

Notes

Generator Verification SDT — Project 2007-09

August 13, 2010

Attendees: Lee Taylor, Jason MacDowell, Brendan Kirby,
Stephanie Schmidt, Baj Agrawal, Sharma Kolluri, Howard Illian

Conference call highlights:

- The attendees were brought up to date regarding the small work group efforts to re-structure MOD-026. The attendees were informed that the revised structure is intended to create a standard that would be simpler to comply with and to enforce, and that is technically comparable to earlier drafts. (A copy of the proposed new framework is attached.)
- Discussion then turned to MOD-027. An overview of an early draft of MOD-027 was presented (copy attached). The attendees concurred with applying the MOD-026 framework to MOD-027 in principle. Some comments included:
 - Modify title (and maybe requirements) to remove any question that MOD-027 should apply to all generation technologies and not just those that have a “traditional” governor.
 - Simplify the purpose statement.
 - Is a Balancing Authority or Reliability Coordinator the more appropriate entity to provide frequency event information?
- Baj Agrawal agreed to draft additional verbiage for MOD-026 Measure M1 sections 1.1 to 1.4 by August 20.
- Lee Taylor agreed to flesh out the MOD-026 VSLs and to draft verbiage for requirement R2 by August 20.
- Lee will canvass the sub team members for available date and times during the week of August 23 for a follow-up conference call and web session.
