to actually provide more reliable service to the grid. This process should be revised to address the need to process duplicative reports by generators. Finally, it is unclear how the timelines proposed in the process document posted with the standard may impact compliance. As an example, if a Generator Owner files for a CAP extension 30 days before the CAP deadline, does this cause a violation? Or does the request get immediately denied without review because it does not meet the timeline specified in the document and therefore the Generator Owner will be deemed to have violated the standard when they cannot complete the CAP by the deadline?

OPG supports HQ comments: 'The Generator Cold Weather CAP Extension and Constraint Process document should be updated to reflect Canadian-specific language regarding applicable governmental authorities, for example, similar to the language used in the footnote 11." OPG supports Manitoba Hydro's comment recommending that for non-US Registered Entities: Prior to the implementation of any element of a Corrective Action Plan developed in accordance with this Requirement all applicable corporate, regulatory, provincial, and federal evaluations and approvals must be completed and obtained. The applicable timeline for implementation of a Corrective Action Plan shall be determined by the Registered Entities Generator Owner. OPG supports BC Hydro's comment (freezing precipitation in Québec can and has occurred in March and April months) regarding Requirement "R6: Similar to previously submitted comments, in Québec, Canada, Generator Cold Weather Reliability Events such as freezing precipitation, can and have happened well into the Spring calendar months (including April and May). The requirement to develop a CAP within 150-days of the Event is reasonable. However, the first day of July deadline will considerably reduce the CAP development timeline for late Spring Events. Worst case scenario, for a May Event, identification of common failure causes, solution identification and CAP development would need to be done in less than 45 days, which may result in an inadequate CAP. The addition of the December 1 deadline to implement a CAP (R6 Part 6.1.5) would ensure that adequate CAPs are developed and implemented before the next Winter season. With the addition of the December 1 deadline, HQ recommends deleting "the first day of July" language. "

If the expectation is that Generator Owners are to monitor for Generator Cold Weather Reliability Events throughout the year, rather than only during the winter season, then please consider the following revisions:

1. Strike “before the first day of July” from Requirement R6 and simply require that Corrective Action Plans be developed no more than 150 days after the Generator Cold Weather Reliability Event. This ensures that each event receives the same amount of time, regardless of when it occurs.

2. Consider revising Requirement R6.1.5 to read, “A timetable specifying that implementation of the Corrective Action Plan shall be completed prior to the first day of December of the next calendar year following the Generator Cold Weather Reliability Event; and”

These revisions would provide greater flexibility to the Generator Owner to schedule any needed maintenance outages in a manner that better supports reliability and keeps generators online.

Comment	

We at ACES greatly appreciate the monumental effort put forth by the drafting team in developing the proposed updates to EOP-012-2 in accordance with the FERC directives.

From the perspective of ACES, the proposed modifications to Requirement R6, while a good start, would benefit from further refinement. We believe that, as written, the timelines identified in Requirement R6 are too elastic and unduly discriminate against the GO based solely upon the date the generating unit(s) experienced a Generator Cold Weather Reliability event.

It is our opinion that the required compliance timeline would be best defined by removing the inherent obscurity associated with using specific calendar days. In short, we recommend using a timeline based solely on a defined quantity of calendar days and removing all references to explicit months and days. Please consider the following example scenarios as an illustration:

- Generating Unit 1 belonging to Entity A experiences a Generator Cold Weather reliability event on November 1st, 2024. Per the currently proposed version of Requirement R6, Entity A has until April 1st, 2025, to develop a CAP (150 days after).
- Generating Unit 2 belonging to Entity B experiences a Generator Cold Weather reliability event on March 17th, 2025. Per the currently proposed version of Requirement R6, Entity B has until June 30th, 2025, to develop a CAP (before the first day of July).
- In the above examples, Entity A is allowed 150 days after their event to develop a CAP whereas, Entity B is only allowed 90 days after the same event type to do the same.
    - This results in an unequal application of the Reliability Standard by granting Entity A an additional 60 calendar days to complete the same compliance activities as Entity B.
    - Assuming both entities develop a CAP within 100 calendar days of the event date:
        - Entity A would be compliant with Requirement R6.
        - Conversely, Entity B would be in violation of Requirement R6 and would potentially be subject to a compliance Penalty.

It is the viewpoint of ACES that entities should be provided with the **same** length of time to complete compliance activities required by a Reliability Standard. We recommend that the timeline be modified to 120 calendar days regardless of when the Generator Cold Weather Event occurs.

By examining NOAA Annual/Seasonal Climate Normals data, we were able to determine that almost all areas of the lower 48 US states experience the last spring freeze on or before May 28th (90% probability) and the first fall freeze on or after September 18th (90% probability). As there are 113 days between these two dates, we believe that a strict 120 calendar day metric is a reasonable alternative.

Additionally, it is our opinion that the timeline to address similar potential issues across a fleet for those units that have not experienced issues is too short. We are concerned that a GO with either a large generating fleet (large IOU) or limited resources (small electric cooperative), may not be able to complete all corrective actions on all applicable units within 24 calendar months. We believe that 36 calendar months is more appropriate to allow for variability between GOs across the industry. Thus, we recommend modifying Requirement R6 as follows (note: for the sake of brevity, the requirement text for any sections without recommended changes has been omitted): R6 Each Generator Owner shall, for each generating unit that has a calculated Extreme Cold Weather Temperature at or below 32 degrees Fahrenheit (zero degrees Celsius) as determined in Requirement R1 and that self-commits or is required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), develop and implement a Corrective Action Plan when the generating unit experiences a Generator Cold Weather Reliability Event. The Corrective Action Plan shall be developed no more than 120 calendar days after the Generator Cold Weather Reliability Event. The Generator Owner shall: 6.1.5. A timetable specifying that implementation of the Corrective Action Plan shall be completed within 12 calendar months of the Generator Cold Weather Reliability Event; and 6.1.6. A review of applicability to similar equipment freeze protection measures at generating units owned by the Generator Owner, with a specified timetable for corrective actions to be completed within 36 calendar months of the Generator Cold Weather Reliability Event.

Response
Thank you for your comments. The DT made significant changes to R6 to accommodate some of industry's comments while still supporting the FERC directives. FERC stated "The Commission has repeatedly expressed an urgency in completing cold weather Reliability Standards and having them implemented in a timely manner to address the risks presented by cold weather events on the reliability of the Bulk-Power System." in its June Order with associated directives. While there may be instances where utilities may not be able to meet the 24 calendar months, the proposed language offers approaches for CAP extensions and declaration of Generator Cold Weather Constraints. No change.

Recent changes to Southwest Power Pool (SPP) policy require all planned outages for the summer season to be submitted by February 15th. With the proposed shortened timeline to implement and complete a Corrective Action Plan and the associated freeze protection measures, a late season Generator Cold Weather Reliability Event could require scheduling an outage that has not been authorized by SPP to implement required corrective actions by the proposed December 1st deadline. This would negatively impact an entity's Performance Based Accreditation (PBA) SPRM recommends an exception or preapproved extension for instances when implementing corrective actions would require an outage not authorized by an entity's Balancing Authority.

Reclamation does not agree. Shortening time frames does not alleviate the burden of lack of material, contracting resources or other schedulable items. Cost and timeframe are always intertwined. For example, government bid processes are often time consuming and shortening corrective action timeframe requirements could cause the entity to become non-compliant.

EEI does not object to the proposed shortened deadlines except for the language in Requirement R6, subpart 6.1.6. We understand 6.1.6 to mean that a GO is to complete freeze protection CAPs on similar equipment vulnerabilities within 24 months, however, we disagree that this is what the Commission directed in Paragraph 68 of the order. What they directed was that corrective actions needed to be taken on "similar equipment on all of its fleet within 24 months of becoming **aware of the freeze issue**." In other words, the clock should start after the GO has confirmed similar vulnerabilities on similar equipment on other generating resources. To address this issue, EEI suggests adding the following clarifying language to 6.1.6 as suggested below in boldface: **6.1.6.** A review of applicability **of** similar **freeze protection** equipment **installed on similar generating units within 12 calendar months of the of the Generator Cold Weather Reliability event** by the Generator Owner, with a specified timetable for corrective actions to be completed within 24 calendar months of **confirming a generating unit has similar equipment vulnerabilities**;

Response
Thank you for your comments. The DT disagrees with the interpretation as the "freeze issue" references the freezing issue causing the Generator Cold Weather Reliability Event. Since the freeze protection measures should be known for each generating unit, the cause of the Generator Cold Weather Reliability Event will be identified, and annual maintenance/inspection will be occurring, it seems plausible that implementation of corrective actions should occur within 24 calendar months of the Generator Cold Weather Reliability Event. The Standard allows flexibility for extending Corrective Action Plans. The suggestion supplied provides no timeframe for determining applicability which would mean a GO could take as long as they want BEFORE starting the 24-calendar month clock. This does not meet the FERC stated urgency to address this risk.

AES US Renewables are in agreement that any corrective actions needed to mitigate root cause(s) resulting from a Generator Cold Weather Reliability Event should be completed as expeditiously as possible. However, we have real concerns about the ability to complete the CAP by December 1 if the Generator Cold Weather Reliability Event (GCWRE) occurred in the same year. For example, winter storms in the northeast can still occur as late as in March. With that in mind, it will be difficult to develop a CAP, implement the CAP and complete the CAP within 7-8 months if a generating facility located in northeast is impacted by the GCWRE. This time constraint will be reduced even further if there is extension request involved since it requires submittal of the extension at least 60 days in advance of the due date (December 1).

Additionally, we have concerns that corrective actions need to be completed within 24 months of the GCWRE at other sites owned by the Generator Owner for same equipment or freeze protection measures implicated in the root cause analysis for a site that experienced a GCWRE. This proposal may work for GOs that don't own a lot of sites. However, for IPPs that have generating assets in multiple regions, 24 months is not a realistic timeframe to complete the corrective actions. It will require time to send out RFPs to multiple contractors and then for internal review of the contractor proposals as well as negotiations involved. This could take up several months in best case scenario. And depending on the work that needs to be done, it will

require coordination with site-level personnel and outage coordination with other entities (eg: BAs, TOPs). So, we strongly suggest modifying the 24 calendar months to at least 36 calendar months.

Current proposed R6 requirement language does not specify when the extension requests need to be made. However, a companion document (*EOP-012-3 Constraint and CAP Process 10172024.pdf*) indicated that "*Entities are encouraged to submit the extension request as soon as they are aware they will not meet the CAP completion date but no later than **60 days** before the original required completion*

date." We would like to understand if the 60 days timeline is enforceable if it is not used within the R6 language. Furthermore, R6 language does not state what happens when the extension request is denied. Only the companion document specifies that *(If an extension request is denied, the selected actions in the Corrective Action Plan need to be completed in accordance with the original timetables.*). Again, we would like to understand if the language in the companion document is enforceable. It is stated in the companion document that if the extension request is denied, the CAP will need to be completed in accordance to its original timetable. This will not be feasible if the CAP extension request is submitted close to the December 1 deadline. The CEA is allowed minimum of 60 days for the whole extension approval process (15 days to acknowledge receipt and verify all information has been provided + 45 days of review before providing notification to registered entity on whether their request is approved or denied). There is potentially the need for the CEA to extend beyond the 45 days to perform their review. That will further reduce the length of time for the GO to complete the CAP based on original timeline if the CAP extension is denied. So, for a registered entity to implement the CAP prior to December 1, the time for CEA to review will eat into the time that registered entities have to investigate the GCWRE, develop CAP and implement CAP. Using the example for a GCWRE that occurs in March, this extension review process can reduce the time registered entity has from 7-8 months down to 5-6 months (which can be further reduced if certain ISO/RTO regions do not allow planned outages during certain times of the year like peak summer time). We request the drafting team to look into all possible scenarios to ensure that reasonable amount of time is allocated for developing CAP, implementing CAP and requesting CAP extension (if applicable). Currently, the timeline listed in R6 is not reasonable.

Under the proposed 6.1.5, there may be cases where remedies to correct results from an Extreme Cold Weather Reliability event may not be feasible to be completed by December due to vendor or supply chain issues. There should be some flexibility to allow for mitigation activities with longer lead times for complete resolution without going through a formal corrective action plan extension. The additional approval process needed for an extension is very inefficient and builds in potential delays that, if an extension is not approved, can set back the timing of a plan, creating a potential violation itself. Approval decisions would need to be mandated to be made in a short timeframe if they are still included in the standard. Finally, within the section, footnote 10 speaks to freeze events occurring outside a winter period, such as October and November. Please clarify what is the designated winter period as it relates to this standard.

Dominion Energy supports EEI comments and further stipulates that the SDT has gone beyond the language and intent of the FERC Order. For larger generation entities with a diverse fleet, time for reviewing the specs for its fleet and identifiying potential cold weather issues should not be included in the 24 calendar month timeframe. Once the issue has been identified in a specific unit the clock should begin.

The 3 types of items required to complete a Corrective Action Plan (CAP) under R1, R2 and R3 are the same 3 types of items required to complete a Corrective Action Plan under R6, qualified personnel, proper materials, and the required plant conditions. Any repair or	

modification that can reasonably be completed before December 1st in fact should be completed, however any repair or modification that needs an outage or if qualified materials and people are not available CAP completion may have to wait until the next planned outage. Planned outages are scheduled to maintain reliability. Adding unplanned outages either postpones scheduled outages or forces outages into periods of time when demand is high, therefore reducing the reliability to satisfy load requirements. The expertise for making decisions regarding the timing repairs is best left with the GOs, GOPs, and BAs. Any event after February 2nd will be due by July 1st. If the CEA takes 60 days to make a decision on an extension it is now August 30th. If that decision is NO, there are only 93 days until December 1st. Forcing completion of a CAP needing an extension will require either unqualified personnel, improper materials, or andan Unplanned Outage. All of which impact BES reliability. Instead of requiring CEA approval, require the entity to keep evidence justifying the decision to make the repair later than December 1st. This is appropriate for audit during a subsequent audit.

Comment	
Duke Energy does not support the language used in requirement R6.1.5 which requires the resolution of all winter event corrective actions by December 1st of the following year. This interval is too restrictive to allow for evaluation and correction on many freeze protection repairs or for the installation of new freeze protection measures. The inadequacies of this time interval are compounded when the effects of a major winter storm are considered. Large storms, like Elliott or a Polar Vortex, impact multiple units across multiple utilities. It would be difficult for a GO to address multiple events in this timeframe with available vendor support, and competing against other utilities for these vendors will only make this situation worse. Maintaining R6.1.5 as proposed will also result in higher levels of extension approvals for CEAs to process. Duke Energy recommends the requirement be modified to a period of 24 calendar months.

Manitoba Hydro recommends that for non-US Registered Entities: Prior to the implementation of any element of a Corrective Action Plan developed in accordance with this Requirement all applicable corporate, regulatory, provincial, and federal evaluations and approvals must be completed and obtained. The applicable timeline for implementation of a Corrective Action Plan shall be determined by the Registered Entities Generator Owner. Manitoba Hydro supports Hydro Quebec's comment: "The Generator Cold Weather CAP Extension and Constraint Process document should be updated to reflect Canadian-specific language regarding applicable governmental authorities, for example, similar to the language used in the footnote 11." Manitoba Hydro supports BC Hydro's comment (freezing precipitation in Manitoba can and has occurred in March and April months): "Requirement R6: Similar to previously submitted comments, in British Columbia, Canada, Generator Cold Weather Reliability Events such as freezing precipitation, can and have happened well into the Spring calendar months (including April and May). The requirement to develop a CAP within 150-days of the Event is reasonable. However, the first day of July deadline will considerably reduce the CAP development timeline for late Spring Events. Worst case scenario, for a May Event, identification of common failure causes, solution identification and CAP development would need to be done in less than 45 days, which may result in an inadequate CAP. The addition of the December 1 deadline to implement a CAP (R6 Part 6.1.5) would ensure that adequate CAPs are developed and implemented before the next Winter season. With the addition of the December 1 deadline, BC Hydro recommends deleting "the first day of July" language. "

Jennifer Weber - Tennessee Valley Authority - 1,3,5,6 - SERC	
Answer	No
Document Name	

Comment
Taking unplanned maintenance outages to meet a CAP deadline or pivot from a rejected CAP extension could be overburdensome to the GO. Clarity around timeliness, expectations, and exceptions could help alleviate pressure. Additionally, maintenance outages are typically planned during off-peak times. This limits availability to schedule last minute changes prior to the winter period.

1. Requirement R6: Similar to previously submitted comments, in British Columbia, Canada, Generator Cold Weather Reliability Events (Events) such as freezing precipitation, can and have happened well into the Spring calendar months (including April and May). The requirement to develop a Corrective Action Plan (CAP) within 150 days of the Event is reasonable. However, the July 1 deadline will considerably reduce the CAP development timeline for late Spring Events. Worst case scenario, for a May Event, identification of common failure causes, solution identification and CAP development would need to be done in less than 45 days, which may result in an inadequate CAP. The addition of the December 1 deadline to implement a CAP (R6 Part 6.1.5) would ensure that adequate CAPs are developed and implemented before the next Winter season. With the addition of the December 1 deadline, BC Hydro recommends deleting "the first day of July" language.
2. Requirement R6 Part 6.1.6 requires corrective actions be implemented to similar equipment freeze protection measures (FPMs) within 24 calendar months of a GCWRE. BC Hydro interprets "similar equipment freeze protection measures" as existing FPMs, and therefore the Part 6.1.6 timeline of 24 calendar months only applies to existing FPMs. Any identified need for new FPMs will follow a similar timeline to R7.1.2 which is up to 48 calendar months. Given the BC Hydro fleet size and possible differing design solutions for the same cause at different locations throughout the fleet, a longer implementation timeline (36 calendar months to 48 calendar months) may be required for new FPMs. BC Hydro requests that the DT confirm this understanding or clarify the timeline expectation for new FPMs implementation.
3. BC Hydro recommends that R6 Part 6.2.1 be revised to replace "how" with "why" for which better explains the rationale for circumstances beyond an entity's control.

4. Requirement R6 Part 6.1. "Ensure the Corrective Action Plan contains at a minimum:". BC Hydro notes that this wording does not align with other Standard Requirements that list what must be in a Procedure, Plan, etc. BC Hydro recommends revising the wording in R6 as appropriate so Part 6.1 would be: "6.1 The Corrective Action Plan shall include:"

PNM agrees with the comments of EEI: *EEI does not object to the proposed shortened deadlines except for the language in Requirement R6, subpart 6.1.6. We understand 6.1.6 to mean that a GO is to complete freeze protection CAPs on similar equipment vulnerabilities within 24 months, however, we disagree that this is what the Commission directed in Paragraph 68 of the order. What they directed was that corrective actions needed to be taken on "similar equipment on all of its fleet within 24 months of becoming* ***aware of the freeze issue****." In other words, the clock should start after the GO has confirmed similar vulnerabilities on similar equipment on other generating resources. To address this issue, EEI suggests adding the following clarifying language to 6.1.6 as suggested below in boldface:* ***6.1.6.*** *A review of applicability* ***to of*** *similar* ***freeze protection*** *equipment* ***installed on similar generating units within 12 calendar months of the of the Generator Cold Weather Reliability event freeze protection measures at generating units owned*** *by the Generator Owner, with a specified timetable for corrective actions to be completed within 24 calendar months of* ***the Generator Cold Weather Reliability Event confirming a generating unit has similar equipment vulnerabilities****;*

Section 6.2 adequately addresses this situation, and Section 7.3 provides clarity on what needs to be submitted. From a Generator Owner (GO) perspective, here is some background on the likely reasoning for CAP extension requests and what the GO should be briefed on regarding expected deliverables: If an engineering study or similar activity is required to assess the balance of freeze protection measures, the GO may need to request a CAP extension. This is because such activities can take considerable time, depending on non-recurring O&M budgeting and implementation policies. The GO should be prepared to file a CAP extension request with a plan and timeline as soon as practicable, based on the known implementation timeline for assessing similar freeze protection measures.

NERC needs to provide more clarity about where the CAP Extension and Constraint Process documents will be posted on NERC's website to make them easy to access. Also, if these processes are to be done through NERC's ERO Portal, and Registered Entities must file these through a Regional Entity, a contact for each Region should be established and published so Registered Entities will have a contact to address any process or access issues with the ERO Portal.

While AEP agrees with the overall substance of R6, we recommend that it be revised to indicate what it means to properly “implement” a Corrective Action Plan. Does it perhaps mean to complete what is later specified and required in R6.1, or something else entirely? If so, the phrase “complete the obligations of R6.1” may be preferable to “implement the Corrective Action Plan.” AEP requests this clarity be provided in the obligation.

R6 states, “develop and implement” a Corrective Action Plan…”, with “and implement” being added in this version. For the situation where a CAP is not being developed but a Generator Cold Weather Constraint is being submitted, the “and implement” does not seem to fit this scenario. Also, Southern believes the intent for R6 is to require 6.1 and 6.2, **or** 6.3 and not to require all items in R6.1. For example, a timetable as mentioned in R6.1.5. If a Generator Cold Weather Constraint is declared, then a timetable obviously should not be required.	

In addition, then requirement in R6.1.5 could be a very aggressive goal especially if outages, manpower, or material limitations arise. Assuming these types of problems are deemed valid, then an extension would have to be approved. In addition, Southern agrees with the comments from NAGF related to the short timelines and potential difficulty scheduling outages for CAPS that involve taking a unit off for the necessary work. Southern does not agree that a Compliance Enforcement Authority's (CEA) approval of a CAP is consistent with a risk-based action that improves reliability. The insertion of the CEA into a registered entity's process of mitigating a reliability concern adds unneeded and burdensome administrative layers. The NERC standard should solely focus on identifying the problem and implementation of mitigating actions, both of which are in the registered entity's purview. The provision of an entity's mitigation plan to the CEA should be required, but only for compliance enforcement purposes. Actions that allow the CEA to go beyond an audit of the implementation plan are out of scope of the standard.

Thank you for your comments. Each Generator Cold Weather Reliability Event requires a CAP. The only instance of a CAP not being needed for a Generator Cold Weather Constraint is Requirement R2 Part 2.2. The DT made significant changes to Requirement R6 based on industry comments and taking into consideration the FERC directives. Please see responses to NAGFs comments. CEA is only approving CAP extensions per the FERC directive.

3. In paragraph 70 of the June 2024 Order, FERC directed NERC to develop and submit modifications to Requirement R7 of Reliability Standard EOP-012-2 to ensure that any extension of a corrective action plan implementation deadline beyond the maximum implementation timeframe required by the proposed Reliability Standard is pre-approved by NERC.

The drafting team provided language changes in Requirements R6 and R7 for a Corrective Action Plan extension process. Do you believe that the proposed language changes meet the intent of paragraph 70 of the FERC Order? Please provide any additional comments to consider. If you do not agree but believe the directive can be addressed in an equally effective and efficient manner, please provide your suggestions in the form of specific language changes for the drafting team.

Anna Martinson - MRO - 1,2,3,4,5,6 - MRO, Group Name MRO Group	
Answer	No
Document Name	
Comment	
MRO NSRF recommends that dates for which a registered entity is to be held to must be in the Requirement.	

MRO NSRF recommends there be an “approval by default” if the CEA does not respond within a given period, for example 30 days after submittal to CEA. MRO NSRF recommends that the existing 60-day corrective action plan extension request have caveats for scenarios when it is not determined until within in the 60 day period that an extension is required. There are various obvious scenarios where this is a real and realized risk, with causes outside of the control of the entity, and must be addressed.

Dominion Energy supports the EEI comments. In addition, Dominion Energy has a concern that the appeal process is not formally outlined or appear even exist for denial of constraints by NERC staff. Also, the entire constraint review process should be formalized in a public document in either the standard itself or in the Rules of Procedure. While the draft internal NERC procedure is a good start, a formal documented and public process should be created and maintained.

Comment
Does the R6.2 footnote 11 exclude Canadian entities from having to request CAP extensions. Is this interpretation correct? Please advise. R6 and R7 requirements regarding pre-approval of CAPs by NERC use language that is similar to the TPL-007 standard. TPL-007 has a Canadian Variance where implementation of Corrective Action Plan(s) that require capital investment must be approved by the applicable provincial regulatory authority. This project should consider whether Canadian-specific language is needed in Requirements R6, R7 and R8 to align with the regulatory practices/processes in Canada for approving Corrective Action Plan(s) requiring capital investments. HQ supports Manitoba Hydro's comment "Manitoba Hydro recommends that for non-US Registered Entities, this additional language/guidance be added to footnote 11 and 12: Prior to the implementation of any element of a Corrective Action Plan developed in accordance with this Requirement all applicable corporate, regulatory, provincial, and federal evaluations and approvals must be completed and obtained. The applicable timeline for implementation of a Corrective Action Plan shall be determined by the Registered Entities Generator Owner.

This approach does not take into account potential for excess outages. In addition, as explained in Response to Q2, the additional approval process needed for an extension is very inefficient and builds in potential delays that, if an extension is not approved, can set back the timing of a plan. NRG recommends that approval decisions would need to have a short mandate timeframe if they are still included in the standard.

Similar to the comment on proposed R6, current proposed R7.3 requirement language does not specify when the extension requests need to be made. However, a companion document (*EOP-012-3 Constraint and CAP Process 10172024.pdf*) indicated that "*Entities are encouraged to submit the extension request as soon as they are aware they will not meet the CAP completion date but no later than **60 days** before the original required completion date.*" We would like to understand if the 60 days timeline is enforceable if it is not used within the R7 language. Furthermore, R7 language does not state what happens when the extension request is denied. Only the companion document specifies that *(If an extension request is denied, the selected actions in the Corrective Action Plan need to be completed in accordance with the original timetables.*). Again, we would like to understand if the language in the companion document is enforceable. Additionally, the reference to R2 in R7's language needs to be more specific. R2 is split into two parts – R2.1 and R2.2. Only R2.1 is allowed to have CAP. Recommend modifying the R7 language as following: *Each Generator Owner, for each Corrective Action Plan developed pursuant to Requirements R1, **R2 Part 2.1**, or R3 shall, as applicable:*

Although the changes made to Requirements R6 and R7 comply with the intent of the FERC Order, there needs to be more detail defining the timelines associated with the CEA reviews and determinations. We further ask that consideration be given to including an appeals process for a denial of a Corrective Action Plan extension. While we understand that NERC is not bound to Requirements contained in Reliability Standards, determinations that represent the denial of a CAP extension may be caused by a misunderstanding or missing information that can be resolved through an appeals process.

EEI additionally questions the value of Footnotes 11 and 12, which state that extension requests will be evaluated in accordance with NERC processes and extension requests for non US-Registered entities should be implemented in a manner consistent with the responsible government authority. Given NERC or applicable governmental authorities or agencies in non-US jurisdiction are not subject to Requirements within NERC Reliability Standards, these footnotes have no utility and should be removed.

As stated above, the timelines for the CAPs may create a significant burden since the GO cannot simply take outages to address these issues or may face other barriers. It would be highly counterproductive regarding reliability assurance for NERC to insist that these outages must take priority over other outage work that has long been planned and is critically needed. This issue needs clarification to ensure the standard is clear and unambiguous.

The NAGF also recommends that the R7 language be modified to only refer to R2, Part 2.1 since CAP is not allowed under 2.2.

Does the R6.2 footnote 11 exclude Canadian entities from having to request CAP extensions. Is this interpretation correct? Please advise. R6 and R7 requirements regarding pre-approval of CAPs by NERC use language that is similar to the TPL-007 standard. TPL-007 has a Canadian Variance where implementation of Corrective Action Plan(s) that require capital investment must be approved by the applicable	

provincial regulatory authority. This project should consider whether Canadian-specific language is needed in Requirements R6, R7 and R8 to align with the regulatory practices/processes in Canada for approving Corrective Action Plan(s) requiring capital investments. NB Power supports Manitoba Hydro's comment "Manitoba Hydro recommends that for non-US Registered Entities, this additional language/guidance be added to footnote 11 and 12: Prior to the implementation of any element of a Corrective Action Plan developed in accordance with this Requirement all applicable corporate, regulatory, provincial, and federal evaluations and approvals must be completed and obtained. The applicable timeline for implementation of a Corrective Action Plan shall be determined by the Registered Entities Generator Owner.

Recommend that any corrective action plan approval and extension that is requested be handled by a single senior management official with overall authority and responsibility for leading and managing implementation of and continuing adherence to the requirements within the NERC EOP-012 cold weather standards and not at the Compliance Enforcement Authority (CEA). The CEA will then be able to audit the process as required.

PNM agrees with the comments of Texas RE: *In Requirement Part 6.1.6, Texas RE recommends the SDT take a similar approach to PRC-004-6 Requirement R5 to ensure that applicable entities will conduct an evaluation of all similar equipment, document which equipment needs a CAP to be completed within 24 hours and which equipment does not need a CAP. Texas RE recommends the following revision:* *6.1.6 An evaluation of applicability to similar equipment freeze protection measures at generating units owned by the Generator Owner:*	

Develop a Corrective Action Plan (CAP) for the identified similar equipment freeze protection measures to be completed within 24 calendar months of the Generator Cold Weather Reliability Event; or ***Explain in a declaration why corrective actions are beyond the entity's control or would not improve BES reliability, and that no further corrective actions will be taken.*** *M6 Each Generator Owner will have documented evidence that it developed and implemented a Corrective Action Plan following a Cold Weather Reliability Event at an applicable unit in accordance with Requirement R6. Acceptable evidence may include, but is not limited to, the following dated documentation (electronic or hardcopy format): Corrective Action Plan(s), Generator Cold Weather Constraint(s), completed work orders, copies of any Corrective Action Plan extension requests and supporting documentation, and updated cold weather preparedness plan(s) where indicated as needed by the Corrective Action Plan.* ***Each Generator owner shall have dated evidence that demonstrates it developed a CAP and an evaluation of the CAP's applicability to other equipment freeze protection measures, or a declaration in accordance with Requirement Part 6.1.6.***

The SRC generally agrees with the drafting team's proposed language, and recommends the following additional revisions. First, the SRC recommends that the deadline for developing a CAP in Requirement R6 be revised from "before the first day of July" to "before the first day of ***the following*** July" to help minimize potential ambiguity regarding the CAP development deadline. Second, the SRC recommends that Part 6.2 of Requirement R6 be revised to clarify that CEA review and approval is not needed in scenarios in which the actions in the CAP need to be updated, but the updates will not require extension of the timelines in Part 6.1. The SRC therefore recommends that the beginning of Part 6.2 be revised to read as follows: "If it determines that it may need to exceed a timeline in Part 6.1, update the Corrective Action Plan . . ."	

Third, the SRC recommends including a timeline for submitting extension requests (for example, 60 days before the first deadline that would be impacted by the extension request). This would help reduce last-minute extension requests and ensure the CEA has adequate time to review and process extension requests. Finally, the SRC recommends that the beginning of Part 6.2.1 be revised to read "an explanation of the circumstances . . ." to better fit the overall structure of the list of elements of Part 6.2.

In Requirement Part 6.1.6, Texas RE recommends the SDT take a similar approach to PRC-004-6 Requirement R5 to ensure that applicable entities will conduct an evaluation of all similar equipment, document which equipment needs a CAP to be completed within 24 hours and which equipment does not need a CAP. Texas RE recommends the following revision:

6.1.6 An evaluation of applicability to similar equipment freeze protection measures at generating units owned by the Generator Owner:

- **Develop a Corrective Action Plan (CAP) for the identified similar equipment freeze protection measures to be completed within 24 calendar months of the Generator Cold Weather Reliability Event; or**
- **Explain in a declaration why corrective actions are beyond the entity's control or would not improve BES reliability, and that no further corrective actions will be taken.**

M6 Each Generator Owner will have documented evidence that it developed and implemented a Corrective Action Plan following a Cold Weather Reliability Event at an applicable unit in accordance with Requirement R6. Acceptable evidence may include, but is not limited to, the following dated documentation (electronic or hardcopy format): Corrective Action Plan(s), Generator Cold Weather Constraint(s), completed work orders, copies of any Corrective Action Plan extension requests and supporting documentation, and updated cold weather preparedness plan(s) where indicated as needed by the Corrective Action Plan. **Each Generator owner shall have dated evidence that demonstrates it developed a CAP and an evaluation of the CAP's applicability to other equipment freeze protection measures, or a declaration in accordance with Requirement Part 6.1.6.**

OPG supports HQ comments: "The Generator Cold Weather CAP Extension and Constraint Process document should be updated to reflect Canadian-specific language regarding applicable governmental authorities, for example, similar to the language used in the footnote 11."

OPG supports Manitoba Hydro's comment recommending that for non-US Registered Entities: Prior to the implementation of any element of a Corrective Action Plan developed in accordance with this Requirement all applicable corporate, regulatory, provincial, and federal evaluations and approvals must be completed and obtained. The applicable timeline for implementation of a Corrective Action Plan shall be determined by the Registered Entities Generator Owner.

OPG supports BC Hydro's comment (freezing precipitation in Québec can and has occurred in March and April months) regarding Requirement "R6: Similar to previously submitted comments, in Québec, Canada, Generator Cold Weather Reliability Events such as freezing precipitation, can and have happened well into the Spring calendar months (including April and May). The requirement to develop a CAP within 150-days of the Event is reasonable. However, the first day of July deadline will considerably reduce the CAP development timeline for late Spring Events. Worst case scenario, for a May Event, identification of common failure causes, solution identification and CAP development would need to be done in less than 45 days, which may result in an inadequate CAP. The addition of the December 1 deadline to implement a CAP (R6 Part 6.1.5) would ensure that adequate CAPs are developed and implemented before the next Winter season. With the addition of the December 1 deadline, HQ recommends deleting "the first day of July" language. "

Likes 0	
Dislikes 0	

Response

Thank you for your comment. Canadian regulators will determine applicability and other adjustments as needed. The DT has deleted the July 1 out of the Requirement R6 to improve reliability.

4. In paragraph 72 of the June 2024 Order, FERC directed NERC to develop and submit modifications to Requirement R7 of Reliability Standard EOP-012-2 to clarify that any Requirement R7 corrective action plans for new generation (i.e. commercially operational after October 1, 2027) must be completed prior to the generating unit's commercial operation date. **The drafting team provided updated language in Requirement R2 Part 2.1 to address the issue of units in different stages of design and construction. February 16, 2023 was chosen as a date of demarcation as that was the date the Extreme Cold Weather Temperature was approved by FERC. Do you agree that revisions to Requirement R2 Part 2.1 address this directive? If you do not agree but believe the directive can be addressed in an equally effective and efficient manner, please provide your suggestions in the form of specific language changes for the drafting team.**

Invenergy disagrees that the revisions to Requirement 2 address the FERC directive. If the intent is for corrective action plans to be completed prior to the generating unit's commercial operation date and for the entity to have the capability to operate at the unit's ECWT for at least 12 hours, then it is unnecessary to divide this requirement into separate tracks based on the approval date of the ECWT definition. As such, we recommend returning to the language of EOP-012-2 and replacing the CAP language with constraint declaration language. If two tracks are to be pursued, then we disagree that February 16, 2023, is the most reasonable date of demarcation to address the issue of units in different stages of design and construction and instead proposes October 1, 2024. The effective date of EOP-012-2 presents as a more reasonable alternative by which industry would have received sufficient notice of the approval of the ECWT definition and had an opportunity to calculate that value for incorporation in the design criteria of new generating units.

PNM agrees with the comments of EEI: *While EEI appreciates the intent of the February 16, 2023, date, we do not agree that compliance date should be aligned to when a glossary term is approved. We also note that there are other changes within the proposed standard that could impact what an entity includes in the design of their resource beyond the definition of Extreme Cold Weather Temperature, including the proposed definition of Generator Cold Weather Constraint. For this reason, we ask that the date used for Requirement R2, subparts 2.1 and 2.2 for new resources should be the approval of this Standard. NERC Reliability Standards should be forward looking and should not be aligned to compliance measures or dates from previous versions of Reliability Standards or approval dates of Glossary Terms.*

Comment	
While we appreciate the intent of the February 16, 2023, date, we do not agree that compliance date should be aligned to when a glossary term is approved. We also note that there are other changes within the proposed standard that could impact what an entity includes in the design of their resource beyond the definition of Extreme Cold Weather Temperature, including the proposed definition of Generator Cold Weather Constraint. For this reason, we ask that the date used for Requirement R2, subparts 2.1 and 2.2 for new resources should be the approval of this Standard. NERC Reliability Standards should be forward looking and should not be aligned to compliance measures or dates from previous versions of Reliability Standards or approval dates of Glossary Terms.

Jeffrey Streifling - NB Power Corporation - 1	
Answer	No
Document Name	
Comment	
There is no reason to split the language into two parts around February 16, 2023. Requirement R2 will only apply once the unit is in commercial operation, and a corrective action plan for freeze protection measures that is required to be completed prior to commercial operation is not really different from simply requiring the freeze protection measures to be in place as of the date of commercial operation.	

The language in R2 should be updated to provide 32 km/hr as an equivalent wind speed to 20 mph." NB Power supports BC Hydro's comments: "Under Requirement R2, BC Hydro recommends that instead of referencing the February 16, 2023 date in the Requirement and having a footnote, remove the date in the Requirement and add the wording "date on which the definition of Extreme Cold Weather Temperature was approved in the relevant jurisdiction." This will help with the process of standard adoption in non-FERC regulated jurisdictions, such as Canada." The date of February 16, 2023, when the definition of Extreme Cold Weather Temperature was approved by FERC it is not equivalent with a compliance requirement, unless accompanied by an applicable effective standard. The recommendation is to use instead the effective date for the new EOP-012-3 to be enforceable for non-US entities, as applicability criteria for the Generator Owner first contractual commitment to design criteria.

As drafted, it is unclear if a unit constructed after 2027 would be in violation of R2 if it experiences a Generator Cold Weather Reliability Event. As an example, if the new unit is built with the design specified to be to -10 deg F and a 20-mph wind where the ECWT is 0, is there a violation if a GCWRE occurs and the cause is determined to be an error in the calculation made by the construction engineer? Or is the fact that you have a document that says the design should meet the ECWT plus 20 mph wind sufficient for compliance with R2, regardless of performance?	
Likes 0	
Dislikes 0	
Response	
Thank you for your comment. If a freezing event occurs, a CAP will need to be developed and completed in accordance with Requirement R6. The recalculation will require that a CAP be developed within 6 months. Errors in ECWT calculation are not addressed by the standard. The DT does not determine compliance with the Standard. Requirement R6 is clear in that if a Generator Cold Weather Reliability Event occurs, a Corrective Action Plan would be developed, which includes the summary of identified causes of the Generator Cold Weather Reliability Event. The purpose of the Standard is to address mitigating reliability impacts of extreme cold weather on generating units so performance of the generating unit should be the focus of each Generator Owner. Requirement R2 is focused on providing the capability to operate at the ECWT and, while a Generator Cold Weather Reliability Event may occur, the intent of the actions within the Requirements is that the quantity of those events will be minimized.

Comment	
AES US Renewables believe the February 16, 2023 date should not be used as demarcation. Typically, once FERC approves a standard, there is a period prior to the standard becoming enforceable. Using the FERC approval date does not follow the typical implementation process and is unreasonable. Instead it should follow the EOP-012-1 Implementation Plan that was part of the package that was approved by FERC on 2/16/2023. Per the Implementation Plan, EOP-012-1 along with the definitions of three new terms were supposed to become effective on 10/1/2024. We strongly recommend using 10/1/2024 as the demarcation date.

Texas RE has the following comments on Requirement R2:

Texas RE suggests a grammatical review be conducted for the second bullet in Requirement Part 2.1. It looks like there either a misplaced parenthetical or it needs a closing parenthetical, or it needs an “or” or an “and” after the first comma.

Texas RE is concerned that the measures do not require dated evidence for demonstrating contractual design criteria commitment before February 16, 2023. Texas RE recommends the following revision to the measure (in bold):

M2. Each Generator Owner will have dated evidence that demonstrates it has freeze protection measures for its unit(s) in accordance with R2, or it has developed a Corrective Action Plan or declared a Generator Cold Weather Constraint for the identified issues. **Each GO shall have dated evidence that demonstrates the signed contractual design criteria commitments in accordance with 2.1 and/or 2.2.** Acceptable evidence may include the following (electronic or hardcopy format): Identification of generating unit(s) minimum temperature under Requirement R1 Part 1.2.2 which is equal to or less than the unit’s Extreme Cold Weather Temperature, documentation of freeze protection measures, Corrective Action Plan(s) (if applicable), and Generator Cold Weather Constraints (if applicable).

Likes 1	JEA, 1, McClung Joseph
Dislikes 0	

Response
Thank you for your comment. The DT incorporated these minor edits. Dated evidence is addressed in the measurement of these requirements.

5. In paragraph 72 of the June 2024 Order, FERC directed NERC to develop and submit modifications to Requirement R7 of Reliability Standard EOP-012-2 to clarify that any Requirement R7 corrective action plans for new generation (i.e. commercially operational after October 1, 2027) must be completed prior to the generating unit's commercial operation date.

The drafting team provided updated language in Requirement R2 Part 2.2 to address the issue of units in newer stages of design and construction. February 16, 2023 was chosen as a date of demarcation as that was the date the Extreme Cold Weather Temperature was approved by FERC. Units committed to design criteria on or after February 16, 2023 do not have the option to utilize a Corrective Action Plan but may still declare a Generator Cold Weather Constraint. Do you agree that revisions to Requirement R2 Part 2.2 address this directive? If you do not agree but believe the directive can be addressed in an equally effective and efficient manner, please provide your suggestions in the form of specific language changes for the drafting team.

TEPC agrees with EEI's comments: *we do not agree that compliance date should be aligned to when a glossary term is approved. We also note that there are other changes within the proposed standard that could impact what an entity includes in the design of their resource beyond the definition of Extreme Cold Weather Temperature, including the proposed definition of Generator Cold Weather Constraint*.

HQ supports BC Hydro's comments: "Under Requirement R2, BC Hydro recommends that instead of referencing the February 16, 2023 date in the Requirement and having a footnote, remove the date in the Requirement and add the wording "date on which the definition of Extreme Cold Weather Temperature was approved in the relevant jurisdiction." This will help with the process of standard adoption in non-FERC regulated jurisdictions, such as Canada." HQ supports NB Power's comment: "The second option in Part 2.2 opens the possibility of a Generator Cold Weather Constraint, including a pre-approving constraints based on criteria in Attachment 1 that may not be appropriate in the future. Future units should simply be engineered to provide the required freeze protection measures. If there is any need for exceptions, they should be handled on a case-by-case basis. As an aside, the language in R2 should be updated to provide 32 km/hr as an equivalent wind speed to 20 mph."

Comment	

Invenergy disagrees that the revisions to Requirement 2 address the FERC directive. If the intent is for corrective action plans to be completed prior to the generating unit's commercial operation date and for the entity to have the capability to operate at the unit's ECWT for at least 12 hours, then it is unnecessary to divide this requirement into separate tracks based on the approval date of the ECWT definition. As such, we recommend returning to the language of EOP-012-2 and replacing the CAP language with constraint declaration language.

If two tracks are to be pursued, then we disagree that February 16, 2023, is the most reasonable date of demarcation to address the issue of units in different stages of design and construction and instead proposes October 1, 2024.

The effective date of EOP-012-2 presents as a more reasonable alternative by which industry would have received sufficient notice of the approval of the ECWT definition and had an opportunity to calculate that value for incorporation in the design criteria of new generating units.

Response

Thank you for the comments. The DT is trying to meet the FERC directives provided in a manner that allows some flexibility for those units already being designed and constructed while setting the expectations for units that have not begun the process. Bifurcation was deemed a reasonable approach and changes have been made based on industry comment. The ECWT definition was a known quantity when voted on and approved by the NERC Board in February of 2022. Thank you for your comment. The Drafting Team appreciates the constructive feedback and suggested language offered by several industry organizations and has modified the standard to improve clarity. Thank you for your comment. Requirement R2, subparts 2.1 and 2.2 was changed to 6/29/2023 to align with the approval date of EOP 012-1.

Kennedy Meier - Electric Reliability Council of Texas, Inc. - 2, Group Name ISO/RTO Council Standards Review Committee (SRC)	
Answer	Yes
Document Name	
Comment	
The SRC recommends that the upcoming technical conference include discussion of the extent to which it is appropriate to allow constraints under Part 2.2 of Requirement R2, as the units described in Part 2.2 should generally be designed and constructed to achieve the necessary level of extreme cold weather performance, and the standard should incentivize the development of more effective freeze protection measures over the course of time. If the discussion indicates that there is a technical basis for allowing constraints for this category of units, it should also address whether these units should qualify for all of the constraint criteria listed in Attachment 1 or only a subset of the criteria. Subject to any additional information that may become available at the technical conference, the SRC recommends that if constraints are allowed for the units described in Part 2.2 of Requirement R2, these units should only be eligible to declare constraints under item 5 of the case-by-case constraint list. In light of the goal of incentivizing development of more effective freeze protection measures, the SRC believes the accelerated review process used for the accelerated approval constraint list is not appropriate for the units described in Part 2.2. Any constraint declared by a Part 2.2 unit should be reviewed under item 5 of the case-by-case constraint list, even if the constraint might otherwise fall under the accelerated approval constraint list.

Texas RE recommends clarifying some of the footnotes: • Footnote 1 - Reword to remove “this designation”. Texas RE suggests the following verbiage: “COD means that the facility has received all approvals necessary for operation after completion of initial start-up testing.” • Footnotes 3 and 5 - Include the word “dated”. Texas RE suggests the following verbiage: “Such commitments would be demonstrated by dated and signed contractual commitments, **dated** emailed correspondence agreeing to thermal design criteria, or other similar dated documented evidence.” • In Footnotes 4 and 6, Texas RE recommends the date be clearer. As it is currently written, it is referring to the date of the governmental authority’s order. Is this the intent? If the intent is to refer to the effective date of the definitions, it should state that and reference the implementation plan.

OPG supports BC Hydro's comments: "Under Requirement R2, BC Hydro recommends that instead of referencing the February 16, 2023 date in the Requirement and having a footnote, remove the date in the Requirement and add the wording "date on which the definition of Extreme Cold Weather Temperature was approved in the relevant jurisdiction." This will help with the process of standard adoption in non-FERC regulated jurisdictions, such as Canada." OPG supports NB Power's comment: "The second option in Part 2.2 opens the possibility of a Generator Cold Weather Constraint, including a pre-approving constraints based on criteria in Attachment 1 that may not be appropriate in the future. Future units should simply be engineered to provide the required freeze protection measures. If there is any need for exceptions, they should be handled on a case-by-case basis. As an aside, the language in R2 should be updated to provide 32 km/hr as an equivalent wind speed to 20 mph." OPG has the following alternative comment: The date of February 16, 2023, when the definition of Extreme Cold Weather Temperature was approved by FERC it is not equivalent with a compliance requirement, unless accompanied by an applicable effective standard. The recommendation is to use instead the effective date for the new EOP-012-3 to be enforceable for non-US entities, as applicability criteria for the Generator Owner first contractual commitment to design criteria.

6. In paragraph 76 of the June 2024 Order, FERC directs NERC to develop and submit modifications to Requirement R7 of Reliability Standard EOP-012-2 to address certain ambiguities by expanding on Requirement R7.1.1 and 7.1.2 to make it clear which corrective action plan implementation deadline applies when a generator owner must implement both remedying issues with existing and installing new freeze protection measures.

The drafting team clarified Requirement R7 for Corrective Action Plans developed in accordance with Requirements R1, R2, or R3. Do you agree that revisions to Requirement R7 address this directive to differentiate between the existing and new freeze protection

measures? If you do not agree but believe the directive can be addressed in an equally effective and efficient manner, please provide your suggestions in the form of specific language changes for the drafting team.

Jodirah Green - ACES Power Marketing - 1,3,4,5,6 - MRO,WECC,Texas RE,SERC,RF, Group Name ACES Collaborators	
Answer	No

Comment	

We at ACES understand the difficulty faced by the drafting team in complying with this FERC directive. We especially appreciate the effort taken by the drafting team to limit the scope of the changes while also complying with the FERC directive. However, we feel as though the addition to the language of part 7.1.1 creates more confusion than it remedies. We recommend that the drafting team consider other alternatives such as adding an additional sub-part to both Part 7.1.1 and Part 7.1.2.

We recommend modifying Requirement R7, Part 7.1as follows:

R7. Each Generator Owner, for each Corrective Action Plan developed pursuant to Requirements R1, R2, or R3 shall, as applicable:

7.1 Include a timetable for implementing the applicable type(s) of corrective action(s) that shall:

7.1.1. List modification(s) to existing (or previously planned pursuant to Requirement 2, Part 2.1) freeze protection measures, if any;

7.1.1.1. Any item listed in accordance with Part 7.1.1 shall be completed within 24 calendar months of completing development of the Corrective Action Plan.

7.1.2. List new freeze protection measures, if any, and

7.1.2.1 Any item listed in accordance with Part 7.1.2 shall be completed within 48 calendar months of completing development of the Corrective Action Plan.

7.1.3. Describe the updates to the cold weather preparedness plan required under Requirement R4 to identify the updates or additions to the Generator Cold Weather Critical Components and their freeze protection measures.

The 3 types of items required to complete a Corrective Action Plan (CAP) under R1, R2 and R3 are the same 3 types of items required to complete a Corrective Action Plan under R6, qualified personnel, proper materials, and the required plant conditions. A Cold Weather Reliability Event does not change the circumstances required to correct the cause. Evidence to support implementation timelines should be retained for following audits of the Standard.

Requirement R7: in Parts 7.1.1 and 7.1.2 the current wording " list the action(s) … to be completed" can be seen as ambiguous as to which actions need to be listed, i.e. whether all actions need to be planned for completion within in the specified timeframe, or whether only those actions planned to be completed in the timeframe would need to be listed. As well, in Part 7.1.1 adding the "regardless of any longer timelines in … associated with new freeze protection measures;" may add ambiguity, i.e. 7.1.2 is for new FPM so adding this to existing FPM could cause confusion on expectations. As well, in Part 7.1.2, the wording "List the action(s) which require(s) new freeze protection measures …" is ambiguous and could be interpreted as listing items such as, Needing a CAP due to a recalculated Temperature per Part 1.1.1, as opposed to actions to implement such as, Select vendor to supply new FPM. BC Hydro recommends revising R7 and Parts 7.1 with its subparts 7.1.1 through 7.1.3 for clarity. Please see suggested wording below: R7. Each Generator Owner, for each Corrective Action Plan developed pursuant to Requirements R1, R2, or R3, shall: 7.1. Include a timetable for implementing the Corrective Action Plan that: 7.1.1. For remediating issues with existing freeze protection measures, if any, the corrective actions shall be completed within 24 calendar months of completing development of the Corrective Action Plan; and

7.1.2. For adding new freeze protection measures, if any, the corrective actions shall be completed within 48 calendar months of completing development of the Corrective Action Plan; and 7.2. Contain a description of the updates to the cold weather preparedness plan required under Requirement R4 to identify updates or additions to the Generator Cold Weather Critical Components and their freeze protection measures, if required.

Thank you for your comments. The DT made modifications to R7 to provide some additional clarity. 7.1.1 is specific to the new freeze protection measures and 7.1.2 is specific to existing freeze protection measures.

Thank you for your comments. The DT made modifications to both R2 and R7 to provide the additional clarity related to industry's concern. Requirement R7 is no longer applicable to R2 CAPs and R2 was modified to include the applicable activities and clear due dates based on contractually committed design criteria dates. Additionally, R7.1.1 was modified to be specificspecific to the new freeze protection measures and 7.1.2 was modified to be specific to existing freeze protection measures. And R6 was modified to provide additional details and clarity related to developing Corrective Action Plans.

7. The drafting team provided language in the Implementation Plan to address parts 3 through 5 of paragraph 4 of the June 2024 Order addressing FERC's concerns regarding urgency. The Standard language updates were written to meet the core directives in an effective and efficient manner while providing language that is objective, unambiguous, and auditable. With EOP-012-2 already effective October 1, 2024 (with the exception of Requirement R3), the changes made were intended to meet the FERC Directives without adding significantly to the efforts already in progress. Do you agree that the associated Implementation Plan meets the Directives? If you do not agree but believe the Directives can be addressed in an equally effective and efficient manner, please provide your suggestions in the form of specific language changes for the drafting team.

Jennifer Weber - Tennessee Valley Authority - 1,3,5,6 - SERC	
Answer	No
Document Name	
Comment	
The current implementation plan would require a resubmission of any declaration under EOP-012-2. This would create redundant work and confusion around tracking. Suggest adding language a "grandfathering" process for existing units.

Response	
Thank you for your comment. Under EOP-012-2, the GO has no obligation to submit the Generator Cold Weather Constraint Declaration. EOP-012-2 Requirement R8 simply requires the GO to review the declaration on a 5-year periodicity and update any operating limitations that result from the constraint. Based on the FERC Directives, the DT revised EOP-012-3 R8 to require the submission of any Generator Cold Weather Constraint Declaration to the CEA. Attachment 1 was created, and additionally modified, to provide better clarity to GO's on identifying Generator Cold Weather Constraints. GO's may be required to modify any constraints declared under EOP-012-2 to comply with Attachment 1 but all GO's will be required to submit any existing declarations in order for the CEA to review and follow the FERC required approval process. The CEA cannot apply EOP-012-3 criteria to an EOP-012-2 constraint during the period between October 1, 2024 and the effective date of EOP-012-3.

AES US Renewables support NAGF comments for this question NAGF comments: *The NAGF is concerned with the potential confusion related to declaration made under EOP-012-2 and how these will be addressed under EOP-012-3. More information is needed related to the process to be used to address these declarations made under the current standard, including the expectations for these existing declarations, timelines related to rejected declarations and any other obligations related to these declarations. Additional support for this position is provided under question 9.* *Next, the NAGF believes that the requirement to create duplicative CAPs and declarations over the years and have them approved for an approved event is extremely inefficient for both the registered entities and NERC and the regions. This issue should be addressed through modifications to R6 or the definition of Generator Cold Weather Reliability Event. Prior to the requirement to request approval for these declarations, the repetition was likely manageable. But with the additional requirements related to both the filing process and the requirements, this is likely to become a documentation issue that detracts from the reliable operation of the grid.*

Comment
The NAGF is concerned with the potential confusion related to declaration made under EOP-012-2 and how these will be addressed under EOP-012-3. More information is needed related to the process to be used to address these declarations made under the current standard, including the expectations for these existing declarations, timelines related to rejected declarations and any other obligations related to these declarations. Additional support for this position is provided under question 9. In addition, the NAGF believes that the requirement to create duplicative CAPs and declarations over the years and have them approved for an approved event is extremely inefficient for both the registered entities and NERC and the regions. This issue should be addressed through modifications to R6 or the definition of Generator Cold Weather Reliability Event. Prior to the requirement to request approval for these declarations, the repetition was likely manageable. But with the additional requirements related to both the filing process and the requirements, this is likely to become a documentation issue that detracts from the reliable operation of the grid.

Thank you for your comment. Under EOP-012-2, the GO has no obligation to submit the Generator Cold Weather Constraint Declaration. EOP-012-2 R8 simply requires the GO to review the declaration on a 5-year periodicity and update any operating limitations that result from the constraint. Based on the FERC Directives, the DT revised EOP-012-3 R8 to require the submission of any Generator Cold Weather Constraint Declaration to the CEA. Attachment 1 was created, and based on industry feedback, additionally modified, to provide better clarity to GO's on identifying Generator Cold Weather Constraints. GO's may be required to modify any constraints declared under EOP-012-2 to comply with EOP-012-3 Attachment 1 but all GO's will be required to submit all declarations, whether newly identified under EOP-012-3 or an EOP-012-2 declaration modified per EOP-013-3 criteria in order for the CEA to review and follow the FERC required approval process. The CEA cannot apply EOP-012-3 criteria to an EOP-012-2 constraint declared during the period between October 1, 2024 and the effective date of EOP-012-3. The DT made significant modifications, based on industry feedback, to the CAP language and the Generator Cold Weather Constraint Declaration language. While the modifications were based on industry feedback, the underlying requirements are based on the FERC Directive(s). Additionally, the DT made significant modifications to R6 and the CAP process, including better separation of CAPs for units that actually experience a Generator Cold Weather Reliability Event and the review of applicability on similar equipment at other generating units.

MP feels more clarity is needed on items in Question #1 and #3, therefore is unable to support the Implementation Plan at this time. Additionally, MP supports NAGF comments on Question #7 response related to the requirements to complete duplicative CAPs and declarations over the years and have them approved is extremely inefficient for registered entities and NERC. The addition of the approvals process greatly increases the inefficiencies related to minor refinements that may be needed to the Generator Cold Weather Reliability Event definition.

: It is the opinion of ACES that the effective date language for Requirements R2, R6, R7, and R8 is overly verbose and ambiguous. We recommend modifying the Implementation Plan as follows:

Effective Date and Phased-In Compliance Dates

Compliance Date for EOP-012-3 Requirement R2 – New Generating Units

Entities beginning commercial operation after the effective date of EOP-012-3 shall become compliant with Requirement R3 no later than the commercial operations date for the applicable unit. Any Generator Cold Weather Constraint shall be submitted in accordance with the timeline provided in Requirement R8.

Compliance Date for EOP-012-3 Requirement R6

Entities shall comply with Requirement R6 by the effective date of the Standard.

Compliance Date for EOP-012-3 Requirement R7

Entities shall comply with Requirement R7 by the effective date of the Standard.

Compliance Date for EOP-012-3 Requirement R8

Entities shall comply with Requirement R8 by the effective date of the Standard.

Any entity that previously declared one or more Generator Cold Weather Constraint(s) under Reliability Standard EOP-012-2 shall perform a review of any such declaration(s) for compliance with Reliability Standard EOP-012-3 Attachment 1 by the effective date. The entity shall submit any previously declared Generator Cold Weather Constraint(s) no later than 45 days following the effective date of Reliability Standard EOP-012-3.

AES US Renewables is concerned with the current implementation plan which requires an entity to submit previously declared constraint under EOP-012-2 for compliance with EOP-012-3 no later than 45 days following the effective date of EOP-012-3. While the 45-day timeline is not a major concern, we have questions for the drafting team to consider:

- Cost constraints that are allowed in EOP-012-2 are no longer allowed in EOP-012-3. If this constraint is denied by the CEA under EOP-012-3, what is the process and associated timelines that entities need to follow for recourse?
- Is there a possibility for entities to make changes to the constraint declared under EOP-012-2 before submittal to CEA under EOP-012-3 to conform to the Attachment 1 criteria?

Accelerated timelines and redundant reporting criteria create inefficiencies in work processes for the GO. This includes potential unplanned maintenance outages to meet CAP implementation expectations.

Timelines to complete CAPs shorter than those specified in R7 are not cost effective if qualified personnel, proper materials and required plant conditions are not available. Unplanned outages reduce reliability of the BES by causing units to be started and stopped outside of planned outage periods.

AES US Renewables support NAGF comments for this question.

NAGF comments:

As identified above, as proposed, the modifications requiring multiple filings for what is likely to be annual events is unreasonable and extremely inefficient while not providing any improvement to reliability. Ultimately, this is a documentation requirement that falls under paragraph 81. Efforts should be made to minimize the time and effort required to address the FERC order while trying to minimize the burden to industry. This can be done by modifying R6, to allow for the identification of the event being the same as a previous event and therefore the event falls under the already approved declaration. As one way to address this, Section 6.1.1 could have language added to allow the GO to state, once a review of the event is completed, that this event is similar or the same as the event addressed under the CAP dated XX/XX/XX that addresses the event that occurred on XX/XX/XXXX. This would end the process at that point and no further actions would be required, including creation of a new CAP, new constraint and a new filing to NERC to have them tell the GO they are correct.

The NAGF recognizes that FERC has ordered that all reference to cost be removed. In discussions with OEM providers related to doing an engineering study the cost of the study to determine what it would take to improve the capability of generators is more than reasonable. In other words, the cost to do the study to determine the cost is very expensive, before any effort to improve the capability is made. The NAGF asks for the SDT to address with the CEA how cost will be considered when the generation of documentation is excessive.

With the removal of the cost component in the Definition of the “Generator Cold Weather Constraint” it is very difficult to evaluate the cost effectiveness of the standard. Please retain the cost component in the definition of the “Generator Cold Weather Constraint” to ensure the Generation Owner has the ability to evaluate cold weather protections against reliability and availability impacts.

This would end the process at that point and no further actions would be required, including creation of a new CAP, new constraint and a new filing to NERC to have them tell the GO they are correct. The NAGF recognizes that FERC has ordered that all reference to cost be removed. In discussions with OEM providers related to doing an engineering study, especially for increasing the tower strength of wind turbines, the cost of the study to determine what it would take to improve the capability of generators is such that they are unwilling to offer the service. In other words, the cost to do the study to determine the cost is very expensive, before any effort to improve the capability is made. The NAGF asks for the SDT to address with the CEA how cost will be considered when the generation of documentation is excessive.

Enel North America is concerned that timelines for completing CAPs that are shorter than those outlined in R7 are not cost-effective unless qualified personnel, appropriate materials, and necessary plant conditions are available. Additionally, the shorter timelines could cause an increase in unplanned outages that compromise the reliability of the BES by occurring outside scheduled outage periods.

OPG supports HQ comments: "R2 High and Severe VSL: The Lower VSL and Moderate VSL's text "The Generator Owner did not have freeze protection measure(s) for its applicable unit(s) …." Is not reflected in the R2 High and Severe VSL. For consistency throughout the R2 VSLs, we suggest adding "for its applicable unit(s)" before "meeting the criteria in R2 …"

E2 Lower VSL: we suggest removing "to implement appropriate freeze protection measures" from the E2 Lower VSL to ensure consistency with the wording of the Moderate, High and Severe VSLs."

OPG supports Manitoba's comment regarding the wording around extremely low ECWTs: "Some of our ECWT is below -40 degree C. In discussions with our design team, many components only have a rating down to -40 degrees C. There should be some wording around extremely low ECWTs where it is not readily available (or economically possible to pursue) the purchase of equipment with that low of a temperature rating. (To clarify: we are talking about ECWTs around -43 degrees C and ratings of -40 degrees C. We are not suggesting equipment ratings of -15 degrees C vs -43 degree ECWT)."

OPG supports Manitoba Hydro's comment : "For R3 Manitoba Hydro recommends instead of referencing the October 1, 2027 date in the Requirement remove the date in the Requirement and add the wording "date on which the definition of Extreme Cold Weather Temperature was approved in the relevant jurisdiction."

OPG has the following comments:

NERC definition uses the concept of apparent cause(s), which is different from the Root Cause.

OPG suggest that SDT be consistent with other standards terminology (PRC-004-6 and PRC-010-2, where they are using the term “Root Cause”) Please clarify, in the case of the Canadian entities that routinely and for extensive durations are operating at temperatures close to their respective ECWT (i.e. -40◦C), through what meteorological phenomenon it is possible to have freezing precipitation (e.g., sleet, snow, ice, and freezing rain) at that ECWT (i.e. -40◦C) that could impact equipment within the Generator Owner’s control. If rain will find it’sits way to an equipment operating at -40◦C will actually warm-up that equipment. Basically, there could be only a very low probability of exacerbating cooling effect, involving the latent heat related to energy involved in water phase changes. Water vapors would release latent heat of fusion in the atmosphere long before reaching the BES Generation Units equipment, and unless they aggregate into falling chunks of ice it would most likely not be the root cause of “Generator Cold Weather Reliability Event” We propose that impacts of freezing precipitation (e.g., sleet, snow, ice, and freezing rain) on equipment within the Generator Owner’s control, should be excluded for equipment with ECWT of -10◦C or below.

Jodirah Green - ACES Power Marketing - 1,3,4,5,6 - MRO,WECC,Texas RE,SERC,RF, Group Name ACES Collaborators	
Answer	
Document Name	

Comment
We at ACES appreciate the effort put forth by the SDT to modify EOP-012 under such an abbreviated timeline. It is our understanding that the specific intent of this project is to consider and implement the directives in the FERC Order; however, we believe that one additional modification should be considered by the SDT. Requirement 1, Part 1.1.1 contains an overlapping timeline for updating the entities' cold weather preparedness plan(s) and developing a Corrective Action Plan (CAP). As written, both actions require completion within six (6) calendar months of the recalculation of the Extreme Cold Weather Temperature (ECWT). It is our contention that corrective actions will likely not be identified until after a cold weather preparedness plan is reviewed/updated. Thus, we believe that requiring both actions to be completed concurrently effectively shortens the time allowed for a cold weather preparedness plan to be reviewed and updated. Therefore, we contend that nine (9) calendar months is a more appropriate deadline for developing a CAP. We recommend the following modification to Requirement R1 Part 1.1.1: R1. At least once every five calendar years, each Generator Owner shall, for each of its applicable generating unit(s): 1.1. Calculate the Extreme Cold Weather Temperature for each of its applicable unit(s) and identify the calculation date and source of temperature data; and 1.1.1. If the re-calculated Extreme Cold Weather Temperature is lower than the previous Extreme Cold Weather Temperature, the entity shall:

1.1.1.1. Review and update its cold weather preparedness plan(s) under Requirement R4 within six (6) calendar months of the recalculation. 1.1.1.2. Develop a Corrective Action Plan for any new corrective actions needed to provide the required operational capability under Requirement R2 or R3 within nine (9) calendar months of the recalculation. Thank you for the opportunity to comment.	
Likes 0	
Dislikes 0	
Response	
Thank you for your comments. The DT believes that a Corrective Action Plan and updates to the cold weather preparedness plans can be completed during the same time period. A recalculation of the ECWT at least once every five calendar years that might cause a significant change in the ECWT value, implies, short if Generator Cold Weather Reliability Events, a generating unit can effectively operate to the ECWT. If it suffered a Generator Cold Weather Reliability Event, a Corrective Action Plan would already be in progress (as well as an update to the cold weather preparedness plan because of the Generator Cold Weather Reliability Event.)

Kennedy Meier - Electric Reliability Council of Texas, Inc. - 2, Group Name ISO/RTO Council Standards Review Committee (SRC)	
Answer	
Document Name	
Comment	
The SRC recommends that the CAP extension and Constraint processes each be revised to include a Step 5 – NERC Reporting to Industry. Under this step 5, NERC would publish an annual report to provide industry insight into the types of constraints CEAs have approved and disapproved during the year, discuss lessons learned from the review and approval process, and provide Reliability Coordinators and Balancing Authorities insight into the cumulative impact of constraint approvals across fleets of resource types. This report would not include any confidential unit-specific information, and could coincide with or otherwise leverage NERC's annual report to FERC on Generator Cold Weather Constraint declarations.	

Additionally, the SRC recommends that the Generator Cold Weather CAP Extension and Constraint Process be referenced in EOP-012-3, Section E, Associated Documents, since footnote 11 appears to reference this process. The SRC also recommends that Requirement R7 be revised as follows to include a new Part 7.5 that clarifies that the existence of a CAP does not excuse a Generator Owner from taking such technically feasible steps as it can to improve the extreme cold weather performance of a unit while the CAP is being implemented: 7.5. Continue to otherwise prepare its applicable generating unit(s) to meet the requirements of EOP-012-3.

Likes 0	
Dislikes 0	

Response
Thank you for your comments. The NERC Section 1600 Cold Weather Data submittals will capture the current Generator Cold WeatherWeather Constraints. The DT defers the suggestion to NERC staff regarding reporting to industry. The DT has updated the "Associated Documents" section. The DT feels that the "existence of a Corrective Action Plan" suggestion is better placed in the Technical Rationale.

In Requirement R1 Part 1.1.1- Consider adding “calendar” in later part of language to be consistent with added language. Consider “If new corrective actions are needed to provide the required operational capability under Requirement R2 or R3, the entity shall develop a Corrective Action Plan within six (6) **calendar** months of the recalculation.” Measure M3 : The phrase “Identification of generating unit(s) minimum temperature per Part 1.2.2 which is equal to or less than the unit’s Extreme Cold Weather Temperature” needs to drop the latter part “which is equal to or less than the unit’s Extreme Cold Weather Temperature” as that statement could be incorrect. A unit’s minimum temperature might be above an ECWT due to a Generator Cold Weather Constraint or simply the geographical location of the unit.	

Requirement R7 could be sharpened by removing “as applicable” to read as “Each Generator Owner, for each Corrective Action Plan developed pursuant to Requirements R1, R2, or R3 shall:, as applicable”. Requirement R7 requires a Corrective Action Plan condition to be evident and “as applicable” is not needed to differentiate if it is a R1, R2, or R3 Corrective Action Plan.

Suggest that language in Requirement R6 Part 6.2 and Requirement R7 Part 7.3 should be mirrored:

Requirement R6 Part 6.2 states: ”6.2 Update the Corrective Action Plan action(s) and timetable(s), with justification, and submit a Corrective Action Plan extension request to the Compliance Enforcement Authority (CEA) for approval where the timetable(s) for completing selected actions are projected to exceed the timelines in Part 6.1. The submitted Corrective Action Plan extension request shall include the following:

6.2.1. Circumstances causing the delay and how those circumstances are beyond the control of the Generator Owner;

6.2.2. Revisions to the selected actions in Part 6.1, if any, including utilization of Operating Procedures, if applicable; and

6.2.3. Updated timetable for implementing the selected actions in Part 6.1.”

Requirement R7 Part 7.3 states: “7.3 Submit a Corrective Action Plan extension request, for the approval of the CEA, where the timetable(s) for completing selected actions are projected to exceed the timelines in Part 7.1. The submitted request shall:

7.3.1 Explain the circumstances causing the delay and how those circumstances are beyond the control of the Generator Owner;

7.3.2 Include, as applicable, revisions to the selected actions in Part 7.1, including utilization of Operating Procedures; and

7.3.3 Include an updated timetable for implementing the selected actions in Part 7.1”

Suggest changing Requirement R7 Part 7.3 to mirror 6.2 and read as :

“7.3 Update the Corrective Action Plan action(s) and timetable(s), with justification, and submit a Corrective Action Plan extension request to the Compliance Enforcement Authority (CEA) for approval where the timetable(s) for completing selected actions are projected to exceed the timelines in Part 7.1. The submitted Corrective Action Plan extension request shall include the following:

7.3.1. Circumstances causing the delay and how those circumstances are beyond the control of the Generator Owner;

7.3.2. Revisions to the selected actions in Part 7.1, if any, including utilization of Operating Procedures, if applicable; and

7.3.3. Updated timetable for implementing the selected actions in Part 7.1."

Need to mirror language in Requirement 6 Part 6.3 and Requirement R7 Part 7.4. Requirement R6 Part 6.3 contains "if applicable" after "Requirement R8". If the DT believes "if applicable" is appropriate it should be added (with appropriate punctuation) to Requirement R7 Part 7.4 to read "Document in a declaration, with justification, any Generator Cold Weather Constraint in accordance with Requirement R8**, if applicable**, that precludes the Generator Owner from implementing selected action(s) contained within the Corrective Action Plan."

In Attachment 1, the phrase "Heat tracing or other de-icing technologies for wind turbine blades that are not available in the Generator Owner's location" may need some clarification. Is the DT's thought the blades are "not available to the Generator Owner for the Generators Owner's location" or simply "not available for the Generator Owner's location."?

For "Case-by-Case" criteria 3a- What does the DT consider as "premature" and does it vary based on generator type (e.g., wind versus natural gas unit)? Is "replacement" meant to reference the unit being retired? To be auditable a timetable such as "3 or more years" should be incorporated into the language. While conditions may vary for consideration of retirement there can notcannot be a consideration for a replacement unit without the unit signaling to a TP/PC/BA that it was retiring

Consider updating the "Case-by-Case" criteria 3b to state: "The freeze protection measures would be applied to a generating unit that has a previously published retirement date **slated to occur** within three years of the Generator Cold Weather Constraint declaration; "

The definition provided in the Standard (to be included in the Glossary of Terms) for Generator Cold Weather Constraint and the definition language in the Technical Rationale for same term needs updated. The Standard states the definition as "Any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components." but the Technical Rationale states "A Generator Cold Weather Constraint is any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components using the following criteria." Suggest changing the Technical Rationale to "A Generator Cold Weather Constraint is defined as "Any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components." The following criteria should be used in the development of Generator Cold Weather Constraints:"

The NERC process should add some clarifying language to line up with SGAS FAQ regarding use of Corrective Action Plans to cover multiple entities and locations within a single Corrective Action Plan even in cases where the entities are not in Coordinated Oversight.

Comment

Reclamation recommends removing requirement R1.1 as the calculations being required by NERC/FERC do not provide a proper long-term analysis of the temperature conditions for industry. An "average" over 24 years does not properly reflect the extreme weather conditions that have been recorded in history.

Reclamation strongly recommends revising R1.2.2 in its entirety to:

- Ensure bullets are in an "OR" statement. It is misleading now which bullets are required to be met.
- Remove concurrent wind speed and precipitation, as this data is not tracked as detailed as weather temperatures and also does not affect equipment the same across industry, thus is subjective to interpretation. See previous comment on wind speed.
- Reword or provide guidance on "historical operating temperature at least one hour in duration". Temperature tracking is performed hourly or daily, and not recorded by the minute, thus "at least one hour in duration" is misleading.
- Remove the bullet containing engineering analysis. This is not feasible to meet this requirement for existing sites as contracting an engineering firm for an analysis could take years. An engineering analysis could be performed on certain industries, but would be a no value added on others (hydropower).

Response

Thank you for your comments. R1.2.2 follows the NERC approved style guideline and, only one of the items, per the style guideline for all Standards, is required within R1.2.2. Previous DTs had developed the wind speed caveat which would affect the ability of a unit to maintain heat in the surrounding environment. While the wind speed does not change the temperature of inanimate objects it does accelerate cooling by removing heat from inanimate objects until it matches the ambient temperature.

R2 High and Severe VSL: The Lower VSL and Moderate VSL’s text “The Generator Owner did not have freeze protection measure(s) for its applicable unit(s) ….” Is not reflected in the R2 High and Severe VSL. For consistency throughout the R2 VSLs, we suggest adding “for its applicable unit(s)” before “meeting the criteria in R2 …”	

E2 Lower VSL: we suggest removing “to implement appropriate freeze protection measures” from the E2 Lower VSL to ensure consistency with the wording of the Moderate, High and Severe VSLs.

NB Power supports Manitoba’s comment regarding the wording around extremely low ECWTs: “Some of our ECWT is below -40 degree C. In discussions with our design team, many components only have a rating down to -40 degrees C. There should be some wording around extremely low ECWTs where it is not readily available (or economically possible to pursue) the purchase of equipment with that low of a temperature rating. (To clarify: we are talking about ECWTs around -43 degrees C and ratings of -40 degrees C. We are not suggesting equipment ratings of -15 degrees C vs -43 degree ECWT).”

NB Power supports Manitoba Hydro’s comment : “For R3 Manitoba Hydro recommends instead of referencing the October 1, 2027 date in the Requirement remove the date in the Requirement and add the wording “date on which the definition of Extreme Cold Weather Temperature was approved in the relevant jurisdiction.”

NERC definition uses the concept of apparent cause(s), which is different from the Root Cause. Unless there is an obvious situation, the CAP resulting from the apparent cause(s) related to Generator Cold Weather Reliability Event, may require a longer time for implementation, however we can avoid rework and use instead the Root Cause Analysis, which is better suited for the CAP determination

Please clarify, in the case of the Canadian entities that routinely and for extensive durations are operating at temperatures close to their respective ECWT (i.e. -40◦C), through what meteorological phenomenon it is possible to have freezing precipitation (e.g., sleet, snow, ice, and freezing rain) at that ECWT (i.e. -40◦C) that could impact equipment within the Generator Owner’s control. If rain will find it’sits way to an equipment operating at -40◦C will actually warm-up that equipment. Basically, there could be only a very low probability of exacerbating cooling effect, involving the latent heat related to energy involved in water phase changes. Water vapors would release latent heat of fusion in the atmosphere long before reaching the BES Generation Units equipment, and unless they aggregate into falling chunks of ice it would most likely not be the root cause of “Generator Cold Weather Reliability Event”

We propose that impacts of freezing precipitation (e.g., sleet, snow, ice, and freezing rain) on equipment within the Generator Owner’s control, should be excluded for equipment with ECWT of -10◦C or below.

The NAGF identified two issues that the SDT must address based on implementation issues seen with EOP-012-2. The first was related to freeze protection measures not associated with Generator Cold Weather Critical Components. The SDT addresses this issue in the revised standard and the NAGF thanks the SDT for that modification.

The second issue is related to the individual regions looking at the ECWT calculations differently, with different expectations related to the data used for determining the ECWT for a plant. While the SDT has significantly modified the document related to calculating the ECWT, and while the NAGF supports these modifications, nothing in this document addresses the unreasonable position that some regions are taking to require a temperature reading for every hour in order to make an ECWT valid. In the vast majority of cases, the GO is not in a position to have over 54,000 data points for any location, let alone every location. The GO in most cases must gather data from third party providers, and none of the data is perfect. This issue must be addressed through either Requirement R1 or modification to the ECWT definition. The NAGF looks forward to working with the SDT to address this identified concern.

Since the NAGF members likely have a great deal more experience making these calculations, determining issues with the data and addressing these issues, the NAGF recommends that time be spent by the SDT to first understand the issues and the impact to entities before rushing this standard through the process without addressing this concern.

Under R2, there is a great deal of confusion related to incorporating the 20 MPH wind speed into the ECWT calculation process. The NAGF is requesting that the SDT add language to the technical reference document explaining how Generator Owners should accommodate the wind speed into their design criteria.

The NAGF has several concerns with language in Attachment 1. These are identified below:

1. In the second bullet under pre-approved constraints, the NAGF recommends adding “or unlikely to provide sufficient impact on blade icing events”

2.Under section 3 of Case-by-case Determination, the majority of the identified issues will come down to cost. As currently structured, it is unclear how the CEA will ensure consistency between regions or even within a single region. More details must be provided in the attachment or proposed process document to allow the Generator Owners to understand what is expected of them.

3. Under Bullet 3.a, the word dispatchable should be removed. Based on the evaluations from NERC, the unplanned retirement of any generator will likely reduce the reliability of the grid since a new generator will not be available to replace it for several years.

4. The NAGF would like the SDT to provide justification for the three years used in bullet 3.b. Based on current industry trends; it is more likely that a new unit to replace generators retiring early will not be available for 5 to 7 years. The NAGF believes that three-year period is much shorter than reasonable.

5. Bullet 3.e. is duplicative of bullet 3.d.

6. The pre-approved cold weather constraints in Attachment 1 should be re-worded for consistency. Item 1 for example is, “Wind turbine towers that have structural limitations...,” so the last one should be, “Combustion turbine inlet air filters that are vulnerable to the buildup of frozen precipitation, such that applying heat upstream of inlet air filters would be required.”

7. The last of the pre-approved GCWCs should be expanded to cover CTGs that do have inlet air heating but would require upsizing to ride through worst-possible snowstorms without tripping or derating.

8. A pre-approved GCWC should be added for derates or being forced offline due to freezing of items not under the GO’s control, e.g. having to reduce load at a combined cycle plant under adverse wind direction conditions so that the cooling tower plume does not create hazardous icing on adjacent roadways.

Response

Thank you for your comments. The DT refers comments related to Regions approach to NERC staff. The previous DT provided some content on the 20 mph wind speed determination in the Technical Rationale which was retained. The DT has made changes to Attachment 1 based on industry comments. In paragraph 47 of the June 2024 Order, FERC directed NERC to develop and submit

modifications to the Generator Cold Weather Constraint definition of Reliability Standard EOP-012-2, to remove the references to “cost,” “reasonable cost,” “unreasonable cost,” and “good business practices” and replace them with criteria that are objective, unambiguous, and auditable. The DT defers to NERC on comments related to regional consistency. The three year time period refers to when a unit has already declared they are retiring and additions of freeze protection measures were called out to be applied within the three years leading up to the retirement. Example- A unit announces retirement for 2032. In 2029 they had a Generator Cold Weather Reliability Event. Adding freeze protection measures may have an adverse effect on reliability (in terms of taking the unit out of service to add the freeze protection measures when the unit is not likely scheduled for any major maintenance outage). Bullets 3e and 3 d may not necessarily be duplicative. The DT made several changes to Attachment 1 which include updating the Case-by-Case determinations.

AES US Renewables strongly recommend the drafting team to develop further guidance on how to account both ECWT and 20mph wind speed for new generators (specifically for IBRs) as required in R2. Currently, the technical rationale does not provide much guidance on how determination can be made and our OEMs do not provide information concerning equipment’s minimum operating temperature at	

certain wind speeds. Using wind chill temperature formula to determine what the minimum design temperature can be misleading. In fact, on the National Weather Service webpage, it specifically states that “wind chill temperature is how cold people and animals feel when outside”. Additionally, we request that the drafting team provide guidance in the Technical Rationale concerning the need for Solar facilities to meet ECWT since the lowest temperatures normally occur during night time when Solar facilities are not generating. Should ECWT be calculated differently for Solar generators? We also recommend adding the flow chart that was provided during the 10/24/2024 webinar in the Technical Rationale. It is a good reference to include in the Technical Rationale.

1. There should be a process for Registered Entities to be able to submit consideration of additional constraints to be added to the EOP-012-3 Attachment 1 Pre-Approved Generator Cold Weather Constraints in the future after EOP-012-3 is approved by FERC.

2. What documentation will NERC require for submitting a constraint declaration? Suggest NERC develop a form and required evidence (e.g., photos, narrative, OEM pre-existing limitations, engineering analysis, etc.).

3. If the Regional Entities do not have the technical expertise to evaluate constraint declarations, and rely on third-party 'experts' this needs to be made transparent to the Registered Entities.

4. If a Registered Entity has previously received an approval of a Pre-Approved Generator Cold Weather Constraint (per Attachment 1 of EOP-012-3) due to one cold weather event, do they need to resubmit the constraint declaration for every similar cold weather event during that particular winter season that causes the same constraint? Suggest requiring constraint declarations of a similar nature just once per winter season.

5. Regarding the ECWT calculation, suggest adding guidance regarding combining data from different weather data resources, so that the frequency sampling is the same. For example, if one weather data source gathers temperature data three times per hour and another weather data source gathers weather data one time per hour, this will skew the 0.2 percentile in favor of the more frequent weather data source. Suggest adding guidance with a threshold such as at least 66% of the hours for each year from each weather data source must have hourly data.

1. BC Hydro requests that the Technical Rationale documented by the 2021-07 Drafting Team be consolidated with the Technical Rationale developed under this 2024-03 project under a single document for consistency and easy reference.
2. BC Hydro recommend that the draft standard be reviewed for consistent use of timelines, e.g. days/months vs. calendar days/months.
3. The Requirement R8 Part 8.4 wording is ambiguous “If the CEA determines the declared Generator Cold Weather Constraint is invalid, update its Corrective Action Plan(s) to require corrective actions be completed in accordance with the timetables in Requirement R6 Part 6.1 or Requirement R7 Part 7.1, to begin from the date the Generator Owner is notified that the Generator

Cold Weather Constraint is invalid". Would an entity interpret this as the Corrective Action Plan(s) need to be updated within six months for R7 (per R1.1.1) or be updated within 150 days for R6 (per R6) as applicable?

4. The Generator Cold Weather CAP Extension and Constraint Process is a standalone document, which therefore may not be enforceable. As this document sets timeline expectations for CAP extensions, including for CEA, that are either not in the Requirements and/or impact the Requirements, there could be situations where if the CEA exceeds the 45-day expectation to approve an extension, the submitting GO would be in potential noncompliance to EOP-012-3. Examples include requiring an entity to submit extension requests within 60 days prior to the original CAP completion date. The actual Requirements R6 and R7 don't include timelines for submitting extension requests. Therefore, an entity could submit the extension request at any time up to the completion date and still be in compliance. BC Hydro recommends revising the process and Requirements and including any timelines in the Requirements if the entity will be expected to meet them. As well, in Step 3 of the process, the CEA could take up to 45 days to approve (or more) and therefore the entity could be past the originally proposed completion date with no approved extension request. Step 3 also says "If an extension request is denied, the selected actions in the Corrective Action Plan need to be completed in accordance with the original timetables". However, the entity may be well beyond the original timelines if the review takes more than 45 days and therefore not able to meet the original timetables. As there is no maximum time for the CEA to review and this may lead to very long review times, this will be challenging for an entity. BC Hydro recommends there be an "approval by default" if the CEA does not respond within a given period after entity's submittal to CEA.
5. BC Hydro suggests that, similar to the pre-approved Generator Cold Weather Constraints in Attachment 1, it would be helpful to also include pre-approved circumstances deemed acceptable as beyond the Generator Owner control for CAP extensions.
6. Requirements R2, R6 and R7 reference "documentation of a declaration" of an identified Generator Cold Weather Constraint in accordance with R8. Should these requirements reference the Attachment 1 instead?

Thank you for your comments. The Technical Rational developed by the 2021-07 Drafting Team was used as the framework for the 2024-03 Drafting Teams version and still contains the majority of details from the 2021-07 efforts (except where changes were needed). Consistent use of timelines was noted. Requirement R8 was changed based on industry comments. The DT defers proposed comments regarding changes in the process to NERC staff. The DT has worked with NERC staff to support changes within the Standard based on the comments received from industry. The "approval by default" approach does not meet the FERC directive for NERC to receive, review,

evaluate and confirm the validity of a Generator Cold Weather Constraint. Requirement R8 has specific actions for the entity to perform and is the correct reference.

MRO NSRF recommends that the standard drafting team ensure that any dates for which a registered entity is to be held to be in the requirement language and not a document that exists outside the structure of NERC Reliability Standards.

The values for wind speed and duration of ECWT that are used in R2 could be more tailored to each GO location. The guidance provided by NERC on how to calculate the ECWT (2021-07 Calculating Extreme Cold Weather Temperature_082022.pdf) was very helpful, and the fact that it used statistical analysis of real-world data seem to be a good compromise between reliability and cost. The same approach should be used to calculate the wind speed and duration of ECWT that should be used as the design criteria for new units. Otherwise, new units could be designed with overly conservative ECWT, which could lead to increased cost of construction, and	

ongoing O&M costs. Additionally, if a GO is in a windier than average area of the U.S., the 20-mph wind speed may not be an accurate representation of the winds they may experience during the ECWT event.

The obligation in R6.1.6 states the CAP needs to include a timetable for implementing freeze protection measure to “similar” generating units owned by the Generator Owner. It is unclear how the term “similar” is to be applied, as some Generator Operators operate in a large footprint. Does the term “similar” refer to the generating unit design, the generating unit’s geographical location, or perhaps even both? Likewise, “similar equipment freeze protection measures” is problematic, because the word “similar” could be understood as being tied to either the equipment or the measures. Rather than stating “A review of applicability to similar equipment freeze protection measures”, AEP recommends instead using “A review of the freeze protection measures used for similar critical components.” The R6.1.6 obligation to perform “A review of applicability to similar equipment freeze protection measures at generating units owned by the Generator Owner” needs further clarification. A Generator Cold Weather Reliability Event may be the result of either a failed equipment freeze protection measure or due to inadequate freeze protection measures. The obligation to perform an applicability review should only be required due to a Generator Cold Weather Reliability Event resulting from inadequate freeze protection measures.

Response	

Thank you for your comments. The DT updated the wording to be “freeze protection measures on similar equipment”. The freezing issue may have occurred on an “unidentified” Generator Cold Weather Critical Component and the suggested language may mute efforts to correct the issue. A Generator Cold Weather Reliability Event could be caused by either scenario (and may speak to an entity’s approach to maintenance and inspection).

Project 2024-03 Revisions to EOP-012-2

Initial Ballots and Non-binding Poll Open through November 5, 2024

Now Available

Initial ballots for draft one of **EOP-012-3 Extreme Cold Weather Preparedness and Operations** and non-binding poll of the associated Violation Risk Factors and Violation Severity Levels are open through **8 p.m. Eastern, Tuesday, November 5, 2024**.

The Standards Committee approved the following waiver of provisions of the Standard Processes Manual (SPM) for Project 2024-03 Revisions to EOP-012-2:

- Informal comment period for SAR reduced from 30 days to as few as 15 days (Section 4.2);
- Initial formal comment and ballot period(s) reduced from 45 days to as little as 20 days, with the ballot pool formed concurrently during the first 10 days of the initial formal comment period, and with the ballot and non-binding poll of Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) conducted concurrently during the last 5 days of the comment period (Sections 4.8 and 4.9);
- Additional formal comment and ballot period(s) reduced from 30 days to as little as 15 days, with the ballot and non-binding poll of VRFs and VSLs conducted concurrently during the last 5 days of the comment period (Sections 4.9 and 4.12);
- Final ballot period(s) reduced from 10 days to as little as 5 days (Section 4.13).

Reminder Regarding Corporate RBB Memberships

Under the NERC Rules of Procedure, each entity and its affiliates is collectively permitted one voting membership per Registered Ballot Body Segment. Each entity that undergoes a change in corporate structure (such as a merger or acquisition) that results in the entity or affiliated entities having more than the one permitted representative in a particular Segment must withdraw the duplicate membership(s) prior to joining new ballot pools or voting on anything as part of an existing ballot pool. Contact ballotadmin@nerc.net to assist with the removal of any duplicate registrations.

Balloting

Members of the ballot pools associated with this project can log in and submit their votes by accessing the Standards Balloting and Commenting System (SBS) here.

- *Contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern) for problems regarding accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out.*

- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

The ballot results will be announced and posted on the project page. The drafting team will review all responses received during the comment period and determine the next steps of the project.

For information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer, Ben Wu (via email) or at 470-542-6882. Subscribe to this project's observer mailing list by selecting "NERC Email Distribution Lists" from the "Service" drop-down menu and specify “Project 2024-03 Revisions to EOP-012-2 observer list” in the Description Box.

Standards Announcement

Project 2024-03 Revisions to EOP-012-2

Formal Comment Period Open through November 5, 2024
Ballot Pools Forming through October 28, 2024

Now Available

A 20-day formal comment period for draft one of **EOP-012-3 Extreme Cold Weather Preparedness and Operations** is open through **8 p.m. Eastern, Tuesday, November 5, 2024**.

The Standards Committee approved the following waiver of provisions of the Standard Processes Manual (SPM) for Project 2024-03 Revisions to EOP-012-2:

- Informal comment period for SAR reduced from 30 days to as few as 15 days (Section 4.2);
- Initial formal comment and ballot period(s) reduced from 45 days to as little as 20 days, with the ballot pool formed concurrently during the first 10 days of the initial formal comment period, and with the ballot and non-binding poll of Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) conducted concurrently during the last 5 days of the comment period (Sections 4.8 and 4.9);
- Additional formal comment and ballot period(s) reduced from 30 days to as little as 15 days, with the ballot and non-binding poll of VRFs and VSLs conducted concurrently during the last 5 days of the comment period (Sections 4.9 and 4.12);
- Final ballot period(s) reduced from 10 days to as little as 5 days (Section 4.13).

Commenting

Use the Standards Balloting and Commenting System (SBS) to submit comments. An unofficial Word version of the comment form is posted on the project page.

Reminder Regarding Corporate RBB Memberships

Under the NERC Rules of Procedure, each entity and its affiliates is collectively permitted one voting membership per Registered Ballot Body Segment. Each entity that undergoes a change in corporate structure (such as a merger or acquisition) that results in the entity or affiliated entities having more than the one permitted representative in a particular Segment must withdraw the duplicate membership(s) prior to joining new ballot pools or voting on anything as part of an existing ballot pool. Contact ballotadmin@nerc.net to assist with the removal of any duplicate registrations.

Ballot Pools

Ballot pools are being formed through **8 p.m. Eastern, Monday, October 28, 2024.** Registered Ballot Body members can join the ballot pools here.

- *Contact NERC IT support directly at https://support.nerc.net/ (Monday – Friday, 8 a.m. - 5 p.m. Eastern) for problems regarding accessing the SBS due to a forgotten password, incorrect credential error messages, or system lock-out.*
- *Passwords expire every **6 months** and must be reset.*
- *The SBS **is not** supported for use on mobile devices.*
- *Please be mindful of ballot and comment period closing dates. We ask to **allow at least 48 hours** for NERC support staff to assist with inquiries. Therefore, it is recommended that users try logging into their SBS accounts **prior to the last day** of a comment/ballot period.*

Next Steps

Initial ballots for the standard and implementation plan, as well as a non-binding poll of the associated Violation Risk Factors and Violation Severity Levels will be conducted **October 31 – November 5, 2024**.

For information on the Standards Development Process, refer to the Standard Processes Manual.

For more information or assistance, contact Senior Standards Developer, Ben Wu (via email) or at 470-542-6882. Subscribe to this project's observer mailing list by selecting "NERC Email Distribution Lists" from the "Service" drop-down menu and specify “Project 2024-03 Revisions to EOP-012-2 observer list” in the Description Box.

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the second draft of the proposed standard for a formal 18-day comment and ballot period.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	July 17, 2024
SAR posted for comment	July 18, 2024 – August 16, 2024
20-day formal comment period with initial ballot	October 17, 2024 – November 5, 2024

Anticipated Actions	Date
18-day formal comment period with additional ballot	December 3, 2024 – December 20, 2024
15-day formal comment period with additional ballot	January 29, 2025 – February 12, 2025
Board adoption	TBD

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

Generator Cold Weather Constraint – Any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components. Freeze protection measures include practices, methods, or technologies implemented by the electric industry in areas that experience similar winter climate conditions and are not intended to be limited to optimum practices, methods, or technologies.

Previously Approved Terms

This section includes previously approved terms from EOP-012-1 and EOP-012-2. It is included to help with drafting and the posting of EOP-012-3.

Extreme Cold Weather Temperature – The temperature equal to the lowest 0.2 percentile of the hourly temperatures measured in December, January, and February from 01/01/2000 through the date the temperature is calculated.

Generator Cold Weather Critical Component – Any generating unit component or system, or associated Fixed Fuel Supply Component, that is under the Generator Owner's control, and is susceptible to freezing issues, the occurrence of which would likely lead to a Generator Cold Weather Reliability Event. This definition excludes any component or system or associated Fixed Fuel Supply Component located inside a permanent building with a heating source that regularly maintains the space at a temperature above 32 degrees Fahrenheit (0 degrees Celsius).

Fixed Fuel Supply Component – Non-mobile equipment that supports the reliable delivery of fuel to the generating unit and under the control of the Generator Owner at a plant site. Gaseous, liquid, or solid fuel handling components that are installed on site as fixed parts of the fuel delivery system that are under the Generator Owner's control are included. Mobile equipment such as trains, bulldozers, or other equipment that are not fixed in one location are excluded.

Generator Cold Weather Reliability Event – One of the following events for which the apparent cause(s) is due to freezing of equipment or impacts of freezing precipitation (e.g., sleet, snow, ice, and freezing rain) on equipment within the Generator Owner's control, and the dry bulb temperature at the time of the event was at or above the Extreme Cold Weather Temperature:

(1) a forced derate of more than 10% of the total capacity of the unit, but not less than 20 MWs for longer than four hours in duration;

(2) a start-up failure where the unit fails to synchronize within a specified start-up time; or

(3) a Forced Outage.

A. Introduction

1. **Title:** Extreme Cold Weather Preparedness and Operations

2. **Number:** EOP-012-3

3. **Purpose:** To address the effects of operating in extreme cold weather by ensuring each Generator Owner has developed and implemented plan(s) to mitigate the reliability impacts of extreme cold weather on its applicable generating units.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1. Generator Owner

   4.1.2. Generator Operator

   4.2. Facilities:

   4.2.1. Bulk Electric System (BES) generating units. For purposes of this standard, the term "generating unit" subject to these requirements refers to the following Bulk Electric System (BES) resources:

   4.2.1.1. A Bulk Electric System generating resource identified in the BES definition, Inclusion I2 and I4; or

   4.2.1.2. A Blackstart Resource, identified in the BES definition, Inclusion I3.

5. **Effective Date:** See Implementation Plan for Project 2024-03.

B. Requirements and Measures

R1. At least once every five calendar years, each Generator Owner shall, for each of its applicable generating unit(s): [*Violation Risk Factor: Lower*] [*Time Horizon: Long-term Planning*]

1.1. Calculate the Extreme Cold Weather Temperature for each of its applicable generating unit(s) and identify the calculation date, source(s) of temperature data, and adjustments utilized for missing or invalid hourly temperature data, if necessary; and

1.1.1. If the recalculated Extreme Cold Weather Temperature is lower than the previous Extreme Cold Weather Temperature, the entity shall review and update its cold weather preparedness plan(s) under Requirement R4 within six (6) calendar months of the recalculation, and if new corrective actions are needed, to provide the required operational capability described in Requirement R2 or R3, the entity shall develop a Corrective Action Plan within six (6) calendar months of the recalculation.

1.2. Identify generating unit(s) cold weather data, to include:

1.2.1. Generating unit(s) operating limitations in cold weather to include:

1.2.1.1. Capability and availability;

1.2.1.2. Fuel supply and inventory concerns;

1.2.1.3. Start-up issues;

1.2.1.4. Fuel switching capabilities; and

1.2.1.5. Environmental constraints.

1.2.2. Generating unit(s) minimum:

- Design temperature, and if available, the concurrent wind speed and precipitation;
- Historical operating temperature at least one hour in duration, and if available, the concurrent wind speed and precipitation; or
- Current cold weather performance temperature determined by an engineering analysis, which includes the concurrent wind speed and precipitation.

M1. Each Generator Owner will have evidence documenting its Extreme Cold Weather Temperature calculation, including the calculation date, source(s) of temperature data, and adjustments utilized for missing or invalid hourly temperature data, and design information, operating data, or engineering analysis that supports its generating unit minimum temperature.

R2. Applicable to generating units that begin commercial operation[1] on or after October 1, 2027: Each Generator Owner, for each generating unit that has a calculated Extreme Cold Weather Temperature at or below 32 degrees Fahrenheit (zero degrees Celsius) as determined in Requirement R1, and that self-commits or is required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius),[2] shall: [*Violation Risk Factor: Medium*] [*Time Horizon: Long-term Planning, Operations Planning*]

2.1 For generating units for which the Generator Owner first contractually committed to design criteria[3] relevant to this Requirement before June 29, 2023[4]:

- Implement freeze protection measures to protect Generator Cold Weather Critical Components that provide the capability to operate at the generating unit(s)' Extreme Cold Weather Temperature with sustained concurrent twenty (20) mph (32 km/h) wind speed for (i) a period of not less than twelve (12) continuous hours, or (ii) the maximum operational duration for intermittent energy resources if less than twelve (12) continuous hours; or
- Develop, implement, and complete by April 1, 2028, a Corrective Action Plan to add new or modify existing or previously planned freeze protection measures to provide the capability to operate at the generating unit(s)' Extreme Cold Weather Temperature with a sustained concurrent twenty (20) mph (32 km/h) wind speed for (i) a period of not less than twelve (12) continuous hours, or (ii) the maximum operational duration for intermittent energy resources if less than twelve (12) continuous hours; or
- Document in a declaration, with justification, if applicable, a Generator Cold Weather Constraint in accordance with Requirement R8.

2.2 For generating units for which the Generator Owner first contractually committed to design criteria[5] relevant to this Requirement on or after June 29, 2023[6:]

- Implement freeze protection measures to protect Generator Cold Weather Critical Components that provide the capability to operate at the generating unit(s)' Extreme Cold Weather Temperature with sustained concurrent twenty (20) mph (32 km/h) wind speed for (i) a period of not less than twelve (12)

[1] Commercial operation means achievement of this designation indicating that the facility has received all approvals necessary for operation after completion of initial start-up testing.
[2] Generating unit(s) that do not self-commit or are not required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), but may be called upon to operate in order to assist in the mitigation of BES Emergencies, Capacity Emergencies, or Energy Emergencies during periods at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), are exempt from this requirement.
[3] Such commitments would be demonstrated by signed contractual commitments, or other similar documented evidence.
[4] In non-U.S. jurisdictions, use the date approved by the applicable government authority in the relevant jurisdiction.
[5] Such commitments would be demonstrated by signed contractual commitments, or other similar documented evidence.
[6] In non-U.S. jurisdictions, use the date approved by the applicable government authority in the relevant jurisdiction.

continuous hours, or (ii) the maximum operational duration for intermittent energy resources if less than twelve (12) continuous hours; or

- Document in a declaration, with justification, if applicable, a Generator Cold Weather Constraint in accordance with Requirement R8.

M2. Each Generator Owner will have dated evidence that demonstrates it has freeze protection measures for its generating unit(s) in accordance with R2, or it has developed, implemented, and completed by April 1, 2028, a Corrective Action Plan, or it has declared a Generator Cold Weather Constraint for the identified issues. Acceptable evidence may include the following (electronic or hardcopy format): Identification of generating unit(s) minimum temperature under Requirement R1 Part 1.2.2 which is equal to or less than the generating unit's Extreme Cold Weather Temperature, documentation of freeze protection measures, Corrective Action Plan(s) (if applicable), and Generator Cold Weather Constraints (if applicable).

R3. Applicable to generating unit(s) in commercial operation prior to October 1, 2027: Each Generator Owner, for each generating unit that has a calculated Extreme Cold Weather Temperature at or below 32 degrees Fahrenheit (zero degrees Celsius) as determined in Requirement R1, and that self-commits or is required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius),[7] shall: [*Violation Risk Factor: Medium*] [*Time Horizon: Long-term Planning, Operations Planning*]

- Implement freeze protection measures to protect Generator Cold Weather Critical Components that provide the capability to operate at the generating unit(s)' Extreme Cold Weather Temperature; or
- Develop a Corrective Action Plan to add new or modify existing freeze protection measures to provide the capability to operate at the generating unit(s)' Extreme Cold Weather Temperature.

M3. Each Generator Owner will have dated evidence that demonstrates it has freeze protection measures for its generating unit(s) in accordance with R3, or it has developed a Corrective Action Plan for the identified issues. Acceptable evidence may include, but is not limited to, the following (electronic or hardcopy format): Identification of generating unit(s) minimum temperature per Part 1.2.2 which is equal to or less than the unit's Extreme Cold Weather Temperature, documentation of freeze protection measures, and Corrective Action Plan(s).

R4. Each Generator Owner shall implement and maintain one or more cold weather preparedness plan(s) for its generating units. The cold weather preparedness plan(s)

[7] Generating unit(s) that do not self-commit or are not required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), but may be called upon to operate in order to assist in the mitigation of BES Emergencies, Capacity Emergencies, or Energy Emergencies during periods at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), are exempt from this requirement.

shall include the following, at a minimum: *[Violation Risk Factor: High] [Time Horizon: Operations Planning and Real-time Operations]*

4.1. The lowest calculated Extreme Cold Weather Temperature for each generating unit, as determined in Requirement R1;[8]

4.2. The generating unit cold weather data, as determined in Requirement R1, Part 1.2;

4.3. Documentation identifying Generator Cold Weather Critical Components;

4.4. Documentation of freeze protection measures implemented on Generator Cold Weather Critical Components that includes measures used to reduce the cooling effects of wind determined necessary by the Generator Owner to protect against heat loss, and where applicable, the effects of freezing precipitation (e.g., sleet, snow, ice, and freezing rain); and

4.5. Annual inspection and maintenance of generating unit(s) freeze protection measures implemented on Generator Cold Weather Critical Components.

M4. Each Generator Owner will have evidence documenting that its cold weather preparedness plan(s) was implemented and maintained in accordance with Requirement R4. Examples of documentation to demonstrate a cold weather preparedness plan may include existing operating procedures, plans, checklists, or processes. Examples of documentation, to demonstrate inspections and maintenance have been completed, may include, but are not limited to, completed work order(s) from the Generator Owner's work management system and/or freeze protection checklists identifying the measures inspected and maintained for the Generator Cold Weather Critical Components.

R5. Each Generator Owner, in conjunction with its Generator Operator, shall identify the entity responsible for providing generating unit-specific training, and that identified entity shall provide annual training to the maintenance and operations personnel, as applicable, responsible for implementing the cold weather preparedness plan(s) developed pursuant to Requirement R4. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning, Operations Planning]*

M5. Each Generator Operator or Generator Owner will have documented evidence that the applicable personnel completed annual training of the Generator Owner's cold weather preparedness plan(s). This evidence may include, but is not limited to, documents such as personnel training records, training materials, date of training, agendas or learning objectives, attendance at pre-work briefings, review of work order tasks, tailboards, attendance logs for classroom training, and completion records for computer-based training in fulfillment of Requirement R5.

[8] Generator Owners shall include the lowest calculated Extreme Cold Weather Temperature for the unit, even where subsequent periodic re-calculations under Requirement R1 Part 1.1 cause an increase in the Extreme Cold Weather Temperature.

R6. Each Generator Owner shall, when experiencing a Generator Cold Weather Reliability Event at a generating unit that has a calculated Extreme Cold Weather Temperature at or below 32 degrees Fahrenheit (zero degrees Celsius) as determined in Requirement R1 and that self-commits or is required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius),[9] develop and implement[10] a Corrective Action Plan(s) to address identified issues as follows: *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

6.1. The Generator Owner shall develop a Corrective Action Plan for the generating unit experiencing a Generator Cold Weather Reliability Event.

6.2. The Generator Owner shall conduct a review of the applicability of the corrective actions from the Corrective Action Plan developed under Part 6.1 to freeze protection measures on similar equipment at other generating unit(s) owned by the Generator Owner and, if corrective actions are applicable, develop or update a Corrective Action Plan no later than 12 calendar months following the Generator Cold Weather Reliability Event to address the other unit(s).

6.3. For each Corrective Action Plan, the Generator Owner shall include at a minimum:

6.3.1. A summary of the identified cause(s) of the Generator Cold Weather Reliability Event, where applicable, and any relevant associated data;

6.3.2. A list of actions to add new freeze protection measures or remedy issues with existing freeze protection measures;

6.3.3. An identification of operating limitations on the generating unit(s), or impacts to the cold weather preparedness plan, if any, that would apply until implementation of the corrective action(s) identified in the Corrective Action Plan is completed;

6.3.4. A description of the updates to the cold weather preparedness plan required under Requirement R4 to identify updates or additions to the Generator Cold Weather Critical Components and their freeze protection measures, if required; and

6.3.5. A timetable specifying that implementation of the Corrective Action Plan(s) shall be completed as follows:

[9] Generating unit(s) that do not self-commit or are not required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), but may be called upon to operate in order to assist in the mitigation of BES Emergencies, Capacity Emergencies, or Energy Emergencies during periods at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), are exempt from this requirement.

[10] If a Generator Owner has previously experienced a Generator Cold Weather Reliability Event and developed a Corrective Action Plan for the generating unit under Requirement R6 Parts 6.1 or 6.2, the Generator Owner may review and update its existing plan(s) in lieu of developing a new plan.

6.3.5.1. For the generating unit experiencing the Generator Cold Weather Reliability Event, prior to the first day of the first December following the Generator Cold Weather Reliability Event.[11]

6.3.5.2. For other generating unit(s) owned by the Generator Owner, within 24 calendar months of the Generator Cold Weather Reliability Event.

6.4 If a Generator Owner determines it will be unable to complete one or more of the actions in a Corrective Action Plan in accordance with the timetables specified in Requirement R6 Part 6.3.5 due to circumstances beyond its control, the Generator Owner shall submit a Corrective Action Plan extension request to the Compliance Enforcement Authority (CEA) for approval. The submitted Corrective Action Plan extension request shall include the following:

6.4.1. An explanation of the circumstances causing the delay and why those circumstances are beyond the control of the Generator Owner;

6.4.2. Revisions to the selected actions in Part 6.3.2, if any, including utilization of operating procedures, if applicable; and

6.4.3. Updated timetable for implementing the selected actions in Part 6.3.2.

6.5 The Generator Owner shall document in a declaration, with justification, if applicable, any Generator Cold Weather Constraint in accordance with Requirement R8, as applicable.

M6. Each Generator Owner will have dated evidence that it developed and implemented a Corrective Action Plan following a Cold Weather Reliability Event for applicable unit(s) in accordance with Requirement R6. Acceptable evidence may include, but is not limited to, the following dated documentation (electronic or hardcopy format): Corrective Action Plan(s), completed work orders, copies of any Corrective Action Plan extension requests and supporting documentation, updated cold weather preparedness plan(s) where indicated as needed by the Corrective Action Plan, and, where applicable, declared Generator Cold Weather Constraint(s).

R7. Each Generator Owner that is required to develop a Corrective Action Plan under Requirements R1 or R3 shall develop and implement the Corrective Action Plan in accordance with the following: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

7.1. For each Corrective Action Plan, the Generator Owner shall include at a minimum the following:

7.1.1. A list of any actions that require new freeze protection measures, with a timetable specifying completion of such measures within 48 calendar months of completing development of the Corrective Action Plan;

[11] For events that occur early in the season, such as in October or November, the timetable shall specify completion prior to December 1 of the next calendar year.

7.1.2. A list of any actions that remedy issues with existing freeze protection measures with a timetable specifying completion of such measures within 24 calendar months of completing development of the Corrective Action Plan (regardless of any longer timelines in the Corrective Action Plan associated with new freeze protection measures);

7.1.3. A description of updates to the cold weather preparedness plan required under Requirement R4 to identify the updates or additions to the Generator Cold Weather Critical Components and their freeze protection measures; and

7.1.4. An identification of operating limitations on the generating unit(s), or impacts to the cold weather preparedness plan, if any, that would apply until implementation of the corrective action(s) identified in the Corrective Action Plan is completed.

7.2. If a Generator Owner determines it will be unable to complete one or more of the actions in a Corrective Action Plan in accordance with the timetables specified in Requirement R7 Part 7.1 due to circumstances beyond its control, the Generator Owner shall submit a Corrective Action Plan extension request to the CEA for approval. The submitted Corrective Action Plan extension request shall include the following:

7.2.1. An explanation of the circumstances causing the delay and how those circumstances are beyond the control of the Generator Owner;

7.2.2. Revisions to the selected actions in Parts 7.1, if any, including utilization of operating procedures, if applicable; and

7.2.3. Updated timetable for implementing the selected actions in Part 7.1.

7.3. The Generator Owner shall document in a declaration, with justification, if applicable, any Generator Cold Weather Constraint in accordance with Requirement R8.

M7. Each Generator Owner shall have dated evidence that it developed and implemented a Corrective Action Plan for applicable unit(s) in accordance with Requirement R7. Acceptable evidence may include, but is not limited to, the following dated documentation (electronic or hardcopy format): Corrective Action Plan(s), completed work orders, copies of any Corrective Action Plan extension requests and supporting documentation, updated cold weather preparedness plan(s) where indicated as needed by the Corrective Action Plan, and, where applicable, declared Generator Cold Weather Constraints.

R8. Each Generator Owner that declares a Generator Cold Weather Constraint in accordance with Attachment 1 shall: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

8.1. Submit its Generator Cold Weather Constraint declaration(s) to the CEA as follows:

- For Generator Cold Weather Constraints determined in accordance with Requirement R2 for generating unit(s) upon beginning commercial operation, submit within 15 calendar days after commercial operation; or
- For all other Generator Cold Weather Constraints, submit within 45 calendar days of determining that the Generator Cold Weather Constraint is applicable.

8.2. Update the operating limitations under Requirement R1 Part R1.2 if applicable; and

8.3. If the CEA determines the declared Generator Cold Weather Constraint is invalid, update its Corrective Action Plan(s) to require corrective actions be completed in accordance with Requirement R6 or Requirement R7, as applicable, subject to any extensions approved by the CEA or implement freeze protection measures to provide the necessary capability in accordance with Requirement R2.

M8. Each Generator Owner shall have dated evidence that demonstrates it performed the actions in accordance with Requirement R8. Acceptable evidence may include, but is not limited to, the following dated documentation (electronic or hardcopy format): a copy of the Generator Cold Weather Constraint declaration, evidence the declaration was provided to the Compliance Enforcement Authority in accordance with the specified timeframe, records that document update(s) to the operating limitations, as needed, and updated Corrective Action Plan(s), if applicable.

R9. The Generator Owner shall review each Generator Cold Weather Constraint declaration validated by the CEA at least once every 36 calendar months to determine if it remains valid in accordance with Attachment 1. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

M9. Each Generator Owner shall have dated evidence that demonstrates it reviewed Generator Cold Weather Constraints in accordance with Requirement R9. Acceptable evidence may include, but is not limited to, the following dated documentation (electronic or hardcopy format): records that document the performance of the review within the required timeframe.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation.

- The Generator Owner shall retain data or evidence to support its current Extreme Cold Weather Temperature calculation and generating unit cold weather data, plus each calculation or revision since the last audit, for Requirement R1 and Measure M1.
- The Generator Owner shall keep data or evidence to show compliance for three years, or until any Corrective Action Plan under Requirement R2 or R3 is complete, whichever timeframe is greater, for Requirements R2 and R3 and Measures M2 and M3. Generator Cold Weather Constraint data or evidence shall be retained until no longer valid.
- The Generator Owner shall retain the current cold weather preparedness plan(s), as evidence of review or revision history, plus each version issued since the last audit and evidence of compliance since the last audit for Requirement R4 and Measure M4.
- The Generator Owner or Generator Operator shall keep data or evidence to show compliance for three years for Requirement R5 and Measure M5.
- The Generator Owner shall keep data or evidence to show compliance for three years, or until any Corrective Action Plan, including extensions (if applicable), under Requirement R6 is complete, whichever timeframe is greater, for Requirement R6 and Measure M6. Generator Cold Weather Constraint data or evidence shall be retained until no longer valid.
- The Generator Owner shall keep data or evidence to show compliance for three years, or until any Corrective Action Plan, including extension (if applicable), under Requirement R7 is complete, whichever time-frame is

greater, for Requirement R7 and Measure M7. Generator Cold Weather Constraint data or evidence shall be retained until no longer valid.

- The Generator Owner shall maintain data or evidence to support its current Generator Cold Weather Constraint declaration(s), plus each revision since the last audit, for Requirement R8 and Measure M8.
- The Generator Owner shall maintain data or evidence to support that it reviewed each Generator Cold Weather Constraint declaration validated by the Compliance Enforcement Authority at least once every 36 calendar months since the last audit, for Requirement R9 and Measure M9.

1.3. "Compliance Monitoring Enforcement Program" or "CMEP" means, depending on the context (1) the NERC Compliance Monitoring and Enforcement Program (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for performing compliance monitoring and enforcement activities with respect to Registered Entities' compliance with Reliability Standards.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	The Generator Owner did not calculate the Extreme Cold Weather Temperature or identify generating unit(s) cold weather data in accordance with Requirement R1 for 5% or less of its applicable units.	The Generator Owner did not calculate the Extreme Cold Weather Temperature or identify generating unit(s) cold weather data in accordance with Requirement R1 for more than 5%, but less than or equal to 10% of its applicable units.	The Generator Owner did not calculate the Extreme Cold Weather Temperature or identify generating unit(s) cold weather data in accordance with Requirement R1 for more than 10%, but less than or equal to 20% of its applicable units.	The Generator Owner did not calculate the Extreme Cold Weather Temperature or identify generating unit(s) cold weather data in accordance with Requirement R1 for more than 20% of its applicable units.
R2.	The Generator Owner did not have freeze protection measure(s) for its applicable unit(s) meeting the criteria in Requirement R2 for 5% or less of its applicable units. OR The Generator Owner did not complete a Corrective Action Plan or declare a Generator Cold Weather Constraint (if applicable) to implement appropriate freeze protection measures for 5% or less of its applicable units.	The Generator Owner did not have freeze protection measure(s) for its applicable unit(s) meeting the criteria in Requirement R2 for more than 5%, but less than or equal to 10% of its applicable units. OR The Generator Owner did not complete a Corrective Action Plan or declare a Generator Cold Weather Constraint (if applicable) for more than 5%, but less than or equal to 10% of its applicable units.	The Generator Owner did not have freeze protection measure(s) meeting the criteria in Requirement R2 for more than 10%, but less than or equal to 20% of its applicable units. OR The Generator Owner did not complete a Corrective Action Plan or declare a Generator Cold Weather Constraint (if applicable) for more than 10%, but less than or equal to 20% of its applicable units.	The Generator Owner did not have freeze protection measure(s) meeting the criteria in Requirement R2 for more than 20% of its applicable units. OR The Generator Owner did not complete a Corrective Action Plan or declare a Generator Cold Weather Constraint (if applicable) for more than 20% of its applicable units.
R3.	The Generator Owner did not have freeze protection	The Generator Owner did not have freeze protection	The Generator Owner did not have freeze protection	The Generator Owner did not have freeze protection

Implementation Plan

Calculating Extreme Cold Weather Temperature

EOP-012-3 Technical Rationale

Generator Cold Weather CAP Extension and Constraint Process

Attachment 1

Generator Owners shall determine the applicability of a Generator Cold Weather Constraint declared under Requirements R2, R6, and R7 using the criteria as described below.

The definition of a Generator Cold Weather Constraint is: "Any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components. Freeze protection measures include practices, methods, or technologies implemented by the electric industry in areas that experience similar winter climate conditions and are not intended to be limited to optimum practices, methods, or technologies".

A Generator Cold Weather Constraint can be identified using the following criteria:

Known Generator Cold Weather Constraints

The following are circumstances which, if present and confirmed as valid by the CEA, will constitute Generator Cold Weather Constraints:

- Individual wind turbine towers manufactured prior to October 1, 2027 that have structural limitations established by Original Equipment Manufacturers (OEMs) based on a minimum temperature that is higher than the Extreme Cold Weather Temperature calculated per Requirement R1 for generating units that began commercial operation prior to October 1, 2027.
- Implementation of heat tracing or other de-icing technologies for wind turbine blades, that, through analysis, have been shown to not be effective or not made available by the OEM for generating units of a comparable types in regions that experience similar winter climate conditions.
- Replacing existing wind turbine blades with new blades solely for the purpose of adding de-icing or ice-minimizing capabilities.
- Removal of accumulated frozen precipitation on solar panels.
- Applying heat upstream of inlet air filters to prevent the buildup of frozen precipitation on combustion turbine inlet air filters.

Case-by-case Determinations of Generator Cold Weather Constraints

The following situations may constitute a Generator Cold Weather Constraint, depending on the facts and circumstances. Only upon approval by the CEA will these circumstances constitute a valid Generator Cold Weather Constraint:

1. The implementation of a specific freeze protection measure will void an equipment warranty.
2. The implementation of a specific freeze protection measure applied to address conditions beyond the manufacturer's design limitations.
3. The implementation of a specific freeze protection measure is precluded by technical or physical limitations. For example:

   a. Installing wind breaks around a cooling tower or air-cooled heat exchanger that requires free airflow for its functionality;
   b. Implementing freeze protection measures with size or weight that would require the structural re-design and re-construction of the protected equipment or its support system;
   c. Other similar circumstances as determined through operating experience or engineering analysis and supported with justification.
4. A determination, through an analysis, that the freeze protection measure has been shown to be ineffective or that there is no record that such a measure has been effectively utilized on generating unit(s) of comparable types in regions that experience similar winter climate conditions.
5. A determination, through an analysis, that the implementation of a specific freeze protection measure or measures would adversely affect the reliability of the Bulk Power System to an extent that outweighs the reliability benefit of applying the freeze protection measure(s). For example:
   a. The implementation of freeze protection measures, while feasible, would result in the accelerated premature retirement of an existing generating unit with no acceptable replacement available within the accelerated timeframe;
   b. The implementation of freeze protection measures would cause the Generator Owner to cancel plans to finish the development of a new generating unit;
   c. The implementation of freeze protection measures would reduce the generating unit's ability to provide Real Power or Reactive Power by more than three percent, or another value supported by the appropriate functional entity (e.g., TP, RC, BA, etc.), when freeze protection measures are not in use; or
   d. The implementation of freeze protection measures would reduce the summer net dependable capacity[1], or net dependable capacity at Peak Demand, of the generating unit by more than three percent or another value supported by the appropriate functional entity (e.g., TP, RC, BA, etc.);
   e. Other similar circumstances as determined through operating experience or engineering analysis and supported with justification.
6. The implementation of new freeze protection measures to an existing generating unit that has previously communicated a retirement date to the appropriate functional entity (e.g., Transmission Planner (TP), Reliability Coordinator (RC), Balancing Authority (BA), etc.) that falls within three calendar years of the Generator Cold Weather Constraint declaration;

[1] "net dependable capacity" refers to the definition used for reporting to the NERC in Generating Availability Data System (GADS) appropriate for the generation type.

7. The implementation of a specific freeze protection measure would introduce the risk of noncompliance with other statutory, regulatory, or health and safety requirements or standards for which relief via waiver, exemption or other means of excused noncompliance is not available during extreme cold weather.
8. A determination through an analysis that the freeze protection measure is not available on the commercial market for generating units of comparable types in regions that experience similar winter climate conditions.
9. Implementation of freeze protection measures would not increase reliability of a generating unit due to technical or physical constraints on fuel supply which are not due to Fixed Fuel Supply Components, and which are outside the Generator Owner's control.
10. Other situations identified by the Generator Owner that may, based on the specific circumstances beyond the Generator Owner's control, limit its ability to apply freeze protection measures to Generator Cold Weather Critical Components.

When submitting a Generator Cold Weather Constraint declaration to the CEA per Requirement R8, the Generator Owner must include documentation that defends and supports the declared constraint and also describes other compensating or mitigating freeze protection measures, if applicable, that the Generator Owner will apply. An approved Generator Cold Weather Constraint declaration for any specific Generator Cold Weather Critical Component does not relieve the Generator Owner of its obligation to otherwise prepare its applicable generating unit(s) to meet the requirements of EOP-012-3.

Version History

Version	Date	Action	Change Tracking
1	October 1, 2022	Drafted by Project 2021-07	New
2	February 16, 2023	Revisions drafted by Project 2021-07 due to FERC Order and inquiry Recommendations.	Revisions
2	February 15,2024	Board Adopted	
2	June 27, 2024	FERC Approved

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the second draft of the proposed standard for a formal 18-day comment and ballot period.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	July 17, 2024
SAR posted for comment	July 18, 2024 – August 16, 2024
20-day formal comment period with initial ballot	October 17, 2024 – November 5, 2024

Anticipated Actions	Date
18-day formal comment period with additional ballot	December 3, 2024 – December 20, 2024
15-day formal comment period with additional ballot	January 29, 2025 – February 12, 2025
Board adoption	TBD

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

Generator Cold Weather Constraint – Any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components. Freeze protection measures include practices, methods, or technologies implemented by the electric industry in areas that experience similar winter climate conditions and are not intended to be limited to optimum practices, methods, or technologies.

Previously Approved Terms

This section includes previously approved terms from EOP-012-1 and EOP-012-2. It is included to help with drafting and the posting of EOP-012-3.

Extreme Cold Weather Temperature – The temperature equal to the lowest 0.2 percentile of the hourly temperatures measured in December, January, and February from ~~1/1/2000~~01/01/2000 through the date the temperature is calculated.

Generator Cold Weather Critical Component – Any generating unit component or system, or associated Fixed Fuel Supply Component, that is under the Generator Owner's control, and is susceptible to freezing issues, the occurrence of which would likely lead to a Generator Cold Weather Reliability Event. This definition excludes any component or system or associated Fixed Fuel Supply Component located inside a permanent building with a heating source that regularly maintains the space at a temperature above 32 degrees Fahrenheit (0 degrees Celsius).

Fixed Fuel Supply Component – Non-mobile equipment that supports the reliable delivery of fuel to the generating unit and under the control of the Generator Owner at a plant site. Gaseous, liquid, or solid fuel handling components that are installed on site as fixed parts of the fuel delivery system that are under the Generator Owner's control are included. Mobile equipment such as trains, bulldozers, or other equipment that are not fixed in one location are excluded.

Generator Cold Weather Reliability Event – One of the following events for which the apparent cause(s) is due to freezing of equipment or impacts of freezing precipitation (e.g., sleet, snow, ice, and freezing rain) on equipment within the Generator Owner's control, and the dry bulb temperature at the time of the event was at or above the Extreme Cold Weather Temperature:

(1) a forced derate of more than 10% of the total capacity of the unit, but not less than 20 MWs for longer than four hours in duration;

(2) a start-up failure where the unit fails to synchronize within a specified start-up time; or

(3) a Forced Outage.

A. Introduction

1. **Title:** Extreme Cold Weather Preparedness and Operations

2. **Number:** EOP-012-3

3. **Purpose:** To address the effects of operating in extreme cold weather by ensuring each Generator Owner has developed and implemented plan(s) to mitigate the reliability impacts of extreme cold weather on its applicable generating units.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1. Generator Owner

   4.1.2. Generator Operator

   4.2. Facilities:

   4.2.1. Bulk Electric System (BES) generating units. For purposes of this standard, the term "generating unit" subject to these requirements refers to the following Bulk Electric System (BES) resources:

   4.2.1.1. A Bulk Electric System generating resource identified in the BES definition, ~~inclusion~~Inclusion I2 and I4; or

   4.2.1.2. A Blackstart Resource, identified in the BES definition, ~~inclusion~~Inclusion I3.

5. **Effective Date:** See Implementation Plan for Project 2024-03.

B. Requirements and Measures

R1. At least once every five calendar years, each Generator Owner shall, for each of its applicable generating unit(s): [*Violation Risk Factor: Lower*] [*Time Horizon: Long-term Planning*]

1.1. Calculate the Extreme Cold Weather Temperature for each of its applicable generating unit(s) and identify the calculation date ~~and~~, source(s) of temperature data, and adjustments utilized for missing or invalid hourly temperature data, if necessary; and

1.1.1. If the ~~re-calculated~~recalculated Extreme Cold Weather Temperature is lower than the previous Extreme Cold Weather Temperature, the entity shall review and update its cold weather preparedness plan(s) under Requirement R4 within six (6) calendar months of the recalculation~~. If~~, and if new corrective actions are needed, to provide the required operational capability ~~under~~described in Requirement R2 or R3, the entity shall develop a Corrective Action Plan within six (6) calendar months of the recalculation.

1.2. Identify generating unit(s) cold weather data, to include:

1.2.1. Generating unit(s) operating limitations in cold weather to include:

1.2.1.1. Capability and availability;

1.2.1.2. Fuel supply and inventory concerns;

1.2.1.3. Start-up issues;

1.2.1.4. Fuel switching capabilities; and

1.2.1.5. Environmental constraints.

1.2.2. Generating unit(s) minimum:

- Design temperature, and if available, the concurrent wind speed and precipitation;
- Historical operating temperature at least one hour in duration, and if available, the concurrent wind speed and precipitation; or
- Current cold weather performance temperature determined by an engineering analysis, which includes the concurrent wind speed and precipitation.

M1. Each Generator Owner will have evidence documenting its Extreme Cold Weather Temperature calculation, including the calculation date, source(s) of temperature data, and adjustments utilized for missing or invalid hourly temperature data, and design information, operating data, or engineering analysis that supports its generating unit minimum temperature.

R2. Applicable to generating units ~~which~~that begin commercial operation[1] on or after October 1, 2027: Each Generator Owner, for each generating unit that has a calculated Extreme Cold Weather Temperature at or below 32 degrees Fahrenheit (zero degrees Celsius) as determined in Requirement R1, and that self-commits or is required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius),[2] shall: [*Violation Risk Factor: Medium*] [*Time Horizon: Long-term Planning, Operations Planning*]

2.1 For generating units for which the Generator Owner first contractually committed to design criteria[3] relevant to this Requirement before ~~February 16~~June 29, 2023[4]:

- Implement freeze protection measures to protect Generator Cold Weather Critical Components that provide the capability to operate at the generating unit(s)' Extreme Cold Weather Temperature with sustained concurrent twenty (20) mph (32 km/h) wind speed for (i) a period of not less than twelve (12) continuous hours, or (ii) the maximum operational duration for intermittent energy resources if less than twelve (12) continuous hours; or

- ~~Have~~Develop, implement, and complete by April 1, 2028, a Corrective Action Plan~~(s) in place (to include any applicable Generator Cold Weather Constraint(s) upon beginning commercial operation,~~ to add new or modify existing or previously planned freeze protection measures to provide the capability to operate at the generating unit(s)' Extreme Cold Weather Temperature with a sustained concurrent twenty (20) mph (32 km/h) wind speed for (i) a period of not less than twelve (12) continuous hours, or (ii) the maximum operational duration for intermittent energy resources if less than twelve (12) continuous hours~~.~~; or

- Document in a declaration, with justification, if applicable, a Generator Cold Weather Constraint in accordance with Requirement R8.

[1] Commercial operation means achievement of this designation indicating that the facility has received all approvals necessary for operation after completion of initial start-up testing.

[2] Generating unit(s) that do not self-commit or are not required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), but may be called upon to operate in order to assist in the mitigation of BES Emergencies, Capacity Emergencies, or Energy Emergencies during periods at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), are exempt from this requirement.

[3] Such commitments would be demonstrated by signed contractual commitments, ~~emailed correspondence agreeing to thermal design criteria,~~ or other similar documented evidence.

[4] ~~Or~~In non-U.S. jurisdictions, use the date ~~the definition of Extreme Cold Weather Temperature was~~ approved by the applicable government authority in the relevant jurisdiction.

2.2 For generating units for which the Generator Owner first contractually committed to design criteria[5] relevant to this Requirement on or after ~~February 16~~June 29, 2023[6]:

- Implement freeze protection measures to protect Generator Cold Weather Critical Components that provide the capability to operate at the generating unit(s)' Extreme Cold Weather Temperature with sustained concurrent twenty (20) mph (32 km/h) wind speed for (i) a period of not less than twelve (12) continuous hours, or (ii) the maximum operational duration for intermittent energy resources if less than twelve (12) continuous hours; or
- Document in a declaration, with justification, ~~as~~if applicable, a Generator Cold Weather Constraint in accordance with Requirement R8.

M2. Each Generator Owner will have dated evidence that demonstrates it has freeze protection measures for its generating unit(s) in accordance with R2, or it has developed, implemented, and completed by April 1, 2028, a Corrective Action Plan, or it has declared a Generator Cold Weather Constraint for the identified issues. Acceptable evidence may include the following (electronic or hardcopy format): Identification of generating unit(s) minimum temperature under Requirement R1 Part 1.2.2 which is equal to or less than the generating unit's Extreme Cold Weather Temperature, documentation of freeze protection measures, Corrective Action Plan(s) (if applicable), and Generator Cold Weather Constraints (if applicable).

R3. Applicable to generating unit(s) in commercial operation prior to October 1, 2027: Each Generator Owner, for each generating unit that has a calculated Extreme Cold Weather Temperature at or below 32 degrees Fahrenheit (zero degrees Celsius) as determined in Requirement R1, and that self-commits or is required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius),[7] shall: [*Violation Risk Factor: Medium*] [*Time Horizon: Long-term Planning, Operations Planning*]

- Implement freeze protection measures to protect Generator Cold Weather Critical Components that provide the capability to operate at the generating unit(s)' Extreme Cold Weather Temperature; or
- Develop a Corrective Action Plan to add new or modify existing freeze protection measures to provide the capability to operate at the generating unit(s)' Extreme Cold Weather Temperature.

---

[5] Such commitments would be demonstrated by signed contractual commitments, ~~emailed correspondence agreeing to thermal design criteria,~~ or other similar documented evidence.

[6] ~~Or~~In non-U.S. jurisdictions, use the date ~~the definition of Extreme Cold Weather Temperature was~~ approved by the applicable government authority in the relevant jurisdiction.

[7] Generating unit(s) that do not self-commit or are not required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), but may be called upon to operate in order to assist in the mitigation of BES Emergencies, Capacity Emergencies, or Energy Emergencies during periods at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), are exempt from this requirement.

M3. Each Generator Owner will have dated evidence that demonstrates it has freeze protection measures for its generating unit(s) in accordance with R3, or it has developed a Corrective Action Plan for the identified issues. Acceptable evidence may include, but is not limited to, the following (electronic or hardcopy format): Identification of generating unit(s) minimum temperature per Part 1.2.2 which is equal to or less than the unit's Extreme Cold Weather Temperature, documentation of freeze protection measures, and Corrective Action Plan(s).

R4. Each Generator Owner shall implement and maintain one or more cold weather preparedness plan(s) for its generating units. The cold weather preparedness plan(s) shall include the following, at a minimum: *[Violation Risk Factor: High] [Time Horizon: Operations Planning and Real-time Operations]*

4.1. The lowest calculated Extreme Cold Weather Temperature for each generating unit, as determined in Requirement R1;[8]

4.2. The generating unit cold weather data, as determined in Requirement ~~R1.2~~R1, Part 1.2;

4.3. Documentation identifying Generator Cold Weather Critical Components;

4.4. Documentation of freeze protection measures implemented on Generator Cold Weather Critical Components ~~which~~that includes measures used to reduce the cooling effects of wind determined necessary by the Generator Owner to protect against heat loss, and where applicable, the effects of freezing precipitation (e.g., sleet, snow, ice, and freezing rain); and

4.5. Annual inspection and maintenance of generating unit(s) freeze protection measures implemented on Generator Cold Weather Critical Components.

M4. Each Generator Owner will have evidence documenting that its cold weather preparedness plan(s) was implemented and maintained in accordance with Requirement R4. Examples of documentation to demonstrate a cold weather preparedness plan may include existing operating procedures, plans, checklists, or processes. Examples of documentation, to demonstrate inspections and maintenance have been completed, may include, but are not limited to, completed work order(s) from the Generator Owner's work management system and/or freeze protection checklists identifying the measures inspected and maintained for the Generator Cold Weather Critical Components.

R5. Each Generator Owner, in conjunction with its Generator Operator, shall identify the entity responsible for providing ~~the~~ generating unit-specific training, and that identified entity shall provide annual training to ~~its~~the maintenance ~~or~~and operations personnel, as applicable, responsible for implementing the cold weather

[8] Generator Owners shall include the lowest calculated Extreme Cold Weather Temperature for the unit, even where subsequent periodic re-calculations under Requirement R1 Part 1.1 cause an increase in the Extreme Cold Weather Temperature.

preparedness plan(s) developed pursuant to Requirement R4. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning, Operations Planning]*

M5. Each Generator Operator or Generator Owner will have documented evidence that the applicable personnel completed annual training of the Generator Owner's cold weather preparedness plan(s). This evidence may include, but is not limited to, documents such as personnel training records, training materials, date of training, agendas or learning objectives, attendance at pre-work briefings, review of work order tasks, tailboards, attendance logs for classroom training, and completion records for computer-based training in fulfillment of Requirement R5.

R6. Each Generator Owner shall, ~~for each~~when experiencing a Generator Cold Weather Reliability Event at a generating unit that has a calculated Extreme Cold Weather Temperature at or below 32 degrees Fahrenheit (zero degrees Celsius) as determined in Requirement R1 and that self-commits or is required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius),[9] develop and implement[10] a Corrective Action Plan ~~when the generating unit experiences a Generator Cold Weather Reliability Event. The Corrective Action Plan shall be developed before the first day of July, but not more than 150 days after the Generator Cold Weather Reliability Event. The Generator Owner shall~~(s) to address identified issues as follows: *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

6.1. The Generator Owner shall develop a Corrective Action Plan for the generating unit experiencing a Generator Cold Weather Reliability Event.

6.2. The Generator Owner shall conduct a review of the applicability of the corrective actions from the Corrective Action Plan developed under Part 6.1 to freeze protection measures on similar equipment at other generating unit(s) owned by the Generator Owner and, if corrective actions are applicable, develop or update a Corrective Action Plan no later than 12 calendar months following the Generator Cold Weather Reliability Event to address the other unit(s).

~~**6.1.** Ensure the~~**6.3.** For each Corrective Action Plan ~~contains~~, the Generator Owner shall include at a minimum:

~~**6.1.1**~~**6.3.1.** A summary of the identified cause(s) ~~for~~of the Generator Cold Weather Reliability Event, where applicable, and any relevant associated data;

[9] Generating unit(s) that do not self-commit or are not required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), but may be called upon to operate in order to assist in the mitigation of BES Emergencies, Capacity Emergencies, or Energy Emergencies during periods at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), are exempt from this requirement.

[10] If a Generator Owner has previously experienced a Generator Cold Weather Reliability Event and developed a Corrective Action Plan for the generating unit under Requirement R6 Parts 6.1 or 6.2, the Generator Owner may review and update its existing plan(s) in lieu of developing a new plan.

~~6.1.2~~6.3.2. A list of actions to add new freeze protection measures or remedy issues with existing freeze protection measures;

~~6.1.3~~6.3.3. An identification of operating limitations on the generating unit(s), or impacts to the cold weather preparedness plan, if any, that would apply until ~~execution~~implementation of the corrective action(s) identified in the Corrective Action Plan is completed;

~~6.1.4~~6.3.4. A description of the updates to the cold weather preparedness plan required under Requirement R4 to identify updates or additions to the Generator Cold Weather Critical Components and their freeze protection measures, if required; and

~~6.1.5~~6.3.5. A timetable specifying that implementation of the Corrective Action Plan(s) shall be completed as follows:

6.3.5.1. For the generating unit experiencing the Generator Cold Weather Reliability Event, prior to the first day of the first December following the Generator Cold Weather Reliability Event[10]~~; and~~.[11]

~~**6.1.6.** A review of applicability to similar equipment freeze protection measures at~~**6.3.5.2.** For other generating ~~units~~unit(s) owned by the Generator Owner, ~~with a specified timetable for corrective actions to be completed~~ within 24 calendar months of the Generator Cold Weather Reliability Event~~;~~.

~~**6.2.** Update the~~**6.4** If a Generator Owner determines it will be unable to complete one or more of the actions in a Corrective Action Plan ~~action(s) and timetable(s), with justification, and~~in accordance with the timetables specified in Requirement R6 Part 6.3.5 due to circumstances beyond its control, the Generator Owner shall submit a Corrective Action Plan extension request to the Compliance Enforcement Authority (CEA)[11] for approval ~~where the timetable(s) for completing selected actions are projected to exceed the timelines in Part 6.1~~. The submitted Corrective Action Plan extension request shall include the following~~;~~ :

~~**6.2.1.** Circumstances~~**6.4.1.** An explanation of the circumstances causing the delay and ~~how~~why those circumstances are beyond the control of the Generator Owner;

~~[10] For events that occur early in the season, such as in October or November, the timetable shall specify completion prior to December 1 of the next calendar year.~~

[11] For events that occur early in the season, such as in October or November, the timetable shall specify completion prior to December 1 of the next calendar year.

~~[11] Extension requests will be received and evaluated in accordance with the NERC process. The extension requests for a non-US Registered Entity should be implemented in a manner that is consistent with, or under the direction of, the applicable governmental authority or its agency in the non-US jurisdiction.~~

~~6.2.2~~6.4.2. Revisions to the selected actions in Part ~~6.1~~6.3.2, if any, including utilization of ~~Operating Procedures~~operating procedures, if applicable; and

~~6.2.3~~6.4.3. Updated timetable for implementing the selected actions in Part ~~6.1~~6.3.2.

~~**6.3.** Document~~**6.5** The Generator Owner shall document in a declaration, with justification, if applicable, any Generator Cold Weather Constraint in accordance with Requirement R8, ~~if~~as applicable~~, that precludes the Generator Owner from implementing selected action(s) contained within the Corrective Action Plan~~.

M6. Each Generator Owner will have ~~documented~~dated evidence that it developed and implemented a Corrective Action Plan following a Cold Weather Reliability Event ~~at an~~for applicable unit(s) in accordance with Requirement R6. Acceptable evidence may include, but is not limited to, the following dated documentation (electronic or hardcopy format): Corrective Action Plan(s), ~~Generator Cold Weather Constraint(s),~~ completed work orders, copies of any Corrective Action Plan extension requests and supporting documentation, ~~and~~ updated cold weather preparedness plan(s) where indicated as needed by the Corrective Action Plan, and, where applicable, declared Generator Cold Weather Constraint(s).

R7. Each Generator Owner~~, for each~~ that is required to develop a Corrective Action Plan ~~developed pursuant to~~under Requirements R1~~, R2,~~ or R3 shall~~, as applicable~~ develop and implement the Corrective Action Plan in accordance with the following: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

7.1. ~~Include a timetable for implementing the selected corrective action(s) that shall~~For each Corrective Action Plan, the Generator Owner shall include at a minimum the following:

7.1.1. A list of any actions that require new freeze protection measures, with a timetable specifying completion of such measures within 48 calendar months of completing development of the Corrective Action Plan;

~~**7.1.1.** List the action(s) which~~**7.1.2.** A list of any actions that remedy~~(ies)~~ issues with existing freeze protection measures~~, if any, to be completed~~ with a timetable specifying completion of such measures within 24 calendar months of completing development of the Corrective Action Plan~~,~~ (regardless of any longer timelines in the Corrective Action Plan associated with new freeze protection measures);

~~**7.1.2.** List the action(s) which require(s) new freeze protection measures, if any, to be completed within 48 calendar months of completing development of the Corrective Action Plan; and~~

7.1.3. ~~Describe the~~A description of updates to the cold weather preparedness plan required under Requirement R4 to identify the updates or additions

to the Generator Cold Weather Critical Components and their freeze protection measures~~.~~; and

7.1.4. An identification of operating limitations on the generating unit(s), or impacts to the cold weather preparedness plan, if any, that would apply until implementation of the corrective action(s) identified in the Corrective Action Plan is completed.

7.2. ~~Complete all~~If a Generator Owner determines it will be unable to complete one or more of the actions ~~described in the~~in a Corrective Action Plan in accordance with the ~~specified~~ timetables ~~in~~specified in Requirement R7 Part 7.1~~;~~

due to circumstances beyond its control, the Generator Owner shall submit ~~**7.3.** Submit~~ a Corrective Action Plan extension request~~, for the approval of the CEA[12], where the timetable(s) for completing selected actions are projected to exceed the timelines in Part 7.1~~ to the CEA for approval. The submitted Corrective Action Plan extension request shall include the following:

~~**7.**3.1 Explain the~~**7.2.1.** An explanation of the circumstances causing the delay and how those circumstances are beyond the control of the Generator Owner;

~~**7.**3.2 Include, as applicable, revisions~~**7.2.2.** Revisions to the selected actions in ~~Part~~Parts 7.1, if any, including utilization of ~~Operating Procedures~~operating procedures, if applicable; and

~~**7.**3.3 Include an updated~~**7.2.3.** Updated timetable for implementing the selected actions in Part 7.1.

~~**7.4.** Document in a declaration, with justification, any Generator Cold Weather Constraint in accordance with Requirement R8 that precludes the Generator Owner from implementing selected action(s) contained within the Corrective Action Plan.~~

7.3. The Generator Owner shall document in a declaration, with justification, if applicable, any Generator Cold Weather Constraint in accordance with Requirement R8.

M7. Each Generator Owner shall have dated evidence that ~~demonstrates it~~it developed and implemented ~~each~~a Corrective Action Plan~~, including updating actions or timetables, or has explained in a declaration why corrective actions are not being implemented~~ for applicable unit(s) in accordance with Requirement R7. Acceptable evidence may include, but is not limited to, the following dated documentation (electronic or hardcopy format): ~~records that document the implementation of each~~ Corrective Action Plan~~ and the completion of actions for each Corrective Action Plan~~

~~[12] Extension requests will be received and evaluated in accordance with the NERC process. The extension requests for a non-US Registered Entity should be implemented in a manner that is consistent with, or under the direction of, the applicable governmental authority or its agency in the non-US jurisdiction.~~

~~including revision history of each Corrective Action Plan, documentation from the Compliance Enforcement Authority indicating that a Corrective Action Plan extension request was granted and, if applicable, justification to support any changes to corrective action(s) identified in the Corrective Action Plan or~~(s), completed work orders, copies of any Corrective Action Plan extension requests ~~when timetables exceeding the timelines in Requirement R7 Part 7.1. For each Corrective Action Plan applying to multiple generating units, the timetable shall reflect implementation at each unit addressed in~~and supporting documentation, updated cold weather preparedness plan(s) where indicated as needed by the Corrective Action Plan~~. Evidence may also include work management program records, work orders, and maintenance records. Any declaration shall contain dated documentation to support constraints identified by the Generator Owner.~~, and, where applicable, declared Generator Cold Weather Constraints.

R8. Each Generator Owner that declares a Generator Cold Weather Constraint in accordance with Attachment 1 shall: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

8.1. Submit its Generator Cold Weather Constraint declaration(s) to the CEA ~~within 45 days of determining that the Generator Cold Weather Constraint is applicable.~~ as follows:

- For Generator Cold Weather Constraints determined in accordance with Requirement R2 for generating unit(s) upon beginning commercial operation, submit ~~the Generator Cold Weather Constraint declaration(s) no later than~~within 15 calendar days after commercial operation; or
- ~~**8.2.** Review any~~For all other Generator Cold Weather Constraints, submit within 45 calendar days of determining that the Generator Cold Weather Constraint ~~declaration validated by the CEA every 24 calendar months to determine if it remains valid under Attachment 1;~~is applicable.

~~**8.3**~~**8.2.** Update the operating limitations ~~associated with capability and availability~~ under Requirement R1 Part R1.2 if applicable; and

~~**8.4**~~**8.3.** If the CEA determines the declared Generator Cold Weather Constraint is invalid, update its Corrective Action Plan(s) to require corrective actions be completed in accordance with ~~the timetables in~~ Requirement R6 ~~Part 6.1~~ or Requirement R7~~ Part 7.1, to begin from the date the Generator Owner is notified that the Generator Cold Weather Constraint is invalid.~~, as applicable, subject to any extensions approved by the CEA or implement freeze protection measures to provide the necessary capability in accordance with Requirement R2.

M8. Each Generator Owner shall have dated evidence that demonstrates it performed the actions in accordance with Requirement R8. Acceptable evidence may include, but is not limited to, the following dated documentation (electronic or hardcopy format): a copy of the Generator Cold Weather Constraint declaration, evidence the declaration was provided to the Compliance Enforcement Authority in accordance with the

specified timeframe, records that document update(s) to the operating limitations, as needed, and updated Corrective Action Plan(s), if applicable.

R9. The Generator Owner shall review each Generator Cold Weather Constraint declaration validated by the CEA at least once every 36 calendar months to determine if it remains valid in accordance with Attachment 1. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

~~M8~~M9. Each Generator Owner shall have dated evidence that demonstrates it ~~performed the actions~~reviewed Generator Cold Weather Constraints in accordance with Requirement ~~R8~~R9. Acceptable evidence may include, but is not limited to, the following dated documentation (electronic or hardcopy format): records that document the performance of the review ~~and update to the operating limitations, as needed~~within the required timeframe.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation.

- The Generator Owner shall retain data or evidence to support its current Extreme Cold Weather Temperature calculation and generating unit cold weather data, plus each calculation or revision since the last audit, for Requirement R1 and Measure M1.
- The Generator Owner shall keep data or evidence to show compliance for three years, or until any Corrective Action Plan under Requirement R2 or R3 is complete, whichever timeframe is greater, for Requirements R2 and R3 and Measures M2 and M3. Generator Cold Weather Constraint data or evidence shall be retained until no longer valid.
- The Generator Owner shall retain the current cold weather preparedness plan(s), as evidence of review or revision history, plus each version issued since the last audit and evidence of compliance since the last audit for Requirement R4 and Measure M4.
- The Generator Owner or Generator Operator shall keep data or evidence to show compliance for three years for Requirement R5 and Measure M5.
- The Generator Owner shall keep data or evidence to show compliance for three years, or until any Corrective Action Plan, including extensions (if applicable), under Requirement R6 is complete, whichever timeframe is greater, for Requirement R6 and Measure M6. Generator Cold Weather Constraint data or evidence shall be retained until no longer valid.
- The Generator Owner shall keep data or evidence to show compliance for three years, or until any Corrective Action Plan, including extension (if applicable), under Requirement R7 is complete, whichever ~~time frame~~time-

frame is greater, for Requirement R7 and Measure M7. Generator Cold Weather Constraint data or evidence shall be retained until no longer valid.

- The Generator Owner shall maintain data or evidence to support its current Generator Cold Weather Constraint declaration(s), plus each revision since the last audit, for Requirement R8 and Measure M8.

~~**Compliance Monitoring and Enforcement Program:** As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.~~

- The Generator Owner shall maintain data or evidence to support that it reviewed each Generator Cold Weather Constraint declaration validated by the Compliance Enforcement Authority at least once every 36 calendar months since the last audit, for Requirement R9 and Measure M9.

1.3. "Compliance Monitoring Enforcement Program" or "CMEP" means, depending on the context (1) the NERC Compliance Monitoring and Enforcement Program (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for performing compliance monitoring and enforcement activities with respect to Registered Entities' compliance with Reliability Standards.

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	The Generator Owner did not calculate the Extreme Cold Weather Temperature ~~and~~or identify generating unit(s) cold weather data in accordance with Requirement R1 for 5% or less of its applicable units.	The Generator Owner did not calculate the Extreme Cold Weather Temperature ~~and~~or identify generating unit(s) cold weather data in accordance with Requirement R1 for more than 5%, but less than or equal to 10% of its applicable units.	The Generator Owner did not calculate the Extreme Cold Weather Temperature ~~and~~or identify generating unit(s) cold weather data in accordance with Requirement R1 for more than 10%, but less than or equal to 20% of its applicable units.	The Generator Owner did not calculate the Extreme Cold Weather Temperature ~~and~~or identify generating unit(s) cold weather data in accordance with Requirement R1 for more than 20% of its applicable units.
R2.	The Generator Owner did not have freeze protection measure(s) for its applicable unit(s) meeting the criteria in Requirement R2 for 5% or less of its applicable units. OR The Generator Owner did not ~~have~~complete a Corrective Action Plan or declare a Generator Cold Weather Constraint (if applicable) to implement appropriate freeze protection measures for 5% or less of its applicable units.	The Generator Owner did not have freeze protection measure(s) for its applicable unit(s) meeting the criteria in Requirement R2 for more than 5%, but less than or equal to 10% of its applicable units. OR The Generator Owner did not ~~have~~complete a Corrective Action Plan or declare a Generator Cold Weather Constraint (if applicable) for more than 5%, but less than or equal to 10% of its applicable units.	The Generator Owner did not have freeze protection measure(s) meeting the criteria in Requirement R2 for more than 10%, but less than or equal to 20% of its applicable units. OR The Generator Owner did not ~~have~~complete a Corrective Action Plan or declare a Generator Cold Weather Constraint (if applicable) for more than 10%, but less than or equal to 20% of its applicable units.	The Generator Owner did not have freeze protection measure(s) meeting the criteria in Requirement R2 for more than 20% of its applicable units. OR The Generator Owner did not ~~have~~complete a Corrective Action Plan or declare a Generator Cold Weather Constraint (if applicable) for more than 20% of its applicable units.

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R3.	The Generator Owner did not have freeze protection measure(s) meeting the criteria in Requirement R3 for 5% or less of its applicable units. OR The Generator Owner did not develop a Corrective Action Plan as required by Requirement R3 for 5% or less of its applicable units.	The Generator Owner did not have freeze protection measure(s) meeting the criteria in Requirement R3 for more than 5%, but less than or equal to 10% of its applicable units. OR The Generator Owner did not develop a Corrective Action Plan as required by Requirement R3 for more than 5%, but less than or equal to 10% of its applicable units.	The Generator Owner did not have freeze protection measure(s) meeting the criteria in Requirement R3 for more than 10%, but less than or equal to 20% of its applicable units. OR The Generator Owner did not develop a Corrective Action Plan as required by Requirement R3 for more than 10%, but less than or equal to 20% of its applicable units.	The Generator Owner did not have freeze protection measure(s) meeting the criteria in Requirement R3 for more than 20% of its applicable units. OR The Generator Owner did not develop a Corrective Action Plan as required by Requirement R3 for more than 20% of its applicable units.
R4.	The Generator Owner ~~created~~ implemented a cold weather preparedness plan(s) but failed to maintain it.	The Generator Owner's cold weather preparedness plan failed to include one of the applicable Parts within Requirement R4.	The Generator Owner ~~had and~~ maintained a cold weather preparedness plan(s) but failed to implement it. OR The Generator Owner's cold weather preparedness plan failed to include two of the applicable requirement parts within Requirement R4.	The Generator Owner does not have a cold weather preparedness plan(s). OR The Generator Owner's cold weather preparedness plan failed to include three or more of the applicable requirement parts within Requirement R4.
R5.	The Generator Owner or Generator Operator failed to	The Generator Owner or Generator Operator failed to	The Generator Owner or Generator Operator failed to	The Generator Owner or Generator Operator failed to

Implementation Plan

Calculating Extreme Cold Weather Temperature

EOP-012-3 Technical Rationale

Generator Cold Weather CAP Extension and Constraint Process

Attachment 1

Generator Owners shall determine the applicability of a Generator Cold Weather Constraint declared under Requirements R2, R6, and R7 using the criteria as described below.

~~A~~The definition of a Generator Cold Weather Constraint is ~~any~~: "Any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components ~~using the following criteria:~~. Freeze protection measures include practices, methods, or technologies implemented by the electric industry in areas that experience similar winter climate conditions and are not intended to be limited to optimum practices, methods, or technologies".

A Generator Cold Weather Constraint can be identified using the following criteria:

~~Pre-Approved~~Known Generator Cold Weather Constraints

The following are circumstances which, if present and confirmed as valid by the ~~Compliance Enforcement Authority~~CEA, will constitute Generator Cold Weather Constraints:

- ~~Wind~~Individual wind turbine towers manufactured~~-~~ prior to October 1, 2027 that have structural limitations established by Original Equipment Manufacturers (OEMs) based on a minimum temperature that is higher than the Extreme Cold Weather Temperature calculated per Requirement R1 for generating units that began commercial operation prior to October 1, 2027.
- ~~Heat~~Implementation of heat tracing or other ~~de-icing~~de-icing technologies for wind turbine blades, that ~~are not~~, through analysis, have been shown to not be effective or not made available ~~in~~by the ~~Generator Owner's location~~OEM for generating units of a comparable types in regions that experience similar winter climate conditions.
- Replacing existing wind turbine blades with new blades solely for the purpose of adding de-icing or ice-minimizing capabilities.
- ~~Applying heat to remove~~Removal of accumulated frozen precipitation on solar panels.
- Applying heat upstream of inlet air filters to prevent the buildup of frozen precipitation on combustion turbine inlet air filters.

Case-by-case Determinations of Generator Cold Weather Constraints

The following situations may constitute a Generator Cold Weather Constraint, depending on the facts and circumstances. Only upon approval by the ~~Compliance Enforcement Authority~~CEA will these circumstances ~~comprise~~constitute a valid Generator Cold Weather Constraint:

1. The ~~application~~implementation of a specific freeze protection measure will void an equipment warranty.
2. The implementation of a specific freeze protection measure applied to address conditions beyond the manufacturer's design limitations.

~~2.~~3. The ~~application~~implementation of a specific freeze protection measure is precluded by technical or physical limitations. For example:

a. Installing wind breaks around a cooling tower or air-cooled heat exchanger ~~which~~that requires free airflow for its functionality;

b. ~~Applying~~Implementing freeze ~~control~~protection measures with size or weight that would require the structural re-design and re-construction of the protected equipment or its support system~~.~~;

c. Other similar circumstances as determined through operating experience or engineering analysis and supported with justification.

~~3.~~4. A determination, through an analysis, that the freeze protection measure has been shown to be ineffective or that there is no record that such a measure has been effectively utilized on generating unit(s) of comparable types in regions that experience similar winter climate conditions.

~~4.~~5. ~~The application~~A determination, through an analysis, that the implementation of a specific freeze protection measure or measures would adversely affect the reliability of the Bulk Power System to an extent that outweighs the reliability benefit of applying the freeze protection measure(s). For example:

a. The ~~application~~implementation of freeze protection measures, while feasible, would result in the accelerated premature retirement of an existing ~~dispatchable~~ generating unit with no acceptable replacement ~~currently~~ available within the accelerated timeframe;

~~The freeze protection measures would be applied to a generating unit that has a previously published retirement date within three years of the Generator Cold Weather Constraint declaration;~~

b. The ~~application~~implementation of freeze protection measures would cause the Generator Owner to cancel plans to finish the development of a new generating unit~~(s)~~;

c. The ~~application~~implementation of freeze protection measures would reduce the generating unit's ability to provide Real Power or Reactive Power by more than three percent, or another value supported by the appropriate functional entity (e.g., TP, RC, BA, etc.), when freeze protection measures are not in use; or

d. The ~~application~~implementation of freeze protection measures would reduce the summer net dependable capacity[12], or net dependable capacity at Peak Demand, of the generating unit by more than three percent~~.~~ or another value supported by the appropriate functional entity (e.g., TP, RC, BA, etc.);

e. Other similar circumstances as determined through operating experience or engineering analysis and supported with justification.

[12] "net dependable capacity" refers to the definition used for reporting to the NERC in Generating Availability Data System (GADS) appropriate for the generation type.

~~5.~~6. The implementation of new freeze protection measures to an existing generating unit that has previously communicated a retirement date to the appropriate functional entity (e.g., Transmission Planner (TP), Reliability Coordinator (RC), Balancing Authority (BA), etc.) that falls within three calendar years of the Generator Cold Weather Constraint declaration;

~~6.~~7. The ~~application~~implementation of a specific freeze protection measure would introduce the risk of noncompliance with other statutory, regulatory, or health and safety requirements or standards for which relief via waiver, exemption or other means of excused noncompliance is not available during extreme cold weather.

~~7.~~8. A determination through an analysis that the freeze protection measure is not available on the commercial market for generating units of comparable types in regions that experience similar winter climate conditions.

9. Implementation of freeze protection measures would not increase reliability of a generating unit due to technical or physical constraints on fuel supply which are not due to Fixed Fuel Supply Components, and which are outside the Generator Owner's control.

~~8.~~10. Other situations identified by the Generator Owner that may, based on the specific circumstances beyond the Generator Owner's control, limit its ability to apply freeze protection measures to Generator Cold Weather Critical Components.

When submitting a Generator Cold Weather Constraint declaration to the CEA per Requirement R8, the Generator Owner must include documentation that defends and supports the declared constraint and also describes other compensating or mitigating freeze protection measures, if applicable, that the Generator Owner will apply. An approved Generator Cold Weather Constraint declaration for any specific Generator Cold Weather Critical Component does not relieve the Generator Owner of its obligation to otherwise prepare its applicable generating unit(s) to meet the requirements of EOP-012-3.

Version History

Version	Date	Action	Change Tracking
1	October 1, 2022	Drafted by Project 2021-07	New
2	February 16, 2023	Revisions drafted by Project 2021-07 due to FERC Order and inquiry Recommendations.	Revisions
2	February 15,2024	Board Adopted	
2	June 27, 2024	FERC Approved	
3	October 17, 2024	Drafted by Project 2024-03	As directed by the June 2024 FERC Order

Standard Development Timeline

This section is maintained by the drafting team during the development of the standard and will be removed when the standard is adopted by the NERC Board of Trustees (Board).

Description of Current Draft

This is the second draft of the proposed standard for a formal 18-day comment and ballot period.

Completed Actions	Date
Standards Committee approved Standard Authorization Request (SAR) for posting	July 17, 2024
SAR posted for comment	July 18, 2024 – August 16, 2024
20-day formal comment period with initial ballot	October 17, 2024 – November 5, 2024

Anticipated Actions	Date
18-day formal comment period with additional ballot	December 3, 2024 – December 20, 2024
15-day formal comment period with additional ballot	January 29, 2025 – February 12, 2025
Board adoption	TBD

New or Modified Term(s) Used in NERC Reliability Standards

This section includes all new or modified terms used in the proposed standard that will be included in the *Glossary of Terms Used in NERC Reliability Standards* upon applicable regulatory approval. Terms used in the proposed standard that are already defined and are not being modified can be found in the *Glossary of Terms Used in NERC Reliability Standards*. The new or revised terms listed below will be presented for approval with the proposed standard. Upon Board adoption, this section will be removed.

Term(s):

Generator Cold Weather Constraint – Any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components. Freeze protection measures include practices, methods, or technologies implemented by the electric industry in areas that experience similar winter climate conditions and are not intended to be limited to optimum practices, methods, or technologies.

Previously Approved Terms

This section includes previously approved terms from EOP-012-1 and EOP-012-2. It is included to help with drafting and the posting of EOP-012-3.

Extreme Cold Weather Temperature – The temperature equal to the lowest 0.2 percentile of the hourly temperatures measured in December, January, and February from 01/01/2000 through the date the temperature is calculated.

Generator Cold Weather Critical Component – Any generating unit component or system, or associated Fixed Fuel Supply Component, that is under the Generator Owner's control, and is susceptible to freezing issues, the occurrence of which would likely lead to a Generator Cold Weather Reliability Event. This definition excludes any component or system or associated Fixed Fuel Supply Component located inside a permanent building with a heating source that regularly maintains the space at a temperature above 32 degrees Fahrenheit (0 degrees Celsius).

Fixed Fuel Supply Component – Non-mobile equipment that supports the reliable delivery of fuel to the generating unit and under the control of the Generator Owner at a plant site. Gaseous, liquid, or solid fuel handling components that are installed on site as fixed parts of the fuel delivery system that are under the Generator Owner's control are included. Mobile equipment such as trains, bulldozers, or other equipment that are not fixed in one location are excluded.

Generator Cold Weather Reliability Event – One of the following events for which the apparent cause(s) is due to freezing of equipment or impacts of freezing precipitation (e.g., sleet, snow, ice, and freezing rain) on equipment within the Generator Owner's control, and the dry bulb temperature at the time of the event was at or above the Extreme Cold Weather Temperature:

(1) a forced derate of more than 10% of the total capacity of the unit, but not less than 20 MWs for longer than four hours in duration;

(2) a start-up failure where the unit fails to synchronize within a specified start-up time; or

(3) a Forced Outage.

A. Introduction

1. **Title:** Extreme Cold Weather Preparedness and Operations

2. **Number:** EOP-012-~~2~~3

3. **Purpose:** To address the effects of operating in extreme cold weather by ensuring each Generator Owner has developed and implemented plan(s) to mitigate the reliability impacts of extreme cold weather on its applicable generating units.

4. **Applicability:**

   4.1. Functional Entities:

   4.1.1. Generator Owner

   4.1.2. Generator Operator

   4.2. Facilities:

   4.2.1. Bulk Electric System (BES) generating units. For purposes of this standard, the term "generating unit" subject to these requirements refers to the following Bulk Electric System (BES) resources:

   4.2.1.1. A Bulk Electric System generating resource identified in the BES definition, ~~inclusion~~Inclusion I2 and I4; or

   4.2.1.2. A Blackstart Resource, identified in the BES definition, ~~inclusion~~Inclusion I3.

5. **Effective Date:** See Implementation Plan for Project ~~2021-07 Phase 2~~2024-03.

B. Requirements and Measures

R1. At least once every five calendar years, each Generator Owner shall, for each of its applicable generating unit(s): [*Violation Risk Factor: Lower*] [*Time Horizon: Long-term Planning*]

1.1. Calculate the Extreme Cold Weather Temperature for each of its applicable generating unit(s) and identify the calculation date ~~and~~, source(s) of temperature data, and adjustments utilized for missing or invalid hourly temperature data, if necessary; and

1.1.1. If the ~~re-calculated~~recalculated Extreme Cold Weather Temperature is lower than the previous Extreme Cold Weather Temperature, the entity shall review and update its cold weather preparedness plan(s) under Requirement R4 within six (6) calendar months of the recalculation~~. If~~, and if new corrective actions are needed, to provide the required operational capability ~~under~~described in Requirement R2 or R3, the entity shall develop a Corrective Action Plan within six (6) calendar months of the recalculation.

1.2. Identify generating unit(s) cold weather data, to include:

1.2.1. Generating unit(s) operating limitations in cold weather to include:

1.2.1.1. Capability and availability;

1.2.1.2. Fuel supply and inventory concerns;

1.2.1.3. Start-up issues;

1.2.1.4. Fuel switching capabilities; and

1.2.1.5. Environmental constraints.

1.2.2. Generating unit(s) minimum:

- Design temperature, and if available, the concurrent wind speed and precipitation;
- Historical operating temperature at least one hour in duration, and if available, the concurrent wind speed and precipitation; or
- Current cold weather performance temperature determined by an engineering analysis, which includes the concurrent wind speed and precipitation.

M1. Each Generator Owner will have evidence documenting its Extreme Cold Weather Temperature calculation, including the calculation date, source(s) of temperature data, and adjustments utilized for missing or invalid hourly temperature data, and design information, operating data, or engineering analysis that supports its generating unit minimum temperature.

R2. Applicable to generating units ~~with a~~that begin commercial operation ~~date~~ [1] on or after October 1, 2027: Each Generator Owner, for each generating unit that has a calculated Extreme Cold Weather Temperature at or below 32 degrees Fahrenheit (zero degrees Celsius) as determined in Requirement R1, and that self-commits or is required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius),~~1~~[2] shall: [*Violation Risk Factor: Medium*] [*Time Horizon: Long-term Planning, Operations Planning*]

2.1 For generating units for which the Generator Owner first contractually committed to design criteria[3] relevant to this Requirement before June 29, 2023[4]:

- Implement freeze protection measures to protect Generator Cold Weather Critical Components that provide the capability to operate at the generating unit(s)' Extreme Cold Weather Temperature with sustained concurrent twenty (20) mph (32 km/h) wind speed for (i) a period of not less than twelve (12) continuous hours, or (ii) the maximum operational duration for intermittent energy resources if less than twelve (12) continuous hours; or
- Develop, implement, and complete by April 1, 2028, a Corrective Action Plan~~(s)~~ to add new or modify existing or previously planned freeze protection measures to provide the capability to operate at the generating unit(s)' Extreme Cold Weather Temperature with a sustained concurrent twenty (20) mph (32 km/h) wind speed for (i) a period of not less than twelve (12) continuous hours, or (ii) the maximum operational duration for intermittent energy resources if less than twelve (12) continuous hours~~.~~; or
- Document in a declaration, with justification, if applicable, a Generator Cold Weather Constraint in accordance with Requirement R8.

2.2 For generating units for which the Generator Owner first contractually committed to design criteria[5] relevant to this Requirement on or after June 29, 2023[6]:

- Implement freeze protection measures to protect Generator Cold Weather Critical Components that provide the capability to operate at the generating unit(s)' Extreme Cold Weather Temperature with sustained concurrent twenty

---

[1] Commercial operation means achievement of this designation indicating that the facility has received all approvals necessary for operation after completion of initial start-up testing.

~~1~~[2] Generating unit(s) that do not self-commit or are not required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), but may be called upon to operate in order to assist in the mitigation of BES Emergencies, Capacity Emergencies, or Energy Emergencies during periods at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), are exempt from this requirement.

[3] Such commitments would be demonstrated by signed contractual commitments, or other similar documented evidence.

[4] In non-U.S. jurisdictions, use the date approved by the applicable government authority in the relevant jurisdiction.

[5] Such commitments would be demonstrated by signed contractual commitments, or other similar documented evidence.

[6] In non-U.S. jurisdictions, use the date approved by the applicable government authority in the relevant jurisdiction.

(20) mph (32 km/h) wind speed for (i) a period of not less than twelve (12) continuous hours, or (ii) the maximum operational duration for intermittent energy resources if less than twelve (12) continuous hours; or

- Document in a declaration, with justification, if applicable, a Generator Cold Weather Constraint in accordance with Requirement R8.

M2. Each Generator Owner will have dated evidence that demonstrates it has freeze protection measures for its generating unit(s) in accordance with R2, or it has developed, implemented, and completed by April 1, 2028, a Corrective Action Plan, or it has declared a Generator Cold Weather Constraint for the identified issues. Acceptable evidence may include the following (electronic or hardcopy format): Identification of generating unit(s) minimum temperature under Requirement R1 Part 1.2.2 which is equal to or less than the generating unit's Extreme Cold Weather Temperature, documentation of freeze protection measures, ~~and~~ Corrective Action Plan(s) (if applicable), and Generator Cold Weather Constraints (if applicable).

R3. Applicable to generating unit(s) in commercial operation prior to October 1, 2027: Each Generator Owner, for each generating unit that has a calculated Extreme Cold Weather Temperature at or below 32 degrees Fahrenheit (zero degrees Celsius) as determined in Requirement R1, and that self-commits or is required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius),[~~2~~7] shall: [*Violation Risk Factor: Medium*] [*Time Horizon: Long-term Planning, Operations Planning*]

- Implement freeze protection measures to protect Generator Cold Weather Critical Components that provide the capability to operate at the generating unit(s)' Extreme Cold Weather Temperature; or
- Develop a Corrective Action Plan to add new or modify existing freeze protection measures to provide the capability to operate at the generating unit(s)' Extreme Cold Weather Temperature.

M3. Each Generator Owner will have dated evidence that demonstrates it has freeze protection measures for its generating unit(s) in accordance with R3, or it has developed a Corrective Action Plan for the identified issues. Acceptable evidence may include, but is not limited to, the following (electronic or hardcopy format): Identification of generating unit(s) minimum temperature per Part 1.2.2 which is equal to or less than the unit's Extreme Cold Weather Temperature, documentation of freeze protection measures, and Corrective Action Plan(s).

R4. Each Generator Owner shall implement and maintain one or more cold weather preparedness plan(s) for its generating units. The cold weather preparedness plan(s)

[~~2~~7] Generating unit(s) that do not self-commit or are not required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), but may be called upon to operate in order to assist in the mitigation of BES Emergencies, Capacity Emergencies, or Energy Emergencies during periods at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), are exempt from this requirement.

shall include the following, at a minimum: *[Violation Risk Factor: High] [Time Horizon: Operations Planning and Real-time Operations]*

4.1. The lowest calculated Extreme Cold Weather Temperature for each generating unit, as determined in Requirement R1;[38]

4.2. The generating unit cold weather data, as determined in Requirement ~~R1.2~~R1, Part 1.2;

4.3. Documentation identifying Generator Cold Weather Critical Components;

4.4. Documentation of freeze protection measures implemented on Generator Cold Weather Critical Components ~~which~~that includes measures used to reduce the cooling effects of wind determined necessary by the Generator Owner to protect against heat loss, and where applicable, the effects of freezing precipitation (e.g., sleet, snow, ice, and freezing rain); and

4.5. Annual inspection and maintenance of generating unit(s) freeze protection measures implemented on Generator Cold Weather Critical Components.

M4. Each Generator Owner will have evidence documenting that its cold weather preparedness plan(s) was implemented and maintained in accordance with Requirement R4. Examples of documentation to demonstrate a cold weather preparedness plan may include existing operating procedures, plans, checklists, or processes. Examples of documentation, to demonstrate inspections and maintenance have been completed, may include, but are not limited to, completed work order(s) from the Generator Owner's work management system and/or freeze protection checklists identifying the measures inspected and maintained for the Generator Cold Weather Critical Components.

R5. Each Generator Owner, in conjunction with its Generator Operator, shall identify the entity responsible for providing ~~the~~ generating unit-specific training, and that identified entity shall provide annual training to ~~its~~the maintenance ~~or~~and operations personnel, as applicable, responsible for implementing the cold weather preparedness plan(s) developed pursuant to Requirement R4. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning, Operations Planning]*

M5. Each Generator Operator or Generator Owner will have documented evidence that the applicable personnel completed annual training of the Generator Owner's cold weather preparedness plan(s). This evidence may include, but is not limited to, documents such as personnel training records, training materials, date of training, agendas or learning objectives, attendance at pre-work briefings, review of work order tasks, tailboards, attendance logs for classroom training, and completion records for computer-based training in fulfillment of Requirement R5.

---

[38] Generator Owners shall include the lowest calculated Extreme Cold Weather Temperature for the unit, even where subsequent periodic re-calculations under Requirement R1 Part 1.1 cause an increase in the Extreme Cold Weather Temperature.

R6. Each Generator Owner shall, ~~for each~~when experiencing a Generator Cold Weather Reliability Event at a generating unit that has a calculated Extreme Cold Weather Temperature at or below 32 degrees Fahrenheit (zero degrees Celsius) as determined in Requirement R1 and that self-commits or is required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius),[49] develop and implement[10] a Corrective Action Plan ~~when the generating unit experiences a Generator Cold Weather Reliability Event. The Corrective Action Plan shall be developed within 150 days or by July 1, whichever is earlier, and contain at a minimum~~(s) to address identified issues as follows: *[Violation Risk Factor: High] [Time Horizon: Long-term Planning]*

6.1. The Generator Owner shall develop a Corrective Action Plan for the generating unit experiencing a Generator Cold Weather Reliability Event.

6.2. The Generator Owner shall conduct a review of the applicability of the corrective actions from the Corrective Action Plan developed under Part 6.1 to freeze protection measures on similar equipment at other generating unit(s) owned by the Generator Owner and, if corrective actions are applicable, develop or update a Corrective Action Plan no later than 12 calendar months following the Generator Cold Weather Reliability Event to address the other unit(s).

6.3. For each Corrective Action Plan, the Generator Owner shall include at a minimum:

~~6.1~~6.3.1. A summary of the identified cause(s) ~~for~~of the Generator Cold Weather Reliability Event, where applicable, and any relevant associated data;

~~**6.2.** A review of applicability to similar equipment at generating units owned by the Generator Owner; and~~

6.3.2. A list of actions to add new freeze protection measures or remedy issues with existing freeze protection measures;

~~6.3~~6.3.3. An identification of operating limitations on the generating unit(s), or impacts to the cold weather preparedness plan, if any, that would apply until ~~execution~~implementation of the corrective action(s) identified in the Corrective Action Plan~~.~~ is completed;

6.3.4. A description of the updates to the cold weather preparedness plan required under Requirement R4 to identify updates or additions to the

[49] Generating unit(s) that do not self-commit or are not required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), but may be called upon to operate in order to assist in the mitigation of BES Emergencies, Capacity Emergencies, or Energy Emergencies during periods at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), are exempt from this requirement.

[10] If a Generator Owner has previously experienced a Generator Cold Weather Reliability Event and developed a Corrective Action Plan for the generating unit under Requirement R6 Parts 6.1 or 6.2, the Generator Owner may review and update its existing plan(s) in lieu of developing a new plan.

Generator Cold Weather Critical Components and their freeze protection measures, if required; and

6.3.5. A timetable specifying that implementation of the Corrective Action Plan(s) shall be completed as follows:

6.3.5.1. For the generating unit experiencing the Generator Cold Weather Reliability Event, prior to the first day of the first December following the Generator Cold Weather Reliability Event.[11]

6.3.5.2. For other generating unit(s) owned by the Generator Owner, within 24 calendar months of the Generator Cold Weather Reliability Event.

6.4 If a Generator Owner determines it will be unable to complete one or more of the actions in a Corrective Action Plan in accordance with the timetables specified in Requirement R6 Part 6.3.5 due to circumstances beyond its control, the Generator Owner shall submit a Corrective Action Plan extension request to the Compliance Enforcement Authority (CEA) for approval. The submitted Corrective Action Plan extension request shall include the following:

6.4.1. An explanation of the circumstances causing the delay and why those circumstances are beyond the control of the Generator Owner;

6.4.2. Revisions to the selected actions in Part 6.3.2, if any, including utilization of operating procedures, if applicable; and

6.4.3. Updated timetable for implementing the selected actions in Part 6.3.2.

6.5 The Generator Owner shall document in a declaration, with justification, if applicable, any Generator Cold Weather Constraint in accordance with Requirement R8, as applicable.

M6. Each Generator Owner will have ~~documented~~dated evidence that it developed and implemented a Corrective Action Plan following a Cold Weather Reliability Event ~~at an~~for applicable unit(s) in accordance with Requirement R6. Acceptable evidence may include, but is not limited to, the following dated documentation (electronic or hardcopy format): Corrective Action Plan(s) ~~and~~, completed work orders, copies of any Corrective Action Plan extension requests and supporting documentation, updated cold weather preparedness plan(s) where indicated as needed by the Corrective Action Plan, and, where applicable, declared Generator Cold Weather Constraint(s).

R7. Each Generator Owner~~, for each~~ that is required to develop a Corrective Action Plan ~~developed pursuant to~~under Requirements R1~~, R2,~~ or R3~~, or R6, shall~~ shall develop and implement the Corrective Action Plan in accordance with the following: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

[11] For events that occur early in the season, such as in October or November, the timetable shall specify completion prior to December 1 of the next calendar year.

7.1. ~~Include a timetable for implementing the selected corrective action(s) that shall~~For each Corrective Action Plan, the Generator Owner shall include at a minimum the following:

7.1.1. ~~List the action(s) which address(es) existing equipment or~~A list of any actions that require new freeze protection measures, ~~if any, to be completed~~with a timetable specifying completion of such measures within ~~24~~48 calendar months of completing development of the Corrective Action Plan;

~~**7.1.2.** List the action(s) which require(s) new equipment or freeze protection measures, if any, to be completed within 48 calendar months of completing development of the Corrective Action Plan; and~~

7.1.2. A list of any actions that remedy issues with existing freeze protection measures with a timetable specifying completion of such measures within 24 calendar months of completing development of the Corrective Action Plan (regardless of any longer timelines in the Corrective Action Plan associated with new freeze protection measures);

7.1.3. ~~List the~~A description of updates to the cold weather preparedness plan required under Requirement R4 to identify the updates or additions to the Generator Cold Weather Critical Components and their freeze protection measures; and

~~**7.2.** Implement the Corrective Action Plan in accordance with the specified timetables in Requirement R7 Part 7.1;~~

~~**7.3.** Update the Corrective Action Plan action(s) and timetable(s), with justification, if corrective action(s) change or timetable(s) exceed the timelines in Requirement R7 Part 7.1; and~~

7.1.4. An identification of operating limitations on the generating unit(s), or impacts to the cold weather preparedness plan, if any, that would apply until implementation of the corrective action(s) identified in the Corrective Action Plan is completed.

7.2. If a Generator Owner determines it will be unable to complete one or more of the actions in a Corrective Action Plan in accordance with the timetables specified in Requirement R7 Part 7.1 due to circumstances beyond its control, the Generator Owner shall submit a Corrective Action Plan extension request to the CEA for approval. The submitted Corrective Action Plan extension request shall include the following:

7.2.1. An explanation of the circumstances causing the delay and how those circumstances are beyond the control of the Generator Owner;

7.2.2. Revisions to the selected actions in Parts 7.1, if any, including utilization of operating procedures, if applicable; and

7.2.3. Updated timetable for implementing the selected actions in Part 7.1.

7.4. Document**7.3.** The Generator Owner shall document in a declaration, with justification, if applicable, any Generator Cold Weather Constraint that precludes the Generator Owner from implementing selected action(s) contained within the Corrective Action Planin accordance with Requirement R8.

M7. Each Generator Owner shall have dated evidence that demonstrates itit developed and implemented eachha Corrective Action Plan, including updating actions or timetables, or has explained in a declaration why corrective actions are not being implemented for applicable unit(s) in accordance with Requirement R8R7. Acceptable evidence may include, but is not limited to, the following dated documentation (electronic or hardcopy format): records that document the implementation of each Corrective Action Plan and the completion of actions for each(s), completed work orders, copies of any Corrective Action Plan including revision history of each Corrective Action Plan and, if applicable, justification to support any changes to corrective action(s) identified in the Corrective Action Plan or timetables exceeding the timelines in Requirement R7 Part 7.1. For each Corrective Action Plan applying to multiple generating units, the timetable shall reflect implementation at each unit addressed in the Corrective Action Plan. Evidence may also include work management program records, work orders, and maintenance records. Any declaration shall contain dated documentation to support constraints identified by the Generator Owner.extension requests and supporting documentation, updated cold weather preparedness plan(s) where indicated as needed by the Corrective Action Plan, and, where applicable, declared Generator Cold Weather Constraints.

R8. Each Generator Owner that createsdeclares a Generator Cold Weather Constraint declarationin accordance with Attachment 1 shall: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

8.1. Review theSubmit its Generator Cold Weather Constraint declaration at least every five calendar years or as needed when a change of status to the Generator Cold Weather Constraint occurs; and (s) to the CEA as follows:

- For Generator Cold Weather Constraints determined in accordance with Requirement R2 for generating unit(s) upon beginning commercial operation, submit within 15 calendar days after commercial operation; or
- For all other Generator Cold Weather Constraints, submit within 45 calendar days of determining that the Generator Cold Weather Constraint is applicable.

8.2. Update the operating limitations associated with capability and availability under Requirement R1 Part R1.2 if applicable.; and

8.3. If the CEA determines the declared Generator Cold Weather Constraint is invalid, update its Corrective Action Plan(s) to require corrective actions be completed in accordance with Requirement R6 or Requirement R7, as applicable, subject to

any extensions approved by the CEA or implement freeze protection measures to provide the necessary capability in accordance with Requirement R2.

M8. Each Generator Owner shall have dated evidence that demonstrates it performed the ~~review and updated operating limitations as needed~~actions in accordance with Requirement R8. Acceptable evidence may include, but is not limited to, the following dated documentation (electronic or hardcopy format): a copy of the Generator Cold Weather Constraint declaration, evidence the declaration was provided to the Compliance Enforcement Authority in accordance with the specified timeframe, records that document ~~the performance of the review and~~ update(s) to the operating limitations, as needed, and updated Corrective Action Plan(s), if applicable.

R9. The Generator Owner shall review each Generator Cold Weather Constraint declaration validated by the CEA at least once every 36 calendar months to determine if it remains valid in accordance with Attachment 1. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

M9. Each Generator Owner shall have dated evidence that demonstrates it reviewed Generator Cold Weather Constraints in accordance with Requirement R9. Acceptable evidence may include, but is not limited to, the following dated documentation (electronic or hardcopy format): records that document the performance of the review within the required timeframe.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority: "Compliance Enforcement Authority" (CEA) means NERC or the Regional Entity, or any entity as otherwise designated by an Applicable Governmental Authority, in their respective roles of monitoring and/or enforcing compliance with mandatory and enforceable Reliability Standards in their respective jurisdictions.

1.2. Evidence Retention: The following evidence retention period(s) identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the CEA may ask an entity to provide other evidence to show that it was compliant for the full-time period since the last audit.

The applicable entity shall keep data or evidence to show compliance as identified below unless directed by its CEA to retain specific evidence for a longer period of time as part of an investigation.

- The Generator Owner shall retain data or evidence to support its current Extreme Cold Weather Temperature calculation and generating unit cold weather data, plus each calculation or revision since the last audit, for Requirement R1 and Measure M1.
- The Generator Owner shall keep data or evidence to show compliance for three years, or until any Corrective Action Plan under Requirement R2 or R3 is complete, whichever timeframe is greater, for Requirements R2 and R3 and Measures M2 and M3. Generator Cold Weather Constraint data or evidence shall be retained until no longer valid.
- The Generator Owner shall retain the current cold weather preparedness plan(s), as evidence of review or revision history, plus each version issued since the last audit and evidence of compliance since the last audit for Requirement R4 and Measure M4.
- The Generator Owner or Generator Operator shall keep data or evidence to show compliance for three years for Requirement R5 and Measure M5.
- The Generator Owner shall keep data or evidence to show compliance for three years, or until any Corrective Action Plan, including extensions (if applicable), under Requirement R6 is complete, whichever timeframe is greater, for Requirement R6 and Measure M6. Generator Cold Weather Constraint data or evidence shall be retained until no longer valid.
- The Generator Owner shall keep data or evidence to show compliance for three years, or until any Corrective Action Plan, including extension (if applicable), under Requirement R7 is complete, whichever ~~time-frame~~time-

frame is greater, for Requirement R7 and Measure M7. Generator Cold Weather Constraint data or evidence shall be retained until no longer valid.

- The Generator Owner shall maintain data or evidence to support its current Generator Cold Weather Constraint declaration(s), plus each revision since the last audit, for Requirement R8 and Measure M8.
- The Generator Owner shall maintain data or evidence to support that it reviewed each Generator Cold Weather Constraint declaration validated by the Compliance Enforcement Authority at least once every 36 calendar months since the last audit, for Requirement R9 and Measure M9.

1.3. "Compliance Monitoring Enforcement Program" or "CMEP" means, depending on the context (1) the NERC Compliance Monitoring and Enforcement Program (Appendix 4C to the NERC Rules of Procedure) or the Commission-approved program of a Regional Entity, as applicable, or (2) the program, department or organization within NERC or a Regional Entity that is responsible for performing compliance monitoring and enforcement activities with respect to Registered Entities' compliance with Reliability Standards.

~~**Compliance Monitoring and Enforcement Program:** As defined in the NERC Rules of Procedure, "Compliance Monitoring and Enforcement Program" refers to the identification of the processes that will be used to evaluate data or information for the purpose of assessing performance or outcomes with the associated Reliability Standard.~~

Violation Severity Levels

R #	Violation Severity Levels			
	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1.	The Generator Owner did not calculate the Extreme Cold Weather Temperature ~~and~~or identify generating unit(s) cold weather data in accordance with Requirement R1 for 5% or less of its applicable units.	The Generator Owner did not calculate the Extreme Cold Weather Temperature ~~and~~or identify generating unit(s) cold weather data in accordance with Requirement R1 for more than 5%, but less than or equal to 10% of its applicable units.	The Generator Owner did not calculate the Extreme Cold Weather Temperature ~~and~~or identify generating unit(s) cold weather data in accordance with Requirement R1 for more than 10%, but less than or equal to 20% of its applicable units.	The Generator Owner did not calculate the Extreme Cold Weather Temperature ~~and~~or identify generating unit(s) cold weather data in accordance with Requirement R1 for more than 20% of its applicable units.
R2.	The Generator Owner did not have freeze protection measure(s) for its applicable unit(s) meeting the criteria in Requirement R2 for 5% or less of its applicable units. OR The Generator Owner did not ~~develop~~complete a Corrective Action Plan or declare a Generator Cold Weather Constraint (if applicable) to implement appropriate freeze protection measures for 5% or less of its applicable units.	The Generator Owner did not have freeze protection measure(s) for its applicable unit(s) meeting the criteria in Requirement R2 for more than 5%, but less than or equal to 10% of its applicable units. OR The Generator Owner did not ~~develop~~ complete a Corrective Action Plan or declare a Generator Cold Weather Constraint (if applicable) for more than 5%, but less than or equal to 10% of its applicable units.	The Generator Owner did not have freeze protection measure(s) meeting the criteria in Requirement R2 for more than 10%, but less than or equal to 20% of its applicable units. OR The Generator Owner did not ~~develop~~ complete a Corrective Action Plan or declare a Generator Cold Weather Constraint (if applicable) for more than 10%, but less than or equal to 20% of its applicable units.	The Generator Owner did not have freeze protection measure(s) meeting the criteria in Requirement R2 for more than 20% of its applicable units. OR The Generator Owner did not ~~develop~~ complete a Corrective Action Plan or declare a Generator Cold Weather Constraint (if applicable) for more than 20% of its applicable units.

R #	Violation Severity Levels

Implementation Plan

Calculating Extreme Cold Weather Temperature

EOP-012-3 Technical Rationale

Generator Cold Weather CAP Extension and Constraint Process

Attachment 1

Generator Owners shall determine the applicability of a Generator Cold Weather Constraint declared under Requirements R2, R6, and R7 using the criteria as described below.

The definition of a Generator Cold Weather Constraint is: "Any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components. Freeze protection measures include practices, methods, or technologies implemented by the electric industry in areas that experience similar winter climate conditions and are not intended to be limited to optimum practices, methods, or technologies".

A Generator Cold Weather Constraint can be identified using the following criteria:

Known Generator Cold Weather Constraints

The following are circumstances which, if present and confirmed as valid by the CEA, will constitute Generator Cold Weather Constraints:

- Individual wind turbine towers manufactured prior to October 1, 2027 that have structural limitations established by Original Equipment Manufacturers (OEMs) based on a minimum temperature that is higher than the Extreme Cold Weather Temperature calculated per Requirement R1 for generating units that began commercial operation prior to October 1, 2027.
- Implementation of heat tracing or other de-icing technologies for wind turbine blades, that, through analysis, have been shown to not be effective or not made available by the OEM for generating units of a comparable types in regions that experience similar winter climate conditions.
- Replacing existing wind turbine blades with new blades solely for the purpose of adding de-icing or ice-minimizing capabilities.
- Removal of accumulated frozen precipitation on solar panels.
- Applying heat upstream of inlet air filters to prevent the buildup of frozen precipitation on combustion turbine inlet air filters.

Case-by-case Determinations of Generator Cold Weather Constraints

The following situations may constitute a Generator Cold Weather Constraint, depending on the facts and circumstances. Only upon approval by the CEA will these circumstances constitute a valid Generator Cold Weather Constraint:

1. The implementation of a specific freeze protection measure will void an equipment warranty.
2. The implementation of a specific freeze protection measure applied to address conditions beyond the manufacturer's design limitations.
3. The implementation of a specific freeze protection measure is precluded by technical or physical limitations. For example:

a. Installing wind breaks around a cooling tower or air-cooled heat exchanger that requires free airflow for its functionality;
b. Implementing freeze protection measures with size or weight that would require the structural re-design and re-construction of the protected equipment or its support system;
c. Other similar circumstances as determined through operating experience or engineering analysis and supported with justification.

4. A determination, through an analysis, that the freeze protection measure has been shown to be ineffective or that there is no record that such a measure has been effectively utilized on generating unit(s) of comparable types in regions that experience similar winter climate conditions.
5. A determination, through an analysis, that the implementation of a specific freeze protection measure or measures would adversely affect the reliability of the Bulk Power System to an extent that outweighs the reliability benefit of applying the freeze protection measure(s). For example:
    a. The implementation of freeze protection measures, while feasible, would result in the accelerated premature retirement of an existing generating unit with no acceptable replacement available within the accelerated timeframe;
    b. The implementation of freeze protection measures would cause the Generator Owner to cancel plans to finish the development of a new generating unit;
    c. The implementation of freeze protection measures would reduce the generating unit's ability to provide Real Power or Reactive Power by more than three percent, or another value supported by the appropriate functional entity (e.g., TP, RC, BA, etc.), when freeze protection measures are not in use; or
    d. The implementation of freeze protection measures would reduce the summer net dependable capacity[12], or net dependable capacity at Peak Demand, of the generating unit by more than three percent or another value supported by the appropriate functional entity (e.g., TP, RC, BA, etc.);
    e. Other similar circumstances as determined through operating experience or engineering analysis and supported with justification.
6. The implementation of new freeze protection measures to an existing generating unit that has previously communicated a retirement date to the appropriate functional entity (e.g., Transmission Planner (TP), Reliability Coordinator (RC), Balancing Authority (BA), etc.) that falls within three calendar years of the Generator Cold Weather Constraint declaration;

[12] "net dependable capacity" refers to the definition used for reporting to the NERC in Generating Availability Data System (GADS) appropriate for the generation type.

7. The implementation of a specific freeze protection measure would introduce the risk of noncompliance with other statutory, regulatory, or health and safety requirements or standards for which relief via waiver, exemption or other means of excused noncompliance is not available during extreme cold weather.
8. A determination through an analysis that the freeze protection measure is not available on the commercial market for generating units of comparable types in regions that experience similar winter climate conditions.
9. Implementation of freeze protection measures would not increase reliability of a generating unit due to technical or physical constraints on fuel supply which are not due to Fixed Fuel Supply Components, and which are outside the Generator Owner's control.
10. Other situations identified by the Generator Owner that may, based on the specific circumstances beyond the Generator Owner's control, limit its ability to apply freeze protection measures to Generator Cold Weather Critical Components.

When submitting a Generator Cold Weather Constraint declaration to the CEA per Requirement R8, the Generator Owner must include documentation that defends and supports the declared constraint and also describes other compensating or mitigating freeze protection measures, if applicable, that the Generator Owner will apply. An approved Generator Cold Weather Constraint declaration for any specific Generator Cold Weather Critical Component does not relieve the Generator Owner of its obligation to otherwise prepare its applicable generating unit(s) to meet the requirements of EOP-012-3.

Background

The purpose of Project 2024-03 is to address the directives identified by FERC in its June 27, 2024 order approving Reliability Standard EOP-012-2 and directing further modifications. *N. Am. Elec. Reliability Corp.*, 187 FERC ¶ 61,204 (2024) (June 2024 Order), available here. In that order, FERC found that further improvements are needed to address ambiguous language and other reliability gaps/implementation issues in the standard and related definitions to fully address issues first raised in the Commission's February 2023 Order approving EOP-012-1. *See N. Am. Elec. Reliability Corp.*, 182 FERC ¶ 61,094, PP 3-11 (2023) (February 2023 Order); *reh'g denied*, 183 FERC ¶ 62,034, *order on reh'g*, 183 FERC ¶ 61,222 (2023). In the June 2024 Order, FERC directed that NERC submit the modifications within nine months of the date of the order, or by March 27, 2025.

Proposed EOP-012-3 Requirement R1 is an existing EOP-012-2 requirement that consolidated and clarified requirements for each Generator Owner to calculate the Extreme Cold Weather Temperature for its generating unit location(s) and identify generating unit cold weather data, and to review these calculations and data every five years. Proposed EOP-012-3 Requirement R4 and R5 continue the current requirements under EOP-012-2 (with minimal clarifications in Requirement R4), that all Generator Owners develop cold weather preparedness plans and that all Generator Owners or Generator Operators (as appropriate) conduct annual training on those plans. Proposed EOP-012-3 clarifies which generating unit(s) are subject to the winter operations capability requirements of the standard (Requirements R2 and R3). Proposed EOP-012-3 Requirement R6 provides clarification regarding responses to a Generator Cold Weather Reliability Event that may require Corrective Action Plans (CAPs). Proposed EOP-012-3 Requirement R7 specifies timelines for the completion of Corrective Action Plans, consistent with the February 2023 Order and FERC directives in its June 2024 Order. The drafting team crafted language to meet the concern of Generator Owners regarding

timelines for units under consideration or development. The language reflects FERC's concern regarding applicability of Corrective Action Plans to the correct Generator Owner. Proposed EOP-012-3 Requirement R9 requires Generator Owners to review constraint declarations at least every 36 calendar months, or as needed, when a change of status occurs and ensures operating limitations caused by the constraints are clearly identified. The revised *Glossary* term for Generator Cold Weather Constraint, and new Attachment 1 both clarify the circumstances under which Generator Owners may declare Generator Cold Weather Constraints.

For additional information on the FERC Order directives addressed in proposed Reliability Standard EOP-012-3, see the Consideration of Directives, available on the Project 2024-03 project page.

General Considerations

This implementation plan reflects past consideration that entities need time to develop, implement, and maintain cold weather plans; identify Generator Cold Weather Critical Components, and identify freeze protection measures. The implementation plan also considers the FERC directives regarding the need for an accelerated effective date of directed changes and abbreviated implementation periods for generator winterization measures. FERC has repeatedly expressed an urgency in completing cold weather Reliability Standards and having them implemented in a timely manner to address the risks cold weather events present to the reliability of the Bulk-Power System. FERC noted the five core directives to NERC in the June 2024 Order are not new issues, but rather targeted modifications necessary to fully address issues identified in FERC's prior February 2023 Order. *See* June 2024 Order at P 30.

In consideration of these factors, and to ensure entities have sufficient notice of their revised obligations under Reliability Standard EOP-012-3, the proposed implementation plan provides that the standard shall become effective on the later of October 1, 2025, which is the date Reliability Standard EOP-012-2 will be fully enforceable in the United States, or three months following regulatory approval.

The drafting team determined that later phased-in compliance dates were not necessary for the revised requirements in EOP-012-3, as the practical impact of implementing the proposed changes, in light of the regulatory history described above, is not expected to be significant:

- For revised Requirement R2, units further into design or construction have separate requirements from those units in the early phases of design: the units further along in the design/construction phase are allowed to develop, implement, and complete Corrective Action Plans to meet the more rigorous requirements for new generating units, whereas units in the early stages of design are expected to meet the more rigorous requirements unless a Generator Cold Weather Constraint applies. Additional time is not needed to implement this change.
- For revised Requirement R6, relating to Generator Cold Weather Reliability Events, the language reflects the FERC directives regarding Corrective Action Plans, Corrective

Action Plan extensions, and consideration of the applicability of corrective actions across a fleet for Generation Owners that had a generating unit(s) that experienced a Generator Cold Weather Reliability Event. Additional time to implement these changes is not needed, given the conditions in which a Corrective Action Plan may be needed for a Generator Cold Weather Reliability Event.

- For revised Requirement R7, the drafting team clarified the applicability of Corrective Action Plan requirements and provided Corrective Action Plan extension request language similar to that found in Reliability Standard TPL-007-4 to address the June 2024 Order. Additional guidance is provided below.

Additional guidance is provided to aid in the orderly implementation of the standard as entities transition from compliance with Reliability Standard EOP-012-2 to Reliability Standard EOP-012-3.

Effective Date

The effective dates for the proposed Reliability Standards are provided below. Where the drafting team identified or recognized the need for a longer implementation period for compliance with a particular section of a proposed Reliability Standard (i.e., an entire Requirement or a portion thereof), the additional time for compliance with that section is specified below. The phased-in compliance date for those particular sections represents the date that entities must be compliant with that particular section of the Reliability Standard, even where the Reliability Standard goes into effect at an earlier date.

EOP-012-3 and Definitions

Where approval by an applicable governmental authority is required, the standard and associated definitions shall become effective on the later of: (1) October 1, 2025; or (2) the first day of the first calendar quarter that is three (3) months after the effective date of the applicable governmental authority's order approving the standard, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is three (3) months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

Additional Implementation Information

EOP-012-3 Requirement R1

In the United States, entities were required to become compliant with Requirement R1 by the effective date of EOP-012-2 (October 1, 2024) in accordance with that implementation plan. Entities

shall perform their first periodic review under Reliability Standard EOP-012-3 Requirement R1 by no more than 60 months after the effective date of **EOP-012-2**.[1]

EOP-012-3 Requirement R2 – New Generating Units entering commercial operation on/after October 1, 2027

Entities shall become compliant with Requirement R2 no later than the commercial operations date for the applicable unit. Any Generator Cold Weather Constraint shall be submitted in accordance with the timeline provided in Requirement R8.

EOP-012-3 Requirement R3 – Existing and New Generating Units entering commercial operation before October 1, 2027

Entities beginning commercial operation after the effective date of EOP-012-3 shall become compliant with Requirement R3 no later than the commercial operations date for the applicable unit.

EOP-012-3 Requirement R8

Entities shall review all Generator Cold Weather Constraints previously declared under Reliability Standard EOP-012-2 for compliance with Reliability Standard EOP-012-3 Attachment 1 by the effective date. Each entity shall submit any previously declared Generator Cold Weather Constraints to the Compliance Enforcement Authority (CEA) no later than 45 days following the effective date of Reliability Standard EOP-012-3. Newly declared Generator Cold Weather Constraints shall be submitted in accordance with the timelines specified in Requirement R8.

EOP-012-3 Requirement R9

If applicable, entities shall review each Generator Cold Weather Constraint in accordance with Requirement R9 no later than 36 calendar months following validation by the Compliance Enforcement Authority.

Retirement Date of EOP-012-2

Reliability Standard EOP-012-2 shall be retired immediately prior to the effective date of Reliability Standard EOP-012-3 in the particular jurisdiction in which the revised standard is becoming effective.

[1] In jurisdictions where EOP-012-2 has not become effective, entities shall perform their first periodic review under Reliability Standard EOP-012-3 Requirement R1 by no later than five calendar years following the initial calculation of the Extreme Cold Weather Temperature, or as directed by the applicable governmental authority in the jurisdiction.

Background

The purpose of ~~this project~~Project 2024-03 is to address the directives identified by FERC in its June 27, 2024 order approving Reliability Standard EOP-012-2 and directing further modifications. *N. Am. Elec. Reliability Corp.*, 187 FERC ¶ 61,204 (2024) (June 2024 Order), available here. In that order, FERC found that further improvements are needed to address ambiguous language and other reliability gaps/implementation issues in the standard and related definitions to fully address issues first raised in the Commission's February 2023 Order approving EOP-012-1. ~~FERC directed that NERC submit the modifications within nine months of the date of the order, or by March 27, 2025.~~

~~**Project 2024-03**~~

~~Project 2024-03 is a project to address FERC directives in the June 2024 Order approving EOP-012-2. Proposed Reliability Standard EOP-012-3 revises the EOP-012-2 standard by providing and clarifying further improvements needed to be made to address ambiguous language and address other reliability gaps/implementation issues in the standard and related definitions to fully address issues first raised in the Commission's February 2023 Order approving EOP-012-1.~~ *See N. Am. Elec. Reliability Corp.*, 182 FERC ¶ 61,094, PP 3-11 (2023) (February 2023 Order); *reh'g denied*, 183 FERC ¶ 62,034, *order on reh'g*, 183 FERC ¶ 61,222 (2023). In the June 2024 Order ~~approving EOP-012-2~~, FERC directed that NERC submit the ~~directed~~ modifications within nine months of the date of the order, or by March 27, 2025.

Proposed EOP-012-3 Requirement R1 is an existing EOP-012-2 requirement that consolidated and clarified requirements for each Generator Owner to calculate the Extreme Cold Weather Temperature for its generating unit location(s) and identify generating unit cold weather data, and to review these calculations and data every five years. Proposed EOP-012-3 Requirement R4 and R5 continue the current requirements under EOP-012-2 (with minimal clarifications in Requirement R4),

that all Generator Owners develop cold weather preparedness plans and that all Generator Owners or Generator Operators (as appropriate) conduct annual training on those plans. Proposed EOP-012-3 clarifies which generating unit(s) are subject to the winter operations capability requirements of the standard (Requirements R2 and R3). Proposed EOP-012-3 Requirement R6 provides clarification regarding responses to a Generator Cold Weather Reliability Event that may require Corrective Action Plans (~~CAP~~CAPs). Proposed EOP-012-3 Requirement R7 specifies timelines for the completion of Corrective Action Plans, consistent with the February 2023 Order and FERC directives in ~~the~~its June 2024 ~~FERC~~ Order. The drafting team crafted language to meet the concern of Generator Owners regarding timelines for units under consideration or development. The language reflects FERC's concern regarding applicability of Corrective Action Plans to the correct Generator Owner. Proposed EOP-012-3 Requirement ~~R8~~R9 requires Generator Owners to review constraint declarations at least every ~~24~~36 calendar months, or as needed, when a change of status occurs and ensures operating limitations caused by the constraints are clearly identified. The revised *Glossary* term for Generator Cold Weather Constraint, and new Attachment 1~~, provides clarity to~~ both clarify the circumstances under which Generator Owners may declare Generator Cold Weather Constraints~~ and thus further clarifies the requirements of the standard~~.

For additional information on the FERC Order directives addressed in proposed Reliability Standard EOP-012-3, see the Consideration of Directives, available on the Project 2024-03 project page.

General Considerations

This implementation plan reflects past consideration that entities ~~needed~~need time to develop, implement, and maintain cold weather plans~~,~~; identify Generator Cold Weather Critical Components, and identify freeze protection measures. The implementation plan also considers the FERC directives regarding the need for an accelerated effective date of directed changes and abbreviated implementation periods for generator winterization measures. FERC has repeatedly expressed an urgency in completing cold weather Reliability Standards and having them implemented in a timely manner to address the risks ~~presented by~~ cold weather events ~~on~~present to the reliability of the Bulk-Power System. FERC noted the five core directives to NERC in the June 2024 Order are not new issues, but rather targeted modifications necessary to fully address issues identified in FERC's prior February 2023 Order. *See* June 2024 Order at P 30.

In consideration of these factors, and to ensure entities have sufficient notice of their revised obligations under Reliability Standard EOP-012-3, the proposed implementation plan provides that the standard shall become effective on the later of October 1, 2025, which is the date Reliability Standard EOP-012-2 will be fully enforceable in the United States, or three months following regulatory approval.

The drafting team determined that later phased-in compliance dates were not necessary for the revised requirements in EOP-012-3, as the practical impact of implementing the proposed changes, in light of the regulatory history described above, is not expected to be significant:

- For revised Requirement R2, units further into design or construction have separate requirements from those units in the early phases of design: the units further along in the design/construction phase are allowed to develop, implement, and complete Corrective Action Plans to meet the more rigorous requirements for new generating units, whereas units in the early stages of design are expected to meet the more rigorous requirements unless a Generator Cold Weather Constraint applies. Additional time is not needed to implement this change.
- For revised Requirement R6, relating to Generator Cold Weather Reliability Events, the language reflects the FERC directives regarding Corrective Action Plans, Corrective Action Plan extensions, and consideration of the applicability of ~~Corrective Action Plan~~ corrective actions across a fleet for Generation Owners that had a generating unit(s) that experienced a Generator Cold Weather Reliability Event. Additional time to implement these changes is not needed, given the conditions in which a Corrective Action Plan may be needed for a Generator Cold Weather Reliability Event.
- For revised Requirement R7, the drafting team clarified the applicability of Corrective Action Plan requirements and ~~implemented a~~provided Corrective Action Plan extension ~~process~~request language similar to that found in Reliability Standard TPL-007-4 to address the June 2024 Order. Additional guidance is provided below.

Additional guidance is provided to aid in the orderly implementation of the standard as entities transition from compliance with Reliability Standard EOP-012-2 to Reliability Standard EOP-012-3.

Effective Date

The effective dates for the proposed Reliability Standards are provided below. Where the drafting team identified or recognized the need for a longer implementation period for compliance with a particular section of a proposed Reliability Standard (i.e., an entire Requirement or a portion thereof), the additional time for compliance with that section is specified below. The phased-in compliance date for those particular sections represents the date that entities must be compliant with that particular section of the Reliability Standard, even where the Reliability Standard goes into effect at an earlier date.

EOP-012-3 and Definitions

Where approval by an applicable governmental authority is required, the standard and associated definitions shall become effective on the later of: (1) October 1, 2025; or (2) the first day of the first calendar quarter that is three (3) months after the effective date of the applicable governmental authority's order approving the standard, or as otherwise provided for by the applicable governmental authority.

Where approval by an applicable governmental authority is not required, the standard shall become effective on the first day of the first calendar quarter that is three (3) months after the date the standard is adopted by the NERC Board of Trustees, or as otherwise provided for in that jurisdiction.

~~Effective Date and Phased-In Compliance Dates~~ Additional Implementation Information

~~Compliance Date for~~ EOP-012-3 Requirement R1

~~Entities~~In the United States, entities were required to become compliant with Requirement R1 by the effective date of EOP-012-2 (October 1, 2024) in accordance with that implementation plan. Entities shall perform their first periodic review under Reliability Standard EOP-012-3 Requirement R1 by no more than 60 months after the effective date of **EOP-012-2**.[1]

~~Compliance Date for~~ EOP-012-3 Requirement R2 – New Generating Units entering commercial operation on/after October 1, 2027

Entities shall become compliant with Requirement R2 no later than the commercial operations date for the applicable unit. Any Generator Cold Weather Constraint shall be submitted in accordance with the timeline provided in Requirement R8.

~~Compliance Date for~~ EOP-012-3 Requirement R3 – Existing and New Generating Units entering commercial operation before October 1, 2027

Entities beginning commercial operation after the effective date of EOP-012-3 shall become compliant with Requirement R3 no later than the commercial operations date for the applicable unit.

~~Compliance Date for~~ EOP-012-3 Requirement ~~R6~~R8

~~Entities shall comply with Requirement R6 within the timeframes listed within the requirement if a Generator Cold Weather Reliability Event has occurred.~~

~~Compliance Date for EOP-012-3 Requirement R7~~

~~Entities shall comply with Requirement R7 within the timeframes listed within the requirement if a Corrective Action Plan is required.~~

~~Compliance Date for EOP-012-3 Requirement R8~~

~~Each entity~~Entities shall review all Generator Cold Weather Constraints previously declared under Reliability Standard EOP-012-2 for compliance with Reliability Standard EOP-012-3 Attachment 1 by the effective date. ~~The~~Each entity shall submit any previously declared Generator Cold Weather Constraints to the Compliance Enforcement Authority (CEA) no later than 45 days following the effective date of Reliability Standard EOP-012-3. Newly declared Generator Cold Weather Constraints shall be submitted in accordance with the timelines specified in Requirement R8.

EOP-012-3 Requirement R9

If applicable, entities shall review each Generator Cold Weather Constraint in accordance with Requirement R9 no later than 36 calendar months following validation by the Compliance Enforcement Authority.

[1] In jurisdictions where EOP-012-2 has not become effective, entities shall perform their first periodic review under Reliability Standard EOP-012-3 Requirement R1 by no later than five calendar years following the initial calculation of the Extreme Cold Weather Temperature, or as directed by the applicable governmental authority in the jurisdiction.

Retirement Date of EOP-012-2

Reliability Standard EOP-012-2 shall be retired immediately prior to the effective date of Reliability Standard EOP-012-3 in the particular jurisdiction in which the revised standard is becoming effective.

Technical Rationale

Project 2024-03 Revisions to EOP-012-2
Reliability Standard EOP-012-3 | December 2024

EOP-012-3 – Extreme Cold Weather Preparedness and Operations

Introduction

This document explains the technical rationale and justification for the proposed Reliability Standard EOP-012-3. It provides stakeholders and the ERO Enterprise with an understanding of the technology and technical requirements in the Reliability Standard. This Technical Rationale and Justification for EOP-012-3 is not a Reliability Standard and should not be considered mandatory and enforceable.

Background

From February 8 through February 20, 2021, extreme cold weather and precipitation caused large numbers of generating units to experience outages, derates or failures to start, resulting in energy and transmission emergencies (referred to as the "Event"). The total Event firm load shed was the largest controlled firm load shed event in U.S. history and was the third largest in quantity of outaged megawatts (MW) of load after the August 2003 Northeast blackout and the August 1996 West Coast blackout. The Event was most severe from February 15 through February 18, 2021, and it contributed to power outages affecting millions of electricity customers throughout the regions of ERCOT, SPP, and MISO South. Additionally, the February 2021 event is the fourth cold weather event in the past 10 years, which jeopardized BPS reliability. A joint inquiry was conducted to discover reliability-related findings and develop recommendations from Federal Energy Regulatory Commission (FERC), NERC, and Regional Entity staff. The FERC, NERC, and Regional Entity Staff Report into the February 2021 Cold Weather Outages[1] ("Joint Inquiry Report") was published on November 16, 2021.

Project 2021-07 was a two-phase project to address the 10 sub-recommendations in Key Recommendation 1 of the Joint Inquiry Report for new or enhanced NERC Reliability Standards. Reliability Standard EOP-012-1 was originally developed to address Recommendations 1d, 1e, and 1f of the Joint Inquiry Report through new and enhanced requirements for generator preparedness for extreme cold weather conditions. Reliability Standard EOP-012-2 was revised to address Key Recommendations 1a, 1b, and 1c as well as the FERC directives in the February 2023 Order approving the Phase 1 standards EOP-011-3 and EOP-012-1.[2] Reliability Standard EOP-012-3 is being revised to address FERC directives in the June 2024 Order approving EOP-011-4 and EOP-012-2[3].

Defined Terms

Previous DTs developed five defined terms to be added to the NERC Glossary of Terms to make the requirements easier to understand. Project 2024-03 updated one term (Generator Cold Weather Constraint) to meet the FERC directives in the June 2024 Order and provided additional language to clarify issues noted during the development of EOP-012-3, 2024 Small Group Advisory Session(s), and input received during outreach with industry. These five terms are:

Extreme Cold Weather Temperature

The temperature equal to the lowest 0.2 percentile of the hourly temperatures measured in December, January, and February from 1/1/2000 through the date the temperature is calculated.

The definition of Extreme Cold Weather Temperature (ECWT) was developed by the 2021-07 Drafting Team (DT) to provide clarity to the Generator Owner (GO) on determining what temperature triggers the requirement obligations. Each GO should select a reliable source of data from a recording location near the plant to determine their ECWT. Sources could include, for example, the National Weather Service (NWS) or National Oceanographic and Atmospheric Administration (NOAA) weather stations, Federal Aviation Administration (FAA) weather stations, or Environment and Climate Change Canada location for Canadian entities[4], etc. NOAA's National Centers for Environmental Information provides Climate Data Online (CDO) as a free resource that includes quality-controlled weather data and 30-year Climate Normals[5]. In general, GOs should use the location nearest the plant, but may select a further location if geographic or local climatic patterns make a further location more representative of the weather at the generating unit. GOs may use on-site weather stations if data, which reasonably matches reliable nearby off-site sources since January 1, 2000, is available. The starting period chosen by the 2021-07 DT to gather data to determine the lowest temperatures that occur near a facility is based on the completion of the modernization of the National Weather Service project known as MAR (Modernization and Associated Restructuring). This project was completed in the year 2000. In general, the National Weather Service modernization provides weather data to be available at most large airports. This will make it fairly accessible for companies to gather data and perform the required analysis. The December through February timeframe was selected to correspond to the meteorological winter, as defined by NOAA.[6]

The 2021-07 DT discussed methods for determining an ECWT with engineering design professionals, and it was determined that it is typical engineering practice to use a statistical approach to determine the design temperature when implementing generation facility freeze protection measures. The 2021-07 DT determined that only winter temperature values (i.e. between December and February) shall be used for the statistical approach and based on analysis of multiple weather data sites, it was determined that by using the lowest 0.2 percentile, there will be sufficient data points to ensure that a single hour at a temperature that may not be accurate, or may be a statistical anomaly, doesn't result in an overly conservative design or preclude the ability of the GO to use historical operating data to prove compliance to the requirements. The 2021-07 DT selected the 0.2 percentile of winter month temperatures since 1/1/2000 to identify a temperature which has been rarely surpassed, but which allows some margin for a

4 Environment and Climate Change Canada - Canada.ca
5 U.S. Climate Normals | National Centers for Environmental Information (NCEI) (noaa.gov)
6 Meteorological Versus Astronomical Seasons | News | National Centers for Environmental Information (NCEI) (noaa.gov)

GO to have previously demonstrated successful operation. The 2021-07 DT considered using the lowest recorded hourly ambient temperature, but upon further review of the historical weather data and generally accepted design principles, determined that the statistical approach to setting the ECWT for a site's location was more reasonable.

The 2024-03 DT recognized comments and concerns raised during the 2024 Small Group Advisory Session on cold weather preparedness regarding application of the ECWT calculation if hourly temperature values were questionable. If complete data sets are not available (e.g., data is corrupt or missing) at a single weather station back to January 1, 2000, the GO should document the methodology they use to determine their ECWT, such as appending data from multiple weather stations or selecting a complete or partial data set from a weather station further away from the facility. The 2021-07 and 2024-03 DTs realized that a complete data set (i.e., all hours of every day of every year for the months of December, January, and February) may not be available due to a variety of technical reasons. To that point, the Generator Owner's approach in handling the missing/corrupt data should be documented in their methodology and available to Compliance Monitoring Enforcement Program (CMEP) staff as needed. To accommodate concerns raised by industry, the 2024-03 DT felt additional clarification was needed to address missing data and set an expectation for entities to meet when reviewing the inputs to the ECWT calculations within Requirement R1. Entities should be able to explain the reasoning behind the substitution of missing or corrupt data points.

It has been noted that there will likely be the possibility of missing data utilized for the ECWT calculation. The 2024-03 DT discussed data completeness concerns and, after considering the likely variability in such hourly temperature data sets across North America, ultimately chose not to establish a requirement regarding the size of the data set necessary to support an accurate ECWT determination. The 2024-03 DT understands that the entity may very well have an overall approach to missing data versus a unit-by-unit approach. By the nature of the percentile function, significant data loss may not change the ECWT value. The key is where the data is missing in relationship to the ECWT determined value. Missing hourly temperature values above the ECWT has limited impact to the determination. However, missing hourly temperature values below the ECWT can impact the ECWT determination value. For example, the 0.2 percentile of 50,000 hourly values equates to 100 hourly values (in this case the lowest recorded hourly temperatures.) If there are missing hourly values that would have been included in the list of the lowest 100 hourly temperature values, those values should be explained by the entity and may warrant further review. Missing data in the lowest 100 values effectively has the potential of moving the ECWT value higher but that is very dependent upon the data set. This simplified example is intended to demonstrate a principle; not establish a fixed number of lowest temperature values of concern. Any data set with missing or invalid hourly temperature values recorded during the coldest periods since January 1, 2000 should be carefully evaluated to assure that any adjustments utilized on those particular values are properly addressed in a transparent and logical way. Please reference the Calculating Extreme Cold Weather Temperature document drafted by the 2021-07 DT and updated by the 2024-03 DT for an example of how to calculate the ECWT[7].

[7] Report (nerc.com)

Generator Cold Weather Critical Component

Any generating unit component or system, or associated Fixed Fuel Supply Component, that is under the Generator Owner's control, and is susceptible to freezing issues, the occurrence of which would likely lead to a Generator Cold Weather Reliability Event. This definition excludes any component or system or associated Fixed Fuel Supply Component located inside a permanent building with a heating source that regularly maintains the space at a temperature above 32 degrees Fahrenheit (0 degrees Celsius).

The 2021-07 DT felt the best method to address where freeze protection measures should be implemented was to define a term which specifies a subset of components that may be susceptible to freezing and are critical to the operation of generating units. GOs should consider previous freeze-related issues experienced by the generating unit(s), as well as actions taken to mitigate those freeze-related issues, when establishing its list of Cold Weather Critical Components. The 2021-07 DT also felt it is appropriate to specifically exclude components that are not susceptible to freezing due to being inside heated buildings that maintain the interior temperature above freezing.

The 2021-07 DT's intent with regard to the language "that is under the Generator's Owner's control" was to clearly delineate that cold weather events external to the generation site such as loss of fuel supply or loss of auxiliary power to the site that resulted in a Generator Cold Weather Reliability Event (see definition below) would not be subject to this standard. Furthermore, ice buildup on transmission lines and/or high voltage lines between the generating station and point of interconnection with the Transmission Owner would not constitute a freezing condition in the context of this Standard, and therefore, these lines would not be considered a Generator Cold Weather Critical Component.

The 2021-07 DT's intent with the use of the phrase "permanent building" is to refer to a structure that is in place year-round, shall accommodate personnel entry, and has a heating source that regularly maintains the space at a temperature above 32 degrees Fahrenheit for the purpose of protecting components from freezing (e.g. heated container that protects inverter-based resources or battery energy systems). The 2024-03 DT recognized comments and concerns raised during the 2024 Small Group Advisory Session on cold weather preparedness regarding heating of the "permanent building." The HVAC/heating system is not a freeze protection measure in terms of being included in the cold weather preparedness plan as it is not protecting a Generator Cold Weather Critical Component (per the definition) nor is it a Generator Cold Weather Critical Component. The 2024-03 DT expects the HVAC/heating system to be part of routine maintenance and monitoring to ensure that the heated building remains above 32 degrees Fahrenheit.

Fixed Fuel Supply Component

Non-mobile equipment that supports the reliable delivery of fuel to the generating unit and under the control of the Generator Owner at a plant site. Gaseous, liquid, or solid fuel handling components that are installed on site as fixed parts of the fuel delivery system that are under the Generator Owner's control are included. Mobile equipment such as trains, bulldozers, or other equipment that are not fixed in one location are excluded.

The 2021-07 DT wanted to clarify the boundaries of responsibility for the GO as it relates to sites having fuel handling equipment within their control and responsibility to provide freeze protection. The intent of this definition is to clarify that mobile equipment is not part of this requirement, but permanent fixed equipment impacting fuel delivery needed for generation is included.

Generator Cold Weather Reliability Event

One of the following events for which the apparent cause(s) is due to freezing of equipment or impacts of freezing precipitation (e.g., sleet, snow, ice, and freezing rain) on equipment within the Generator Owner's control, and the dry bulb temperature at the time of the event was at or above the Extreme Cold Weather Temperature:

(1) a forced derate of more than 10% of the total capacity of the unit but not less than 20 MWs for longer than four hours in duration;

(2) a start-up failure where the unit fails to synchronize within a specified start-up time; or

(3) a Forced Outage.

Key Recommendation 1d: To require Generator Owners that experience outages, failures to start, or derates due to freezing to review the generating unit's outage, failure to start, or derate and develop and implement a corrective action plan (CAP) for the identified equipment, and evaluate whether the CAP applies to similar equipment for its other generating units. Based on the evaluation, the Generator Owner will either revise its cold weather preparedness plan to apply the CAP to the similar equipment, or explain in a declaration (a) why no revisions to the cold weather preparedness plan are appropriate, and (b) that no further corrective actions will be taken. The standard drafting team should specify the specific timing for the CAP to be developed and implemented after the outage, derate, or failure to start, but the CAP should be developed as quickly as possible, and be completed by no later than the beginning of the next winter season.

The Key Recommendation from the Joint Inquiry Report recommends a Reliability Standard that requires GOs to develop a Corrective Action Plan for generating units that experience outages, failures to starts, or derates due to freezing. The Joint Inquiry Report identifies that most of the outages and derates in the February 2021 event were due to freezing of instrumentation, transmitters, sensing lines, or wind turbine blades (p 166 in the Joint Inquiry Report). As such, the 2021-07 DT followed the Joint Inquiry Report recommendation to require a Corrective Action Plan when the apparent cause of the event is freezing of equipment or impacts of freezing precipitation (e.g., sleet, snow, ice, or freezing rain) on equipment. The 2021-07 DT felt that it was important to clearly call out freezing precipitation as these events were included in the outages and derates that identified as freezing in the Joint Inquiry Report. Furthermore, Key Recommendation 1c of the report requires GOs to account for the effect of precipitation. The 2021-07 DT has developed parameters around these events to clarify a reasonable baseline of what level of derate qualifies as an event, and provide additional language to identify what constitutes a start-up failure. With the additional clarifications, the 2021-07 DT determined that the standard would benefit from a defined term, to clearly and efficiently state what constitutes an event. The result is a new defined term, Generator Cold Weather Reliability Event, that defines the circumstances for which a Corrective Action Plan is required (i.e., when a freezing event affects the equipment within the control of the GO). The defined term will make the standard easier to understand and implement by providing clear and reasonable factors to determine whether the impact of an event requires mitigation. The 2021-07 DT is

using the definition of apparent as defined in the Webster's dictionary as "clear or manifest to the understanding".

Note that the 2024-03 DT provided additional language to alleviate concerns regarding the administrative nature of developing Corrective Action Plans specifically for similar noted issues occurring at one or more locations (e.g., freezing precipitation on wind turbines). Care should be taken if updating existing Corrective Action Plans for additional units especially in terms of effectively capturing the actions and timetables applicable to the additional units.

The Corrective Action Plan requirement applies to any forced outage due to freezing, regardless of duration. Derates, which are short lived (specified as four hours by the 2021-07 DT) or of small capacity impact (specified as less than 20 MW by the 2021-07 DT, which roughly corresponds with the threshold for Bulk Electric System (BES) impacting generation units), are excluded from the Corrective Action Plan requirement to limit the administrative burden to GOs for events that are minimally impacting to the BES. Also excluded are proactive operational actions to limit the potential of forced outages or derates. It should be noted that nothing in this standard prevents a GO from taking its own corrective actions resulting from such events. Startup failures for conventional generation are defined using the GADS definition with the removal of "following an outage or reserve shutdown", since reserve shutdown is defined differently by NERC in GADS than it is by some of the Regional Transmission Organizations (RTOs) and Independent System Operators (ISOs). From the GADS data reporting instructions, the startup period for each unit is determined by the operating company. It is unique for each unit and may depend on the condition of the unit at the time of startup (cold, warm, or hot). A typical unit startup occurs in three phases: warm up, synchronization, and ramp up. NERC defines a startup period to begin with the command to start and end when the unit is synchronized. A startup failure begins when a problem, preventing the unit from synchronizing, occurs. The startup failure ends when the unit is synchronized, another startup failure occurs, or the unit enters another permissible state.

The 2021-07 DT determined that Corrective Action Plans will be required for any freezing event that occurs at temperatures above the generator site's ECWT. By using the site's ECWT, as opposed to the generator unit minimum temperature as defined by the GO in Requirement R1 Part 1.2.2 as the threshold, this achieves the following:

- Provides a consistent basis for the temperature at which CAPS are required for all GOs
- Provides a consistent basis for when Corrective Action Plans are required for all generation types
- Provides a consistent basis for when Corrective Action Plans are required regardless of the level of effort that GOs may have applied to-date winterizing their generators such that they can operate to the ECWT that their sites will reasonably experience
- Removes any incentive (perceived or real) to not further winterize GOs generating sites to meet the ECWT at the GO site by not providing a window where one site might not be subject to the Corrective Action Plan requirement while sites in the same vicinity experiencing the same temperatures are subject to this requirement

- Removes any disincentive for GOs to design the units to operate well below the ECWT for a site by not requiring them to perform Corrective Action Plans while sites in the same vicinity experiencing the same temperatures are subject to this requirement

Generator Cold Weather Constraint

Any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components. Freeze protection measures include practices, methods, or technologies implemented by the electric industry in areas that experience similar winter climate conditions and are not intended to be limited to optimum practices, methods, or technologies.

The 2024-03 DT reviewed the material from the June 2024 Order when determining how best to update the Generator Cold Weather Constraint definition. The 2024-03 DT relied upon industry and FERC guidance as a basis for updating the definition language and the process captured in Attachment 1 of EOP-012-3. The 2024-03 DT also ensured that constraint language would be fully captured within the Standard itself through Attachment 1.

The 2024-03 DT felt that an Attachment that included specific language further explaining Generator Cold Weather Constraints with discrete known Generator Cold Weather Constraints and other case-by-case Generator Cold Weather Constraints meets the FERC (and industry) expectations to provide unambiguous, objective, and auditable language. The 2024-03 DT discussed providing clarity with examples knowing that additional instances or conditions that may be considered a Generator Cold Weather Constraint may exist.

Per the FERC Order, NERC staff is responsible to provide a process describing the receipt, evaluation, approval (as needed), and validation of Generator Cold Weather Constraints. This process is captured in the Generator Cold Weather CAP Extension and Constraint Process ("NERC Process") document.

Attachment 1 contains a non-comprehensive list of known Generator Cold Weather Constraints as well as a list of situations, circumstances, and criteria that may constitute a Generator Cold Weather Constraint. The Generator Owner **must** submit all Generator Cold Weather Constraints to the CEA for approval, regardless of which category it might fall into.

Once a declaration is approved by the CEA, it is considered valid. It is the GO's responsibility to document, in the Generator Cold Weather Constraint declaration, the circumstances and reasons why the modification needed to address the freeze protection measure(s) is not being implemented. A Generator Cold Weather Constraint declaration, that no further corrective actions will be taken, is expected to be used sparingly.

The 2024-03 DT is intentionally leaving room for additional instances of Generator Cold Weather Constraints as it would be impossible to foresee every potential circumstance that could possibly necessitate a review of potential freeze protection technologies across the breadth of the US and Canada and the breadth of generating unit types and ages that fall under this Standard. Furthermore, the 2024-

03 DT wants to ensure that the Standard language supports the adoption of new freeze protection measure practices, methods, or technologies while not immediately requiring a new freeze protection measure practice, method, or technology to be implemented industry-wide when a leading utility pilots a novel approach, as this would be a disincentive to utilities piloting new technologies. The 2024-03 DT encourages additional studying and implementation of freeze protection measures to remove Generator Cold Weather Constraints as appropriate over time.

In the June 2024 Order, there was a directive to change the frequency of Generator Cold Weather Constraint reviews to facilitate consideration of new freeze protection measure technologies to reduce the risk resulting from the need for a Generator Cold Weather Constraint. That change is captured in Requirement R9 discussed later in this Technical Rationale document.

Facilities

After reviewing this reference material and the efforts of the 2021-07 DT, the 2024-03 DT determined that EOP-012-3 should continue to apply to all Bulk Electric System (BES) generating units in order to ensure consistency in extreme cold weather preparedness. The Applicability section first defines "generating unit" as a BES resource. The NERC Glossary of Terms provides the foundation for what BES resources are included in the definition (see Inclusions I2 through I4). Additionally, Blackstart Resources are also specifically declared subject to the winterization requirements. Such Blackstart Resources, consistent with the NERC Glossary of Terms, are those units designated in the Transmission Operator's restoration plans. Proposed EOP-012-3 clarifies which Facilities and their Generator Cold Weather Critical Components are subject to implementing freeze protection measures through specific language in Requirements R2 and R3. The 2024-03 DT briefly discussed Generator Owner Category 2 Inverter-Based Resource (IBR) applicability to EOP-012-3 but it was noted the applicability is under review as part of the Registration of IBR Work Plan so no changes were presented.

Rationale for Requirement R1

The Project 2024-03's Technical Rationale language for Requirement R1 did not substantially change from 2021-07 DT language and, as such, use of DT below is referencing 2021-07 DT. Much of the criteria of R1 is carried over from the previously approved EOP-011 Standard and requires the GO to document several cold weather performance parameters for the unit. This information is valuable, and in some cases, must be shared with other entities. For Requirement R1 Part 1.1, the GO is required to calculate the Extreme Cold Weather Temperature (ECWT) for each unit using a reliable source of data (See the supporting document "Calculating Extreme Cold Weather Temperature"). The DT believes that the GO is in the best position to select the most representative weather information relative to its generating unit. The ECWT will be updated if a new lower ECWT is determined under the periodic review requirement of R1. Defining the operating limitations in Requirement R1 Part 1.2.1 will make affected personnel more aware of unit capabilities and constraints as well as systems and practices that may be necessary to ensure reliability in cold weather, particularly when alternative fuels are involved. In addition, the unit minimum temperature identified in Requirement R1 Part 1.2.2 is used to demonstrate compliance with Requirement R3 for existing units. The DT chose one hour of historical operating data recognizing that there is extremely limited historical operating data available for a unit below their ECWT. This was not to infer that the DT expects that existing generation will only reliably operate for one hour during an extreme cold weather event. The information contained within Requirement R1 Part 1.2 is required to be requested by the Balancing Authorities in TOP-003 to make sure they have the most accurate unit performance information possible for their reliability analysis during the winter season. It is critical, especially if a Corrective Action Plan, extension request for a Corrective Action Plan, or a Generator Cold Weather Constraint declaration is in effect, that the Generator Owner keep Requirement R1 Part 1.2 information updated with those entities requiring said information. The 2024-03 DT did not add a notification Requirement to EOP-012-3 as TOP-003 and IRO-010 obligate the applicable entities (Balancing Authority, Reliability Coordinator, and Transmission Operator) to have "*Provisions for notification of BES generating unit(s) during local*

forecasted cold weather to include" Requirement R1 Part 1.2 information. Balancing Authority(ies), Reliability Coordinators, and Transmission Operators should ensure complete coverage and timeliness of Requirement R1 Part 1.2 data submission within their data specifications.

It is recognized that the determination of a single unit minimum temperature is of limited value if applied without consideration of the other ambient conditions under which it was determined, that is, wind and precipitation. Consideration of wind and precipitation, along with the minimum temperature, provides a greater understanding of the potential generating unit capability for cold weather resource planning. The Standard requires that the GO include wind and precipitation data with their generating unit minimum temperature data when the data is available. The impact of deviations from this known temperature/wind/precipitation stated point are expected to be evaluated qualitatively. For example, if the historical minimum temperature occurred at low wind and dry conditions, and actual future cold weather event expected conditions are high winds with precipitation, planning personnel will recognize that a specific unit may not achieve the minimum temperature and can arrange for additional resources. The opposite also applies, i.e., if a design minimum temperature assumes some level of wind and precipitation and actual cold weather expectations are for low wind and dry conditions, planning personnel will recognize that there is increased likelihood that a generation resource may continue to be available below its minimum temperature. If no information about wind or precipitation is known, wind and precipitation are assumed to be zero at the minimum temperature until further information is obtained. The 2024-03 DT did provide updated language within the "Defined Terms" section of this Technical Rationale document to capture concerns regarding ECWT data availability.

Rationale for Requirement R2

The Joint Inquiry Report Key Recommendation 1f referenced recommendation 12 of the 2011 report8 suggesting that consideration should be given to designing all new generation plants and designing modifications to existing plants (unless committed solely for summer peaking purposes) to be able to perform at the lowest recorded ambient temperature for the nearest location for which historical weather data is available.

The 2021-07 DT believed and 2024-03 DT believes that there needs to be allowances made for units that are in the development process, and for which the design phase may have already commenced. The 2021-07 DT recommended this requirement apply to generation going into service three (3) years after the effective date of EOP-012-1 (i.e., October 1, 2027, based on an effective date of October 1, 2024). The 2024-03 DT edited Requirement R2 in response to the June 2024 Order Paragraph 72 to create differentiation among units based on when the ECWT definition became effective (February 16, 2023). The ECWT definition date was selected as it is a specific point in time where Generator Owners had clear direction for design implications as well as being unambiguous and auditable. Upon receiving feedback on that date, the 2024-03 DT determined that June 29, 2023 was a more appropriate brightline. This was the date where clearer direction was provided to the industry based on FERC decision. In addition, based on the Standard language and Implementation Plans of EOP-012-1 , April 1, 2028 was selected as a date to complete any Corrective Action Plans. The initial Implementation Plan of EOP-012-1 was slated to be

effective 18 months after the effective date of the applicable governmental authority's order approving the Standard. The DT understanding of the material resulted in allowing a period of time, similar in length, to a unit not meeting their ECWT because of design timing not significantly beyond the original planned date of October 1, 2027. EOP-012-1 original language was based on the effective date of the requirement. In this case, Requirement R2 was effective 42 months after the effective date of the Standard. The FERC and DT expectation would be that units are prepared for operations at their ECWT (or below) by commercial operation for units in the near future and beyond (but no later than April 1, 2028.) Note that the date for Canadian entities may need adjustment by the appropriate governmental authority and so a footnote was added to allow that to occur. The changes proposed recognize the potential conditions that exist in terms of generators under consideration or construction but removes the means of achieving compliance through a Corrective Action Plan for units establishing their design criteria on or after June 29, 2023. Allowances for Corrective Action Plans to achieve the required design criteria were maintained as a means of compliance, but only for units which established design criteria prior to June 29, 2023. Additionally, the 2024-03 DT identified that Generator Owners may need to declare a Generator Cold Weather Constraint for units that commit to design criteria on or after the June 29, 2023 date under certain circumstances. Generation that begins commercial operation before October 1, 2027 would be subject to Requirement R3.

GOs with generating units that enter commercial operation on or after October 1, 2027 that contractually committed to design criteria before the ECWT definition approval date (June 29, 2023) and cannot operate for 12 continuous hours at the ECWT taking into account a concurrent twenty (20) mph wind speed shall have completed a Corrective Action Plan by April 1, 2028. It is recognized that Generator Cold Weather Constraints may exist that prevent a new generating unit(s) from being capable of 12 continuous hours of operation at their identified ECWT.

GOs with generating units that enter commercial operation on or after October 1, 2027 that contractually committed to design criteria on or after the ECWT definition approval date (June 29, 2023) that are not able to comply with Requirement R2 would be required to declare a Generator Cold Weather Constraint in accordance with Requirement R8.

The 2021-07 DT chose 12 hours of continuous operation because it is a typical length of the nighttime in winter in most regions of the US and Canada and typically include the hours with the coldest experienced temperatures. The 2021-07 DT was of the opinion that tying the requirement to the 12-hour period would provide a reasonable level of reliability during a cold weather event. The 2021-07 DT chose a concurrent sustained 20 mph wind speed after an evaluation using the wind chill formula developed by the NWS in the United States. Though wind chill temperature is not an exact science, it is widely understood to reflect the **non-linear increased rate of convective heat loss due to air moving at different velocities**. Commonly available charts show wind chill temperatures as a function of actual air temperature at various wind speeds. Approximately 2/3 of the wind chill temperature drop between 0–60 mph is achieved at 20 mph. Using the NWS chart, this holds true for still air temperatures starting at 40ºF and dropping in 20-degree increments to -40°F. Further, 20 mph is a wind speed commonly experienced across the ERO and yet appropriately higher than the approximate average wind speeds in the United States and Canada, 6-12 mph and 8-11 mph respectively. Generator Owners should consider that wind

concurrent with cold temperatures will decrease the amount of time for a unit's equipment (e.g., sensing lines) to reach the ambient temperature. While this may not be readily apparent in all cases, operational history of operating at a certain temperature may not equate (in terms of capability or duration of operation) to operating at that same temperature with a 20 mph (32 km/h) wind speed. Providing freeze protection measures, such as tarps or temporary wind block structures, may support the ability to operate longer during extreme cold weather. Each of these three probabilistically infrequent conditions (the ECWT, a steady 20 mph (32 km/h) wind, and a duration of 12 continuous hours at these conditions) is in and of itself conservative. When they have their effects combined, it results in a requirement that will significantly contribute to BES reliability during extreme cold weather conditions.

Rationale for Requirement R3

The 2021-07 Drafting Team created a requirement for existing generating units, as defined in Requirement R3, to be able to operate at their ECWT. Many existing generating units have already demonstrated this capability. An early FERC order on EOP-012-1 rejected a one-hour timing requirement, consequently the 2021-07 DT chose to forego any specific time requirement in Requirement R3. If a generating unit cannot meet the requirements of Requirement R3, it is required to develop a CAP to add new freeze protection measures or modify existing freeze protection measures to be capable of operations at the ECWT (as calculated in Requirement 1).

Rationale for Requirement R4

General Considerations

Requirement R4 requires GOs to develop and maintain cold weather preparedness plans for their unit(s) and describes the information and documentation required in such plans. It is an expansion of the cold weather preparedness plan required under Requirement R7 of EOP-011-2 and is intended to be used and reviewed regularly by the GO. Originally, Requirement R4 Part 4.5 required the GO to annually inspect and perform necessary maintenance of freeze protection measures. The 2024-03 DT added some clarifying language to ensure that annual inspection and maintenance of freeze protection measures is applied specifically to Generator Cold Weather Critical Components. While other freeze protection measures may be applied to equipment by the Generator Owner, the freeze protection measures included in the cold weather preparedness plan with annual inspections and maintenance are expected to be those applied to Generator Cold Weather Critical Components. Working in concert with other parts of EOP-012-3, including but not limited to Requirements R1, R5, R6, and R7, the substantive elements of the cold weather preparedness plan will be subject to review requirements, updated as necessary, and the responsible party (GO or GOP) is required to annually train personnel on the cold weather preparedness plan requirements.

Requirement R4 Part 4.1

In Requirement R4 Part 4.1, the GO is required to include in the cold weather preparedness plan the lowest ECWT, as calculated pursuant to Requirement R1, for each unit using reliable source(s) of data. The

2021-07 DT believed that the GO is in the best position to select the most representative weather information relative to its generating unit. The cold weather preparedness plan will be updated if a new lower ECWT is calculated under the Requirement R1 periodic review language.

Requirement R4 Part 4.2

Requirement R4 Part 4.2 is intended to capture, within the cold weather preparedness plan, the information being developed pursuant to Requirement R1 Part 1.2, which is carried over from the previously approved EOP-011 Standard and requires the GO to document several cold weather performance parameters for the unit. This information is valuable, and in some cases, must be shared with other entities consistent with the data specification requirements contained in TOP-003 and IRO-010. A requirement for the GO to document this information within the cold weather preparedness plan ensures the information is readily available and documented when the GO responds to a data specification. It should be noted that if a Corrective Action Plan extension request is approved, the underlying generator cold weather data, as called out in Requirement R1 Part 1.2, should be correctly identified by the Generator Owner and provided to the Reliability Coordinators, Balancing Authorities, and Transmission Operators as requested. The June 2024 Order mentions this in Paragraph 3. The 2024-03 DT believes that the data specification Reliability Standards applicable to Reliability Coordinators, Balancing Authorities, and Transmission Operators (e.g., IRO-010 and TOP-003) require the entities to request the information and the GO is therefore obligated to provide the most current version of the relevant information within a Corrective Action Plan. The 2024-03 DT did not believe a notification Requirement was needed in EOP-012-3 in addition to those already existing in the data specification Reliability Standards. The 2024-03 DT encourages parties to work together to ensure the most accurate and up-to-date information is provided, especially when conditions increase risk to reliable operations. See the Technical Rationale for Requirement R1 for substantive rationale regarding the operating limitations and generating unit minimum temperatures documented in the cold weather preparedness plan.

Requirement R4 Part 4.3

In Requirement R4 Part 4.3, the GO identifies the Generator Cold Weather Critical Components to help inform their decision on where to implement appropriate freeze protection measures. The NERC *Reliability Guideline, Generating Unit Winter Weather Readiness – Current Industry Practices*[10], presents a suggested list of components that GOs may choose to utilize when developing their own Generator Cold Weather Critical Component inventory. The GO shall develop and maintain a list of Generator Cold Weather Critical Components for each unit.

Requirement R4 Part 4.4

Requirement R4 Part 4.4 requires GOs to document the freeze protection measures implemented on Generator Cold Weather Critical Components. These freeze protection measures should include those to reduce the cooling effects of wind. Requirement R4 does not require GOs to install new freeze protection measures to reduce the cooling effects of wind, but rather to identify freeze protection measures for Generator Cold Weather Critical Components that will protect against heat loss and the effect of freezing precipitation, where applicable, and document those measures (e.g., water-resistant insulation,

protective shielding, insulated boxes, etc.). These measures could include temporary measures as well, such as wind breaks, but there is no expectation for entities to list all climate-controlled areas as freeze protection measures. Specifically, the freeze protection measures applied to Generator Cold Weather Critical Components must be captured in the cold weather preparedness plan.

Requirement R4 Part 4.5

Requirement R4 Part 4.5 is largely carried over from the previously approved EOP-011 Standard and requires annual inspection and maintenance of the freeze protection measures applied to Generator Cold Weather Critical Components identified in the cold weather preparedness plan. The 2024-03 DT added clarifying language to emphasize the need to effectively mitigate risk on the Generator Cold Weather Critical Components. This Requirement ensures these freeze protection measures will be ready and serviceable when needed.

Rationale for Requirement R5

The 2024-03 DT noted that there could be a combination of operations and maintenance personnel that require training, so minor adjustments were made to that extent. Additionally, the personnel may not be physically located at the generator site depending on how an entity implements their cold weather preparedness plan(s).

Rationale for Requirement R6

Key Recommendation 1d: To require Generator Owners that experience outages, failures to start, or derates due to freezing to review the generating unit's outage, failure to start, or derate and develop and implement a corrective action plan (CAP) for the identified equipment and evaluate whether the CAP applies to similar equipment for its other generating units. Based on the evaluation, the Generator Owner will either revise its cold weather preparedness plan to apply the CAP to the similar equipment or explain in a declaration (a) why no revisions to the cold weather preparedness plan are appropriate, and (b) that no further corrective actions will be taken. The standard drafting team should specify the specific timing for the CAP to be developed and implemented after the outage, derate, or failure to start, but the CAP should be developed as quickly as possible and be completed by no later than the beginning of the next winter season.

The Key Recommendation from the Joint Inquiry Report recommended a Reliability Standard that requires GOs to develop a Corrective Action Plan for generating units that experience outages, failures to starts, or derates due to freezing. The Joint Inquiry Report identifies that most of the outages and derates in the February 2021 event were due to freezing of instrumentation, transmitters, sensing lines, or wind turbine blades (p 166 in the Joint Inquiry Report). As such, the 2021-07 DT followed the Joint Inquiry Report recommendation to require a Corrective Action Plan when the apparent cause of the event is freezing. The 2021-07 DT developed parameters around these events to clarify a reasonable baseline of what level of derate qualified as an event and provide additional language to identify what constitutes a start-up

failure. With the additional clarifications, the 2021-07 DT determined that the Reliability Standard would benefit from a defined term, to clearly and efficiently state what constitutes an event. The result was a defined term, Generator Cold Weather Reliability Event, that describes the circumstances for which a Corrective Action Plan is required (i.e., when a freezing event affects the equipment within the control of the GO). The defined term made the Reliability Standard easier to understand and implement by providing clear and reasonable factors to determine whether the impact of an event requires mitigation. However, because of the June 2024 Order, the 2024-03 DT updated Requirement R6 to provide clearer timeline obligations for those units that suffer a Cold Weather Reliability Event. In general, the 2024-03 DT understands that if a Generator Cold Weather Reliability Event occurs, Generator Owners will remediate the issue as soon as possible.

General Considerations for All Corrective Action Plans

To simplify the proposed requirements related to creating a Corrective Action Plan, the 2021-07 DT used the NERC Definition of a Corrective Action Plan. The Corrective Action Plan definition reads "A list of actions and an associated timetable for implementation to remedy a specific problem." As written, the definition requires two parts for a document to qualify as a Corrective Action Plan, i.e., a list of items to be addressed and a timeline for completion. A Corrective Action Plan without both a list of actions and the timeline to implement is not complete. The 2024-03 DT provided additional language for Corrective Action Plans to clarify expectations for those Corrective Action Plans created as a result of a Generator Cold Weather Reliability Event and other Corrective Action Plans referenced throughout the Requirement language. The resulting language kept the underlying structure developed during previous Projects but clarified and added information as needed to meet the June 2024 Order.

The Corrective Action Plan requirement applies to Generator Cold Weather Reliability Events as well as other instances of required actions to support reliable operations within the EOP-012-3 Standard Requirements. It should be noted that nothing in this standard prevents a GO from taking its own corrective actions resulting from events that do not meet the criteria of a Generator Cold Weather Reliability Event. Startup failure criteria were based on the GADS definition with the removal of "following an outage or reserve shutdown", since the definition of reserve shutdown is different in GADS than it is in some of the Regional Transmission Organizations (RTOs).

Requirement R6 requires the GO to develop, implement, and complete a Corrective Action Plan prior to the first day of December following a Generator Cold Weather Reliability Event. Note that the 2024-03 DT considered early occurrences (e.g., October or November) of Generator Cold Weather Reliability Events and provided a footnote to allow remedial activities to be completed by December 1 of the following calendar year. The December 1 date was chosen based on the FERC directives and the urgency stated within the June 2024 Order regarding this risk. This timeframe was maintained by the 2024-03 DT to allow GOs to review multiple events holistically following a winter season, if that scenario occurs, and create one Corrective Action Plan for components with common failure causes. Care should be taken when developing a multi-unit or multi-event Corrective Action Plan to ensure it meets the Corrective Action Plan criteria for each unit (e.g., actions and timetables may be different.)

The 2021-07 DT determined that Corrective Action Plans would be required for any freezing event that occurs at temperatures at or above the site's ECWT in accordance with the definition of a Generator Cold Weather Reliability Event. Using the site's ECWT as the threshold, as opposed to the generator unit minimum temperature as determined by the GO, achieves the following:

- Provides a consistent basis for the temperature at which Corrective Action Plans are required for all GOs
- Provides a consistent basis for when Corrective Action Plans are required for all generation types
- Provides a consistent basis for when Corrective Action Plans are required regardless of the level of effort that GOs may have applied to-date winterizing their generators such that they can operate to the ECWT that their sites will reasonably experience
- Removes any incentive (perceived or real) to not further winterize GOs sites to meet the ECWT at the GO site by not providing a window where one site might not be subject to the Corrective Action Plans requirement while sites in the same vicinity experiencing the same temperatures are subject to this requirement
- Removes any disincentive for GOs to design the units to operate well below the ECWT for a site by not requiring them to perform Corrective Action Plans while sites in the same vicinity experiencing the same temperatures are subject to this requirement

The 2024-03 DT provided clarifying language to have Corrective Action Plans developed in response to Generator Cold Weather Reliability Events completed by the first day of December of the winter season following the Generator Cold Weather Reliability Event. Allowances for events which occur early winter season, which varies across the North American continent, were provided with the expectation that more transient fixes occurring after a Generator Cold Weather Reliability Event would be applied quickly but allowing a reasonable time horizon for compliance with this Requirement. A Corrective Action Plan triggered by a Generator Cold Weather Reliability Event and for which the apparent cause is the failure of relatively simple existing piece of freeze protection equipment, the scope of the Corrective Action Plan may be documented after the fact. Such prompt repairs may be completed before creation of the Corrective Action Plan, and the GO may complete the implementation of the Corrective Action Plan simply by evaluating the requirements of R6 and documenting how and when the repair work was completed. An example of this circumstance would be a freezing event caused by a single heat trace circuit failure which would have been sufficient to prevent the event had it not failed. The June 2024 Order also directed changes affecting the application of a Generator Cold Weather Reliability Event Corrective Action Plans to other units within a Generator Owner's fleet. The 2024-03 DT established a 12 calendar month window from the time of the originating Generator Cold Weather Reliability Event to develop or update such a plan and a 24-calendar month window (initiated on the date of the Generator Cold Weather Reliability Event) to implement it. This timeframe allows Generator Owners with larger fleets to accommodate any required changes. Considering a Corrective Action Plan extension may be requested, the DT felt that 24 calendar months was sufficient time noting that even large fleets may not have large numbers of units suffering a possible Generator Cold Weather Reliability Event with a similar freeze protection measure. Entities should evaluate the issue with the freeze protection measure that

may have initiated the Generator Cold Weather Reliability Event to see if the maintenance and inspection efforts need to be adjusted (at the unit that suffered the Generator Cold Weather Reliability Event as well as at other similar units with similar freeze protection measures applied to Generator Cold Weather Critical Component(s)).

The existence of a Corrective Action Plan should not discourage the Generator Owner from applying any other actions necessary and feasible to prepare a unit to perform at extreme cold weather temperatures during the Corrective Action Plan implementation period.

The 2024-03 DT also created language that allows for Corrective Action Plan extension requests using the NERC Process. ERO Enterprise staff developed the NERC Process that leveraged the current TPL-007 Corrective Action Plan extension process (See ERO Enterprise Periodic Data Submittal Schedule). While TPL-007 has not been utilized extensively, the NERC Process is flexible enough to manage the expected submittals. The DT is not in control of updates to the process but the NERC staff have been engaged and responsive to industry concerns noted during the Standard development timeline. The NERC Process will allow a thorough review in a timely manner for any Corrective Action Plan extension requests including those that go beyond the 24 or 48 calendar month timetables. While there may be actions impacting the implementation and completion of Corrective Action Plans beyond the control of Generator Owners (e.g., supply chain issues), the Generator Owners should accelerate completion of corrective actions as much as possible to support reliable operations.

The 2024-03 DT updated language regarding Generator Cold Weather Constraints to clarify expectations. Please review Requirements R8 and R9 and Attachment 1 for further discussions of Generator Cold Weather Constraints.

Rationale for Requirement R7

In EOP-012-2, R7 was expanded from EOP-012-1 to provide additional definition on the requirements to implement a Corrective Action Plan, and to meet the direction for this requirement set by the February 2023 FERC Order. One such direction was to define expectations on implementation timelines for Corrective Action Plans. Under EOP-012-2 R7, Corrective Action Plans were divided into two categories: 1) those which address existing freeze protection measure(s), and 2) those which require new equipment or freeze protection measure(s). The former category required completion of the Corrective Action Plan to remedy the cause(s) within 24 months, and the latter required completion of the Corrective Action Plan within 48 months. The 2021-07 DT modeled this timeline structure after similar Corrective Action Plan implementation requirements in TPL-007. These are maximum durations and entities are expected to work diligently to correct issues and take prompt actions to mitigate future issues as soon as practical. At the same time, the 2021-07 DT recognized that the following time-consuming activities make the 24 and 48 calendar months maximum timelines reasonable: scoping applicability to similar units, freeze protection engineering and design, project development, budgeting processes, material supply lead times, outage scheduling, skilled labor availability, and startup/commissioning. However, the June 2024 Order established directives to clarify timelines and responsibilities associated with Corrective Action Plans. The

2024-03 DT chose to specifically remove Corrective Action Plan obligations for Generator Cold Weather Reliability Events and place those in Requirement R6. For Requirement 7, the 2024-03 DT provided clarifying language regarding existing and new freeze protection measures and the associated completion timelines. Language was provided for Corrective Action Plans that may include changes to existing freeze protection measures and addition of new freeze protection measures to help clarify expectations for completing the corrective actions. Entities are expected to work diligently to correct issues and take prompt actions to mitigate future recurrence. The 2024-03 DT updated Parts 7.1.3. and 7.1.4 for completeness to ensure updates would be made to document needed changes to the cold weather preparedness plan(s) to eliminate recurrence of issue(s) identified in the Corrective Action Plan. In clarifying these timeframes, the 2024-03 DT considered the FERC directives.

Within the revised Requirement R7, the GO is required to implement the Corrective Action Plan within a timetable defined by the GO in the Corrective Action Plan but limited by maximum durations in Part 7.1. If the GO is unable to complete the Corrective Action Plan within the time limits in Part 7.1, or the corrective action(s) change, the GO is required to update the Corrective Action Plan with justification. GOs that are unable to complete the Corrective Action Plan due to a Generator Cold Weather Constraint are required under Part 7.3 to create a declaration of the Generator Cold Weather Constraint which shall be provided to the Compliance Enforcement Authority per Requirement R8. Further requirements for the Generator Cold Weather Constraints are provided under Requirements R8 and R9.

The 2024-03 DT also created language that allows for Corrective Action Plan extension requests using the NERC Process. ERO Enterprise staff developed the NERC Process that leveraged the current TPL-007 Corrective Action Plan extension process (See ERO Enterprise Periodic Data Submittal Schedule). The NERC Process will allow a thorough review in a timely manner for any Corrective Action Plan extension requests including those that go beyond the 24 or 48 calendar months. The 2024-03 DT utilized the precedent set by TPL-007 to ensure the unique circumstances of each request will be considered while also avoiding potential compliance burdens which may not have a corresponding reliability benefit (e.g. specific timelines for submission and approval of extension requests). While there may be actions impacting the implementation and completion of Corrective Action Plans beyond the control of Generator Owners (e.g., supply chain issues), the Generator Owners should accelerate completion of corrective actions as much as possible to support reliable operations. It is expected that extension requests will be limited in nature. Generator Owners will have to provide clear justifications with supporting materials within the extension request. Due diligence in ordering equipment, obtaining permits, etc., will be considered as part of the determination of whether a particular set of facts constitute circumstances beyond the control of the entity. Denials of extension requests will be minimized if Generator Owners work diligently to correct issues and take prompt actions. Denial of an extension means the initial timelines for corrective actions must be met.

The 2024-03 DT updated language regarding Generator Cold Weather Constraints to clarify expectations. Please review Requirements R8 and R9 for further discussions of Generator Cold Weather Constraints.

If one or more actions within a Corrective Action Plan fall under a Generator Cold Weather Constraint declaration, it is the intent of the DT that only those constraint affected actions would not be

implemented as part of the Corrective Action Plan. The remaining corrective actions should be implemented per the timelines provided unless dependent upon the corrective action triggering the Generator Cold Weather Constraint declaration.

Rationale for Requirement R8

In the February 2023 FERC Order, the Commission expressed concern that a GO may make a Generator Cold Weather Constraint declaration without informing planning and operational entities (e.g., the Balancing Authority) that are expecting the reliable operation of the generating unit to its ECWT. An additional concern was that the Generator Cold Weather Constraint declarations may be used by a functional entity as an opt-out of compliance with requirements set forth in the standards or in a corrective action plan. To mitigate the concern, the Commission directed NERC to work with Commission staff and submit a data collection and assessment plan that contains information related to GO constraint declarations and explanations thereof. The 2021-07 DT expected that ERO Enterprise compliance staff will be responsible for reviewing declared Generator Cold Weather Constraints and assessing compliance with the Generator Cold Weather Constraint definition criteria in accordance with established processes. The June 2024 Order directives included more direct language that required NERC to receive, review, evaluate, and confirm the validity of each Generator Cold Weather Constraint in a timely manner. Additionally, the June 2024 Order directives required an increase in the frequency of reviews of Generator Cold Weather Constraints. If a Corrective Action Plan extension request is denied by the CEA, then the GO may request a joint CEA/NERC review of the denial.

The 2024-03 DT updated Requirement R8 to require the GO to submit, to the Compliance Enforcement Authority, a Generator Cold Weather Constraint in accordance with Attachment 1 under specific timelines. The ERO Enterprise staff have developed the Generator Cold Weather CAP Extension and Constraint Process ("NERC Process") that leveraged the current TPL-007 Corrective Action Plan extension process (See ERO Enterprise Periodic Data Submittal Schedule) as a foundation for the Generator Cold Weather Constraint process. The NERC Process will allow a thorough review in a timely manner for any Generator Cold Weather Constraint submitted. The 2024-03 DT created Attachment 1 to provide clear expectations on Generator Cold Weather Constraint conditions. Attachment 1 contains some known Generator Cold Weather Constraint conditions as well as examples of other case-by-case Generator Cold Weather Constraint conditions that may also be considered valid. To be clear, all Generator Cold weather Constraints declarations require submittal per the NERC Process. The 2024-03 DT could not create an exhaustive list of Generator Cold Weather Constraint conditions but provided language that allows professional judgement to be utilized. The 2024-03 DT believes the NERC Process in conjunction with Requirement R8 and Attachment 1 effectively meets the FERC directive regarding receiving, reviewing, evaluating, and confirming the validity of Generator Cold Weather Constraints.

Initially EOP-012-1 required an annual review of Generator Cold Weather Constraints. That frequency of reviews was subsequently changed to five years in EOP-012-2. The June 2024 Order directed that the review frequency be increased from the five-year periodicity. While Generator Owners should perform a

review and update any constraint declarations as needed, the 2024-03 DT has developed language requiring a review of validated Generator Cold Weather Constraints every 36 calendar months.

The 2021-07 DT believed that Generator Cold Weather Constraint declarations would be the exception, but it is clear to the 2024-03 DT that certain conditions may exist (based on general weather patterns) that will increase the amount of Generator Cold Weather Constraint declarations and subsequent submittals. In anticipation of that scenario, and following the June 2024 Order, the 2024-03 DT considers the NERC Process a valuable tool to capture data that may help future understanding of the effectiveness of the ECWT. The February 2023 FERC Order and subsequent NERC filing require the collection of data to evaluate the effectiveness of the EOP-12-3 standard.

Updated Generator Cold Weather Constraint declarations would also require an update to the operating limitations provided via data specifications to the entities overseeing reliability (e.g., Balancing Authority, Transmission Operator, or Reliability Coordinator). In this manner, information relevant to valid Generator Cold Weather Constraint declarations are made available to the planning and operational entities pursuant to their data collection authority contained in TOP-003 and IRO-010.

Rationale for Requirement R9

Based on multiple comments regarding Requirement R8 and the FERC directive regarding periodicity of reviews, the 2024-03 DT pulled this Requirement R8 language out as a separate new Requirement R9. There were multiple concerns raised about the 24 calendar month periodicity and the 2024-03 DT chose to extend it to 36 calendar months. CIP-014, a Reliability Standard addressing another significant risk, is proposing a review every 36 calendar months. Based on information shared at the Technical Conference held on November 12, 2024, changes to some technologies that may affect Generator Cold Weather Constraints may take a significant amount of time (well in excess of 36 months) to become available. By shortening from the five calendar years, the 36 calendar month timeline provides a reasonable approach to meeting the Commission's directives without creating undue administrative burden to periodically monitor if Generator Cold Weather Constraints remain valid or if new technologies have become available that effectively obviate the originally validated constraint.

Attachment 1

The 2024-03 DT chose to utilize a limited and discrete list of known Generator Cold Weather Constraints as well as a description of other case-by-case situational descriptions that may constitute Generator Cold Weather Constraints. All declared Generator Cold Weather Constraints must be confirmed as valid by the Compliance Enforcement Authority. Nevertheless, the limited and discrete list is intended to describe specific circumstances that, if met, would have a very high probability of being approved. The 2024-03 DT discussed providing clarity with examples (as noted by FERC Order Paragraph 47) knowing that additional instances or conditions that may be considered a Generator Cold Weather Constraint may exist.

Per the FERC Order, NERC staff is responsible to provide a process describing the receipt, evaluation, approval (as needed), and validation of Generator Cold Weather Constraints. This process is captured in the Generator Cold Weather CAP Extension and Constraint Process ("NERC Process") document.

Once a declaration is approved by the CEA it is considered valid.

The 2024-03 DT is intentionally leaving room for additional instances of Generator Cold Weather Constraints to be presented as it would be impossible to foresee every potential set of circumstances that could possibly constitute a constraint. Furthermore, the 2024-03 DT wants to ensure that the Standard language supports the development and adoption of new freeze protection measures, practices, methods, or technologies while not immediately requiring that the new freeze protection measures, practices, methods, or technologies be implemented industry-wide. The 2024-03 DT encourages additional study and implementation of freeze protection measures to remove Generator Cold Weather Constraints, as appropriate, over time.

The 2024-03 DT updated the definition of Generator Cold Weather Constraints to provide clarity as directed by FERC. In addition to modifying the definition, the 2024-03 DT developed Attachment 1. Requirement R8 provides entities a clear understanding of what is expected when managing Generator Cold Weather Constraints and directly references use of Attachment 1. The list of known Generator Cold Weather Constraints focuses on technical issues or conditions that are widely understood to exist which may have limited or no freeze protection measures to implement. For example, the DT recognizes that some existing wind turbine towers were not constructed of materials that will meet lower ECWT values and therefore has established a Generator Cold Weather Constraint for those situations.

In addition, the DT recognized the need to balance potential adverse effects to the Bulk Power System reliability from implementing a freeze protection measure with benefits to the same is best done on a localized basis. Therefore the DT has selected a value of three precent, or another value supported by the appropriate functional entity, to mitigate such adverse effects.

Regardless of a Generator Cold Weather Constraint being of the "known" type, a Generator Owner is still required to submit "known Generator Cold Weather Constraints for approval. The case-by-case

determination section of Attachment 1 provides examples of conditions or issues that may constitute a valid Generator Cold Weather Constraint depending on the facts and circumstances presented by the Generator Owner. The language provided is meant to be objective, unambiguous, and auditable.

With all Generator Cold Weather Constraints, it is the responsibility of the Generator Owner to provide supporting materials to facilitate approval and validation of the Generator Cold Weather Constraint by the ERO Enterprise. As mentioned in the Requirement R8 Technical Rational discussion, the NERC Process was developed to support the FERC directives in the June 2024 Order. The 2024-03 DT believes the new definition of Generator Cold Weather Constraint, updated language throughout the Standard with emphasis on Requirement R8, and the contents of Attachment 1 provide significant clarity to industry on what is expected for Generator Cold Weather Constraints to be considered valid.

EOP-012-3 – Extreme Cold Weather Preparedness and Operations

Introduction

This document explains the technical rationale and justification for the proposed Reliability Standard EOP-012-3. It provides stakeholders and the ERO Enterprise with an understanding of the technology and technical requirements in the Reliability Standard. This Technical Rationale and Justification for EOP-012-3 is not a Reliability Standard and should not be considered mandatory and enforceable.

Background

From February 8 through February 20, 2021, extreme cold weather and precipitation caused large numbers of generating units to experience outages, derates or failures to start, resulting in energy and transmission emergencies (referred to as the "Event"). The total Event firm load shed was the largest controlled firm load shed event in U.S. history and was the third largest in quantity of outaged megawatts (MW) of load after the August 2003 Northeast blackout and the August 1996 West Coast blackout. The Event was most severe from February 15 through February 18, 2021, and it contributed to power outages affecting millions of electricity customers throughout the regions of ERCOT, SPP, and MISO South. Additionally, the February 2021 event is the fourth cold weather event in the past 10 years, which jeopardized BPS reliability. A joint inquiry was conducted to discover reliability-related findings and develop recommendations from Federal Energy Regulatory Commission (FERC), NERC, and Regional Entity staff. The FERC, NERC, and Regional Entity Staff Report into the February 2021 Cold Weather Outages[1] ("Joint Inquiry Report") was published on November 16, 2021.

Project 2021-07 was a two-phase project to address the 10 sub-recommendations in Key Recommendation 1 of the Joint Inquiry Report for new or enhanced NERC Reliability Standards. Reliability Standard EOP-012-1 was originally developed to address Recommendations 1d, 1e, and 1f of the Joint Inquiry Report through new and enhanced requirements for generator preparedness for extreme cold weather conditions. Reliability Standard EOP-012-2 was revised to address Key Recommendations 1a, 1b, and 1c as well as the ~~-~~FERC directives in the February 2023 Order approving the Phase 1 standards EOP-

Energy Regulatory Commission

011-3 and EOP-012-1.[2] Reliability Standard EOP-012-3 is being revised to address FERC directives in the June 2024 ~~order~~Order approving EOP-011-4 and EOP-012-2[3].

Defined Terms

Previous DTs developed five defined terms to be added to the NERC Glossary of Terms to make the requirements easier to ~~read and~~ understand. Project 2024-03 updated one term (Generator Cold Weather Constraint) to meet the FERC directives in the June 2024 Order and provided additional language to clarify issues noted during the development of EOP-012-3, 2024 Small Group Advisory Session(s), and input received during outreach with industry. These five terms are:

Extreme Cold Weather Temperature

The temperature equal to the lowest 0.2 percentile of the hourly temperatures measured in December, January, and February from 1/1/2000 through the date the temperature is calculated.

The definition of Extreme Cold Weather Temperature (ECWT) was developed by the 2021-07 Drafting Team (DT) to provide clarity to the Generator Owner (GO) on determining what temperature triggers the requirement obligations. Each GO should select a reliable source of data from a recording location near the plant to determine their ECWT. Sources could include, for example, the National Weather Service (NWS) or National Oceanographic and Atmospheric Administration (NOAA) weather stations, Federal Aviation Administration (FAA) weather stations, or Environment and Climate Change Canada location for Canadian entities[4], etc. NOAA's National Centers for Environmental Information provides Climate Data Online (CDO) as a free resource that includes quality-controlled weather data and 30-year Climate Normals[5]. In general, GOs should use the location nearest the plant, but may select a further location if geographic or local climatic patterns make a further location more representative of the weather at the generating unit. GOs may use on-site weather stations if data, which reasonably matches reliable nearby off-site sources since January 1, 2000, is available. The starting period chosen by the 2021-07 DT to gather data to determine the lowest temperatures that occur near a facility is based on the completion of the modernization of the National Weather Service project known as MAR (Modernization and Associated Restructuring). This project was completed in the year 2000. In general, the National Weather Service modernization provides weather data to be available at most large airports. This will make it fairly accessible for companies to gather data and perform the required analysis. The December through February timeframe was selected to correspond to the meteorological winter, as defined by NOAA.[6]

The 2021-07 DT discussed methods for determining an ECWT with engineering design professionals, and it was determined that it is typical engineering practice to use a statistical approach to determine the design temperature when implementing generation facility freeze protection measures. The 2021-07 DT determined that only winter temperature values (i.e. between December and February) shall be used for the statistical approach and based on analysis of multiple weather data sites, it was determined that by using the lowest 0.2 percentile, there will be sufficient data points to ensure that a single hour at a temperature that may not be accurate, or may be a statistical anomaly, doesn't result in an overly conservative design or preclude the ability of the GO to use historical operating data to prove compliance to the requirements. The 2021-07 DT selected the 0.2 percentile of winter month temperatures since 1/1/2000 to identify a temperature which has been rarely surpassed, but which allows some margin for a GO to have previously demonstrated successful operation. The 2021-07 DT considered using the lowest recorded hourly ambient temperature, but upon further review of the historical weather data and generally accepted design principles, determined that the statistical approach to setting the ECWT for a site's location was more reasonable.

The 2024-03 DT recognized comments and concerns raised during the 2024 Small Group Advisory Session on cold weather preparedness regarding application of the ECWT calculation if hourly temperature values were questionable. If complete data sets are not available (e.g., data is corrupt or missing) at a single weather station back to January 1, 2000, the GO should document the methodology they use to determine their ECWT, such as appending data from multiple weather stations or selecting a complete or partial data set from a weather station further away from the facility. The 2021-07 and 2024-03 DTs realized that a complete data set (i.e., all hours of every day of every year for the months of December, January, and February) may not be available due to a variety of technical reasons. To that point, the Generator Owner's approach in handling the missing/corrupt data should be documented in their methodology and available to Compliance Monitoring Enforcement Program (CMEP) staff as needed. ~~Please reference the Calculating Extreme Cold Weather Temperature document drafted by the 2021-07 DT and updated by the 2024-03 DT for an example of how to calculate the ECWT.~~ To accommodate concerns raised by industry, the 2024-03 DT felt additional clarification was needed to address missing data and set an expectation for entities to meet when reviewing the inputs to the ECWT calculations within Requirement R1. Entities should be able to explain the reasoning behind the substitution of missing or corrupt data points.

It has been noted that there will likely be the possibility of missing data utilized for the ECWT calculation. The 2024-03 DT discussed data completeness concerns and, after considering the likely variability in such hourly temperature data sets across North America, ultimately chose not to establish a requirement regarding the size of the data set necessary to support an accurate ECWT determination. The 2024-03 DT understands that the entity may very well have an overall approach to missing data versus a unit-by-unit approach. By the nature of the percentile function, significant data loss may not change the ECWT value. The key is where the data is missing in relationship to the ECWT determined value. Missing hourly temperature values above the ECWT has limited impact to the determination. However, missing hourly temperature values below the ECWT can impact the ECWT determination value. For example, the 0.2 percentile of 50,000 hourly values equates to 100 hourly values (in this case the lowest recorded hourly temperatures.) If there are missing hourly values that would have been included in the list of the lowest 100 hourly temperature values, those values should be explained

by the entity and may warrant further review. Missing data in the lowest 100 values effectively has the potential of moving the ECWT value higher but that is very dependent upon the data set. This simplified example is intended to demonstrate a principle; not establish a fixed number of lowest temperature values of concern. Any data set with missing or invalid hourly temperature values recorded during the coldest periods since January 1, 2000 should be carefully evaluated to assure that any adjustments utilized on those particular values are properly addressed in a transparent and logical way. Please reference the Calculating Extreme Cold Weather Temperature document drafted by the 2021-07 DT and updated by the 2024-03 DT for an example of how to calculate the ECWT[7].

Generator Cold Weather Critical Component

Any generating unit component or system, or associated Fixed Fuel Supply Component, that is under the Generator Owner's control, and is susceptible to freezing issues, the occurrence of which would likely lead to a Generator Cold Weather Reliability Event. This definition excludes any component or system or associated Fixed Fuel Supply Component located inside a permanent building with a heating source that regularly maintains the space at a temperature above 32 degrees Fahrenheit (0 degrees Celsius).

The 2021-07 DT felt the best method to address where freeze protection measures should be implemented was to define a term which specifies a subset of components that may be susceptible to freezing and are critical to the operation of generating units. GOs should consider previous freeze-related issues experienced by the generating unit(s), as well as actions taken to mitigate those freeze-related issues, when establishing its list of Cold Weather Critical Components. The 2021-07 DT also felt it is appropriate to specifically exclude components that are not susceptible to freezing due to being inside heated buildings that maintain the interior temperature above freezing.

The 2021-07 DT's intent with regard to the language "that is under the Generator's Owner's control" was to clearly delineate that cold weather events external to the generation site such as loss of fuel supply or loss of auxiliary power to the site that resulted in a Generator Cold Weather Reliability Event (see definition below) would not be subject to this standard. Furthermore, ice buildup on transmission lines and/or high voltage lines between the generating station and point of interconnection with the Transmission Owner would not constitute a freezing condition in the context of this Standard, and therefore, these lines would not be considered a Generator Cold Weather Critical Component.

The 2021-07 DT's intent with the use of the phrase "permanent building" is to refer to a structure that is in place year ~~-~~round, shall accommodate personnel entry, and has a heating source that regularly maintains the space at a temperature above 32 degrees Fahrenheit for the purpose of protecting components from freezing (e.g. heated container that protects inverter-based resources or battery energy systems). The 2024-03 DT recognized comments and concerns raised during the ~~2024 Small Group Advisory Session~~2024 Small Group Advisory Session on cold weather preparedness regarding heating of the "permanent building." The HVAC/heating system is not a freeze protection measure in terms of being

[7] Report (nerc.com)

included in the cold weather preparedness plan as it is not protecting a Generator Cold Weather Critical Component (per the definition) nor is it a Generator Cold Weather Critical Component. The 2024-03 DT expects the HVAC/heating system to be part of routine maintenance and monitoring to ensure that the heated building remains above 32 degrees Fahrenheit.

Fixed Fuel Supply Component

Non-mobile equipment that supports the reliable delivery of fuel to the generating unit and under the control of the Generator Owner at a plant site. Gaseous, liquid, or solid fuel handling components that are installed on site as fixed parts of the fuel delivery system that are under the Generator Owner's control are included. Mobile equipment such as trains, bulldozers, or other equipment that are not fixed in one location are excluded.

The 2021-07 DT wanted to clarify the boundaries of responsibility for the GO as it relates to sites having fuel handling equipment within their control and responsibility to provide freeze protection. The intent of this definition is to clarify that mobile equipment is not part of this requirement, but permanent fixed equipment impacting fuel delivery needed for generation is included.

Generator Cold Weather Reliability Event

One of the following events for which the apparent cause(s) is due to freezing of equipment or impacts of freezing precipitation (e.g., sleet, snow, ice, and freezing rain) on equipment within the Generator Owner's control, and the dry bulb temperature at the time of the event was at or above the Extreme Cold Weather Temperature:

(1) a forced derate of more than 10% of the total capacity of the unit but not less than 20 MWs for longer than four hours in duration;

(2) a start-up failure where the unit fails to synchronize within a specified start-up time; or

(3) a Forced Outage.

<u>Key Recommendation 1d:</u> To require Generator Owners that experience outages, failures to start, or derates due to freezing to review the generating unit's outage, failure to start, or derate and develop and implement a corrective action plan (CAP) for the identified equipment, and evaluate whether the CAP applies to similar equipment for its other generating units. Based on the evaluation, the Generator Owner will either revise its cold weather preparedness plan to apply the CAP to the similar equipment, or explain in a declaration (a) why no revisions to the cold weather preparedness plan are appropriate, and (b) that no further corrective actions will be taken. The standard drafting team should specify the specific timing for the CAP to be developed and implemented after the outage, derate, or failure to start, but the CAP should be developed as quickly as possible, and be completed by no later than the beginning of the next winter season.

The Key Recommendation from the Joint Inquiry Report recommends a Reliability Standard that requires GOs to develop a Corrective Action Plan for generating units that experience outages, failures to starts, or derates due to freezing. The Joint Inquiry Report identifies that most of the outages and derates in the February 2021 event were due to freezing of instrumentation, transmitters, sensing lines, or wind turbine blades (p 166 in the Joint Inquiry Report). As such, the 2021-07 DT followed the Joint Inquiry Report recommendation to require a Corrective Action Plan when the apparent cause of the event is freezing of equipment or impacts of freezing precipitation (e.g., sleet, snow, ice, or freezing rain) on equipment. The 2021-07 DT felt that it was important to clearly call out freezing precipitation as these events were included in the outages and derates that identified as freezing in the Joint Inquiry Report. Furthermore, Key Recommendation 1c of the report requires GOs to account for the effect of precipitation. The 2021-07 DT has developed parameters around these events to clarify a reasonable baseline of what level of derate qualifies as an event, and provide additional language to identify what constitutes a start-up failure. With the additional clarifications, the 2021-07 DT determined that the standard would benefit from a defined term, to clearly and efficiently state what constitutes an event. The result is a new defined term, Generator Cold Weather Reliability Event, that defines the circumstances for which a Corrective Action Plan is required (i.e., when a freezing event affects the equipment within the control of the GO). The defined term will make the standard easier to understand and implement by providing clear and reasonable factors to determine whether the impact of an event requires mitigation. The 2021-07 DT is using the definition of apparent as defined in the Webster's dictionary as "clear or manifest to the understanding".

Note that the 2024-03 DT provided additional language to alleviate concerns regarding the administrative nature of developing Corrective Action Plans specifically for similar noted issues occurring at one or more locations (e.g., freezing precipitation on wind turbines). Care should be taken if updating existing Corrective Action Plans for additional units especially in terms of effectively capturing the actions and timetables applicable to the additional units.

The Corrective Action Plan requirement applies to any forced outage due to freezing, regardless of duration. Derates, which are short lived (specified as four hours by the 2021-07 DT) or of small capacity impact (specified as less than 20 MW by the 2021-07 DT, which roughly corresponds with the threshold for Bulk Electric System (BES) impacting generation units), are excluded from the Corrective Action Plan requirement to limit the administrative burden to GOs for events that are minimally impacting to the BES. Also excluded are proactive operational actions to limit the potential of forced outages or derates. It should be noted that nothing in this standard prevents a GO from taking its own corrective actions resulting from such events. Startup failures for conventional generation are defined using the GADS definition with the removal of "following an outage or reserve shutdown", since ~~the definition of~~ reserve shutdown is ~~different~~defined differently by NERC in GADS than it is ~~in~~by some of the Regional Transmission Organizations (~~RTO's~~RTOs) and Independent System Operators (ISOs). From the GADS data reporting instructions, the startup period for each unit is determined by the operating company. It is unique for each unit and ~~depends~~may depend on the condition of the unit at the time of startup (cold, warm, or hot). A typical unit startup occurs in three phases: warm up, synchronization, and ramp up. NERC defines a startup period to begin with the command to start and end when the unit is synchronized. A startup failure begins when a problem, preventing the unit from synchronizing, occurs. The startup

failure ends when the unit is synchronized, another startup failure occurs, or the unit enters another permissible state.

The 2021-07 DT determined that Corrective Action Plans will be required for any freezing event that occurs at temperatures above the generator site's ECWT. By using the site's ECWT, as opposed to the generator unit minimum temperature as defined by the GO in Requirement R1 Part 1.2.2 as the threshold, this achieves the following:

- Provides a consistent basis for the temperature at which CAPS are required for all GOs
- Provides a consistent basis for when Corrective Action Plans are required for all generation types
- Provides a consistent basis for when Corrective Action Plans are required regardless of the level of effort that GOs may have applied to-date winterizing their generators such that they can operate to the ECWT that their sites will reasonably experience
- Removes any incentive (perceived or real) to not further winterize GOs generating sites to meet the ECWT at the GO site by not providing a window where one site might not be subject to the Corrective Action Plan requirement while sites in the same vicinity experiencing the same temperatures are subject to this requirement
- Removes any disincentive for GOs to design the units to operate well below the ECWT for a site by not requiring them to perform Corrective Action Plans while sites in the same vicinity experiencing the same temperatures are subject to this requirement

Generator Cold Weather Constraint

~~A~~*Any condition that would preclude a Generator Owner from implementing freeze protection measures on one or more Generator Cold Weather Critical Components* ~~.~~ *Freeze protection measures include practices, methods, or technologies implemented by the electric industry in areas that experience similar winter climate conditions and are not intended to be limited to optimum practices, methods, or technologies.*

The 2024-03 DT reviewed the material from the June 2024 ~~FERC~~ Order when determining how best to update the Generator Cold Weather Constraint definition. The 2024-03 DT relied upon industry and FERC guidance as a basis for updating the definition language and the process captured in Attachment 1 of EOP-012-3. The 2024-03 DT also ensured that constraint language would be fully captured within the Standard itself through Attachment 1.

The 2024-03 DT felt that an Attachment that included specific language further explaining Generator Cold Weather Constraints with discrete ~~pre-approved~~known Generator Cold Weather Constraints and other case-by-case Generator Cold Weather Constraints ~~requiring pre-approval~~ meets the FERC (and industry) expectations to provide unambiguous, objective, and auditable language. The 2024-03 DT discussed providing clarity with examples knowing that additional instances or conditions that may be considered a Generator Cold Weather Constraint may exist.

Per the FERC Order, NERC staff is responsible to provide a process describing the receipt, evaluation, approval (as needed), and validation of Generator Cold Weather Constraints. This process is captured in the ~~Generator Cold Weather CAP Extension and Constraint Process~~Generator Cold Weather CAP Extension and Constraint Process ("NERC Process") document.

Attachment 1 contains a non-comprehensive list of ~~preapproved~~known Generator Cold Weather Constraints as well as a list of situations, circumstances, and criteria that may constitute a Generator Cold Weather Constraint~~ that a~~. The Generator Owner **must** submit all Generator Cold Weather Constraints to the CEA for approval, regardless of which category it might fall into.

Once a declaration is approved by the CEA, it is considered valid. It is the GO's responsibility to document, in the Generator Cold Weather Constraint declaration, the circumstances and reasons why the modification needed to address the freeze protection measure(s) is not being implemented. A Generator Cold Weather Constraint declaration, that no further corrective actions will be taken, is expected to be used sparingly.

The 2024-03 DT is intentionally leaving room for additional instances of Generator Cold Weather Constraints as it would be impossible to foresee every potential circumstance that could possibly necessitate a review of potential freeze protection technologies across the breadth of the US and Canada and the breadth of generating unit types and ages that fall under this Standard. Furthermore, the 2024-03 DT wants to ensure that the Standard language supports the adoption of new freeze protection measure practices, methods, or technologies while not immediately requiring a new freeze protection measure practice, method, or technology to be implemented industry-wide when a leading utility pilots a novel approach, as this would be a disincentive to utilities piloting new technologies. The 2024-03 DT encourages additional studying and implementation of freeze protection measures to remove Generator Cold Weather Constraints as appropriate over time.

In the June ~~27,~~ 2024~~, FERC~~ Order, there was a directive to change the frequency of Generator Cold Weather Constraint reviews to facilitate consideration of new freeze protection measure technologies to reduce the risk resulting from the need for a Generator Cold Weather Constraint. That change is ~~capture~~captured in Requirement ~~R8~~R9 discussed later in this Technical Rationale document.

Facilities

~~*4.1. Facilities:*~~

~~*4.1.1. Bulk Electric System (BES) generating units. For purposes of this standard, the term "generating unit" subject to these requirements refers to the following BES resources:*~~

~~*4.1.1.1. A BES generating resource identified in the BES definition, Inclusion I2 and I4;*~~
~~*or*~~

~~*4.1.1.2. A Blackstart Resource, identified in the BES definition, Inclusion I3.*~~

After reviewing this reference material and the efforts of the 2021-07 DT, the 2024-03 DT determined that EOP-012-3 should continue to apply to all Bulk Electric System (BES) generating units in order to ensure consistency in extreme cold weather preparedness. The Applicability section first defines "generating unit" as a BES resource. The NERC Glossary of Terms provides the foundation for what BES resources are included in the definition (see Inclusions I2 through I4). Additionally, Blackstart Resources are also specifically declared subject to the winterization requirements. Such Blackstart Resources, consistent with the NERC Glossary of Terms, are those units designated in the Transmission Operator's restoration plans. Proposed EOP-012-3 clarifies which Facilities and their Generator Cold Weather Critical Components are subject to implementing freeze protection measures through specific language in Requirements R2 and R3. The 2024-03 DT briefly discussed Generator Owner Category 2 Inverter-Based Resource (IBR) applicability to EOP-012-3 but it was noted the applicability is under review ~~per~~as part of the ~~Order 901 NERC~~Registration of IBR Work Plan so no changes were presented.

Rationale for Requirement R1

~~***R1.*** *At least once every five calendar years, each Generator Owner shall, for each of its applicable generating unit(s): [Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*~~

~~***1.1.*** *Calculate the Extreme Cold Weather Temperature for each of its applicable unit(s) and identify the calculation date and source of temperature data; and*~~

~~***1.1.1.*** *If the re-calculated Extreme Cold Weather Temperature is lower than the previous Extreme Cold Weather Temperature, the entity shall review and update its cold weather preparedness plan under Requirement R4 within six (6) calendar months of the recalculation. If new corrective actions are needed to provide the required operational capability under Requirement R2 or R3, the entity shall develop a Corrective Action Plan within 6 calendar months of the recalculation.*~~

~~***1.2.*** *Identify generating unit(s) cold weather data, to include:*~~

~~***1.2.1.*** *Generating unit(s) operating limitations in cold weather to include:*~~

~~***1.2.1.1.*** *Capability and availability;*~~

~~***1.2.1.2.*** *Fuel supply and inventory concerns;*~~

~~***1.2.1.3.*** *Start-up issues;*~~

~~***1.2.1.4.*** *Fuel switching capabilities; and*~~

~~***1.2.1.5.*** *Environmental constraints.*~~

~~***1.2.2.*** *Generating unit(s) minimum:*~~

- ~~*Design temperature and if available, the concurrent wind speed and precipitation;*~~
- ~~*Historical operating temperature at least one hour in duration, and if available, the concurrent wind speed and precipitation; or*~~
- ~~*Current cold weather performance temperature determined by an engineering analysis, which includes the concurrent wind speed and precipitation.*~~

The Project 2024-03's Technical Rationale language for Requirement R1 did not substantially change from 2021-07 DT language and, as such, use of DT below is referencing 2021-07 DT. Much of the criteria of R1 is carried over from the previously approved EOP-011 Standard and requires the GO to document several cold weather performance parameters for the unit. This information is valuable, and in some cases, must be shared with other entities. For Requirement R1 Part 1.1, the GO is required to calculate the Extreme Cold Weather Temperature (ECWT) for each unit using a reliable source of data (See the supporting

document "Calculating Extreme Cold Weather Temperature"). The DT believes that the GO is in the best position to select the most representative weather information relative to its generating unit. The ECWT will be updated if a new lower ECWT is determined under the periodic review requirement of R1. Defining the operating limitations in Requirement R1 Part 1.2.1 will make affected personnel more aware of unit capabilities and constraints as well as systems and practices that may be necessary to ensure reliability in cold weather, particularly when alternative fuels are involved. In addition, the unit minimum temperature identified in Requirement R1 Part 1.2.2 is used to demonstrate compliance with Requirement R3 for existing units. The DT chose one hour of historical operating data recognizing that there is extremely limited historical operating data available for a unit below their ECWT. This was not to infer that the DT expects that existing generation will only reliably operate for one hour during an extreme cold weather event. The information contained within Requirement R1 Part 1.2 is required to be requested by the Balancing Authorities in TOP-003 to make sure they have the most accurate unit performance information possible for their reliability analysis during the winter season. It is critical, especially if a Corrective Action Plan, extension request for a Corrective Action Plan, or a Generator Cold Weather Constraint declaration is in effect, that the Generator Owner keep Requirement R1 Part 1.2 information updated with those entities requiring said information. The 2024-03 DT did not add a notification Requirement to EOP-012-3 as TOP-003 and IRO-010 obligate the applicable entities (Balancing Authority, Reliability Coordinator, and Transmission Operator) to have "*Provisions for notification of BES generating unit(s) during local forecasted cold weather to include*" Requirement R1 Part 1.2 information. Balancing Authority(ies), Reliability Coordinators, and Transmission Operators should ensure complete coverage and timeliness of Requirement R1 Part 1.2 data submission within their data specifications.

It is recognized that the determination of a single unit minimum temperature is of limited value if applied without consideration of the other ambient conditions under which it was determined, that is, wind and precipitation. Consideration of wind and precipitation, along with the minimum temperature, provides a greater understanding of the potential generating unit capability for cold weather resource planning. The Standard requires that the GO include wind and precipitation data with their generating unit minimum temperature data when the data is available. The impact of deviations from this known temperature/wind/precipitation stated point are expected to be evaluated qualitatively. For example, if the historical minimum temperature occurred at low wind and dry conditions, and actual future cold weather event expected conditions are high winds with precipitation, planning personnel will recognize that a specific unit may not achieve the minimum temperature and can arrange for additional resources. The opposite also applies, i.e., if a design minimum temperature assumes some level of wind and precipitation and actual cold weather expectations are for low wind and dry conditions, planning personnel will recognize that there is increased likelihood that a generation resource may continue to be available below its minimum temperature. If no information about wind or precipitation is known, wind and precipitation are assumed to be zero at the minimum temperature until further information is obtained. The 2024-03 DT did provide updated language within the "Defined Terms" section of this Technical Rationale document to capture concerns regarding ECWT data availability.

Rationale for Requirement R2

~~**R2.** Applicable to generating units which begin commercial operation[8] on or after October 1, 2027: Each Generator Owner, for each generating unit that has a calculated Extreme Cold Weather Temperature at or below 32 degrees Fahrenheit (zero degrees Celsius) as determined in Requirement R1, and that self-commits or is required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius),[9] shall: [Violation Risk Factor: Medium] [Time Horizon: Long-term Planning, Operations Planning]~~

~~**2.1** For generating units for which the Generator Owner first contractually committed to design criteria[10] relevant to this Requirement before February 16, 2023[11]: -~~

- ~~Implement freeze protection measures to protect Generator Cold Weather Critical Components that provide the capability to operate at the unit(s)' Extreme Cold Weather Temperature with sustained concurrent twenty (20) mph wind speed for (i) a period of not less than twelve (12) continuous hours, or (ii) the maximum operational duration for intermittent energy resources if less than twelve (12) continuous hours; or~~
- ~~Have a Corrective Action Plan(s) in place (to include any applicable Generator Cold Weather Constraint(s) upon beginning commercial operation, to add new or modify existing or previously planned freeze protection measures to provide the capability to operate at the unit(s)' Extreme Cold Weather Temperature with a sustained concurrent twenty (20) mph wind speed for (i) a period of not less than twelve (12) continuous hours, or (ii) the maximum operational duration for intermittent energy resources if less than twelve (12) continuous hours.~~

~~**2.2** For generating units for which the Generator Owner first contractually committed to design criteria[12] relevant to this Requirement on or after February 16, 2023[13]:~~

- ~~Implement freeze protection measures to protect Generator Cold Weather Critical Components that provide the capability to operate at the unit(s)' Extreme Cold Weather Temperature with sustained concurrent twenty (20) mph wind speed for (i) a period of~~

~~[8] Commercial operation means achievement of this designation indicating that the facility has received all approvals necessary for operation after completion of initial start-up testing.~~
~~[9] Generating unit(s) that do not self-commit or are not required to operate at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), but may be called upon to operate in order to assist in the mitigation of BES Emergencies, Capacity Emergencies, or Energy Emergencies during periods at or below a temperature of 32 degrees Fahrenheit (zero degrees Celsius), are exempt from this requirement.~~
~~[10] Such commitments would be demonstrated by signed contractual commitments, emailed correspondence agreeing to thermal design criteria, or other similar documented evidence.~~
~~[11] Or the date the definition of Extreme Cold Weather Temperature was approved in the relevant jurisdiction.~~
~~[12] Such commitments would be demonstrated by signed contractual commitments, emailed correspondence agreeing to thermal design criteria, or other similar documented evidence.~~
~~[13] Or the date the definition of Extreme Cold Weather Temperature was approved in the relevant jurisdiction.~~

~~*not less than twelve (12) continuous hours, or (ii) the maximum operational duration for intermittent energy resources if less than twelve (12) continuous hours; or*~~

~~*Document in a declaration, with justification, as applicable, a Generator Cold Weather Constraint in accordance with Requirement R8.*~~

The Joint Inquiry Report Key Recommendation 1f referenced recommendation 12 of the 2011 report8 suggesting that consideration should be given to designing all new generation plants and designing modifications to existing plants (unless committed solely for summer peaking purposes) to be able to perform at the lowest recorded ambient temperature for the nearest location for which historical weather data is available.

The 2021-07 DT believed and 2024-03 DT believes that there needs to be allowances made for units that are in the development process, and for which the design phase may have already commenced. The 2021-07 DT recommended this requirement apply to generation going into service three (3) years after the effective date of EOP-012-1 (i.e., October 1, 2027, based on an effective date of October 1, 2024). The 2024-03 DT edited Requirement R2 in response to the June 2024 ~~FERC~~ Order Paragraph 72 to create differentiation among units based on when the ECWT definition became effective (February 16, 2023). The ECWT definition date was selected as it is a specific point in time where Generator Owners had clear direction for design implications as well as being unambiguous and auditable. Upon receiving feedback on that date, the 2024-03 DT determined that June 29, 2023 was a more appropriate brightline. This was the date where clearer direction was provided to the industry based on FERC decision. In addition, based on the Standard language and Implementation Plans of EOP-012-1 , April 1, 2028 was selected as a date to complete any Corrective Action Plans. The initial Implementation Plan of EOP-012-1 was slated to be effective 18 months after the effective date of the applicable governmental authority's order approving the Standard. The DT understanding of the material resulted in allowing a period of time, similar in length, to a unit not meeting their ECWT because of design timing not significantly beyond the original planned date of October 1, 2027. EOP-012-1 original language was based on the effective date of the requirement. In this case, Requirement R2 was effective 42 months after the effective date of the Standard. The FERC and DT expectation would be that units are prepared for operations at their ECWT (or below) by commercial operation for units in the near future and beyond (but no later than April 1, 2028.) Note that the date for Canadian entities may need adjustment by the appropriate governmental authority and so a footnote was added to allow that to occur. The changes proposed recognize the potential conditions that exist in terms of generators under consideration or construction~~,~~ but removes the means of achieving compliance through a Corrective Action Plan for units establishing their design criteria on or after ~~February 16~~June 29, 2023. Allowances for Corrective Action Plans to achieve the required design criteria were maintained as a means of compliance, but only for units which established design criteria prior to ~~February 16~~June 29, 2023. Additionally, the 2024-03 DT identified that Generator Owners may need to declare a Generator Cold Weather Constraint for units that commit to design criteria on or after the ~~February 16~~June 29, 2023 date under certain circumstances. Generation that begins commercial operation before October 1, 2027 would be subject to Requirement R3.

GOs with generating units that enter commercial operation on or after October 1, 2027 that contractually committed to design criteria before the ECWT definition approval date (~~February 16~~June 29, 2023) and cannot operate for ~~twelve (~~12~~)~~ continuous hours at the ECWT taking into account a concurrent twenty (20) mph wind speed shall have completed a Corrective Action Plan ~~upon beginning commercial operations. The GO then must implement the Corrective Action Plan according to Requirement R7~~by April 1, 2028. It is recognized that Generator Cold Weather Constraints may exist that prevent a new generating unit(s) from being capable of ~~twelve (~~12~~)~~ continuous hours of operation at their identified ECWT. ~~Thus, the 2021-07 DT included, in Requirement R7 Part 7.4, the option for the GO to make a declaration supporting why Generator Cold Weather Constraints preclude the ability to implement appropriate freeze protection measures.~~

GOs with generating units that enter commercial operation on or after October 1, 2027 that contractually committed to design criteria on or after the ECWT definition approval date (~~February 16~~June 29, 2023) that are not able to comply with Requirement R2 would be required to declare a Generator Cold Weather Constraint in accordance with Requirement R8.

The 2021-07 DT chose 12 hours of continuous operation because it is a typical length of the nighttime in winter in most regions of the US and Canada and typically include the hours with the coldest experienced temperatures. The 2021-07 DT was of the opinion that tying the requirement to the 12-hour period would provide a reasonable level of reliability during a cold weather event. The 2021-07 DT chose a concurrent sustained 20 mph wind speed after an evaluation using the wind chill formula developed by the NWS in the United States. Though wind chill temperature is not an exact science, it is widely understood to reflect the **non-linear increased rate of convective heat loss due to air moving at different velocities**. Commonly available charts show wind chill temperatures as a function of actual air temperature at various wind speeds. Approximately 2/3 of the wind chill temperature drop between 0–60 mph is achieved at 20 mph. Using the NWS chart, this holds true for still air temperatures starting at ~~40 F~~40ºF and dropping in 20-degree increments to -40-°F. Further, 20 mph is a wind speed commonly experienced across the ERO and yet appropriately higher than the approximate average wind speeds in the United States and Canada, 6-12 mph and 8-11 mph respectively. ~~Each of these three probabilistically infrequent conditions (the ECWT, a steady 20 mph~~Generator Owners should consider that wind concurrent with cold temperatures will decrease the amount of time for a unit's equipment (e.g., sensing lines) to reach the ambient temperature. While this may not be readily apparent in all cases, operational history of operating at a certain temperature may not equate (in terms of capability or duration of operation) to operating at that same temperature with a 20 mph (32 km/h) wind speed. Providing freeze protection measures, such as tarps or temporary wind block structures, may support the ability to operate longer during extreme cold weather. Each of these three probabilistically infrequent conditions (the ECWT, a steady 20 mph (32 km/h) wind, and a duration of 12 continuous hours at these conditions) is in and of itself conservative. When they have their effects combined, it results in a requirement that will significantly contribute to BES reliability during extreme cold weather conditions.

Rationale for Requirement R3

The 2021-07 Drafting Team ~~did not make any changes to this Requirement. Therefore, the technical rationales are not provided here.~~

~~Requirement R4~~

~~*R4. Each Generator Owner shall implement and maintain one or more cold weather preparedness plan(s) for its*~~created a requirement for existing generating units~~. The cold weather preparedness plan(s) shall include the following, at a minimum:~~
~~*[Violation Risk Factor: High] [Time Horizon: Operations Planning and Real-time Operations]*~~

~~**4.1** *The lowest calculated Extreme Cold Weather Temperature for each unit*~~, as ~~*determined*~~defined in Requirement ~~*R1;*~~

~~**4.2** *The*~~R3, to be able to operate at their ECWT. Many existing generating ~~*unit cold weather data, as determined in Part 1.2;*~~

~~**4.3** *Documentation identifying Generator Cold Weather Critical Components;*~~

~~**4.4** *Documentation of*~~ units have already demonstrated this capability. An early FERC order on EOP-012-1 rejected a one-hour timing requirement, consequently the 2021-07 DT chose to forego any specific time requirement in Requirement R3. If a generating unit cannot meet the requirements of Requirement R3, it is required to develop a CAP to add new freeze protection measures ~~*implemented on Generator Cold Weather Critical Components which may include measures used to reduce the cooling effects of wind determined necessary by the Generator Owner to protect against heat loss, and where applicable, the effects of freezing precipitation (e.g., sleet, snow, ice, and freezing rain); and*~~

~~**4.5** *Annual inspection and maintenance of generating unit(s)*~~or modify existing freeze protection measures ~~*implemented on Generator Cold Weather Critical Components.*~~to be capable of operations at the ECWT (as calculated in Requirement 1).

Rationale for Requirement R4
