Comment Report

Project Name: 2021-08 Modifications to FAC-008 | Draft 1

Comment Period Start Date: 9/5/2023

Comment Period End Date: 10/19/2023

Associated Ballots: 2021-08 Modifications to FAC-008 FAC-008-6 IN 1 ST

2021-08 Modifications to FAC-008 Implementation Plan IN 1 OT

There were 91 sets of responses, including comments from approximately 210 different people from approximately 123 companies representing 10 of the Industry Segments as shown in the table on the following pages.

Questions

- 1. Do you agree that the modification of Requirement R6 has clarified the meaning of "jointly owned" and clarified that Requirement R6 is a risk-based Requirement?
- 2. Do you agree that the new Requirement R9 has clarified the meaning of "consistent" in relation to defining the processes?
- 3. Do you agree that the modifications made in FAC-008-6 are cost effective?
- 4. Do you agree that the Implementation Plan for revised FAC-008-6 is appropriate?
- 5. Provide any additional comments for the standard drafting team to consider, if desired.

WAPA understands the SDT rationale seeking to recognize that "joint-ownership" may imply a Facility comprised of Elements that are individually solely-owned by one or more owners, or may imply a Facility comprised of Elements that have shared ownership by one or more owners. If the SDT seeks to clarify and differentiate between shared ownership of a Facility and joint ownership of equipment comprising a Facility, the "Shared Ownership of Bulk Electric System Facilities" ERO Enterprise Endorsed Implementation Guidance (October 10, 2017) has a workable framework to better define these concepts.

WAPA believes the existing principle of FAC-008 is that each equipment owner must develop Equipment Ratings for the equipment they solely- or jointly-own consistent with their methodology, as well as participate with other owners of equipment in the Facility to determine the overall Facility Rating to respect the most-limiting Equipment Rating of equipment comprising the Facility. The proposed Requirement R6 modification, including the addition of Part 6.1, introduce more problems than it solves. Specifically, in Requirement R6:

- "BES Facilities" is unnecessarily redundant. The NERC Glossary of Terms definition of Facility already includes reference to BES.
- Reference to "accurately identifying" is ambiguous and problematic. This language should be removed.
- The requirement to identify the rating of the most Limiting Element(s) is redundant to the existing FAC-008-5 Requirement R3, Part 3.3 which already requires a Transmission Owner to have a Facility Ratings methodology that specifies that Facility Ratings shall respect the most-limiting applicable Equipment Rating of the individual equipment that comprise the Facility.

In Requirement R6, Part 6.1:

- The existing FAC-008-5 implicitly requires coordination between joint owners to establish Facility Ratings. In other words, any joint ownership in a Facility (whether joint ownership of one piece of equipment or joint ownership of the Facility where each entity solely owns each piece of equipment) demands that each sole- or joint equipment owner share most-limiting Equipment Rating information towards the establishment of the overall Facility Rating that respects "the most limiting applicable Equipment Rating of the individual equipment that comprises that Facility" (Requirement R3, Part 3.3).
- The attempt to codify how coordination between joint owners will occur confusingly mixes Requirement R3, Part 3.4 obligations for Equipment Ratings with the different concept of Element. The SDT should consider that no inception of the FAC-008 Reliability Standard has included the term Element for good reason. Instead, FAC-008-5 Requirement R3 recognizes that the Transmission Owner, through its Facility Ratings methodology, is best positioned to demarcate the equipment comprising a Facility for which Equipment Ratings (not Element ratings) shall be determined. All references to "Element" should be replaced with suitable references to simply "equipment" or "equipment comprising a Facility."
- An important NERC Rules of Procedure concept is that no registered entity may delegate its obligations to the Reliability Standards without a Joint Registration Organizations (JRO) or Coordinated Functional Registration (CFR) agreement. The requirement to "designate one owner to solely develop the most limiting Equipment Rating(s) for the Element(s)" appears to inappropriately delegate a Transmission Owner obligation to establish its Equipment Ratings. This should be removed.

| a Transmission Owner obligation | n to establish its Equipment Ratings. This should be removed. |

|--|---|--|
| Answer | No | |
| Document Name | | |
| Comment | | |
| AECI supports the additional clarity provided for jointly owned facilities, however this requirement has not been addressed from a risk based perspective as described in the SAR. | | |
| Demonstration of compliance requires an entity's field conditions, real-time models, near-term planning models, and long-term planning models to collectively and consistently align with an entities Facility Ratings methodology. As written, this requires 100% accurate field conditions and associated system models 100% of the time. Demonstration of compliance with this requirement has been unattainable by industry due to the immense scope of Facility applicability. Facility Ratings were not identified as a high risk profile in the 2023 RISC ERO Reliability Risk Priorities Report, mandatory requirements should reflect this analysis. Facility Ratings are definitely important as they are foundational to BES modeling, however AECI believes a similar approach as proposed in the draft R9 should be implemented for R6. | | |

| Kendra Buesgens - MRO - 1,2,3,4,5,6 - MRO, Group Name MRO NSRF | | |
| Answer | No | |
| Document Name | | |
| Comment | | |
| The statement: "accurately identifying the rating of the most Limiting Element(s) in accordance with its associated Facility Ratings methodology" This statement is ambiguous. Shouldn't all requirements requiring a rating, a measurement or a report be accurate? | | |
| The measurement for R6 states: | | |
| "shall have evidence to show that its Facility Ratings accurately identify the rating of the most | | |
| Limiting Element(s) in accordance are consistent with the documentation for determining its | | |
| Facility Ratings" | | |
| Adding "accurately identifying" does not add clarity to the requirement or make it risk based. It does add compliance confusion. How do you define "accurately identify"? | | |
| Suggest removing 'accurately identify' from the requirement and measurement. The MRO NSRF recommends the following: | | |
| R6: Each Transmission Owner and Genera | tor Owner shall develop Facility Ratings for its solely and | |

jointly owned BES Facilities as specified within its Facility Ratings methodology or

| As written, R6.1 can be confusing and should be clarified. | | |
|--|---|--|
| For a BES Facility with two or more owners, all applicable entities that own a share of the | | |
| Facility shall coordinate development of a common Facility Rating and determine the owner of the common Facility Rating. The common Facility Rating shall incorporate the most limiting element across all the applicable entities. The common Facility Rating shall be communicated to all applicable entities. | | |

| Comment | | |
| | IWG base case, we currently rely on this process to be communicated via this channel. R6.1 should be duit as a means of meeting this requirement. | |

The verbiage in the redline Requirement R6 is unclear and clarification is warranted. It implies that an Owner would now have to consider and assign limits to a Facility/circuit for Elements of another Owner, specifically in the case where the POI is the R1 boundary (GSU) and R2 equipment belongs to the TO. This implied change adds a coordination element and conflicts with the language in earlier Requirements. Requirements R1 thru R3 clearly define rating boundaries for applicable Owners, while R6 blurs those demarcation lines. The intent does not seem to be to add communication/coordination responsibilities between Owners across a POI, but the proposed R6 mods are ambiguous and can be interpreted that way as written.

Further, FirstEnergy also supports EEI's edit which states:

documentation for determining its Facility Ratings.

| | le within subparts of Requirement R6. To address this concern, Jointly Owned should be defined in FAC-R6 could be used for this definition (see below): |

In the SAR, it states that the term "jointly owned" is to be clarified. Given the use of this term in other standards, it should be defined in the context of

The new R6 item, "For Element(s) with multiple owners, the owners shall designate one owner to solely develop the most limiting Equipment Rating(s) for the Element(s)," is unproductive and burdensome, and should be inapplicable for radial outflows of power from a generation unit to the TO's system. A GO and the TO often co-own the HV spans from the GSUs to the TO's switchyard, for example, with the boundary being at the generation plant fenceline. The rating of this line is calculated using IEEE-738, based on user-specific values for maximum temperature, which derive in turn from equipment life expectations. The TO's goal in this respect may differ from that of the GO, which is immaterial so long as both parties' values exceed the maximum power output of the generator. There is no problem with the GO calculating an HV span rating that has X% safety margin while the TO says that it's Y%.

The word "accurately" should be deleted from R6, because it tasks auditors with judgments that are subjective in nature unless following rigorous principles that ought to be communicated up-front. GOs have always developed ratings for FAC-008 to the best of their ability (mostly nameplate data),

| and if NERC has some alternative, better metime of an audit for GOs to learn what FAC- | neans of doing so in mind they should present their methodology in FAC-008-6 rather than leaving it until the -008 accuracy expectations are. |

| No; the requirement, as written, will be more ambiguous for the use of "Facility" in the revised standard. The current NERC Glossary defines "Facility" as a set electrical equipment that operates as a single BES element. R6.1 has incorrectly applied Facility, re-defining it as electrical Elements installed within a common geographic boundary. In other words, Facility becomes the ground where the electrical Elements are mounted. The determination who owns the "Facility in its entirety" should remain tied to the existing NERC Glossary definition. When the BES elements are solely owned by one entity and ownership changes at an electrical line of demarcation, such as a point of interconnection, this is not Joint ownership in the application of the Standard. In the Technical Rationale, Scenario 1 is in direct conflict with the current definition of Facility. Rather it implies that adjacent owners meet the terminology of "jointly-owned". If that is the intent, this terminology must be explicitly defined. Perhaps it would be better to define this as a Point of Interconnection demarcation and remove the terminology "jointly owned". In addition, radial interconnecting feeds to a generating unit, including circuit breakers and disconnect switches, should have Facility ratings strictly tied to the applicable generating unit, rather than to the Transmission Owner's Facility Rating, regardless of their physical location. This is consistent with the NERC Glossary definition. | |

The SDT has proposed a definition of "jointly owned" to address the SAR concern for uncertainty in the responsibilities and the development of a single Facility Rating. However, the "clarification" that now includes two different scenarios of "jointly owned," adds even more ambiguity and potentially interferes with the contractual rights of parties with respect to joint ownership of facilities. In addition, it resides in the supporting Technical Rational document which has no regulatory force and is not defined in the Standard draft nor proposed to be added to the NERC Glossary of Terms and therefore introduces more ambiguity with respect to compliance with the Standard. If the goal is to bring clarity to the Standard and consistency in interpretation, then the wording in the Technical Rationale needs to be clarified so that it does not interfere with parties' contractual ownership arrangements and/or added to the NERC Glossary of Terms and "upper cased" in the Standard. In addition, the SDT has introduced additional burden to those GOs that currently have an R2 rating. From the Technical Rationale for Requirement R6 the SDT proposes two scenarios of "jointly owned" Scenario 1: Split ownership- Entities have shared ownership of a Facility where ownership of specific Elements that make up the Facility are solely owned by one entity and ownership changes over a line of demarcation. Scenario 2: Joint ownership- Entities share ownership of individual Element(s) For Scenario 1, this interpretation of the definition of joint ownership would have a significant impact on generating units that currently have a R2 rating from the high side of the main power transformer to the point of interconnection with the transmission entity (if a different entity from the GO), under the new 'split ownership' definition, the boundary or end point for the GO R2 Facility Rating would have to be re-evaluated and will require working with the

| TO to validate or develop a new R2. The GO may be required to adopt a new methodology for Facility Ratings which will now be subject to audit beyond the contractual ownership and POI. Also, recommend removing the word "accurately" from the revised R6. The word "accurately" is defined as "correct in all details, exactly". To meet the requirements of any NERC Standard the action is expected to be performed as correctly as possible. The word "accurately" is implied and not necessary in the wording of the Requirement. | | |

| would still require that a coordinated commo owned". | on Facility Ratings for jointly owned Facilities are clarifying and helpful. Compliance with the revised R6 on overall Facility Rating be materially correct. RF supports the proposed changes regarding "jointly | |
| introduce reliability risk. | e the basis for operational and planning studies performed on the Bulk Electric System and any errors | |
| Regarding the risk-based clarification, inherent in the proposed requirement to accurately identify the rating of the most Limiting Element(s) is an implied requirement to accurately identify the identity of the most Limiting Element. As such, applicable entities will need to continue to be prepared to demonstrate that the other equipment comprising the Facility is not most limiting in accordance with its Facility Ratings methodology or documentation. However, the proposed revision to R6 is such that omissions, discrepancies, and deficiencies in documentation of non-limiting Equipment Ratings would not be construed as R6 violations but will rather trigger the internal process developed under R9. And in its current form, R9 is inadequate, and therefore, as a whole, the proposed revisions inadequately address the potential risk posed by inaccurate Equipment Ratings. | | |

| 3C Hydro appreciates the drafting team efforts, the opportunity to comment, and offers the following. 1. BC Hydro believes that each owner is responsible to derive Ratings for their equipment comprising a jointly owned BES Facility and does not consider that reviewing adjacent entities' evidence needs to be part of the compliance obligations under Requirement R6, Part 6.1. BC Hydro requests that the drafting team clarifies the compliance evidence expectations for "coordination" of jointly owned BES Facilities and whether gathering rating evidence for other entities Elements is expected from drafting team's perspective. 2. The Technical Rationale states under the Rationale for Requirement R9 heading that "This allows entities the freedom to make necessary corrections of Equipment Ratings that do not affect the most Limiting Element within their own process without the administrative overhead of self-reporting". However, based on Requirement R6 wording as drafted, an entity could be found noncompliant for not having Facility Ratings developed in accordance with the R1 documentation or R2 and/or R3 methodology regardless of the type of discrepancy found. Requirement R9 as drafted only asks for a process to correct discrepancies, the wording doesn't give an out for not-self-reporting discrepancies that don't impact the overall Facility rating. BC Hydro recommends that any exceptions or provisions be codified within the wording of the Standard instead of relying on Technical Rationale's and verbinars to eliminate potential confusion during enforcement. 3. In Requirement R6, the use of the term "accurately" is subjective and could create confusion on the compliance expectations. BC Hydro suggests that the use of accurately is not required as long as an entity identifies the equipment that is most limiting when deriving the Facility Ratings, and its Rating is determined in accordance with R1 documentation and R2 and/or R3 methodology. 3. In Requirement R6, the use of the NERC Glossary term Limiting Element appears | |

In the SAP, it states that the term "igintly owned" is to be clarified. Given the use of this term in other standards, it should be defined in the context of

The NAGF supports the SDT's intent to clarify the meaning of "jointly owned" as well as the risk posed to the Bulk Electric System (BES) when there is a discrepancy found in the most Limiting Element of a Facility Rating. However, the NAGF recommends that the meaning of "jointly owned" be further clarified/defined in the standard or in the NERC Glossary of Terms and not just limited to an explanation in the Technical Rationale supporting document.

As proposed in the Technical Rationale for Requirement R6 the SDT proposes two scenarios of "jointly owned":

Scenario 1: Split ownership- Entities have shared ownership of a Facility where ownership of specific Elements that make up the Facility are solely owned by one entity and ownership changes over a line of demarcation.

Scenario 2: Joint ownership- Entities share ownership of individual Element(s)

For Scenario 1, this interpretation of the definition of joint ownership may have a significant impact on generating units that currently have a R2 rating from the high side of the main power transformer to the point of interconnection with the transmission entity (if a different entity from the GO), under the new 'split ownership' definition, the boundary or end point for the GO R2 Facility Rating may have to be re-evaluated which would require working with

| the associated Transmission Owner (TO) to validate or develop a new R2. The GO may also be required to adopt a new methodology for Facility Ratings which will now be subject to audit beyond the contractual ownership and Point of Interconnection (POI). | |

| LCRA TSC believes the following existing principles of FAC-008 are: | |

Comment

- Each equipment owner must develop and maintain Equipment Ratings for the equipment they solely or jointly own consistent with their Facility Rating methodology, to determine the overall Facility Rating to respect the most-limiting Equipment Rating of equipment comprising the Facility.
- Each equipment owner must provide the Equipment Ratings, Facility Ratings, and identity of the most limiting equipment of the Facilities to its associated Reliability Coordinator(s), Planning Coordinator(s), Transmission Planner(s), Transmission Owner(s) and Transmission Operator(s).

The proposed Requirement R6 modification, including the addition of Part 6.1, introduce more problems than it solves. Specifically, the proposed revisions complicate the standard by:

- The proposed revisions are mute on clarifying "jointly owned" in R1, R2, and R3, which are foundational requirements for R6.
- The proposed revisions are mute on clarifying "jointly owned" in R8.
- An important NERC Rules of Procedure concept is that no registered entity may delegate its obligations to the Reliability Standards without a Joint Registration Organizations (JRO) or Coordinated Functional Registration (CFR) agreement. The requirement to "designate one owner to solely develop the most limiting Equipment Rating(s) for the Element(s)" appears to inappropriately delegate a Transmission Owner obligation to establish its Equipment Ratings.

FAC-008-5 Requirement 2 and 3 already requires a Entities to have a Facility Ratings methodology/documented process that specifies that Facility Ratings shall respect the most-limiting applicable Equipment Rating of the individual equipment that comprise the Facility. This includes jointly-owned facilities. The attempt to define coordination of Facility Ratings for "jointly owned" Facilities should be addressed earlier in the standard.

In the ERCOT ISO, entities are required to provide their Normal Rating, Emergency Rating, 15-Minute Rating, Conductor/Transformer 2-Hour Rating, and Relay Loadability Rating to ERCOT for use in the operations model. The operations model accepts ratings from more than one entity when there is an ownership share of equipment/facilities. In the instance ownership is shared for equipment/facilities, each entity enters their rating of the equipment, and the most limiting rating is then identified and used by the TOPs. ERCOT entities can use this process and information to understand the ratings for the other owner of a jointly-owned facility. The proposed language in R6.1 places the burden of the current ERCOT process on the individual entities.

LCRA TSC recommends adding an additional option/bullet under R6.1 to allow for ERCOT ISO entities to use ERCOT's operation model ownershare process to determine the most limiting Equipment Ratings for jointly-owned Facilities, as described in the paragraph above.

- The proposed revisions are mute on clarifying "jointly owned" in R1, R2, and R3, which are foundational requirements for R6.
- The proposed revisions are mute on clarifying "jointly owned" in R8.

- An important NERC Rules of Procedure concept is that no registered entity may delegate its obligations to the Reliability Standards without a Joint Registration Organizations (JRO) or Coordinated Functional Registration (CFR) agreement. The requirement to "designate one owner to solely develop the most limiting Equipment Rating(s) for the Element(s)" appears to inappropriately delegate a Transmission Owner obligation to establish its Equipment Ratings.

FAC-008-5 Requirement 2 and 3 already requires a Entities to have a Facility Ratings methodology/documented process that specifies that Facility Ratings shall respect the most-limiting applicable Equipment Rating of the individual equipment that comprise the Facility. This includes jointly-owned facilities. The attempt to define coordination of Facility Ratings for "jointly owned" Facilities should be addressed earlier in the standard.

In the ERCOT ISO, entities are required to provide their Normal Rating, Emergency Rating, 15-Minute Rating, Conductor/Transformer 2-Hour Rating, and Relay Loadability Rating to ERCOT for use in the operations model. The operations model accepts ratings from more than one entity when there is an ownership share of equipment/facilities. In the instance ownership is shared for equipment/facilities, each entity enters their rating of the equipment, and the most limiting rating is then identified and used by the TOPs. ERCOT entities can use this process and information to understand the ratings for the other owner of a jointly-owned facility. The proposed language in R6.1 places the burden of the current ERCOT process on the individual entities.

LCRA TSC recommends adding an additional option/bullet under R6.1 to allow for ERCOT ISO entities to use ERCOT's operation model ownershare process to determine the most limiting Equipment Ratings for jointly-owned Facilities, as described in the paragraph above.

Comment

The revised requirement requires the TO/GO to "develop Facility Ratings" that accurately identify the rating of the most "Limiting Element" in accordance with their associated Facility Ratings methodology or documentation. The methodology and documentation requirements come from Requirements R1, R2, and R3. However, Requirements R1, R2, and R3 do not include the term "Limiting Element", so this creates a disconnect in the requirements. We suggest not using the defined term "Limiting Element" in R6/M6 but rather use the terminology "most limiting applicable Equipment Rating" since that is what's used in Requirements R1, R2, and R3.

In the first line of R6, we suggest that the word "have" be replaced with "develop and maintain" rather than just "develop", since this is an ongoing exercise.

Part 6.1 uses the terminology "most limiting Equipment Rating". However, Requirements R1, R2, and R3 use the terminology "most limiting applicable Equipment Rating. We suggest revising Part 6.1 to be consistent with the earlier requirements.

We offer the following suggested wording for Part 6.1:

6.1. For a BES Facility where no entity owns the Facility in its entirety (i.e., jointly owned), all applicable entities that own a portion of the Facility shall coordinate development of a common Facility Rating using one or a combination of the following:

• Each entity shall provide the most limiting applicable Equipment Rating of their solely owned Elements to the other entities who share in the overall Facility ownership. Each entity will then adopt the most limiting applicable Equipment Rating(s) from all Element owner(s) as the Facility Rating for the jointly owned Facility.

| • For Element(s) with multiple owners, Element(s). | the owners shall designate one owner to solely develop the most limiting Equipment Rating(s) for the |

From 6.1, please remove "and the most limiting Equipment Rating(s) from the other element owner(s)." Our FAC rating documentation is based on our equipment that we own as part of the facility. The other utility bases their rating on their associated elements. Transmission planning and System Operations takes these two ratings to come up with the operating limit for that facility. We do coordinate in the planning stage, but not with the FAC rating. This will be very difficult and not cost effective (see Question 3). It will be very much so burdensome with the oncoming AAR ratings.

This is not clear in cases where we tie into another owner's system and NEER would own all the equipment up to the point of delineation. In this instance, my understanding is I now need to keep an accurate account of the other party's equipment ratings? The language seems to be ambiguous

The revised language does not address how to handle BES Facility interconnections, nor does the definition of Facility support unique (non-typical) BES Facilities such as HVDC Transmission lines and other associated interconnectors where multiple pieces of electrical equipment act as a BES Facility. The revised language does not clarify the meaning of jointly owned, it only provides a method of procedure with regards to split ownership. It does not clarify any requirements for interconnected facilities where an Entity owns the facility in its entirety and provides a point of interconnection to a neighboring entity nor does the technical rationale describe the management of such scenario. The definitions and language used does not put any objective constraints on the limits of common Facility Ratings.

| 2. Do you agree that the new Requirement R9 has clarified the meaning of "consistent" in relation to defining the processes? | | |
|---|----------------|--|
| Michiko Sell - Pine Gate Renewables - 5 | | |
| Answer | No | |
| Document Name | | |
| Comment | | |
| Requirement R9 does not address or clarify the term "consistent" in relation to defining the processes. According to Merriam-Webster (online version), one definition of "consistent" is "tending to be arbitrarily close to the true value of the parameter estimated as the same becomes large I a <i>consistent</i> statistical estimator." If this was the direction the SDT was trying to go, the SDT was unsuccessful, as no correlation can be made. The addition of Requirement R9 adds little to no reliability benefit. Building a process to self-correct Element or Equipment Rating errors and determining if and when (R9.1 and R9.2) an extent of condition review is necessary is not an efficient use of limited resources that would be better used making process improvements and developing internal controls (specifically, detective controls.) If the intent is to lighten the burden in reporting Equipment Rating errors, the SDT should consider alternate paths. | | |

| R9 adds administrative burden without providing clarity and with no clear connection to improving reliability. R9 brings into scope every piece of equipment which actually detracts from the original risk-based intentions and aspects of the standard. Southern Company believes this requirement should be removed. | | |
| If R9 is not removed, R9 should clearly specify that it only applies to non-MLE. | | |
| Additionally, in regulation protecting nuclear safety (10CFR50), discrepancies that do not change the final outcome of analyses are not deemed violations. Why should NERC standards consider these types of errors (non-MLEs) as violations for BES reliability when other regulators would not consider similar errors a violation? | | |

| We do not believe the proposed language in Requirement R9 addresses consistency. Furthermore, we believe that the proposed language in Requirement R9 adds an unnecessary compliance burden on the responsible entity by requiring them to develop and maintain a documented process for correcting discrepancies on low-risk equipment that does not pose an impact to the BES. It is our opinion that, as written, this requirement seems to be more akin to an internal control than a Reliability Standard Requirement. For example, how will an entity be able to identify its most Limiting Element(s) if the other equipment ratings at the same facility are inaccurate? It is our opinion that this additional requirement is unnecessary, and we recommend removing Requirement R9. | | |

| Requirement R9 does not contain the word "consistent". LCRA TSC would like additional clarification for the R9 requirement to include "developing timelines" in the process to correct a Facility rating discrepancy. Timelines can vary based on the individual discrepancy and how widespread the extent of condition review needs to be. An example or additional language in the Technical Rationale would be helpful. | | |

| There is potentially some "additional reliability benefit" of the proposed R9. We suspect it could increase utilities' accountability for the correction process/timeline, but we do sympathize that it could be an unnecessary administrative burden. If entities are fulfilling the current FAC-008 requirement of having ratings that are consistent with their methodology, then they would have a solid internal correction process. | | |

NV Energy does not agree with Requirement R9 and recommends its removal. Requiring an entity to have a 'documented process' to correct inaccurate equipment Ratings is unnecessary, burdensome, administrative and provides no reliability value. Inherently, Requirement R6 requires a responsible entity to accurately Rate its equipment to develop a Facility Rating(s). If equipment Ratings are inaccurate, then the responsible entity has not effectively applied Requirement R1, R2 and/or R3.

It appears that the SAR scope and technical rationale are attempting to provide an exemption to the zero-tolerance aspect FAC-008 regarding Equipment Ratings or data errors that do not affect the overall Facility Rating or do not produce a risk to the BES.

From the technical rationale: This allows entities the freedom to make necessary corrections to Equipment Ratings that do not affect the most Limiting Element within their own process without the administrative overhead of self-reporting. Requirement 9 as written does not clarify "consistent" in anyway. R9 also does not reflect the intent of the SAR or technical rationale. R9 does not call out Equipment Ratings that do not affect the most limiting element or data errors. R9 does not mention that self-reporting is not necessary. Another aspect of R9. It's intended purpose per the technical rationale is to reduce PNCs for Equipment Ratings or data errors that do not affect the overall Facility Rating; however, a PNC can occur if you do not have a process for reducing Equipment Ratings or data errors that do not affect the overall Facility Rating. This may lead to a double jeopardy situation where an entity is in violation of an incorrect Equipment Rating for a low-risk element and a process for not correcting an incorrect Equipment Rating or data error for Equipment that do not affect the overall Facility Rating or do not produce a risk to the BES. R9 is an internal control that an entity may already have as part of their Facility Ratings program. The SDT needs to reconsider R9 with respect to the SAR, technical rationale, and the intended purpose of reducing the administrative and punitive burden of Equipment Ratings or data errors that do not affect the overall Facility Rating or do not produce a risk to the BES. | Dominion Energy supports EEi comments in general, but we are also of the opinion that R9 is boh outside of the scope of the SAR and is vague and open to excessive interpretation. A rating discrepency is undefined and can be defined very differently throughout industry. Also, by using when necessary in the Requirement, the Requirement is now open to subjective determination by the ERO. Finally, use of "Elements or Equipment Ratings" creates confusion as differnetiating between ther two is subjective. | | |

| RF believes the combination of the proposed R6 revision and new R9 will be an improvement over the use of "consistent with" in FAC-008-5 R6. However, as currently proposed, Requirement R9 and Measure M9 do not explicitly require utilization of the process. RF recommends revising the requirement to specify "establish and utilize a process to correct" (patterned after PRC-027). RF also recommends including "dated electronic or hard copy documentation to demonstrate that the responsible entity utilized its process to correct any identified Element or Equipment Rating discrepancies" in the measure. Additionally, while the addition of R9 should help to ensure extensive Equipment Rating discrepancies found during CMEP activities are mitigated, the requirement does not explicitly require applicable entities to proactively look for issues. Other standards, such as PRC-027 R2 and other standards have 20% per year requirements for periodic review, and 10% per year for some PRC-005 activities of periodic reviews which serve as detective | | |
| controls. The R9 requirement should not only require corrective controls, but also include detective controls. | | |

| The R9 rationale and R9 requirement wording do not appear to align. R9 discusses having a process to correct discrepancy errors but the rationale further indicates that if the error does not impact the MLE rating, then self-reporting would not be required. As this is not clear in the R9 wording, recommend including it (and not leaving in the rationale). Furthermore, is R9 necessary? This appears to be merely an administrative requirement with no real reliability value. Alison Mackellar on behalf of Constellation Segments 5 and 6 | |

| AESCE supports the intent behind R9. The idea that an entity should correct any rating discrepancies that do not affect the most limiting Element(s) is great. But the way in which the requirement is written (shall have a process) makes it administrative in nature and does not add real reliability value. | |

| Comment | |
| NYPA appreciates the intent of the standard, however we are concerned that the SAR goals were able to meet as the proposed revision still keeps the administrative burden. NYPA also recommends that there should be a clarification explicitly stating that non-MLE (Most limiting Element) discrepancies do not require reporting. Also, there is no timeline mentioned with respect to R9. The current wording leaves too much room for interpretation, which could lead to varying assessments by auditors. | |

| Violation Severity Level table: For the new R9, please use "section" or "part" to refer to the list containing R9.1, R9.2, R9.3 instead of "element" due to confusion with element ratings. R9: Must the timeline in the process document be fixed for all discoveries of a rating discrepancy, or can the timeline vary based on the action needed to correct a rating discrepancy? For example, the timeline for fixing a written error might be much shorter than the timeline for tracking down equipment information, which might be much shorter than the timeline to replace a piece of equipment, if that is required to correct the discrepancy. R9: Does NERC have suggested minimum or maximum timelines for correcting various types of rating discrepancies? No calendar timeline is specified within R9 or in the VSL table. | | |

| R6 requires development of ratings; and, while the word "accurately" raises concerns as noted above, it is implied that the work is done in a fundamentally correct manner. R9 assumes that an error was made, however, and must be corrected. This internal conflict in the standard should be addressed by removing R9, unless NERC is hinting at an obligation to challenge OEM ratings and not assume that nameplate values are correct. Such an outlook would be unwarranted, and again R9 should be removed. | |

| Comment | |
| Requirement R9 mandates a written process for activities that are already being performed by applicable Owners to ensure continued compliance to the existing Standard. The proposed Requirement also lacks an adherence/enforcement element as written; simply having a documented internal control/process does not inherently improve performance and therefore the Requirement does not add value. However, policing adherence to internal controls (via an extension of R9 or addition of R10) would be an over-reach of authority. The proposed Requirement is designed to act as a control to promote compliance to the other Requirements, which is redundant. R9 should be removed. | |
| Further, FirstEnergy supports EEI's comments which state: | |
| EEI does not support the addition of Requirement R9 because it adds new administrative requirements that provide no additional reliability benefit, is not risk based, and could be understood to be redundant to existing language already contained in Requirements R1, R2 and R3. EEI also notes that the SAR scope includes scope language that was intended to remove unnecessary administrative burdens, not add new ones within other requirements. Moreover, the language in Requirement R9 attempts to solve regional consistency issues that would be better served through the use of the ERO's Enterprise Program Alignment Process. | |

| R6 is redundant to parts of R1, R2, and R3. Ambiguousness needs to be removed from some or all of those requirements. | | |
| R1, R2, and R3 require documentation of Facility Ratings, a definition which includes elements in addition to the most limiting element. The proposed FAC-008 standard does not remove the burden of correctly documenting all elements in a Facility Rating. It may be argued that one may connect-the-dots through FAC-008 and the NERC Glossary of Terms to conclude that only the most limiting element needs to be correctly documented. However, the proposed FAC-008 revision does not make this clear, and it should make that clear if this is the primary motivation for the revision. | | |
| R9's requirement for a CAP seems random. R9 does not remove any documentation or self-reporting burden other than to create more audit overhead in cases where a utility has found and corrected errors. Entergy, and likely most if not all utilities, have some form of a corrective action program which they use with FAC-008, other NERC standards, and a litany of topics outside of NERC. I see no value in adding a CAP requirement to FAC-008 that justifies the compliance and audit burden. | | |
| If the object is to remove consequences of incorrectly recorded elements other than the most-limiting-element, the SDT should revise all Facility Rating requirements to refer only to the most limiting element. Measurements could be revised to require documentation supporting the most-limiting-element conclusions. This may support the goal of requirements to document the most limiting element without a hard requirement to have other elements documented. | | |

| R9 appears to be an administrative requirement to develop and have a process even if not needed. R6 appears to have been written to minimize zero tolerance auditing for equipment rating discrepancies for elements that are not the mmost limiting element by providing for the entity to correct the discrepancy. However, an error found on one of these elements at audit could result in a non-compliance with the new R9 because the entity did not use its process to find and correct the discrepancy. | | |
| Recommend changing R9 to be performance based similar to R5 of PRC-004 rather than a process/administrative requirement. Remove the need for a process and make the performance requirement something like "when a discrepancy is identitied, correc the applicable rating, determine if the error applies to other equipment and correct any additional errors found." Could also consider or require some sort of time limit. | | |

Texas RE supports the addition of Requirement R9. Texas RE recommends two points of clarification: including verbiage for TOs and GOs to implement their processes to correct rating discrepancies and ensuring the requirement language is consistent with the technical rationale.

Texas RE understands the requirement to mean that TOs and GOs shall have a process to correct rating discrepancies and be required to implement said processes. It would be clearer and more consistent with other standards, such as the CIP standards, if the verbiage included specifically that the process shall be implemented.

Additionally, Texas RE noticed a possible discrepancy between the Technical Rationale and the language in Requirement R9. The Technical Rationale for Requirement 9 states that the addition of this requirement is to ensure registered entities correct discrepancies found in Equipment Ratings that do not affect the most Limiting Element. Requirement R9, however, does not specify that it is not intended for the most Limiting Element.

There is no NERC Glossary definition for Element Rating and the language seems to indicate that as written. Texas RE suggests the SDT consider moving "Equipment Rating(s) in front of "Element" in the "or" statement for clarity.

Texas RE proposes the following revision to Requirement R9:

Each Transmission Owner and Generator Owner shall develop, review, and implement a documented process to determine Equipment Rating or Element(s) discrepancies and correct each discrepancy found in either Equipment Rating(s) or Elements used to develop Facility Ratings outside of the most Limiting Element. The documented process must include timelines to:

9.1 Complete corrections

| 9.2 Determination if an extent of condition review is necessary | |
|---|--|
| 9.3 Perform extent of condition review when necessary | |
| | |
| Texas RE inquires whether the SDT believe | es a potential noncompliance exists if the entity goes beyond the timeline developed in the process? |

| A cost justification or quantified improvement in reliability has never existed to validate the need for Facility Ratings applied to radial connected generation resources. For example, a generating unit that has successfully provided a specified output consistently for 1, 5, or 50 years must comply with Facility Rating methodologies, documentation, and evidence, disregarding demonstrated operating capability proven on a regular basis. For practical operation, the ability to meet generation output capacity expectations are assessed daily. There are other standards that require reporting of diminished or degraded output generating capacity such as MOD-025 capability testing performed on scheduled intervals. In fact, Balancing Authorities and Transmission Owners have never requested Generator Facility ratings information from NRG entities for any of their planning efforts. Repetitive application of FAC-008 obligations is unproductive and unnecessary; Facility Rating documents do not improve the reliability of Generator Owner's equipment, performance, or operation. | | |

| The SDT should go back to the original <i>FAC-008 Facility Ratings</i> SAR submitted by Tri-State on July 14, 2021, prior to any modifications being made, and determine if the justification, industry need, purpose or goal, and project scope were addressed in Draft 1. If the SDT determines each of these items was sufficiently addressed by Draft 1 and wants to expand the scope of the SAR, strategize where and how additional objectives fit, if, in fact, they fit at all. An additional SAR may need to be submitted to address the expanded scope and additional objectives (e.g., "Ensure that Requirement R6 is reviewed as a risk-based Requirement.") | | |

| EAC 008 exists to provent electrical everles | ading and Eacility damage. The NSPE does not agree that mechanical limits be included in EAC 008, this |

FAC-008 exists to prevent electrical overloading and Facility damage. The NSRF does not agree that mechanical limits be included in FAC-008, this needs to be addressed in the Standard's Requirements and not just the technical rationale. Mechanical limits can be addressed through standards such as MOD-025, MOD-032 and others.

MPC has several comments for the consideration of the SDT:

- R6.1, bullet point 1: MPC suggest modifying the language as follows:
 - "Entities shall use the most limiting Equipment Rating of their solely owned Elements and the most limiting Equipment Rating(s) from the other Element owner(s) when ratings are provided by the other Element owner(s)."
 - As currently written, it is not clear how this requirement would be applied in a situation where the other joint owner, who's methodology has resulted in the most limiting rating for the jointly owned element, has not shared their rating or has not shared the rating in a timely manner.
- R6.1, bullet point 2: This language is duplicative of the first bullet point. If an entity is required to use "the most limiting Equipment Rating(s) from the other Element owner(s)", then each entity should be using the same rating for a jointly owned piece of equipment. Requiring entities to designate which owner is responsible for developing the most limiting Equipment Rating for the shared element adds compliance and administrative burden without any reliability benefit.
- R9: It is not clear what is meant by "extent of condition analysis". MPC proposes the following language for parts 9.2 and 9.3, including a new part 9.4:
 - 9.2: Determine if it is possible, as determined by the entity, that the identified discrepancy affects multiple Facilities or other similar Elements.
 - o 9.3: If it is possible, as determined by the entity, that the identified discrepancy affects multiple Facilities or other similar Elements, determine the full effect of the discrepancy on the impacted Element and determine if the discrepancy exists on similar Elements.
 - 9.4: Develop a corrective action plan to correct any identified discrepancies, including the initial discrepancy, and any other related discrepancies at other Facilities or involving similar Elements.

As an alternate suggestion, Minnkota appreciates a comment submitted by WECC Entity Monitoring:

Recommend changing R9 to be performance based like R5 of PRC-004 rather than a process/administrative requirement. Remove the need for a process and make the performance requirement something like "when a discrepancy is identified, correct the applicable rating, determine if the error applies to other equipment and correct any additional errors found." Could also consider or require some sort of time limit.

Furthermore, R9 could be extended to include all discrepancies, including discrepancies in the Facility Ratings for the most Limiting Elements. The deciding factor for whether a discrepancy occurs on a most Limiting Element vs a non-most Limiting Element is primarily luck. It seems odd to self-report on one discrepancy but not on another purely on account of chance. Requiring a CAP for any discrepancy and clarifying that an entity will only violate FAC-008-6 R6 if they fail to establish and complete a CAP in some yet-to-be-defined reasonable period would remove a significant compliance and administrative burden while supporting reliability. If the ERO has an interest in data that is currently being gathered via reported non-compliance with FAC-008-5, then a data request could be established to report identified discrepancies. This change would make R6 risk-based.

Minnkota also appreciates similar comments submitted by AECI:

- AECI acknowledges the efforts of the drafting team and appreciates the opportunity to comment on this important matter. AECI provides the following alternative approaches to support the draft R6 risk based approaches proposed by the drafting term:
 - o Incorporate a rating error tolerance concept similar to NERC Standard BAL-005-1 R3.

| being a violation of the Star | an entity to identify, assess, and correct Facility Rating inconsistencies for R6 Facility Ratings without them ndard. porate competency-based requirements such as training. |

After 16 years of FAC-008 implementation, the need for Requirement R9 is an unjustified mandate for Generator Owners. In the Technical Rationale for Requirement R9, the extent of condition review is to discover "Systemic errors" by the R9 process. In the Technical Rationale, please provide an actual example of when and how Systemic errors in Generator Owner's Facility Rating documents led to a significant reliability risk or restricted an ISO's ability to meet load demands. Relative to Section 2.4.1, the application of PRC loadability standards (PRC-023 and PRC-025) preclude relay protective

| | of a Facility. Yet, Section 2.4.1 requires the inclusion of relays to be addressed within the scope of Facility FAC-008 is unnecessary, and it is inaccurate to imply the need to do so. |

| Buckeye supports the comments made by ACES: | |
|---|---|
| It is our opinion that Requirement R1 should be modified to explicitly include mechanical component limitations for Generators and their associated Elements when said mechanical components are more limiting than the thermal ratings. Consider the following hypothetical scenarios as examples: 1. Utility A has a hydro generating facility that is part of the BES per Inclusion I2b. Due to various other environmental compliance requirements, the decision has been made to mechanically reduce the flow rate on a single unit at this facility; however, due to cost concerns no electrical components were modified. This mechanical modification to the turbine limits the overall power rating of the prime mover such that it is now the most Limiting Element. However, due to the GO only considering the thermal ratings of electrical components, the identified Facility Rating no longer accurately reflects the actual available output of the generating facility. 2. Utility B experiences a failure of the GSU on a BES generating unit requiring replacement of the GSU. Due to the long lead times associated with this equipment type, the GO is unable to replace the GSU with a "like in kind" replacement in a timely manner. The GO therefore chooses to replace the failed GSU with one that appropriately rated for the generating unit but has a higher equipment rating than the failed GSU. Prior to the failure, the GSU had been identified as the most Limiting Element; however, due to the higher rating of the replacement GSU, this is no longer the case. The prime mover is now the most Limiting Element; however, due to the GO only considering the thermal ratings of electrical components (i.e. excluding mechanical components), the identified Facility Rating no longer accurately reflects the actual available output of the BES generating unit. Given that accurate Facility Ratings are critical to the safe and reliable operation of the BES, we recommend the SDT give further consideration to whether mechanical components should be included in Facility | |

We agree with the changes to R6 to make it a more risk-based requirement by focusing on accurately identifying the most Limiting Element (MLE) rather than other rating discrepancies that would not impact the Facility Rating. It would be beneficial if further clarification is provided explicitly stating that discrepancies with the non-MLE are not a compliance violation so that there is no misinterpretation of this requirement and to ensure it is not audited differently across the regions.

Some of the reporting requirements are extremely bureaucratic and do not add any value. These requirements for evidence should be simplified for efficiency. For example, if RAS approvals are approved and recorded by the Regional process, requirement can be simplified to get an attestation vs 5 years of history of each step and documentation from each step.

With respect to R6.1, we agree that it is the accountability of Facility owners to coordinate the development of a common Facility Rating by requiring the MLE of their solely owned elements and the MLE from other owner(s). We support that the assigned responsibility for coordinating the common Facility Rating is for facility owners, and cannot be undertaken by the ISO/RTO. Consistent with current processes, ISO/RTO, in coordination with facility owners, undertake joint studies to determine the required minimum rating of a Facility. Following that, facility owners will utilize their own facility rating methodology to plan, design, and in-service equipment.

| We support the flexibility provided in R9 for not affect the MLE. | each entity to develop their own process and documents related to corrections of Equipment Ratings that do | |

The 2021-08 SAR seeks to ensure clarification around "jointly-owned" and the level of detail of component sharing amongst such entities. It goes on to seek "consistent" Facility Ratings which lead to SOL. There's an overall presumption within the proposed language for R6 that two or more entities must have the exact same (i.e., common) limits across a singular Facility based on a singular TO Methodology alone, lest they be deemed to not achieve consistent ratings. Given an evolving industry, PJM finds the proposed language to be restrictive to that singular approach, and placing a prohibition on advanced technologies which can simultaneously respect a multitude of limits (each of merit, and based upon individual TO Rating Methodologies for the respective owners) across an individual facility.

There is not in place today a singular industry-wide TO Rating Methodology, but the proposed language seeks to apply a singular approach on a Facility by Facility basis, established by a singular TO Rating Methodology, for joint-owned Facilities alone. It presumes that all TOP and RC cannot manage

such a distinction in their SOL derivation, respecting each Facility Rating independently. PJM supports the point of view that if a given TOP or RC have systematic restrictions which limit them to use a singular common rating set, that limitation should be managed in their domain, subject to their SOL Methodology evolving. For TOP & RC which can respect the individually determined Rating Sets from their respective TO Rating Methodologies, the proposed language would render that ability as null and void as the owners would be obligated to leverage a singular approach by a singular TO per Facility.

Additionally, while all industry entities have normal and emergency ratings in common, there is variance across emergency ratings within the industry. If one entity has X emergency rating types, and another Y emergency rating types, the proposed language would seem to require a lowest common denominator approach which limits innovation, alters approaches deemed otherwise reliable today, and/or impacts congestion for the entity held to the "designated" jointly-owner's Methodology.

In the inverse, if the "designated" joint-owner is seeking an automated approach to dynamically derive their ratings for a joint-owned facility, the language may subject the non-designated owner to the dynamic approach, even if their systems are established to manage such ratings. PJM suggests that the use of the derived Rating Sets, by TOP and RC leveraging the SOL Methodology, should be the element which either permit such variance and/or inhibit it, not the FAC-008 standard language restricting such variance within the limits themselves.

PJM wants to thank the Standard Drafting Team for their work and dedication to the Project; and to please reach out with any clarifying questions. Thank you.

The GO function should be removed from this standard. The generator interconnect circuit is radial. The power flow is strictly controlled in this circuit. The FAC-008 standard' purpose is to identify the most limiting element of the equipment analyzed so that overloading and burn down of the equipment can be avoided. With the generator interconnect circuit not being networked (is radial) coupled with the power flow being strictly controlled with the use of closed loop controllers, there is no purpose for these ratings to be formalized. For GOs, the work resulting from the requirements of this standard amounts to a design review of the generating plant and its interconnect circuit and is used only for proving compliance during an audit. Neither the Transmission Operator nor the Generator Operator use this information for anything. This results in the work required to achieve compliance to be an administrative exercise only.

Within the technical rationale document, the second sentence is not true for generators. "While there are similar requirements in other standards, FAC-008 is the only Standard that focuses on thermal rating capabilities for Generators and their associated Elements" Any standard that involves the rating on the generator and its facilities, inherently includes the thermal limits of the equipment (MOD-025, MOD-032, PRC-005, PRC-025, e. g.).

| Document Name | Project 2021-08 Unofficial Comment Form_MISO_10-19-23.docx | |

Comment

MISO appreciates the opportunity to provide comments. Our recommendations relate to the notification provisions envisioned under the "Project Scope" (page 2 of this project's SAR):

1. Clarify the term "jointly owned" as it applies to FAC-008, and what information is required to be shared with neighboring entities.

Requirement 8 - MISO recommends requirement R8, Part 8.1 be expanded to include the identity of the owner of the most limiting equipment for *jointly* owned facilities as detailed in Part 8.1.3 below. Knowing the identity of the owner of the most limiting equipment is important for coordination purposes. Particularly as we implement FERC Order 881 and ambient adjusted ratings, we anticipate "the owner of the most limiting equipment for jointly owned facilities" to change more frequently.

- **R8.** Each Transmission Owner (and each Generator Owner subject to Requirement R2) shall provide requested information as specified below (for its solely and jointly owned Facilities that are existing Facilities, new Facilities, modifications to existing Facilities and re-ratings of existing Facilities) to its associated Reliability Coordinator(s), Planning Coordinator(s), Transmission Planner(s), Transmission Owner(s) and Transmission Operator(s): [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]
- **8.1.** As scheduled by the requesting entities:
- 8.1.1. Facility Ratings
- 8.1.2. Identity of the most limiting equipment of the Facilities
- 8.1.3. Identity of the owner of the most limiting equipment for jointly owned Facilities

| | g a notification to the Reliability Coordinator when an entity's extent of condition review indicates a take an entity time to complete the corrections (see example format in Part 9.4 below). | | | |
|---|---|--|--|--|
| R9. Each Transmission Owner and Generator Owner shall have a process to correct each rating discrepancy found in either Element or Equipment Rating(s) used to develop Facility Ratings, that includes developing timelines to: [Violation Risk Factor: Lower] [Time Horizon: Operations Planning] | | | | |
| 9.1. Complete the corrections | | | | |
| 9.2. Determine if an extent of condition review is necessary | | | | |
| 9.3. Perform extent of condition review when necessary | | | | |
| 9.4. If the extent of condition review indicates the discrepancy affects more than X Facilities and will take more than Y days to complete corrections, the entity must notify its Reliability Coordinator within Z days. | | | | |

| Changing "Facilities" to "BES Facilities" in requirement R6 appears to be unnecessary, as the existing definition of "Facility" is already limited to the BES. | | | | |
| Additionally, requirement R9 as currently drafted does not appear to require asset owners to implement the corrective process. ERCOT recommends that "shall have a process" be revised to "shall have and implement a process" in requirement R9. | | | | |
| | | | | |

| Finally, ERCOT believes requirement R9 would more effectively enhance reliability if it included guidance on what needs to be included in an extent of condition review and a deadline for entities to complete corrections to rating discrepancies. | | |

| MRO believes the proposed revision to R9 tries to address the SAR scope and technical rationale. However, as in its current form, the requirement language does not completely clarify the intent of the requirement. The current requirement language just requires TO and GO to have a process to correct rating discrepancies but does not require to implement the process. MRO recommends adding clarifying language to include internal controls such as detective and corrective control to R9; and ensure that the language in requirement is implementable and auditable. | | |
| In addition, since omission, discrepancies, and deficiencies in documentation of non-limiting Equipment Ratings is no longer a violation according to new R6, MRO recommends that this gap is properly addressed by R9. | | |
| Also, we recomment revising measure M9 to match the R9 requirements. | | |

| Ve disagree with the SAR. Regardless, the proposed modification don't meet the SAR. There is no clarification of Jointly Owned. | | | |
| TDs should be required to provide a cost estimate and reliability improvement benefit prior to being allowed to have purposals balloted on. | | | |
| This proposal in our view has zero reliability benefit and is just another proposed adminitrative burden and cost with no value to our customers. | | | |
