(1) What measure does the effective date use when determining percentage of applicable Facilities that must be completed by the given date? Is it a percentage based on the net nameplate rating of the generator? We suggest this should be stated directly to avoid conflicts between what the auditor assumes versus what the registered entity assumes. (2) Attachment 2 discusses subtracting tertiary real and reactive power to get net real and reactive power, yet there is no entry for it. Should there be an entry added in the form? (3) The response to our last comments regarding inclusion of the last verification column indicated that a note would be added to indicate that this column would be blank for the initial verification. We could not find the note. Please add it. We were concerned a similar issue to the one experienced with the Protection System Maintenance and Testing standard would be experienced. In the PRC standard, auditors interpreted statements in the standard to require data prior to the enforceable date even though registered entities were not required to keep it. It resulted in a number of violations. (4) In applicability sections 4.2.1 through 4.2.3, please change “directly connected to the BES” to “that are part of the BES”. Per the BES definition, generation units can be and are part of the BES. Using “directly connected to the BES” could draw in a non-BES unit. (5) How will mothballed units be handled? If a mothballed unit is returned to service, is it treated like a new unit with the return date serving as the commissioning date?

A stated purpose of Generator Verification is “to ensure that generator models accurately reflect the generator’s capabilities and operating characteristics.” Modeling behind-the-meter generation based on gross name-plate ratings will not accurately reflect those assets’ capabilities or operating characteristics, and, in fact, may seriously distort BES expansion plans or other modeling scenarios if name-plate ratings are used. Behind-the-meter generation is a misnomer. It is not comparable to utility or merchant generation in which the primary function is to deliver electric energy to the bulk electric system. The primary function of behind-the-meter generation that employs cogeneration or combined heat and power (CHP) systems is to deliver thermal energy (usually in the form of steam) in support of the load’s process technology. In the case of industrial loads, the capabilities or operating characteristics of that process are a function of the load’s production schedule associated with its products (e.g., chemicals, petroleum, paper, etc.) and independent of conditions on the BES. Any electric power delivered to the BES is a residual by-product of the industrial process and generally a small fraction of the name-plate rating of the generator. Section III.c.4 of the Statement of Compliance Registry Criteria (v.5) and Exclusion E2 of the revised BES definition both recognize this fundamental characteristic of behind-the-meter generation and that is why neither document uses name-plate rating as a useful metric for behind-the-meter generation. The GVSDT is urged to do the same. Additionally, the SDT should define the term ‘Synchronous condenser’ so that it is clear that a large synchronous motor is not a synchronous condenser.

Delete Note 3 on page 18 of the clean version, and delete the reference to Note 3 located on page 15 under “Verification specifications for applicable Facilities: #2”. If a unit is equipped with AVR, the test must be conducted with the AVR in service.
Yes
1) Attachment 2, Summary of Verification – Strike the fifth bullet (The recorded Mvar values were adjusted to rated generator voltage, where applicable.) In the Consideration of Comments Report the Standard Drafting Team agreed to make this change, but it was overlooked. 2) The focus of this standard appears to be on testing rather than on verifying the P and Q limits to be used in Transmission Planning models. The standard is more of a performance test than a model verification test – the requirements do not directly fulfill the purpose. 3) Leading VAR Staged Testing – Leading VAR staged testing provides little benefit to the BES and should only be performed once in an initial staged test or validation. The fact that the regions will not be able to provide operational data for the leading VAR test points requested, proves that the system usually doesn’t

require leading VARS. In the situations such as system recovery and lightly loaded BES where leading VARS may be required, the initial testing and validation that the unit’s heat removal capability (such as lagging VAR operational data) is sufficient, should serve as satisfactory verification of the unit’s capability. The risk (and cost) of repeated operation of the unit in the maximum leading VAR is not warranted for the little benefit it provides to the BES. The risk of Step Iron degradation and loss of synchronous operation every five years far outweighs the benefit such testing would provide the BES once the unit has been proven capable. The lagging VAR capability test or validation will prove that the unit’s heat removal capability has not been compromised. MOD-025-2 should be reworded to only require periodic validation (either by staged testing or operational data) for lagging VARS, and that periodic leading VAR testing only be required if the unit is not capable of passing the lagging VAR capability test or validation. 4) Applicable Facilities – Verification of units between 20 MVA and 100 MVA provide little benefit to the BES for the risk and cost of performing the staged test for these units. The maximum VAR contribution for these units is in the 5 to 20 MVAR range, and the risk and cost for testing, documentation and auditing of units of this size is not warranted for the small benefit gained. If there is a specific need for a particular small unit to provide VAR support due to regional constraints, then it should be validated. But to require validation for all the small units that have little impact on the reliability of the BES, the cost is not warranted. The unit size applicability for PRC-019-1 and MOD-025-2 should be set equivalent to that specified by MOD-026 and MOD-027 (i.e. in the Eastern Interconnection, individual generating units greater than 100 MVA directly connected to the BES, etc.). Regional criteria can be used to address any smaller units identified as critical to BES reliability in that region.

Attachment 1, Parts 2.2.1 and 2.2.2, AECI does appreciate adequate Attachment 1 allowances for voltage-schedule restrictive operating conditions, so that actual Maximum and Minimum reactive capabilities that simply cannot be attained, are not required, as acknowledged per Notes 1 & 2. However we do question the value to industry, beyond initial testing per this standard, of the 5-year retesting and believe this Requirement will eventually be removed unless redrafted per responsible entities' internal controls program expectations. We do however agree with the requirement to retest when unit conditions change sufficiently to warrant retesting.

Yes
Paragraph 4.2 contains several typos and the intent is not clear. Recommend revise 4.2 to read: “An adjustment may be requested by the TP to develop the relationships between test conditions and generator output at different conditions, such as peak summer conditions. If so requested, test results should be adjusted to ambient conditions specified by the TP. Adjusted results should be submitted to the TP within 90 days of the request or the date the data was recorded/selected whichever is later.”
Yes
In attachment 1, change the periodicity for performing Real and Reactive Power capability verification from five years to ten years. This would be consistent with standards MOD-026 and MOD-027. The comments expressed herein represent a consensus of the views of the above-named members of the SERC EC Planning Standards Subcommittee only and should not be construed as the position of SERC Reliability Corporation, its board, or its officers.

Russell Noble
Cowlitz PUD

No
Cowlitz supports the comments developed by the NAGF SRT: 1. The 90-day limit for historical data in R1.2 and R2.2 conflicts with the statement at the bottom of p.15 that "Operational data from within the two years prior to the verification date is acceptable for the verification of either the Real Power or the Reactive Power capability…." It is also unclear how the day on which verification data are collected can differ at all from the verification date, much less by two years. 2. The semantics regarding applicability should be made more consistent. The criterion, "Generating plant/Facility greater than 75 MVA (gross aggregate nameplate rating) directly connected to the Bulk Electric System," in para. 4.2.3 appears to state that a station with two 500 MW NERC-registered fossil units and a standby, non-NERC-registered10 MW diesel genset connecting to the 13.2 kV bus, for example, needs testing only for the large units because the diesel is not part of the NERC-defined Facility. Para. 1 at the bottom of p.15 appears to take a contradictory position, however, by saying that "For generating units of 20 MVA or less that are part of a plant greater than 75 MVA in aggregate, record data either on an individual unit basis or as a group." This would be better stated as, that "For generating units of 20 MVA or less that are included as part of a Facility greater than 75 MVA in aggregate, record data either on an individual unit basis or as a group." 3. Applying on p.16 an "unduly restricted" classification to reactive power verification results that fall short of 50% of the thermal capability curve (D-curve) constitutes a technical error that is fatal to the approvability of MOD-025-2 in its present form. The D-curve deals only with a single characteristic (temperature) of a single component (generator), and the reactive capability of a generation unit system is generally set by other factors. Lagging PF is frequently restricted to less than 50% of the D-curve value due to variation of aux bus voltages beyond the IEEE-recommended range of +/- 5% for normal operation, and it is not uncommon for stability issues to preclude any leading-PF operation (nuclear units in particular never operate at leading PF). Potential lack of leading capability is acknowledged in Note 4 of Att. 1, but contradicted by the p.16 references discussed above. All explicit and implied connections in the draft standard between the expectable reactive power capability and the generator OEM D-curve should be expunged. 4. Note 1 of Att. 1 (pp. 17-18) is inaccurate and should be deleted. The limitations described in comment #3 above are not related to transmission system conditions. Our concerns are amplified by the statement, "Observe auxiliary bus voltage limits," in Note 1 from the previously-voted-on version of MOD-025-2 having been deleted from the present draft. Is it the SDT's intent that units should import and export reactive power to the generator OEM D-curve regardless of whether or not there is risk of tripping due to aux bus dropout? Doing so would constitute an inacceptable operational practice. 5. Note 2 should be deleted as well ("While not required by the standard, it is desirable to perform engineering analyses to determine expected applicable Facility capabilities under less restrictive system voltages than those encountered during the verification….") since there is no quantitative indication of what these other conditions should be or what such an analysis would mean. The line, "The recorded Mvar values were adjusted to rated generator voltage, where applicable," on P.21 should also be deleted. 6. Clarification is needed regarding the requirement in para. 2.1 of Att. 1 to verify capability, "at the applicable Facilities' normal (not emergency) expected maximum Real Power output at the time of the verifications." It is understood that a unit typically running for example at 720 MW in the summer and 740 in the winter could be reported at either value, depending on when the verification was performed; but the term "normal maximum" is inherently an oxymoron, given the dictionary definitions of "normal" as meaning standard, usual, typical, etc. and "maximum" as representing an extreme condition. Para. 2.1 should be changed to read, "within the Facilities' normal (not emergency) range of full load Real Power output at the time of the verifications," to indicate that readings within the dotted lines in the graph below are what's wanted, not the heavy, solid line. Note that normal power is never a single value, it is a range. It would be helpful to include a diagram on the subject, along with any statistical criteria involved in defining NERC's concept of the normal range. 7. The statement on p.15 that, "It is intended that Real Power testing be performed at the same time as full Load Reactive Power testing…," should be expunged. A considerable operational period must be reviewed to determine what the normal full-load real power range is, as explained in comment #4 above, and it is impossible to go back in time and insert a VAR test. 8. It would be helpful to state any coordination of units within a plant that is required or preferred for VAR testing. Running for example a three-unit plant with all units exporting MVARs together, then all importing together, will produce more conservative reactive power capabilities (i.e. the aux bus limits will sooner be encountered) than is the case for testing units one at a time with the other two under normal operation. Pull-together/push-together is the more realistic approach, however, for simulating the response of the plant to a Disturbance of the BES. 9. The reference to "maximum Real Power" in para. 2.2.2 of Att. 1 should be changed to match the terminology in para. 2.1, after modification per comment #6 above. 10. The requirement in para. 3.4 of Att. 1 that one record, "The ambient conditions, if applicable, at the end of the verification period that the Generator Owner requires to perform corrections to Real Power for different ambient conditions," are incomprehensible. It appears to indicate that in some cases ('if applicable") the GO may require that ambient corrections be performed, and in other cases they won't; but there is no indication when and if such calculations are mandatory, and there is no hint as to the reference conditions that GOs are supposed to correct-to. 11. Para. 4 of Att.1 should state that the simplified key one-line diagram need be no more detailed than that shown in Att. 2. Development of diagrams showing all aux transformers and real and reactive power flows would be unduly burdensome, and the wording of Att. 2 indicates that such a level of detail is not intended. 12. GSU losses should have a separate line in Att. 2, since they are not specifically a

tertiary load (item C in the Att. 2 diagram). 13. MOD-025 should not require "staged testing" without option. Staged testing should only be required if requested under TOP-002-2b R13. This will ensure the appropriate system conditions exist to support the testing (coordinated by the TOP and RC). This eliminates the GO from being required to perform testing that cannot be supported by the TOP and RC. Industry experience has shown that verification of the true reactive limits via staged testing is typically not possible due to transmission system constraints. Due to these constraints, an option to use engineering analysis for validation should be allowed by this standard. While the standard could allow staged testing as an option, we believe that staged testing should only be considered when there is a demonstrated need for the testing. 14. We do not see significant value in a 5-year re-verification cycle through staged testing. We believe a periodic confirmation that the previously verified MW and MVAR capabilities are still valid does have value. Re-verification should only be necessary when there is a long term configuration change, a major equipment modification, or equipment problems that impact the unit MW or MVAR capabilities. Possible equipment problems are being used as reason by some for wanting staged testing and periodic re-verification. Equipment problems that could limit real and reactive power capability generally manifest themselves during normal operation. These are appropriately addressed via normal operational reporting to satisfy requirements in TOP-002-2.1b and VAR-002-2b and are corrected through normal maintenance practices. Therefore, we do not agree that concerns for equipment problems justify periodic testing of every generator in the BES. Furthermore, that approach will subject the BES to a constant state of testing and off-normal operational conditions that we believe could actually prove to be detrimental to BES reliability.

We would suggest that there be something added to give those GO’s who have not modified their plants to be able to opt out of the re-verification. There is a concern that the updated data would be at least a year out of step with the development of the ERAG model in the eastern interconnect.

Suggest the SDT specifically identify or show examples of how to match the percentage thresholds outlined in the Effective Date sections of the Standard and the associated Implementation Plans. Given recent experience with other Standards, it would be helpful for the SDT to establish how the entities can demonstrate meeting the requisite threshold percentages. Over time, we have observed that in some cases percentages were established by the number of devices or units; but in other cases, the measurement has been based upon magnitude of nameplate ratings.

Attachment 1, Row Number 5, Recommend deleting “at the same physical location” from the Verification condition. The first condition is recommended to read “Existing applicable unit that is equivalent to another unit(s),”

Justification is that if a GO has units that are equivalent and meet the "sister" criteria, the standard does not need to be restricted to the same physical location. The GO identical equipment at different physical locations are still equivalent.
Step 4.2.3, Recommend adding "in" to the requirement to read "Generation in the ERCOT Interconnection ..." Justification is to be consistent with similar steps 4.2.1 and 4.2.2.

Verification requirements would be burdensome, e.g., model response by a load rejection test or comparison with a system frequency excursion may be of only limited value. Another basic problem with this standard is the unnecessary back and forth between generation owners and transmission planners in the data development and collection. This standard could be greatly simplified for all involved parties with reporting requirements similar to MOD-025 where the generation owner provides information to the transmission planner upon the installation of new equipment or the modification of existing equipment. Given the above, Transmission Planning recommends a vote against this standard in its present form.

R1 - The text would be more clear if rewritten to read 'Within 90 calendar days of receiving a written request, each Transmission Owner shall provide to its requesting Generator Owner:' 4.2 - The language immediately preceding the bullets is unclear: 'that meet the following' should perhaps be rewritten as 'provided they meet the following'. Effective Date Section 5.1 - Manitoba Hydro recommends changing the "R6" to "R5" because there is no "R6" in the standard. General Comment - Manitoba Hydro has a concern with respect to the phased in implementation measured by percent compliance. We believe that this may lead to a potential for some uncertainty and debate. Does a phased in implementation such as this, do anything to increase reliability?

We voted “Negative” on this standard the reasons shown below: This FIRST COMMENT was provided for MOD-025-1, MOD-026-1, MOD-027-1, and PRC-019-1. 1.SYNCHRONOUS CONDENSERS: The GVSDT is not working as a “team” with regards to synchronous condensers owned by TOs. The team working on this standard and PRC-019-1 INSIST that they be included as “applicable facilities,” while the team working on MOD-026-1 has stated otherwise. We provided this comment to the MOD-026-1 team in the last set of comments: “The exclusion of synchronous condensers (and other reactive devices) in MOD-026-1 per the rationale provided in the Background (with which we agree) states “Synchronous condensers are not currently addressed in the NERC Registry Criteria” However, companion standards under Project 2007-09 (MOD-025-2 and PRC-019-1) are applicable to synchronous condensers. The GVSDT should address this inconsistency.” The SDT responded as follows: “The SDT believes that MOD-026 is different from the other standards with respect to synchronous condensers due to the complex interaction required between the Transmission Planner and the Generator Owner, and thus believes it better to wait for efforts by others to define where synchronous condensers fit in the functional model.” In response to a similar comment on MOD-025-2 and PRC-019-1, we received these responses: MOD-025-1: “The GVSDT thanks you for your comment. There was overwhelming industry support (approximately 96%) for inclusion of synchronous condensers at the first posting of MOD-025-2. The Definition of Bulk Electric System (BOT Adoption Jan 2012) includes in “I5 – Static or dynamic devices (excluding generators) dedicated to supplying or absorbing Reactive Power that are connected at 100 kV or higher, or through a dedicated transformer with a high-side voltage of 100 kV or higher, or through a transformer that is designated in Inclusion I2.” PRC-019-1: “The SDT feels that it is appropriate to include synchronous condensers because of their similarity to generators in terms of dynamic reactive power supply, voltage control, disturbance response, control functions, and protection systems. For this reason the SDT proposes to apply to the standard to similar size generators and synchronous condensers.” We need to see “one” statement from the SDT on the inclusion or exclusion of synchronous condensers that makes sense technically, and soon. This SECOND COMMENT was provided for MOD-025-1, MOD-026-1, MOD-027-1, and PRC-024-1. 2.DATA SHARING POLICY: For all of the MOD standards in this, only Transmission Planners are the recipient of the data developed. We asked that the standard require that the TP be required to share the data with others. The response we received is that the Functional Model requires the TP to share data with the TOP. Unfortunately, the Functional Model is unenforceable. We note that in PRC-024-1 R6 requires the GO to share its data with the RC, PC, TOP, and TO, upon request. Unless the same data is shared across all “modelers,” the result will be outdated data in someone’s model, which can have a bad result. The team should have one broad “data sharing” policy in the three MOD standards and PRC-024-1. Since the TP receives data in three of the standards, we suggest this language or similar language: The GO shall provide data to its TP within 60 days of its development [describe the data]. The TP shall provide the same data to any RC, PC, TP, or TOP within 60 days of receiving a request for it.

Yes
Ingleside Cogeneration LP agrees that the explanation of the periodicity requirements are an improvement over previous versions.
Ingleside Cogeneration LP agrees that the ability for Transmission Planners to effectively model and simulate actual system response to frequency transients can lead to reliability improvements. In addition, the technical language used in the latest version of MOD-027-1 has been refined to an acceptable point in our view. However, we are concerned with the aggregate work load that all five standards in Project 2007-09 will place upon our engineering and operations organizations. Each has its own unique purpose, which means unique processes to support them – as well as test results that demonstrate compliance. With so much uncertainty surrounding this program, we cannot agree to proceed without the following items being addressed: 1) All requirements for recurring tests (R2) must contain language that focuses on the strength of the validation process – not the execution. This could be similar to that used in the CIP version 5 standards calling for the Responsible Entity to implement an action "in a manner that identifies, assesses, and corrects deficiencies". Experience has shown that without this preface, auditors will focus on missed due dates, whether or not all check boxes are filled in, and statements showing that every sub-requirement was addressed – even those not applicable to the facility. The CEA's focus needs to be on the entity's commitment to the validation effort, not the documentation. 2) The Compliance organization needs to be engaged in the development process so that industry stakeholders have a sense of how adherence to the standard will be determined. The existing process is disconnected – leading to inconsistent interpretations of the drafting team's original intent. Other projects have begun to post drafts of the RSAWs concurrently with the standards for exactly this reason. The SDT should take note that these modifications are consistent with the risk-based compliance direction that both NERC and FERC support. The intent is to focus industry and regulatory resources on the reliability aspects of the initiative – not its administrative aspects.

ATC recommends the following changes: 1. For Requirement 5, ATC recommends replacing the wording at the end of the requirement "that includes the following;" with "that includes how any of the following criteria are not met:" because the existing wording does not express that the criteria are not met when the model is not usable. 2. Attachment 1, Row 7, Verification Condition column – ATC agrees with the STD intention that base load units should be exempt because they are "not responsive to frequency excursion events". However, this insinuation of base load units is too vague. Therefore, ATC recommends additional wording to read "New or existing base loaded units are normally not responsive to a frequency excursion event". This makes it abundantly clear that this condition normally applies to base loaded units.
Individual
Ken Gardner

1. In section 4.2.2, The AESO considers the existing applicability for model validation to be more appropriate: • Connected to a transmission grid at 60 kV or higher voltage; and • single unit capacity of 10 MVA and larger; or • facilities with aggregate capacity of 20 MVA and larger. 2. Requirement R2, the AESO considers the existing validation period of 5 years to be more appropriate. 3. The AESO does not consider a partial load rejection test to be an appropriate method of model validation for base loaded units. 4. Requirement R4, as written it appears owners of generating units that plan to change out the governor are not required to provided preliminary (design) data to the Transmission Planner only validated data. The AESO does not consider this to be appropriate as this preliminary (design) data should be provided to the Transmission Planner in advance of the change.
Individual
Anthony Jablonski
ReliabilityFirst

ReliabilityFirst votes in the Negative for the draft MOD-027-1 standard since ReliabilityFirst believes there is a major disconnect/flaw between the Applicability Section (4.2. Facilities) and Requirement R2, part 2.1. This major flaw will create confusion on which generating units are required to be verified per the standard. ReliabilityFirst offers the following comments for consideration: 1. Requirements R2, Part 2.1 - There is a clear disconnect between the Applicability section of the standard (i.e. individual units/plants greater than 100MVA - Eastern or Quebec Interconnections) and Requirements R2, Part 2.1 which requires"… Verification of an individual unit less than 20 MVA." Based on the Applicability section, units less than 20 MVA are not applicable under this standard. Furthermore, units under 20 MVA do not fall under the NERC Statement of Compliance Registry Criteria as criteria for registration purposes for GOs and GOPs. 2.Applicability Section 4.2. Facilities – ReliabilityFirst thanks the SDT for their justification for the 100 MVA threshold, but still believes that the Applicability should be consistent with the NERC Statement of Compliance Registry Criteria generator thresholds (i.e. 20 MVA or 75 MVA aggregate connected to the BES). Even though the 100 MVA threshold covers 80% of the connected MVA or greater for each Interconnection (in aggregate), depending on the geographic location (within the BES), that value may be much less. For example, if there is a certain load pocket in which the majority of the connected generation is lest that 100 MVA, the dynamic models would not be required to be verified per this standard. Thus not having verified accurate dynamic models for this specific location could hinder the reliability of the BES. ReliabilityFirst recommends changing the Applicability section to be consistent with the NERC Statement of Compliance Registry Criteria generator thresholds (i.e. 20 MVA or 75 MVA aggregate connected to the BES).

No
In Row 5, the use of 350 MVA as the cutoff for "sister unit" treatment is not reasonable. We propose the limit can be increased to 500 MVA without any adverse reliability impacts. Also, in Row 6, the allowable time for existing units to be verified following an indication of model problems should be 2 years, rather than 1 year, since existing legacy units may require additional resources to understand and resolve the issues.
1. In 4.2.1.2, the use of the term "directly connected at a common BES bus" suggests that wind farms are not applicable facilities, since wind generators are typically directly connected to a non-BES bus (e.g. 34.5 kv). We suggest that the applicability to wind farms be clarified more explicitly. 2. In R1, the present wording allows for the TP to provide only one of the three types of data, even if the GO requested all three. We suggest removing the wording, "one or more of". 3. In R1, the present requirement is for the TP to provide instructions to the GO on how to obtain the acceptable models and associated block diagrams and data. We believe that since the TP is very familiar with this data and the GO may not be, it is far simpler and efficient for the TP to provide the actual data on request, not just the instructions on how to obtain it. 4. In R2.1.1, the GO is required to have documentation comparing the "model response" to the "recorded response", in this case MW vs. frequency. First, to determine the model response requires the ability to run dynamic studies. Generally the GO does not have the simulation capability or the subject matter experts required to perform dynamic system studies. It would seem that the intent of this requirement is that the GO must expend considerable resources to gain this capability, either internally or by other means. Is this the intent of the SDT? 5. In R3, the requirements for the written response to the TP need clarification. The term "either" would suggest there are two possible responses. However, there appear to be three possible responses. We suggest there needs to be a 4th possible response option for the GO, for the GO to initiate contact with the TP to schedule a meeting to discuss the technical issues with the model. The necessary collaboration between the GO and TP to understand the model deficiencies will require time, thus may require more than the 90 days to reconcile the model issues. 120 days is suggested. 6. There is a document problem with the first sentence in R4. 7. In Section 5 Effective Dates: The considerable time and resources needed to get up to speed with model verification suggests there needs to be more time allowed in the earlier phases of the compliance timeline. We suggest using 20 percent in 4 years, 40 percent in 6 years, and 100 percent in 10 years.

Attachment 1 Row 7 leaves the impression responding to frequency excursion is merely a choice and this impression is harmful to reliability. Few "applicable units" should be unresponsive to over and under frequency excursions. If Generator Owners can choose to not help regulate frequency by simply notifying the Transmission Planner, why would any Generator Owner continue to regulate frequency? The attachment should be changed so units are unresponsive to frequency excursions only under conditions accepted by the Transmission Planner.
No
The long periods in Attachment 1 introduce too much risk to modeling assumptions used to assess transmission system reliability and to make other operating and planning decisions which do not reflect or address the actual performance of the system and equipment. This standard should not only establish the maximum period that Transmission Planners and Generator Owners to complete tasks but also to require the Transmission Planners to establish more stringent requirements when necessary to reduce the risk to reliability to an acceptable level. In some jurisdictions, e.g., Ontario, Generator Owners have 30 days to transmit the verified model, documentation and data to the Transmission Planner. Generator Owners are also required to indicate immediately following testing whether the installed equipment performed as expected. This approach has worked well. New or modified equipment must first pass through a connection assessment process to establish whether expected performance will meet connection requirements. Emerging from this process is the Generator Owner's conditional right to connect provided he meets an obligation to demonstrate the installed equipment behaves as well as assumed during the assessment process. In this way, the risk to reliability is reduced to an acceptable level as the exposure of the decision making process to flawed modeling assumptions is minimized
a. All references to "real" power should be changed to "active" power to follow SI standard practice. b. One serious weakness is no there are explicit NERC performance requirements for frequency regulation. In some jurisdiction, e.g., Ontario, generating units are required to materially help regulate the frequency as the Transmission Planner sets performance requirements for droop, deadband and speed of response. All forms of generation are required to help regulate frequency to the extent practicable. For example, solar installations are required to reduce output during over frequency excursions. This standard in its present form allows "applicable units" to continue to not help regulate frequency could expose the BES to reliability risks. c. In Ontario, experience has been the models typically used by the Transmission Planner are not commonly employed by Generator Owners. The standard recognizes this in R1 by giving the obligation to the Transmission Planner to provide model block diagrams or data sheets to the Generator Owner. As the Transmission Planner may be unaware of practicable constraints on a unit and the Generator Owner may not be familiar with the reliability models, both parties must reach an accommodation on the details to verify the model. R2 should be changed so the Generator Owner is required to provide a model that has been verified by a method accepted by the Transmission Planner. If the Transmission Planner requires verification only with ambient measurements, then the Generator owner should be required to do verification in this way. This concept that the Transmission Planner should decide whether submissions it receives are suitable should permeate this standard. d. R2.1 should be amended (see below) to add flexibility to include other practical combinations of units to be used for verification. For example, it can be more practicable to test wind and solar installation one feeder at a time but this is not allowable with the standard in its present form. Each applicable unit's model shall be verified by the Generator Owner using one or more models acceptable to the Transmission Planner. Verification of an individual unit rated less than 20 MVA (gross nameplate rating) may be performed using either an individual unit, a combination of units, or plant aggregate model(s). e. In Ontario, we face resistance to our standards that exceed NERC requirements. It will be very helpful if the SDT in its response offers its opinion on elements of our comments that are not incorporated into the next version of this standard? For example, we would appreciate responses such as: "In the opinion of the SDT, having more applicable units on closed loop voltage control, reducing the time to transmit verified information to the Transmission Planner, having specific excitation performance requirements, expanding verified information to include limiters and other devices that affect excitation system performance, and making the requirements in this standard applicable to wider range of equipment are all practices that will tend to improve reliability." or "In the opinion of the SDT, the requirements in this standard are not intended to preclude continuing or implementing more stringent Transmission Planner requirements." This type of response would help us to continue to augment the continent-wide standard with additional requirements to maintain reliability in our part of the interconnection. f. We appreciate the SDT's effort to implement our proposed language changes to remove a potential conflict with the Ontario regulatory practice respecting the effective date of implementing approved standards. The added language, unfortunately, was not added at the appropriate places. We suggest the SDT to move the wording ", or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities," in Section 5.1 to right after "approved by applicable regulatory approval", and move that same wording to right after "following applicable regulatory

approval" in Sections 5.2 to 5.4. Also, the same phrase should be appended to each of the four bullets in the Section "In those jurisdictions where regulatory approval is required:" of the Implementation Plan right after "following applicable regulatory approval."

Yes
Yes
Southern Company agrees with the modifications to Attachment 1 (the Periodicity Table) as they both simplify and clarify the periodicity.
The SDT should consider moving the capacity factor exemption information found in Attachment 1, row 8 into the applicability section. The applicability section should allow an entity to be able to determine if the standard applies to them and be able to determine the scope of the facilities affected. It is best for those impacted to immediately know which units are in the scope and not have to realize the scope from a detailed study of the table of Attachment 1. This would allow row 8 of Attachment 1 to be deleted. Requirement R4 has a problem with the bookmark "Error! Bookmark not defined". We recommend removing the first element of the logical AND statement of Attachment 1 Row 5 (the same physical location element). If a GO has identical equipment at different physical locations, they are equivalent. A sister is a sister independent of the physical location. As long as the equipment is identical, the concept should be allowed to apply regardless of location.

FirstEnergy
Larry Raczkowski
Yes
Yes
Although FirstEnergy (FE) agrees with the revision to Attachment 1, we feel that the capacity factor calculation in Row 8 should be a part of Applicability section 4.2 Facilities. The reader of the standard shouldn't have to get to the last row of an attachment to determine as to whether a unit is exempt or not.
1.FE believes that Requirement 5 in an un-necessary requirement that the Transmission Planner must respond within 90 calendar days that the model is usable. The Transmission Planner should only respond if the information is not usable. We suggest that this requirement should be in a negative perspective and offer the following revision: R5. Each Transmission Planner shall notify the Generator Owner within 90 calendar days of receiving the turbine/governor and load control or active power/frequency control system verified model information in accordance with Requirement R2 that the model is not usable (see Sub-requirements 5.1 through 5.5), and shall include a technical description if the model is not usable that includes (but not limited to) the following: [Violation Risk Factor: Medium] [Time Horizon: Operations Planning] 5.1. The turbine/governor and load control or active power frequency control function model fails to to compute modeling data without error along with suggested areas for investigation, 5.2. A listing of parameters that fail the Transmission Planner's data checks, 5.3. A no-disturbance simulation fails to result in non negligible transients ("flat line"), 5.4. For an otherwise stable simulation, a disturbance simulation results in the turbine/governor and load control or active power/frequency control model exhibiting an under-damped or critically damped response, or otherwise fails the Transmission Planner's stability criteria. 5.5. The turbine/governor and load control or active power/frequency control model submitted by the Generator Owner is either a user defined model or a model that is not acceptable for use in the Transmission Planner's Regional Reliability Organization footprint

Utility Services
Utility Services suggests the SDT specifically identify or show examples of how to match the percentage thresholds outlined in the Effective Date sections of the standard and the associated Implementation Plans. Given our recent experience in other standards, it would be helpful for the SDT to establish how the entities can demonstrate meeting the requisite threshold percentages. Over time, we have observed that in some cases, percentages were established by the number of devices or units; but in other cases, the measurement has been based upon magnitude of nameplate ratings.

Requirement 2.1.1 states three separate ways to verify MW response for a synchronous generator, but uses the term "either of" when refering to the choice of tests, which implies two tests. Please clarify with either two tests or change the reference to "any of." In addition, one of the tests of 2.1.1 includes a partial load rejection. Such a test is already part of the Kestrel test procedures currently performed by Seattle City Light. It is not clear from the requirement and footnote if our existing test would be sufficient for validation or if the other two tests would also be required. Please clarify the language of R2.1.1.

1. The standard is based on the assumption that it is possible to tune the acceptable models cited in R1 such that their predictions will match actual power output responses to system Disturbances. The yet-to-be-defined acceptable models may not be capable of achieving this goal, however, because standard governor component models are inadequate to predict with high fidelity the generation system response that is the subject of MOD-027-1. Take for example a combined cycle plant with the CTs at base load output and the steam turbine in the sliding pressure mode (HPT control valves wide-open). Governor-only models will show a demand for increased output if a system frequency dip is postulated; yet absolutely nothing will happen in real life, because the fuel input to the CTs is already maxed-out and the STG has no throttle reserve. The situation for a fossil unit is analogous, with non-governor-model factors such as throttle reserve, boiler thermal inertia, mill ramp rates, control valve slew rate and hysteresis, the output cap associated with going VWO, furnace and duct pressure limits, fan stall run-back routines and the like all having an impact on the outcome, depending on the time-scale involved. Sustained Disturbances with fluctuations of system frequency above and below 60 Hz pose even greater challenges, as the response characteristics of controls systems for fuel, air, drum level etc. may become temporarily destabilized. A key clarification is needed in this respect. The references in R2.1.5 to “real power

response" and in R3 (3rd bull-dot) to "the recorded response" indicate that models complying with MOD-027-1 must cover the factors cited above, but R2.1.5 also speaks of elements that "override the governor response." Including in models only load control function blocks that impose a max-MW set point or otherwise modify the governor output signal may not pose a problem; but the effects of all factors that cause the actual MW response to lag or otherwise vary from the governor output demand signal can be captured only by dynamic simulators, not governor models. Simulators involve enormous cost and demand on engineering resources, and can be justified for only a handful of the largest generation plants. The SDT is therefore asking for a considerable advancement in the excitation modeling state of the art, to be undertaken in parallel by the owners of every generation unit in North America. This is a doubly daunting task in that GOs often do not have any dynamic modeling software or expertise, much less the ability to invent something new, because the present approach to the subject is that GOs just provide the values of input parameters to the TP, which owns and runs models. Independent GOs (i.e. deregulated entities that are not part of a vertically-integrated utility) moreover do not have and cannot obtain information on the system outside the plant battery limits. This circumstance renders them unable to model the plant-T&D interactions associated with Disturbances, and independent GOs may therefore forever remain unable to develop model results that closely match actual Disturbance responses. The approach being taken in MOD-027-1 is consequently viewed as being technically infeasible for the present state of the art as well as unjustified in light of FERC's March 15, 2012 FFT Order to propose specific standards or requirements that should be revised or Page 7 of 11 removed [or not enacted in the first place] due to having little effect on reliability or because of compliance burdens. The SDT should instead collaborate with industry associations (EPRI, IEEE, NAGF), equipment OEMs, and modeling services vendors to develop the right tools for the job, and put the new models through trial runs at several plants. These trials should be limited to data-collection means that can be non-invasively employed (e.g. short-term on-line monitoring, and controlled perturbations during normal-stop events), and should lead to definition of specific testing means for definition of specific model parameters. The SDT should then put out for voting a standard requiring TOPs to own and run these models and requiring GOs to provide them the appropriate input data, developed via the non-invasive means stated above. 2. The complexity of the task at hand is compounded by the circumstance that generation unit response may vary widely depending on the output level at the time a BES upset occurs (as in the combined cycle example above). There are no specifics in MOD-27-1 regarding this aspect of reliability standard scope, however, just a requirement that the model shall match the actual response. The implication appears to be that a close correlation is needed for all upset magnitudes and all possible initial conditions, which brings us back to the dynamic simulator objections in comment #1 above. 3. There is presently no definition of how closely the model must match the recorded response or for what period of time, just a requirement that it be deemed "usable" by the TP. The SDT is asking for a blank check, and we cannot agree to regulations for which it is impossible to say at the time of balloting whether or not compliance can be achieved, let alone in a fashion that is justified per the FERC order cited above. Perceived shortcomings in these respects would presumably trigger the Transmission Planner expression of concern described in R3, but it would be better to establish the rules up-front rather than addressing the matter only after a GO has attempted to comply with MOD-026 and been found lacking. . 4. R2.1.1 and the verification table in the standard allow the alternative of an on-line speed governor reference change test, but such testing is not always possible. Where it can be attempted there is risk of creating a larger-than-desired Disturbance, possibly threatening grid stability or tripping the generation unit. Making GOs create Disturbances if they do not naturally occur is not a good idea. NERC should consider directing TOPs to construct load banks, which they can tie-in and cut-out to jar the system for response test purposes. 5. R2.1.1 and the verification table also allow partial load-rejection tests. The SDT may have envisioned rejection to house load, followed by rapid re-synchronization, but such an outcome cannot be expected. House load is often below the minimum stable output (always below for coal-fired and nuclear plants), and it is always far below the minimum environmentally-acceptable load for fuel-burning units. The need to avoid over speed following load rejections meanwhile generally requires that the main steam stop valves be commanded closed at the same moment that a breaker-open signal is given. Trip testing may additionally be extremely disruptive and costly. Power Technologies, in their paper "Testing Methods, An Overview," states that five episodes may be required, which would be enormously expensive for combined cycle plants with a fixed dollars per trip figure written into the long-term service agreement. Page 8 of 11 Such expenditures might nonetheless be justified, if the information obtained is of sufficient value; but, as explained in comment #1 above, trip tests will yield data only for standard governor models and not for the on-line extra functions for which information is evidently being sought. Footnote 2 of MOD-027-1 indicates recognition of this shortcoming. The solutions offered however, "Differences between the control mode tested and the final simulation model must be identified," and "some method of accounting for these differences must be presented," are too vague and constitute no solution at all. It would be better to just admit that trip testing can't get the job done. 6. The instruction in R4 to notify the TP, "within 180 calendar days of making changes to the turbine/governor and load control or active power/frequency control," is too vague, despite the attempted clarification in footnote #5, since many activities can have some degree of impact as noted above. Reportable thresholds regarding degree of impact on system response and the expected duration are needed. Would an output power restriction due to a broken coal feeder belt be reportable, for example? 7. The SDT should consider moving the capacity factor exemption information found in Attachment 1, row 8 into the applicability section. The applicability section should allow an entity to be able to determine if the standard applies to them and be able to determine the scope of the facilities affected. It is best for those impacted to immediately know which units are in the scope and not have to realize the scope from a detailed study of the table of Attachment 1. This would allow row 8 of Attachment 1 to be deleted. 8. We

recommend removing the first element of the logical AND statement of Attachment 1 Row 5 (the same physical location element). If a GO has identical equipment at different physical locations, they are equivalent. A sister is a sister independent of the physical location. As long as the equipment is identical, the concept should be allowed to apply regardless of location.

Consumers' previous comments - The generator model with the excitation system and the load rejection testing or frequency step response testing is difficult to perform and has possibilities of damaging equipment and causing reliability issues on the system in order to perform. Previous SDT reply - The GVSDT thanks you for your comment. MOD-027 is written to allow for the use of ambient monitoring, recorded data associated with the normal operation of your equipment. A GO with your concerns can alleviate the issues you mention using ambient monitoring. While we agree with the reply by the SDT when ambient monitoring is available, it is not available on all of our equipment. Therefore, we stand by our previous comments.

Idaho Power System Planning agrees with the revisions made to Attachment 1.
Yes

Idaho Power System Planning agrees with the revisions made to Attachment 1.
Attachment 1 – Note 1 Idaho Power System Planning comments Attachment 1 discusses unit model verification to a frequency excursion using a recorded response from the generating unit. Attachment 1, Note 1 defines the frequency deviation criteria. Idaho Power System Planning asks the GVSDT to include the minimum acceptable data sampling criteria of the recording equipment as part of the Note 1 criteria. Requiring each Transmission Planner to maintain a list of acceptable models, and then requiring Generator Owners to submit data according to those models is unreasonable. The list of acceptable models needs to be at least regional, if not continent-wide. In addition, some required longevity needs to be specified to allow Generator Owners to appropriately plan and perform the verification work.

We believe that there is a discrepancy between the language in the requirement and VSL for R4 and Row 4 of the Attachment 1. In the requirement, a 180 day period is stated, while in Row 4 of Attachment 1, a 365 day period is stated.
Yes
(1)As a general comment, NERC should make all the papers listed in the references section of the standard readily available on their website. (2)There appears to be an extra word "thirty" in both redline and clean versions of the standard under section 5.3 of the Effective Date section of the draft standard. (3)As we understand, part of R1 is for the Transmission Planner to provide instructions on how to obtain the list of acceptable model types for use in dynamic simulations. In this regard, we ask the SDT if this would preclude the use of user-written models? (4)We still have serious concerns about compliance with new MOD-027-1 while compliance with MOD-012-0 and MOD-013-1 is still in effect as explained in our response to draft MOD-026-1. We strongly request the SDT seriously consider incorporating the current MOD-012/MOD-013 submittal requirements within MOD-026 and MOD-027. This will synchronize the reporting and verification requirements and help minimize the resource burden of compliance with both efforts. At the same time it will create consistency across the country.

1. Exelon previously commented that MOD-027-1 R5 implies that it is the Generator Owner's responsibility to ensure that the model is "useable" based on the criteria specified in Parts 5.1 through 5.3; however, it is at the discretion of the Transmission Planner. As written, the requirement gives the Transmission Planner the discretion to reject the model based on governor response to a frequency deviation (positive damping) which appears to be outside of the original purpose of Project 2007-09. Exelon again reiterates that the usability of the model should not be confused with a model that accurately represents the generating unit governor and provides projected results. 2. Please confirm that the number of generating units combined into the percentage for implementation of unit verification includes those generating units that may have a documented exclusion such as an existing unit that does not have an installed control system. 3. MOD-027-1 R4 appears to have a formatting issue – the statement "Error! Bookmark not defined" is in bold letters within the requirement.

1) Considering the proposed new BES definition and the Guidance Document, there may be confusion in determining if a generator is “directly connected” to the BES. Please consider reviewing the language to see if it should instead say “included in” the BES. Note that a BES generator can be connected to the BES by non-BES elements, and arguably not “directly connected” to the BES. See, for example, figures E1-4 and E1-6 in the BES Definition Guidance Document. 2) Requirement R4: Suggest removing the phrase “or plans . . .” and rewording as “Each Generator Owner shall provide revised model data for each applicable unit . . ..” There appears to be a footnote error here – delete “6”? 3) TRE recommends changing to “Planning Authority or Transmission Planner” in the Functional Entities in Section 4.1.2 instead of “Transmission Planner”. This change should be duplicated in the requirements. The change may be needed since the Planning Authority or the Transmission Planner may have the responsibility for modeling the generation data provided by the Generator Owners.

(1) While the clarity of Attachment 1 has been improved, we noticed a couple of issues. Note 3 provides guidance for early compliance and we agree that early compliance should be allowable. It establishes that 10 year period begins from the transmittal date. If a GO has data that satisfies the early compliance condition for a verified model and that data is a five years old, the Note would appear to allow the GO to transmit the data to the TP and receive credit for next 10 years effectively creating an initial 15-year re-verification cycle. Is this intended? If not, please provide more guidance for how soon the GO would have to re-verify its model. (2) Row 4 in Attachment 1 states

that it applies to initial verification for a newly applicable unit or for an existing applicable unit with a new turbine/governor and load control or active power/frequency control equipment control system. However, Requirement R4 also applies to changes to the same control system. Wouldn't complete replacement be a change? We recommend modifying Attachment 1 to avoid this overlap. (3) Per Requirement R4 and Row 6 in attachment 1, the GO has 180 days to submit a plan to Transmission Planner to verify the model and then another 365 days to perform the model verification date. That would appear to give the GO approximately a year and half to complete the verification for changes (including replacement) to the control system. Requirement R2 and Row 4 appear to require completion of the verification in 365 days or a year. Please modify the table or requirement to clarify appropriate application.
(1) Thank you for modifying the applicability section. It is greatly improved and is much clearer than the previous version. However, we believe there are a few additional minor refinements necessary. First, generators can be and are part of the Bulk Electric System. Thus, we suggest changing "Facilities that are directly connected to the Bulk Electric System (BES)" to "generation Facilities that are part of the Bulk Electric System." Otherwise, there might be some confusion if the drafting team intends to draw in generators that are not part of the BES. Second, we find the wording "will be collectively referred as an 'applicable unit' that meet the following" confusing. We think the intent was to clarify that an applicable unit is one that is part of the BES and meets criteria established in section 4.2.1, 4.2.2, and 4.2.3. However, we think the inclusion of the "will be collectively referred as an 'applicable unit'" is superfluous. Because the section is the applicability section, we think this language could be struck for clarity and the applicable units will be understood to mean those that meet the criteria in section 4.2. As an alternative, the drafting team could explain in a footnote what they mean by the term applicable unit. Third, with the two proposed changes, we think the final wording of section 4.2 after the opening clause should be "generation Facilities that are part of the Bulk Electric System (BES) that meet the following criteria:". (2) In requirement R2, please change "for each applicable unit" to "for each of its applicable units." This is the previous wording and is more correct. The current wording literally says that the GO must provide a verified model for each applicable unit including those it does not own. After all any unit that meets applicability criteria including those owned by other GOs would be an applicable unit. (3) Please specify in M1 that a Transmission Planner may also provide an attestation that no such request was received if this is the case. Use of an attestation that an event did not occur is established as an acceptable form of evidence in CAN-0030. Furthermore, precedent has been set in the use of attestations in measures in FAC-003-2 M1 and M2. (4) We continue to believe that the examples provided in the comment form should be included in the standard. Please create an Application Guidelines or Guidelines and Technical Basis section in the standard and add them. This has become common practice with developing standards. We do not understand why the drafting team would not want to retain such information that helps readers understand the standard and that has already been developed. Furthermore, it would make it easier for commenters to see what has changed in the examples because a red-line of the standard is required. Because the examples were contained in the comment form this time and during the previous posting, it is not easy to deduce the changes because there is no red-line. If the examples are not included in the standard, please provide more explanation than was provided during the last response to comments which was that it is not appropriate to include the examples. We do not understand why it is not appropriate. (5) We disagree with the need to retain the latest model verification evidence under Requirement R2 and M2. First, this is not consistent with the Section 3.1.4.2 of Appendix 3c to the NERC Rules of Procedure section which states that the audit will cover the period from the day after the last compliance audit to the end date of the current compliance audit. Since the audit cycle for a GO is six years and the model verification period is 10 years, the GO will have to retain data past its prior audit period. Furthermore, the auditor will have already had an opportunity to review the model verification data during the last audit. Presumably, if they did not find any compliance violations, there should not be a need to review this data again. Thus, the data retention should not exceed the six year audit cycle. (6) How will mothballed units be handled in Attachment 1? If a mothballed unit is returned to service which row in Attachment 1 applies? What if the unit was mothballed before the effective date and returned to service after all stages of the effective dates? What if it was mothballed after an initial verification? How does this affect the next verification date?

Why wouldn't the GVSDT just identify (i.e. show reference note on Attachment 1 table) that "Applicable units does not include units that don't respond to frequency excursions (e.g. base-loaded units)"?
In trying to follow the flow of this standard, it is obvious that R1 precedes R2 logically. But then it also appears that possibly R5 actually takes place before R3. There does not seem to be any requirement for the Transmission Planner to provide Written Comments to the GO that address the second and third bullet points of R3. It seems that a requirement should be added for the TP to provide written comments for any of the 3 bullets shown in R3; however, only the first bullet of R3 has been required of the TP (in R5) as the standard is currently written in Draft 3. The first element of the logical AND statement of Attachment 1 Row 5 (the same physical location element). If a

GO has identical equipment at different physical locations, they are equivalent. Equivalency of units should be independent of the physical location. Other minor edits: • In A.5.1 for the Effective Date, it should say R3 through R5 (not R6, as there is no R6). • Also, by footnote 4 on R4, there appears to be some sort of "Error! Bookmark" from when the footnotes were changed. The standard is based on the assumption that it is possible to tune the acceptable models cited in R1 such that their predictions will match actual power output responses to system Disturbances. The yet-to-be-defined acceptable models may not be capable of achieving this goal, however, because standard governor component models are inadequate to predict with high fidelity the generation system response that is the subject of MOD-027-1. Take for example a combined cycle plant with the CTs at baseload output and the steam turbine in the sliding pressure mode (HPT control valves wide-open). Governor-only models will show a demand for increased output if a system frequency dip is postulated; yet absolutely nothing will happen in real life, because the fuel input to the CTs is already maxed-out and the STG has no throttle reserve. The situation for a fossil unit is analogous, with non-governor-model factors such as throttle reserve, boiler thermal inertia, mill ramp rates, control valve slew rate and hysteresis, the output cap associated with going VWO, furnace and duct pressure limits, fan stall run-back routines and the like all having an impact on the outcome, depending on the time-scale involved. Sustained Disturbances with fluctuations of system frequency above and below 60 Hz pose even greater challenges, as the response characteristics of controls systems for fuel, air, drum level etc may become temporarily destabilized. A key clarification is needed in this respect. The references in R2.1.5 to "real power response" and in R3 (3rd bull-dot) to "the recorded response" indicate that models complying with MOD-027-1 must cover the factors cited above, but R2.1.5 also speaks of elements that "override the governor response." Including in models only load control function blocks that impose a max-MW setpoint or otherwise modify the governor output signal may not pose a problem; but the effects of all factors that cause the actual MW response to lag or otherwise vary from the governor output demand signal can be captured only by dynamic simulators, not governor models. Simulators involve enormous cost and demand on engineering resources, and can be justified for only a handful of the largest generation plants. The SDT is therefore asking for a considerable advancement in the generator modeling state of the art, to be undertaken in parallel by the owners of every generation unit in North America. This is a doubly daunting task in that GOs often do not have any dynamic modeling software or expertise, much less the ability to invent something new, because the present approach to the subject is that GOs just provide the values of input parameters to the TP, which owns and runs models. Independent GOs (i.e. deregulated entities that are not part of a vertically-integrated utility) moreover do not have and cannot obtain information on the system outside the plant battery limits. This circumstance renders them unable to model the plant-T&D interactions associated with Disturbances, and independent GOs may therefore forever remain unable to develop model results that closely match actual Disturbance responses. The approach being taken in MOD-027-1 is consequently viewed as being technically infeasible for the present state of the art as well as unjustified in light of FERC's March 15, 2012 FFT Order to propose specific standards or requirements that should be revised or removed [or not enacted in the first place] due to having little effect on reliability or because of compliance burdens. The SDT should instead collaborate with industry associations (EPRI, IEEE, NAGF), equipment OEMs, and modeling services vendors to develop the right tools for the job, and put the new models through trial runs at several plants. These trials should be limited to data-collection means that can be non-invasively employed (e.g. short-term on-line monitoring, and controlled perturbations during normal-stop events), and should lead to definition of specific testing means for definition of specific model parameters. The SDT should then put out for voting a standard requiring TOPs to own and run these models and requiring GOs to provide them the appropriate input data, developed via the non-invasive means stated above. The complexity of the task at hand is compounded by the circumstance that generation unit response may vary widely depending on the output level at the time a BES upset occurs (as in the combined cycle example above). There are no specifics in MOD-27-1 regarding this aspect of reliability standard scope, however, just a requirement that the model shall match the actual response. The implication appears to be that a close correlation is needed for all upset magnitudes and all possible initial conditions, which brings us back to the dynamic simulator objections in our comments above. There is presently no definition of how closely the model must match the recorded response or for what period of time, just a requirement that it be deemed "usable" by the TP. The SDT is asking for a blank check, and we cannot agree to regulations for which it is impossible to say at the time of balloting whether or not compliance can be achieved, let alone in a fashion that is justified per the FERC order cited above. Perceived shortcomings in these respects would presumably trigger the Transmission Planner expression of concern described in R3, but it would be better to establish the rules up-front rather than addressing the matter only after a GO has attempted to comply with MOD-026 and been found lacking. R2.1.1 and the verification table in the standard allow the alternative of an on-line speed governor reference change test, but such testing is not always possible. Where it can be attempted there is risk of creating a larger-than-desired Disturbance, possibly threatening grid stability or tripping the generation unit. Making GOs create Disturbances if they do not naturally occur is not a good idea. NERC should consider directing TOPs to construct load banks, which they can tie-in and cut-out to jar the system for response test purposes. R2.1.1 and the verification table also allow partial load-rejection tests. The SDT may have envisioned rejection to house load, followed by rapid re-synchronization, but such an outcome cannot be expected. House load is often below the minimum stable output (always below for coal-fired and nuclear plants), and it is always far below the minimum environmentally-acceptable load for fuel-burning units. The need to avoid overspeed following load rejections meanwhile generally requires that the main steam stop valves be commanded closed at the same moment that a breaker-open signal is given. Trip testing may additionally be extremely disruptive and costly. Power Technologies, in their paper "Testing Methods, An

Overview," states that five episodes may be required, which would be enormously expensive for combined cycle plants with a fixed dollars per trip figure written into the long-term service agreement. Such expenditures might nonetheless be justified, if the information obtained is of sufficient value; but, as explained in our comments above, trip tests will yield data only for standard governor models and not for the on-line extra functions for which information is evidently being sought. Footnote 2 of MOD-027-1 indicates recognition of this shortcoming. The solutions offered however, "Differences between the control mode tested and the final simulation model must be identified," and "some method of accounting for these differences must be presented," are too vague and constitute no solution at all. It would be better to just admit that trip testing can't get the job done. The instruction in R4 to notify the TP, "within 180 calendar days of making changes to the turbine/governor and load control or active power/frequency control," is too vague, despite the attempted clarification in footnote #5, since many activities can have some degree of impact as noted above. Reportable thresholds regarding degree of impact on system response and the expected duration are needed. Would an output power restriction due to a broken coal feeder belt be reportable, for example?

A stated purpose of Generator Verification is "to ensure that generator models accurately reflect the generator's capabilities and operating characteristics." Modeling behind-the-meter generation based on gross name-plate ratings will not accurately reflect those assets' capabilities or operating characteristics, and, in fact, may seriously distort BES expansion plans or other modeling scenarios if name-plate ratings are used. Behind-the-meter generation is a misnomer. It is not comparable to utility or merchant generation in which the primary function is to deliver electric energy to the bulk electric system. The primary function of behind-the-meter generation that employs cogeneration or combined heat and power (CHP) systems is to deliver thermal energy (usually in the form of steam) in support of the load's process technology. In the case of industrial loads, the capabilities or operating characteristics of that process are a function of the load's production schedule associated with its products (e.g., chemicals, petroleum, paper, etc.) and independent of conditions on the BES. Any electric power delivered to the BES is a residual by-product of the industrial process and generally a small fraction of the name-plate rating of the generator. Section III.c.4 of the Statement of Compliance Registry Criteria (v.5) and Exclusion E2 of the revised BES definition both recognize this fundamental characteristic of behind-the-meter generation and that is why neither document uses name-plate rating as a useful metric for behind-the-meter generation. The GVSDT is urged to do the same.

Oncor does not support the position that the Transmission Planner (TP) is applicable for this standard. In the ERCOT Interconnection, Section 3 and Section 5 of the ERCOT Nodal Operating Guides prescribes the ERCOT ISO to request and receive generation unit performance data, not the TP. Oncor takes the position that a regional variance be granted for the ERCOT Interconnection such that the standard would prescribe that the Planning Authority (PA) only be the only requestor and receiver of unit performance data to support Section 3 and Section 5 of the ERCOT Nodal Operating Guides.

Cowlitz PUD
No
Cowlitz supports the comments of the NAGF SRT: 1. The SDT should consider moving the capacity factor exemption information found in Attachment 1, row 8 into the applicability section. The applicability section should allow an entity to be able to determine if the standard applies to them and be able to determine the scope of the facilities affected. It is best for those impacted to immediately know which units are in the scope and not have to realize the scope from a detailed study of the table of Attachment 1. This would allow row 8 of Attachment 1 to be deleted.
Yes
Cowlitz supports the comments from the NAGF SRT: 1. The standard is based on the assumption that it is possible to tune the acceptable models cited in R1 such that their predictions will match actual power output responses to system Disturbances. The yet-to-be-defined acceptable models may not be capable of achieving this goal, however, because standard governor component models are inadequate to predict with high fidelity the generation system response that is the subject of MOD-027-1. Take for example a combined cycle plant with the CTs at base load output and the steam turbine in the sliding pressure mode (HPT control valves wide-open). Governor-only models will show a demand for increased output if a system frequency dip is postulated; yet absolutely nothing will happen in real life, because the fuel input to the CTs is already maxed-out and the STG has no throttle reserve. The situation for a fossil unit is analogous, with non-governor-model factors such as throttle reserve, boiler thermal inertia, mill ramp rates, control valve slew rate and hysteresis, the output cap associated with going VWO, furnace and duct pressure limits, fan stall run-back routines and the like all having an impact on the outcome, depending on the time-scale involved. Sustained Disturbances with fluctuations of system frequency above and below 60 Hz pose even greater challenges, as the response characteristics of controls systems for fuel, air, drum level etc. may become temporarily destabilized. A key clarification is needed in this respect. The references in R2.1.5 to "real power response" and in R3 (3rd bull-dot) to "the recorded response" indicate that models complying with MOD-027-1 must cover the factors cited above, but R2.1.5 also speaks of elements that "override the governor response." Including in models only load control function blocks that impose a max-MW set point or otherwise modify the governor output signal may not pose a problem; but the effects of all factors that cause the actual MW response to lag or otherwise vary from the governor output demand signal can be captured only by dynamic simulators, not governor models. Simulators involve enormous cost and demand on engineering resources, and can be justified for only a handful of the largest generation plants. The SDT is therefore asking for a considerable advancement in the excitation modeling state of the art, to be undertaken in parallel by the owners of every generation unit in North America. This is a doubly daunting task in that GOs often do not have any dynamic modeling software or expertise, much less the ability to invent something new, because the present approach to the subject is that GOs just provide the values of input parameters to the TP, which owns and runs models. Independent GOs (i.e. deregulated entities that are not part of a vertically-integrated utility) moreover do not have and cannot obtain information on the system outside the plant battery limits. This circumstance renders them unable to model the plant-T&D interactions associated with Disturbances, and independent GOs may therefore forever remain unable to develop model results that closely match actual Disturbance responses. The approach being taken in MOD-027-1 is consequently viewed as being technically infeasible for the present state of the art as well as unjustified in light of FERC's March 15, 2012 FFT Order to propose specific standards or requirements that should be revised orremoved [or not enacted in the first place] due to having little effect on reliability or because of compliance burdens. The solutions offered however, "Differences between the control mode tested and the final simulation model must be identified," and "some method of accounting for these differences must be presented," are too vague and constitute no solution at all. It would be better to just admit that trip testing can't get the job done. 6. The instruction in R4 to notify the TP, "within 180 calendar days of making changes to the turbine/governor and load control or active power/frequency control," is too vague, despite the attempted clarification in footnote #5, since many activities can have some degree of impact as noted above. Reportable thresholds regarding degree of impact on system response and the expected duration are needed. Would an output power restriction due to a broken coal feeder belt be reportable, for example? 7. We recommend removing the first element of the logical AND statement of Attachment 1 Row 5 (the same physical location element). If a GO has identical equipment at different physical locations, they are equivalent. A sister is a sister independent of the physical location. As long as the equipment is identical, the concept should be allowed to apply regardless of location.

Attachment 1, Row 4 allows for transmission of a verified model 365 days after commissioning of a new generator. This is an unacceptable length of time for a generator to be on-line from both a reliability standpoint and this length of time is in conflict with ISO/RTO Standard Generator Interconnection Agreement language. The ISO/RTO Standard Generator Interconnection language requires Generator Owners to provide verified models ***prior to*** Commercial Operation.
Kathleen Goodman
ISO-New England
Attachment 1, Row 8 has a reference to capacity factor. The capacity factor section has been removed from the body of the standard. If the capacity factor is still part of the standard by it's existence in the Attachment then this is unacceptable. Older large units with low capacity factors will be called upon to operate during extreme weather events when the system is most stressed. System reliability will be compromised if the modeled characteristics of the units differ from what is actually installed in the field.

Requirement R1 may bring out some concern over the copyrighted models supplied by the simulation software vendors. Hopefully this can be worked out with the vendors.

Requirement R3 might only require a “written response” from a Generator Owner to the Transmission Planners notification that a model is not useable with some technical basis for keeping the current model that is not usable. Wording must be included so that ultimately the Generator Owner shall provide a “usable model” to the Transmission Planner.

Requirement R5 sub-requirement wording should be changed to indicate the Transmission Planner shall notify the Generator Owner if the excitation model does not initialize, a no-disturbance simulation results in transients or a disturbance simulation results in a model exhibiting negative damping.

R1 appears to have been written with ever-evolving T&D systems in mind. It should be made clear that all that would be needed every five years for a generation unit that has had no changes affecting the systems in question is an attestation to this effect, not a new coordination study, It should also be made clear that the in-service limiters referenced in R1 and R1.1.1 pertain where they exist. That is, it is not necessary to have a pre-Protection-System limiter for every relay listed in sect. G of PRC-019-1 (i.e. there is not a relay that stands behind every limiter). Section 1.1.2 should be struck – as this is covered under the direction of other standards such as EOP-003. The non-exclusive nature of the listing in section G is a concern regarding proof of compliance. This is, it would be burdensome to have to document a rationale for all relays and excitation system and voltage regulator functions for which a PRC-019-1 study is felt to not be required. The sect. G list should be complete and exclusive. The term “blackstart unit material” in applicability para. 4.2.4 (p.2) is not understood. We suggest that the SDT remove the term “blackstart unit material” or clarify when a blackstart unit designated as part of the Transmission Operator’s restoration plan would be immaterial. Coordination studies are often performed by third-party contractors, with only the resultant relay settings being in a Generator’s possession. The calculations can be re-performed, but at substantial cost; and, excepting units that are critical to the BES, it is not clear that the required expenditure is justifiable. PRC-019-1 should be made applicable to GOs only for Critical Assets, since damage to a generator outside this category would not imperil BES reliability.

Suggest the SDT specifically identify or show examples of how to match the percentage thresholds outlined in the Effective Date sections of the Standard and the associated Implementation Plans. Given recent experience with other Standards, it would be helpful for the SDT to establish how the entities can demonstrate meeting the requisite threshold percentages. Over time, we have observed that in some cases percentages were established by the number of devices or units; but in other cases, the measurement has been based upon magnitude of nameplate ratings.

Attachment 1 and Attachment 2 have been revised since the last draft. In these latest set of attachments, although the Zone 2 loss of field characteristic has been set to operate prior to the Steady State Stability Limit (SSSL) is reached, it is also set so that it would operate prior to the generator capability curve being exceeded. This appears to be in conflict with the intent of the standard to ensure that protection should not operate before the equipment capability is exceeded. The Zone 2 characteristic should properly be set between the Generator Capability Curve and the Steady State Stability Limit. As such, Figures A.6 and A.7 in IEEE C37.102-2006 might be better coordination examples to use for these attachments.

R1 - Manitoba Hydro finds the wording ‘At a maximum of every five calendar years’ awkward. We suggest changing the wording to read ‘at least once every five calendar years’. R1.1.2 - Manitoba Hydro suggests deleting R1.1.2 which reads, “The applicable in-service Protection System devices are set to operate, isolate or de-energize equipment, in order to limit the extent of damage when operating conditions exceed equipment capabilities or stability limits”. Since these are fundamental functions of any protection system device, there is no need to include this in the NERC standard. R1.1.1 - Is AVR defined somewhere? We could not find its definition in the Glossary. General Comments - 1. Manitoba Hydro has a concern with respect to the phased in implementation measured by percent compliance. We believe that this may lead to a potential for some uncertainty and debate. Does a phased in implementation such as this, do anything to increase reliability?. 2. The concept of equivalent unit testing should be applied to both synchronous condensers and generators. Equivalent units are addressed in Row 5 of MOD-027-1 Attachment 1, but it is not clear if this attachment applies to PRC-019. We would suggest that “Attachment 1” from MOD-027-1 be added to all of the standards included in this project. 3. Attachment 1 of MOD-026-1 (Note 2) and M0D-027-1 (Note 3) contain a section titled “Consideration for early Compliance” with language pertaining to previous testing and model verification which were completed under the applicable regional policies, guidelines or criteria or which are compliant with the requirements of the standard. Manitoba Hydro recommends that similar

language be included in the other standards (PRC-019-1, MOD-025-2 and PRC-024-1).

Yes
Yes
Regarding the "Functional Entities" listed in the Applicability Section, it is not clear how PRC-019 can only apply to TOs that own synchronous condensers because R1 & R2 require GOs to communicate with TOs regarding the generation equipment subject to the standard (units over 20 MVA, units connected at a common bus with total generation over 75 MVA, and blackstart units in the TOPs restoration plan). Regarding the "Facilities" listed in the Applicability section, BPA believes that Section 4.2.4 should apply to blackstart units designated as part of a TOP's restoration plan. The phrase "material to and designated as part of" the restoration plan creates ambiguity and would seem to require TOPs & GOs to agree on which generators are "material to" the blackstart plan. R2 is designated as a Long-Term Planning standard, but appears to allow coordination within 90 days following the implementation of setting changes. The phrase "Within 90 calendar days following the identification or implementation of systems, equipment or setting changes that will affect the coordination described in Requirement R1," is not clear. R1 requires coordination at least once every five years. R2 should require coordination before implementation of system, equipment, or setting changes, not within 90 days after.

We voted "Negative" on this standard the reasons shown below: This FIRST COMMENT was provided for MOD-025-1, MOD-026-1, MOD-027-1, and PRC-019-1. 1.SYNCHRONOUS CONDENSERS: The GVSDT is not working as a "team" with regards to synchronous condensers owned by TOs. The team working on this standard and PRC-019-1 INSIST that they be included as "applicable facilities," while the team working on MOD-026-1 has stated otherwise. We provided this comment to the MOD-026-1 team in the last set of comments: "The exclusion of synchronous condensers (and other reactive devices) in MOD-026-1 per the rationale provided in the Background (with which we agree) states "Synchronous condensers are not currently addressed in the NERC Registry Criteria" However, companion standards under Project 2007-09 (MOD-025-2 and PRC-019-1) are applicable to synchronous condensers. The GVSDT should address this inconsistency." The SDT responded as follows: "The SDT believes that MOD-026 is different from the other standards with respect to synchronous condensers due to the complex interaction required between the Transmission Planner and the Generator Owner, and thus believes it better to wait for efforts by others to define where synchronous condensers fit in the functional model." In response to a similar comment on MOD-025-2 and PRC-019-1, we received these responses: MOD-025-1: "The GVSDT thanks you for your comment. There was overwhelming industry support (approximately 96%) for inclusion of synchronous condensers at the first posting of MOD-025-2. The Definition of Bulk Electric System (BOT Adoption Jan 2012) includes in "I5 – Static or dynamic devices (excluding generators) dedicated to supplying or absorbing Reactive Power that are connected at 100 kV or higher, or through a dedicated transformer with a high-side voltage of 100 kV or higher, or through a transformer that is designated in Inclusion I2." PRC-019-1: "The SDT feels that it is appropriate to include synchronous condensers because of their similarity to generators in terms of dynamic reactive power supply, voltage control, disturbance response, control functions, and protection systems. For this reason the SDT proposes to apply to the standard to similar size generators and synchronous condensers." We need to see "one" statement from the SDT on the inclusion or exclusion of synchronous condensers that makes

sense technically, and soon. 2.No reliability benefit has been demonstrated for having the coordination review required by R1 done every five years. We suggest that the R1 be modified so that it's clear that the entities must "verify" coordination upon the effective date ONLY, but not every 5 years thereafter. The effective date Section 5, part 5.1.1 states "By the first day of the first calendar quarter, two calendar years following applicable regulatory approval each Generator Owner and Transmission Owner shall have verified at least 40 percent of its applicable Facilities." Therefore, we suggest that R1 be rewritten as follows: "BY ITS EFFECTIVE DATE IN SECTION 5, each Generator Owner and Transmission Owner with applicable Facilities shall VERIFY the COORDINATION OF the voltage regulating system controls, (including in-service limiters and protection functions) with the applicable equipment capabilities and settings of the applicable Protection System devices and functions."

Yes
Ingleside Cogeneration LP agrees that the proper coordination between a generator's voltage limiters, protective relay settings, and its stability limits can best assure its availability in response to transient conditions. However, we are concerned with the aggregate work load that all five standards in Project 2007-09 will place upon our engineering and operations organizations. Each has its own unique purpose, which means unique processes to support them – as well as test results that demonstrate compliance. With so much uncertainty surrounding this program, we cannot agree to proceed without the following items being addressed: 1) All requirements for recurring assessments (R1) must contain language that focuses on the strength of the validation process – not the execution. This could be similar to that used in the CIP version 5 standards calling for the Responsible Entity to implement an action "in a manner that identifies, assesses, and corrects deficiencies". Experience has shown that without this preface, auditors will focus on missed due dates, whether or not all check boxes are filled in, and statements showing that every sub-requirement was addressed – even those not applicable to the facility. The CEA's focus needs to be on the entity's commitment to the validation effort, not the documentation. 2) The Compliance organization needs to be engaged in the development process so that industry stakeholders have a sense of how adherence to the standard will be determined. The existing process is disconnected – leading to inconsistent interpretations of the drafting team's original intent. Other projects have begun to post drafts of the RSAWs concurrently with the standards for exactly this reason. The SDT should take note that these modifications are consistent with the risk-based compliance direction that both NERC and FERC support. The intent is to focus industry and regulatory resources on the reliability aspects of the initiative – not its administrative aspects.

1. In R1.1.2, we suggest revising the sentence to : “The applicable in-service Protection System devices are set to operate to isolate or de-energize equipment in order to limit the extent of damage…”. 2. In R1, there needs to be a way for entities to take credit for coordination studies done in the last 2 years prior to the effective date of this standard. 3. In R2, the 90 day requirement to document coordination following a change is not reasonable. It may not be possible to obtain the necessary information from equipment vendors in this timeframe. We suggest a time of 180 days for this requirement. 4. It is not clear how these requirements would be satisfied at wind farms. None of the example information in Section G Reference appears to be applicable to wind farm equipment. We suggest that wind resources be specifically exempted from this standard.

1. The effective dates in the proposed Implementation Plan and in Section A5.1 of the standard may conflict with Ontario regulatory practice respecting the effective date of implementing approved standards. It is suggested that this conflict be removed by: a. In the Implementation Plan, under the Section “In those jurisdictions where regulatory approval is required:”, adding a phrase “, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities,” right after “following applicable regulatory approval” and before “each Generator Owner…” b. In Section A5.1 of the standard, adding the same phrase “, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities,” right after “following applicable regulatory approval” and before “each Generator Owner…”. 2. The wording of R1 is confusing, since the required coordination shall be maintain all the time. We suggest a change of the wording as follows: the phrase “At a maximum of every five calendar years, each Generator Owner and Transmission Owner with applicable Facilities shall coordinate the voltage regulating system controls” should read “At a maximum of every five calendar years, each Generator Owner and Transmission Owner with applicable Facilities shall review the coordination of the voltage regulating system controls” ; Also, the phrase “1.1.1. The in-service limiters are set to operate before the Protection System of the applicable Facility in order to avoid disconnecting the generator unnecessarily.” should read” 1.1.1. The in-service voltage regulating control limiters are set to operate before the Protection System of the applicable Facility in order to avoid disconnecting the generator unnecessarily.”

Please consider placing the applicable unit size for PRC-019 and MOD-025 equivalent to that specified by MOD-026 and MOD-027. The periodicity of PRC-019 coordination and MOD-025 real & reactive capability should match that of PRC-005-2 for relay testing (6 years) rather than 5 years due to generating plant outage schedules usually being 1-1/2, 2, or 3 years, all of which are integral factors of a 6 year interval. We suggest striking "Convertor Overtemperature" from the list of typical limiting and protection examples in Section G, Page 7, as this feature is not a coordinatable element. R2 specifies "perform the coordination" while M2 states "coordination review" – we believe that R2 should be changed to "review the coordination" R1 appears to have been written with evolving T&D systems in mind. It should be made clear that all that is required for a generation unit that has experienced no changes affecting the response in question is a review of the equipment state every 6 (six) years rather than requiring a new coordination study.

Utility Services
Utility Services suggests the SDT specifically identify or show examples of how to match the percentage thresholds outlined in the Effective Date sections of the standard and the associated Implementation Plans. Given our recent experience in other standards, it would be helpful for the SDT to establish how the entities can demonstrate meeting the requisite threshold percentages. Over time, we have observed that in some cases, percentages were established by the number of devices or units; but in other cases, the measurement has been based upon magnitude of nameplate ratings.

New Requirement R2 requires, among other things, for Generator Owners to verify the existence of the identified coordination between the voltage regulating system controls and the relay settings every five years. This timing seems objectionable in the opinion of Seattle City Light, and furthermore it is now included in the Violation Severity Levels to be enforced. The reason for objection is that said coordination is already verified within 90 days following any major system modifications, equipment or setting changes as part of R2, and thus the need for verification every five years seems redundant and unnecessary.

1. R1 appears to have been written with ever-evolving T&D systems in mind. It should be made clear that all that would be needed every five years for a generation unit that has had no changes affecting the systems in question is an attestation to this effect, not a new coordination study, 2. It should also be made clear that the in-service limiters referenced in R1 and R1.1.1 pertain where they exist. That is, it is not necessary to have a pre-Protection-System limiter for every relay listed in sect. G of PRC-019-1. 3. The non-exclusive nature of the listing in section G is a concern regarding proof of compliance. That is, it would be burdensome to have to document a rationale for all relays and excitation system and voltage regulator functions for which a PRC-019-1 study is felt to not be required. The sect. G list should be complete and exclusive. 4. The term “black start unit material” in applicability para. 4.2.4 (p.2) is not understood. We would object if the intent was to designate any unit that has the potential for black startcapable conversion, in addition to units that are presently black start resources. GOs would in this

case have to take on substantial burdens based on mere conjecture as to modifications that might (but probably would not) be made sometime in the future. 5. Coordination studies are often performed by third-party contractors, with only the resultant relay settings being in our possession. The calculations can be re-performed, but at substantial cost; and, excepting units that are critical to the BES, it is not clear that the required expenditure is justifiable. PRC-019-1 should be made applicable to GOs only for Critical Assets, since damage to a generator outside this category would not imperil BES reliability. 6. The periodicity of PRC-019 coordination and MOD-025 real & reactive capability should match that of PRC-005-2 for relay testing (6 years) rather than 5 years due to generating plant outage schedules usually being 1-1/2, 2, or 3 years, all of which are integral factors of a 6 year interval. 7. It is suggested to strike "Convertor Over temperature" from the list of typical limiting and protection examples in Section G, Page 7, as this feature is not an element that can be coordinated. 8. R2 specifies "perform the coordination" while M2 states "coordination review" – we suggest that R2 be changed to "review the coordination"
Group
Florida Municipal Power Agency
Frank Gaffney
1) R1 can be misinterpreted to require a full-blown coordination study every 5 years even if nothing at the plant had changed. There should be a qualifier saying that past coordination studies are still valid if nothing has changed, but that at minimum a review is needed every 5 years to see if the existing coordination study is still valid. 2) A synchronous condenser can be owned by either a TO or GO. For instance, there are installation of generators where a clutch is installed to separate the electric generator from the prime mover to run the electric generator as a synchronous condenser. Such a synchronous condenser would be owned by a GO. The standard should not force a GO to register as a TO simply because it owns a synchronous condenser. FMPA recommends making the requirement applicable to a GO or TO who owns a synchronous condenser.

Yes
1) Section 1.1: Reword to clarify "normal" is describing the AVR control mode only. Also, SDT should consider mentioning weak system operating conditions are typically used when coordination with the SSSL. Suggested rewording: "Under steady-state system operating conditions, and assuming normal AVR control loop conditions, verify the following coordination items for each applicable Facility:" 2) Section 1.1.2: Strike this section, as it is outside the scope of this document. It appears to be mandating protection. PRC-019-1 should be focused on settings. 3) Page 7/11: (Reword 2nd paragraph) Examples of limits, limiters, protection which must be coordinated if employed include: 4) Page 7/11: Remove all the words "associated" in second paragraph. 5) Page 7/11: Remove section on SSSL calculation. Does not belong in standard, see references listed as needed. 6) The unit size applicability for PRC-019 and MOD-025 should be set equivalent to that specified by MOD-026 and MOD-027. We disagree with linking generator applicability to the Compliance Registry criteria. Instead, the approach to applicability should be the same as that used in MOD-026-1 and MOD-027-1 (i.e. in the Eastern Interconnection, individual generating units greater than 100 MVA directly connected to the BES, etc.). Regional criteria can be used to address any smaller units identified as critical to BES reliability in that region. 7) The periodicity of PRC-019 coordination and MOD-025 real & reactive capability should match that of PRC-005-2 for relay testing (6 years) rather than 5 years due to generating plant outage schedules usually being 1-1/2, 2, or 3 years, all of which are integral factors of a 6 year interval. 8) Strike "Convertor Overtemperature" from this list of typical limiting and protection examples in Section G, Page 7, as this feature is not a coordinatable element. 9) R2 specifies "perform the coordination" while M2 states "coordination review" – we believe that R2 and M2 should be consistent.

No
(1)Although we prefer a % of Facilities approach, we can accept the R1 VSL revision with the stated time frames. (2)A time-based VSL does not align with the severity of failing to meet R2. The severity is primarily a function of the amount of on-line exposure. As proposed, an entity that misses coordination for one 20MVA generator causes a Severe Violation even though that generator may operate <1% of the year and represent <1% of their fleet. We request that for R2 the SDT replace the time-based (days late) with % of MWh during the period of violation to more properly account for aggregate impact and restate the R2 VSL as follows: (a)Lower VSL becomes 'The Generator Owner failed to verify the coordination specified in Requirement R1 on their Facilities producing from 0% to 5% of their total MWh generated during the violation period.' This does require each unit to be coordinated. (b)Moderate VSL becomes '…more than 5% and less than 10%' (c)High VSL becomes '…more than 10% and less than 15%'(d)Severe VSL becomes '… more than 15%'. (3)We request that the SDT insert 'latter of' before 'identification or implementation' in R2 VSL if the SDT does retain the time-based VSL format. Identification differs from implementation so clarity is needed if a violation does occur.
(1)R2 is unclear as written, please insert 'latter of' before 'identification or implementation' to avoid repeat triggers for the same change. The reality is that the implementation of a change may well lag its identification by years. (2)Attachment 1 Example appears to violate R1 1.1.2. Loss of Field Zone 2 trips before 'operating conditions exceed equipment capabilities.' On the other hand, it would certainly 'limit the extent of damage when operating conditions exceed equipment capabilities or stability limits' since it trips before either of them are reached. This example does show how specialized and complex this coordination is. Entities may have different margins, asset protection, and operating practices. We presume the SDT intends that the examples show 'coordinated' capabilities, controls, and protection. If not, the lack of coordination should be pointed out. (3)We request that the GVSDT make all the papers listed in the reference section of the standard readily available on the NERC website.
Individual
Exelon Corporation and its affiliates
Yes
Yes
Section D, "Compliance," Part 1.2, "Evidence Retention," (page 4 of 11) first paragraph is unnecessary and redundant since the retention periods specified are for a six year time period which would be the maximum time between compliance audits for a registered entity. Exelon suggests that this paragraph be deleted in its entirety.

Group
Luminant
Brenda Hampton
Yes
Yes
Luminant recommends that Requirement R1 and Measure M1 be revised to clarify that the coordination described in the text is not between the Generator Operator and Transmission Operator. R1 would be revised in the following manner, “At a maximum of every five calendar years, each Generator Owner and Transmission Owner with applicable Facilities shall coordinate the voltage regulating system controls, (including in-service 1imiters and protection functions) with its applicable equipment capabilities and settings of the applicable Protection System devices and functions. 1.1. Assuming normal AVR control loop and system steady-state operating conditions, verify the following coordination items for each applicable Facility”. Measure M1 would be altered in the same manner.
Individual
Texas Reliability Entity
Yes
Yes
1) Does the SDT foresee any conflicts between the proposed language in PRC-019-1 and the proposed setting limits in PRC-025-1, Generator Loadability? 2) The SDT may want to include a reference ANSI C50.13-2005 for proper coordination of the over/under excitation limiters with AVR, equipment capabilities, and loss-of-field, and other protective functions. 3) Measure M1: Evidence should also include documentation that actual settings for relays, AVRs, and limiters match the coordination study. 4) Considering the proposed new BES definition and the Guidance Document, there may be confusion in determining if a generator is “directly connected” to the BES. Please consider reviewing the language to see if it should instead say “included in” the BES. Note that a BES generator can be connected to the BES by non-BES elements, and arguably not “directly connected” to the BES. See, for example, figures E1-4 and E1-6 in the BES Definition Guidance Document. 5) In general, the Protection System changes should be coordinated before energization (or re-energization) following a change. Is the 90 day time period in R2 consistent with the expectations of PRC-001?
Individual
City of Redding
Agree
SMUD/BANC
Individual
SMUD
SMUD strongly suggests the SDT align the proposed PRC standard with NERC’s current direction of migrating reliability standards to a Results Based Standards (RBS) and internal controls approach. This standard, along with all the other recent NERC PRC proposed standards, are vastly increasing the administrative effort by asking for more documentation of relay settings. For instance, in R1.1.2 – Is it really necessary to have a regulatory requirement for the GO to protect his own generator from damage? (Intentional Space.....) As an alternate approach, why not state that anytime a generator trips off by a protective function that must be set to coordinate with a limiter, the GO must demonstrate that the relay was set per this standard. That is, that the protective function did(emphasis added) coordinate with the limiters. If it is set correctly, there is no violation. If not, violation. This reduces the compliance burden significantly, but does not weaken the incentive to comply. Entities will want to ensure they set their relays per the standard because no one wants to cause an outage or get a violation. But no entity needs to spend time on pre-event, zero-defect, compliance documentation for all its units – only post event documentation is necessary for units that tripped. We feel this type of results based approach is a better choice for this standard.

David Dockery, NERC Reliability Compliance Coordinator

No
AECI does not believe R1 should exist as currently drafted, see below.
Yes
Applicability, Part 4.2.4, CHANGE: Remove this entire clause specific to Blackstart of units of any size, RATIONALE: AECI agrees with earlier Industry commenters that opposed the inclusion of these units and disagrees with the SDT's persistent inclusion. Inclusion of Blackstart units of any size, ultimately harms the grid reliability by imposing more regulatory-risk exposure upon them, such that our industry is already seeing many disappear from system restoration plans. With this trend left unchecked, and we are trying to piece our systems back together 10 years from now for whatever reason, the RCs will not even know that many of these viable units still exist. Many may have in fact been driven from existence by such well-intentioned laws having failed to consider the unintended consequences. In addition, the value of AVR functionality for Blackstart units is highly questionable during blackstart situations. Requirement R1, CHANGE: Redraft the language toward each responsible entity's internal controls program, RATIONALE: While AECI appreciates the initial 5-year time-line to "check the coordination of all our unit's in-service limiting "stuff", we see the R1 5-year revisit of no added value. This is in contrast to the value of R2's invoking the correct triggering mechanism for events that would precipitate rechecking such protective systems and setting's coordination. AECI simply believes R1 to be overly prescriptive and its existence, as currently drafted, will destine it for future removal.

Yes
Yes
(1) R1 should be modified to clarify that the GO or TO shall coordinate their applicable Facilities. While most readers would interpret the requirement to apply to the Facilities owned by the GO and TO, it simply does not say this. We recommend using "each GO and TO shall coordinate the voltage regulating system controls … applicable equipment capabilities of its applicable Facilities and the settings of the applicable Protection System devices and functions." (2) While we disagree with the inclusion of blackstart units in this standard, the previous wording was actually more correct and consistent with the Statement of Compliance Registry Criteria. Changing "Blackstart Resource" to "blackstart unit" only causes confusion and ambiguity. By definition a "Blackstart Resource" is a blackstart unit that is included in the Transmission Operator's restoration plan. Since the applicability section also states that the blackstart unit must be included in the TOP's restoration plan, it is not clear what was accomplished with changing Blackstart Resource to blackstart unit. It causes the reader to question what additional units are intended if they don't mean Blackstart Resource. Furthermore, it deviates from the wording in the Statement of Compliance Registry Criteria. This is contrary to the response that was provided to a comment by PSEG to change the language during the last posting. The response indicated that the "SDT feels it is best to retain the NERC wording without modification." We can find no other citation in the response to comments indicating a reason to change it. Please change blackstart unit back to Blackstart Resource. (3) In applicability sections 4.2.1 through 4.2.3, please change "directly connected to the BES" to "that are part of the BES". Per the BES definition, generation units can be and are part of the BES. Using "directly connected to the BES" could draw in a non-BES unit. (4) There is an extraneous comma in R2.

Do not agree with the Standard requirement structure; therefore, it is too early to assign VRFs.
No
Do not agree with the Standard requirement structure; therefore, it is too early to assign VRFs.
Cowlitz supports the review performed by the NAGF SRT with modification: 1. Requirement R1 appears to have been written with ever-evolving T&D systems with multiple owners/planners in play where Protection System settings may require adjustment to assure proper operation. However, this is not the case for generation facilities

which remain relatively static under single management until system improvements are made. Further, it is unprecedented to require a scheduled reassessment of system control settings without cause. The Standard Requirement R1 appears to assume it necessary to review past coordination engineering work and resulting system control and Protection System settings for errors every five calendar years. We see no reliability return in such activity. Requirement R1 must be centered on first establishing that proper coordination engineering and resulting system control and Protection System settings have been completed, and documentation of such work is retained in a Generation Facility Control and Protection Manual. Requirement R2 then covers the cause for review – system improvements, equipment upgrades, new operation theory, etc. – that triggers a reassessment of the coordination engineering and if necessary a revision to the Generation Facility Control and Protection Manual. The only possible item that may merit a scheduled activity is to verify all settings have not inadvertently changed, and are in compliance with the current Generation Facility Control and Protection Manual. 2. The nonexclusive nature of the listing in section G is a concern regarding proof of compliance. That is, it would be burdensome to have to document a rationale for all relays and excitation system and voltage regulator functions for which a PRC-019-1 study is felt to not be required. The sect. G list should be complete and exclusive. 3. The term "black start unit material" in applicability para. 4.2.4 (p.2) should be changed to the NERC defined term Blackstart Resource. Further, (departing from NAGF SRT Comments with suggested SDT response) it must be understood that Blackstart Resources must involve coordination between the TOP and the GOP. The TOP is not allowed to unilaterally designate blackstart capable resources within their restoration plan. EOP-005-2 mandates this via Requirement R13.

Consideration of Comments

Project 2007-09 Generator Verification
MOD-025-2

The Project 2007-09 Generator Verification Standard Drafting Team (GVSDT) thanks all commenters who submitted comments on the proposed revisions to MOD-025-2. The standard was posted for a 30-day public comment period from September 28, 2012 through October 31, 2012. Stakeholders were asked to provide feedback on the standard and associated documents through a special electronic comment form. There were 48 sets of comments, including comments from approximately 155 different people from approximately 100 companies representing 8 of the 10 Industry Segments as shown in the table on the following pages.

All comments submitted may be reviewed in their original format on the standard's project page.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Mark Lauby, at 404-446-2560 or at mark.lauby@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

Summary Consideration of all Comments Received:

There were a number of non-substantive changes made to the standard. Those changes are both explained in the summary comments for each question and in the individual responses to comments under Questions 1, 2, and 3:

In general, the comments indicated that industry is supports Attachment 1 as posted in Draft 3 of MOD-025-2. In response to stakeholder comments several changes were made to provide consistent wording and clarity within and among Attachments 1 and 2.

Based on comments received the GVSDT determined that Note 3 of Attachment 1 added confusion and since it was not vital to Attachment 1 it was removed. Note 3 said "It is desired that the automatic voltage regulator be in service when testing a generator's reactive capability. If an automatic voltage regulator is not installed on the unit to be tested, or is not available at the time of the test, exercise extra caution not to exceed the operating limits of the generator. "

[1] The appeals process is in the Standard Processes Manual: http://www.nerc.com/files/Appendix_3A_StandardsProcessesManual_20120131.pdf

Clarifications were made in the standard regarding treatment of units in long term reserve shutdown, coordination with the Transmission Operator for staged testing, and collection of data for ambient condition corrections. The GVSDT also clarified that the first verification must be a staged test.

The industry is generally supportive of the VSLs. As a result of stakeholder comments, clarifying edits were made to VSLs for Requirements R2 and R3 to provide wording consistent with the VSL for Requirement R1– this is non-substantive because the level was not changed.

The following note was added to the Effective Date section for clarity – “The verification percentage above is based on the number of applicable units owned.”

As a result of stakeholder comment, clarification was added to the Effective Date section regarding regulatory approval in Canada.

In response to stakeholder comments, the following non-substantive changes were made in Attachment 2:

1) A clarifying phrase was added to the header in the “last verification” column

2) A bullet point in the Summary of Verification that was intended to be removed during the last comment cycle and was not, has now been removed

3) The tap setting and voltage ratio wording were made consistent throughout Attachments 1 and 2.

Spelling and punctuation corrections:

- Footnote 2 – Corrected capitalization in Wind farm verification
- VSL Requirement R1 moderate - removed period
- Attachment 1
  - Periodicity for conducting a new verification - second to last paragraph corrected capitalization of the word “load”
  - Verification specification for applicability Facilities – Changed ‘shall’ to ‘will’
  - 4.1 - corrected capitalization of the word “load”
  - Renumbered Notes 4 and 5 due to deletion of Note 3
- Attachment 2 – Added missing arrow at point “F”

Minority Views:

- A minority of commenters requested a periodicity greater than five years. The GVSDT believes that the verification periodicity for Real Power and Reactive Power capability is appropriate at five year intervals and was addressed in previous comment periods. The GVSDT believes that stakeholder consensus has been achieved in this regard.

- A few entities submitted comments with regard to the use of engineering analysis in place of staged testing similar to comments submitted during previous postings. The GVSDT explained that engineering analysis could be appropriate in some cases, but not in place of staged testing because engineering analysis will not identify equipment problems and these equipment problems may not show up during normal operations.

- At least one entity suggested that nuclear units should not be required to perform under-excited (leading) reactive capability verification testing due to concerns with unit stability and potential under voltage conditions on internal nuclear plant safety buses that may challenge safe plant operations and could lead to a plant transient or shutdown in accordance with nuclear plant specific NRC operating license.

The GVSDT reaffirmed that challenging the plant's safety systems is not required by this standard. The standard does not require operating beyond plant operating limits.

[SC1]

Index to Questions, Comments, and Responses

1. The GVSDT has revised attachment 1 based on stakeholder comments. Do you agree with this revision? If not, please explain in the comment area below. 13

2. The GVSDT has revised the VSLs based on stakeholder comments. Do you agree with these revisions? If not, please explain in the comment area below.. 41

3. Do you have any other comment, not expressed in questions above, for the GVSDT?.................. 46

Brazos Electric Power Cooperative, Inc.	ACES Power Marketing
Nebraska Public Power District	MRO NSRF

1. **The GVSDT has revised attachment 1 based on stakeholder comments. Do you agree with this revision? If not, please explain in the comment area below.**

Summary Consideration: In general, the industry is supportive of the revisions made to Attachment 1 in Draft 3. In response to stakeholder comments several changes were made to provide consistent wording and clarity within Attachments 1 and 2. None of these changes is substantive.

Based on comments received the GVSDT determined that Note 3 of Attachment 1 added confusion and since it was not vital to Attachment 1 it was removed. Note 3 said "It is desired that the automatic voltage regulator be in service when testing a generator's reactive capability. If an automatic voltage regulator is not installed on the unit to be tested, or is not available at the time of the test, exercise extra caution not to exceed the operating limits of the generator. "

Clarifications were made in the standard regarding treatment of units in long term reserve shutdown, coordination with the Transmission Operator for staged testing, and collection of data for ambient condition corrections. The GVSDT also clarified that the first verification must be a staged test.

Organization	Yes or No	Question 1 Comment
ACES Power Marketing Standards Collaborators	No	(1) We believe that Attachment 1 is clearer but we still have a few issues that the drafting team should address. In response to our previous comments, the drafting team indicated that a staged test is required prior to the use of operational data. In other words, the first verification must be through a staged test. The response to comments cited a sentence in sub-section 2 of the "Verification specifications for applicable Facilities:" in Attachment one as the reason. Essentially, it says if the previous test was unduly restricted, then the next verification should be a staged test. We do not think this is straight forward. What if there was no test? Could a test that did not occur be called unduly restricted? It would be much clearer for the drafting team to state directly either in Attachment 1, the requirements, the implementation plan or the effective date section that the first test must be a staged test.

Organization	Yes or No	Question 1 Comment
		Response: The SDT agrees and has added clarification to Attachment 1 under item 1 of "Periodicity for conducting a new verification". It now reads: "The first verification for each applicable Facility under this standard must be a staged test." (2) In subsection 3.4 of the "Verification specifications for applicable Facilities:" section of Attachment 1, we disagree with including "Other data as applicable." It is ambiguous, open ended and will only lead to inconsistent enforcement. Who decides what is applicable? The TP? The GO? The auditor? What happens if an auditor decides they believe a piece of data should be included but the TP and GO agree it shouldn't? If the other needed data cannot be enumerated, an open ended statement such as the one discussed here should not be added as a "catch all." This type of statement is unduly burdensome. **Response: We have changed the wording to provide clarification as follows: "Other data as determined to be applicable by the GO to perform corrections for ambient conditions."**
Response: The GVSDT thanks you for your comments. Please see responses above.		
Texas Reliability Entity	No	1) Attachment 1, 2.2.2: We recommend changing the reactive power capability test to be conducted at 95% or higher of the expected maximum Real Power gross output. **Response: Your comment suggests relaxing the standard with no supporting reason. The GVSDT believes that we have reached industry consensus with respect to this aspect of the standard and will not make further revisions** 2) Attachment 1, 2. We disagree with the statement that "...previously staged test that demonstrated at least 50 percent of the Reactive

Organization	Yes or No	Question 1 Comment
		capability shown on the associated thermal capability curve (D-curve). Unless there is a documented system limitation, an accurate test should result in 90% or better of the D-curve, after correction for ambient conditions. **Response: The GVSDT agrees with your comment however the 50% of the D-Curve requirement recognizes that the previously staged test provided the documented limitation that you reference.** 3) Attachment 1, 2.2 does not require wind and photovoltaic "applicable facilities" to verify Reactive Power capability at a minimum Real Power output. The ISO may still have reactive requirement for renewable resources at minimum output levels. If so, the resource should be required to demonstrate and test against those requirements? **Response: The ISO can request additional testing at any time. Defining minimum Real Power from variable generation resources can be problematic. For that reason the GVSDT allows testing variable generation plants at whatever load is available at the time of the test.** 4) Attachment 1, 2.1.1: What is the basis for "one hour?" Attachment 1, 3.1 says to record the value at the end of the verification period. What is the expected value(s) to be provided for the hour of verification (i.e. an instantaneous value, an integrated value, or average value)? Variability in solar and wind turbines may not allow for a full hour. Current ERCOT regional criteria for the Reactive Power leading and lagging test duration is 15-minutes. **Response: The industry has reached a consensus that 1 hour is long enough for a unit to stabilize thermally. The GVSDT recognizes that a variable generation plant may not have constant output for one hour. The instantaneous values at the end of the one hour test are the values expected to be reported.**

Organization	Yes or No	Question 1 Comment
		5) Attachment 1, 3.2: If there is a modified voltage schedule to accommodate the testing, the normal voltage schedule and modified voltage schedule should be recorded. **Response: The voltage schedule recorded should be the one that is in effect at the time of the test. Additional documentation on the voltage schedule should not be required since the TOP issues that voltage schedule.** 6) As written, this Standard will only capture one season and may not facilitate proper use of the data in Planning models. In ERCOT, resource entities currently provide minimum and maximum seasonal capabilities for Fall, Winter, Spring, and Summer. We would suggest that, as a minimum, this Standard should require Real and Reactive capabilities for the Winter and Summer seasons. **Response: Seasonal adjustments are expected to be calculated with the data that is recorded in Attachment 1, 3.4 if requested by the TP.** 7) Attachment 1, section 3: Generator Owner should also include the D-curve with the verification data. For many air-cooled units, the real and reactive capability can vary significantly with ambient temperature. The Transmission Planner needs both the ambient temperature and the D-curve data to verify the validity of the test. **Response: The verifications in MOD-025-2 are intended to demonstrate the capability of the unit that is reported or show limitations to that capability, not necessarily to demonstrate the D-curve.** 8) Attachment 1, 3.4: we suggest re-wording to "... perform corrections to Real Power ***and Reactive Power*** for different ambient conditions..." **Response: Corrections for ambient conditions are intended for Real Power as it can vary substantially for some units.**

Organization	Yes or No	Question 1 Comment
Response: The GVSDT thanks you for your comments. Please see responses above.		
Tennessee Valley Authority	No	1. Att 1, Periodicity for conducting a new verification: 1. For staged verification; recommend changing the allotted time to make a change to 12 months. From Att 1: "... of a change that affects its Real Power or Reactive Power capability by more than 10 percent of the last reported verified capability and is expected to last more than six months" - change to 12 months. Justification is based on the possibility of generator temporary derates lasting more than 6 months due to seasonal conditions, outage schedules, economic dispatch, etc. Twelve months is more realistic. **Response: The GVSDT added the additional six month to perform another verification in order to allow the GO time to do this in a scheduled manner. The GVSDT believes that industry consensus has been achieved with regard to this issue.** 2. Att 1, Periodicity for conducting a new verification: 2. For verification using operational data; recommend changing the allotted time to make a change to 12 months. Att 1: "... discovery that its Real Power or Reactive Power capability has changed by more than 10 percent of the last reported verified capability and is expected to last more than six months" - change to 12 months. Justification is based on the possibility of generator temporary derates lasting more than 6 months due to seasonal conditions, outage schedules, economic dispatch, etc. Twelve months is more realistic. **Response: The GVSDT added the additional six month to perform another verification in order to allow the GO time to do this in a scheduled manner. The GVSDT believes that industry consensus has been achieved with regard to this issue.**

Organization	Yes or No	Question 1 Comment
		3. Att 1, Periodicity for conducting a new verification:, 1 For Staged verification; and 2. For verification using operational data; both steps require verification at least every five years. Recommend verification periodicity equal to PRC-005-2 Draft, Table 1-1, Component Type - Protective Relay, Maximum Maintenance Interval, "6 calendar years." Justification is to coordinate protective system relay testing during plant outages with the real and reactive power testing that can be performed during outage shut-down or start-up. **Response: The GVSDT believes that industry consensus has been achieved with regard to a five years testing cycle.** 4. Attachment 1, 3.6, add "voltage ration and," as follows: The existing GSU and/or system interconnection transformer(s) voltage ration and tap setting. Justification is to be consistent between Attachment 1 and Attachment 2. Current Attachment 1, 3.6, identifies "transformer(s) tap setting"; Attachment 2, had data entries for "Voltage Ratio." Both values are legitimate transformer parameters. **Response: The GVSDT agrees and has corrected the oversight adding "voltage ratio" to Attachment 1, 3.6.** 5. Recommend Att 1, 4., be titled as "Record the following auxiliary load information:" Justification is that the current "step 4" is more of a substep to this new "step 4" description. **Response: The GVSDT disagrees and considers Attachment 1, Item 4 to direct the development of a simplified key one-line diagram as stated.** 6. Recommend Att 1, 4., current step text be moved to a substep 4.1, "Develop a simplified key one-line diagram ... " Justification is that this step is similar to the current "steps 4.1 and 4.2" **Response: The GVSDT has renumbered Attachment 1, 4.2 as 5 to**

Organization	Yes or No	Question 1 Comment
		provide clarity. 7. Recommend renumbering steps “4.1 to 4.2” and “4.2 to 4.3.” Justification is to change the current “step 4 to 4.1.” See items 4 and 5, above. **Response: See responses to comments 4 and 5 above.** 8. Recommend changing the current “step 4.2 / recommended step 4.3” to read as follows:”If an adjustment is requested by the TP, then develop the relationship between test conditions and generator output so that the amount of Real Power that can be expected to be delivered can be determined from a generator at different conditions, such as peak summer conditions [remove can be determined]... “ Justification is to reword for clarity. **Response: The GVSDT has revised this sentence for clarity as: “If an adjustment is requested by the TP, then develop the relationships between test conditions and generator output so that the amount of Real Power that can be expected to be delivered from a generator can be determined at different conditions, such as peak summer conditions.**
Response: The GVSDT thanks you for your comments. Please see responses above.		
Exelon Corporation and its affiliates	No	1) Attachment 1 (general comment):Exelon appreciates the addition by the GVSDT of the exclusion that nuclear units are not required to perform Reactive Power verification at minimum Real Power output (Attachment 1 Section 2.2.3); however, as stated in the previous comments, Exelon still is concerned that nuclear units should not be required to perform under-excited (leading) reactive capability verification testing due to concerns with unit stability and potential under voltage conditions on internal nuclear plant safety buses that may challenge safe plant operations and could lead to a plant transient or shutdown in accordance with nuclear

Organization	Yes or No	Question 1 Comment
		plant specific NRC operating license. In response to Exelon's comments in the 9-27-12 Consideration of Comments, the GVSDT states that they "disagree with not requiring a verification to define the unit's reactive capability" and further states that they are "aware of nuclear units that have been safely tested to their leading power factor limits." Although the GVSDT may purport that it is safe to perform such testing there is not one unique design for a nuclear generating unit in the NERC Regional Entities. Exelon continues to believe that there should be a provision in the Standard to allow for such an exemption based on considerations for nuclear unit regulatory, unit stability or other potential equipment restrictions. To address the concern that the GVSDT has related to providing a blanket exemption for nuclear units, Exelon suggests that such an exemption must be justified, documented in writing, and accepted by the Transmission Planner. Exelon suggests that a new note be added to Attachment 1 as follows:"If a unit is restricted due to other regulatory, unit stability, plant operating procedures, or other potential equipment restrictions then it should be reported with no leading capability, or the minimum lagging capability at which it can operate. A generating unit with such a restriction must be justified, documented in writing and accepted by the Transmission Planner." **Response: The GVSDT reaffirms, as stated in the previous response to comments, that challenging the plant's safety systems is not required by this standard.** 2) Periodicity for conducting a new verification: Attachment 1 Section related to the periodicity for conducting a new verification (page 15 of 22) second paragraph states: "The test shall be scheduled at a time advantageous for the unit being verified to demonstrate its Reactive Power capabilities while the Transmission Operator takes measure to maintain the plant's system bus voltage at the scheduled value or within acceptable tolerance of the scheduled value." Experience shows that maintaining the

Organization	Yes or No	Question 1 Comment
		plant's substation bus voltage within the scheduled voltage range at some arbitrary value is often inadequate to allow maximum VAR output during staged Reactive Capability testing. In such cases the system operator would need to adjust the substation voltage, potentially close to a schedule limit. Exelon suggests that the sentence be revised as follows: "The test shall be scheduled at a time advantageous for the unit being verified to demonstrate its Reactive Power capabilities while the Transmission Operator takes measure to coordinate with the Generator Operator to adjust the plants substation bus voltage as required to accommodate the desired reactive output." **Response: The GVSDT believes the standard, as worded allows for adjustments by the TOP but only to the limits acceptable to the TOP.**
Response: The GVSDT thanks you for your comments. Please see responses above.		
Associated Electric Cooperative, Inc. - JRO00088	No	Attachment 1, Parts 2.2.1 and 2.2.2, AECI does appreciate adequate Attachment 1 allowances for voltage-schedule restrictive operating conditions, so that actual Maximum and Minimum reactive capabilities that simply cannot be attained, are not required, as acknowledged per Notes 1 & 2. However we do question the value to industry, beyond initial testing per this standard, of the 5-year retesting and believe this Requirement will eventually be removed unless redrafted per responsible entities' internal controls program expectations. We do however agree with the requirement to retest when unit conditions change sufficiently to warrant retesting.
Response: The GVSDT thanks you for your comments. Periodic verification is necessary for discovering the equipment limitations that impact the unit MW or MVAR capabilities. The GVSDT believes that industry consensus has been achieved regarding the 5 year verification cycle.		

Organization	Yes or No	Question 1 Comment
Seattle City Light	No	Attachment 1, Section 2.1 explicitly states to run each unit at maximum real power and lagging reactive power for a minimum of one hour. Due to constraints of the load, water flow, or other operational characteristics such as generators' thermal limits this is typically not possible.
Response: The GVSDT thanks you for your comments. The generator's thermal limits should not adversely restrict a unit's capability verification. If your reference to water flow indicates the units in question are hydro units then Attachment 1, Section 2.1.2 applies and the load required is only that which is available at the time of the test.		
Cowlitz PUD	No	Cowlitz supports the comments developed by the NAGF SRT: 1. The 90-day limit for historical data in R1.2 and R2.2 conflicts with the statement at the bottom of p.15 that "Operational data from within the two years prior to the verification date is acceptable for the verification of either the Real Power or the Reactive Power capability...." It is also unclear how the day on which verification data are collected can differ at all from the verification date, much less by two years. **Response: The GVSDT does not see a conflict because R1.2, R2.2 and R3.2 state that you have 90 calendar days from the date the data is selected for submission of the data to the Transmission Planner. The two year limit in Attachment 1 refers to how far back in time you can go when you select operational data.** 2. The semantics regarding applicability should be made more consistent. The criterion, "Generating plant/Facility greater than 75 MVA (gross aggregate nameplate rating) directly connected to the Bulk Electric System," in para. 4.2.3 appears to state that a station with two 500 MW NERC-registered fossil units and a standby, non-NERC-registered10 MW diesel genset connecting to the 13.2 kV bus, for example, needs testing only for the large units because the diesel is not part of the NERC-defined Facility. Para. 1 at the bottom of p.15 appears to take a contradictory

Organization	Yes or No	Question 1 Comment
		position, however, by saying that "For generating units of 20 MVA or less that are part of a plant greater than 75 MVA in aggregate, record data either on an individual unit basis or as a group." This would be better stated as, that "For generating units of 20 MVA or less that are included as part of a Facility greater than 75 MVA in aggregate, record data either on an individual unit basis or as a group." **Response: Your example of a 10 MW diesel genset connected to a 13.2 kV bus would not be applicable because it is not directly connected to the BES nor is it a registered unit. There is no conflict between the Applicability Section and what is on page 15 since page 15 is only Verification specifications for what is found in the Applicability Section.** 3. Applying on p.16 an "unduly restricted" classification to reactive power verification results that fall short of 50% of the thermal capability curve (D-curve) constitutes a technical error that is fatal to the approvability of MOD-025-2 in its present form. The D-curve deals only with a single characteristic (temperature) of a single component (generator), and the reactive capability of a generation unit system is generally set by other factors. Lagging PF is frequently restricted to less than 50% of the D-curve value due to variation of aux bus voltages beyond the IEEE-recommended range of +/- 5% for normal operation, and it is not uncommon for stability issues to preclude any leading-PF operation (nuclear units in particular never operate at leading PF). Potential lack of leading capability is acknowledged in Note 4 of Att. 1, but contradicted by the p.16 references discussed above. All explicit and implied connections in the draft standard between the expectable reactive power capability and the generator OEM D-curve should be expunged. **Response: The generator D-Curve is recognized as the absolute maximum achievable reactive capability. The reference to 50% of the D-curve is an acceptability criterion for using operational data in lieu**

Organization	Yes or No	Question 1 Comment
		of a staged test. 4. Note 1 of Att. 1 (pp. 17-18) is inaccurate and should be deleted. The limitations described in comment #3 above are not related to transmission system conditions. Our concerns are amplified by the statement, "Observe auxiliary bus voltage limits," in Note 1 from the previously-voted-on version of MOD-025-2 having been deleted from the present draft. Is it the SDT's intent that units should import and export reactive power to the generator OEM D-curve regardless of whether or not there is risk of tripping due to aux bus dropout? Doing so would constitute an inacceptable operational practice. **Response: The GVSDT disagrees and believes you may have misinterpreted the standard relative to reactive capability testing and the primary reason for not reaching the D-curve is likely due to system conditions. The GVSDT has repeatedly commented and clearly stated in the standard that safe unit limits should not be challenged to perform this testing. Safe limits should be determined by the GO and testing should be stopped short of those limits and the reasons for stopping the test reported.** 5. Note 2 should be deleted as well ("While not required by the standard, it is desirable to perform engineering analyses to determine expected applicable Facility capabilities under less restrictive system voltages than those encountered during the verification....") since there is no quantitative indication of what these other conditions should be or what such an analysis would mean. The line, "The recorded Mvar values were adjusted to rated generator voltage, where applicable," on P.21 should also be deleted. **Response: The standard does not require engineering analysis and its use is completely at the option of the Generator Owner.**

Organization	Yes or No	Question 1 Comment
		The GVSDT agreed after the previous posting in the Consideration of comments to remove this point ("The recorded MVAR values were adjusted to rated generator voltage, where applicable.") from Attachment 2. We apologize that it did not get removed from the standard and have removed it 6. Clarification is needed regarding the requirement in para. 2.1 of Att. 1 to verify capability, "at the applicable Facilities' normal (not emergency) expected maximum Real Power output at the time of the verifications." It is understood that a unit typically running for example at 720MW in the summer and 740 in the winter could be reported at either value, depending on when the verification was performed; but the term "normal maximum" is inherently an oxymoron, given the dictionary definitions of "normal" as meaning standard, usual, typical, etc. and "maximum" as representing an extreme condition. Para. 2.1 should be changed to read, "within the Facilities' normal (not emergency) range of full load Real Power output at the time of the verifications," to indicate that readings within the dotted lines in the graph below are what's wanted, not the heavy, solid line. Note that normal power is never a single value, it is a range. It would be helpful to include a diagram on the subject, along with any statistical criteria involved in defining NERC's concept of the normal range. **Response: The GVSDT has made changes for clarity of this language several times. We believe that there is now consensus for this language and have no plans for further changes.** 7. The statement on p.15 that, "It is intended that Real Power testing be performed at the same time as full Load Reactive Power testing...," should be expunged. A considerable operational period must be reviewed to determine what the normal full-load real power range is, as explained in comment #4 above, and it is impossible to go back in time and insert a VAR

Organization	Yes or No	Question 1 Comment
		test. **Response: The suggestion to perform the testing at the same time was meant for staged testing only if desired by the GO. It is not a requirement for either operational data or staged testing to do both the Reactive Power and Real Power test at the same time.** 8. It would be helpful to state any coordination of units within a plant that is required or preferred for VAR testing. Running for example a three-unit plant with all units exporting MVARs together, then all importing together, will produce more conservative reactive power capabilities (i.e. the aux bus limits will sooner be encountered) than is the case for testing units one at a time with the other two under normal operation. Pull-together/push-together is the more realistic approach, however, for simulating the response of the plant to a Disturbance of the BES. **Response: It is envisioned that coordination of units within a plant would be necessary to perform reactive capability testing as those other units would be part of the reactive resources needed for optimal testing. It is not within the scope of this standard to analyze each plant for the best test configuration. The GVSDT suggests discussing optimal testing configurations with your TP. Your comment that states in part "….for simulating the response of the plant to Disturbance of the BES." Indicates possible confusion over this standard and MOD-026.** 9. The reference to "maximum Real Power" in para. 2.2.2 of Att. 1 should be changed to match the terminology in para. 2.1, after modification per comment #6 above. **Response: Attachment 1, 2.1 describes the maximum Real Power output for both Real Power and Reactive Power capability testing. Attachment 1, 2.2.2 only provides the time needed before recording the data for the leading reactive power test at maximum real power.**

Organization	Yes or No	Question 1 Comment
		The GVSDT does not feel Attachment 1, 2.1 needs to be restated in Attachment 1, 2.2.2. 10. The requirement in para. 3.4 of Att. 1 that one record, "The ambient conditions, if applicable, at the end of the verification period that the Generator Owner requires to perform corrections to Real Power for different ambient conditions," are incomprehensible. It appears to indicate that in some cases ('if applicable") the GO may require that ambient corrections be performed, and in other cases they won't; but there is no indication when and if such calculations are mandatory, and there is no hint as to the reference conditions that GOs are supposed to correct-to. **Response: The hint is found in Attachment 1, 4.2 which states: "If an adjustment is requested by the TP, then develop the relationships between test conditions and generator output so that the amount of Real Power that can be expected to be delivered from a generator at different conditions, such as peak summer conditions, can be determined. Adjust MW values tested to ambient conditions specified by the TP upon request and submit them to the TP within 90 days of the request or the date the data was recorded/selected whichever is later."** 11. Para. 4 of Att.1 should state that the simplified key one-line diagram need be no more detailed than that shown in Att. 2. Development of diagrams showing all aux transformers and real and reactive power flows would be unduly burdensome, and the wording of Att. 2 indicates that such a level of detail is not intended. **Response: The format used should provide information comparable to that provided in Attachment 2 as stated in Requirements R1, R2 and R3. The GVSDT feels the directions are clear as currently drafted.** 12. GSU losses should have a separate line in Att. 2, since they are not specifically a tertiary load (item C in the Att. 2 diagram).

Organization	Yes or No	Question 1 Comment
		Response: The GVSDT believes that adequate data is recorded in Attachment 2 to determine gross and net Real or Reactive Power Capability as stated in the Purpose of the standard. 13. MOD-025 should not require "staged testing" without option. Staged testing should only be required if requested under TOP-002-2b R13. This will ensure the appropriate system conditions exist to support the testing (coordinated by the TOP and RC). This eliminates the GO from being required to perform testing that cannot be supported by the TOP and RC. Industry experience has shown that verification of the true reactive limits via staged testing is typically not possible due to transmission system constraints. Due to these constraints, an option to use engineering analysis for validation should be allowed by this standard. While the standard could allow staged testing as an option, we believe that staged testing should only be considered when there is a demonstrated need for the testing. **Response: TOP-002-2.1b covers real-time and near-real-time studies. It is believed that the TOP-002-2.1b, Requirement R13 is intended for verification of units that do not appear to be meeting the stated capabilities of the unit. MOD-025-2 is Real Power and Reactive Power verification for BES units for long range planning. Reasons for staged or operational testing requirements have been well documented in previous consideration of comments documents.** 14. We do not see significant value in a 5-year re-verification cycle through staged testing. We believe a periodic confirmation that the previously verified MW and MVAR capabilities are still valid does have value. Re-verification should only be necessary when there is a long term configuration change, a major equipment modification, or equipment problems that impact the unit MW or MVAR capabilities. Possible equipment problems are being used as reason by some for wanting staged testing and periodic re-verification. Equipment problems that could limit

Organization	Yes or No	Question 1 Comment
		real and reactive power capability generally manifest themselves during normal operation. These are appropriately addressed via normal operational reporting to satisfy requirements in TOP-002-2.1b and VAR-002-2b and are corrected through normal maintenance practices. Therefore, we do not agree that concerns for equipment problems justify periodic testing of every generator in the BES. Furthermore, that approach will subject the BES to a constant state of testing and off-normal operational conditions that we believe could actually prove to be detrimental to BES reliability. **Response: The GVSDT disagrees that "Equipment problems that could limit real and reactive power capability generally manifest themselves during normal operation." The GVSDT believes that the recent ballot results and comments show that industry consensus has been achieved. The GVSDT also disagrees that periodic testing within normal capability ranges would be detrimental to the BES reliability.**
Response: The GVSDT thanks you for your comments. Please see responses above.		
Duke Energy	No	Delete Note 3 on page 18 of the clean version, and delete the reference to Note 3 located on page 15 under "Verification specifications for applicable Facilities: #2". If a unit is equipped with AVR, the test must be conducted with the AVR in service.
Response: The GVSDT thanks you for your comments. The GVSDT agrees with this clarification and has revised the standard accordingly.		
Manitoba Hydro	No	General Comments - There is reference to certain actions that would be 'desirable' although not strictly required by the standard. This type of language can be problematic if the entity is held to this, or asked to explain why they did not meet the 'desirable' level.

Organization	Yes or No	Question 1 Comment
		Response: The GVSDT only found one use of the word "desirable" in the standard and it is in Note 2 of Attachment 1. The GVSDT believes that this language is appropriate and that stakeholder consensus has been achieved on this note. There appear to be requirements embedded in the attachment, and there should be no requirements here. For example, the word "shall" should be removed (since it implies a requirement) from (i) page 15 (clean version) "If the Reactive Power capability is verified through test, the Generator Owner shall schedule the test with its Transmission Operator. The test shall be scheduled . . . . ." and (ii) page 16 " . . . then the next verification shall be by another staged test, not operational data:" **Response: The language in these instances was revised to remove the use of "shall".** Another example which sounds like a requirement is on page 17 "Adjust MW values tested to ambient conditions specified by the TP upon request and submit them to the TP within 90 days of the request or the date the data was recorded/selected whichever is later." **Response: The language provides instruction regarding the adjustments requested by the Transmission Planner. The GVSDT believes that consensus has been achieved for this language.** Additionally, in 4.2 (i) "TP" should be expanded to Transmission Planner and (ii) the first sentence is worded poorly and should be clarified. **Response: This was corrected as noted.** Section 2.1 - Manitoba Hydro recommends removing the words "over excited" and replacing the words "normal (not emergency)" with "nominal". **Response: The language used here has been revised several times per**

Organization	Yes or No	Question 1 Comment
		stakeholder comments. The GVSDT believes that the consensus of stakeholders is to use these terms. Section 3.7 - "(real or reactive)" should be changed to "(real and reactive)". **Response: The GVSDT disagrees because the verification may not be for both Real and Reactive Power. The standard allows for independent verifications.** Page 15 (clean version) - The word "Load" should not be capitalized. **Response: The GVSDT agrees and has made the correction.** Page 17 (clean version), Note 1 - Manitoba Hydro suggests replacing 'improper tap settings' in Note 1 which reads "...such as rotor thermal instability, improper tap settings,..." with "improper voltage ratios". **Response: The GVSDT revised item 3.6 to add "voltage ratio" based on another stakeholder comment. We have revised Note 1 to add "voltage ratio" as well.** Page 18 (clean version), Note 5 - Manitoba Hydro suggests removing Note 5 which reads "Synchronous Condensers only need to be tested at two points (one over-excited point and one under-excited point) since they have no Real Power output." Such descriptive wording is not required in a standard and should be left for reference books. **Response: The intent of Note 4 (formerly Note 5) is simply to clarify the testing required for synchronous condensers.**
Response: The GVSDT thanks you for your comments. Please see responses above.		
pacificorp	No	PacifiCorp does not support the minimum one hour hold requirement for verifying a generating unit's maximum real power and lagging reactive power in Section 2.1.1 of Attachment 1. The one hour hold is excessive and fails to correlate to how a machine responds to a system event that

Organization	Yes or No	Question 1 Comment
		only lasts for a few minutes. The one hour requirement also puts unnecessary stress on plant equipment and directly contradicts the WECC Synchronous Machine Reactive Limits Verification Guideline that recommends holding a unit for a minimum of 15 minutes. PacifiCorp has followed this guideline since it was approved in 1996, and recommends this same standard to be applied in Attachment 1.
Response: The GVSDT thanks you for your comments. The industry has reached a consensus that 1 hour is long enough for a unit to stabilize thermally. The verifications performed under this standard do not relate to system events (as opposed to MOD-026-1 and MOD-027-1) and are intended to provide "accurate information on generator gross and net Real and Reactive Power capability and synchronous condenser Reactive Power capability" as per the purpose statement. The GVSDT does not believe that there is a conflict with WECC guidelines as they are for a "minimum of 15 minutes".		
Dynegy	No	Recommend deleting the requirement in Attachment 1 section 2.2.1 to verify reactive power at minimum load. This puts the unit in an unstable condition and then stresses it by varying reactive power leading to the increased likelihood of a unit trip.
Response: The GVSDT thanks you for your comments. No test should be run that makes the unit unstable. The GVSDT suggests that minimum load be verified prior to performing any testing to avoid unit instability. The SDT is responding to FERC directives as part of the revisions of this standard. In one of the FERC directives (Order 693, Paragraph 1321) testing at multiple points was required. The standard does not require any testing that would violate any equipment operating limits or lead to equipment damage.		
PPL Corporation NERC Registered Affiliates	No	1)The 90-day limit for historical data in R1.2 and R2.2 conflicts with the statement at the bottom of p.15 that "Operational data from within the two years prior to the verification date is acceptable for the verification of either the Real Power or the Reactive Power capability...." It is also unclear how the day on which verification data are collected can differ at all from the verification date, much less by two years. **Response: The GVSDT does not see a conflict because R1.2, R2.2 and R3.2 state that you have 90 calendar days from the date the data is**

Organization	Yes or No	Question 1 Comment
		selected for submission of the data to the Transmission Planner. The two year limit in Attachment 1 refers to how far back in time you can go when you select operational data. 2)The phrasing regarding applicability should be made more consistent. The criterion, "Generating plant/Facility greater than 75 MVA (gross aggregate nameplate rating) directly connected to the Bulk Electric System," in para. 4.2.3 appears to state that a station with two 500 MW fossil units (meeting NERC registry criteria) and a standby, 10 MW diesel genset connecting to the 13.2 kV bus (not meeting the NERC registry criteria), for example, needs testing only for the large units because the diesel is not part of the NERC-defined Facility. Para. 1 at the bottom of p.15 appears to take a contradictory position, however, by saying that "For generating units of 20 MVA or less that are part of a plant greater than 75 MVA in aggregate, record data either on an individual unit basis or as a group." This would be better stated as, that "For generating units of 20 MVA or less that are included as part of a Facility greater than 75 MVA in aggregate, record data either on an individual unit basis or as a group." **Response: Your example of a 10 MW diesel genset connected to a 13.2 kV bus would not be applicable because it is not directly connected to the BES nor is it a registered unit. There is no conflict between the Applicability Section and what is on page 15 since page 15 is only Verification specifications for what is found in the Applicability Section.** 3) Applying on p.16 an "unduly restricted" classification to reactive power verification results that fall short of 50% of the thermal capability curve (D-curve) constitutes a technical error. The D-curve deals only with a single characteristic (temperature) of a single component (generator), and the reactive capability of a generation unit system is generally set by other factors. Lagging PF is frequently restricted to less than 50% of the D-curve value due to variation of aux bus voltages beyond the IEEE-recommended

Organization	Yes or No	Question 1 Comment
		range of +/- 5% for normal operation, and it is not uncommon for stability issues to preclude any leading-PF operation (nuclear units in particular never operate at leading PF). Potential lack of leading capability is acknowledged in Note 4 of Att. 1, but contradicted by the p.16 references discussed above. All explicit and implied connections in the draft standard between the expectable reactive power capability and the generator OEM D-curve should be expunged. **Response: The generator D-Curve is recognized as the absolute maximum achievable reactive capability. The reference to 50% of the D-curve is an acceptability criterion for using operational data in lieu of a staged test.** 4) Note 1 of Att. 1 (pp. 17-18) is inaccurate and should be deleted. The limitations described in our comments above are not related to transmission system conditions. Our concerns are amplified by the statement, "Observe auxiliary bus voltage limits," in Note 1 from the previously-voted-on version of MOD-025-2 having been deleted from the present draft. Is it the SDT's intent that units should import and export reactive power to the generator OEM D-curve regardless of whether or not there is risk of tripping due to aux bus drop-out? Doing so would constitute an unacceptable operational practice. **Response: The GVSDT disagrees and believes you may have misinterpreted the standard relative to reactive capability testing and the primary reason for not reaching the D-curve is likely due to system conditions. The GVSDT has repeatedly commented clearly stated in the standard that safe unit limits should not be challenged to perform this testing. Safe limits should be determined by the GO and testing should be stopped short of those limits and the reasons for stopping the test reported.**

Organization	Yes or No	Question 1 Comment
		5)Note 2 should be deleted as well ("While not required by the standard, it is desirable to perform engineering analyses to determine expected applicable Facility capabilities under less restrictive system voltages than those encountered during the verification....") since there is no quantitative indication of what these other conditions should be or what such an analysis would mean. The line, "The recorded Mvar values were adjusted to rated generator voltage, where applicable," on P.21 should also be deleted. **Response: The GVSDT agreed after the previous posting in the Consideration of comments to remove this point ("The recorded MVAR values were adjusted to rated generator voltage, where applicable.") from Attachment 2. We apologize that it did not get removed from the standard and have removed it.** 6) Clarification is needed regarding the requirement in para. 2.1 of Att. 1 to verify capability, "at the applicable Facilities' normal (not emergency) expected maximum Real Power output at the time of the verifications." It is understood that a unit typically running for example at 720 MW in the summer and 740 in the winter could be reported at either value, depending on when the verification was performed; but the term "normal maximum" is inherently incorrect, given the dictionary definitions of "normal" as meaning standard, usual, typical etc and "maximum" as representing an extreme condition. Para. 2.1 should be changed to read, "within the Facilities' normal (not emergency) range of full load Real Power output at the time of the verifications," to indicate that readings within the dotted lines in the graph below are what's wanted, not the heavy, solid line. Note that normal power is never a single value, it is a range. It would be helpful to include a diagram on the subject, along with any statistical criteria involved in defining NERC's concept of the normal range.

Organization	Yes or No	Question 1 Comment
		Response: The GVSDT has made changes for clarity of this language several times. We believe that there is now consensus for this language and have no plans for further changes. 7) The statement on p.15 that, "It is intended that Real Power testing be performed at the same time as full Load Reactive Power testing...," should be expunged. A considerable operational period must be reviewed to determine what the normal full-load real power range is, as explained in comment #4 above, and it is impossible to go back in time and insert a VAR test. **Response: The suggestion to perform the testing at the same time was meant for staged testing only if desired by the GO. It is not a requirement for either operational data or staged testing.** 8) The reference to "maximum Real Power" in para. 2.2.2 of Att. 1 should be changed to match the terminology in para. 2.1, after modification per our comments above. **Response: Attachment 1, 2.1 describes the maximum Real Power output for both Real Power and Reactive Power capability testing. Attachment 1, 2.2.2 only provides the time needed before recording the data for the leading reactive power test at maximum real power. The GVSDT does not feel Attachment 1, 2.1 needs to be restated in Attachment 1, 2.2.2.** 9) The requirement in para. 3.4 of Att. 1 that one record, "The ambient conditions, if applicable, at the end of the verification period that the Generator Owner requires to perform corrections to Real Power for different ambient conditions," is incomprehensible. It appears to indicate that in some cases ('if applicable") the GO may require that ambient corrections be performed, and in other cases they won't; but there is no indication when and if such calculations are mandatory, and there is no hint as to the reference conditions that GOs are supposed to correct-to.

Organization	Yes or No	Question 1 Comment
		Response: The hint is found in Attachment 1, 4.2 which states: "If an adjustment is requested by the TP, then develop the relationships between test conditions and generator output so that the amount of Real Power that can be expected to be delivered from a generator at different conditions, such as peak summer conditions, can be determined. Adjust MW values tested to ambient conditions specified by the TP upon request and submit them to the TP within 90 days of the request or the date the data was recorded/selected whichever is later." 10) Para. 4 of Att.1 should state that the simplified key one-line diagram need be no more detailed than that shown in Att. 2. Development of diagrams showing all aux transformers and real and reactive power flows would be unduly burdensome, and the wording of Att. 2 indicates that such a level of detail is not intended. **Response: The format used should provide information comparable to that provided in Attachment 2 as stated in Requirements R1, R2 and R3. The GVSDT feels the directions are clear as currently drafted.**
Response: The GVSDT thanks you for your comments. Please see responses above.		
Ameren	No	While it is a step in the right direction to direct the Transmission Operator to take measures to maintain the system bus voltage of the plant under test at an acceptable level during the reactive power capability testing of the plant, this still does not mean that the plant would necessarily be able to reach its full reactive power output capability during the test. If it is the intent of this standard to produce reactive power limit data which would be of use for inclusion in powerflow model data, then we believe that there needs to be some means of permitting the generator owner to take the as-tested values and extrapolate to system conditions where full reactive power capability of the generator would be called upon should be allowed.

Organization	Yes or No	Question 1 Comment
Response: The GVSDT thanks you for your comments. Please reference Attachment 2, Note 1 for the permission you are requesting with regard to extrapolation.		
ExxonMobil Research and Engineering	No	No comments on this question.
Southern Company	No	
Idaho Power Company	Yes	Idaho Power System Planning as a Transmission Owner that owns synchronous condensers agrees with the revisions made to Attachment 1.
Response: The GVSDT thanks you for your comments.		
Ingleside Cogeneration LP (Voting entity Occidental Chemical Corporation)	Yes	In our view, Ingleside Cogeneration LP believes the technical language used in the latest version of MOD-025-2 Attachment 1 has been refined to an acceptable point.
Response: The GVSDT thanks you for your comments.		
SERC Planning Standards Subcommittee	Yes	Paragraph 4.2 contains several typos and the intent is not clear. Recommend revise 4.2 to read: "An adjustment may be requested by the TP to develop the relationships between test conditions and generator output at different conditions, such as peak summer conditions. If so requested, test results should be adjusted to ambient conditions specified by the TP. Adjusted results should be submitted to the TP within 90 days of the request or the date the data was recorded/selected whichever is later."
South Carolina Electric and Gas	Yes	Paragraph 4.2 contains several typos and the intent is not clear. Recommend revising 4.2 to read: "An adjustment may be requested by the TP to develop the relationships between test conditions and generator output at different conditions, such as peak summer conditions. If so

Organization	Yes or No	Question 1 Comment
		requested, test results should be adjusted to ambient conditions specified by the TP. Adjusted results should be submitted to the TP within 90 days of the request or the date the data was recorded/selected whichever is later.”
Response: The GVSDT thanks you for your comments. Based on your and other’s comments, the GVSDT revised this paragraph to: **“If an adjustment is requested by the Transmission Planner, then develop the relationships between test conditions and generator output so that the amount of Real Power that can be expected to be delivered from a generator can be determined at different conditions, such as peak summer conditions. Adjust MW values tested to the ambient conditions specified by the Transmission Planner upon request and submit them to the Transmission Planner within 90 days of the request or the date the data was recorded/selected whichever is later.”**

2. **The GVSDT has revised the VSLs based on stakeholder comments. Do you agree with these revisions? If not, please explain in the comment area below.**

Summary Consideration: The industry is generally supportive of the VSLs. As a result of stakeholder comments, edits were made to VSLs for Requirements R2 and R3 to provide wording consistent with the VSL for Requirement R1– this is non-substantive because the level was not changed.

Organization	Yes or No	Question 2 Comment
Exelon Corporation and its affiliates	No	Although Exelon agrees with a majority of the revisions, it does not seem reasonable to assign a Severe VSL for a potential administrative oversight for not submitting the data to the Transmission Planner within a set period of calendar days equally to a complete failure to perform the required testing for an applicable generating unit. Exelon suggests that the administrative requirement for submitting data within a set period be limited to maximum of a High VSL and the application of the specific submission time periods be adjusted for the Low and Medium VSLs and the Severe VSL be revised to reflect inability to produce sufficient data to substantiate that the required testing was performed (i.e., the Generator Owner may have performed the test but is unable to produce any data to support the testing). As an example, the proposed example revision to the Severe VSL is as follows: The Generator Owner failed to produce data upon request of the Transmission Planner. OR The Generator Owner failed to verify the [applicable test] per Attachment 1 of an applicable generating unit.
Response: The GVSDT thanks you for your comments. The NERC VSL Development Guidelines call for providing multiple VSLs when there are varying elements in the requirement such as completeness of data and timely submission of data as well as failure to perform a verification. The GVSDT followed these guidelines in developing the VSLs for MOD-025-2.		

Organization	Yes or No	Question 2 Comment
Luminant	No	Luminant disagrees with the expanded VSLs and recommends that the SDT return to the VSL list in the previous posting. Luminant believes that the original VSL list is comprehensive and does not require expanding to include completeness of the data reported, or specific compliance to items, 1, 2, and 3 of the "Periodicity for conducting a new verification."
Response: The GVSDT thanks you for your comments. The VSLs were not revised appreciably from the previous posting. The NERC VSL Development Guidelines call for providing multiple VSLs when there are varying elements in the requirement such as completeness of data and timely submission of data as well as failure to perform a verification. The GVSDT followed these guidelines in developing the VSLs for MOD-025-2.		
Seattle City Light	No	The VSL associated with Attachment 1 Section 2.1 will often be violated, because due to constraints of load, water flow, or other operational characteristics such as generators' thermal limits it is typically not possible to run each unit at maximum real power and lagging reactive power for a minimum of one hour as required.
Response: The GVSDT thanks you for your comments. The GVSDT assumes that you are referring to variable generation in your comment. Attachment 1, Section 2.1.2 states: "Verify variable generating units, such as wind, solar, and run of river hydro, at the maximum Real Power output the variable resource can provide at the time of the verification." If this is met, then there is no violation of the requirement and the VSLs are moot.		
Ameren	No	There seems to some discrepancy in the reporting date that the VSLs are based on when using the operational data to verify. The first section in the VSL for R1 is worded slightly differently than the same portion of the VSL for R2 and R3. For R1, the reporting date seems to be based on the date that the data is selected for verification based on historical data, whereas for R2 and R3 the reporting date seems to be based on the date when the historical operating point was reached. Please clarify the SDT's intention to have such a difference, as it could make a big difference in meeting the reporting date deadline, and cause confusion among Generator Owners.

Organization	Yes or No	Question 2 Comment
Response: The GVSDT thanks you for your comments. The GVSDT intended the language to be the same for each requirement. The VSLs for R2 and R3 were revised to match the language in R1.		
ExxonMobil Research and Engineering	No	No comments on this question.
Idaho Power Company	Yes	Idaho Power System Planning agrees with the revised VSLs.

3. **Do you have any other comment, not expressed in questions above, for the GVSDT?**

Summary Consideration: The following note was added to the Effective Date section for clarity – "The verification percentage above is based on the number of applicable units owned."

As a result of stakeholder comment, clarification was added to the Effective Date section regarding regulatory approval in Canada.

In response to stakeholder comments, the following non-substantive changes were made in Attachment 2:

1) A clarifying phrase was added to the header in the "last verification" column

2) A bullet point in the Summary of Verification that was intended to be removed during the last comment cycle and was not, has now been removed

3) The tap setting and voltage ratio wording were made consistent throughout Attachments 1 and 2.

Organization	Question 3 Comment
ACES Power Marketing Standards Collaborators	(1) What measure does the effective date use when determining percentage of applicable Facilities that must be completed by the given date? Is it a percentage based on the net nameplate rating of the generator? We suggest this should be stated directly to avoid conflicts between what the auditor assumes versus what the registered entity assumes. **Response: The SDT has added a clarifying note as follows: "Note: The verification percentage above is based on the number of applicable units owned."** (2) Attachment 2 discusses subtracting tertiary real and reactive power to get net real and reactive power, yet there is no entry for it. Should there be an entry added in the form? **Response: Tertiary loads are accounted for on the one-line diagram and associated table as point C.** (3) The response to our last comments regarding inclusion of the last verification column indicated that a note would be added to indicate that this column would be blank for the initial verification. We could not find the note. Please add it. We were concerned a similar issue to the one

Organization	Question 3 Comment
	experienced with the Protection System Maintenance and Testing standard would be experienced. In the PRC standard, auditors interpreted statements in the standard to require data prior to the enforceable date even though registered entities were not required to keep it. It resulted in a number of violations. **Response: The GVSDT has added this note as follows: "Previous Data; will be blank for the initial verification"** (4) In applicability sections 4.2.1 through 4.2.3, please change "directly connected to the BES" to "that are part of the BES". Per the BES definition, generation units can be and are part of the BES. Using "directly connected to the BES" could draw in a non-BES unit. **Response: The GVSDT has used the registry criteria to identify applicable Facilities. The MVA limits shown will prevent non-BES units from being included under the standard.** (5) How will mothballed units be handled? If a mothballed unit is returned to service, is it treated like a new unit with the return date serving as the commissioning date? **Response: The GVSDT has added the following clarification to Attachment 1, Item 3 under Periodicity for conducting a new verification, "Existing units that have been in long term shut down and have not been tested for more than five years shall be verified within 12 calendar months. "**
Response: The GVSDT thanks you for your comments. Please see responses above.	
Ameren	(1)We believe that for sets of generators that are designed and operated identically, there should be a provision allowing use of "Sister Units" for compliance as done in MOD-026. **Response: The intent of testing all units is to discover unintended differences or deficiencies with unit capabilities or control systems that can only be identified by testing all units, including sister units.** (2)We believe the 5 year cycle with a 66 month limit is too stringent. We request that due to possible outage scheduling issues or other impacts, extending this 66 month limit by 18 months allowing a maximum of 84 months between test verifications.

Organization	Question 3 Comment
	Response: The GVSDT believes that industry consensus has been achieved in this regard. Outages are not required for this testing. (3)Was it the intent of the SDT to leave out a minimum verification time of one hour for both MW and MVAR verification? Could the SDT please clarify their intention and if a minimum of one hour was intended? **Response: Attachment 1, Item 2.1.1 states: "Verify synchronous generating unit's maximum real power and lagging reactive power for a minimum of one hour."**
Response: The GVSDT thanks you for your comments. Please see responses above.	
Duke Energy	1) Attachment 2, Summary of Verification - Strike the fifth bullet (The recorded Mvar values were adjusted to rated generator voltage, where applicable.) In the Consideration of Comments Report the Standard Drafting Team agreed to make this change, but it was overlooked. **Response: The GVSDT has made this correction.** 2) The focus of this standard appears to be on testing rather than on verifying the P and Q limits to be used in Transmission Planning models. The standard is more of a performance test than a model verification test - the requirements do not directly fulfill the purpose. **Response: The verifications performed under this standard are intended to provide actual performance data as inputs to the models and the GVSDT believes that industry consensus has been achieved in this regard.** 3) Leading VAR Staged Testing - Leading VAR staged testing provides little benefit to the BES and should only be performed once in an initial staged test or validation. The fact that the regions will not be able to provide operational data for the leading VAR test points requested, proves that the system usually doesn't require leading VARS. In the situations such as system recovery and lightly loaded BES where leading VARS may be required, the initial testing and validation that the unit's heat removal capability (such as lagging VAR operational data) is sufficient, should serve as satisfactory verification of the unit's capability. The risk (and cost) of repeated operation of the unit in the maximum leading VAR is not warranted for the little benefit it provides to the BES. The risk of

Organization	Question 3 Comment
	Step Iron degradation and loss of synchronous operation every five years far outweighs the benefit such testing would provide the BES once the unit has been proven capable. The lagging VAR capability test or validation will prove that the unit's heat removal capability has not been compromised. MOD-025-2 should be reworded to only require periodic validation (either by staged testing or operational data) for lagging VARS, and that periodic leading VAR testing only be required if the unit is not capable of passing the lagging VAR capability test or validation. **Response: The SDT is responding to FERC directives as part of the revisions of this standard. In one of the FERC directives (Order 693, Paragraph 1321) testing at multiple points was required. The standard does not require any testing that would violate any equipment operating limits or lead to equipment damage.** 4) Applicable Facilities - Verification of units between 20 MVA and 100 MVA provide little benefit to the BES for the risk and cost of performing the staged test for these units. The maximum VAR contribution for these units is in the 5 to 20 MVAR range, and the risk and cost for testing, documentation and auditing of units of this size is not warranted for the small benefit gained. If there is a specific need for a particular small unit to provide VAR support due to regional constraints, then it should be validated. But to require validation for all the small units that have little impact on the reliability of the BES, the cost is not warranted. The unit size applicability for PRC-019-1 and MOD-025-2 should be set equivalent to that specified by MOD-026 and MOD-027 (i.e. in the Eastern Interconnection, individual generating units greater than 100 MVA directly connected to the BES, etc.). Regional criteria can be used to address any smaller units identified as critical to BES reliability in that region. **Response: The GVSDT has used the registry criteria to identify applicable Facilities and believes that industry consensus has been achieved in this regard.**
Response: The GVSDT thanks you for your comments. Please see responses above.	
Texas Reliability Entity	1) Seasonal considerations for Real and Reactive Power do not appear to be considered in this Standard. This could be detrimental to use in Planning and Operations models for specific periods. **Response: Seasonal conditions were considered for Real Power. The GVSDT has revised this**

Organization	Question 3 Comment
	sentence for clarity as: "If an adjustment is requested by the TP, then develop the relationships between test conditions and generator output so that the amount of Real Power that can be expected to be delivered from a generator can be determined at different conditions, such as peak summer conditions. 2) In section 4, the phrase "directly connected to the Bulk Electric System" may have the unintended consequences of excluding a generator unit connected to the BES through a 69/138 kV autotransformer (for example). Suggest removing 'directly' from these requirements. **Response: The GVSDT has used the registry criteria to identify applicable Facilities and believes that industry consensus has been achieved in this regard.** 3) Considering the proposed new BES definition and the Guidance Document, there may be confusion in determining if a generator is "directly connected" to the BES. Please consider reviewing the language to see if it should instead say "included in" the BES. Note that a BES generator can be connected to the BES by non-BES elements, and arguably not "directly connected" to the BES. See, for example, figures E1-4 and E1-6 in the BES Definition Guidance Document. **Response: The GVSDT has used the registry criteria to identify applicable Facilities and believes that industry consensus has been achieved in this regard.** 4) TRE recommends changing to "Planning Authority or Transmission Planner" in the requirement sections instead of "Transmission Planner". The change may be needed since the Planning Authority or the Transmission Planner may have the responsibility for modeling the generation data provided by the Generator Owners. **Response: The GVSDT has set the requirements for model verifications to be submitted to the Transmission Planner. Per the NERC Reliability Functional Model, the Transmission Planner provides this information to the Planning Coordinator. The GVSDT believes that stakeholder consensus has been achieved in this regard.** 5) The Functional Entities are listed as the Generator Owner and the Transmission Operator. However, the VAR standards have the Transmission Operator provide the Generator Operator a voltage or reactive schedule and require the Generator Operator to maintain that voltage or reactive schedule. Should the Generator Operator be included in this standard for verification and

Organization	Question 3 Comment
	data reporting? There are many cases where the Generator Owner is not the Generator Operator and confusion could result (or incorrect data/testing) if different criteria were provided. **Response: Per the NERC Reliability Functional Model, the Generator Owner is the responsible entity for "Establish generating facilities ratings, limits, and operating requirements." (see page 50, item 1 of the Functional Model).** 6) Overall the timing is too long. Waiting 12 calendar months for verification impacts reliability. Based on this requirement, the capability could be reduced by 50% but not tested for 12 calendar months (or longer). That could put significant strain on a local system that may not be tested for an extended period and yet be compliant with the standard. **Response: The standard is intended to verify long term planning models. The GVSDT believes that industry consensus has been achieved in regards to the 12 month verification specification.**
Response: The GVSDT thanks you for your comments. Please see responses above.	
Wisconsin Electric Power Company	1. In Attachment 1 Section 2.2.1, we take issue with the requirement to verify reactive power capability at the minimum real power output. We are not convinced this is necessary for BES reliability. The reactive capability at this point can be estimated by the GO with sufficient accuracy for the planning model. Verification of reactive output at minimum real power requires considerable effort and resource scheduling flexibility for data which can be readily estimated without adverse impact to the BES. Especially for large units, it may require a multiple day effort to verify reactive power at the minimum and maximum real power points, due to issues with auxiliary equipment. **Response: The standard only requires testing up to the point any limit is reached and as such extended testing times should not be required. FERC Order 693 (Paragraph 1321) requires verification at multiple points, and the GVSDT believes that verification at a minimum of four points is necessary to approximate the capability curve.** 2. Attachment 2: On the One Line Diagram and the following data table, it is indicated that the net unit capability is to be provided at the GSU high-side (Point F). This should be revised to allow the GO to provide the net capability at the GSU low-voltage side instead. There may not be adequate

Organization	Question 3 Comment
	metering capability at the GSU high-side, whereas metering at the generator voltage level is commonly available. **Response: The standard allows calculation of the net capability if appropriate metering is not available. See Section 4.1 of attachment 1.**
Response: The GVSDT thanks you for your comments. Please see responses above.	
Chelan PUD	1. It is unclear how auxiliary load should be calculated where several units share a common station service power supply and all units are not in operation (multi unit hydro plant). Suggest some guidelines in allocation in these cases should be included. **Response: The auxiliary load should be allocated amongst the running units. The standard allows for engineering analysis and that could be utilized to calculate the appropriate auxiliary load.** 2. It may not be possible to generate maximum real power for one hour for hydro with small reservoir volumes. Similar to run of river hydro, reservoir volume or other license requirements may restrict this ability. Suggest a similar allowance in these cases to the run of river power qualification. **Response: Section 2.1.2 of Attachment 1 addresses verification of variable resources and only requires that verification be conducted at the maximum level that can be achieved at the time of the verification. Wind, solar, and run of river hydro were mentioned only as examples of variable resources.** 3. R2 requires the Generator Owner to verify Reactive Power capability per Attachment 1, and submit the data per Attachment 2. Note 1 and Note 2 on Attachment 1 are commentary on the meaning of the test results and imply additional analyses is expected but provide no explicit directions that must be taken. Note 1 recognizes that the value of the testing may be limited to uncovering MVAR limitations. Note 2 is a commentary that encourages the Generator owner to perform engineering analyses, but the expectations are unclear. MOD-025-2 must clearly describe what engineering analyses are to be performed, what operational data is required to support the analyses, and the deliverables of this effort. MOD-025-2 should be made more specific regarding acceptable system conditions for collecting test or operational data, and the extent to which

Organization	Question 3 Comment
	engineering analysis is required for model verification. **Response: The standard does not require engineering analysis and its use is completely at the option of the Generator Owner.** 4. It may not be possible to test full reactive capability at minimum power for hydro units due to the broad capability curve without exceeding TOP established voltage schedules. I suggest going to some percentage of the "full" value to verify the curve with concurrence of the TOP and TP in these cases or test documentation of limiter settings. If the GO is required to perform staged test, the TOP and RC must be able to support it. Some system should be established where this cannot be done. **Response: The standard only requires testing to the point a limit is reached. There is no requirement to reach any "full value".**
Response: The GVSDT thanks you for your comments. Please see responses above.	
Tennessee Valley Authority	1. Entire Attachment 2, recommend linking Att 2 data entries to Att 1 requirements by adding (e.g. Att 1 requirement _____) in parenthesis, to each Att 2 line/bullet. Justification is to define the source requirement for the data. **Response: The standard does not require use of Attachment 2 as is. The Generator Owner can modify Attachment 2 or create an alternate form that provides the required data. Cross references to Attachment 1 could be included in the revised form if the Generator Owner wishes** 2. Attachment 2, Summary of Verification, recommend adding the following bullet under "Transformer Voltage Ratio: ..."Add: "Transformer Tap Setting: GSU ___, Unit Aux ___, Station Aux ___, Other Aux ___"Justification is to be consistent between Attachment 1 and Attachment 2. Current Attachment 1, 3.6, identifies "transformer(s) tap setting"; Attachment 2, had data entries for "Voltage Ratio." Both values are legitimate transformer parameters. **Response: The SDT agrees with your suggestion and has made the suggested change to Attachment 2.** 3. Overall Standard, The focus of this standard appears to be on testing rather than on verifying the

Organization	Question 3 Comment
	limits to be used in Transmission Planning models. The standard is more of a performance test than a model verification test. Justification is that the requirements do not directly fulfill the purpose. **Response: The GVSDT believes that the requirements do fulfill the purpose and that industry consensus has been achieved in this regard.** 4. Overall Standard, recommend removing the requirements to perform “staged testing.” Justification is that staged testing should only be required if requested by the TOP. Justification is that verification of the true reactive limits via staged testing often produces less than optimal results because of transmission system constraints. **Response: Reasons for staged or operational testing requirements have been well documented in previous consideration of comments documents.** 5. Standard, 4.0 Applicability, The unit size applicability for MOD-025-2 should be set equivalent to the unit size applicability found in MOD-026 and MOD-027 (i.e. MOD-026-1 Draft, 4.2, Facilities, 4.2.1, Generation in the Eastern or Quebec Interconnections ...(including 4.2.1.1, 4.2.1.2); 4.2.2 Generation in the Western Interconnection ...(including 4.2.2.1, 4.2.2.2); 4.2.3 Generation in the ERCOT Interconnection ...(including 4.2.3.1, 4.2.3.2). Justification is to be consistent across all generator verification standards (e.g. Generation in the Eastern Interconnection with individual units greater than 100 MVA, etc.) **Response: The GVSDT has used the registry criteria to identify applicable Facilities and believes that industry consensus has been achieved in this regard.**
Response: The GVSDT thanks you for your comments. Please see responses above.	
Manitoba Hydro	1. Manitoba Hydro has a concern with respect to the phased in implementation measured by percent compliance. We believe that this may lead to a potential for some uncertainty and debate. Does a phased in implementation such as this, do anything to increase reliability? **Response: The reason for a phased implementation is to allow Generator Owners a reasonable schedule for testing.** 2. Attachment 1 of MOD-026-1 (Note 2) and M0D-027-1 (Note 3) contain a section titled

Organization	Question 3 Comment
	"Consideration for early Compliance" with language pertaining to previous testing and model verification which were completed under the applicable regional policies, guidelines or criteria or which are compliant with the requirements of the standard. Manitoba Hydro recommends that similar language be included in the other standards (PRC-019-1, MOD-025-2 and PRC-024-1). **Response: The phased implementation was developed to allow GO's sufficient time to perform the verification on their units. Because of this, the GVSDT does not believe an early compliance provision is needed.**
Response: The GVSDT thanks you for your comments. Please see responses above.	
Alberta Electric System Operator (AESO)	1. In section 4.2 The AESO considers the existing applicability for reactive power verification to be more appropriate: o Connected to a transmission grid at 60 kV or higher voltage; and o single unit capacity of 10 MVA and larger; or o facilities with aggregate capacity of 20 MVA and larger. **Response: The GVSDT has used the registry criteria to identify applicable Facilities and believes that industry consensus has been achieved in this regard.** 2. Attachment 1, the statements regarding testing the capability of units with a change lasting more than 6 months within 12 months of the change appears to be in conflict with each other. EG: If a change is in place for 7 months but not tested in these 7 months and then issue is rectified how is this change then tested? The time frame for testing cannot exceed the time that change is in effect. **Response: The standard allows up to 12 months to complete a test upon discovering the change. If the issue is rectified before the end of the 12-month period a test is not required.**
Response: The GVSDT thanks you for your comments. Please see responses above.	
Independent Electricity System Operator	1. The effective dates in the proposed Implementation Plan and in Section A5.1 of the standard may conflict with Ontario regulatory practice respecting the effective date of implementing approved standards. It is suggested that this conflict be removed by: a. In the Implementation Plan, under the Section "In those jurisdictions where regulatory approval is required:", adding a phrase ", or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities,"

Organization	Question 3 Comment
	right after "following applicable regulatory approval" and before "each Generator Owner..."b. In Section A5.1 of the standard, adding the same phrase ", or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities," right after "following applicable regulatory approval," and before "each Generator Owner...". **Response: The GVSDT has made the suggested clarifying revision.** 2. There are four measurements of "Gross Reactive Power Capability" for generators: over-excited and under-excited at minimum and maximum active power outputs. Which one of the four measurements should be recorded in Appendix 2 under "Gross Reactive Power Capability"? **Response: By utilizing the check boxes in Attachment 2, the particular test or tests that are being recorded are specified.**
Response: The GVSDT thanks you for your comments. Please see responses above.	
ExxonMobil Research and Engineering	A stated purpose of Generator Verification is "to ensure that generator models accurately reflect the generator's capabilities and operating characteristics." Modeling behind-the-meter generation based on gross name-plate ratings will not accurately reflect those assets' capabilities or operating characteristics, and, in fact, may seriously distort BES expansion plans or other modeling scenarios if name-plate ratings are used. Behind-the-meter generation is a misnomer. It is not comparable to utility or merchant generation in which the primary function is to deliver electric energy to the bulk electric system. The primary function of behind-the-meter generation that employs cogeneration or combined heat and power (CHP) systems is to deliver thermal energy (usually in the form of steam) in support of the load's process technology. In the case of industrial loads, the capabilities or operating characteristics of that process are a function of the load's production schedule associated with its products (e.g., chemicals, petroleum, paper, etc.) and independent of conditions on the BES. Any electric power delivered to the BES is a residual by-product of the industrial process and generally a small fraction of the name-plate rating of the generator. Section III.c.4 of the Statement of Compliance Registry Criteria (v.5) and Exclusion E2 of the revised BES definition both recognize this fundamental characteristic of behind-the-meter generation and that is why neither document uses name-plate rating as a useful metric for behind-the-meter generation. The GVSDT is urged to do the same. Additionally, the SDT should define the term 'Synchronous condenser' so that it is

Organization	Question 3 Comment
	clear that a large synchronous motor is not a synchronous condenser.
Response: The GVSDT thanks you for your comments. The GVSDT has used the registry criteria to identify applicable Facilities . If a unit meets the registry criteria it is obligated to comply with the standard. **The GVSDT feels that the accepted industry understanding would not allow a synchronous motor to be confused with a synchronous condenser.**	
Florida Municipal Power Agency	A synchronous condenser can be owned by either a TO or GO. For instance, there are installation of generators where a clutch is installed to separate the electric generator from the prime mover to run the electric generator as a synchronous condenser. Such a synchronous condenser would be owned by a GO. The standard should not force a GO to register as a TO simply because it owns a synchronous condenser. FMPA recommends making the requirement applicable to a GO or TO whoever owns the synchronous condenser.
Response: The GVSDT thanks you for your comments. There are separate requirements for a GO and a TO. Requirement R2 applies to a GO who owns a synchronous condenser and Requirement R3 applies to a TO that owns a synchronous condenser. A GO will not need to register as a TO if they own a synchronous condenser.	
Lincoln Electric System	Although supportive of the standard drafting team's efforts, LES believes MOD-025 could be further enhanced in consideration of the following recommendations. Recommend Attachment 1 "Periodicity for conducting a new verification" be revised to require verification of the Real Power capability on an annual basis with Reactive Power remaining at every 5 years. In consideration that regions such as the MRO and SPP maintain existing procedures requiring members to perform Real Power verification at a minimum of annually, LES believes this reduced timeframe is not only reasonable but also achievable for entities. Additionally, it seems reasonable to expect a re-verification be performed if the Real Power is reduced by as little as 5 percent as several units with that level of lost capacity could be significant in adversely affecting the integrity of the BES. **Response: The SDT believes that industry consensus has been achieved regarding the required**

Organization	Question 3 Comment
	periodicity of testing. Recommend Attachment 1 “Verification specifications for applicable Facilities” Part 3.4 be modified to specify the duration of the verification period and that the data supplied should be an average of the verification test period. - Per the standard, the purpose of MOD-025 is to ensure accurate information is available for the planning models in order to assess BES reliability. NERC annually builds 4 seasonal peak models (summer, winter, spring and fall) in addition to a spring minimum model. Within these models the TPs must provide Real Power maximum and minimum values and up to 10 sets of correlated real and reactive values in order to model a generators “D curve”. As such, LES would recommend that the GO develop these values and provide them to the TO. While Real Power Max is tested it is only done under the conditions of a single season, it would then be up to the TP to adjust the MW output for the other 3 seasons. LES believes the GO is the more appropriate person to make these adjustments rather than the TP. Additionally, Real Power minimum testing is not addressed within this standard. LES believes with the increase in highly variable generation, such as wind, generators may end up operating at their minimums much more than they have done historically and therefore Real Power minimums should be verified on an annual or 5 year basis as well. In terms of Reactive Power generation, a GO should be required to go beyond what is required in the current Attachment 2 and align with the number of correlated Real/Reactive sets which the TP is required to provide in their models to NERC. - In further support of BES reliability, LES recommends that the net Real Power output for generating facilities be adjusted based on a high temperature for the month based on the model that the Real Power output is being developed for, i.e. summer, winter, spring, fall, or minimum model. The criteria for determining what should be used for a high temperature adjustment point could be an average of the entity’s high temperature for the month over a ten-year period or possibly the 0.4% ASHRAE temperature could be used. LES believes it would not be unreasonable to expect that data be supplied by the GO for the seasons required for model submission by the TP. **Response: If the Transmission Planner requires ambient adjustments to the tested values the standard requires that adjusted values be provided (Section 5 of Attachment 1). The standard requires real power testing at minimum load.**

Organization	Question 3 Comment
Response: The GVSDT thanks you for your comments. Please see responses above.	
American Transmission Company	ATC recommends the following changes: Attachment 1, Periodicity for new verification Item 3 - Allow for mutually agreed on flexibility by adding the wording at the end of the sentence like, ". . . or a mutually agreed verification date." **Response: The GVSDT believes that testing of new facilities should be conducted within one year and that stakeholder consensus has been achieved regarding this language.** Attachment 1, Verification Specifications Item 2.1.2 - The wording is unclear near the end of Item 2.1.2. ATC recommends this be changed to read, "Reschedule the test of the facility within six months after being unable to test at or above the 90 percent threshold". **Response: The GVSDT disagrees. The six month interval is the period allowed to complete the testing following the date that the facility has 90 percent or more of its units available to test.**
Response: The GVSDT thanks you for your comments. Please see responses above.	
Domion	Dominion suggests that footnote 1 not contain the capitalized term Wind Farm Verification as this is not defined in either this standard or the NERC Glossary of Terms.
Response: The GVSDT thanks you for your comments. The GVSDT agrees and has revised this to "Wind farm verification…"	
Idaho Power Company	Idaho Power System Planning as a Transmission Owner that owns synchronous condensers has the following comments for the GVSDT to consider: Attachment 1 - Item 2.1.1 lists the verification duration for a synchronous generating unit at maximum real power and maximum reactive power with a one hour testing duration. Idaho Power System Planning comments that the voltage schedule may be difficult to maintain during a one hour test at maximum reactive power for a one hour test during for N-0 system conditions. Idaho Power System Planning asks the GVSDT to consider a 30 minute testing duration for performing the verification to be consistent with the 30 minute duration established for operators to make manual

Organization	Question 3 Comment
	system adjustments following contingency events. **Response: The time period selected was based on allowing for time for the unit to achieve a stable operating condition. The standard does not require exceeding any limits including voltage schedules during the test.** Attachment 1 - Item 2.1.2: Idaho Power System Planning comments that it is unclear what the maximum reactive capability testing duration is for variable generating units. Idaho Power System Planning asks the GVSDT to include the minimum testing duration for variable generating units for the maximum reactive capability test. **Response: The standard does not differentiate the type of unit being tested and the SDT does not see a need to do so. For reactive testing, the standard only requires recording the value achieved at the end of the test period.** Attachment 1: Idaho Power System Planning comments that it is unclear what the maximum reactive capability testing duration is for synchronous condensers. Idaho Power System Planning asks the GVSDT to include the minimum testing duration for synchronous generators for the maximum reactive capability test. Requirements to submit verification with 90 days of test date are unreasonable. 365 days is more reasonable, and is consistent with MOD-026-1 and MOD-027-1. **Response: See response to question 2 above. The SDT believes the 90 day deadline is reasonable and industry consensus has been achieved on this issue.**
Response: The GVSDT thanks you for your comments. Please see responses above.	
Northeast Power Coordinating Council	If the primary purpose of obtaining net Real Power and net Reactive Power is to build system models to support planning studies, then the Drafting Team should consider that MOD-025 may not be required and could be eliminated. Under Standard IRO-010-1a the Reliability Coordinator can require GOs and TOs to submit Real and Reactive Power data in a format the RC deems necessary. The detailed requirements of MOD-025 can be addressed in IRO-010-1a. **Response: The verifications required under MOD-025-2 are to verify the unit capability for an applicable Facility, not real-time characteristics as required in IRO-010-1a. The drafting team is**

Organization	Question 3 Comment
	also addressing a FERC Order 693 directive to: *"direct the ERO to modify MOD-025-1 to require verification of reactive power capability at multiple points over a unit's operating range".* This was discussed during the first comment period of the standard and the majority of stakeholders agreed with our approach. Suggest the SDT specifically identify or show examples of how to match the percentage thresholds outlined in the Effective Date sections of the Standard and the associated Implementation Plans. Given recent experience with other Standards, it would be helpful for the SDT to establish how the entities can demonstrate meeting the requisite threshold percentages. Over time, we have observed that in some cases percentages were established by the number of devices or units; but in other cases, the measurement has been based upon magnitude of nameplate ratings. **Response: The SDT has added a clarifying note as follows: "Note: The verification percentage above is based on the number of applicable units owned."** If the Drafting Team believes that a separate Standard to verify the gross and net Real and Reactive Power of the turbine generator is required, then MOD-025 should be limited to requiring the reporting of maximum Real and Reactive Power only. In our view the detailed data requirements specified in Attachment 1 and 2 are not required for planning studies. The data in Attachments 1 and 2 have value to plant personal to evaluate unit efficiency and performance, but this data is not needed to support reliability. This data is more relevant to market functions. **Response: The verifications required under MOD-025-2 are to verify the unit capability for an applicable Facility. The drafting team is also addressing a FERC Order 693 directive to: *"direct the ERO to modify MOD-025-1 to require verification of reactive power capability at multiple points over a unit's operating range".* This was discussed during the first comment period of the standard and the majority of stakeholders agreed with our approach. The other data is provided to make adjustments if requested.**
Response: The GVSDT thanks you for your comments. Please see responses above.	

Organization	Question 3 Comment
South Carolina Electric and Gas	In attachment 1, change the periodicity for performing Real and Reactive Power capability verification from five years to ten years. This would be consistent with standards MOD-026 and MOD-027.
SERC Planning Standards Subcommittee	In attachment 1, change the periodicity for performing Real and Reactive Power capability verification from five years to ten years. This would be consistent with standards MOD-026 and MOD-027. The comments expressed herein represent a consensus of the views of the above-named members of the SERC EC Planning Standards Subcommittee only and should not be construed as the position of SERC Reliability Corporation, its board, or its officers.
Response: The GVSDT thanks you for your comments. The GVSDT believes that the verification periodicity for Real Power and Reactive Power capability is appropriate at five year intervals and was addressed in previous comment periods. The GVSDT believes that stakeholder consensus has been achieved in this regard.	
Ingleside Cogeneration LP (Voting entity Occidental Chemical Corporation)	Ingleside Cogeneration LP agrees that the ability for Transmission Planners and other operating entities to be able to rely on a generator's available real and reactive capacity under system duress is essential to BES reliability. In addition, the technical veracity and implementation time frames in the latest version of MOD-025-2 are far improved over previous versions. However, we are concerned with the aggregate work load that all five standards in Project 2007-09 will place upon our engineering and operations organizations. Each has its own unique purpose, which means unique processes to support them - as well as test results that demonstrate compliance. With so much uncertainty surrounding this program, we cannot agree to proceed without the following items being addressed: 1) All requirements for recurring tests (R1 and R2) must contain language that focuses on the strength of the validation process - not the execution. This could be similar to that used in the CIP version 5 standards calling for the Responsible Entity to implement an action "in a manner that identifies, assesses, and corrects deficiencies". Experience has shown that without this preface, auditors will focus on missed due dates, whether or not all check boxes are filled in, and statements showing that every sub-requirement was addressed - even those not applicable to the facility. The CEA's focus needs to be on the entity's commitment to the validation effort, not the documentation.

Organization	Question 3 Comment
	2) The Compliance organization needs to be engaged in the development process so that industry stakeholders have a sense of how adherence to the standard will be determined. The existing process is disconnected - leading to inconsistent interpretations of the drafting team's original intent. Other projects have begun to post drafts of the RSAWs concurrently with the standards for exactly this reason. The SDT should take note that these modifications are consistent with the risk-based compliance direction that both NERC and FERC support. The intent is to focus industry and regulatory resources on the reliability aspects of the initiative - not its administrative aspects
Response: The GVSDT thanks you for your comments. Your issues relate to the "Find, Fix and Track" process that was most notably incorporated in the CIP body of standards. For example, CIP-003-5, Requirement R2 states:"Each Responsible Entity for its assets identified in CIP-002-5, Requirement R1, Part R1.3, shall implement, in a manner that *identifies, assesses, and corrects deficiencies*, one or more documented cyber security policies that collectively address the following topics, and review and obtain CIP Senior Manager approval for those policies at least once every 15 calendar months:" This requirement relates to a specific program that addresses a wide range of topics, including documentation of the processes involved. The requirements of MOD-025 are to simply verify the output of an applicable Facility and report it. Under this standard, the responsible entity either performed the verification and reported it or they didn't. There is no inherent program deficiency that can be identified and corrected. The GVSDT does not believe that this approach is applicable to the requirements that we have developed.	
JEA	JEA supports the comments of the NAGF and believes that the SDT team should accept a request by the NAGF to have a joint meeting to discuss and resolve the many differences since these differences are so substantial that the usual iterative process will be excessively long. We also support NAGF's suggestion to evaluate these standards using the Cost Effective Analysis Process.
Response: The GVSDT thanks you for your comments. The GVSDT did not receive any comments from the NAGF, however others have mirrored the intent to concur with their comments (see specifically Cowlitz). We have responded to those comments above. The CEAP is not in effect as this time and cannot be implemented at this time.	
Exelon Corporation and its affiliates	Section D, "Compliance," Part 1.2, "Evidence Retention," (page 6 of 22) first paragraph is unnecessary and redundant since the retention periods specified are for the time period since the last compliance audit. Exelon suggests that this paragraph be deleted in its entirety.

Organization	Question 3 Comment
Response: The GVSDT thanks you for your comments. The first paragraph of this section is boilerplate language provide by NERC for inclusion in all standards.	
Southern Company	The focus of this standard appears to be on testing rather than on verifying the P and Q limits to be used in Transmission Planning models. An engineering study for reactive capability is an option that needs to be allowed by this standard Currently, the standard is more of a performance test than a model verification test - the requirements do not directly fulfill the purpose. Applying an “unduly restricted” classification to reactive power verification results that fall short of 50% of the thermal capability curve (page 16) creates a technical error that does not prove or disprove the reactive capability of the generating unit. The D-curve represents the thermal characteristic of a single component (generator). The reactive capability of a generation unit system is also a function of other factors. These other factors include the transmission system bus voltage, GSU impedance and tap setting, unit auxiliary transformer and downstream station service transformer impedances and tap settings, station service bus loadings and voltage limits, and the excitation limiter settings. Staged testing has limitations when attempting to prove a unit’s reactive capability. We currently use an engineering assessment approach that establishes a unit’s expected reactive capabilities using an analytical model. The model has been validated using historical operational data. The model takes into account all the above factors and is used to estimate the unit’s reactive capabilities for extreme system voltage conditions when unit’s reactive limits will be challenged. The limits are then reviewed by plant operations to ensure any operational limitations have been identified and factored into the assessment. This has proven to be a better process for establishing the reactive limits needed for the transmission planning system models than the use of staged test data. MOD-025 should not require “staged testing” without option. Staged testing should only be required if requested under TOP-002-2b R13. This will ensure the appropriate system conditions exist to support the testing (coordinated by the TOP and RC). This eliminates the GO from being required to perform testing that cannot be supported by the TOP and RC. Industry experience has shown that verification of the true reactive limits via staged testing is typically not possible due to transmission system constraints. Due to these constraints, an option to use engineering analysis for validation should be allowed by this standard. While the standard could allow staged testing as an option, we believe that staged testing should only be considered when there is a demonstrated need for the

Organization	Question 3 Comment
	testing. The unit size applicability for PRC-019 and MOD-025 should be set equivalent to that specified by MOD-026 and MOD-027. We do not see significant value in a 5-year re-verification cycle through staged testing. We believe a periodic confirmation that the previously verified MW and MVAR capabilities are still valid does have value. Re-verification should only be necessary when there is a long term configuration change, a major equipment modification, or equipment problems that impact the unit MW or MVAR capabilities. Possible equipment problems are being used as reason by some for wanting staged testing and periodic re-verification. Equipment problems that could limit real and reactive power capability generally manifest themselves during normal operation. These are appropriately addressed via normal operational reporting to satisfy requirements in TOP-002-2.1b and VAR-002-2b and are corrected through normal maintenance practices. Therefore, we do not agree that concerns for equipment problems justify periodic testing of every generator in the BES. Furthermore, that approach will subject the BES to a constant state of testing and off-normal operational conditions that we believe could actually prove to be detrimental to BES reliability. The recorded Mvar values were adjusted to rated generator voltage, where applicable," on p.21 should be deleted because it does not make sense to do this.
Response: The GVSDT thanks you for your comments. Historical operational data may be used for subsequent verifications if the data meets the requirements in the standard. The GVSDT has developed the applicability of the standard based on the NERC registry criteria. **Again, MOD-025-2 allows the use of historical operational data for re-verifications. Equipment problems that limit a units capability will not always manifest themselves during normal operations. Reactive limitations reported under the VAR and TOP standards are Real-time or Operations Planning issues and are not reported to the Transmission Planner. These issues have been addressed during prior comment periods. The GVSDT agreed after the previous posting in the Consideration of comments to remove this point ("The recorded MVAR values were adjusted to rated generator voltage, where applicable.") from Attachment 2. We apologize that it did not get removed from the standard and have removed it.**	
NIPSCO	This is the information that generator owners are supposed to provide every year to transmission owners as part of the MOD-10 data submittal. Why a new standard is being developed instead of

Organization	Question 3 Comment
	modification of the existing MOD-10 is questionable. The burden for complying with this standard falls almost entirely with the generation group, e.g., electric production. Given the above, Transmission Planning recommends a vote in favor of this standard.
Response: The GVSDT thanks you for your comments. MOD-011 relates to steady state data requirements and requires the following data be submitted with respect to generating units: **"R1.2. Generating Units (including synchronous condensers, pumped storage, etc.): location, minimum and maximum Ratings (net Real and Reactive Power), regulated bus and voltage set point, and equipment status."** **MOD-025-2 requires that the capability of a unit be verified as, over time, equipment operating characteristics change.**	
Wolverine Power Supply Cooperative, Inc.	This standard is redundant. We are already required by MISO to provide real power data. It would be more logical for this standard to be applicable to the RTO because they are already asking for most of this data. I would rather have MISO expand what they are asking for and have them pass the data along to NERC, than to have to comply with two entities asking for the same thing with slightly different methods.
Response: The GVSDT thanks you for your comments. The standard applies continent-wide and does not require that any data be submitted to NERC. This standard contains requirements to provide data to Transmission Planners. Any procedures developed by an ROT or ISO are in addition to NERC standards. The same data may possibly satisfy both. It is up to the individual entities to determine whether or not this is the case.	
Utility Services	Utility Services suggests the SDT specifically identify or show examples of how to match the percentage thresholds outlined in the Effective Date sections of the standard and the associated Implementation Plans. Given our recent experience in other standards, it would be helpful for the SDT to establish how the entities can demonstrate meeting the requisite threshold percentages. Over time, we have observed that in some cases, percentages were established by the number of devices or units; but in other cases, the measurement has been based upon magnitude of nameplate ratings.
Response: The GVSDT thanks you for your comments. The GVSDT has added a note to provide clarification: "Note: The	

Organization	Question 3 Comment
verification percentage above is based on the number of applicable units owned.	
PSEG	We voted “Negative” on this standard the reasons shown below: This FIRST COMMENT was provided for MOD-025-1, MOD-026-1, MOD-027-1, and PRC-019-1.1.SYNCHRONOUS CONDENSERS: The GVSDT is not working as a “team” with regards to synchronous condensers owned by TOs. The team working on this standard and PRC-019-1 INSIST that they be included as “applicable facilities,” while the team working on MOD-026-1 has stated otherwise. We provided this comment to the MOD-026-1 team in the last set of comments:”The exclusion of synchronous condensers (and other reactive devices) in MOD-026-1 per the rationale provided in the Background (with which we agree) states “Synchronous condensers are not currently addressed in the NERC Registry Criteria” However, companion standards under Project 2007-09 (MOD-025-2 and PRC-019-1) are applicable to synchronous condensers. The GVSDT should address this inconsistency.”The SDT responded as follows:”The SDT believes that MOD-026 is different from the other standards with respect to synchronous condensers due to the complex interaction required between the Transmission Planner and the Generator Owner, and thus believes it better to wait for efforts by others to define where synchronous condensers fit in the functional model.”In response to a similar comment on MOD-025-2 and PRC-019-1, we received these responses: MOD-025-1: “The GVSDT thanks you for your comment. There was overwhelming industry support (approximately 96%) for inclusion of synchronous condensers at the first posting of MOD-025-2. The Definition of Bulk Electric System (BOT Adoption Jan 2012) includes in “I5 - Static or dynamic devices (excluding generators) dedicated to supplying or absorbing Reactive Power that are connected at 100 kV or higher, or through a dedicated transformer with a high-side voltage of 100 kV or higher, or through a transformer that is designated in Inclusion I2.”PRC-019-1: “The SDT feels that it is appropriate to include synchronous condensers because of their similarity to generators in terms of dynamic reactive power supply, voltage control, disturbance response, control functions, and protection systems. For this reason the SDT proposes to apply to the standard to similar size generators and synchronous condensers.” We need to see “one” statement from the SDT on the inclusion or exclusion of synchronous condensers that makes sense technically, and soon. **Response: The GVSDT is indeed working as a “team” with these standards. Each individual standard was developed based on the reliability needs and benefits that each specific standard**

Organization	Question 3 Comment
	requires. There are fundamental differences in the types of verifications required under each standard. Therefore, the reliability needs for each standard will not necessarily be the same, nor will the applicable facilities necessarily be the same. As you are the only commenter that has raised an issue regarding the applicability of synchronous condenser, the GVSDT concludes that stakeholder consensus has been achieved with respect to the inclusion of synchronous condensers in MOD-025-2. This SECOND COMMENT was provided for MOD-025-1, MOD-026-1, MOD-027-1, and PRC-024-1.2.DATA SHARING POLICY: For all of the MOD standards in this, only Transmission Planners are the recipient of the data developed. We asked that the standard require that the TP be required to share the data with others. The response we received is that the Functional Model requires the TP to share data with the TOP. Unfortunately, the Functional Model is unenforceable. We note that in PRC-024-1 R6 requires the GO to share its data with the RC, PC, TOP, and TO, upon request. Unless the same data is shared across all "modelers," the result will be outdated data in someone's model, which can have a bad result. The team should have one broad "data sharing" policy in the three MOD standards and PRC-024-1. Since the TP receives data in three of the standards, we suggest this language or similar language: The GO shall provide data to its TP within 60 days of its development [describe the data]. The TP shall provide the same data to any RC, PC, TP, or TOP within 60 days of receiving a request for it. **Response: The GVSDT has written the requirements of this body of standards based on the NERC Reliability Functional Model. The requirements of Reliability Standards MOD-010-0. MOD-011-0, MOD-012-0 and MOD-013-1 address the requirement for steady state and dynamic models (which are planning models) and the dissemination of these models to appropriate entities. The data to build Real-time models that are necessary for reliability and used by Reliability Coordinators and Transmission Operators are addressed in standards IRO-010-1a and TOP-003-2 respectively. The GVSDT does not see any reason to include duplicative requirements in this standard.**
Response: The GVSDT thanks you for your comments. Please see responses above.	
PPL Corporation NERC Registered Affiliates	Without some exemption, we disagree with the GVSDT linking generator applicability of this standard to the Compliance Registry Criteria. Instead, the approach to applicability should be the

<table>
<tr><th>Organization</th><th>Question 3 Comment</th></tr>
<tr><td></td><td>same as what is used/proposed in MOD-026 and MOD-027 (i.e. in the Eastern Interconnection, individual units greater than 100 MVA directly connected to the BES, etc.) Other than that size unit, use regional criteria to address any smaller units identified as critical to the BES in a given region. Consistency of criteria among the standards within this Project 2007-09 should be the same.</td></tr>
<tr><td colspan="2">Response: The GVSDT thanks you for your comments. The GVSDT has developed the applicability of MOD-025-2 based on the registration criteria. Each individual standard in this project has been developed based on the reliability needs and benefits that each specific standard requires. There are fundamental differences in the types of verifications required under each standard. Therefore, the reliability needs for each standard will not necessarily be the same, nor will the applicable facilities necessarily be the same.</td></tr>
<tr><td>Xcel Energy</td><td>Xcel Energy questions the reliability value of determining the maximum leading reactive power value at maximum real power output. This is not an operating regime for most generating units, so operational data will not be available, and operating at maximum power would normally occur during higher system load conditions when the loss of a generating unit due to a mistake during a test would stress the system more severely.</td></tr>
<tr><td colspan="2">Response: The GVSDT thanks you for your comments. During the comment period of June 15 – July 15, 2011 of MOD-025-2, the SDT asked the following question:

“5. The draft standard requires that the Reactive Power capability be verified at four points: over-excited (lagging) and under-excited (leading) reactive capability at (1) the rated Real Power capability and (2) expected minimum Real Power output. The SDT believes that this is consistent with the FERC directive in Order 693 at P1321, “Therefore, we adjust the proposal in the NOPR and direct the ERO to modify MOD-025-1 to require verification of reactive power capability at multiple points over a unit’s operating range.” Do you agree that the four points proposed by the SDT is adequate to provide a straight line approximation to a unit’s Reactive Power capability over its actual operating range? If not, please explain.”

The majority of stakeholders agreed with the proposed points. A note was added to Attachment 1 to address comments regarding leading capability: “Note 4: The verification is intended to define the limits of the unit’s capabilities. If a unit has no leading capability, then it should be reported with no leading capability, or the minimum lagging capability at which it can operate.”

To minimize stress to the system, the following is included in Attachment 1 – “If the Reactive Power capability is verified through</td></tr>
</table>

Organization	Question 3 Comment
test, it is to be scheduled at a time advantageous for the unit being verified to demonstrate its Reactive Power capabilities while the Transmission Operator takes measures to maintain the plant's system bus voltage at the scheduled value or within acceptable tolerance of the scheduled value." **The GVSDT believes that stakeholder consensus has been reached on this issue.**	

END OF REPORT

Consideration of Comments

Project 2007-09 Generator Verification
MOD-027-1

The Project 2007-09 Generator Verification Standard Drafting Team (GVSDT) thanks all commenters who submitted comments on the proposed revisions to MOD-027-1. The standard was posted for a 30-day public comment period from September 28, 2012 through October 31, 2012. Stakeholders were asked to provide feedback on the standard and associated documents through a special electronic comment form. There were 46 sets of comments, including comments from approximately 152 different people from approximately 98 companies representing 9 of the 10 Industry Segments as shown in the table on the following pages.

All comments submitted may be reviewed in their original format on the standard's project page.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Mark Lauby, at 404-446-2560 or at mark.lauby@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

Summary Consideration

The vast majority of commenters agreed with the revisions to Attachment 1 clarifying that for units that do not respond to frequency excursions, Requirement 2 is met with a written statement to that effect transmitted to the Transmission Planner, and that units which respond to over-frequency would need to have verification performed. No modifications were made to the draft standard as a result of industry comments for Question 1.

The vast majority of industry agreed that the revised Attachment 1 is clearer. There were a few minority comments about some of the specific rows in the Attachment, including proposals to refine the proxy sister unit philosophy and to move capacity factor philosophy back to the Applicability Section. However, the vast majority of industry agreed with the modified Attachment 1 and no further revisions were made to Attachment 1.

Based on stakeholder comments, the GVSDT made the following clarifications to the standard:

[1] The appeals process is in the Standard Processes Manual: http://www.nerc.com/files/Appendix_3A_StandardsProcessesManual_20120131.pdf

- In the Effective Date section 5.3, the word “thirty” after the word “quarter” was inserted in the standard by mistake. As such, the SDT removed the word “thirty.” Also, in 5.1, the GV SDT changed the beginning of the first sentence from: “For Requirements R1, and R3 through R6 …“ to “For Requirements R1, and R3 through R5 …“ to reflect that there are five, not six requirements in the standard.

- The wording, “… or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities,” in Section 5.1 was moved to right after “… approved by applicable regulatory authorities …” And that same wording was moved to right after, “… following applicable regulatory approval …” in Sections 5.2 to 5.4. Also, the same phrase was appended to each of the four bullets in the Effective Date Section, “… in those jurisdictions where regulatory approval is required …” of the Implementation Plan right after, “… following applicable regulatory approval.” This was done to address regulatory approvals in Canada.

- In the Applicability section 4.2.3, added the word “in” so that the phrase now reads, “Generation in the ERCOT Interconnection…” to be consistent with the language associated with the other interconnections (sections 4.2.1 and 4.2.2).

- Revised the first sentence in R1 to read: “Each Transmission Planner shall provide the following requested information to the Generator Owner within 90 calendar days of receiving a written request …”

- The SDT has refined the applicable portion of Part 2.1 to read, “Verification for individual units rated less than 20 MVA (gross nameplate rating) in a generating plant (per Section 4.2.1.2, 4.2.2.2, or 4.2.3.2) may be performed using either individual unit or aggregate unit model(s) or both.” Stakeholders believed that this added clarity to the Requirement.

- In the previous posting, there was a problem with footnote 4 where the language, “Error! Bookmark not defined,” was included in the language of the Requirement R4. This has been corrected.

- Several commenters provided suggestions for improvements to Requirement R5. The GVSDT clarified that the response by the Transmission Planner to the Generator Owner concerning the results of testing the model useability is required to be a written response. Also, for ease of reading, the GVSDT moved the last sentence in the requirement to after the Requirement Parts 1-3.

Index to Questions, Comments, and Responses

1. The GVSDT has revised Attachment 1 to attempt to clarify that, for units that do not respond to frequency excursions, Requirement 2 is met with a written statement to that effect transmitted to the Transmission Planner. Units which respond to over-frequency would need to have verification performed. Do you agree with this revision? If not, please explain in the comment area below. ... 12
2. The GVSDT has revised Attachment 1 to make the periodicity requirements more clear. Do you agree with these revisions? If not, please explain in the comment area below. 17
3. Do you have any other comment, not expressed in questions above, for the GVSDT?..................... 26

The Industry Segments are:

1 — Transmission Owners

2 — RTOs, ISOs

3 — Load-serving Entities

4 — Transmission-dependent Utilities

5 — Electric Generators

6 — Electricity Brokers, Aggregators, and Marketers

7 — Large Electricity End Users

8 — Small Electricity End Users

9 — Federal, State, Provincial Regulatory or other Government Entities

10 — Regional Reliability Organizations, Regional Entities

1. **The GVSDT has revised Attachment 1 to attempt to clarify that, for units that do not respond to frequency excursions, Requirement 2 is met with a written statement to that effect transmitted to the Transmission Planner. Units which respond to over-frequency would need to have verification performed. Do you agree with this revision? If not, please explain in the comment area below.**

Summary Consideration: The vast majority of commenters agreed with the revisions to Attachment 1 clarifying that for units that do not respond to frequency excursions, Requirement 2 is met with a written statement to that effect transmitted to the Transmission Planner, and that units which respond to over-frequency would need to have verification performed. No modifications were made to the draft standard as a result of industry comments for Question 1.

Organization	Yes or No	Question 1 Comment
Independent Electricity System Operator	No	Attachment 1 Row 7 leaves the impression responding to frequency excursion is merely a choice and this impression is harmful to reliability. Few "applicable units" should be unresponsive to over and under frequency excursions. If Generator Owners can choose to not help regulate frequency by simply notifying the Transmission Planner, why would any Generator Owner continue to regulate frequency? The attachment should be changed so units are unresponsive to frequency excursions only under conditions accepted by the Transmission Planner.
Response: The GVSDT thanks you for your comment. The SAR for this draft standard calls for the verification of the generator's Turbine/Governor and Load Control or Active Power/Frequency Control Function model data. Performance or operational requirements are beyond the scope of this standard. It is important that the correct response be modeled so that the simulation represents reality. The SDT believes that we have achieved stakeholder consensus on the current language of the standard.		
Cowlitz PUD	No	Cowlitz supports the comments of the NAGF SRT:1. The SDT should consider moving the capacity factor exemption information found

Organization	Yes or No	Question 1 Comment
		inAttachment 1, row 8 into the applicability section. The applicability section should allow anentity to be able to determine if the standard applies to them and be able to determine thescope of the facilities affected. It is best for those impacted to immediately know which unitsare in the scope and not have to realize the scope from a detailed study of the table ofAttachment 1. This would allow row 8 of Attachment 1 to be deleted.
Response: The GVSDT thanks you for your comment. The SDT decided to place all the scenarios that effectively "exempt" otherwise applicable units in Attachment 1 for clarity. The SDT believes that we have achieved stakeholder consensus on the current language of the standard.		
Oncor Electric Delivery Company	No	Oncor does not support the position that the Transmission Planner (TP) is applicable for this standard. In the ERCOT Interconnection, Section 3 and Section 5 of the ERCOT Nodal Operating Guides prescribes the ERCOT ISO to request and receive generation unit performance data, not the TP.Oncor takes the position that a regional variance be granted for the ERCOT Interconnection such that the standard would prescribe that the Planning Authority (PA) only be the only requestor and receiver of unit performance data to support Section 3 and Section 5 of the ERCOT Nodal Operating Guides.
Response: The GVSDT thanks you for your comment. Regarding the responsibilities assigned to the Transmission Planner in the draft standard, the SDT believes standard language lines up well with both the functional model and the vast majority of entity business practices in effect regarding the interactions between generation and transmission entities when collaborating on generator dynamic models. There are defined NERC processes outside the GV SDT effort where entities can request a regional variance. Alternatively, the Transmission Planner could delegate the responsibility to another such as its Planning Authority.		

Organization	Yes or No	Question 1 Comment
Ameren	No	We believe that there is a discrepancy between the language in the requirement and VSL for R4 and Row 4 of the Attachment 1. In the requirement, a 180 day period is stated, while in Row 4 of Attachment 1, a 365 day period is stated.
Response: The GVSDT thanks you for your comment. R4 requires a Generator Owner to provide revised model data or plans to perform model verification within 180 days of changes to the equipment. If the Generator Owner chooses to plan to perform model verification, then when that verification plan is submitted to the Transmission Planner, then in accordance with Requirement 2, Row 6 of Attachment 1 would specify that the Generator Owner has an additional 365 days to actually perform the verification – including transmitting the verified model, documentation, and data to the Transmission Planner.		
PPL Corporation NERC Registered Affiliates	No	Why wouldn't the GVSDT just identify (i.e. show reference note on Attachment 1 table) that "Applicable units does not include units that don’t respond to frequency excursions (e.g., base-loaded units)"?
Response: The GVSDT thanks you for your comment. The SDT decided to place all the scenarios that effectively “exempt” otherwise applicable units in Attachment 1 for clarity. The SDT believes that we have achieved stakeholder consensus on the current language of the standard.		
ExxonMobil Research and Engineering	No	No comments on the question.
Idaho Power Company	Yes	Idaho Power System Planning agrees with the revisions made to Attachment 1.
Response: The GVSDT thanks you for your comment.

2. **The GVSDT has revised Attachment 1 to make the periodicity requirements more clear. Do you agree with these revisions? If not, please explain in the comment area below.**

Summary Consideration: The vast majority of industry agreed that the revised Attachment 1 is clearer. There were a few minority comments about some of the specific rows in the Attachment, including proposals to refine the proxy sister unit philosophy and to move capacity factor philosophy back to the Applicability Section. However, the vast majority of industry agreed with the modified Attachment 1.

Organization	Yes or No	Question 2 Comment
ACES Power Marketing Standards Collaborators	No	(1) While the clarity of Attachment 1 has been improved, we noticed a couple of issues. Note 3 provides guidance for early compliance and we agree that early compliance should be allowable. It establishes that 10-year period begins from the transmittal date. If a GO has data that satisfies the early compliance condition for a verified model and that data is a five years old, the Note would appear to allow the GO to transmit the data to the TP and receive credit for next 10 years effectively creating an initial 15-year re-verification cycle. Is this intended? If not, please provide more guidance for how soon the GO would have to re-verify its model. **Response: The intent of Attachment 1 Note 2 is to establish the recurring 10-year unit verification period start date assuming no consideration for early compliance. Consideration for early compliance is addressed in Note 3. This allows early compliance for a 10-year period. The 10-year period begins when model verification is specified to be "complete" per the regional policies, guidelines, or criteria that were in force. If early compliance is sought based on existing verification compliant with the requirements of this standard, as the SDT strove to write the standard such that the "how's" are specified and not the "what's," the modeling expert is expected to responsibly manage the time between the data used to verify the model and the subsequent verification and the transmittal of the**

Organization	Yes or No	Question 2 Comment
		verified model, documentation, and data to the Transmission Planner. (2) Row 4 in Attachment 1 states that it applies to initial verification for a newly applicable unit or for an existing applicable unit with a new turbine/governor and load control or active power/frequency control equipment control system. However, Requirement R4 also applies to changes to the same control system. Wouldn't complete replacement be a change? We recommend modifying Attachment 1 to avoid this overlap. **Response: The SDT believes that we have achieved stakeholder consensus on the current language of the standard. The SDT feels like the distinction of a complete replacement of an governor system merits its own row in Attachment 1 as there is no doubt that this would result in the need to verify the model and is applicable to Requirement 2 and not Requirement 4.** (3) Per Requirement R4 and Row 6 in attachment 1, the GO has 180 days to submit a plan to Transmission Planner to verify the model and then another 365 days to perform the model verification date. That would appear to give the GO approximately a year and half to complete the verification for changes (including replacement) to the control system. Requirement R2 and Row 4 appear to require completion of the verification in 365 days or a year. Please modify the table or requirement to clarify appropriate application. **Response: The time lines for Requirements R2 and R4 are different as the Requirements are different. Requirement R4 specifies the need for model verification due to changes to the turbine / governor that alter the equipment response characteristic, and allows 180 days to determine if the model needs to be verified or if the submission of updated data is sufficient. Attachment 1 addresses the required periodicity and acceptable time delays to remain compliant (365 days for activities described in R4 assuming for R4 that the Generator Owner decided that they will verify the model). Conversely, R2 specifies the periodic required model verification and thus no time needs to be allotted to determine if the model needs to be verified – as it must be verified at least once every 10 years.**

Organization	Yes or No	Question 2 Comment
		Attachment 1 goes on to specify the required time or anniversary date for which verification per R2 is required.
Response: The GVSDT thanks you for your comment. Please see responses above.		
Tennessee Valley Authority	No	Attachment 1, Row Number 5, Recommend deleting “at the same physical location” from the Verification condition. The first condition is recommended to read “Existing applicable unit that is equivalent to another unit(s),” Justification is that if a GO has units that are equivalent and meet the “sister” criteria, the standard does not need to be restricted to the same physical location. The GO identical equipment at different physical locations are still equivalent.
Response: The GVSDT thanks you for your comment. The SDT notes the general agreement among industry with using the proxy unit approach. The SDT respectfully maintains that the “same physical location” requirement is necessary since it provides a strong indication of similarity of equipment and settings (which could be verified by the same field personnel during a single site walk down). For example, a GO/GOP could own/operate otherwise similar equipment physically located in vastly different geographic locations with substantially different Reliability Coordinator or Transmission Operator requirements (e.g., requirement for governor droop response vs. constant load set point) or equipment with identical design ratings, but different control system settings which would result in different models and performance).		
Consumers Energy	No	Consumers' previous comments - The generator model with the excitation system and the load rejection testing or frequency step response testing is difficult to perform and has possibilities of damaging equipment and causing reliability issues on the system in order to perform. Previous SDT reply - The GVSDT thanks you for your comment. MOD-027 is written to allow for the use of ambient monitoring, recorded data associated with the normal operation of your equipment. A GO with your concerns can alleviate the issues you mention using ambient monitoring. While we agree with the reply by the SDT when ambient monitoring is available, it is not available on all of our equipment. Therefore, we stand by our previous comments.

Organization	Yes or No	Question 2 Comment
Response: The GVSDT thanks you for your comment. Ambient monitoring can be accomplished by recording the unit's MW response, when it is in a mode in which it is expected to govern. The recordings could come from a variety of source such as from plant DCS systems, recorders, SCADA data, etc. Note that for units that need to acquire recorders, slow resolution data, approximately 1 sample per second, is adequate for turbine/governor and load control or active power/frequency control function model verification.		
Wisconsin Electric Power Company	No	In Row 5, the use of 350 MVA as the cutoff for "sister unit" treatment is not reasonable. We propose the limit can be increased to 500 MVA without any adverse reliability impacts. **Response: Based on industry comments in a previous posting, the SDT raised the proxy unit cutoff from 250 MVA to 350 MVA. This cutoff will enable the inclusion of many steam units at sites with multiple and identical CC plants. The SDT believes that it has we have achieved stakeholder consensus on the current proxy unit MVA threshold.** Also, in Row 6, the allowable time for existing units to be verified following an indication of model problems should be 2 years, rather than 1 year, since existing legacy units may require additional resources to understand and resolve the issues. **Response: The language and timing in Attachment 1 have been vetted through several comment periods. The SDT believes that we have achieved stakeholder consensus on the current language of the standard.**
Response: The GVSDT thanks you for your comment. Please see responses above.		
Oncor Electric Delivery Company	No	Oncor does not support the position that the TP is applicable for this standard. In the ERCOT Interconnection, Section 3 and Section 5 of the ERCOT Nodal Operating Guides prescribes the ERCOT ISO to request and receive generation unit performance data, not the TP.Oncor takes the position that a regional variance be granted for the ERCOT Interconnection such that the standard would prescribe that the PA only be the only requestor and receiver of unit performance data to support

Organization	Yes or No	Question 2 Comment
		Section 3 and Section 5 of the ERCOT Nodal Operating Guides.
Response: The GVSDT thanks you for your comment. Regarding the responsibilities assigned to the Transmission Planner in the draft standard, the SDT believes standard language lines up well with the functional model and the vast majority of entity business practices in effect regarding the interactions between generation and transmission entities when collaborating on generator dynamic models. There are defined NERC processes outside the GV SDT effort where entities can request a regional variance. Alternatively, the Transmission Planner could delegate the responsibility to another such as its Planning Authority.		
Independent Electricity System Operator	No	The long periods in Attachment 1 introduce too much risk to modeling assumptions used to assess transmission system reliability and to make other operating and planning decisions which do not reflect or address the actual performance of the system and equipment. This standard should not only establish the maximum period that Transmission Planners and Generator Owners to complete tasks but also to require the Transmission Planners to establish more stringent requirements when necessary to reduce the risk to reliability to an acceptable level. In some jurisdictions, e.g., Ontario, Generator Owners have 30 days to transmit the verified model, documentation and data to the Transmission Planner. Generator Owners are also required to indicate immediately following testing whether the installed equipment performed as expected. This approach has worked well. New or modified equipment must first pass through a connection assessment process to establish whether expected performance will meet connection requirements. Emerging from this process is the Generator Owner's conditional right to connect provided he meets an obligation to demonstrate the installed equipment behaves as well as assumed during the assessment process. In this way, the risk to reliability is reduced to an acceptable level as the exposure of the decision making process to flawed modeling assumptions is minimized
Response: The GVSDT thanks you for your comment. The time periods in Attachment 1 have been vetted through several comment		

Organization	Yes or No	Question 2 Comment
periods. Also, performance or operational requirements and the submittal of preliminary models (typically per interconnection agreements) are beyond the scope of this standard. The SDT believes that we have achieved stakeholder consensus on the current language of the standard.		
Luminant	No	While Luminant agrees with the concepts in the periodicity requirements in Attachment 1, it would be beneficial for the drafting team to clearly identify that units that are base load (row 7) are excluded from model verification.
Response: The GVSDT thanks you for your comment. The SDT decided to place all the scenarios that effectively "exempt" otherwise applicable units in Attachment 1 for clarity. The SDT believes that we have achieved stakeholder consensus on the current language of the standard. The way the non-responsive unit exemption is structured will provide for base loaded units to meet the requirement with a statement regarding the unit not responding to frequency.		
ISO-New England	No	Attachment 1, Row 4 allows for transmission of a verified model 365 days after commissioning of a new generator. This is an unacceptable length of time for a generator to be on-line from both a reliability standpoint and this length of time is in conflict with ISO/RTO Standard Generator Interconnection Agreement language. The ISO/RTO Standard Generator Interconnection language requires Generator Owners to provide verified models ***prior to*** Commercial Operation.
Response: The GVSDT thanks you for your comment. This standard does not address collection of preliminary model data from the equipment manufacturer. New equipment models cannot be verified until after the equipment is available. Generator Owner development of the original model during the equipment commissioning process – including iterations with transmission entities such as the submittal of preliminary models by the Generator Owner and modifications to preliminary model data and any requirements to verify the models prior to Commercial Operations should be governed by individual interconnection agreements.		
ExxonMobil Research and Engineering	No	No comments on this question.
FirstEnergy	Yes	Although FirstEnergy (FE) agrees with the revision to Attachment 1, we feel that the capacity factor calculation in Row 8 should be a part of Applicability section 4.2

Organization	Yes or No	Question 2 Comment
		Facilities. The reader of the standard shouldn't have to get to the last row of an attachment to determine as to whether a unit is exempt or not.
Response: The GVSDT thanks you for your comment. The SDT decided to place all the scenarios that effectively "exempt" otherwise applicable units in Attachment 1 for clarity. The SDT believes that we have achieved stakeholder consensus on the current language of the standard. The way the capacity factor exemption is structured will provide for the requirement to be met with a statement regarding the capacity factor. It provides for an alternative way to meet the requirement, rather than a change in applicability. This will provide for more clarity in tracking the status for a given unit. The SDT believes that we have achieved stakeholder consensus on the current language of the standard.		
Idaho Power Company	Yes	Idaho Power System Planning agrees with the revisions made to Attachment 1.
Response: The GVSDT thanks you for your comment.		
Ingleside Cogeneration LP (Voting entity Occidental Chemical Corporation)	Yes	Ingleside Cogeneration LP agrees that the explanation of the periodicity requirements are an improvement over previous versions.
Response: The GVSDT thanks you for your comment.		
Southern Company	Yes	Southern Company agrees with the modifications to Attachment 1 (the Periodicity Table) as they both simplify and clarify the periodicity.
Response: The GVSDT thanks you for your comment.		
Southwest Power Pool Reliability Standards Development Team	Yes	We would suggest that there be something added to give those GO's who have not modified their plants to be able to opt out of the re-verification. There is a concern that the updated data would be at least a year out of step with the development of

Organization	Yes or No	Question 2 Comment
		the ERAG model in the eastern interconnect.
Response: The GVSDT thanks you for your comment. The processes incorporating new model data are existing processes that have proven to work well.

3. Do you have any other comment, not expressed in questions above, for the GVSDT?

Summary Consideration:

In the Effective Date section 5.3, the word “thirty” after the word “quarter” was inserted in the standard by mistake. As such, the SDT removed the word “thirty.” Also, in 5.1, the GV SDT changed the beginning of the first sentence from: “For Requirements R1, and R3 through R6 …“ to “For Requirements R1, and R3 through R5 …“ to reflect that there are five, not six requirements in the standard.

The wording, “… or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities,” in Section 5.1 was moved to right after “… approved by applicable regulatory authorities …” And that same wording was moved to right after, “… following applicable regulatory approval …” in Sections 5.2 to 5.4. Also, the same phrase was appended to each of the four bullets in the Effective Date Section, “… in those jurisdictions where regulatory approval is required …” of the Implementation Plan right after, “… following applicable regulatory approval.” This was done to address regulatory approvals in Canada.

In the Applicability section 4.2.3, added the word “in” so that the phrase now reads, “Generation in the ERCOT Interconnection…” to be consistent with the language associated with the other interconnections (sections 4.2.1 and 4.2.2).

The SDT has refined the applicable portion of Part 2.1 to read, “Verification for individual units rated less than 20 MVA (gross nameplate rating) in a generating plant (per Section 4.2.1.2, 4.2.2.2, or 4.2.3.2) may be performed using either individual unit or aggregate unit model(s) or both.” Stakeholders believed that this added clarity to the Requirement.

The footnote formatting error in R4 has been corrected.

Clarified that the response by the Transmission Planner to the Generator Owner concerning the results of testing the model useability is required to be a written response (R5). Also, for ease of reading, moved the last sentence in the requirement to after the parts.

Revised the first sentence in R1 to read, “Each Transmission Planner shall provide the following requested information to the Generator Owner within 90 calendar days of receiving a written request …”

Organization	Question 3 Comment
ACES Power Marketing Standards Collaborators	(1) Thank you for modifying the applicability section. It is greatly improved and is much clearer than the previous version. However, we believe there are a few additional minor refinements necessary. First, generators can be and are part of the Bulk Electric System. Thus, we suggest changing “Facilities that are directly connected to the Bulk Electric System (BES)” to “generation Facilities that

Organization	Question 3 Comment
	are part of the Bulk Electric System." Otherwise, there might be some confusion if the drafting team intends to draw in generators that are not part of the BES. Second, we find the wording "will be collectively referred as an 'applicable unit' that meet the following" confusing. We think the intent was to clarify that an applicable unit is one that is part of the BES and meets criteria established in section 4.2.1, 4.2.2, and 4.2.3. However, we think the inclusion of the "will be collectively referred as an 'applicable unit'" is superfluous. Because the section is the applicability section, we think this language could be struck for clarity and the applicable units will be understood to mean those that meet the criteria in section 4.2. As an alternative, the drafting team could explain in a footnote what they mean by the term applicable unit. Third, with the two proposed changes, we think the final wording of section 4.2 after the opening clause should be "generation Facilities that are part of the Bulk Electric System (BES) that meet the following criteria:". **Response: The SDT believes that the term "directly connected to the Bulk Electric System" is appropriate as that is the verbiage used in the Statement of Compliance Registry Criteria. The reason for utilizing the term "applicable unit" is that it is used in other portions of the standard and allows a simple reference to the base Applicability for each Interconnection.** (2) In requirement R2, please change "for each applicable unit" to "for each of its applicable units." This is the previous wording and is more correct. The current wording literally says that the GO must provide a verified model for each applicable unit including those it does not own. After all any unit that meets applicability criteria including those owned by other GOs would be an applicable unit. **Response: The SDT believes that the use of the phrase "for each applicable unit" being placed in a sentence immediately after the phrase "Each Generator Owner shall provide" clearly conveys the intent that the applicable units being referenced are those which belong to each Generator Owner. Also, note that the term "applicable unit" is defined for the content of this standard in the Applicability section.** (3) Please specify in M1 that a Transmission Planner may also provide an attestation that no such request was received if this is the case. Use of an attestation that an event did not occur is established as an acceptable form of evidence in CAN-0030. Furthermore, precedent has been set

Organization	Question 3 Comment
	in the use of attestations in measures in FAC-003-2 M1 and M2. **Response: As you stated, compliance recognizes that an attestation is an acceptable form of evidence. As such, including that in the Measures is repetitive.** (4) We continue to believe that the examples provided in the comment form should be included in the standard. Please create an Application Guidelines or Guidelines and Technical Basis section in the standard and add them. This has become common practice with developing standards. We do not understand why the drafting team would not want to retain such information that helps readers understand the standard and that has already been developed. Furthermore, it would make it easier for commenters to see what has changed in the examples because a red-line of the standard is required. Because the examples were contained in the comment form this time and during the previous posting, it is not easy to deduce the changes because there is no red-line. If the examples are not included in the standard, please provide more explanation than was provided during the last response to comments which was that it is not appropriate to include the examples. We do not understand why it is not appropriate. **Response: The examples provided were for clarification, and the SDT does not believe that all possible scenarios are considered. The SDT does not believe the examples are appropriate for inclusion in the standard itself. Also, the sections that you referred to as being an appropriate location to include the examples are not part of this standard's format. We believe that majority of stakeholders do not have a desire to include these examples in the standard.** (5) We disagree with the need to retain the latest model verification evidence under Requirement R2 and M2. First, this is not consistent with the Section 3.1.4.2 of Appendix 3c to the NERC Rules of Procedure section which states that the audit will cover the period from the day after the last compliance audit to the end date of the current compliance audit. Since the audit cycle for a GO is six years and the model verification period is 10 years, the GO will have to retain data past its prior audit period. Furthermore, the auditor will have already had an opportunity to review the model verification data during the last audit. Presumably, if they did not find any compliance violations, there should not be a need to review this data again. Thus, the data retention should not exceed the six year audit cycle.

Organization	Question 3 Comment
	Response: The SDT believes that once the recurring 10-year periodicity is established, that the Generator Owner has to maintain records regarding the last verification to be able to demonstrate that they conducted a valid verification within the last 10 years. As written, this follows the Data Retention guidelines. The alternative is to shorten the periodicity to six years. However, as confirmed by industry comments in prior postings, the SDT believes that the 10-year periodicity has overwhelming industry consensus. (6) How will mothballed units be handled in Attachment 1? If a mothballed unit is returned to service which row in Attachment 1 applies? What if the unit was mothballed before the effective date and returned to service after all stages of the effective dates? What if it was mothballed after an initial verification? How does this affect the next verification date? **Response: If the unit was mothballed before the effective date of the standard, upon coming out of retirements, Row 4 would be applicable. In all cases, after the initial verification, at a minimum, the 10-year periodicity would apply. Thus, if a unit was mothballed for years 5 – 7, the model would still need to be verified with the documentation and data to the Transmission Planner at year 10.**
Response: The GVSDT thanks you for your comment. Please see responses above.	
Ameren	(1)As a general comment, NERC should make all the papers listed in the references section of the standard readily available on their website. **Response: The papers are readily available as documented in the references. Due to copyright limitations, many of the documents cannot be made available on the NERC website.** (2)There appears to be an extra word “thirty” in both redline and clean versions of the standard under section 5.3 of the Effective Date section of the draft standard. **Response: The extra “thirty” has been removed in the current draft of the standard.** (3)As we understand, part of R1 is for the Transmission Planner to provide instructions on how to obtain the list of acceptable model types for use in dynamic simulations. In this regard, we ask the SDT if this would preclude the use of user-written models?

Organization	Question 3 Comment
	Response: The standard does not preclude user written models however the model must be on the list approved by the Transmission Planner. (4)We still have serious concerns about compliance with new MOD-027-1 while compliance with MOD-012-0 and MOD-013-1 is still in effect as explained in our response to draft MOD-026-1. We strongly request the SDT seriously consider incorporating the current MOD-012/MOD-013 submittal requirements within MOD-026 and MOD-027. This will synchronize the reporting and verification requirements and help minimize the resource burden of compliance with both efforts. At the same time it will create consistency across the country. **MOD-012 and MOD-013 contain data submittal requirements that requires submission of the latest dynamic model data for generator, excitation system, voltage regulator, power system stabilizer and turbine-governor. MOD-027 requires model verification including submittal of the verified turbine/governor model and data.**
Response: The GVSDT thanks you for your comment. Please see responses above.	
American Electric Power	1) In Section 4.2.3, the first line should read "Generation *in* the...". **Response: The SDT has made the correction to the typo.** 2) In Section 5.3, the word "thirty" should be removed from the end of the fourth line. **Response: The SDT has made the correction to the typo.** 3) In Section B, Requirement R2 contains bold faced text stating "Error! Bookmark not defined.", is this a mistake? **Response: The SDT has made the correction to the typo (should have been a footnote).** 4) MOD-027-1 R5 ends with "...that includes the following:" yet whatever the SDT intended to follow is missing. Please note that subparts 1 through 3 are referenced in parenthetical statements within the respective requirements and that it does not make sense that these subpart criteria are also what needs to follow "...that includes the following:"

Organization	Question 3 Comment
	Response: Based on your and another commenter's input, the SDT agreed that the sentence needed clarification. As such, the SDT decided to break the sentence up, with the first sentence ending at the next to last use of the word "usable" and we moved that last sentence to after the three criteria. The last sentence now reads: If the model is not usable, the Transmission Planner shall provide a technical description of why the model is not usable.
Response: The GVSDT thanks you for your comment. Please see responses above.	
Texas Reliability Entity	1) Considering the proposed new BES definition and the Guidance Document, there may be confusion in determining if a generator is "directly connected" to the BES. Please consider reviewing the language to see if it should instead say "included in" the BES. Note that a BES generator can be connected to the BES by non-BES elements, and arguably not "directly connected" to the BES. See, for example, figures E1-4 and E1-6 in the BES Definition Guidance Document. **Response: The SDT believes that the term "directly connected to the Bulk Electric System" is appropriate as that is the verbiage used in the Statement of Compliance Registry Criteria.** 2) Requirement R4: Suggest removing the phrase "or plans . . ." and rewording as "Each Generator Owner shall provide revised model data for each applicable unit . . .." There appears to be a footnote error here - delete "6"? **Response: Regarding your first comment, the SDT purposely structured the requirement so that the Generator Owner has a choice of providing revised model data or plans to perform model verification – and the SDT allowed 180 days for the Generator Owner to make that determination. Regarding the second comment, the SDT has made the correction to the typo (should have been a footnote reference).** 3) TRE recommends changing to "Planning Authority or Transmission Planner" in the Functional Entities in Section 4.1.2 instead of "Transmission Planner". This change should be duplicated in the requirements. The change may be needed since the Planning Authority or the Transmission Planner may have the responsibility for modeling the generation data provided by the Generator Owners. **Response: The reporting structure of the standard has been vetted through multiple comment periods and the GVSDT believes that the Transmission Planner is the appropriate entity. The GVSDT believes that we have achieved stakeholder consensus on the current language of the**

Organization	Question 3 Comment
	standard.
Response: The GVSDT thanks you for your comment. Please see responses above.	
Wisconsin Electric Power Company	1. In 4.2.1.2, the use of the term "directly connected at a common BES bus" suggests that wind farms are not applicable facilities, since wind generators are typically directly connected to a non-BES bus (e.g., 34.5 kv). We suggest that the applicability to wind farms be clarified more explicitly. **Response: The SDT believes that the term "directly connected to the Bulk Electric System" is appropriate as that is the verbiage used in the Statement of Compliance Registry Criteria.** 2. In R1, the present wording allows for the TP to provide only one of the three types of data, even if the GO requested all three. We suggest removing the wording, "one or more of". **Response: Based on your comment, the SDT revised the first sentence in R1 to read, "Each Transmission Planner shall provide the following requested information to the Generator Owner within 90 calendar days of receiving a written request…"** 3. In R1, the present requirement is for the TP to provide instructions to the GO on how to obtain the acceptable models and associated block diagrams and data. We believe that since the TP is very familiar with this data and the GO may not be, it is far simpler and efficient for the TP to provide the actual data on request, not just the instructions on how to obtain it. **Response: Transmission Planners ordinarily have license agreements that do not permit them to provide the block diagrams and data sheets directly to the generator owner. However, the software manufacturers have indicated that they will make accommodations so that Generator Owners without software licenses can receive the block diagrams and data sheets.** 4. In R2.1.1, the GO is required to have documentation comparing the "model response" to the "recorded response", in this case MW vs. frequency. First, to determine the model response requires the ability to run dynamic studies. Generally the GO does not have the simulation capability or the subject matter experts required to perform dynamic system studies. It would seem that the intent of this requirement is that the GO must expend considerable resources to gain this capability, either internally or by other means. Is this the intent of the SDT?

Organization	Question 3 Comment
	Response: Turbine/governor and load control system model verification is well established and documented. Some of those documents are referenced in Section G of the standard. EPRI has developed software which supports non invasive ambient monitoring for model verification that is successfully being used by a number of entities. Other developers have also developed similar software. While it is true that many generators do not currently have necessary expertise, this expertise can be developed or hired – or the Generator Owner can enter into agreements with its Transmission Planner, though the Generator Owner will still be responsible from a compliance perspective. Proper software can be purchased to analyze the modeled response – utility grade dynamic simulation software used by Transmission Planners for regional and inter-regional studies does not have to be purchased. 5. In R3, the requirements for the written response to the TP need clarification. The term "either" would suggest there are two possible responses. However, there appear to be three possible responses. We suggest there needs to be a 4th possible response option for the GO, for the GO to initiate contact with the TP to schedule a meeting to discuss the technical issues with the model. The necessary collaboration between the GO and TP to understand the model deficiencies will require time, thus may require more than the 90 days to reconcile the model issues. 120 days is suggested. **Response: The SDT believes that the sentence containing the word "either" clearly lists the three written response options afforded to the Generator Owner. Merriam-Webster dictionary defines "either" when used as a conjunction as "used as a function word before two or more coordinate words, phrases, or clauses joined usually by or to indicate that what immediately follows is the first of two or more alternatives." The SDT believes that 90 days is sufficient time to for the Generator Owner to discuss model issues with the Transmission Planner. The SDT believes all parties will be equally motivated to work through model verification issues.** 6. There is a document problem with the first sentence in R4. **Response: The SDT has made the correction to the typo (should have been a footnote reference).** 7. In Section 5 Effective Dates: The considerable time and resources needed to get up to speed with model verification suggests there needs to be more time allowed in the earlier phases of the

Organization	Question 3 Comment
	compliance timeline. We suggest using 20 percent in 4 years, 40 percent in 6 years, and 100 percent in 10 years. **Response: The SDT believes the effective dates have been well vetted in previous postings and that we have achieved stakeholder consensus on the current language of the standard.**
Response: The GVSDT thanks you for your comment. Please see responses above.	
Cogentrix Energy	1. The standard is based on the assumption that it is possible to tune the acceptable models cited in R1 such that their predictions will match actual power output responses to system Disturbances. The yet-to-be-defined acceptable models may not be capable of achieving this goal, however, because standard governor component models are inadequate to predict with high fidelity the generation system response that is the subject of MOD-027-1.Take for example a combined cycle plant with the CTs at base load output and the steam turbine in the sliding pressure mode (HPT control valves wide-open). Governor-only models will show a demand for increased output if a system frequency dip is postulated; yet absolutely nothing will happen in real life, because the fuel input to the CTs is already maxed-out and the STG has no throttle reserve. The situation for a fossil unit is analogous, with non-governor-model factors such as throttle reserve, boiler thermal inertia, mill ramp rates, control valve slew rate and hysteresis, the output cap associated with going VWO, furnace and duct pressure limits, fan stall run-back routines and the like all having an impact on the outcome, depending on the time-scale involved. Sustained Disturbances with fluctuations of system frequency above and below 60 Hz pose even greater challenges, as the response characteristics of controls systems for fuel, air, drum level etc. may become temporarily destabilized. A key clarification is needed in this respect. The references in R2.1.5 to “real power response” and in R3 (3rd bull-dot) to “the recorded response” indicate that models complying with MOD-027-1 must cover the factors cited above, but R2.1.5 also speaks of elements that” override the governor response.” Including in models only load control function blocks that impose a max-MW set point or otherwise modify the governor output signal may not pose a problem; but the effects of all factors that cause the actual MW response to lag or otherwise vary from the governor output demand signal can be captured only by dynamic simulators, not governor models. Simulators involve enormous cost and demand on engineering resources, and can be justified for only a handful of the

Organization	Question 3 Comment
	largest generation plants. The SDT is therefore asking for a considerable advancement in the excitation modeling state of the art, to be undertaken in parallel by the owners of every generation unit in North America. This is a doubly daunting task in that GOs often do not have any dynamic modeling software or expertise, much less the ability to invent something new, because the present approach to the subject is that GOs just provide the values of input parameters to the TP, which owns and runs models. Independent GOs (i.e. deregulated entities that are not part of a vertically-integrated utility)moreover do not have and cannot obtain information on the system outside the plant battery limits. This circumstance renders them unable to model the plant-T&D interactions associated with Disturbances, and independent GOs may therefore forever remain unable to develop model results that closely match actual Disturbance responses. The approach being taken in MOD-027-1 is consequently viewed as being technically infeasible for the present state of the art as well as unjustified in light of FERC's March 15,2012 FFT Order to propose specific standards or requirements that should be revised or Page 7 of 11removed [or not enacted in the first place] due to having little effect on reliability or because of compliance burdens. The SDT should instead collaborate with industry associations (EPRI, IEEE, NAGF),equipment OEMs, and modeling services vendors to develop the right tools for the job, and put the new models through trial runs at several plants. These trials should be limited to data-collection means that can be non-invasively employed (e.g. short-term on-line monitoring, and controlled perturbations during normal-stop events), and should lead to definition of specific testing means for definition of specific model parameters. The SDT should then put out for voting a standard requiring TOPs to own and run these models and requiring GOs to provide them the appropriate input data, developed via the non-invasive means stated above. **Response: Turbine/governor and load control system model verification is well established and documented. Some of those documents are referenced in Section G of the standard. As stated in previous postings, the SDT recognizes that governors can react differently for events that are essentially the same depending on pre-event operating conditions – the SDT believes that the Generator Owner should strive to verify a model in such a way that it represents an approximate typical response. The acceptable models referenced in Requirement 1 will predominately consist of standard library models included in software manufacturer dynamic simulation packages and are well known and understood – many are models developed by IEEE. Information on the**

Organization	Question 3 Comment
	transmission system beyond the point of interconnection is not required for any of the verification techniques referenced in the standard. EPRI has developed software which supports non invasive ambient monitoring for model verification that is successfully being used by a number of entities. Other developers have also developed similar software. While it is true that many generators do not currently have necessary expertise, this expertise can be developed or hired. Proper software can be purchased to analyze the modeled response – utility grade dynamic simulation software used by Transmission Planners for regional and inter-regional studies does not have to be purchased. This standard has already undergone a NERC field test in the Summer of 2007 – one of the conclusions was that performing the activities specified in the draft standard will improve accuracy of the turbine / governor model used in dynamic simulation. Entities from 4 regions participated, and all successfully completed the field test which validated that performing the activities specified in the draft standard will improve accuracy of the turbine / governor model used in dynamic simulation. 2. The complexity of the task at hand is compounded by the circumstance that generation unit response may vary widely depending on the output level at the time a BES upset occurs (as in the combined cycle example above). There are no specifics in MOD-27-1 regarding this aspect of reliability standard scope, however, just a requirement that the model shall match the actual response. The implication appears to be that a close correlation is needed for all upset magnitudes and all possible initial conditions, which brings us back to the dynamic simulator objections in comment #1 above. **Response: The SDT believes that we have achieved stakeholder consensus on the current language of the standard. As stated in previous postings, the SDT recognizes that governors can react differently for events that are essentially the same depending on pre-event operating conditions – the SDT believes that the Generator Owner should strive to verify a model in such a way that it represents an approximate typical response. The SDT consciously avoided specifying the quality of match between model and test a) to avoid risk of being over-prescriptive and too restrictive and b) because an industry accepted quantification of “match” does not exist. The focus is solely on “what” is required, not “how” it is done.** 3. There is presently no definition of how closely the model must match the recorded responseor for

Organization	Question 3 Comment
	what period of time, just a requirement that it be deemed “usable” by the TP. The SDTis asking for a blank check, and we cannot agree to regulations for which it is impossible tosay at the time of balloting whether or not compliance can be achieved, let alone in afashion that is justified per the FERC order cited above.Perceived shortcomings in these respects would presumably trigger the TransmissionPlanner expression of concern described in R3, but it would be better to establish the rulesup-front rather than addressing the matter only after a GO has attempted to comply withMOD-026 and been found lacking. . **Response: The SDT believes that we have achieved stakeholder consensus on the current language of the standard. The SDT believes that the term “usable” is well defined in R5. Also the SDT consciously avoided specifying the quality of match between model and test a) to avoid risk of being over-prescriptive and too restrictive and b) because an industry accepted quantification of “match” does not exist. The focus is solely on “what” is required, not “how” it’s done. Note that the SDT assumed the reference cited “to comply with MOD-026…” was meant to state “to comply with MOD-027….”** 4. R2.1.1 and the verification table in the standard allow the alternative of an on-line speedgovernor reference change test, but such testing is not always possible. Where it can beattempted there is risk of creating a larger-than-desired Disturbance, possibly threateninggrid stability or tripping the generation unit. Making GOs create Disturbances if they do notnaturally occur is not a good idea. NERC should consider directing TOPs to construct loadbanks, which they can tie-in and cut-out to jar the system for response test purposes. **Response: The SDT understands and agrees that an on-line reference change test is not available on all units as an option due to the lack of an input “port” to insert a step reference change. That is one of the reasons why this test is optional – in fact, no positive tests are required period. All Generator Owners can choose to use the ambient monitoring technique which allows the Generator Owner to wait for a frequency excursion (per Attachment 1 Note 1) – even it takes longer than the time durations stated to wait for this frequency excursion to occur with the applicable unit operating in a frequency responsive mode.** 5. R2.1.1 and the verification table also allow partial load-rejection tests. The SDT may haveenvisioned rejection to house load, followed by rapid re-synchronization, but such anoutcome

Organization	Question 3 Comment
	cannot be expected. House load is often below the minimum stable output (alwaysbelow for coal-fired and nuclear plants), and it is always far below the minimumenvironmentally-acceptable load for fuel-burning units. The need to avoid over speedfollowing load rejections meanwhile generally requires that the main steam stop valves becommanded closed at the same moment that a breaker-open signal is given.Trip testing may additionally be extremely disruptive and costly. Power Technologies, intheir paper “Testing Methods, An Overview,” states that five episodes may be required,which would be enormously expensive for combined cycle plants with a fixed dollars per tripfigure written into the long-term service agreement.Page 8 of 11Such expenditures might nonetheless be justified, if the information obtained is of sufficientvalue; but, as explained in comment #1 above, trip tests will yield data only for standardgovernor models and not for the on-line extra functions for which information is evidentlybeing sought.Footnote 2 of MOD-027-1 indicates recognition of this shortcoming. The solutions offeredhowever, “Differences between the control mode tested and the final simulation model mustbe identified,” and “some method of accounting for these differences must be presented,”are too vague and constitute no solution at all. It would be better to just admit that triptesting can’t get the job done. **Response: The SDT understands that many units are not good candidates for partial load rejection tests for the purposes of governor model verification. That is one of the reasons why this test is optional – in fact, no positive tests are required period. All Generator Owners can choose to use the ambient monitoring technique which allows the Generator Owner to wait for a frequency excursion (per Attachment 1 Note 1) – even it takes longer than the time durations stated to wait for this frequency excursion to occur with the applicable unit operating in a frequency responsive mode (Reference Row 3 of the Periodicity Table [Attachment 1]).** 6. The instruction in R4 to notify the TP, “within 180 calendar days of making changes to theturbine/governor and load control or active power/frequency control,” is too vague, despitethe attempted clarification in footnote #5, since many activities can have some degree ofimpact as noted above. Reportable thresholds regarding degree of impact on systemresponse and the expected duration are needed. Would an output power restriction due toa broken coal feeder belt be reportable, for example? **Response: The SDT believes that we have achieved stakeholder consensus on the current**

Organization	Question 3 Comment
	language of the standard. The SDT believes specifying reportable thresholds for an infinite number of possible permutations are not practical for a standard. 7. The SDT should consider moving the capacity factor exemption information found inAttachment 1, row 8 into the applicability section. The applicability section should allow anentity to be able to determine if the standard applies to them and be able to determine thescope of the facilities affected. It is best for those impacted to immediately know which unitsare in the scope and not have to realize the scope from a detailed study of the table ofAttachment 1. This would allow row 8 of Attachment 1 to be deleted. **Response: The SDT decided to place all the scenarios that effectively "exempt" otherwise applicable units in Attachment 1 for clarity. The SDT believes that we have achieved stakeholder consensus on the current language of the standard.** 8. We recommend removing the first element of the logical AND statement of Attachment 1Row 5 (the same physical location element). If a GO has identical equipment at differentphysical locations, they are equivalent. A sister is a sister independent of the physicallocation. As long as the equipment is identical, the concept should be allowed to applyregardless of location. **Response: The SDT notes the general agreement among industry with using the proxy unit approach. The SDT respectfully maintains that the "same physical location" requirement is necessary since it provides a strong indication of similarity of equipment and settings (which could be verified by the same field personnel during a single site walk down). For example, a GO/GOP could own/operate otherwise similar equipment physically located in vastly different geographic locations with substantially different Reliability Coordinator or Transmission Operator requirements (e.g., requirement for governor droop response vs. constant load set point) or equipment with identical design ratings, but different control system settings which would result in different models and performance).**
Response: The GVSDT thanks you for your comment. Please see responses above.	
Exelon Corporation and its affiliates	1. Exelon previously commented that MOD-027-1 R5 implies that it is the Generator Owner's responsibility to ensure that the model is "useable" based on the criteria specified in Parts 5.1

Organization	Question 3 Comment
	through 5.3; however, it is at the discretion of the Transmission Planner. As written, the requirement gives the Transmission Planner the discretion to reject the model based on governor response to a frequency deviation (positive damping) which appears to be outside of the original purpose of Project 2007-09. Exelon again reiterates that the usability of the model should not be confused with a model that accurately represents the generating unit governor and provides projected results. **Response: The SDT believes that we have achieved stakeholder consensus on the current language of the standard. Also, the SDT believes that the Generator Owner should be positively informed from the Transmission Planner if the model is useable or not based on the criteria listed in parts 5.1 – 5.3. Also note that the Generator Owner is responsible for the model and, in accordance to the first bullet point in R3, only has to reply to the Transmission Planner if they are informed that the model is not useable. Finally, the SDT points out that the "usability" of a model does not indicate if the model accurately predicts the actual response of the equipment.** 2. Please confirm that the number of generating units combined into the percentage for implementation of unit verification includes those generating units that may have a documented exclusion such as an existing unit that does not have an installed control system. **Response: Given that this scenario is associated with Row 7 of the Periodicity Table (Attachment 1), and the Required Action column states that "Requirement 2 is met with a written statement to that effect transmitted to the Transmission Planner" then yes, it the number of generating units combined into the percentage for implementation of unit verification includes those generating units that may have a documented exclusion such as an existing unit that does not have an installed control system.** 3. MOD-027-1 R4 appears to have a formatting issue - the statement "Error! Bookmark not defined" is in bold letters within the requirement. **The SDT has made the correction to the typo (should have been a footnote reference).**
Response: The GVSDT thanks you for your comment. Please see responses above.	
Alberta Electric System	1. In section 4.2.2, The AESO considers the existing applicability for model validation to be more

Organization	Question 3 Comment
Operator	appropriate: o Connected to a transmission grid at 60 kV or higher voltage; and o single unit capacity of 10 MVA and larger; or o facilities with aggregate capacity of 20 MVA and larger. **Response: As discussed in the Comment Form with the first posting of the draft MOD-027 standard, the SDT considered the extent of the facilities to be verified and how to reflect this in the "applicability" of this proposed standard. As a basis, the SDT recognized that the turbine / governor system models and model data are already collected through the processes identified in MOD-012 and MOD-013. These models and data should, with few exceptions, already result in a quality dynamics database. However, as confirmed through the Field Test, performing the activities specified in the draft standard is expected to result in an improvement of the accuracy of the turbine / governor models used in dynamic simulations. Utilizing engineering judgment, based in part on recent entity experiences in verifying turbine / governor models, the SDT is proposing to require verification of turbine / governor associated with 80% or greater of the connected MVA per Interconnection. Therefore, specific MVA and kV thresholds corresponding to 80% of connected MVA or greater for each Interconnection are proposed. The SDT believes that we have achieved stakeholder consensus on the current language of the standard.** 2. Requirement R2, the AESO considers the existing validation period of 5 years to be more appropriate. **Response: The SDT believes that re-verification every 5 years is unnecessary. This position is supported by an overwhelming majority of comments received from the industry. As such, the SDT believes that we have achieved stakeholder consensus on the current language of the standard.** 3. The AESO does not consider a partial load rejection test to be an appropriate method of model validation for base loaded units. **Response: The SDT understands that many units are not candidates for partial load rejection tests for the purposes of governor model verification. That is one of the reasons why this test is optional – in fact, no positive tests are required period. All Generator Owners can choose to use the ambient monitoring technique which allows the Generator Owner to wait for a frequency excursion (per Attachment 1 Note 1) – even it takes longer than the time durations stated to wait**

Organization	Question 3 Comment
	for this frequency excursion to occur with the applicable unit operating in a frequency responsive mode (Reference Row 3 of the Periodicity Table [Attachment 1]). 4. Requirement R4, as written it appears owners of generating units that plan to change out the governor are not required to provided preliminary (design) data to the Transmission Planner only validated data. The AESO does not consider this to be appropriate as this preliminary (design) data should be provided to the Transmission Planner in advance of the change. **Response: This standard addresses model verification, not the submittal of preliminary design models. Model verification can occur only after the equipment is installed. The standard does not address development of the original model during the equipment commissioning process. The SDT believes that we have achieved stakeholder consensus on the current language of the standard.**
Response: The GVSDT thanks you for your comment. Please see responses above.	
FirstEnergy	1.FE believes that Requirement 5 in an un-necessary requirement that the Transmission Planner must respond within 90 calendar days that the model is usable. The Transmission Planner should only respond if the information is not usable. We suggest that this requirement should be in a negative perspective and offer the following revision: R5. Each Transmission Planner shall notify the Generator Owner within 90 calendar days of receiving the turbine/governor and load control or active power/frequency control system verified model information in accordance with Requirement R2 that the model is not usable (see Sub-requirements 5.1 through 5.5), and shall include a technical description if the model is not usable that includes (but not limited to) the following: [Violation Risk Factor: Medium] [Time Horizon: Operations Planning] 5.1. The turbine/governor and load control or active power frequency control function model fails to to compute modeling data without error along with suggested areas for investigation, 5. 2. A listing of parameters that fail the Transmission Planner's data checks, 5.3. A no-disturbance simulation fails to result in non negligible transients ("flat line"), 5.4. For an otherwise stable simulation, a disturbance simulation results in the turbine/governor and load control or active power/frequency control model exhibiting an under-damped or critically damped response, or otherwise fails the Transmission Planner's stability criteria.5.5. The turbine/governor and load

Organization	Question 3 Comment
	control or active power/frequency control model submitted by the Generator Owner is either a user defined model or a model that is not acceptable for use in the Transmission Planner's Regional Reliability Organization footprint
Response: The GVSDT thanks you for your comment. The SDT believes that the level of specificity in R5 sub parts is adequate as drafted. Based on your and another commenters input, the SDT agreed that the sentence needed clarification. As such, the SDT decided to break the sentence up, with the first sentence ending at the next to last use of the word "usable" and we moved that last sentence to after the three criteria. The last sentence now reads: If the model is not usable, the Transmission Planner shall provide a technical description of why the model is not usable. Also, for ease of reading, the SDT moved the last sentence in the requirement to after the parts. Also, the SDT feels that the Generator Owner should be positively informed from the Transmission Planner if the model is useable or not.	
ExxonMobil Research and Engineering	A stated purpose of Generator Verification is "to ensure that generator models accurately reflect the generator's capabilities and operating characteristics." Modeling behind-the-meter generation based on gross name-plate ratings will not accurately reflect those assets' capabilities or operating characteristics, and, in fact, may seriously distort BES expansion plans or other modeling scenarios if name-plate ratings are used. Behind-the-meter generation is a misnomer. It is not comparable to utility or merchant generation in which the primary function is to deliver electric energy to the bulk electric system. The primary function of behind-the-meter generation that employs cogeneration or combined heat and power (CHP) systems is to deliver thermal energy (usually in the form of steam) in support of the load's process technology. In the case of industrial loads, the capabilities or operating characteristics of that process are a function of the load's production schedule associated with its products (e.g.,, chemicals, petroleum, paper, etc.) and independent of conditions on the BES. Any electric power delivered to the BES is a residual by-product of the industrial process and generally a small fraction of the name-plate rating of the generator. Section III.c.4 of the Statement of Compliance Registry Criteria (v.5) and Exclusion E2 of the revised BES definition both recognize this fundamental characteristic of behind-the-meter generation and that is why neither document uses name-plate rating as a useful metric for behind-the-meter generation. The GVSDT is urged to do the same.
Response: The GVSDT thanks you for your comment. The GVSDT has used a subset of the registry criteria to identify applicable	

Organization	Question 3 Comment
Facilities. If a unit meets the sub set of the registry criteria it is obligated to comply with the standard.	
Independent Electricity System Operator	a. All references to “real” power should be changed to “active” power to follow SI standard practice. **Response: Though the term “active power’ is a SI practice, the SDT used the term “real power” to be consistent with terminology utilized in most other NERC Reliability standards.** b. One serious weakness is no there are explicit NERC performance requirements for frequency regulation. In some jurisdiction, e.g.,, Ontario, generating units are required to materially help regulate the frequency as the Transmission Planner sets performance requirements for droop, deadband and speed of response. All forms of generation are required to help regulate frequency to the extent practicable. For example, solar installations are required to reduce output during over frequency excursions. This standard in its present form allows “applicable units” to continue to not help regulate frequency could expose the BES to reliability risks. **Response: The SAR for this draft standard calls for the verification of the generator’s Turbine/Governor and Load Control or Active Power/Frequency Control Function model data. Performance or operational requirements are beyond the scope of this standard.** c. In Ontario, experience has been the models typically used by the Transmission Planner are not commonly employed by Generator Owners. The standard recognizes this in R1 by giving the obligation to the Transmission Planner to provide model block diagrams or data sheets to the Generator Owner. As the Transmission Planner may be unaware of practicable constraints on a unit and the Generator Owner may not be familiar with the reliability models, both parties must reach an accommodation on the details to verify the model. R2 should be changed so the Generator Owner is required to provide a model that has been verified by a method accepted by the Transmission Planner. If the Transmission Planner requires verification only with ambient measurements, then the Generator owner should be required to do verification in this way. This concept that the Transmission Planner should decide whether submissions it receives are suitable should permeate this standard. **Response: The SDT believes that we have achieved stakeholder consensus on the current language of the standard. The SDT believes that the method used to verify the model should be determined by those doing the model verification, and that the transmission planner should only**

Organization	Question 3 Comment
	be concerned with the result, which is a correct model for the equipment. The testing expert will determine the method to use during testing and other details regarding how to do the test. Also the SDT consciously avoided specifying the quality of match between model and test a) to avoid risk of being over-prescriptive and too restrictive and b) because an industry accepted quantification of "match" does not exist. The focus is solely on "what" is required, not "how" it's done. d. R2.1 should be amended (see below) to add flexibility to include other practical combinations of units to be used for verification. For example, it can be more practicable to test wind and solar installation one feeder at a time but this is not allowable with the standard in its present form. Each applicable unit's model shall be verified by the Generator Owner using one or more models acceptable to the Transmission Planner. Verification of an individual unit rated less than 20 MVA (gross nameplate rating) may be performed using either an individual unit, a combination of units, or plant aggregate model(s). **Response: The SDT thanks you for your comment. Based on your comment, the SDT has modified the applicable portion of Part 2.1 to read: Verification for individual units rated less than 20 MVA (gross nameplate rating) in a generating plant (per Section 4.2.1.2, 4.2.2.2, or 4.2.3.2) may be performed using either individual unit or aggregate unit model(s) or both** e. In Ontario, we face resistance to our standards that exceed NERC requirements. It will be very helpful if the SDT in its response offers its opinion on elements of our comments that are not incorporated into the next version of this standard? For example, we would appreciate responses such as: "In the opinion of the SDT, having more applicable units on closed loop voltage control, reducing the time to transmit verified information to the Transmission Planner, having specific excitation performance requirements, expanding verified information to include limiters and other devices that affect excitation system performance, and making the requirements in this standard applicable to wider range of equipment are all practices that will tend to improve reliability." Or "In the opinion of the SDT, the requirements in this standard are not intended to preclude continuing or implementing more stringent Transmission Planner requirements."This type of response would help us to continue to augment the continent-wide standard with additional requirements to maintain reliability in our part of the interconnection.

Organization	Question 3 Comment
	Response: The SDT does believe that the requirements in this standard provide a floor and that individual regions or transmission entities, through venues such as interconnection agreements, can implement more stringent requirements. Unfortunately, the SDT scope is limited to drafting a national standard. f. We appreciate the SDT's effort to implement our proposed language changes to remove a potential conflict with the Ontario regulatory practice respecting the effective date of implementing approved standards. The added language, unfortunately, was not added at the appropriate places. We suggest the SDT to move the wording ", or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities," in Section 5.1 to right after "approved by applicable regulatory approval", and move that same wording to right after "following applicable regulatory approval" in Sections 5.2 to 5.4.Also, the same phrase should be appended to each of the four bullets in the Section "In those jurisdictions where regulatory approval is required:" of the Implementation Plan right after "following applicable regulatory approval." **Response: We have made the requested edits to the Implementation Plan and Standard**
Response: The GVSDT thanks you for your comment. Please see responses above.	
American Transmission Company	ATC recommends the following changes:1. For Requirement 5, ATC recommends replacing the wording at the end of the requirement "that includes the following;" with "that includes how any of the following criteria are not met:" because the existing wording does not express that the criteria are not met when the model is not usable. **Response: Based on your and another commenters input, the SDT agreed that the sentence needed clarification. As such, the SDT decided to break the sentence up, with the first sentence ending at the next to last use of the word "usable" and we moved that last sentence to after the three criteria. The last sentence now reads: If the model is not usable, the Transmission Planner shall provide a technical description of why the model is not usable.** 2. Attachment 1, Row 7, Verification Condition column - ATC agrees with the STD intention that base load units should be exempt because they are "not responsive to frequency excursion events". However, this insinuation of base load units is too vague. Therefore, ATC recommends additional

Organization	Question 3 Comment
	wording to read “New or existing base loaded units are normally not responsive to a frequency excursion event”. This makes it abundantly clear that this condition normally applies to base loaded units. **Response: The SDT believes the existing verbiage, especially the clarification in parenthesis, is very specific and unambiguous. To re-state, in order for an applicable unit to be relevant to this Row 7, the controls must be set up so that it does not operate in a frequency control mode that would result in a turbine/governor and load control or active power frequency control mode response – the exception being only during normal start up and shut down.**
Response: The GVSDT thanks you for your comment. Please see responses above.	
Idaho Power Company	Attachment 1 - Note 1Idaho Power System Planning comments Attachment 1 discusses unit model verification to a frequency excursion using a recorded response from the generating unit. Attachment 1, Note 1 defines the frequency deviation criteria. Idaho Power System Planning asks the GVSDT to include the minimum acceptable data sampling criteria of the recording equipment as part of the Note 1 criteria. **Response: The SDT believes that we have achieved stakeholder consensus on the current language of the standard. The SDT believes that the method used to verify the model should be determined by those doing the model verification, and that the transmission planner should only be concerned with the result, which is a correct model for the equipment. The testing expert will determine the required data sampling rate and other details regarding how to do the test. The focus is solely on “what” is required, not “how” it’s done.** Requiring each Transmission Planner to maintain a list of acceptable models, and then requiring Generator Owners to submit data according to those models is unreasonable. The list of acceptable models needs to be at least regional, if not continent-wide. In addition, some required longevity needs to be specified to allow Generator Owners to appropriately plan and perform the verification work. **Response: Since the Transmission Planner is the user of the models, the models must be acceptable to the Transmission Planner in order to be deemed useful. The list of models in the**

Organization	Question 3 Comment
	vast majority of the time will be models included in major manufacturer dynamic simulation software vendor libraries and they have a high correlation with other dynamic simulation software vendor model libraries and those developed via IEEE.
Response: The GVSDT thanks you for your comment. Please see responses above.	
Cowlitz PUD	Cowlitz supports the comments from the NAGF SRT:1. The standard is based on the assumption that it is possible to tune the acceptable modelscited in R1 such that their predictions will match actual power output responses to systemDisturbances. The yet-to-be-defined acceptable models may not be capable of achievingthis goal, however, because standard governor component models are inadequate to predictwith high fidelity the generation system response that is the subject of MOD-027-1.Take for example a combined cycle plant with the CTs at base load output and the steamturbine in the sliding pressure mode (HPT control valves wide-open). Governor-only modelswill show a demand for increased output if a system frequency dip is postulated; yetabsolutely nothing will happen in real life, because the fuel input to the CTs is alreadymaxed-out and the STG has no throttle reserve. The situation for a fossil unit is analogous,with non-governor-model factors such as throttle reserve, boiler thermal inertia, mill ramprates, control valve slew rate and hysteresis, the output cap associated with going VWO,furnace and duct pressure limits, fan stall run-back routines and the like all having an impacton the outcome, depending on the time-scale involved. Sustained Disturbances withfluctuations of system frequency above and below 60 Hz pose even greater challenges, asthe response characteristics of controls systems for fuel, air, drum level etc. may becometemporarily destabilized.A key clarification is needed in this respect. The references in R2.1.5 to “real powerresponse” and in R3 (3rd bull-dot) to “the recorded response” indicate that models complyingwith MOD-027-1 must cover the factors cited above, but R2.1.5 also speaks of elements that”override the governor response.” Including in models only load control function blocks thatimpose a max-MW set point or otherwise modify the governor output signal may not pose aproblem; but the effects of all factors that cause the actual MW response to lag or otherwisevary from the governor output demand signal can be captured only by dynamic simulators,not governor models. Simulators involve enormous cost and demand on engineeringresources, and can be justified for only a handful of the largest generation plants.The SDT is therefore asking for a considerable advancement in the excitation modelingstate of the art, to

Organization	Question 3 Comment
	be undertaken in parallel by the owners of every generation unit in NorthAmerica. This is a doubly daunting task in that GOs often do not have any dynamicmodeling software or expertise, much less the ability to invent something new, because thepresent approach to the subject is that GOs just provide the values of input parameters tothe TP, which owns and runs models.Independent GOs (i.e. deregulated entities that are not part of a vertically-integrated utility)moreover do not have and cannot obtain information on the system outside the plant batterylimits. This circumstance renders them unable to model the plant-T&D interactionsassociated with Disturbances, and independent GOs may therefore forever remain unable todevelop model results that closely match actual Disturbance responses.The approach being taken in MOD-027-1 is consequently viewed as being technicallyinfeasible for the present state of the art as well as unjustified in light of FERC's March 15,2012 FFT Order to propose specific standards or requirements that should be revised orremoved [or not enacted in the first place] due to having little effect on reliability or because of compliance burdens.The SDT should instead collaborate with industry associations (EPRI, IEEE, NAGF),equipment OEMs, and modeling services vendors to develop the right tools for the job, andput the new models through trial runs at several plants. These trials should be limited todata-collection means that can be non-invasively employed (e.g., short-term on-linemonitoring, and controlled perturbations during normal-stop events), and should lead todefinition of specific testing means for definition of specific model parameters. The SDTshould then put out for voting a standard requiring TOPs to own and run these models andrequiring GOs to provide them the appropriate input data, developed via the non-invasivemeans stated above. **Response: Turbine/governor and load control system model verification is well established and documented. Some of those documents are referenced in Section G of the standard. As stated in previous postings, the SDT recognizes that governors can react differently for events that are essentially the same depending on pre-event operating conditions – the SDT believes that the Generator Owner should strive to verify a model in such a way that it represents an approximate typical response. The acceptable models referenced in Requirement 1 will predominately consist of standard library models included in software manufacturer dynamic simulation packages and are well known and understood – many are models developed by IEEE. Information on the transmission system beyond the point of interconnection is not required for any of the verification techniques referenced in the standard. EPRI has developed software which supports**

Organization	Question 3 Comment
	non invasive ambient monitoring for model verification that is successfully being used by a number of entities. Other developers have also developed similar software. While it is true that many generators do not currently have necessary expertise, this expertise can be developed or hired. Proper software can be purchased to analyze the modeled response – utility grade dynamic simulation software used by Transmission Planners for regional and inter-regional studies does not have to be purchased. This standard has already undergone a NERC field test in the Summer of 2007 – one of the conclusions was that performing the activities specified in the draft standard will improve accuracy of the turbine / governor model used in dynamic simulation. Entities from 4 regions participated, and all successfully completed the field test which validated that performing the activities specified in the draft standard will improve accuracy of the turbine / governor model used in dynamic simulation. 2. The complexity of the task at hand is compounded by the circumstance that generation unitresponse may vary widely depending on the output level at the time a BES upset occurs (asin the combined cycle example above). There are no specifics in MOD-27-1 regarding thisaspect of reliability standard scope, however, just a requirement that the model shall matchthe actual response. The implication appears to be that a close correlation is needed for allupset magnitudes and all possible initial conditions, which brings us back to the dynamicsimulator objections in comment #1 above. **Response: The SDT believes that we have achieved stakeholder consensus on the current language of the standard. The SDT consciously avoided specifying the quality of match between model and test a) to avoid risk of being over-prescriptive and too restrictive and b) because an industry accepted quantification of "match" does not exist. The focus is solely on "what" is required, not "how" it is done.** 3. There is presently no definition of how closely the model must match the recorded responseor for what period of time, just a requirement that it be deemed "usable" by the TP. The SDTis asking for a blank check, and we cannot agree to regulations for which it is impossible tosay at the time of balloting whether or not compliance can be achieved, let alone in afashion that is justified per the FERC order cited above.Perceived shortcomings in these respects would presumably trigger the TransmissionPlanner expression of concern described in R3, but it would be better to establish the

Organization	Question 3 Comment
	rulesup-front rather than addressing the matter only after a GO has attempted to comply withMOD-026 and been found lacking. . **Response: The SDT believes that we have achieved stakeholder consensus on the current language of the standard. The SDT believes that the term "usable" is well defined in R5. The SDT consciously avoided specifying the quality of match between model and test a) to avoid risk of being over-prescriptive and too restrictive and b) because an industry accepted quantification of "match" does not exist. The focus is solely on "what" is required, not "how" it's done.** 4. R2.1.1 and the verification table in the standard allow the alternative of an on-line speedgovernor reference change test, but such testing is not always possible. Where it can beattempted there is risk of creating a larger-than-desired Disturbance, possibly threateninggrid stability or tripping the generation unit. Making GOs create Disturbances if they do notnaturally occur is not a good idea. NERC should consider directing TOPs to construct loadbanks, which they can tie-in and cut-out to jar the system for response test purposes. **Response: The SDT understands and agrees that an on-line reference change test is not available on all units as an option due to the lack of an input "port" to insert a step reference change. That is one of the reasons why this test is optional – in fact, no positive tests are required period. All Generator Owners can choose to use the ambient monitoring technique which allows the Generator Owner to wait for a frequency excursion (per Attachment 1 Note 1) – even it takes longer than the time durations stated to wait for this frequency excursion to occur with the applicable unit operating in a frequency responsive mode.** 5. R2.1.1 and the verification table also allow partial load-rejection tests. The SDT may haveenvisioned rejection to house load, followed by rapid re-synchronization, but such anoutcome cannot be expected. House load is often below the minimum stable output (alwaysbelow for coal-fired and nuclear plants), and it is always far below the minimumenvironmentally-acceptable load for fuel-burning units. The need to avoid over speedfollowing load rejections meanwhile generally requires that the main steam stop valves becommanded closed at the same moment that a breaker-open signal is given.Trip testing may additionally be extremely disruptive and costly. Power Technologies, intheir paper "Testing Methods, An Overview," states that five episodes may be required,which would be enormously expensive for combined cycle plants with a fixed dollars per

Organization	Question 3 Comment
	tripfigure written into the long-term service agreement.Such expenditures might nonetheless be justified, if the information obtained is of sufficientvalue; but, as explained in comment #1 above, trip tests will yield data only for standardgovernor models and not for the on-line extra functions for which information is evidentlybeing sought.Footnote 2 of MOD-027-1 indicates recognition of this shortcoming. The solutions offeredhowever, “Differences between the control mode tested and the final simulation model mustbe identified,” and “some method of accounting for these differences must be presented,”are too vague and constitute no solution at all. It would be better to just admit that triptesting can’t get the job done. **Response: The SDT understands that many units are not candidates for partial load rejection tests for the purposes of governor model verification. That is one of the reasons why this test is optional – in fact, no positive tests are required period. All Generator Owners can choose to use the ambient monitoring technique which allows the Generator Owner to wait for a frequency excursion (per Attachment 1 Note 1) – even it takes longer than the time durations stated to wait for this frequency excursion to occur with the applicable unit operating in a frequency responsive mode (Reference Row 3 of the Periodicity Table [Attachment 1]).** 6. The instruction in R4 to notify the TP, “within 180 calendar days of making changes to theturbine/governor and load control or active power/frequency control,” is too vague, despitethe attempted clarification in footnote #5, since many activities can have some degree ofimpact as noted above. Reportable thresholds regarding degree of impact on systemresponse and the expected duration are needed. Would an output power restriction due toa broken coal feeder belt be reportable, for example? **Response: The SDT believes that we have achieved stakeholder consensus on the current language of the standard. The SDT believes specifying reportable thresholds for an infinite number of possible permutations are not practical for a standard.** 7. We recommend removing the first element of the logical AND statement of Attachment 1Row 5 (the same physical location element). If a GO has identical equipment at differentphysical locations, they are equivalent. A sister is a sister independent of the physicallocation. As long as the equipment is identical, the concept should be allowed to applyregardless of location.

Organization	Question 3 Comment
	Response: The SDT notes the general agreement among industry with using the proxy unit approach. The SDT respectfully maintains that the "same physical location" requirement is necessary since it provides a strong indication of similarity of equipment and settings (which could be verified by the same field personnel during a single site walk down). For example, a GO/GOP could own/operate otherwise similar equipment physically located in vastly different geographic locations with substantially different Reliability Coordinator or Transmission Operator requirements (e.g., requirement for governor droop response vs constant load set point) or equipment with identical design ratings, but different control system settings which would result in different models and performance).
Response: The GVSDT thanks you for your comment. Please see responses above.	
PPL Corporation NERC Registered Affiliates	In trying to follow the flow of this standard, it is obvious that R1 precedes R2 logically. But then it also appears that possibly R5 actually takes place before R3. **Response: It is true that R5 could take place before R3. The orders of the requirements are not meant to always reflect the chronological order of events. R3 and R4 are requirements that for the vast majority of applicable units, will never be needed.** There does not seem to be any requirement for the Transmission Planner to provide Written Comments to the GO that address the second and third bullet points of R3. It seems that a requirement should be added for the TP to provide written comments for any of the 3 bullets shown in R3; however, only the first bullet of R3 has been required of the TP (in R5) as the standard is currently written in Draft 3. **Response: In the first bullet, the interaction between Transmission Planner and Generator Owner is required to ensure that the verified model is a useable model. The last two bullets are more "peer review" in nature and as such there is not a requirement for the Transmission Planner to provide a written comment. The vast majority of the time, there will be no issue with the verified model and as such there will be no need for the Transmission Planner to develop a written comment as discussed in the second and third bullet.** The first element of the logical AND statement of Attachment 1 Row 5 (the same physical location

Organization	Question 3 Comment
	element). If a GO has identical equipment at different physical locations, they are equivalent. Equivalency of units should be independent of the physical location. **Response: The SDT respectfully maintains that the "same physical location" requirement is necessary since it provides a strong indication of similarity of equipment and settings (which could be verified by the same field personnel during a single site review). For example, a GO/GOP could own/operate otherwise similar equipment physically located in vastly different geographic locations with substantially different Reliability Coordinator or Transmission Operator requirements (e.g., requirement for PSS in-service). To ensure all GO/GOP equipment meets standard intent, the SDT maintains the "same physical location" requirement is necessary.** Other minor edits: o In A.5.1 for the Effective Date, it should say R3 through R5 (not R6, as there is no R6). o Also, by footnote 4 on R4, there appears to be some sort of "Error! Bookmark" from when the footnotes were changed. **Response: The SDT agrees and have made these edits to the standard.** The standard is based on the assumption that it is possible to tune the acceptable models cited in R1 such that their predictions will match actual power output responses to system Disturbances. The yet-to-be-defined acceptable models may not be capable of achieving this goal, however, because standard governor component models are inadequate to predict with high fidelity the generation system response that is the subject of MOD-027-1.Take for example a combined cycle plant with the CTs at baseload output and the steam turbine in the sliding pressure mode (HPT control valves wide-open). Governor-only models will show a demand for increased output if a system frequency dip is postulated; yet absolutely nothing will happen in real life, because the fuel input to the CTs is already maxed-out and the STG has no throttle reserve. The situation for a fossil unit is analogous, with non-governor-model factors such as throttle reserve, boiler thermal inertia, mill ramp rates, control valve slew rate and hysteresis, the output cap associated with going VWO, furnace and duct pressure limits, fan stall run-back routines and the like all having an impact on the outcome, depending on the time-scale involved. Sustained Disturbances with fluctuations of system frequency above and below 60 Hz pose even greater challenges, as the response characteristics of

Organization	Question 3 Comment
	controls systems for fuel, air, drum level etc may become temporarily destabilized. A key clarification is needed in this respect. The references in R2.1.5 to "real power response" and in R3 (3rd bull-dot) to "the recorded response" indicate that models complying with MOD-027-1 must cover the factors cited above, but R2.1.5 also speaks of elements that "override the governor response." Including in models only load control function blocks that impose a max-MW setpoint or otherwise modify the governor output signal may not pose a problem; but the effects of all factors that cause the actual MW response to lag or otherwise vary from the governor output demand signal can be captured only by dynamic simulators, not governor models. Simulators involve enormous cost and demand on engineering resources, and can be justified for only a handful of the largest generation plants. The SDT is therefore asking for a considerable advancement in the generator modeling state of the art, to be undertaken in parallel by the owners of every generation unit in North America. This is a doubly daunting task in that GOs often do not have any dynamic modeling software or expertise, much less the ability to invent something new, because the present approach to the subject is that GOs just provide the values of input parameters to the TP, which owns and runs models. Independent GOs (i.e. deregulated entities that are not part of a vertically-integrated utility) moreover do not have and cannot obtain information on the system outside the plant battery limits. This circumstance renders them unable to model the plant-T&D interactions associated with Disturbances, and independent GOs may therefore forever remain unable to develop model results that closely match actual Disturbance responses. The approach being taken in MOD-027-1 is consequently viewed as being technically infeasible for the present state of the art as well as unjustified in light of FERC's March 15, 2012 FFT Order to propose specific standards or requirements that should be revised or removed [or not enacted in the first place] due to having little effect on reliability or because of compliance burdens. The SDT should instead collaborate with industry associations (EPRI, IEEE, NAGF), equipment OEMs, and modeling services vendors to develop the right tools for the job, and put the new models through trial runs at several plants. These trials should be limited to data-collection means that can be non-invasively employed (e.g. short-term on-line monitoring, and controlled perturbations during normal-stop events), and should lead to definition of specific testing means for definition of specific model parameters. The SDT should then put out for voting a standard requiring TOPs to own and run these models and requiring GOs to provide them the appropriate input data, developed via the non-invasive means stated

Organization	Question 3 Comment
	above. **Response: Turbine/governor and load control system model verification is well established and documented. Some of those documents are referenced in Section G of the standard. As stated in previous postings, the SDT recognizes that governors can react differently for events that are essentially the same depending on pre-event operating conditions – the SDT believes that the Generator Owner should strive to verify a model in such a way that it represents an approximate typical response. The acceptable models referenced in Requirement 1 will predominately consist of standard library models included in software manufacturer dynamic simulation packages and are well known and understood – many are models developed by IEEE. Information on the transmission system beyond the point of interconnection is not required for any of the verification techniques referenced in the standard. EPRI has developed software which supports non invasive ambient monitoring for model verification that is successfully being used by a number of entities. Other developers have also developed similar software. While it is true that many generators do not currently have necessary expertise, this expertise can be developed or hired. Proper software can be purchased to analyze the modeled response – utility grade dynamic simulation software used by Transmission Planners for regional and inter-regional studies does not have to be purchased. There are no specifics in MOD-27-1 regarding this aspect of reliability standard scope, however, just a requirement that the model shall match the actual response. The implication appears to be that a close correlation is needed for all upset magnitudes and all possible initial conditions, which brings us back to the dynamic simulator objections in our comments above.

Organization	Question 3 Comment
	Response: The SDT believes that we have achieved stakeholder consensus on the current language of the standard. The SDT consciously avoided specifying the quality of match between model and test a) to avoid risk of being over-prescriptive and too restrictive and b) because an industry accepted quantification of "match" does not exist. The focus is solely on "what" is required, not "how" it is done. There is presently no definition of how closely the model must match the recorded response or for what period of time, just a requirement that it be deemed "usable" by the TP. The SDT is asking for a blank check, and we cannot agree to regulations for which it is impossible to say at the time of balloting whether or not compliance can be achieved, let alone in a fashion that is justified per the FERC order cited above. Perceived shortcomings in these respects would presumably trigger the Transmission Planner expression of concern described in R3, but it would be better to establish the rules up-front rather than addressing the matter only after a GO has attempted to comply with MOD-026 and been found lacking. **Response: The SDT believes that we have achieved stakeholder consensus on the current language of the standard. The SDT believes that the term "usable" is well defined in R5. The SDT is not requiring an on-line speed governor reference change test – it is simply an alternative. If that technique is used, experience has proven that it does not cause a disturbance that threatens grid stability. Also the SDT consciously avoided specifying the quality of match between model and test a) to avoid risk of being over-prescriptive and too restrictive and b) because an industry accepted quantification of "match" does not exist. The focus is solely on "what" is required, not "how" it's done.** R2.1.1 and the verification table in the standard allow the alternative of an on-line speed governor reference change test, but such testing is not always possible. Where it can be attempted there is risk of creating a larger-than-desired Disturbance, possibly threatening grid stability or tripping the generation unit. Making GOs create Disturbances if they do not naturally occur is not a good idea. NERC should consider directing TOPs to construct load banks, which they can tie-in and cut-out to jar the system for response test purposes. **Response: The SDT understands and agrees that an on-line reference change test is not available on all units as an option due to the lack of an input "port" to insert a step reference change. That**

Organization	Question 3 Comment
	is one of the reasons why this test is optional – in fact, no positive tests are required period. All Generator Owners can choose to use the ambient monitoring technique which allows the Generator Owner to wait for a frequency excursion (per Attachment 1 Note 1) – even it takes longer than the time durations stated to wait for this frequency excursion to occur with the applicable unit operating in a frequency responsive mode. R2.1.1 and the verification table also allow partial load-rejection tests. The SDT may have envisioned rejection to house load, followed by rapid re-synchronization, but such an outcome cannot be expected. House load is often below the minimum stable output (always below for coal-fired and nuclear plants), and it is always far below the minimum environmentally-acceptable load for fuel-burning units. The need to avoid overspeed following load rejections meanwhile generally requires that the main steam stop valves be commanded closed at the same moment that a breaker-open signal is given. Trip testing may additionally be extremely disruptive and costly. Power Technologies, in their paper “Testing Methods, An Overview,” states that five episodes may be required, which would be enormously expensive for combined cycle plants with a fixed dollars per trip figure written into the long-term service agreement. Such expenditures might nonetheless be justified, if the information obtained is of sufficient value; but, as explained in our comments above, trip tests will yield data only for standard governor models and not for the on-line extra functions for which information is evidently being sought. Footnote 2 of MOD-027-1 indicates recognition of this shortcoming. The solutions offered however, “Differences between the control mode tested and the final simulation model must be identified,” and “some method of accounting for these differences must be presented,” are too vague and constitute no solution at all. It would be better to just admit that trip testing can’t get the job done. **Response: The SDT understands that many units are not good candidates for partial load rejection tests for the purposes of governor model verification. That is one of the reasons why this test is optional – in fact, no positive tests are required period. All Generator Owners can choose to use the ambient monitoring technique which allows the Generator Owner to wait for a frequency excursion (per Attachment 1 Note 1) – even it takes longer than the time durations stated to wait for this frequency excursion to occur with the applicable unit operating in a frequency responsive mode (Reference Row 3 of the Periodicity Table [Attachment 1]).**

Organization	Question 3 Comment
	The instruction in R4 to notify the TP, "within 180 calendar days of making changes to the turbine/governor and load control or active power/frequency control," is too vague, despite the attempted clarification in footnote #5, since many activities can have some degree of impact as noted above. Reportable thresholds regarding degree of impact on system response and the expected duration are needed. Would an output power restriction due to a broken coal feeder belt be reportable, for example? **Response: The SDT believes that we have achieved stakeholder consensus on the current language of the standard. The SDT believes specifying reportable thresholds for an infinite number of possible permutations are not practical for a standard.**
Response: The GVSDT thanks you for your comment. Please see responses above.	
Ingleside Cogeneration LP (Voting entity Occidental Chemical Corporation)	Ingleside Cogeneration LP agrees that the ability for Transmission Planners to effectively model and simulate actual system response to frequency transients can lead to reliability improvements. In addition, the technical language used in the latest version of MOD-027-1 has been refined to an acceptable point in our view. However, we are concerned with the aggregate work load that all five standards in Project 2007-09 will place upon our engineering and operations organizations. Each has its own unique purpose, which means unique processes to support them - as well as test results that demonstrate compliance. With so much uncertainty surrounding this program, we cannot agree to proceed without the following items being addressed: 1) All requirements for recurring tests (R2) must contain language that focuses on the strength of the validation process - not the execution. This could be similar to that used in the CIP version 5 standards calling for the Responsible Entity to implement an action "in a manner that identifies, assesses, and corrects deficiencies". Experience has shown that without this preface, auditors will focus on missed due dates, whether or not all check boxes are filled in, and statements showing that every sub-requirement was addressed - even those not applicable to the facility. The CEA's focus needs to be on the entity's commitment to the validation effort, not the documentation. 2) The Compliance organization needs to be engaged in the development process so that industry stakeholders have a sense of how adherence to the standard will be determined. The existing process is disconnected - leading to inconsistent interpretations of the drafting team's original

Organization	Question 3 Comment
	intent. Other projects have begun to post drafts of the RSAWs concurrently with the standards for exactly this reason. The SDT should take note that these modifications are consistent with the risk-based compliance direction that both NERC and FERC support. The intent is to focus industry and regulatory resources on the reliability aspects of the initiative - not its administrative aspects.
Response: The GVSDT thanks you for your comment. Your issues relate to the "Find, Fix and Track" process that was most notably incorporated in the CIP body of standards. For example, CIP-003-5, Requirement R2 states, "Each Responsible Entity for its assets identified in CIP-002-5, Requirement R1, Part R1.3, shall implement, in a manner that identifies, assesses, and corrects deficiencies, one or more documented cyber security policies that collectively address the following topics, and review and obtain CIP Senior Manager approval for those policies at least once every 15 calendar months." This requirement relates to a specific program that addresses a wide range of topics, including documentation of the processes involved. The requirements of MOD-027 are to simply verify the model and provide that model to the Transmission Planner. Under this standard, the responsible entity either performed the verification and reported it or they didn't. There is no inherent program deficiency that can be identified and corrected. The GVSDT does not believe that this approach is applicable to the requirements that we have developed.	
JEA	JEA supports the comments of the NAGF and believes that the SDT team should accept a request by the NAGF to have a joint meeting to discuss and resolve the many differences since these differences are so substantial that the usual iterative process will be excessively long. We also support NAGF's suggestion to evaluate these standards using the Cost Effective Analysis Process.
Response: The GVSDT thanks you for your comment. The GVSDT did not receive any comments from the NAGF, however others have mirrored the intent to concur with their comments (see specifically Cowlitz). We have responded to those comments above. All reliability standards undergo an economic analysis by the FERC during the NOPR process.	
Chelan PUD	Note 2, Page 4: It is unclear what would constitute and acceptable accounting - "Some method of accounting for these differences must be presented..." Unless any accounting would be acceptable, suggest some guidance.
Response: The GVSDT thanks you for your comment. Based on a review of the Field Test results and experience of the SDT members, the SDT recognized that it was not desirable to develop a dynamic model verification Standard like a technical	

Organization	Question 3 Comment
procedure manual. Such a strategy would fail as there is a wide range of equipment that will need to be verified. Thus, the SDT drafted a Standard that concentrates on "stating what is required" but without "stating how to accomplish what is required" so that the details can be managed by the modeling verification expert.	
Oncor Electric Delivery Company	Oncor does not support the position that the TP is applicable for this standard. In the ERCOT Interconnection, Section 3 and Section 5 of the ERCOT Nodal Operating Guides prescribes the ERCOT ISO to request and receive generation unit performance data, not the TP.Oncor takes the position that a regional variance be granted for the ERCOT Interconnection such that the standard would prescribe that the PA only be the only requestor and receiver of unit performance data to support Section 3 and Section 5 of the ERCOT Nodal Operating Guides.
Response: The GVSDT thanks you for your comment. Regarding the responsibilities assigned to the Transmission Planner in the draft standard, the SDT believes standard language lines up well with the vast majority of entity business practices in effect regarding the interactions between generation and transmission entities when collaborating on generator dynamic models. There are defined NERC processes outside the GV SDT effort where entities can request a regional variance. Alternatively, the Transmission Planner could delegate the responsibility to another such as its Planning Authority.	
Manitoba Hydro	R1 - The text would be more clear if rewritten to read 'Within 90 calendar days of receiving a written request, each Transmission Owner shall provide to its requesting Generator Owner:' **The SDT revised the first sentence in R1 to read, "Each Transmission Planner shall provide the following requested information to the Generator Owner within 90 calendar days of receiving a written request."** 4.2 - The language immediately preceding the bullets is unclear: 'that meet the following' should perhaps be rewritten as 'provided they meet the following'. **If one removes the other parts of the sentence (stand alone phrases), the current language coveys "facilities that meet the following." The SDT believes that terminology conveys the intent. The SDT believes that we have achieved stakeholder consensus on the current language of the standard.** Effective Date Section 5.1 - Manitoba Hydro recommends changing the "R6" to "R5" because there

Organization	Question 3 Comment
	is no "R6" in the standard. **The SDT thanks you for catching this typo. The SDT has corrected the type.** General Comment - Manitoba Hydro has a concern with respect to the phased in implementation measured by percent compliance. We believe that this may lead to a potential for some uncertainty and debate. Does a phased in implementation such as this, do anything to increase reliability? **The SDT is proposed Implementation Plan allows the Generator Owner time to develop in-house expertise to perform model verification if they do not desire to hire consultants. The percentages in the Effective Date section refer to the entity's applicable unit gross MVA for each Interconnection. The SDT believes that the calculation of the percentages will be trivial, and will allow Generator Owners flexibility as compared to a "number " or "percentage" of units approach.**
Response: The GVSDT thanks you for your comment. Please see responses above.	
ReliabilityFirst	ReliabilityFirst votes in the Negative for the draft MOD-027-1 standard since ReliabilityFirst believes there is a major disconnect/flaw between the Applicability Section (4.2. Facilities) and Requirement R2, part 2.1. This major flaw will create confusion on which generating units are required to be verified per the standard. ReliabilityFirst offers the following comments for consideration:1. Requirements R2, Part 2.1 - There is a clear disconnect between the Applicability section of the standard (i.e. individual units/plants greater than 100MVA - Eastern or Quebec Interconnections) and Requirements R2, Part 2.1 which requires"... Verification of an individual unit less than 20 MVA." Based on the Applicability section, units less than 20 MVA are not applicable under this standard. Furthermore, units under 20 MVA do not fall under the NERC Statement of Compliance Registry Criteria as criteria for registration purposes for GOs and GOPs. **Response: The intent of the SDT is to allow the model verification expert to use any combination of individual or aggregate models in the verification of plants. The SDT has modified the applicable portion of Part 2.1 to read, " Verification for individual units rated less than 20 MVA (gross nameplate rating) in a generating plant (per Section 4.2.1.2, 4.2.2.2, or 4.2.3.2) may be performed using either individual unit or aggregate unit model(s) or both."**

Organization	Question 3 Comment
	2.Applicability Section 4.2. Facilities - ReliabilityFirst thanks the SDT for their justification for the 100 MVA threshold, but still believes that the Applicability should be consistent with the NERC Statement of Compliance Registry Criteria generator thresholds (i.e. 20 MVA or 75 MVA aggregate connected to the BES). Even though the 100 MVA threshold covers 80% of the connected MVA or greater for each Interconnection (in aggregate), depending on the geographic location (within the BES), that value may be much less. For example, if there is a certain load pocket in which the majority of the connected generation is lest that 100 MVA, the dynamic models would not be required to be verified per this standard. Thus not having verified accurate dynamic models for this specific location could hinder the reliability of the BES. ReliabilityFirst recommends changing the Applicability section to be consistent with the NERC Statement of Compliance Registry Criteria generator thresholds (i.e. 20 MVA or 75 MVA aggregate connected to the BES). **Response: As discussed in previous postings of the draft MOD-027 standard, the SDT considered the extent of the facilities to be verified and how to reflect this in the "applicability" of this proposed standard. As a basis, the SDT recognized that the excitation system models and model data are already collected through the processes identified in MOD-012 and MOD-013. These models and data should, with few exceptions, already result in a quality dynamics database. However, as confirmed through the Field Test, performing the activities specified in the draft standard is expected to result in an improvement of the accuracy of the exciter models used in dynamic simulations. Utilizing engineering judgment, based in part on recent entity experiences in verifying excitation system models, the SDT is proposing to require verification of excitation systems associated with 80% or greater of the connected MVA per Interconnection. Therefore, specific MVA thresholds corresponding to 80% of connected MVA or greater for each Interconnection are proposed. It is recognized that certain boundaries within an interconnection, such as BA boundaries, may have more or less than 80% of the connected MVA.** **The SDT further believes that a minimum unit interconnection of >100 kV, consistent with the Compliance Registry Guidelines, is appropriate. Finally, the SDT believes that the standard should apply to units with a capacity factor such that they are on-line 400 hours or greater a year. The SDT believes that these three applicability thresholds will result in substantial accuracy improvement to the excitation models and associated Reliability based limits determined by**

Organization	Question 3 Comment
	dynamic simulations, while not unduly mandating costly and time consuming verification efforts. Also, the SDT does recognize that Regional variances can be considered if a Region desires to include additional unit MVA in this standard.
Response: The GVSDT thanks you for your comment. Please see responses above.	
Seattle City Light	Requirement 2.1.1 states three separate ways to verify MW response for a synchronous generator, but uses the term "either of" when referring to the choice of tests, which implies two tests. Please clarify with either two tests or change the reference to "any of." In addition, one of the tests of 2.1.1 includes a partial load rejection. Such a test is already part of the Kestrel test procedures currently performed by Seattle City Light. It is not clear from the requirement and footnote if our existing test would be sufficient for validation or if the other two tests would also be required. Please clarify the language of R2.1.1.
Response: The GVSDT thanks you for your comment. The use of a bullet lists in R2.1.1 conforms to standard development protocol. Specifically, a bullet list indicates the entity selects which of the listed actions is appropriate to perform. Additionally the use of the phrases "either" at the end of the root requirement, followed by a comma at the end of the first bullet, the word "or" at the end of the second bullet emphasizes that one of the three test results can be utilized. Only one of the three bulleted activities has to occur for compliance – as such, if an entity has utilized a partial load rejection test and satisfied the corresponding footnote, then that would satisfy what is required from R2.1.1. For the above stated reasons, the SDT believes that it has achieved stakeholder consensus on the current language of the standard.	
Dynegy	Some smaller Generator Owners have little experience in this type of testing. If possible, it is suggested more detail be placed in Attachment 1 regarding what constitutes an acceptable test, i.e., template.
Response: The GVSDT thanks you for your comment. Based on a review of the Field Test results and experience of the SDT members, the SDT recognized that it was not desirable to develop a dynamic model verification Standard like a technical procedure manual. Such a strategy would fail as there is a wide range of equipment that will need to be verified. Thus, the SDT	

Organization	Question 3 Comment
drafted a Standard that concentrates on "stating what is required" but without "stating how to accomplish what is required" so that the details can be managed by the modeling verification expert.	
Tennessee Valley Authority	Step 4.2.3, Recommend adding "in" to the requirement to read "Generation in the ERCOT Interconnection ..." Justification is to be consistent with similar steps 4.2.1 and 4.2.2.
Response: The GVSDT thanks you for your comment. The SDT has corrected the typo.	
Northeast Power Coordinating Council	Suggest the SDT specifically identify or show examples of how to match the percentage thresholds outlined in the Effective Date sections of the Standard and the associated Implementation Plans. Given recent experience with other Standards, it would be helpful for the SDT to establish how the entities can demonstrate meeting the requisite threshold percentages. Over time, we have observed that in some cases percentages were established by the number of devices or units; but in other cases, the measurement has been based upon magnitude of nameplate ratings. **The percentages in the Effective Date section refer to the entity's applicable unit gross MVA for each Interconnection. The SDT believes this is a clear designation that the thresholds are determined by the percent of unit gross MVA and not by the number of devices. This does mean that the total applicable unit MVA per Interconnection, as specified in Section 4.2 (Applicability / Facilities) will have to be determined by the Generator Owner. The SDT believes that we have achieved stakeholder consensus on the current language of the standard.**
Response: The GVSDT thanks you for your comment.	
Southern Company	The SDT should consider moving the capacity factor exemption information found in Attachment 1, row 8 into the applicability section. The applicability section should allow an entity to be able to determine if the standard applies to them and be able to determine the scope of the facilities affected. It is best for those impacted to immediately know which units are in the scope and not have to realize the scope from a detailed study of the table of Attachment 1. This would allow row 8 of Attachment 1 to be deleted.

Organization	Question 3 Comment
	Response: The SDT decided to place all the scenarios that effectively "exempt" otherwise applicable units in Attachment 1 for clarity. The SDT believes that we have achieved stakeholder consensus on the current language of the standard. The way the capacity factor exemption is structured will provide for the requirement to be met with a statement regarding the capacity factor. It provides for an alternative way to meet the requirement, rather than a change in applicability. This will provide for more clarity in tracking the status for a given unit. The SDT believes that we have achieved stakeholder consensus on the current language of the standard. Requirement R4 has a problem with the bookmark "Error! Bookmark not defined". **Response: Thank you for pointing out this error. The footnote designation has been corrected.** We recommend removing the first element of the logical AND statement of Attachment 1 Row 5 (the same physical location element). If a GO has identical equipment at different physical locations, they are equivalent. A sister is a sister independent of the physical location. As long as the equipment is identical, the concept should be allowed to apply regardless of location. **Response: The SDT notes the general agreement among industry with using the proxy unit approach. The SDT respectfully maintains that the "same physical location" requirement is necessary since it provides a strong indication of similarity of equipment and settings (which could be verified by the same field personnel during a single site walk down). For example, a GO/GOP could own/operate otherwise similar equipment physically located in vastly different geographic locations with substantially different Reliability Coordinator or Transmission Operator requirements (e.g., requirement for PSS in-service).**
Response: The GVSDT thanks you for your comment. Please see responses above.	
Dominion	There appears to be a mismatch between Requirement R2 and the Effective Date statements. Specifically, R2 is applied on an "applicable unit" bases where the Effective Date statements are applied on an "applicable unit gross MVA" basis.R4; **Response: The language in R2 refers back to the Applicability / Facilities definition of "applicable unit." The effective dates determine the quantity of units to be verified for each Effective Date –**

Organization	Question 3 Comment
	and that quantity is based on an "applicable unit gross MVA" basis. bookmark #4 in the clean version needs to be corrected, shows 'Error! Bookmark not defined. **Response: Thank you for pointing out this error. The footnote designation has been corrected.**
Response: The GVSDT thanks you for your comment. Please see responses above.	
Utility Services	Utility Services suggests the SDT specifically identify or show examples of how to match the percentage thresholds outlined in the Effective Date sections of the standard and the associated Implementation Plans. Given our recent experience in other standards, it would be helpful for the SDT to establish how the entities can demonstrate meeting the requisite threshold percentages. Over time, we have observed that in some cases, percentages were established by the number of devices or units; but in other cases, the measurement has been based upon magnitude of nameplate ratings.
Response: The GVSDT thanks you for your comment. The percentages in the Effective Date section refer to the entity's applicable unit gross MVA for each Interconnection. The SDT believes this is a clear designation that the thresholds are determined by the percent of unit gross MVA and not by the number of devices. This does mean that the total applicable unit MVA per Interconnection, as specified in Section 4.2 (Applicability / Facilities) will have to be determined by the Generator Owner. The SDT believes that we have achieved stakeholder consensus on the current language of the standard.	
NIPSCO	Verification requirements would be burdensome, e.g., model response by a load rejection test or comparison with a system frequency excursion may be of only limited value. Another basic problem with this standard is the unnecessary back and forth between generation owners and transmission planners in the data development and collection. This standard could be greatly simplified for all involved parties with reporting requirements similar to MOD-025 where the generation owner provides information to the transmission planner upon the installation of new equipment or the modification of existing equipment. Given the above, Transmission Planning recommends a vote against this standard in its present form.

Organization	Question 3 Comment
Response: The GVSDT thanks you for your comment. The SDT believes peer review is an essential part of the model verification process irrespective of criteria or guidelines available from industry since peer review provides the Transmission Planner an opportunity to review the data and identify problems or errors with information provided. This peer review process is not necessary for the validation of unit steady state parameters, but is necessary for dynamic model verification to ensure accurate models that are compatible with dynamic simulation programs. Note that the use of load rejection test is only an option that does not have to be utilized by the Generator Owner. Also, the SDT believes that the recording of units real power output while they are in operating in a frequency responsive mode during a system frequency excursion that meets or exceeds the criteria in Attachment 1 Note 1 is of great value and can be used to verify the model. Finally, The SDT understands that many units are not good candidates for partial load rejection tests for the purposes of governor model verification. That is one of the reasons why this test is optional.	
Duke Energy	We recommend removing the first element of the logical AND statement of Attachment 1 Row 5 (the same physical location element). If a GO has identical equipment at different physical locations, they are equivalent. Equivalency of units is independent of the physical location.
Response: The GVSDT thanks you for your comment. The SDT notes the general agreement among industry with using the proxy unit approach. The SDT respectfully maintains that the "same physical location" requirement is necessary since it provides a strong indication of similarity of equipment and settings (which could be verified by the same field personnel during a single site walk down). For example, a GO/GOP could own/operate otherwise similar equipment physically located in vastly different geographic locations with substantially different Reliability Coordinator or Transmission Operator requirements (e.g., requirement for PSS in-service).	
PSEG	We voted "Negative" on this standard the reasons shown below:This FIRST COMMENT was provided for MOD-025-1, MOD-026-1, MOD-027-1, and PRC-019-1.1.SYNCHRONOUS CONDENSERS: The GVSDT is not working as a "team" with regards to synchronous condensers owned by TOs. The team working on this standard and PRC-019-1 INSIST that they be included as "applicable facilities," while the team working on MOD-026-1 has stated otherwise. We provided this comment to the MOD-026-1 team in the last set of comments:"The exclusion of synchronous condensers (and other reactive devices) in MOD-026-1 per the rationale provided in the Background (with which we agree)

Organization	Question 3 Comment
	states “Synchronous condensers are not currently addressed in the NERC Registry Criteria” However, companion standards under Project 2007-09 (MOD-025-2 and PRC-019-1) are applicable to synchronous condensers. The GVSDT should address this inconsistency.”The SDT responded as follows:”The SDT believes that MOD-026 is different from the other standards with respect to synchronous condensers due to the complex interaction required between the Transmission Planner and the Generator Owner, and thus believes it better to wait for efforts by others to define where synchronous condensers fit in the functional model.”In response to a similar comment on MOD-025-2 and PRC-019-1, we received these responses:MOD-025-1: “The GVSDT thanks you for your comment. There was overwhelming industry support (approximately 96%) for inclusion of synchronous condensers at the first posting of MOD-025-2. The Definition of Bulk Electric System (BOT Adoption Jan 2012) includes in “I5 - Static or dynamic devices (excluding generators) dedicated to supplying or absorbing Reactive Power that are connected at 100 kV or higher, or through a dedicated transformer with a high-side voltage of 100 kV or higher, or through a transformer that is designated in Inclusion I2.”PRC-019-1: “The SDT feels that it is appropriate to include synchronous condensers because of their similarity to generators in terms of dynamic reactive power supply, voltage control, disturbance response, control functions, and protection systems. For this reason the SDT proposes to apply to the standard to similar size generators and synchronous condensers.”We need to see “one” statement from the SDT on the inclusion or exclusion of synchronous condensers that makes sense technically, and soon. **Response: Note that modeling of synchronous condensers is not applicable to MOD-027. Synchronous condensers are implemented for dynamic voltage control and are not part of any turbine/governor equipment.** SECOND COMMENT was provided for MOD-025-1, MOD-026-1, MOD-027-1, and PRC-024-1.2.DATA SHARING POLICY: For all of the MOD standards in this, only Transmission Planners are the recipient of the data developed. We asked that the standard require that the TP be required to share the data with others. The response we received is that the Functional Model requires the TP to share data with the TOP. Unfortunately, the Functional Model is unenforceable. We note that in PRC-024-1 R6 requires the GO to share its data with the RC, PC, TOP, and TO, upon request. Unless the same data is shared across all “modelers,” the result will be outdated data in someone’s model, which can have a bad result. The team should have one broad “data sharing” policy in the three MOD

Organization	Question 3 Comment
	standards and PRC-024-1. Since the TP receives data in three of the standards, we suggest this language or similar language: The GO shall provide data to its TP within 60 days of its development [describe the data]. The TP shall provide the same data to any RC, PC, TP, or TOP within 60 days of receiving a request for it. **Response: The GVSDT has written the requirements of this body of standards based on the NERC Reliability Functional Model. The requirements of Reliability Standards MOD-010-0. MOD-011-0, MOD-012-0 and MOD-013-1 address the requirement for steady state and dynamic models (which are planning models) and the dissemination of these models to appropriate entities. The data to build Real-time models that are necessary for reliability and used by Reliability Coordinators and Transmission Operators are addressed in standards IRO-010-1a and TOP-003-2 respectively. The GVSDT does not see any reason to include duplicative requirements in this standard. There are already processes in place which facilitate the sharing of the most current dynamic models through MOD-012 and 013. In the eastern interconnection, dynamic models are shared in part through the MMWG.**
Response: The GVSDT thanks you for your comment. Please see responses above.	
ISO-New England	Attachment 1, Row 8 has a reference to capacity factor. The capacity factor section has been removed from the body of the standard. If the capacity factor is still part of the standard by it's existence in the Attachment then this is unacceptable. Older large units with low capacity factors will be called upon to operate during extreme weather events when the system is most stressed. System reliability will be compromised if the modeled characteristics of the units differ from what is actually installed in the field. **Response: The SDT believes that there is little reliability to be gained by testing units with capacity factor of less than 5%. The added cost of testing is not justified. The SDT believes that we have achieved stakeholder consensus on the current language of the standard.** Requirement R1 may bring out some concern over the copyrighted models supplied by the simulation software vendors. Hopefully this can be worked out with the vendors. **Response: The software manufacturers have indicated that they will make accommodations so**

Organization	Question 3 Comment
	that generator owners without software licenses can receive the block diagrams and data sheets. Requirement R3 might only require a "written response" from a Generator Owner to the Transmission Planners notification that a model is not useable with some technical basis for keeping the current model that is not usable. Wording must be included so that ultimately the Generator Owner shall provide a "usable model" to the Transmission Planner. **Response: Requirement R3 is a "peer review" type requirement to ensure cooperation between the Generator Owner and the Transmission Planner. The SDT believes peer review is an essential part of the model verification process since the peer review provides the Transmission Planner an opportunity to request the Generator Owner to review the data and assist in identifying problems or errors with information provided. The SDT believes that all entities will be equally motivated to resolve model issues. This process was over whelming supported by Industry based on their responses in prior postings.** Requirement R5 sub-requirement wording should be changed to indicate the Transmission Planner shall notify the Generator Owner if the excitation model *does not* initialize, a no-disturbance simulation results in transients or a disturbance simulation results in a model exhibiting negative damping. **Response: The SDT believes that we have achieved stakeholder consensus on the current language of the standard. Also, the SDT feels that the Generator Owner should be positively informed from the Transmission Planner if the model is useable or not.**
Response: The GVSDT thanks you for your comment. Please see responses above.	

END OF REPORT

Consideration of Comments

Project 2007-09 Generator Verification
PRC-019-1

The Project 2007-09 Generator Verification Standard Drafting Team (GVSDT) thanks all commenters who submitted comments on the proposed revisions to PRC-019-1. The standard was posted for a 30-day public comment period from September 28, 2012 through October 31, 2012. Stakeholders were asked to provide feedback on the standard and associated documents through a special electronic comment form. There were 47 sets of comments, including comments from approximately 153 different people from approximately 99 companies representing 9 of the 10 Industry Segments as shown in the table on the following pages.

All comments submitted may be reviewed in their original format on the standard's project page.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Mark Lauby, at 404-446-2560 or at mark.lauby@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Standard Processes Manual: http://www.nerc.com/files/Appendix_3A_StandardsProcessesManual_20120131.pdf

Summary Consideration

A large majority of stakeholders agree with the change in the VRF revisions and no stakeholder provided comments suggesting that they should be further revised.

A large majority of stakeholders agree with the revised VSLs. The GVSDT received one suggestion for revisions but the team felt that the proposal would add confusion rather provide further clarity to the VSLs.

Based on the stakeholder comments below, the GVSDT made the following minor edits and clarifications to the standard:

- Added specific language to the Effective Date section to clarify that certain regulatory bodies approve standards differently.
- Changed “AVR” to “automatic voltage regulator” in Requirement R1 (AVR is not a defined term).
- Removed the word “review” from Measure M2.
- Added a reference in Section F for IEE C50.13-2005.
- Removed "Converter Over-temperature limiter and associated protection function" from the example of Section G (Reference Information) because it is not a element that can be coordinated.

Index to Questions, Comments, and Responses

1. The GVSDT revised the VRFs to "Medium" based on stakeholder feedback. Do you agree with the proposed revision? If not, please provide an alternative and supporting information in the comment area below. 12
2. The GVSDT revised the VSLs for each requirement based on stakeholder feedback. Do you agree with the proposed revisions? If not, please explain in the comment area below. 15
3. Do you have any other comment, not expressed in questions above, for the GVSDT? 19

The Industry Segments are:

1 — Transmission Owners

2 — RTOs, ISOs

3 — Load-serving Entities

4 — Transmission-dependent Utilities

5 — Electric Generators

6 — Electricity Brokers, Aggregators, and Marketers

7 — Large Electricity End Users

8 — Small Electricity End Users

9 — Federal, State, Provincial Regulatory or other Government Entities

10 — Regional Reliability Organizations, Regional Entities

1. **The GVSDT revised the VRFs to "Medium" based on stakeholder feedback. Do you agree with the proposed revision? If not, please provide an alternative and supporting information in the comment area below.**

Summary Consideration: A large majority of stakeholders agree with the change in the VRF.

The consensus of stakeholders submitting comments was that an assignment of Medium VRFs was appropriate.

Organization	Yes or No	Question 1 Comment
Associated Electric Cooperative, Inc. - JRO00088	No	AECI does not believe R1 should exist as currently drafted, see below.
Response: The GVSDT thanks you for your comment. The comment does not address the question asked. Please see the response to your comment in Question 3 below.		
Cowlitz PUD	No	Do not agree with the Standard requirement structure; therefore, it is too early to assign VRFs.
Response: The GVSDT thanks you for your comment. The GVSDT is required to assign VRF's as part of the drafting process.

2. **The GVSDT revised the VSLs for each requirement based on stakeholder feedback. Do you agree with the proposed revisions? If not, please explain in the comment area below.**

Summary Consideration: A large majority of stakeholders agree with the revised VSL's.

Organization	Yes or No	Question 2 Comment
Ameren	No	(1)Although we prefer a % of Facilities approach, we can accept the R1 VSL revision with the stated time frames. **Thank you.** (2)A time-based VSL does not align with the severity of failing to meet R2. The severity is primarily a function of the amount of on-line exposure. As proposed, an entity that misses coordination for one 20MVA generator causes a Severe Violation even though that generator may operate <1% of the year and represent <1% of their fleet. We request that for R2 the SDT replace the time-based (days late) with % of MWh during the period of violation to more properly account for aggregate impact and restate the R2 VSL as follows:(a)Lower VSL becomes 'The Generator Owner failed to verify the coordination specified in Requirement R1 on their Facilities producing from 0% to 5% of their total MWh generated during the violation period.' This does require each unit to be coordinated. (b)Moderate VSL becomes '...more than 5% and less than 10%' (c)High VSL becomes '...more than 10% and less than 15%'(d)Severe VSL becomes '... more than 15%'.(3)We request that the SDT insert 'latter of' before 'identification or implementation' in R2 VSL if the SDT does retain the time-based VSL format. Identification differs from implementation so clarity is needed if a violation does occur. **Using a structure as suggested does not meet the NERC guidelines for VSL development. In addition, the GVSDT believes this would be much more complex to administer. No change made.**
Response: The GVSDT thanks you for your comment. See response to specific comments above.		

Organization	Yes or No	Question 2 Comment
Cowlitz PUD	No	Do not agree with the Standard requirement structure; therefore, it is too early to assign VRFs.
Response: The GVSDT thanks you for your comment. The GVSDT is required to develop VRF's and VSL's as part of the drafting process.		
seattle city light	No	New Requirement R2 requires, among other things, for Generator Owners to verify the existence of the identified coordination between the voltage regulating system controls and the relay settings every five years. This timing seems objectionable in the opinion of Seattle City Light, and furthermore it is now included in the Violation Severity Levels to be enforced. The reason for objection is that said coordination is already verified within 90 days following any major system modifications, equipment or setting changes as part of R2, and thus the need for verification every five years seems redundant and unnecessary.
Response: The GVSDT thanks you for your comment. The GVSDT believes there is a reliability benefit to reviewing coordination every five years because limiter and protection settings may be changed by somebody other than the person responsible for the coordination review and the effective system impedance (which affects the SSSL) may easily change without the Generator Owner's knowledge.

3. **Do you have any other comment, not expressed in questions above, for the GVSDT?**

Summary Consideration: Based on the stakeholder comments below, the GVSDT made the following edits and clarifications to the standard:

- **Added specific language to the Effective Date section to clarify that certain regulatory bodies approve standards differently.**
- **Changed "AVR" to "automatic voltage regulator" in Requirement R1 (AVR is not a defined term).**
- **Removed the word "review" from Measure M2.**
- **Added a reference in Section F for IEE C50.13-2005.**
- **Removed "Converter Over-temperature limiter and associated protection function" from the example of Section G because it is not a element that can be coordinated.**

Organization	Question 3 Comment
ACES Power Marketing Standards Collaborators	(1) R1 should be modified to clarify that the GO or TO shall coordinate their applicable Facilities. While most readers would interpret the requirement to apply to the Facilities owned by the GO and TO, it simply does not say this. We recommend using "each GO and TO shall coordinate the voltage regulating system controls ... applicable equipment capabilities of its applicable Facilities and the settings of the applicable Protection System devices and functions." **The GVSDT believes that the applicability section adequately prescribes the scope of the facilities and declines to make this change.** (2) While we disagree with the inclusion of blackstart units in this standard, the previous wording was actually more correct and consistent with the Statement of Compliance Registry Criteria. Changing "Blackstart Resource" to "blackstart unit" only causes confusion and ambiguity. By definition a "Blackstart Resource" is a blackstart unit that is included in the Transmission Operator's restoration plan. Since the applicability section also states that the blackstart unit must be included in the TOP's restoration plan, it is not clear what was accomplished with changing Blackstart Resource to blackstart unit. It causes the reader to question what additional units are intended if

Organization	Question 3 Comment
	they don’t mean Blackstart Resource. Furthermore, it deviates from the wording in the Statement of Compliance Registry Criteria. This is contrary to the response that was provided to a comment by PSEG to change the language during the last posting. The response indicated that the “SDT feels it is best to retain the NERC wording without modification.” We can find no other citation in the response to comments indicating a reason to change it. Please change blackstart unit back to Blackstart Resource. **The compliance registry criteria V5 document, paragraph III.c.3 is shown below….** III(c) Generator Owner/Operator: III.c.1 Individual generating unit > 20 MVA (gross nameplate rating) and is directly connected to the bulk power system, or; III.c.2 Generating plant/facility > 75 MVA (gross aggregate nameplate rating) or when the entity has responsibility for any facility consisting of one or more units that are connected to the bulk power system at a common bus with total generation above 75 MVA gross nameplate rating, or; III.c.3 Any generator, regardless of size, that is a blackstart unit material to and designated as part of a transmission operator entity’s restoration plan, or; III.c.4 Any generator, regardless of size, that is material to the reliability of the bulk power system. **Section 4.2.4 of the draft standard matches this registry criteria wording exactly.** (3) In applicability sections 4.2.1 through 4.2.3, please change “directly connected to the BES” to “that are part of the BES”. Per the BES definition, generation units can be and are part of the BES. Using “directly connected to the BES” could draw in a non-BES unit. **The existing wording more closely matches V5 of the registry criteria and will be retained.** (4) There is an extraneous comma in R2.

Organization	Question 3 Comment
	The sentence structure has been altered slightly to address this concern.
Response: The GVSDT thanks you for your comment. Please see specific responses above.	
Ameren	(1)R2 is unclear as written, please insert 'latter of' before 'identification or implementation' to avoid repeat triggers for the same change. The reality is that the implementation of a change may well lag its identification by years. **The GVSDT believes that the existing wording is adequate to ensure that the protection elements are coordinated.** (2)Attachment 1 Example appears to violate R1 1.1.2. Loss of Field Zone 2 trips before 'operating conditions exceed equipment capabilities.' On the other hand, it would certainly 'limit the extent of damage when operating conditions exceed equipment capabilities or stability limits' since it trips before either of them are reached. This example does show how specialized and complex this coordination is. Entities may have different margins, asset protection, and operating practices. We presume the SDT intends that the examples show 'coordinated' capabilities, controls, and protection. If not, the lack of coordination should be pointed out. **The coordination shown in the example of Attachment 1 is simply that: an example of a system demonstrating the coordination of the settings with respect to an example protection philosophy. This draft standard does not specify margins, asset protection limits, or operating practices. Entities are obligated to review the protection elements to ensure that gross errors do not exist which may result in undesired premature tripping or extensive damage to equipment which contributes to the reliability of the power system.** (3)We request that the GVSDT make all the papers listed in the reference section of the standard readily available on the NERC website. **Copyright laws do not permit this publication the references provided should provide adequate information to allow entities to obtain copies of the documents.**

Organization	Question 3 Comment
Response: The GVSDT thanks you for your comment. Please see specific responses above.	
Florida Municipal Power Agency	1) R1 can be misinterpreted to require a full-blown coordination study every 5 years even if nothing at the plant had changed. There should be a qualifier saying that past coordination studies are still valid if nothing has changed, but that at minimum a review is needed every 5 years to see if the existing coordination study is still valid. **A previously completed coordination study can be used as a baseline or starting point for this recurring requirement. If nothing has changed in the system since the previous coordination, the required action could amount review and confirmation of the previously determined coordination.** 2) A synchronous condenser can be owned by either a TO or GO. For instance, there are installations of generators where a clutch is installed to separate the electric generator from the prime mover to run the electric generator as a synchronous condenser. Such a synchronous condenser would be owned by a GO. The standard should not force a GO to register as a TO simply because it owns a synchronous condenser. FMPA recommends making the requirement applicable to a GO or TO who owns a synchronous condenser. **Draft standard sections 4.1.1 and 4.2.2, taken together, make this standard applicable to GO's with synchronous condensers.**
Response: The GVSDT thanks you for your comment. Please see specific responses above.	
Texas Reliability Entity	1) Does the SDT foresee any conflicts between the proposed language in PRC-019-1 and the proposed setting limits in PRC-025-1, Generator Loadability? **There appears to be industry concern over the "relaxed" protection thresholds currently specified in the draft PRC-025 standard with regard to minimizing equipment damage from overloads. R1.1.1 of the draft PRC-019 has the same objective as PRC-025.** 2) The SDT may want to include a reference ANSI C50.13-2005 for proper coordination of the over/under excitation limiters with AVR, equipment capabilities, and loss-of-field, and other

Organization	Question 3 Comment
	protective functions. **As the referenced document contains design rating considerations for cylindrical-rotor synchronous generators rated 10MVA and above, it can be a useful document when performing the proposed requirements of this standard. It will be referenced in the associated documents section F.** 3) Measure M1: Evidence should also include documentation that actual settings for relays, AVRs, and limiters match the coordination study. **This is superfluous and not necessary. The coordination plots, settings table comparisons, or other methods used to verify coordination are visual representations of the settings that reside in the protective devices. They, by definition, are the same as the actual settings. Otherwise, the coordination studied is not a review of the coordination which is specified in R1 of the draft standard.** 4) Considering the proposed new BES definition and the Guidance Document, there may be confusion in determining if a generator is "directly connected" to the BES. Please consider reviewing the language to see if it should instead say "included in" the BES. Note that a BES generator can be connected to the BES by non-BES elements, and arguably not "directly connected" to the BES. See, for example, figures E1-4 and E1-6 in the BES Definition Guidance Document. **Until the BES definition document is completed, any change to the applicability section of this draft standard is premature. The applicability section of this draft standard matches, very closely, the verbage of version 5 of the NERC Statement of Compliance Registry Criteria, section IIIc.** 5) In general, the Protection System changes should be coordinated before energization (or re-energization) following a change. Is the 90 day time period in R2 consistent with the expectations of PRC-001? **That is true, in general. Utilities generally will not commission new protective relaying without consideration of the application of appropriate settings for the devices. Without this consideration, the protection equipment will either not provide adequate protection or will trip**

Organization	Question 3 Comment
	the equipment premature to necessity. The GVSDT believes that requirements R1 and R2, as drafted, are adequate to confirm that the proper coordination exists. Rather than detailing every possible change which can affect the coordination and specifying timelines for compliance for each type of change, the drafting team elected to present the requirement as provided.
Response: The GVSDT thanks you for your comment. Please see specific responses above.	
Duke Energy	1) Section 1.1: Reword to clarify "normal" is describing the AVR control mode only. Also, SDT should consider mentioning weak system operating conditions are typically used when coordination with the SSSL. Suggested rewording: “Under steady-state system operating conditions, and assuming normal AVR control loop conditions, verify the following coordination items for each applicable Facility:” **“The” was added to R1.1 to emphasize that normal applies to the AVR control mode.** 2) Section 1.1.2: Strike this section, as it is outside the scope of this document. It appears to be mandating protection. PRC-019-1 should be focused on settings. **The words “applicable, in-service” qualify that an entity must consider minimizing the extent of damage to equipment through the settings of protection that he has elected to place in-service. The requirement does not dictate that such protection be placed in-service.** 3) Page 7/11: (Reword 2nd paragraph) Examples of limits, limiters, protection which must be coordinated if employed include: **As this section is simply a section indicating examples of the types of protective functions which may be applied on a generating unit. The NOTE in this section specifies that this section is for reference only, and does not specify additional requirements. The use of “must be coordinated if employed” is not appropriate for an example section. The requirement for inclusion of protective elements which are in service is located in R1, where it should be located.** 4) Page 7/11: Remove all the words "associated" in second paragraph. **The GVSDT believes that “associated” is necessary in this paragraph to make it clear that the protective functions listed in each line item are those that are associated with a particular**

Organization	Question 3 Comment
	protective function. 5) Page 7/11: Remove section on SSSL calculation. Does not belong in standard, see references listed as needed. **This section was added during a previous revision to this standard at the request of multiple commenters.** 6) The unit size applicability for PRC-019 and MOD-025 should be set equivalent to that specified by MOD-026 and MOD-027. We disagree with linking generator applicability to the Compliance Registry criteria. Instead, the approach to applicability should be the same as that used in MOD-026-1 and MOD-027-1 (i.e. in the Eastern Interconnection, individual generating units greater than 100 MVA directly connected to the BES, etc.). Regional criteria can be used to address any smaller units identified as critical to BES reliability in that region. **The coordination review, practically, should be done just prior to the reactive testing specified by MOD-025 so that the protection does not operate undesirably during the testing. The applicability of PRC-019 and MOD-025 are set to match each.** 7) The periodicity of PRC-019 coordination and MOD-025 real & reactive capability should match that of PRC-005-2 for relay testing (6 years) rather than 5 years due to generating plant outage schedules usually being 1-1/2, 2, or 3 years, all of which are integral factors of a 6 year interval. **The GVSDT believes that 5 years is a more appropriate interval for this review.** 8) Strike "Convertor Overtemperature" from this list of typical limiting and protection examples in Section G, Page 7, as this feature is not a coordinatable element. **The standard has been revised to address your concern.** 9) R2 specifies "perform the coordination" while M2 states "coordination review" - we believe that R2 and M2 should be consistent. **The standard has been revised to remove "review" from R2 and M2.**
Response: The GVSDT thanks you for your comment. Please see specific responses above.	

Organization	Question 3 Comment
Wisconsin Electric Power Company	1. In R1.1.2, we suggest revising the sentence to : "The applicable in-service Protection System devices are set to operate to isolate or de-energize equipment in order to limit the extent of damage...". **The GVSDT slightly modified this statement to state the requirement more clearly.** 2. In R1, there needs to be a way for entities to take credit for coordination studies done in the last 2 years prior to the effective date of this standard. **There is no wording to prevent this. Once the standard is in effect, the entity must have 40%, 60%, 80%, and 100% of their applicable units compliance in two years, three years, four years, and five years, respectively. The entity can choose the scheduling order. If an entity has already completed coordination studies and has evidence to prove it at the time of the effective date of this standard, then (barring no changes that invokes R2) they need only to review the coordination before the 5 year time frame to maintain compliance with R1.** 3. In R2, the 90 day requirement to document coordination following a change is not reasonable. It may not be possible to obtain the necessary information from equipment vendors in this timeframe. We suggest a time of 180 days for this requirement. **The GVSDT believes that the 90 day time frame is adequate.** 4. It is not clear how these requirements would be satisfied at wind farms. None of the example information in Section G Reference appears to be applicable to wind farm equipment. We suggest that wind resources be specifically exempted from this standard.
Response: The GVSDT thanks you for your comment. Please see specific responses above.	
Cogentrix Energy	1. R1 appears to have been written with ever-evolving T&D systems in mind. It should be made clear that all that would be needed every five years for a generation unit that has had no changes affecting the systems in question is an attestation to this effect, not a new coordination study, **The GVSDT has revised the standard in an attempt to ensure that coordination of the protection system will occur. If no changes have occurred, a review of the previous coordination will suffice.**

Organization	Question 3 Comment
	2. It should also be made clear that the in-service limiters referenced in R1 and R1.1.1 pertain where they exist. That is, it is not necessary to have a pre-Protection-System limiter for every relay listed in sect. G of PRC-019-1. **The GVSDT believes that the draft standard adequately prescribes that only those elements which are in service are subject to being included into the coordination study. Also, please see the NOTE on p7 of Draft 3 of the draft standard with regard to not requiring installation or activation of limiters or protective functions.** 3. The non-exclusive nature of the listing in section G is a concern regarding proof of compliance. That is, it would be burdensome to have to document a rationale for all relays and excitation system and voltage regulator functions for which a PRC-019-1 study is felt to not be required. The sect. G list should be complete and exclusive. **The listing provided in section G is not meant to be prescriptive. It is to be used for example only. The NOTE in that section reflects this. The phrasing in paragraph 2 of page 7, "limiters and protection functions which could be coordinated include (but are not limited to). The list is representative of functions which typically are found in excitation control systems. Only those functions which are in service (at the choice of the entity) need to be addressed in response to this standard.** 4. The term "black start unit material" in applicability para. 4.2.4 (p.2) is not understood. We would object if the intent was to designate any unit that has the potential for black start capable conversion, in addition to units that are presently black start resources. GOs would, in this case, have to take on substantial burdens based on mere conjecture as to modifications that might (but probably would not) be made sometime in the future. **The wording used in applicability section 4.2.4 is taken directly from V5 of the NERC Statement of Compliance Registry Criteria, and clearly states that the units addressed here are those which are designated in the transmission operator's restoration plan.** 5. Coordination studies are often performed by third-party contractors, with only the resultant relay settings being in our possession. The calculations can be re-performed, but at substantial cost; and, excepting units that are critical to the BES, it is not clear that the required expenditure is justifiable.

Organization	Question 3 Comment
	PRC-019-1 should be made applicable to GOs only for Critical Assets, since damage to a generator outside this category would not imperil BES reliability. **For protective relay settings to be determined, some type of analytical comparison must be used to achieve coordination. Specifying that this documentation be included with any resultant relay settings or excitation system protection parameter settings should not add any considerable cost. The additional cost is simply including some documentation of the comparison method used to determine the relay/excitation control settings.** 6. The periodicity of PRC-019 coordination and MOD-025 real & reactive capability should match that of PRC-005-2 for relay testing (6 years) rather than 5 years due to generating plant outage schedules usually being 1-1/2, 2, or 3 years, all of which are integral factors of a 6 year interval. **The GVSDT believes that the five year interval is more appropriate for PRC-019 and MOD-025.** 7. It is suggested to strike “Convertor Over temperature” from the list of typical limiting and protection examples in Section G, Page 7, as this feature is not an element that can be coordinated. **The standard has been revised to address your concern.** 8. R2 specifies “perform the coordination” while M2 states “coordination review” - we suggest that R2 be changed to “review the coordination” **The standard has been revised to ensure that the protection system is coordinated.**
Response: The GVSDT thanks you for your comment. Please see specific responses above.	
Tennessee Valley Authority	1. Reference, Examples of Coordination, page 7 of 11, bullets at the top of page 7, Recommend deleting the word “associated” in all of the applicable bullets. Justification is that the word “associated” is not needed in these bullets and it will make the bullets more crisp. **The drafting team believes that the phrase “and associated protective functions” is necessary to suggest that those limiters have protective functions that require coordination. It is the responsibility of the entity to illustrate coordination between these limiters and their**

Organization	Question 3 Comment
	associated protective functions while maintaining generator equipment protection. 2. Standard, 4.2 Facilities, The unit size applicability for PRC-019-1 should be set equivalent to the unit size applicability found in MOD-026 and MOD-027-1 (i.e. MOD-026-1 Draft, 4.2, Facilities, 4.2.1, Generation in the Eastern or Quebec Interconnections ... (including 4.2.1.1, 4.2.1.2); 4.2.2 Generation in the Western Interconnection ... (including 4.2.2.1, 4.2.2.2); 4.2.3 Generation in the ERCOT Interconnection ... (including 4.2.3.1, 4.2.3.2). Justification is to be consistent across all generator verification standards (e.g. Generation in the Eastern Interconnection with individual units greater than 100 MVA, etc.) **The GVSDT has limited the set of applicable generators that must perform the verification activities required by MOD-026-1 and MOD-027-1 because these activities can require testing and analysis capabilities that many Generator Owners don't have on staff, and which may have to be contracted to an outside vendor. The verification activities in MOD-025-1 and engineering analysis in PRC-019-1 have been performed for many decades in some regions and typically can be easily performed by a Generator Owner's operations and engineering staff. The GVSDT does not have a technical justification for limiting the scope of these two standards.** 3. Requirement R1, Recommend changing the periodicity of this verification as stated "At a maximum of every five calendar years, ... " to a recommended verification periodicity equal to PRC-005-2 Draft, Table 1-1, Component Type - Protective Relay, Maximum Maintenance Interval, "6 calendar years." Justification is to coordinate protective system relay testing during plant outages with the voltage regulating controls and protections testing that can be performed during outage shut-down or start-up sequences. **The GVSDT believes that a five year periodicity for the re-evaluation of this coordination is appropriate. We believe that GO entities will want to verify this coordination prior to performing the testing of MOD-025, which is also set on a five year periodicity. While there are triggers for the GO to update this coordination when equipment changes take place that will affect the coordination, the GO will need to communicate with the TO for grid system characteristics which may impact the SSSL. Since the SSSL can be the basis for some of the limiter and protection**

Organization	Question 3 Comment
	settings of generating equipment, the GVSDT feels that a five year verification of this characteristic is appropriate.
Response: The GVSDT thanks you for your comment. Please see specific responses above.	
Independent Electricity System Operator	1. The effective dates in the proposed Implementation Plan and in Section A5.1 of the standard may conflict with Ontario regulatory practice respecting the effective date of implementing approved standards. It is suggested that this conflict be removed by:a. In the Implementation Plan, under the Section "In those jurisdictions where regulatory approval is required:", adding a phrase ", or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities," right after "following applicable regulatory approval" and before "each Generator Owner..."b. In Section A5.1 of the standard, adding the same phrase ", or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities," right after "following applicable regulatory approval" and before "each Generator Owner...". **The GVSDT agrees to change the Effective Date wording to address your concerns. After consultation with NERC legal counsel, the following wording has been added: "… or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities."** 2. The wording of R1 is confusing, since the required coordination shall be maintain all the time. We suggest a change of the wording as follows: the phrase "At a maximum of every five calendar years, each Generator Owner and Transmission Owner with applicable Facilities shall coordinate the voltage regulating system controls" should read "At a maximum of every five calendar years, each Generator Owner and Transmission Owner with applicable Facilities shall review the coordination of the voltage regulating system controls" ; Also, the phrase "1.1.1. The in-service limiters are set to operate before the Protection System of the applicable Facility in order to avoid disconnecting the generator unnecessarily." should read" 1.1.1. The in-service voltage regulating control limiters are set to operate before the Protection System of the applicable Facility in order to avoid disconnecting the generator unnecessarily."

Organization	Question 3 Comment
	The GVSDT appreciates your position but since a large majority of stakeholders has approved the standard as it is currently written the GVSDT chooses not to modify the wording at this time.
Response: The GVSDT thanks you for your comment. Please see specific responses above.	
Associated Electric Cooperative, Inc. - JRO00088	Applicability, Part 4.2.4, CHANGE: Remove this entire clause specific to Blackstart of units of any size, RATIONALE: AECI agrees with earlier Industry commenters that opposed the inclusion of these units and disagrees with the SDT's persistent inclusion. Inclusion of Blackstart units of any size, ultimately harms the grid reliability by imposing more regulatory-risk exposure upon them, such that our industry is already seeing many disappear from system restoration plans. With this trend left unchecked, and we are trying to piece our systems back together 10 years from now for whatever reason, the RCs will not even know that many of these viable units still exist. Many may have in fact been driven from existence by such well-intentioned laws having failed to consider the unintended consequences. In addition, the value of AVR functionality for Blackstart units is highly questionable during blackstart situations. **The GVSDT disagrees that Blackstart Resources should be removed from the applicability of this standard. When called upon to operate in their black-start mode, it would probably be under stressed transmission system conditions that could require the generator to provide reactive power to its limits (either leading or lagging). Given the critical nature of an actual transmission system recovery, having the black-start generator limiters and protection properly coordinated is essential.** Requirement R1, CHANGE: Redraft the language toward each responsible entity's internal controls program, RATIONALE: While AECI appreciates the initial 5-year time-line to "check the coordination of all our unit's in-service limiting "stuff", we see the R1 5-year revisit of no added value. This is in contrast to the value of R2's invoking the correct triggering mechanism for events that would precipitate rechecking such protective systems and setting's coordination. AECI simply believes R1 to be overly prescriptive and its existence, as currently drafted, will destine it for future removal. **The GVSDT appreciates your position but since a large majority of stakeholders has approved the**

Organization	Question 3 Comment
	standard as it is currently written the GVSDT chooses not to modify the wording at this time. At a time when the standard is reviewed by NERC staff, the change into another format would be considered.
Response: The GVSDT thanks you for your comment. Please see specific responses above.	
Pepco Holdings Inc and Affiliates	Attachment 1 and Attachment 2 have been revised since the last draft. In these latest set of attachments, although the Zone 2 loss of field characteristic has been set to operate prior to the Steady State Stability Limit (SSSL) is reached, it is also set so that it would operate prior to the generator capability curve being exceeded. This appears to be in conflict with the intent of the standard to ensure that protection should not operate before the equipment capability is exceeded. The Zone 2 characteristic should properly be set between the Generator Capability Curve and the Steady State Stability Limit. As such, Figures A.6 and A.7 in IEEE C37.102-2006 might be better coordination examples to use for these attachments.
Response: The GVSDT thanks you for your comment. The examples for illustrating coordination between AVR limiters and protection examples in the Annex of IEEE C37.102 are very similar to the one in Section G of PRC-019. The drafting team appreciates your position but since a large majority of stakeholders has approved the standard as it is currently written the GVSDT chooses not to modify the P-Q or R-X diagrams.	
Cowlitz PUD	Cowlitz supports the review performed by the NAGF SRT with modification: 1. Requirement R1 appears to have been written with ever-evolving T&D systems with multiple owners/planners in play where Protection System settings may require adjustment to assure proper operation. However, this is not the case for generation facilities which remain relatively static under single management until system improvements are made. Further, it is unprecedented to require a scheduled reassessment of system control settings without cause. The Standard Requirement R1 appears to assume it necessary to review past coordination engineering work and resulting system control and Protection System settings for errors every five calendar years. We see no reliability return in such activity. Requirement R1 must be centered on first establishing that proper coordination engineering and resulting system control and Protection System settings have been completed, and documentation of such work is

Organization	Question 3 Comment
	retained in a Generation Facility Control and Protection Manual. Requirement R2 then covers the cause for review - system improvements, equipment upgrades, new operation theory, etc. - that triggers a reassessment of the coordination engineering and if necessary a revision to the Generation Facility Control and Protection Manual. The only possible item that may merit a scheduled activity is to verify all settings have not inadvertently changed, and are in compliance with the current Generation Facility Control and Protection Manual. **Once the initial study has been completed, the entity is not required to perform a full study at the 5 year time frame. The only item that may have changed in the 5 year time period is the transmission system equivalent which would affect under-excitation limiters, loss of field relay, and steady state stability limit coordination.** 2. The nonexclusive nature of the listing in section G is a concern regarding proof ofcompliance. That is, it would be burdensome to have to document a rationale for all relaysand excitation system and voltage regulator functions for which a PRC-019-1 study is felt tonot be required. The sect. G list should be complete and exclusive. **The examples were offered as such: these are examples. The GVSDT understands that the different regions and different entities will have their specific protocols for the requirements associated with NERC Standards. As such, these methods and examples are just to illustrate the flow of information, as the GVSDT perceives it. These methods and examples are not part of the Requirements, but listed in the Measures. Once again, the methods listed in the Measures are for reference, but are not intended to be an exhaustive and comprehensive list of the possible ways in which this could be implemented.** 3. The term “black start unit material” in applicability para. 4.2.4 (p.2) should be changed to the NERC defined term Blackstart Resource. Further, (departing from NAGF SRT Comments with suggested SDT response) it must be understood that Blackstart Resources must involve coordination between the TOP and the GOP. The TOP is not allowed to unilaterally designate blackstart capable resources within their restoration plan. EOP-005-2 mandates this via Requirement R13. **The wording in Part 4.2.4 comes directly from the NERC Statement of Compliance Registry**

Organization	Question 3 Comment
	Criteria. The GVSDT feels it is best to retain the NERC wording without modification.
Response: The GVSDT thanks you for your comment. Please see specific responses above.	
Ingleside Cogeneration LP (voting entity name Occidental Chemical Corporation)	Ingleside Cogeneration LP agrees that the proper coordination between a generator's voltage limiters, protective relay settings, and its stability limits can best assure its availability in response to transient conditions. However, we are concerned with the aggregate work load that all five standards in Project 2007-09 will place upon our engineering and operations organizations. Each has its own unique purpose, which means unique processes to support them - as well as test results that demonstrate compliance. With so much uncertainty surrounding this program, we cannot agree to proceed without the following items being addressed:1) All requirements for recurring assessments (R1) must contain language that focuses on the strength of the validation process - not the execution. This could be similar to that used in the CIP version 5 standards calling for the Responsible Entity to implement an action "in a manner that identifies, assesses, and corrects deficiencies". Experience has shown that without this preface, auditors will focus on missed due dates, whether or not all check boxes are filled in, and statements showing that every sub-requirement was addressed - even those not applicable to the facility. The CEA's focus needs to be on the entity's commitment to the validation effort, not the documentation.2) The Compliance organization needs to be engaged in the development process so that industry stakeholders have a sense of how adherence to the standard will be determined. The existing process is disconnected - leading to inconsistent interpretations of the drafting team's original intent. Other projects have begun to post drafts of the RSAWs concurrently with the standards for exactly this reason. The SDT should take note that these modifications are consistent with the risk-based compliance direction that both NERC and FERC support. The intent is to focus industry and regulatory resources on the reliability aspects of the initiative - not its administrative aspects.
Response: The GVSDT thanks you for your comment. Your issues relate to the "Find, Fix and Track" process that was most notably incorporated in the CIP body of standards. For example, CIP-003-5, Requirement R2 states:"Each Responsible Entity for its assets identified in CIP-002-5, Requirement R1, Part R1.3, shall implement, in a manner that *identifies, assesses, and corrects deficiencies*, one or more documented cyber security policies that collectively address the following topics, and review and obtain	

Organization	Question 3 Comment
CIP Senior Manager approval for those policies at least once every 15 calendar months:" This requirement relates to a specific program that addresses a wide range of topics, including documentation of the processes involved. The requirements of PRC-019 are to verify coordination of protection systems. Under this standard, the responsible entity either performed the verification or they didn't. There is no inherent program deficiency that can be identified and corrected. The GVSDT does not believe that this approach is applicable to the requirements that we have developed.	
JEA	JEA supports the comments of the NAGF and believes that the SDT team should accept a request by the NAGF to have a joint meeting to discuss and resolve the many differences since these differences are so substantial that the usual iterative process will be excessively long. We also support NAGF's suggestion to evaluate these standards using the Cost Effective Analysis Process.
Response: The GVSDT thanks you for your comment. The GVSDT appreciates your position but since a large majority of stakeholders has approved the standard as it is currently written the GVSDT chooses not make substantive changes at this time.	
Luminant	Luminant recommends that Requirement R1 and Measure M1 be revised to clarify that the coordination described in the text is not between the Generator Operator and Transmission Operator. R1 would be revised in the following manner, "At a maximum of every five calendar years, each Generator Owner and Transmission Owner with applicable Facilities shall coordinate the voltage regulating system controls, (including in-service 1imiters and protection functions) with its applicable equipment capabilities and settings of the applicable Protection System devices and functions. 1.1. Assuming normal AVR control loop and system steady-state operating conditions, verify the following coordination items for each applicable Facility". Measure M1 would be altered in the same manner.
Response: The GVSDT thanks you for your comment. The GVSDT appreciates your position but since a large majority of stakeholders has approved the standard as it is currently written the GVSDT chooses not to modify the wording at this time.	
seattle city light	New Requirement R2 requires, among other things, for Generator Owners to verify the existence of the identified coordination between the voltage regulating system controls and the relay settings every five years. This timing seems objectionable in the opinion of Seattle City Light, and furthermore it is now included in the Violation Severity Levels to be enforced. The reason for

Organization	Question 3 Comment
	objection is that said coordination is already verified within 90 days following any major system modifications, equipment or setting changes as part of R2, and thus the need for verification every five years seems redundant and unnecessary.
Response: The GVSDT thanks you for your comment. The GVSDT considered that entities would want to verify the said coordination of R1 prior to performing the verification of MOD-025, thus the 5 year interval was chosen. The GVSDT chooses not to modify the interval at this time.	
Southern Company	Please consider placing the applicable unit size for PRC-019 and MOD-025 equivalent to that specified by MOD-026 and MOD-027. T**he GVSDT believes that using the Compliance Registry criteria is prudent for setting the applicability of this standard. The commenter did not provide a technical justification for a non-standard Applicability.** The periodicity of PRC-019 coordination and MOD-025 real & reactive capability should match that of PRC-005-2 for relay testing (6 years) rather than 5 years due to generating plant outage schedules usually being 1-1/2, 2, or 3 years, all of which are integral factors of a 6 year interval. **The GVSDT believes the five year interval will not present an undue hardship on Generator Owners considering the phased implementation plan. We are not aware of any generators that run continuously for more than five years.** We suggest striking “Convertor Overtemperature” from the list of typical limiting and protection examples in Section G, Page 7, as this feature is not a coordinatable element. **The GVSDT agrees that "Converter Overtemperature" is not a coordinatable element and has removed it from the example of Section G.** R2 specifies “perform the coordination” while M2 states “coordination review” - we believe that R2 should be changed to “review the coordination”R1 appears to have been written with evolving T&D systems in mind. It should be made clear that all that is required for a generation unit that has experienced no changes affecting the response in question is a review of the equipment state every 6 (six) years rather than requiring a new coordination study. **While the generator limiter and protection settings may not have changed, the equivalent system impedance may easily change which affects the SSSL.**

Organization	Question 3 Comment
Response: The GVSDT thanks you for your comments. Please see specific responses above.	
Manitoba Hydro	R1 - Manitoba Hydro finds the wording ‘At a maximum of every five calendar years’ awkward. We suggest changing the wording to read ‘at least once every five calendar years’.R1.1.2 - Manitoba Hydro suggests deleting R1.1.2 which reads, “The applicable in-service Protection System devices are set to operate, isolate or de-energize equipment, in order to limit the extent of damage when operating conditions exceed equipment capabilities or stability limits”. Since these are fundamental functions of any protection system device, there is no need to include this in the NERC standard. R1.1.1 - Is AVR defined somewhere? We could not find its definition in the Glossary. **The GVSDT has replaced the term “AVR” with “automatic voltage regulator”.** General Comments - 1. Manitoba Hydro has a concern with respect to the phased in implementation measured by percent compliance. We believe that this may lead to a potential for some uncertainty and debate. Does a phased in implementation such as this, do anything to increase reliability?. **The GVSDT believes the phased implementation program allows Generator Owners to coordinate any settings changes to limiters or protection systems with planned generator outage activities. No changes made.** 2. The concept of equivalent unit testing should be applied to both synchronous condensers and generators. Equivalent units are addressed in Row 5 of MOD-027-1 Attachment 1, but it is not clear if this attachment applies to PRC-019. We would suggest that “Attachment 1” from MOD-027-1 be added to all of the standards included in this project.3. Attachment 1 of MOD-026-1 (Note 2) and M0D-027-1 (Note 3) contain a section titled “Consideration for early Compliance” with language pertaining to previous testing and model verification which were completed under the applicable regional policies, guidelines or criteria or which are compliant with the requirements of the standard. Manitoba Hydro recommends that similar language be included in the other standards (PRC-019-1, MOD-025-2 and PRC-024-1). **There are no "equivalent unit" criteria for this standard and the wording used in MOD-027-1 Attachment 1 does not apply to this standard.**
Response: The GVSDT thanks you for your comments. Please see specific responses above.	
PPL Corporation NERC	R1 appears to have been written with ever-evolving T&D systems in mind. It should be made clear

Organization	Question 3 Comment
Registered Affiliates	that all that would be needed every five years for a generation unit that has had no changes affecting the systems in question is an attestation to this effect, not a new coordination study, It should also be made clear that the in-service limiters referenced in R1 and R1.1.1 pertain where they exist. That is, it is not necessary to have a pre-Protection-System limiter for every relay listed in sect. G of PRC-019-1 (i.e. there is not a relay that stands behind every limiter). **The GVSDT agrees that there may not be a Protective Relay behind every Limiter, and Section G is for "Example" only. The GVSDT believes that the Generator Owner is responsible for, and should posses the calculations to perform (or review) the coordination outlined by this standard.** Section 1.1.2 should be struck - as this is covered under the direction of other standards such as EOP-003. **The GVSDT disagrees that EOP-003 (Load Shedding Plans) cover coordination of generator voltage regulator limiters, protection and generator capabilities. No change made.** The non-exclusive nature of the listing in section G is a concern regarding proof of compliance. This is, it would be burdensome to have to document a rationale for all relays and excitation system and voltage regulator functions for which a PRC-019-1 study is felt to not be required. The sect. G list should be complete and exclusive. **The GVSDT cannot possible anticipate all existing and present protective functions that Generator Owners may apply to their equipment. No change made.** The term “blackstart unit material” in applicability para. 4.2.4 (p.2) is not understood. We suggest that the SDT remove the term “blackstart unit material” or clarify when a blackstart unit designated as part of the Transmission Operator’s restoration plan would be immaterial. **The wording in the Applicability section is directly from NERC’s Statement of Registry Criteria. No change made.** Coordination studies are often performed by third-party contractors, with only the resultant relay settings being in a Generator’s possession. The calculations can be re-performed, but at substantial cost; and, excepting units that are critical to the BES, it is not clear that the required expenditure is justifiable. **Once the calculations are set up (in a spreadsheet, for example) reviewing, or recalculating with a new parameter, does not require significant effort. No change made.** PRC-019-1 should be made applicable to GOs only for Critical Assets, since damage to a generator outside this category would not imperil BES reliability. **Inadvertent tripping of any applicable generator could affect BES reliability. No change made.**

Organization	Question 3 Comment
Response: Thank you for your comments. See responses to specific comments above.	
Bonneville Power Administration	Regarding the "Functional Entities" listed in the Applicability Section, it is not clear how PRC-019 can only apply to TOs that own synchronous condensers because R1 & R2 require GOs to communicate with TOs regarding the generation equipment subject to the standard (units over 20 MVA, units connected at a common bus with total generation over 75 MVA, and blackstart units in the TOPs restoration plan). **The Applicability of TO's is only to those who own synchronous condensers because they have to evaluate the coordination of the protection on this equipment. No change made.** Regarding the "Facilities" listed in the Applicability section, BPA believes that Section 4.2.4 should apply to blackstart units designated as part of a TOP's restoration plan. The phrase "material to and designated as part of" the restoration plan creates ambiguity and would seem to require TOPs & GOs to agree on which generators are "material to" the blackstart plan. **The wording in the Applicability section is directly from NERC's Statement of Registry Criteria. No change made.** R2 is designated as a Long-Term Planning standard, but appears to allow coordination within 90 days following the implementation of setting changes. The phrase "Within 90 calendar days following the identification or implementation of systems, equipment or setting changes that will affect the coordination described in Requirement R1," is not clear. R1 requires coordination at least once every five years. R2 should require coordination before implementation of system, equipment, or setting changes, not within 90 days after. **The intent of the 90 days is to allow the coordination to be evaluated following discovery of a change in limiter or protection settings. The GVSDT anticipates that normally, the evaluation would occur prior to the change. No change made.**
Response: The GVSDT thanks you for your comment. See responses to specific comments above.	
Exelon Corporation and its affiliates	Section D, "Compliance," Part 1.2, "Evidence Retention," (page 4 of 11) first paragraph is unnecessary and redundant since the retention periods specified are for a six year time period which would be the maximum time between compliance audits for a registered entity. Exelon suggests that this paragraph be deleted in its entirety.

Organization	Question 3 Comment
Response: The GVSDT thanks you for your comment. The GVSDT appreciates your position but since a large majority of stakeholders has approved the standard as it is currently written the GVSDT chooses not to modify the wording at this time.	
SMUD	SMUD strongly suggests the SDT align the proposed PRC standard with NERC's current direction of migrating reliability standards to a Results Based Standards (RBS) and internal controls approach. This standard, along with all the other recent NERC PRC proposed standards, are vastly increasing the administrative effort by asking for more documentation of relay settings. For instance, in R1.1.2 - Is it really necessary to have a regulatory requirement for the GO to protect his own generator from damage? (Intentional Space.....)As an alternate approach, why not state that anytime a generator trips off by a protective function that must be set to coordinate with a limiter, the GO must demonstrate that the relay was set per this standard. That is, that the protective function did(emphasis added) coordinate with the limiters. If it is set correctly, there is no violation. If not, violation. This reduces the compliance burden significantly, but does not weaken the incentive to comply. Entities will want to ensure they set their relays per the standard because no one wants to cause an outage or get a violation. But no entity needs to spend time on pre-event, zero-defect, compliance documentation for all its units - only post event documentation is necessary for units that tripped. We feel this type of results based approach is a better choice for this standard.
Response: The GVSDT thanks you for your comment. Future revisions of the standard may be rewritten as RBS. The intent of the standard is to prevent inadvertent tripping due to miscoordination of limiters and protection. The GVSDT agrees that the owner would logically want to protect his own equipment, but this could lead to overprotection.	
Northeast Power Coordinating Council	Suggest the SDT specifically identify or show examples of how to match the percentage thresholds outlined in the Effective Date sections of the Standard and the associated Implementation Plans. Given recent experience with other Standards, it would be helpful for the SDT to establish how the entities can demonstrate meeting the requisite threshold percentages. Over time, we have observed that in some cases percentages were established by the number of devices or units; but in other cases, the measurement has been based upon magnitude of nameplate ratings.
Response: The GVSDT thanks you for your comment. The Effective Date section refers to percentage of "applicable Facilities". Since "Facility" is a defined term, and MVA is not included in the definition, the GVSDT believes the intent is clear. The GVSDT	

Organization	Question 3 Comment
would prefer to move this standard to recirculation ballot so that the reliability benefits of the standard are achieved sooner rather than make a substantive change that would require another successive ballot.	
New York Power Authority	This Standard does not bring added reliability for the Bulk Electric System; it only adds an administrative burden for the entities. NYPA in its current protection system relay settings process inherently takes into account a margin for a unit's in-service limiters as well as other typical performance parameters.
Response: The GVSDT thanks you for your comment. The GVSDT is operating under the belief that by approving the SAR for this project, industry feels there is a reliability need.	
Utility Services	Utility Services suggests the SDT specifically identify or show examples of how to match the percentage thresholds outlined in the Effective Date sections of the standard and the associated Implementation Plans. Given our recent experience in other standards, it would be helpful for the SDT to establish how the entities can demonstrate meeting the requisite threshold percentages. Over time, we have observed that in some cases, percentages were established by the number of devices or units; but in other cases, the measurement has been based upon magnitude of nameplate ratings.
Response: The GVSDT thanks you for your comment. The Effective Date section refers to percentage of "applicable Facilities". Since "Facility" is a defined term, and MVA is not included in the definition, the GVSDT believes the intent is clear. The GVSDT would prefer to move this standard to recirculation ballot so that the reliability benefits of the standard are achieved sooner rather than make a substantive change that would require another successive ballot.	
PSEG	We voted "Negative" on this standard the reasons shown below:This FIRST COMMENT was provided for MOD-025-1, MOD-026-1, MOD-027-1, and PRC-019-1.1.SYNCHRONOUS CONDENSERS: The GVSDT is not working as a "team" with regards to synchronous condensers owned by TOs. The team working on this standard and PRC-019-1 INSIST that they be included as "applicable facilities," while the team working on MOD-026-1 has stated otherwise. We provided this comment to the MOD-026-1 team in the last set of comments:"The exclusion of synchronous condensers (and other reactive devices) in MOD-026-1 per the rationale provided in the Background (with which we agree)

Organization	Question 3 Comment
	states “Synchronous condensers are not currently addressed in the NERC Registry Criteria” However, companion standards under Project 2007-09 (MOD-025-2 and PRC-019-1) are applicable to synchronous condensers. The GVSDT should address this inconsistency.”The SDT responded as follows:”The SDT believes that MOD-026 is different from the other standards with respect to synchronous condensers due to the complex interaction required between the Transmission Planner and the Generator Owner, and thus believes it better to wait for efforts by others to define where synchronous condensers fit in the functional model.”In response to a similar comment on MOD-025-2 and PRC-019-1, we received these responses:MOD-025-1: “The GVSDT thanks you for your comment. There was overwhelming industry support (approximately 96%) for inclusion of synchronous condensers at the first posting of MOD-025-2. The Definition of Bulk Electric System (BOT Adoption Jan 2012) includes in “I5 - Static or dynamic devices (excluding generators) dedicated to supplying or absorbing Reactive Power that are connected at 100 kV or higher, or through a dedicated transformer with a high-side voltage of 100 kV or higher, or through a transformer that is designated in Inclusion I2.”PRC-019-1: “The SDT feels that it is appropriate to include synchronous condensers because of their similarity to generators in terms of dynamic reactive power supply, voltage control, disturbance response, control functions, and protection systems. For this reason the SDT proposes to apply to the standard to similar size generators and synchronous condensers.”We need to see “one” statement from the SDT on the inclusion or exclusion of synchronous condensers that makes sense technically, and soon.2.No reliability benefit has been demonstrated for having the coordination review required by R1 done every five years. We suggest that the R1 be modified so that it’s clear that the entities must “verify” coordination upon the effective date ONLY, but not every 5 years thereafter. The effective date Section 5, part 5.1.1 states “By the first day of the first calendar quarter, two calendar years following applicable regulatory approval each Generator Owner and Transmission Owner shall have verified at least 40 percent of its applicable Facilities.” Therefore, we suggest that R1 be rewritten as follows:”BY ITS EFFECTIVE DATE IN SECTION 5, each Generator Owner and Transmission Owner with applicable Facilities shall VERIFY the COORDINATION OF the voltage regulating system controls, (including in-service limiters and protection functions) with the applicable equipment capabilities and settings of the applicable Protection System devices and functions.”

Response: The GVSDT thanks you for your comment. The verification of coordination required by this standard is closely tied to

Organization	Question 3 Comment
MOD-025 because the reactive capability verification is when miscoordination is more likely to manifest itself. MOD-026, and the other standards in the GV project are not directly linked to PRC-019 and thus have different Applicability and Implementation requirements. The requirement for a five year review is to verify that the limiter settings, protection settings, and machine capabilities have not changed since the last coordination study. If these have not changed, then the study is still valid and documentation that the settings and capabilities have not changed is sufficient.	
Southwest Power Pool Reliability Standards Development Team	We would suggest a revision to R2 to remove following after the 90 days and simply leave it within 90 calendar days of identification or implementation. We would like to know before not after.
Response: The GVSDT thanks you for your comment. There is no communication requirement in R2. Presumably, for a planned change, the owner would review the coordination prior to implementing the change. The GVSDT does not feel the present wording creates a reliability gap.	
Omaha Public Power District	We would suggest a revision to R2 to remove following after the 90 days and simply leave it within 90 calendar days of identification or implementation. We would like to know before not after.
Response: The GVSDT thanks you for your comment. There is no communication requirement in R2. Presumably, for a planned change, the owner would review the coordination prior to implementing the change. The GVSDT does not feel the present wording creates a reliability gap.	

END OF REPORT

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. SAR posted for comment (April 20–May 21, 2007).
2. Revised SAR and response to comments posted (July 5, 2007).
3. Revised SAR and response to comments approved by SC (June 14, 2007).
4. SDT appointed on August 18, 2007.
5. Draft 1 MOD-026-1 was posted for a 45-day comment period from February 17 – April 2, 2009.
6. Draft 2 MOD-026-1 was posted for a 45-day concurrent comment and ballot period from June 15 – August 1, 2011.
7. Draft 3 of MOD-026-1 was posted for a 30-day concurrent comment and successive ballot period from February 29 – March 29, 2012.

Proposed Action Plan and Description of Current Draft:

This is the fourth draft of the standard and includes Time Horizons, Data Retention, Violation Risk Factors, and Violation Severity Levels. This fourth posting is for a 30-day comment and successive ballot period.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Develop responses to comments and develop fourth version of draft standard.	April– July 2012
2. Post response to comments and fourth version draft revision of standard for 30-day comment and successive ballot period.	October – November 2012
3. Develop responses to successive ballot comments.	December 2012 - January 2013
4. Post response to comments and conduct recirculation ballot.	February 2013
5. BOT adoption.	March 2012
7. File with regulatory authorities.	April 2013

A. **Introduction**

1. **Title:** Verification of Models and Data for Generator Excitation Control System or Plant Volt/Var Control Functions

2. **Number:** MOD-026-1

3. **Purpose:** To verify that the generator excitation control system or plant volt/var control function[1] model (including the power system stabilizer model and the impedance compensator model) and the model parameters used in dynamic simulations accurately represent the generator excitation control system or plant volt/var control function behavior when assessing Bulk Electric System (BES) reliability.

4. **Applicability:**

4.1. Functional Entities:

4.1.1 Generator Owner

4.1.2 Transmission Planner

4.2. Facilities:

For the purpose of the requirements contained herein, Facilities that are directly connected to the Bulk Electric System (BES) will be collectively referred as an "applicable unit" that meet the following:

4.2.1 Generation in the Eastern or Quebec Interconnections with the following characteristics:

4.2.1.1 Individual generating unit greater than 100 MVA (gross nameplate rating).

4.2.1.2 Individual generating plant consisting of multiple generating units that are directly connected at a common BES bus with total generation greater than 100 MVA (gross aggregate nameplate rating).

4.2.2 Generation in the Western Interconnection with the following characteristics:

4.2.2.1 Individual generating unit greater than 75 MVA (gross nameplate rating).

4.2.2.2 Individual generating plant consisting of multiple generating units that are directly connected at a common BES bus with total generation greater than 75 MVA (gross aggregate nameplate rating).

---

[1] Excitation control system or plant volt/var control function:

a. For individual synchronous machines, the generator excitation control system includes the generator, exciter, voltage regulator and power system stabilizer.

b. For an aggregate generating plant, the volt/var control system includes the voltage regulator & reactive power control system controlling and coordinating plant voltage and associated reactive capable resources.

4.2.3 Generation in the ERCOT Interconnection with the following characteristics:

4.2.3.1 Individual generating unit greater than 50 MVA (gross nameplate rating).

4.2.3.2 Individual generating plant consisting of multiple generating units that are directly connected at a common BES bus with total generation greater than 75 MVA (gross aggregate nameplate rating).

4.2.4 For all Interconnections:

- A technically justified[2] unit that meets NERC registry criteria and is requested by the Transmission Planner.

5. Effective Date:

5.1. For Requirements R1, and R3 through R6, the first day of the first calendar quarter beyond the date that this standard is approved by applicable regulatory authorities. In those jurisdictions where regulatory approval is not required, the standard shall become effective on the first day of the first calendar quarter beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

5.2. For Requirement R2, 30 percent of the entity’s applicable unit gross MVA for each Interconnection on the first day of the first calendar quarter that is four years following applicable regulatory approval, or in those jurisdictions where no regulatory approval is required, on the first day of the first calendar quarter that is four years following NERC Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

5.3. For Requirement R2, 50 percent of the entity’s applicable unit gross MVA for each Interconnection on first day of the first calendar quarter that is six years following applicable regulatory approval, or in those jurisdictions where no regulatory approval is required, on the first day of the first calendar quarter thirty that is six years following NERC Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

5.4. For Requirement R2, 100 percent of the entity’s applicable unit gross MVA for each Interconnection on the first day of the first calendar quarter that is 10 years following applicable regulatory approval, or in those jurisdictions where no regulatory approval is required, on the first day of the first calendar quarter that is 10 years following NERC Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

---

[2] Technical justification is achieved by the Transmission Planner demonstrating that the simulated unit or plant response does not match the measured unit or plant response.

B. Requirements

R1. Each Transmission Planner shall provide one or more of the following to its requesting Generator Owner within 90 calendar days of receiving a written request : *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

- Instructions on how to obtain the list of excitation control system or plant volt/var control function models that are acceptable to the Transmission Planner for use in dynamic simulation,
- Instructions on how to obtain the dynamic excitation control system or plant volt/var control function model library block diagrams and/or data sheets for models that are acceptable to the Transmission Planner, or
- Model data for any of the Generator Owner's existing applicable unit specific excitation control system or plant volt/var control function contained in the Transmission Planner's dynamic database from the current (in-use) models, including generator MVA base.

R2. Each Generator Owner shall provide for each applicable unit, a verified generator excitation control system or plant volt/var control function model, including documentation and data (as specified in Part 2.1) to its Transmission Planner in accordance with the periodicity specified in MOD-026 Attachment 1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

2.1. Each applicable unit's model shall be verified by the Generator Owner using one or more models acceptable to the Transmission Planner. Verification of an individual unit less than 20 MVA (gross nameplate rating) may be performed using either individual unit or plant aggregate model(s), or both. Each verification shall include the following:

2.1.1. Documentation demonstrating the applicable unit's model response matches the recorded response for a voltage excursion from either a staged test or a measured system disturbance,

2.1.2. Manufacturer, model number (if available), and type of excitation control system or plant volt/var control function installed including, but not limited to static, AC brushless, DC rotating, and volt/var function,

2.1.3. Model structure and data including, but not limited to reactance, time constants, saturation factors, total rotational inertia, or equivalent data for the generator,

2.1.4. Model structure and data for the excitation control system, including the closed loop voltage regulator if a closed loop voltage regulator is installed or the model structure and data for the plant volt/var control function system,

2.1.5. Compensation settings (such as droop, line drop, differential compensation), if used, and

2.1.6. Model structure and data for power system stabilizer, if so equipped.

R3. Each Generator Owner shall provide a written response to its Transmission Planner within 90 calendar days of receiving one of the following items for an applicable unit:

- Written notification from its Transmission Planner (in accordance with Requirement R6) that the excitation control system or plant volt/var control function model is not usable,
- Written comments from its Transmission Planner identifying technical concerns with the verification documentation related to the excitation control system or plant volt/var control function model, or
- Written comments and supporting evidence from its Transmission Planner indicating that the simulated excitation control system or plant volt/var control function model response did not match the recorded response to a transmission system event.

The written response shall contain either the technical basis for maintaining the current model, the model changes, or a plan to perform model verification[3] (in accordance with Requirement R2). *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

R4. Each Generator Owner shall provide revised model data or plans to perform model verification[3] (in accordance with Requirement R2) for an applicable unit to its Transmission Planner within 180 calendar days of making changes to the excitation control system or plant volt/var control function that alter the equipment response[4] characteristic.[5] *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

R5. Each Generator Owner shall provide a written response to its Transmission Planner, within 90 calendar days following receipt of a technically justified[6] unit request from the Transmission Planner to perform a model review of a unit or plant that includes one of the following: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

- Details of plans to verify the model (in accordance with Requirement R2), or

---

[3] If verification is performed, the 10-year period as outlined in MOD-026 Attachment 1 is reset.

[4] Ibid.

[5] Exciter, voltage regulator, plant volt/var or power system stabilizer control replacement including software alterations that alter excitation control system equipment response, plant digital control system addition or replacement, plant digital control system software alterations that alter excitation control system equipment response, plant volt/var function equipment addition or replacement (such as static var systems, capacitor banks, individual unit excitation systems, etc), a change in the voltage control mode (such as going from power factor control to automatic voltage control, etc), exciter, voltage regulator, impedance compensator, or power system stabilizer settings change. Automatic changes in settings that occur due to changes in operating mode do not apply to Requirement R4.

[6] Technical justification is achieved by the Transmission Planner demonstrating that the simulated unit or plant response does not match the measured unit or plant response.

- Corrected model data including the source of revised model data such as discovery of manufacturer test values to replace generic model data or updating of data parameters based on an on-site review of the equipment.

R6. Each Transmission Planner shall notify the Generator Owner within 90 calendar days of receiving the verified excitation control system or plant volt/var control function model information in accordance with Requirement R2 that the model is usable (meets the criteria specified in Parts 6.1 through 6.3) or is not usable, and shall include a technical description if the model is not usable that includes the following: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

6.1. The excitation control system or plant volt/var control function model initializes to compute modeling data without error,

6.2. A no-disturbance simulation results in negligible transients, and

6.3. For an otherwise stable simulation, a disturbance simulation results in the excitation control and plant volt/var control function model exhibiting positive damping.

C. Measures

M1. The Transmission Planner must have and provide the dated request for instructions or data, the transmitted instructions or data, and dated evidence of a written transmittal (e.g., electronic mail message, postal receipt, or confirmation of facsimile) as evidence that it provided the request within 90 calendar days in accordance with Requirement R1.

M2. The Generator Owner must have and provide dated evidence it verified each generator excitation control system or plant volt/var control function model according to Part 2.1 for each applicable unit and a dated transmittal (e.g., electronic mail message, postal receipt, or confirmation of facsimile) as evidence it provided the model, documentation, and data to its Transmission Planner, in accordance with Requirement R2.

M3. Evidence for Requirement R3 must include the Generator Owner's dated written response containing the information identified in Requirement R3 and dated evidence of transmittal (e.g., electronic mail message, postal receipt, or confirmation of facsimile) of the response.

M4. Evidence for Requirement R4 must include, for each of the Generator Owner's applicable units for which system changes specified in Requirement R4 were made, a dated revised model data or plans to perform a model verification and dated evidence (e.g., electronic mail message, postal receipt, or confirmation of facsimile) it provided the revised model and data or plans within 180 calendar days of making changes.

M5. Evidence for Requirement R5 must include the Generator Owner's dated written response containing the information identified in Requirement R5 and dated evidence (e.g., electronic mail message, postal receipt, or confirmation of facsimile) it provided a written response within 90 calendar days following receipt of a technically justified request.

M6. Evidence of Requirement R6 must include, for each model received, the dated response indicating the model was usable or not usable according to the criteria specified in Parts 6.1 through 6.3 and for a model that is not usable, a technical description; and dated evidence of transmittal (e.g., electronic mail message, postal receipt, or confirmation of facsimile) that the Generator Owner was notified within 90 calendar days of receipt of model information.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

The Regional Entity shall serve as the Compliance Enforcement Authority unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional entity approved by FERC or other applicable governmental authority shall serve as the CEA.

1.2. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Generator Owner and Transmission Planner shall each keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Transmission Planner shall retain the information/data request and provided response evidence of Requirements R1 and R6, Measures M1 and M6 for three calendar years from the date the document was provided.
- The Generator Owner shall retain the latest excitation control system or plant volt/var control function model verification evidence of Requirement R2, Measure M2.
- The Generator Owner shall retain the information/data request and provided response evidence of Requirements R3 through R5, and Measures M3 through M5 for three calendar years from the date the document was provided.

If a Generator Owner or Transmission Planner is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete or approved or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaints

1.4. Additional Compliance Information

None

2. Violation Severity Levels

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The Transmission Planner provided the instructions and data to the Generator Owner more than 90 calendar days but less than or equal to 120 calendar days of receiving a written request.	The Transmission Planner provided the instructions and data to the Generator Owner more than 120 calendar days but less than or equal to 150 calendar days of receiving a written request.	The Transmission Planner provided the instructions and data to the Generator Owner more than 150 calendar days but less than or equal to 180 calendar days of receiving a written request.	The Transmission Planner failed to provide the instructions and data to the Generator Owner within 180 calendar days of receiving a written request.
R2	The Generator Owner provided its verified model(s), including documentation and data to its Transmission Planner after the timeframe specified in MOD-026 Attachment 1 but less than or equal to 90 calendar days late; OR The Generator Owner provided the Transmission Planner verified models that omitted one of the six Parts identified in Requirement R2, Parts 2.1.1 through 2.1.6.	The Generator Owner provided its verified model(s), including documentation and data to its Transmission Planner more than 90 calendar days but less than or equal to 180 calendar days late as specified by the periodicity timeframe in MOD-026 Attachment 1. OR The Generator Owner provided the Transmission Planner verified models that omitted two of the six Parts identified in Requirement R2, Parts 2.1.1 through 2.1.6.	The Generator Owner provided its verified model(s), including documentation and data to its Transmission Planner more than 180 calendar days but less than or equal to 270 calendar days late as specified by the periodicity timeframe in MOD-026 Attachment 1. OR The Generator Owner provided the Transmission Planner verified models that omitted three of the six Parts identified in Requirement R2, Parts 2.1.1 through 2.1.6.	The Generator Owner provided its verified model(s), including documentation and data more than 270 calendar days late to its Transmission Planner in accordance with the periodicity specified in MOD-026 Attachment 1. OR The Generator Owner failed to use model(s) acceptable to the Transmission Planner as specified in Requirement R2, Part 2.1. OR The Generator Owner provided the Transmission Planner verified model(s) but omitted four or more of the six parts identified in Requirement R2, Subparts 2.1.1 through 2.1.6.

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL
R3	The Generator Owner provided a written response more than 90 calendar days but less than or equal to 120 calendar days of receiving written notice.	The Generator Owner provided a written response more than 120 calendar days but less than or equal to 150 calendar days of receiving written notice.	The Generator Owner provided a written response more than 150 calendar days but less than or equal to 180 calendar days of receiving written notice.	The Generator Owner failed to provide a written response within 180 calendar days of receiving written notice. OR The Generator Owner's written response failed to contain either the technical basis for maintaining the current model, or a list of future model changes, or a plan to perform another model verification.
R4	The Generator Owner provided revised model data or plans to perform model verification more than 180 calendar days but less than or equal to 210 calendar days of making changes to the excitation control system or plant volt/var control function that altered the equipment response characteristic.	The Generator Owner provided revised model data or plans to perform model verification more than 210 calendar days but less than or equal to 240 calendar days of making changes to the excitation control system or plant volt/var control function that altered the equipment response characteristic.	The Generator Owner provided revised model data or plans to perform model verification more than 240 calendar days but less than or equal to 270 calendar days of making changes to the excitation control system or plant volt/var control function that altered the equipment response characteristic.	The Generator Owner failed to provide revised model data or failed to provide plans to perform model verification within 270 calendar days of making changes to the excitation control system or plant volt/var control function that altered the equipment response characteristic.
R5	The Generator Owner provided a written response more than 90 calendar days but less than or equal to 120 calendar days to the Transmission Planner following receipt of a technically justified request to perform a model review of an applicable unit.	The Generator Owner provided a written response more than 120 calendar days but less than or equal to 150 calendar days to the Transmission Planner following receipt of a technically justified request to perform a model review of an applicable unit.	The Generator Owner provided a written response more than 150 calendar days but less than or equal to 180 calendar days to the Transmission Planner following receipt of a technically justified request to perform a model review of an applicable unit.	The Generator Owner failed to provide a written response to the Transmission Planner within 180 calendar days following receipt of a technically justified request to perform a model review of an applicable unit. OR The Generator Owner’s written response failed to include one of the sub bullets of Requirement R5

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL
R6	The Transmission Planner provided a written response to the Generator Owner indicating whether the model is usable or not usable; including a technical description if the model is not usable, more than 90 calendar days but less than or equal to 120 calendar days of receiving verified model information.	The Transmission Planner provided a written response to the Generator Owner indicating whether the model is usable or not usable; including a technical description if the model is not usable, more than 120 calendar days but less than or equal to 150 calendar days of receiving the verified model information. OR The Transmission Planner's written response omitted confirmation for one of the specified model criteria listed in Requirement R6, Parts 6.1 through 6.3.	The Transmission Planner provided a written response to the Generator Owner indicating whether the model is usable or not usable; including a technical description if the model is not usable, more than 150 calendar days but less than or equal to 180 calendar days of receiving the verified model information. OR The Transmission Planner's written response omitted confirmation for two of the specified model criteria listed in Requirement R6, Parts 6.1 through 6.3.	The Transmission Planner failed to provide a written response to the Generator Owner within 180 calendar days of receiving the verified model information. OR The Transmission Planner's written response omitted confirmation for all specified model criteria listed in Requirement R6, Parts 6.1 through 6.3.

MOD-026 Attachment 1

Excitation Control System or Plant Volt/Var Function Model Verification Periodicity

Row Number	Verification Condition	Required Action
1	Establishing the initial verification date for an applicable unit. (Requirement R2)	Transmit the verified model, documentation and data to the Transmission Planner on or before the Effective Date. Row 4 applies when calculating generation fleet compliance during the 10-year implementation period. See Section A5 for Effective Dates.
2	Subsequent verification for an applicable unit. (Requirement R2)	Transmit the verified model, documentation and data to the Transmission Planner on or before the 10-year anniversary of the last transmittal (per Note 1).
3	Initial verification for a new applicable unit or for an existing applicable unit with new excitation control system or plant volt/var control function equipment installed. (Requirement R2)	Transmit the verified model, documentation and data to the Transmission Planner within 365 calendar days after the commissioning date.

MOD-026 Attachment 1

Excitation Control System or Plant Volt/Var Function Model Verification Periodicity

Row Number	Verification Condition	Required Action
4	Existing applicable unit that is equivalent to another unit(s) at the same physical location. AND Each applicable unit has the same MVA nameplate rating. AND The nameplate rating is ≤ 350 MVA. AND Each applicable unit has the same components and settings. AND The model for one of these equivalent applicable units has been verified. (Requirement R2)	Document circumstance with a written statement and include with the verified model, documentation and data provided to the Transmission Planner for the verified equivalent unit. Verify a different equivalent unit during each 10-year verification period. Applies to Row 1 when calculating generation fleet compliance during the 10-year implementation period.
5	The Generator Owner has submitted a verification plan. (Requirement R3, R4 or R5)	Transmit the verified model, documentation and data to the Transmission Planner within 365 calendar days after the submittal of the verification plan.

MOD-026 Attachment 1

Excitation Control System or Plant Volt/Var Function Model Verification Periodicity

Row Number	Verification Condition	Required Action
6	New or existing applicable unit does not include an active closed loop voltage or reactive power control function. (Requirement R2)	Requirement 2 is met with a written statement to that effect transmitted to the Transmission Planner. Perform verification per the periodicity specified in Row 3 for a "New Generating Unit" (or new equipment) only if active closed loop function is established. See Footnote 1 (see Section A.3) for clarification of what constitutes an active closed loop function for both conventional synchronous machines (reference Footnote 1a) and aggregate generating plants (reference Footnote 1b).
7	Existing applicable unit has a current average net capacity factor over the most recent three calendar years, beginning on January 1 and ending on December 31 of 5% or less. (Requirement R2)	Requirement 2 is met with a written statement to that effect transmitted to the Transmission Planner. At the end of this 10-year timeframe, the current average three year net capacity factor (for years 8, 9, and 10) can be examined to determine if the capacity factor exemption can be declared for the next 10-year period. If not eligible for the capacity factor exemption, then model verification must be completed within 365 calendar days of the date the capacity factor exemption expired. For the definition of net capacity factor, refer to Appendix F of the GADS Data Reporting Instructions on the NERC website.

MOD-026 Attachment 1 Excitation Control System or Plant Volt/Var Function Model Verification Periodicity		
Row Number	**Verification Condition**	**Required Action**

NOTES:

NOTE 1: Establishing the recurring 10-year unit verification period start date:

The start date is the actual date of submittal of a verified model to the Transmission Planner for the most recently performed unit verification.

NOTE 2: Consideration for early compliance:

Existing generator excitation control system or plant volt/var control function model verification is sufficient for demonstrating compliance for a 10-year period from the actual transmittal date if either of the following applies:

- The Generator Owner has a verified model that is compliant with the applicable regional policies, guidelines or criteria existing at the time of model verification.
- The Generator Owner has an existing verified model that is compliant with the requirements of this standard.

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. SAR posted for comment (April 20–May 21, 2007).
2. Revised SAR and response to comments posted~~.~~ (July 5, 2007).
3. Revised SAR and response to comments approved by SC (June 14, 2007).
4. SDT appointed on ~~(~~August 18, 2007~~).~~ .
5. Draft 1 MOD-026-1 was posted for a 45-day comment period from February 17 – April 2, 2009.
6. Draft 2 MOD-026-1 was posted for a 45-day concurrent comment and ballot period from June 15 – August 1, 2011.
7. Draft 3 of MOD-026-1 was posted for a 30-day concurrent comment and successive ballot period from February 29 – March 29, 2012.

Proposed Action Plan and Description of Current Draft:

This is the ~~third~~fourth draft of the standard and includes Time Horizons, Data Retention, Violation Risk Factors, and Violation Severity Levels. This ~~second~~fourth posting is for a 30-day comment and successive ballot period.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Develop responses to comments and develop ~~third~~fourth version of draft standard.	~~August 2011 – February~~April– July~~ne~~ 2012
2. Post response to comments and ~~third~~fourth version draft revision of standard for 30-day comment and successive ballot period.	~~February – March~~October – November 2012
3. Develop responses to successive ballot comments.	~~April – May~~December 2012 - January 201~~2~~3
4. Post response to comments and conduct recirculation ballot.	~~June~~February -201~~2~~3
~~5. Conduct recirculation ballot.~~	~~June2012October 2012~~
~~7~~5~~6~~. BOT adoption.	~~July~~March 201~~2~~2
~~8~~7. File with regulatory authorities.	April 2013~~September~~

	~~2012~~

A. **Introduction**

1. **Title:** Verification of Models and Data for Generator Excitation Control System ~~and~~or Plant Volt/Var Control Functions

2. **Number:** MOD-026-1

3. **Purpose:** To verify that the generator excitation control system ~~and~~or plant volt/var control~~[1]~~ function[2] model (including the power system stabilizer model and the impedance compensator model) and the model parameters used in dynamic simulations accurately represent the generator excitation control system ~~and~~or plant volt/var control function behavior when assessing Bulk Electric System (BES) reliability.

4. **Applicability:**

4.1. Functional Entities:

4.1.1 Generator Owner

4.1.2 Transmission Planner

4.2. Facilities:

For the purpose of ~~this standard,~~ the ~~following~~requirements contained herein, Facilities that are ~~considered,~~ directly connected to the Bulk Electric System (BES) will be collectively referred as an "applicable ~~units[3].~~"

~~Units or plants with an average capacity factor[4] greater than 5 percent over the most recent three calendar years, beginning on January 1 and ending on December 31,~~unit" that meet the following:

~~[1] Excitation control system and plant volt/var control function:~~

~~a. For individual synchronous machines, the generator excitation control system includes the generator, exciter, voltage regulator and power system stabilizer.~~

~~b. For an aggregate generating plant, the volt/var control system includes the voltage regulator & reactive power control system controlling and coordinating plant voltage and associated reactive capable resources.~~

[2] Excitation control system or plant volt/var control function:

a. For individual synchronous machines, the generator excitation control system includes the generator, exciter, voltage regulator and power system stabilizer.

b. For an aggregate generating plant, the volt/var control system includes the voltage regulator & reactive power control system controlling and coordinating plant voltage and associated reactive capable resources.

~~[3] Applicable generating units do not include startup or standby units not normally connected to the grid.~~

~~[4] Once a capacity factor exemption is declared by notifying the Transmission Planner, verification is not required for 10 calendar years from the date eligibility occurs. At the end of this 10 calendar year timeframe, the current average 3 year capacity factor (for years 8, 9, and 10) is examined to determine if the capacity factor exemption can be declared for the next 10 calendar year period. If not eligible for the capacity factor exemption, then model verification must be completed within one year of the date the capacity factor exemption expired with the 10 calendar year periodicity requirement reset based on the verification date. For the definition of capacity factor, refer to Appendix F of the GADS Data Reporting Instructions on the NERC website.~~

4.2.1 ~~Generating units connected to~~Generation in the Eastern or Quebec Interconnections with the following characteristics:

4.2.1.1 Individual generating unit greater than 100 MVA (gross nameplate rating~~) directly connected to the bulk power system.~~).

~~**4.2.1.2** For each~~Individual generating plant ~~/ Facility~~ consisting of ~~one or more~~ multiple generating units that are directly connected ~~to the bulk power system~~ at a common BES bus with total generation greater than 100 MVA (gross aggregate ~~rating):~~

~~**4.2.1.3**~~**4.2.1.2** ~~Each individual generating unit greater than 20 MVA (gross~~ nameplate rating~~); and~~).

- ~~Each generating plant / Facility comprised consisting of individual generating units less than 20 MVA (gross nameplate ratings)~~

4.2.2 ~~Generating units connected to~~Generation in the Western Interconnection with the following characteristics:

4.2.2.1 Individual generating unit greater than 75 MVA (gross nameplate rating~~) directly connected to the bulk power system.~~).

~~**4.2.2.2** For each~~Individual generating plant ~~/ Facility~~ consisting of ~~one or more~~ multiple generating units that are directly connected ~~to the bulk power system~~ at a common BES bus with total generation greater than 75 MVA (gross aggregate ~~rating):~~

~~**4.2.2.3**~~**4.2.2.2** ~~Each individual generating unit greater than 20 MVA (gross~~ nameplate rating~~); and~~).

- ~~Each generating plant / Facility comprised consisting of individual generating units less than 20 MVA (gross nameplate ratings)~~

4.2.3 ~~Generating units connected to~~Generation in the ERCOT Interconnection with the following characteristics:

4.2.3.1 Individual generating unit greater than 50 MVA (gross nameplate rating~~) directly connected to the bulk power system.~~).

4.2.3.2 ~~For each~~Individual generating plant ~~/ Facility~~ consisting of ~~one or more~~multiple generating units that are directly connected ~~to the bulk power system~~ at a common BES bus with total generation greater than 75 MVA (gross aggregate nameplate rating~~):~~).

- ~~Each individual generating unit greater than 20 MVA (gross nameplate rating); and~~
- ~~Each generating plant / Facility comprised consisting of individual generating units less than 20 MVA (gross nameplate ratings)~~

4.2.4 For all Interconnections:

- ~~Any registered~~A technically justified[5] unit that meets NERC registry criteria and is requested by the ~~Planning Coordinator~~Transmission Planner.

5. Effective Date:

~~**5.1.** In those jurisdictions where regulatory approval is required:~~

~~**5.1.1** Each responsible entity shall ensure compliance with~~For Requirements R1, and R3 through R6 ~~by~~, the first day of the first calendar quarter~~, four years following~~ beyond the date that this standard is approved by applicable regulatory ~~approval.~~

5.1. ~~Each Generator Owner shall ensure at least 30 percent of its applicable units per Interconnection on an MVA basis are compliant with Requirement R2 by the first day of~~authorities. In those jurisdictions where regulatory approval is not required, the ~~first calendar quarter,~~standard shall become effective on the first day of the first calendar quarter beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

~~**5.1.2**~~ For Requirement R2, 30 percent of the entity's applicable unit gross MVA for each Interconnection on the first day of the first calendar quarter that is four years following applicable regulatory approval~~.~~

~~**5.1.3** Each Generator Owner shall ensure at least 50 percent of its applicable units per Interconnection on an MVA basis are compliant with Requirement R2 by the first day of the first calendar quarter, six years following applicable regulatory approval:~~

5.2. ~~Each Generator Owner shall ensure 100 percent of its applicable units are compliant with Requirement R2 by~~, or in those jurisdictions where no regulatory approval is required, on the first day of the first calendar quarter~~, ten~~ that is four years following NERC Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable ~~regulatory approval:~~to such ERO governmental authorities.

~~**5.3.** In~~For Requirement R2, 50 percent of the entity's applicable unit gross MVA for each Interconnection on first day of the first calendar quarter that is six years following applicable regulatory approval, or in those jurisdictions where no regulatory approval is required~~:~~

~~**5.3.1** Each responsible entity shall ensure compliance with Requirements R1, and R3 through R6 by the first day of the first calendar quarter, four years following Board of Trustees adoption.~~

~~**5.4.**~~**5.3.** ~~Each Generator Owner shall ensure at least 30 percent of its applicable units per Interconnection on an MVA basis are compliant with Requirement R2~~

[5] Technical justification is achieved by the Transmission Planner demonstrating that the simulated unit or plant response does not match the measured unit or plant response.

~~by~~, on the first day of the first calendar quarter~~, four~~ thirty that is six years following NERC Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

~~5.4.1 Each Generator Owner shall ensure at least 50~~For Requirement R2, 100 percent of ~~its~~the entity's applicable ~~units per Interconnection on an MVA basis are compliant with Requirement R2 by~~unit gross MVA for each Interconnection on the first day of the first calendar quarter that is 10 years following applicable regulatory approval, or in those jurisdictions where no regulatory approval is required, on the first day of the first calendar quarter~~, six~~ that is 10 years following NERC Board of Trustees adoption~~.~~

~~5.5.~~5.4. ~~Each Generator Owner shall ensure 100 percent of its applicable units are compliant with Requirement R2 by the first day of the first calendar quarter, ten years following Board of Trustees adoption~~ or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

B. Requirements

R1. Each Transmission Planner shall provide one or more of the following ~~instructions and model data~~ to its requesting Generator Owner within 90 calendar days of receiving a written request ~~for those instructions or model data:~~: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning~~]~~:]*

- Instructions on how to obtain the list of excitation control system ~~and~~or plant volt/var control function models that are acceptable to the Transmission Planner for use in dynamic simulation~~.~~,
- Instructions on how to obtain the ~~Transmission Planner's software manufacturer's~~ dynamic excitation control system ~~and~~or plant volt/var control function model library block diagrams and/or data sheets~~.~~ for models that are acceptable to the Transmission Planner, or
- Model data for any of the Generator Owner's existing applicable unit ~~or plant~~ specific excitation control system ~~and~~or plant volt/var control function contained in the Transmission Planner's dynamic database from the current (in-use) models, including generator MVA base.

R2. Each Generator Owner shall provide~~,~~ for each ~~of its~~ applicable unit~~s~~, a verified generator excitation control system ~~and~~or plant volt/var control function model, including documentation and data (as specified in Part~~s~~ 2.1~~ and 2.2~~) to its Transmission Planner in accordance with the periodicity specified in MOD-026 Attachment 1~~, to ensure modeling data is accurate for use in simulation software.~~. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

2.1. ~~Perform verifications~~Each applicable unit's model shall be verified by the Generator Owner using one or more models acceptable to the Transmission Planner~~ that~~. Verification of an individual unit less than 20 MVA (gross nameplate rating) may be performed using either individual unit or plant aggregate model(s), or both. Each verification shall include~~(s)~~ the following ~~information~~:

2.1.1. Documentation demonstrating the applicable unit's model response matches the recorded response for a voltage excursion ~~at the applicable unit's point of interconnection~~ from either a staged test or a measured system disturbance~~.~~,

2.1.2. Manufacturer, model number (if available), and type of excitation control system ~~and~~or plant volt/var control function installed ~~(such as~~including, but not limited to static, AC brushless, DC rotating, and volt/var function~~).~~,

2.1.3. Model structure and data ~~(such as~~including, but not limited to reactance, time constants, saturation factors, total rotational inertia, or equivalent data~~)~~ for the generator~~ (or plant equivalent).~~,

2.1.4. Model structure and data for the excitation control system, ~~for the plant volt/var function, and for~~including the closed loop voltage regulator if ~~the~~a closed loop voltage regulator is installed~~.~~ or the model structure and data for the plant volt/var control function system,

2.1.5. Compensation settings (such as droop, line drop, differential compensation), if used~~.~~, and

2.1.6. Model structure and data for power system stabilizer, if so equipped.

~~**2.2.** For plants that are comprised of units that have a gross nameplate rating of less than 20 MVA, each Generator Owner shall perform its verification using plant aggregate model(s) that include the information required by Requirement sub-parts 2.1.1 through 2.1.6~~

R3. Each Generator Owner shall provide a written response to its Transmission Planner within 90 calendar days of receiving one of the following items~~. The written response shall contain either the technical basis for maintaining the current model, or the model changes, or a plan to perform model verification[6] (in accordance with Requirement R2)~~ ~~*[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*:~~ for an applicable unit:

- Written notification from its Transmission Planner (in accordance with Requirement R6) that the excitation control system ~~and~~or plant volt/var control function model is not ~~"~~usable~~," or~~,
- Written comments from its Transmission Planner identifying technical concerns with the verification documentation related to the excitation control system ~~and~~or plant volt/var control function model, or

[6] ~~If verification is performed, the 10 year period as outlined in Attachment 1 is reset.~~

- Written comments and supporting evidence from its Transmission Planner indicating that the ~~predicted~~simulated excitation control system ~~and~~or plant volt/var control function model response did not match the recorded response to a transmission system event.

The written response shall contain either the technical basis for maintaining the current model, the model changes, or a plan to perform model verification[7] (in accordance with Requirement R2). *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

R4. Each Generator Owner shall provide revised model data or plans to perform model verification[7] (in accordance with Requirement R2) for an applicable unit to its Transmission Planner within 180 calendar days of making changes to the excitation control system ~~and~~or plant volt/var control function that alter the equipment response[8] characteristic.[9] *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

R5. Each Generator Owner shall provide a written response to its ~~Planning Coordinator~~Transmission Planner, within 90 calendar days following receipt of a technically justified[10] unit request from the ~~Planning Coordinator~~Transmission Planner to perform a model review of ~~any~~a unit~~/~~ or plant ~~not included in the Applicability~~ that includes one of the following: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning~~]:~~]*

- Details of plans to verify the model (in accordance with Requirement R2~~)~~), or
- Corrected model data including the source of revised model data such as discovery of manufacturer test values to replace generic model data or updating of data parameters based on ~~a walk down~~an on-site review of the equipment.

R6. Each Transmission Planner shall notify the Generator Owner within 90 calendar days of receiving the verified excitation control system ~~and~~or plant volt/var control function model information ~~whether~~in accordance with Requirement R2 that the model is us~~e~~able (meets the criteria specified in Parts 6.1 through 6.3~~),~~) or is not us~~e~~able~~;~~, and

---

[7] If verification is performed, the 10-year period as outlined in MOD-026 Attachment 1 is reset.

[8] ~~Exciter, voltage regulator, plant volt/var or power system stabilizer control replacement including software alterations that alter excitation control system equipment response, plant digital control system addition or replacement, plant digital control system software alterations that alter excitation control system equipment response, plant volt/var function equipment addition or replacement (such as static var systems, capacitor banks, individual unit excitation systems, etc), a change in the voltage control mode (such as going from power factor control to automatic voltage control, etc), exciter, voltage regulator, impedance compensator, or power system stabilizer settings change.~~[8] Ibid.

[9] Exciter, voltage regulator, plant volt/var or power system stabilizer control replacement including software alterations that alter excitation control system equipment response, plant digital control system addition or replacement, plant digital control system software alterations that alter excitation control system equipment response, plant volt/var function equipment addition or replacement (such as static var systems, capacitor banks, individual unit excitation systems, etc), a change in the voltage control mode (such as going from power factor control to automatic voltage control, etc), exciter, voltage regulator, impedance compensator, or power system stabilizer settings change. Automatic changes in settings that occur due to changes in operating mode do not apply to Requirement R4.

[10] Technical justification is achieved by the Transmission Planner demonstrating that the simulated unit or plant response does not match the measured unit or plant response.

shall include a technical description if the model is not ~~useable. .~~usable that includes the following: *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

6.1. The excitation control system ~~and~~or plant volt/var control function model initializes to compute modeling data without error~~.~~,

6.2. A no-disturbance simulation results in negligible transients~~.~~, and

6.3. For an otherwise stable simulation, a disturbance simulation results in the excitation control and plant volt/var control function model exhibiting positive damping.

C. Measures

M1. ~~Evidence for Requirement R1~~The Transmission Planner must ~~include~~have and provide the dated request for instructions or data, the transmitted instructions or data, and dated evidence of ~~transmission of requested instructions and data, such as dated~~a written transmittal (e.g., electronic mail ~~messages, dated~~ message, postal ~~receipts, dated~~ receipt, or confirmation of facsimile ~~transmission~~) as evidence that it provided the request within 90 calendar days in accordance with Requirement R1.

M2. ~~Evidence for Requirement R2 must include, for each of the Generator Owner's applicable Facilities, the verification report showing that the~~ The Generator Owner must have and provide dated evidence it verified each generator excitation control system ~~and~~or plant volt/var control function model ~~was verified~~ according to Part 2.1 for each applicable unit and ~~dated evidence of transmission, such as~~ a dated transmittal (e.g., electronic mail ~~messages, dated~~message, postal receipt~~s~~, or ~~dated~~ confirmation of facsimile ~~transmission~~) as ~~specified~~evidence it provided the model, documentation, and data to its Transmission Planner, in accordance with Requirement R2.

M3. Evidence for Requirement R3 must include the Generator Owner's dated written response containing the information identified in Requirement R3 and dated evidence of transmittal~~, such as a dated~~ (e.g., electronic mail ~~messages, dated~~message, postal receipt~~s~~, or ~~dated~~ confirmation of facsimile ~~transmission~~) of the response.

M4. Evidence for Requirement R4 must include, for each of the Generator Owner's ~~Facilities~~applicable units for which system changes specified in Requirement R4 were made, a dated revised model data or ~~dated~~ plans to perform a model verification and dated evidence ~~of transmittal, such as dated~~(e.g., electronic mail ~~messages, dated~~message, postal receipt~~s~~, or ~~dated~~ confirmation of facsimile ~~transmittal~~) it provided the revised model and data or plans within 180 calendar days of making changes.

M5. Evidence for Requirement R5 must include~~, for each request received as specified in Requirement R5, the~~ the Generator Owner's dated written response ~~provided~~ containing the information identified in Requirement R5 and dated evidence ~~of transmittal, such as dated~~(e.g., electronic mail ~~messages, dated~~message, postal receipt~~s~~, or ~~dated~~ confirmation of facsimile ~~transmittal~~) it provided a written response within 90 calendar days following receipt of a technically justified request.

M6. Evidence of Requirement R6 must include, for each model received, the dated response ~~containing the information required in~~ indicating the model was usable or not usable according to the criteria specified in Parts 6.1 through 6.3 and for a model that is not usable, a technical description; and dated evidence of transmittal~~, such as dated~~ (e.g., electronic mail ~~messages, dated~~message, postal receipt~~s~~, or ~~dated~~ confirmation of facsimile ~~transmittal~~) that the Generator Owner was notified within 90 calendar days of receipt of model information.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

~~Regional Entity~~

The Regional Entity shall serve as the Compliance Enforcement Authority unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional entity approved by FERC or other applicable governmental authority shall serve as the CEA.

1.2. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Generator Owner and Transmission Planner shall each keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Transmission Planner shall retain the information/data request and provided response evidence of Requirements R1 and R6, Measures M1 and M6 for ~~3~~three calendar years from the date the document was provided.
- The Generator Owner shall retain the latest ~~and previous~~ excitation control system ~~and~~or plant volt/var control function model verification evidence of Requirement R2, Measure M2.
- The Generator Owner shall retain the information/data request and provided response evidence of Requirements R3 through R5, and Measures M3 through M5 for ~~3~~three calendar years from the date the document was provided.

If a Generator Owner or Transmission Planner is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete or approved or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaints

1.4. Additional Compliance Information

None

2. Violation Severity Levels

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The Transmission Planner provided the instructions and data to the Generator Owner more than 90 calendar days but ~~no more~~less than or equal to 120 calendar days of receiving a written request.	The Transmission Planner provided the instructions and data to the Generator Owner more than 120 calendar days but ~~no more~~less than or equal to 150 calendar days of receiving a written request.	The Transmission Planner provided the instructions and data to the Generator Owner more than 150 calendar days but ~~no more~~less than or equal to 180 calendar days of receiving a written request.	The Transmission Planner failed to provide the instructions and data to the Generator Owner within ~~181~~180 calendar days of receiving a written request.
R2	The Generator Owner provided its verified model(s~~)~~), including documentation and data to its Transmission Planner after the timeframe specified in MOD-026 Attachment 1 but ~~no more~~less than ~~30~~or equal to 90 calendar days late; OR The Generator Owner provided the Transmission Planner verified models that omitted one of the six Parts identified in Requirement R2, ~~Subp~~Parts 2.1.1 through 2.1.6.	The Generator Owner provided its verified model(s~~)~~), including documentation and data to its Transmission Planner more than ~~30~~90 calendar days but ~~no more~~less than ~~60~~or equal to 180 calendar days late as specified by the periodicity timeframe in MOD-026 Attachment 1. OR The Generator Owner provided the Transmission Planner verified models that omitted two of the six Parts identified in Requirement R2, ~~Subp~~Parts 2.1.1 through 2.1.6.	The Generator Owner provided its verified model(s~~)~~), including documentation and data to its Transmission Planner more than ~~60~~180 calendar days but ~~no more~~less than ~~90~~or equal to 270 calendar days late as specified by the periodicity timeframe in MOD-026 Attachment 1. OR The Generator Owner provided the Transmission Planner verified models that omitted three of the six Parts identified in Requirement R2, ~~Subp~~Parts 2.1.1 through 2.1.6.	The Generator Owner provided its verified ~~generator excitation control system~~model(s), including documentation and ~~plant volt/var control function model~~data more than ~~90~~270 calendar days late ~~or failed to provide the verified model(s)~~ to its Transmission Planner in accordance with the periodicity specified in MOD-026 Attachment 1. OR The Generator Owner failed to use model(s) acceptable to the Transmission Planner as specified in Requirement R2, ~~Subp~~Part 2.1. OR The Generator Owner provided the Transmission Planner verified model(s) ~~that~~but omitted four or more of the six ~~P~~parts identified in Requirement R2, Subparts 2.1.1 through 2.1.6.

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL
R3	The Generator Owner provided a written response more than 90 calendar days but ~~no more~~less than or equal to 120 calendar days of receiving written notice. ~~(R3)~~	The Generator Owner provided a written response more than 120 calendar days but ~~no more~~less than or equal to 150 calendar days of receiving written notice. ~~(R3)~~	The Generator Owner provided a written response more than 150 calendar days but ~~no more~~less than or equal to 180 calendar days of receiving written notice. ~~(R3)~~	The Generator Owner failed to provide a written response within ~~181~~180 calendar days of receiving written notice ~~(R3).~~. OR ~~The Generator Owner's written response was provided within 181 calendar days of receiving written notice however, the~~The Generator Owner's written response failed to contain either the technical basis for maintaining the current model, or a list of future model changes, or a plan to perform another model verification.
R4	The Generator Owner provided revised model data or plans to perform model verification more than 180 calendar days but ~~no more~~less than or equal to 210 calendar days of making changes to the excitation control system ~~and~~or plant volt/var control function that altered the equipment response characteristic. ~~(R4)~~	The Generator Owner provided revised model data or plans to perform model verification more than 210 calendar days but ~~no more~~less than or equal to 240 calendar days of making changes to the excitation control system ~~and~~or plant volt/var control function that altered the equipment response characteristic. ~~(R4)~~	The Generator Owner provided revised model data or plans to perform model verification more than 240 calendar days but ~~no more~~less than or equal to 270 calendar days of making changes to the excitation control system ~~and~~or plant volt/var control function that altered the equipment response characteristic. ~~(R4)~~	The Generator Owner failed to provide revised model data or failed to provide plans to perform model verification within ~~271~~270 calendar days of making changes to the excitation control system ~~and~~or plant volt/var control function that altered the equipment response characteristic ~~(R4).~~.

~~MOD-026 Attachment 1~~

~~Excitation Control System and Plant Volt/Var Function Model Verification Periodicity~~

~~Periodicity Determination Supporting Criteria~~MOD-026 Attachment 1 Excitation Control System or Plant Volt/Var Function Model Verification Periodicity		
Row Number	**Verification Condition**	**Required Action**
1	Establishing the initial verification date for an applicable unit. (Requirement R2)	Transmit the verified model, documentation and data to the Transmission Planner on or before the Effective Date. Row 4 applies when calculating generation fleet compliance during the 10-year implementation period. See Section A5 for Effective Dates.
2	Subsequent verification for an applicable unit. (Requirement R2)	Transmit the verified model, documentation and data to the Transmission Planner on or before the 10-year anniversary of the last transmittal (per Note 1).
3	Initial verification for a new applicable unit or for an existing applicable unit with new excitation control system or plant volt/var control function equipment installed. (Requirement R2)	Transmit the verified model, documentation and data to the Transmission Planner within 365 calendar days after the commissioning date.

~~Periodicity Determination Supporting Criteria~~MOD-026 Attachment 1 Excitation Control System or Plant Volt/Var Function Model Verification Periodicity		
Row Number	**Verification Condition**	**Required Action**
4	Existing applicable unit that is equivalent to another unit(s) at the same physical location. AND Each applicable unit has the same MVA nameplate rating. AND The nameplate rating is ≤ 350 MVA. AND Each applicable unit has the same components and settings. AND The model for one of these equivalent applicable units has been verified. (Requirement R2)	Document circumstance with a written statement and include with the verified model, documentation and data provided to the Transmission Planner for the verified equivalent unit. Verify a different equivalent unit during each 10-year verification period. Applies to Row 1 when calculating generation fleet compliance during the 10-year implementation period.
5	The Generator Owner has submitted a verification plan. (Requirement R3, R4 or R5)	Transmit the verified model, documentation and data to the Transmission Planner within 365 calendar days after the submittal of the verification plan.

~~Periodicity Determination Supporting Criteria~~MOD-026 Attachment 1 Excitation Control System or Plant Volt/Var Function Model Verification Periodicity		
Row Number	**Verification Condition**	**Required Action**
6	New or existing applicable unit does not include an active closed loop voltage or reactive power control function. (Requirement R2)	Requirement 2 is met with a written statement to that effect transmitted to the Transmission Planner. Perform verification per the periodicity specified in Row 3 for a "New Generating Unit" (or new equipment) only if active closed loop function is established. See Footnote 1 (see Section A.3) for clarification of what constitutes an active closed loop function for both conventional synchronous machines (reference Footnote 1a) and aggregate generating plants (reference Footnote 1b).
7	Existing applicable unit has a current average net capacity factor over the most recent three calendar years, beginning on January 1 and ending on December 31 of 5% or less. (Requirement R2)	Requirement 2 is met with a written statement to that effect transmitted to the Transmission Planner. At the end of this 10-year timeframe, the current average three year net capacity factor (for years 8, 9, and 10) can be examined to determine if the capacity factor exemption can be declared for the next 10-year period. If not eligible for the capacity factor exemption, then model verification must be completed within 365 calendar days of the date the capacity factor exemption expired. For the definition of net capacity factor, refer to Appendix F of the GADS Data Reporting Instructions on the NERC website.

~~Periodicity Determination Supporting Criteria~~MOD-026 Attachment 1

Excitation Control System or Plant Volt/Var Function Model Verification Periodicity

Row Number	Verification Condition	Required Action

~~Criteria~~NOTES:

NOTE **1**: Establishing the ~~**Initial Ten Year Unit Verification Period Start Date:**~~

~~**For each applicable unit, set the initial start date for compliance with Requirement R2 to the 30 percent, 50 percent, or 100 percent Standard Implementation Effective Dates established for compliance in accordance with the ten calendar**~~ recurring 10-year ~~**transition period and in accordance with the following rules:**~~

- ~~**30 percent of the applicable units in the generation fleet unit MVA is compliant within the first 4 years.**~~
- ~~**50 percent of the applicable units in the generation fleet unit MVA is compliant within the first 6 years.**~~
- ~~**100 percent of the applicable units in the generation fleet unit MVA is compliant within the first 10 years.**~~

~~**Criteria 2: Establishing the Recurring Ten Year Unit Verification Period Start Date**~~unit verification period start date:

The start date is the actual ~~**data collection**~~ date of submittal of a verified model to the Transmission Planner for the most recently performed ~~**applicable unit verification.**~~

~~**Criteria 3: For the purpose of calculating the initial ten year**~~ unit verification ~~**period 30 percent, 50 percent, or 100 percent threshold for generation fleet compliance, equivalent unit MVA is included**~~.

NOTE 2: Consideration for ~~**Early Compliance**~~early compliance:

Existing generator excitation control system ~~**and**~~or plant volt/var control function model verification is sufficient for demonstrating compliance for a ~~**ten**~~ 10-year period from the actual ~~**verification**~~transmittal date if either of the following applies:

- The Generator Owner has a verified model that is compliant with the applicable regional policies, guidelines or criteria existing at the time of model verification.
- The Generator Owner has an existing verified model that is compliant with the requirements of this standard.

~~Event Triggering Verification~~	~~Verification Periodicity~~	~~Comments~~
~~Establishing the initial verification period (Criteria 1) for an applicable unit~~ ~~(Requirement R2)~~	~~Record and collect excitation control system and plant volt/var control response validation data on or before the initial start date per Criteria 1~~	~~Transmit the verified model and documentation and data to the Transmission Planner no more than 365 calendar days from the date that the response was recorded.~~ ~~Criteria 3 applies when calculating generation fleet compliance during the 10-year transition period~~
~~Subsequent verification for an existing applicable unit~~ ~~(Requirement R2)~~	~~Record and collect excitation control system and plant volt/var control function response validation data on or before the ten year anniversary date of the collection of the recorded unit excitation control system and plant volt/var control function response used for the current validation.~~	~~Transmit the verified model and documentation and data to the Transmission Planner no more than 365 calendar days from the date that the recorded response was collected.~~
~~Initial verification for a new applicable unit or for an existing applicable unit with new excitation control system and plant volt/var control function equipment installed with settings final~~ ~~(Requirement R2)~~	~~Record and collect excitation control system and plant volt/var control function response validation data no more than 356 days from the commissioning date~~	~~Transmit the verified model and documentation and data to the Transmission Planner no more than 180 calendar days from the date that the recorded response was collected.~~
~~Existing applicable unit that is equivalent to another operating unit(s) at the same physical location.~~ ~~AND~~ ~~Each equivalent unit has the same MVA nameplate rating.~~ ~~AND~~	~~Verify a different equivalent unit during each ten year verification period.~~ ~~.~~	~~Document circumstance with a written statement and include with the verified model and documentation and data provided to the Transmission Provider for the verified equivalent unit.~~

~~Planning Coordinator requests a review of the excitation control system and plant volt/var control function model for a unit or plant that is not an applicable unit.~~ ~~AND~~ ~~The Generator Owner has submitted a verification plan.~~ ~~(Requirement R5)~~	~~Record and collect excitation control system and plant volt/var control response validation data no more than 365 calendar days from the date of the submitted verification plan.~~	~~Transmit the verified model and documentation and data to the Transmission Planner no more than 180 calendar days from the date that the recorded response was collected.~~
~~New or existing applicable unit does not include active closed loop function.~~	~~Not required until unit has an installed control system~~	~~Document circumstance with a written statement~~ ~~Perform verification per the periodicity specified in Row 3 for a "New Generating Unit" (or new equipment) once an active closed loop function is established.~~

Implementation Plan

Project 2007-09 Generator Verification

Implementation Plan for MOD-026-1, Verification of Models and Data for Generator Excitation Control System or Plant Volt/Var Control Functions

Approvals Required

MOD-026-1, Verification of Models and Data for Generator Excitation Control System or Plant Volt/Var Control Functions

Prerequisite Approvals

None

Revisions to Glossary Terms

None

Applicable Entities

Generator Owner
Transmission Planner

For the purpose of this standard, the following Facilities are considered, "applicable units."

Units or plants that meet the following:

Generating units connected to the Eastern or Quebec Interconnections with the following characteristics:

- Individual generating unit greater than 100 MVA (gross nameplate rating) directly connected to the Bulk Electric System.
- Each generating plant consisting of multiple units that are directly connected to the Bulk Electric System at a common bus with total generation greater than 100 MVA (gross aggregate rating).

Generating units connected to the Western Interconnection with the following characteristics:

- Individual generating unit greater than 75 MVA (gross nameplate rating) directly connected to the Bulk Electric System.

- Each generating plant consisting of multiple units that are directly connected to the Bulk Electric System at a common bus with total generation greater than 75 MVA (gross aggregate rating).

Generating units connected to the ERCOT Interconnection with the following characteristics:

- Individual generating unit greater than 50 MVA (gross nameplate rating) directly connected to the Bulk Electric System.
- Each generating plant / Facility consisting of multiple units that are connected to the Bulk Electric System at a common bus with total generation greater than 75 MVA (gross aggregate rating).

For all Interconnections:

- Any technically justified[1] unit that meets NERC registry criteria and is requested by the Transmission Planner.

Conforming Changes to Other Standards

None

Effective Dates

In those jurisdictions where regulatory approval is required:

- Each responsible entity shall ensure compliance with Requirements R1, and R3 through R6 By the first day of the first calendar quarter following applicable regulatory approval.
- Each Generator Owner shall ensure at least 30 percent of its applicable unit gross MVA per Interconnection are compliant with Requirement R2 by the first day of the first calendar quarter, four years following applicable regulatory approval.
- Each Generator Owner shall ensure at least 50 percent of its applicable unit gross MVA per Interconnection are compliant with Requirement R2 by the first day of the first calendar quarter, six years following applicable regulatory approval.
- Each Generator Owner shall ensure 100 percent of its applicable unit gross MVA are compliant with Requirement R2 By the first day of the first calendar quarter, 10 years following applicable regulatory approval.

[1] Technical justification is achieved by demonstrating that the simulated unit or plant response does not match the measured unit or plant response.

In those jurisdictions where no regulatory approval is required:

- Each responsible entity shall ensure compliance with Requirements R1, and R3 through R6 by the first day of the first calendar quarter following Board of Trustees adoption.
- Each Generator Owner shall ensure at least 30 percent of its applicable unit gross MVA per Interconnection is compliant with Requirement R2 by the first day of the first calendar quarter, four years following Board of Trustees adoption.
- Each Generator Owner shall ensure at least 50 percent of its applicable unit gross MVA per Interconnection is compliant with Requirement R2 By the first day of the first calendar quarter, six years following Board of Trustees adoption.
- Each Generator Owner shall ensure 100 percent of its applicable unit gross MVA is compliant with Requirement R2 By the first day of the first calendar quarter, 10 years following Board of Trustees adoption.

Consideration for Early Compliance

Existing excitation control system and plant volt/var control model verification is sufficient for demonstrating compliance for a 10 year period from the actual verification date if either of the following applies:

- The Generator Owner has a verified model that is compliant with the applicable regional entity policies, guidelines or criteria existing at the time of model verification, or
- The Generator Owner has an existing verified model that is compliant with the requirements of this standard.

Justification

This phased implementation supports the 10 year cycle for the collection of generator response data necessary for required verifications and typical generating unit outage schedules.

When a Generator Owner has verified its Excitation Control System and Plant Volt/Var Control model(s) in compliance with its regional entity requirements 10 years or less prior to the approval date of this Standard, these verifications are deemed sufficient for demonstrating compliance with this Standard for a ten year period from the date of the aforementioned verification.

Implementation Plan for MOD-026-1, Verification of Models and Data for Generator Excitation Control System ~~Functions and~~or Plant Volt/Var Control Functions

Approvals Required

MOD-026-1, Verification of Models and Data for Generator Excitation Control System ~~Functions and~~ or Plant Volt/Var Control Functions

Prerequisite Approvals

None

Revisions to Glossary Terms

None

Applicable Entities

Generator Owner
Transmission Planner

For the purpose of this standard, the following Facilities are considered, "applicable units~~[1]~~."

Units or plants ~~with an average capacity factor[2] greater than 5 percent over the last three calendar years, beginning on January 1 and ending on December 31,~~ that meet the following:

Generating units connected to the Eastern or Quebec Interconnections with the following characteristics:

- Individual generating unit greater than 100 MVA (gross nameplate rating) directly connected to the ~~bulk power system~~Bulk Electric System.

~~[1] Applicable generating units do not include startup or standby units not normally connected to the grid.~~
~~[2] Once a capacity factor exemption is declared by notifying the Transmission Planner, verification is not required for 10 calendar years from the date eligibility occurs. At the end of this 10 calendar year timeframe, the current average 3 year capacity factor (for years 8, 9, and 10) is examined to determine if the capacity factor exemption can be declared for the next 10 calendar year period. If not eligible for the capacity factor exemption, then model verification must be completed within one year of the date the capacity factor exemption expired with the 10 calendar year periodicity requirement reset based on the verification date. For the definition of capacity factor, refer to Appendix F of the GADS Data Reporting Instructions on the NERC website.~~

- ~~For e~~Each generating plant ~~/ Facility~~ consisting of ~~one or more~~multiple -units that are directly connected to the ~~bulk power system~~Bulk Electric System at a common bus with total generation greater than 100 MVA (gross aggregate rating):
  - ~~Each individual generating unit greater than 20 MVA (gross nameplate rating); and~~
  - ~~Each generating plant / Facility comprised consisting of individual generating units less than 20 MVA (gross nameplate ratings)~~

Generating units connected to the Western Interconnection with the following characteristics:

- Individual generating unit greater than 75 MVA (gross nameplate rating) directly connected to the ~~bulk power system~~Bulk Electric System.
- ~~For e~~Each generating plant ~~/ Facility~~ consisting of multiple ~~one or more~~ units that are directly connected to the ~~bulk power system~~Bulk Electric System at a common bus with total generation greater than 75 MVA (gross aggregate rating):
  - ~~Each individual generating unit greater than 20 MVA (gross nameplate rating); and~~
  - ~~Each generating plant / Facility comprised consisting of individual generating units less than 20 MVA (gross nameplate ratings)~~

Generating units connected to the ERCOT Interconnection with the following characteristics:

- Individual generating unit greater than 50 MVA (gross nameplate rating) directly connected to the ~~bulk power system~~Bulk Electric System.
- ~~For e~~Each generating plant / Facility consisting of ~~one~~ multiple~~or more~~ units that are connected to the ~~bulk power system~~Bulk Electric System at a common bus with total generation greater than 75 MVA (gross aggregate rating):
  - ~~Each individual generating unit greater than 20 MVA (gross nameplate rating); and~~
  - ~~Each generating plant / Facility comprised consisting of individual generating units less than 20 MVA (gross nameplate ratings)~~

For all Interconnections:

- Any ~~registered~~ technically justified[3] unit that meets NERC registry criteria and is requested by the Transmission Planner. ~~ing Coordinator.~~

[3] Technical justification is achieved by demonstrating that the simulated unit or plant response does not match the measured unit or plant response.

Conforming Changes to Other Standards

None

Effective Dates

In those jurisdictions where regulatory approval is required:

- Each responsible entity shall ensure compliance with Requirements R1, and R3 through R6 By the first day of the first calendar quarter~~, four years~~ following applicable regulatory approval.
- Each Generator Owner shall ensure at least 30 percent~~%~~ of its applicable unit~~s~~ gross MVA per Interconnection ~~on an MVA basis~~ are compliant with Requirement R2 by the first day of the first calendar quarter, four years following applicable regulatory approval.
- Each Generator Owner shall ensure at least 50 percent~~%~~ of its applicable unit~~s~~ gross MVA per Interconnection ~~on an MVA basis~~ are compliant with Requirement R2 by the first day of the first calendar quarter, six years following applicable regulatory approval.
- Each Generator Owner shall ensure 100 percent~~%~~ of its applicable unit~~s~~ gross MVA are compliant with Requirement R2 By the first day of the first calendar quarter, 10~~ten~~ years following applicable regulatory approval.

In those jurisdictions where no regulatory approval is required:

- Each responsible entity shall ensure compliance with Requirements R1, and R3 through R6 by the first day of the first calendar quarter~~, four years~~ following Board of Trustees adoption.
- Each Generator Owner shall ensure at least 30 percent~~%~~ of its applicable unit~~s~~ gross MVA per Interconnection ~~on an MVA basis are~~ is compliant with Requirement R2 by the first day of the first calendar quarter, four years following Board of Trustees adoption.
- Each Generator Owner shall ensure at least 50 percent~~%~~ of its applicable unit~~s~~ gross MVA per Interconnection ~~on an MVA basis are~~ is compliant with Requirement R2 By the first day of the first calendar quarter, six years following Board of Trustees adoption.
- Each Generator Owner shall ensure 100 percent~~%~~ of its applicable unit~~s~~ gross MVA ~~are~~ is compliant with Requirement R2 By the first day of the first calendar quarter, 10~~ten~~ years following Board of Trustees adoption.

Consideration for Early Compliance

Existing excitation control system and plant volt/var control model verification is sufficient for demonstrating compliance for a 10~~ten~~ year period from the actual verification date if either of the following applies:

- The Generator Owner has a verified model that is compliant with the applicable regional entity policies, guidelines or criteria existing at the time of model verification, or
- The Generator Owner has an existing verified model that is compliant with the requirements of this standard.

Justification

This phased implementation supports the 10~~ten~~ year cycle for the collection of generator response data necessary for required verifications and typical generating unit outage schedules.

When a Generator Owner has verified its Excitation Control System and Plant Volt/Var Control model(s) in compliance with its regional entity requirements ~~ten~~ 10 years or less prior to the approval date of this Standard, these verifications are deemed sufficient for demonstrating compliance with this Standard for a ten year period from the date of the aforementioned verification.

Retirements

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. SAR posted for comment (April 20–May 21, 2007).
2. Revised SAR and response to comments posted.
3. Revised SAR and response to comments approved by SC (June 14, 2007).
4. SDT appointed on (August 18, 2007).
5. Initial draft of PRC-024-1 was posted for a 45 day formal comment period (February 17 – April 2, 2009).
6. Draft 2 of PRC-024-1 was posted for a 45 day concurrent comment and ballot period from June 15 – August 1, 2011.
7. Draft 3 of PRC-024-1 was posted for a 30 day concurrent comment and successive ballot period from February 29 – March 29, 2012.

Proposed Action Plan and Description of Current Draft:

This is the fourth draft of the standard and includes Time Horizons, Data Retention, Violation Risk Factors, and Violation Severity Levels. This fourth posting is for a 30-day comment and successive ballot period.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Develop responses to comments and develop third version draft standard.	April - July 2012
2. Post response to comments and conduct successive ballot.	October-November 2012
3. Develop responses to ballot comments.	December 2012 – January 2013
4. Post responses to comments and conduct recirculation ballot.	February 2013

5. BOT adoption.	March 2013
6. File with regulatory authorities.	April 2013

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None

A. Introduction

1. **Title:** Generator Performance During Frequency and Voltage Excursions

2. **Number:** **PRC-024-1**

3. **Purpose:** Ensure generating units remain connected during frequency and voltage excursions and ensure expected generating unit performance during frequency and voltage excursions is communicated to Reliability Coordinators, Planning Coordinators, Transmission Operators and Transmission Planners for accurate system modeling.

4. **Applicability:**

   4.1. Generator Owner

5. **Effective Date:**

   5.1. In those jurisdictions where regulatory approval is required:

   5.1.1 By the first day of the first calendar quarter, two calendar years following applicable regulatory approval, each Generator Owner shall have verified at least 40 percent of its Facilities are fully compliant with Requirements R1, R2, R3, R4, and R6.

   5.1.2 By the first day of the first calendar quarter, three calendar years following applicable regulatory approval, each Generator Owner shall have verified at least 60 percent of its Facilities are fully compliant with Requirements R1, R2, R3, R4, and R6.

   5.1.3 By the first day of the first calendar quarter, four calendar years following applicable regulatory approval, each Generator Owner shall have verified at least 80 percent of its Facilities are fully compliant with Requirements R1, R2, R3, R4, and R6.

   5.1.4 By the first day of the first calendar quarter, five calendar years following applicable regulatory approval, each Generator Owner shall have verified 100 percent of its Facilities are fully compliant with Requirements R1, R2, R3, R4, and R6.

   5.1.5 By the first day of the first calendar quarter, six calendar years following applicable regulatory approval, each Generator Owner shall have verified 100 percent of its Facilities are fully compliant with Requirement R5.

   5.2. In those jurisdictions where regulatory approval is not required:

   5.2.1 By the first day of the first calendar quarter, two calendar years following Board of Trustees approval, each Generator Owner shall have verified at least 40 percent of its Facilities are fully compliant with Requirements R1, R2, R3, R4, and R6.

5.2.2 By the first day of the first calendar quarter, three calendar years following Board of Trustees approval, each Generator Owner shall have verified at least 60 percent of its Facilities are fully compliant with Requirements R1, R2, R3, R4, and R6.

5.2.3 By the first day of the first calendar quarter, four calendar years following Board of Trustees approval, each Generator Owner shall have verified at least 80 percent of its Facilities are fully compliant with Requirements R1, R2, R3, R4, and R6.

5.2.4 By the first day of the first calendar quarter, five calendar years following Board of Trustees approval, each Generator Owner shall have verified 100 percent of its Facilities are fully compliant with Requirements R1, R2, R3, R4, and R6.

5.2.5 By the first day of the first quarter, six calendar years following Board of Trustees approval, each Generator Owner shall have verified 100 percent of its Facilities are fully compliant with Requirement R5.

B. Requirements

R1. Each Generator Owner that has generator frequency protective relaying[1] activated to trip its generating unit shall set such protective relaying so that the frequency protective relaying does not operate to trip the unit within the "no trip zone" of PRC-024 Attachment 1, subject to the following exceptions: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

[1] Each Generator Owner is not required to have frequency or voltage protective relaying (including but not limited to frequency and voltage protective functions for discrete relays, volts per hertz relays evaluated at nominal frequency, impedance relays, voltage controlled overcurrent relays, multi-function protective devices or protective functions within control systems that directly trip or provide tripping signals to the generator based on frequency or voltage inputs) installed or activated on its unit.

- Generation may trip if the protective functions (such as out-of-step functions or loss-of-field functions) operate due to an impending or actual loss of synchronism or due to instability in power conversion control equipment.
- Generation may trip if clearing a system fault necessitates disconnecting the generation.
- Generation may trip within a portion of the "no trip zone" of PRC-024 Attachment 1 for documented and communicated equipment limitations in accordance with Requirement R3 for an existing generating unit[2].

R2. Each Generator Owner that has generator voltage protective relaying[1] activated to trip its generating unit shall set its protective relaying such that the voltage protective relaying does not trip as a result of a voltage excursion (at the point of interconnection[3]) caused by an event on the transmission system external to the generating plant that remains within the "no trip zone" of PRC-024 Attachment 2 or within the voltage recovery characteristics of a location-specific Transmission Planner's study if the Transmission Planner allows less stringent voltage relay settings than those required to meet PRC-024 Attachment 2 subject to the following exceptions : *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

- Generation may trip in accordance with a Special Protection System (SPS) or Remedial Action Scheme (RAS).
- Generation may trip if clearing a system fault necessitates disconnecting a generating unit.
- Generation may trip by action of protective functions (such as out-of-step functions or loss-of-field functions) that operate due to an impending or actual loss of synchronism or, for asynchronous generating units, due to instability in power conversion control equipment.
- Generation may trip within a portion of the "no trip zone" of PRC-024 Attachment 2 for documented and communicated equipment limitations in accordance with Requirement R3 for an existing generating unit

R3. Each Generator Owner of an existing generating unit shall document each known equipment limitation (excluding limitations that are caused by generator frequency and voltage protective relays) that prevents a generating unit, from meeting the criteria in Requirements R1 or R2 including (but not limited to) study results, experience from an

[2] To include generating units previously commissioned, or generating units under construction, or generating units with an executed interconnection agreement or power purchase agreement by the effective date of PRC-024-1 Requirement R5,

[3] For the purposes of this standard, point of interconnection means the transmission (high voltage) side of the generator step-up or collector transformer.

actual event, or manufacturer's advisory *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*.

3.1. The Generator Owner shall communicate the documented equipment limitation, or the removal of a previously documented equipment limitation, to its Reliability Coordinator, Planning Coordinator, Transmission Operator and Transmission Planner within 30 calendar days of identifying the equipment limitation or when either of the following occurs:

- The equipment causing the limitation is repaired or replaced with equipment that removes the limitation.
- The equipment causing the limitation is modified or upgraded resulting in an increase of generator nameplate capacity rating greater than 10 percent (cumulative from the first effective date of this Standard).

R4. Each Generator Owner of an existing generating unit shall provide an estimate of the time duration the existing generating unit will remain connected (considering performance of the auxiliary systems as well as the generator) if the unit were to experience a frequency or voltage excursion. The voltage or frequency profile at the point of interconnection is determined by dynamic simulation provided by a Reliability Coordinator, Planning Coordinator, Transmission Operator or Transmission Planner that monitors or models the associated generating unit and has requested the time duration estimate. The estimate is to be provided to the requesting Reliability Coordinator, Planning Coordinator, Transmission Owner, or Transmission Planner within 60 calendar days of receipt of a written request.

If the Generator Owner expects the existing generating unit will remain connected for longer than 10 minutes, the estimate should indicate the existing unit is not expected to trip. The Generator Owner may develop the estimates based on experience, actual event histories, or sound engineering judgment. Detailed unit performance studies are not required to develop the estimate. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

R5. Each Generator Owner shall design, build, and maintain new [4] generating units and plants (including auxiliary systems) consistent with the parameters set forth in PRC-024 Attachments 1 and 2, such that the generation, when operating at or above the minimum sustainable generation threshold (and for a generating plant consisting of multiple units with total generation greater than 75 MVA gross aggregate nameplate rating, when the generating plant is producing at least 20 percent of the plant's aggregate nameplate capacity) will not trip due to a frequency excursion or voltage excursion at the point of interconnection, caused by an event on the transmission system external to the generating

[4] Excluding generators referenced in PRC-024-1 Footnote 2.

plant, subject to the following exceptions: *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*

- For a new generating plant consisting of multiple units less than 20 MVA each with total plant generation greater than 75 MVA (gross aggregate nameplate rating), up to 10 percent of the individual generating units may disconnect as a result of the frequency or voltage excursion.
- If the Transmission Planner has provided the Generator Owner with location-specific voltage recovery characteristics as described in Requirement R2, Part 2.2, then the generation may operate to a less stringent voltage ride-through performance criterion than the duration curve identified in PRC-024 Attachment 2 consistent with those provided characteristics.
- Generation may trip if this action is designed as part of a Special Protection System (SPS) or Remedial Action Scheme (RAS).
- Generation may trip if clearing a system fault necessitates disconnecting the generation.
- Generation may trip if the Generator Owner has a temporary exemption granted by its Reliability Coordinator based on a documented equipment limitation. If an equipment limitation is identified following a plant trip caused by a frequency or voltage excursion, the Reliability Coordinator may grant a retroactive temporary exemption for that limitation if the Generator Owner develops and implements an acceptable plan to address the limitation.
- Generation may trip if the protective functions (such as out-of-step functions, or loss-of-field functions) operate due to an impending or actual loss of synchronism or, for asynchronous generating units, due to instability in power conversion control equipment.

R6. Each Generator Owner shall provide its generator protection trip settings to the Reliability Coordinator, Planning Coordinator, Transmission Operator and Transmission Planner (that monitors or models the associated unit), within 60 calendar days of receipt of a written request for the data, and within 60 calendar days of any change to those previously requested trip settings unless otherwise directed by the requesting Reliability Coordinator, Planning Coordinator, Transmission Operator, or Transmission Planner. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

C. Measures

M1. Each Generator Owner shall have evidence such as dated setting sheets, calibration sheets, or other documentation, that generator frequency protective relays have been set in accordance with Requirement R1.

M2. Each Generator Owner shall have evidence such as dated setting sheets, voltage-time curves, calibration sheets, coordination plots or dynamic simulation studies, that generator voltage protective relays have been set in accordance with Requirement R2.

M3. Each Generator Owner shall have evidence that it has documented and communicated any equipment limitations (excluding limitations that are caused by generator frequency and voltage protective relays) that resulted in an exception to Requirements R1 or R2 in accordance with Requirement R3 such as a dated email or letter that contains such documentation as study results, experience from an actual event, or manufacturer's advisory.

M4. Each Generator Owner shall have evidence such as a copy of the estimate of time duration report and correspondence, such as dated e-mails, or other documentation that an estimate of the time duration of its existing generating unit(s) as a result of a frequency excursion or voltage excursion has been communicated in accordance with Requirement R4, and copies of any requests it has received for that information.

M5. Each Generator Owner shall have evidence, such as dated unit output records, trip investigation reports or disturbance monitoring records, showing that each unit trip did not result from a frequency excursion or voltage excursion as specified in Requirement R5, or evidence that a listed exception applied.

M6. Each Generator Owner shall have evidence such as dated e-mails, correspondence or other evidence that it communicated generator protective relay settings to a requesting entity within 60 calendar days of a request or change in setting(s) in accordance with Requirement R6 and copies of any requests it has received for that information..

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

The Regional Entity shall serve as the Compliance enforcement authority unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases, the ERO or a Regional entity approved by FERC or other applicable governmental authority shall serve as the CEA.

1.2. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Generator Owner shall retain evidence of compliance with Requirement R1 through R6, Measures M1 through M6; for 3 years or until the next audit, whichever is longer.

If a Generator Owner is found non-compliant, the Generator Owner shall keep information related to the non-compliance until mitigation is complete and approved for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes

Compliance Audit

Voltage Ride-Through Curve Clarifications

Curve Details:

1. The per unit voltage base for these curves is the nominal operating voltage specified by the Transmission Planner in the analysis of the reliability of the Interconnected Transmission Systems at the point of interconnection to the Bulk Electric System (BES).
2. The curves depicted were derived based on three-phase transmission system zone 1 faults with Normal Clearing not exceeding 9 cycles. The curves apply to voltage excursions regardless of the type of initiating event.
3. The envelope within the curves represents the cumulative voltage duration at the point of interconnection with the BES. For example, if the voltage exceeds 1.15 pu at 0.3 seconds after a fault, does not exceed 1.2 pu voltage, and returns below 1.15 pu at 0.4 seconds, then the cumulative time the voltage is above 1.15 pu voltage is 0.1 seconds and is within the no trip zone of the curve.
4. The curves depicted assume system frequency is 60 Hertz. Adjust the magnitude of the high voltage curve in proportion to deviations of frequency below normal.
5. Voltages in the curve assume minimum fundamental frequency phase-to-ground or phase-to-phase voltage for the low voltage duration curve and the greater of maximum RMS or crest phase-to-phase voltage for the high voltage duration curve.

Evaluating Protective Relay Settings:

6. Use the following assumptions to evaluate voltage protection relay setting calculations on the static case for steady state initial conditions:
   a. All of the units connected to the same transformer are online and operating,
   b. All of the units are at full nameplate real-power output.
   c. Power factor is 0.95 lagging (i.e. supplying reactive power to the system) as measured at the generator terminals).
7. Evaluate voltage protection relay settings assuming that additional installed generating plant reactive support equipment (such as static VAr compensators, synchronous condensers, or capacitors) is available and operating normally.
8. Evaluate voltage protection relay settings accounting for the actual tap settings of transformers between the generator terminals and the point of interconnection.

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. SAR posted for comment (April 20–May 21, 2007).
2. Revised SAR and response to comments posted.
3. Revised SAR and response to comments approved by SC (June 14, 2007).
4. SDT appointed on (August 18, 2007).
5. Initial draft of PRC-024-1 was posted for a 45 day formal comment period (February 17 – April 2, 2009).
6. Draft 2 of PRC-024-1 was posted for a 45 day concurrent comment and ballot period from June 15 – August 1, 2011.
7. Draft 3 of PRC-024-1 was posted for a 30 day concurrent comment and successive ballot period from February 29 – March 29, 2012.

Proposed Action Plan and Description of Current Draft:

This is the ~~third~~fourth draft of the standard and includes Time Horizons, Data Retention, Violation Risk Factors, and Violation Severity Levels. This ~~second~~fourth posting is for a 30-day comment and successive ballot period.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Develop responses to comments and develop ~~third~~fourth version draft standard.	~~August 2011 – February~~April – July 2012
2. Post response to comments and ~~third~~fourth version draft revision of standard for 30 day comment and successive ballot period.	~~February – March~~October - November 2012
3. Develop responses to successive ballot comments.	~~April – June~~December 2012 – January 2013

4. Post response to comments and conduct recirculation ballot.	~~July~~February 201~~2~~3
~~5. Conduct recirculation ballot.~~	~~July 2012~~
~~7~~5. BOT adoption.	~~August~~March 201~~2~~3
~~8~~6. File with regulatory authorities.	~~October~~April 201~~2~~3

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None

A. Introduction

1. **Title:** Generator Performance During Frequency and Voltage Excursions

2. **Number:** **PRC-024-1**

3. **Purpose:** Ensure generating units remain connected during frequency and voltage excursions~~,~~ and ensure expected generating unit performance during frequency and voltage excursions~~,~~ is communicated to Reliability Coordinators, Planning Coordinators, Transmission Operators and Transmission Planners for accurate system modeling.

4. **Applicability:**

   4.1. Generator Owner

5. **Effective Date:**

   5.1. ~~Each~~In those jurisdictions where regulatory approval is required:

   ~~5.1.~~5.1.1 By the first day of the first calendar quarter, two calendar years following applicable regulatory approval, each Generator Owner shall ~~verify that~~have verified at least ~~33~~40 percent of its ~~applicable units~~Facilities are fully compliant with Requirements R1, R2, R3, R4, and R6 ~~by the first day of the first calendar quarter one year following applicable regulatory approval; or, in those jurisdictions where no regulatory approval is required, the first day of the first calendar quarter one year following Board of Trustees adoption.~~ .

   ~~5.2.~~5.1.2 ~~Each~~By the first day of the first calendar quarter, three calendar years following applicable regulatory approval, each Generator Owner shall ~~verify that~~have verified at least ~~66~~60 percent of its ~~applicable units~~Facilities are fully compliant with Requirements R1, R2, R3, R4, and R6 ~~by the first day of the first calendar quarter two years following applicable regulatory approval; or, in those jurisdictions where no regulatory approval is required, the first day of the first calendar quarter two years following Board of Trustees adoption.~~ .

   5.1.3 ~~Each~~By the first day of the first calendar quarter, four calendar years following applicable regulatory approval, each Generator Owner shall ~~verify that 100~~have verified at least 80 percent of its ~~applicable units~~Facilities are fully compliant with Requirements R1, R2, R3, R4, and R6 ~~by~~.

   5.1.4 By the first day of the first calendar quarter ~~three~~, five calendar years following applicable regulatory approval~~; or, in~~, each Generator Owner shall have verified 100 percent of its Facilities are fully compliant with Requirements R1, R2, R3, R4, and R6.

5.1.5 By the first day of the first calendar quarter, six calendar years following applicable regulatory approval, each Generator Owner shall have verified 100 percent of its Facilities are fully compliant with Requirement R5.

5.2. In those jurisdictions where ~~no~~ regulatory approval is not required~~,~~:

~~5.3.~~ By the first day of the first calendar quarter ~~three~~ , two calendar years following Board of Trustees ~~adoption.~~

5.2.1 ~~Requirement R5 shall be effective on the first day of the first calendar quarter six years following applicable regulatory approval; or, in those jurisdictions where no regulatory~~ approval ~~is required,~~, each Generator Owner shall have verified at least 40 percent of its Facilities are fully compliant with Requirements R1, R2, R3, R4, and R6.

5.2.2 By the first day of the first calendar quarter, three calendar years following Board of Trustees approval, each Generator Owner shall have verified at least 60 percent of its Facilities are fully compliant with Requirements R1, R2, R3, R4, and R6.

5.2.3 By the first day of the first calendar quarter, four calendar years following Board of Trustees approval, each Generator Owner shall have verified at least 80 percent of its Facilities are fully compliant with Requirements R1, R2, R3, R4, and R6.

5.2.4 By the first day of the first calendar quarter, five calendar years following Board of Trustees approval, each Generator Owner shall have verified 100 percent of its Facilities are fully compliant with Requirements R1, R2, R3, R4, and R6.

~~5.4.~~5.2.5 By the first day of the first quarter, six calendar years following Board of Trustees ~~adoption.~~ approval, each Generator Owner shall have verified 100 percent of its Facilities are fully compliant with Requirement R5.

B. Requirements

R1. Each Generator Owner that has generator frequency protective relaying[1] activated to trip its ~~new or existing~~ generating unit ~~or generating plant~~ shall set such protective relaying so that ~~it~~the frequency protective relaying does not operate to trip the unit within the "no trip zone" of PRC-024 Attachment 1, ~~unless the Generator Owner has documented and communicated each equipment limitation in accordance with Requirement R3 for an existing generating unit.~~[2]subject to the following exceptions: *[Violation Risk Factor: ~~High~~Medium] [Time Horizon: Long-term Planning]*

~~1.1. A generating unit or generating plant is allowed to trip within the "no trip zone" if the frequency rate of change is more than 2.5 Hz/sec.~~

~~1.2.~~• ~~A generating unit or generating plant~~ Generation may trip if the protective functions (such as out-of-step functions or loss-of-field functions) operate due to an impending or actual loss of synchronism or due to instability in power conversion control equipment.

• Generation may trip if clearing a system fault necessitates disconnecting the generation.

• Generation may trip within a portion of the "no trip zone" of PRC-024 Attachment 2 for documented and communicated equipment limitations in accordance with Requirement R3 for an existing generating unit[3].

R2. Each Generator Owner that has generator voltage protective relaying[1~~1~~] activated to trip its ~~new or existing~~ generating unit ~~or generating plant~~ shall set its protective relaying such that ~~it~~the voltage protective relaying does not trip as a result of a voltage excursion (at the point of interconnection[4]) caused by an event on the transmission system external to the generating plant that remains within the "no trip zone" of PRC-024 Attachment 2 or within the voltage recovery characteristics of a location-specific Transmission Planner's study if the Transmission Planner allows less stringent voltage relay settings than those

[1] Each Generator Owner is not required to have frequency or voltage protective relaying (including but not limited to frequency and voltage protective functions for discrete relays, volts per hertz relays evaluated at nominal frequency, impedance relays, voltage controlled overcurrent relays, multi-function protective devices or protective functions within control systems that directly trip or provide tripping signals to the generator based on frequency or voltage inputs) installed or activated on its unit.

~~[2] To include generators under construction, generators with an executed interconnection agreement or Power Purchase Agreement by the effective date of this standard, or generators with an executed equipment purchase contract and scheduled delivery of major components within 2 years of the effective date of Requirement R5 of Version 1 of this standard.~~

[3] To include generating units previously commissioned, or generating units under construction, or generating units with an executed interconnection agreement or power purchase agreement by the effective date of PRC-024-1 Requirement R5.

[4] For the purposes of this standard, point of interconnection means the transmission (high voltage) side of the generator step-up or collector transformer.

required to meet PRC-024 Attachment 2 ~~caused by an event on the transmission system external to the generating plant per~~ subject to the following exceptions ~~operating conditions and relay settings, unless the Generator Owner has documented and communicated each non-protection system equipment limitation in accordance with Requirement R3 for an existing generating unit[2] or generating plant.: *[Violation Risk Factor: High*~~: *[Violation Risk Factor: Medium*] *[Time Horizon: Long-term Planning]*

~~**2.1.** When operating within 95 percent to 105 percent of rated generator terminal voltage and during the transmission system operating conditions defined in PRC-024 Attachment 2, with the following clarifications:~~.

~~**2.1.1.** If a Transmission Planner's study (based on the location specific voltage recovery characteristics) allows less stringent voltage relay settings than those required to meet PRC-024 Attachment 2, set voltage relays either to meet the Transmission Planner's voltage recovery characteristics or the characteristics in PRC-024 Attachment 2.~~

~~**2.1.2.**~~ • Generation may ~~T~~tripping a ~~generator~~ in accordance with a Special Protection System (SPS) or Remedial Action Scheme (RAS) ~~is acceptable in the "no trip zone" of PRC-024 Attachment 2~~.

~~**2.1.3.**~~ • Generation may trip ~~I~~if clearing a system fault necessitates disconnecting the generation~~a generator, this action is acceptable within the "no trip zone" specified in PRC-024 Attachment 2~~.

~~**2.1.4.**~~ • ~~A g~~Generati~~o~~on~~g unit or generating plant~~ may trip by action of ~~if the~~ protective functions (such as out-of-step functions or loss-of-field functions) that operate due to an impending or actual loss of synchronism or, for asynchronous generating units, due to instability in power conversion control equipment.

• Generation may trip within a portion of the "no trip zone" of PRC-024 Attachment 2 for documented and communicated equipment limitations in accordance with Requirement R3 for an existing generating unit.

R3. Each Generator Owner of an existing generating unit ~~or generating plant~~ shall document each known equipment limitation (excluding limitations that are caused by generator frequency and voltage protective ~~relay limitations~~relays) that prevents a generating unit ~~or generating plant~~, from meeting the criteria in Requirements R1 or R2 (but not limited to) including study results, experience from an actual event, or manufacturer's advisory *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*.

3.1. The Generator Owner shall communicate the documented equipment limitation, or the removal of a previously documented equipment limitation, to its Reliability Coordinator, Planning Coordinator, Transmission Operator and Transmission Planner within 30 calendar days of identifying the equipment limitation or ~~to ensure the accuracy of planning studies and system modeling studies. The existing~~

~~generating unit or generating plant becomes subject to the full extent of Requirements R1 and R2 coincident with~~ or when either of the following ~~conditions~~occurs:

- The equipment causing the limitation is repaired or replaced with equipment that removes the limitation.
- The equipment causing the limitation is modified or upgraded resulting in an increase of generator nameplate capacity rating greater than 10 percent (cumulative from the first effective date of this Standard).

R4. Each Generator Owner of an existing generating unit ~~or generating plant shall provide an estimate of that unit's performance during Frequency/Voltage Excursions to each requesting entity~~shall provide an estimate of the time duration the existing generating unit will remain connected (considering performance of the auxiliary systems as well as the generator) if the unit were to experience a frequency or voltage excursion. The voltage or frequency profile at the point of interconnection is determined by dynamic simulation provided by ~~(~~a Reliability Coordinator, Planning Coordinator, Transmission Operator or Transmission Planner that monitors or models the associated generating unit and has requested the time duration estimate. The estimate is to be provided ~~or generating plant)~~ to the requesting Reliability Coordinator, Planning Coordinator, Transmission Operator or Transmission Planner within 60 calendar days of receipt of a written request~~, to ensure the accuracy of planning studies and system modeling studies~~. ~~The estimate shall include:~~ If the Generator Owner expects the existing generating unit will remain connected for longer than 10 minutes, the estimate should indicate the existing unit is not expected to trip. The Generator Owner may develop the estimates based on experience, actual event histories, or sound engineering judgment. Detailed unit performance studies are not required to develop the estimate. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

4.1. An estimate of the time duration the existing generating unit or generating plant will remain connected (considering performance of the auxiliary systems as well as the generator) as a result of a frequency excursion or a voltage excursion defined by the voltage or frequency profile at the point of interconnection described by dynamic simulation provided by the Transmission Planner. If the Generator Owner expects the existing unit, generating plant will remain connected for longer than 10 minutes, the estimate should indicate the existing unit or generating plant is not expected to trip.

4.2. Identification of the bases for the estimates developed for 4.1 which may include, but is not limited to: experience, actual event histories, or sound engineering judgment.

R5. Each Generator Owner shall design, build, and maintain its new [5] unit or new generating plant so that it (including auxiliary systems) consistent with the parameters set forth in PRC-024 Attachments 1 and 2, such that the generation, when operating at or above the minimum sustainable generation threshold (and for a generating plant consisting of multiple units with total generation greater than 75 MVA gross aggregate nameplate rating, when the generating plant is producing at least 20 percent of the plant's aggregate nameplate capacity) will not trip due to a frequency excursion or voltage excursion at the point of interconnection, caused by an event on the transmission system external to the generating plant, ~~within~~subject to the ~~parameters set forth in PRC-024 Attachments 1 and 2 and in accordance with the following conditions and~~ following exceptions: *[Violation Risk Factor: ~~High~~Medium] [Time Horizon: Real-time Operations]*

~~5.1. (condition) When the generating unit or generating plant is operating at or above the minimum sustainable generation threshold.~~

~~5.1.1. For a generating plant consisting of multiple units with total generation greater than 75 MVA (gross aggregate nameplate rating), when the generating plant is producing at least 20 percent of the plant's aggregate nameplate capacity.~~

- ~~5.2.~~ ~~(exception)~~ For a new generating plant consisting of multiple units less than 20 MVA each with total plant generation greater ~~than75~~than 75 MVA (gross aggregate nameplate rating), up to 10 percent of the individual generating units may disconnect as a result of the frequency or voltage excursion.
- ~~5.3.~~ ~~(exception) A generating unit or generating plant~~If the Transmission Planner has provided the Generator Owner with location-specific voltage recovery characteristics as described in Requirement R2, Part 2.2, then the generation may operate to a less stringent voltage ride-through performance criterion than the duration curve identified in PRC-024 Attachment 2 ~~based on the location-specific voltage recovery characteristics if provided by the Transmission Planner as described in Requirement 2, Part 2.1.1~~consistent with those provided characteristics.
- ~~5.4.~~ ~~(exception) A generating unit or generating plant~~Generation may trip if this action is designed as part of a Special Protection System (SPS) or Remedial Action Scheme (RAS).
- ~~5.5.~~ ~~(exception) A generating unit or generating plant~~Generation may trip if clearing a system fault necessitates disconnecting the ~~generating unit or generating plant~~generation.

[5] ~~Excluding generators in service prior to the effective date of Requirement R5 of Version 1 of this standard and excluding generators referenced in Footnote 2.~~

~~5.6.~~• ~~(exception) A generating unit or generating plant~~Generation may trip if the Generator Owner has a temporary exemption granted by its Reliability Coordinator based on a documented equipment limitation. ~~The Reliability Coordinator may retroactively grant a temporary exemption for~~ If an equipment limitation is identified following a plant trip caused by a frequency or voltage excursion, the Reliability Coordinator may grant a retroactive temporary exemption for that limitation if the Generator Owner develops and implements an acceptable ~~Mitigation Plan~~plan to address the limitation.

~~5.7.~~• ~~(exception) A generating unit or generating plant~~Generation may trip if the protective functions (such as out-of-step functions or loss-of-field functions) operate due to an impending or actual loss of synchronism or, for asynchronous generating units, due to instability in power conversion control equipment.

R6. Each Generator Owner shall provide its generator protection trip settings to the Reliability Coordinator, Planning Coordinator, Transmission Operator and Transmission Planner (that monitors or models the associated unit), within ~~30~~60 calendar days of receipt of a written request for the data, and within ~~30~~60 calendar days of any change to those previously requested trip settings unless otherwise directed by the requesting Reliability Coordinator, Planning Coordinator, Transmission Operator, or Transmission Planner~~, to ensure the accuracy of planning studies and system modeling~~. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

C. Measures

M1. Each Generator Owner shall have evidence such as dated setting sheets, calibration sheets, or other documentation, that generator frequency protective relays have been set in accordance with Requirement R1.

M2. Each Generator Owner shall have evidence such as dated setting sheets, voltage-time curves, calibration sheets, coordination plots or dynamic simulation studies, that generator voltage protective relays have been set in accordance with Requirement R2.

M3. Each Generator Owner shall have evidence that it has documented and communicated any equipment limitations (~~Protection System excluded~~excluding limitations that are caused by generator frequency and voltage protective relays) that resulted in an exception to Requirements R1 or R2 in accordance with Requirement R3 such as a dated email or letter that contains such documentation as study results, experience from an actual event, or manufacturer's advisory.

M4. Each Generator Owner shall have evidence such as a copy of the ~~performance~~estimate of time duration report and correspondence, such as dated e-mails, or other documentation that an estimate of the ~~performance~~time duration of its existing generating unit(s) as a result of a ~~Frequency Excursion~~frequency excursion or ~~Voltage Excursion~~voltage excursion has been communicated in accordance with Requirement R4, and copies of any requests it has received for that information.

M5. Each Generator Owner shall have evidence, such as dated unit output records, trip investigation reports or disturbance monitoring records, showing that each unit trip did not result from a ~~Frequency Excursion~~frequency excursion or ~~Voltage Excursion~~voltage excursion as specified in Requirement R5, or evidence that a listed exception applied~~, or provide an attestation that the generating unit or generating plant did not trip~~.

M6. Each Generator Owner shall have evidence such as dated e-mails, correspondence or other evidence that it communicated generator protective relay settings to a requesting entity within ~~30~~60 calendar days of a request or change in setting(s) in accordance with Requirement R6 and copies of any requests it has received for that information~~.~~.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

~~Regional Entity~~The Regional Entity shall serve as the Compliance enforcement authority unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases, the ERO or a Regional entity approved by FERC or other applicable governmental authority shall serve as the CEA.

1.2. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Generator Owner shall ~~keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:~~

~~•~~ ~~The Generator Owner shall retain the latest evidence of~~retain evidence of compliance with Requirement R1 through R6, ~~Measure~~Measures M1 through M6; ~~and shall retain prior evidence~~ for 3 ~~calendar~~ years or until the next audit, whichever is longer.

If a Generator Owner is found non-compliant, ~~it~~the Generator Owner shall keep information related to the non-compliance until mitigation is complete and approved ~~found compliant or~~ for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes

Voltage Ride-Through Curve Clarifications

Curve Details:

1. The per unit voltage base for these curves is the ~~base~~nominal operating voltage specified ~~in the system models used~~ by the Transmission Planner in the analysis of the reliability of the Interconnected Transmission Systems at the point of interconnection to the Bulk Electric System (BES).

2. The curves depicted were derived based on three-phase transmission system zone 1 faults with Normal Clearing not exceeding 9 cycles. The curves apply to voltage excursions regardless of the type of initiating event.

3. The envelope within the curves represents the cumulative voltage duration at the point of interconnection with the BES. For example, if the voltage exceeds 1.15 pu at 0.3 seconds after a fault, does not exceed 1.2 pu voltage, and returns below 1.15 pu at 0.4 seconds, then the cumulative time the voltage is above 1.15 pu voltage is 0.1 seconds and is within the no trip zone of the curve.

4. The curves depicted assume system frequency is 60 Hertz. Adjust the magnitude of the high voltage curve in proportion to deviations of frequency below normal.

5. Voltages in the curve assume minimum fundamental frequency phase-to-ground or phase-to-phase voltage for the low voltage duration curve and the greater of maximum RMS or crest ~~phase-to-ground or~~ phase-to-phase voltage for the high voltage duration curve.

Evaluating Protective Relay Settings:

~~6.~~1. Use the following assumptions to evaluate voltage protection relay setting calculations on the static case for steady state initial conditions:

    a. All of the units connected to the same transformer are online and operating,

    b. All of the units are at full nameplate real-power output.

    c. Power factor is 0.95 lagging (i.e. supplying reactive power to the system) as measured at the generator terminals).

~~7.~~2. Evaluate voltage protection relay settings assuming that additional installed generating plant reactive support equipment (such as static VAr compensators, synchronous condensers, or capacitors) is available and operating normally.

~~8.~~3. Evaluate voltage protection relay settings accounting for the actual tap settings of transformers between the generator terminals and the point of interconnection.

Implementation Plan

Project 2007-09 Generator Verification

Implementation Plan for PRC-024-1, Generator Performance During Frequency and Voltage Excursions

Approvals Required

PRC-024-1 – Generator Performance During Frequency and Voltage Excursions.

According to its Implementation Plan, PRC-006-1, Requirement R4 (see project 2007-01, Underfrequency Load Shedding) does not become effective until PRC-024 becomes effective. Upon the effective date of PRC-024-1, R4 of PRC-006-1 will also go into effect.

Prerequisite Approvals

None

Revisions to Glossary Terms

None

Applicable Entities

Generator Owner

Conforming Changes to Other Standards

None

Effective Dates

In those jurisdictions where regulatory approval is required:

- By the first day of the first calendar quarter, two calendar years following applicable regulatory approval, each Generator Owner shall have verified at least 40 percent of its applicable Facilities are fully compliant with Requirements R1, R2, R3, R4, and R6.

- By the first day of the first calendar quarter, three calendar years following applicable regulatory approval, each Generator Owner shall have verified at least 60 percent of its applicable Facilities are fully compliant with Requirements R1, R2, R3, R4, and R6.

- By the first day of the first calendar quarter, four calendar years following applicable regulatory approval, each Generator Owner shall have verified at least 80 percent of its applicable Facilities are fully compliant with Requirements R1, R2, R3, R4, and R6.

- By the first day of the first calendar quarter, five calendar years following applicable regulatory approval, each Generator Owner shall have verified 100 percent of its applicable Facilities are fully compliant with Requirements R1, R2, R3, R4, and R6.

- By the first day of the first calendar quarter, six calendar years following applicable regulatory approval, each Generator Owner shall have verified 100 percent of its applicable Facilities are fully compliant with Requirement R5.

In those jurisdictions where regulatory approval is not required:

- By the first day of the first calendar quarter, two calendar years following Board of Trustees approval, each Generator Owner shall have verified at least 40 percent of its applicable Facilities are fully compliant with Requirements R1, R2, R3, R4, and R6.

- By the first day of the first calendar quarter, three calendar years following Board of Trustees approval, each Generator Owner shall have verified at least 60 percent of its applicable Facilities are fully compliant with Requirements R1, R2, R3, R4, and R6.

- By the first day of the first calendar quarter, four calendar years following Board of Trustees approval, each Generator Owner shall have verified at least 80 percent of its applicable Facilities are fully compliant with Requirements R1, R2, R3, R4, and R6.

- By the first day of the first calendar quarter, five calendar years following Board of Trustees approval, each Generator Owner shall have verified 100 percent of its applicable Facilities are fully compliant with Requirements R1, R2, R3, R4, and R6.

- By the first day of the first quarter, six calendar years following Board of Trustees approval, each Generator Owner shall have verified 100 percent of its applicable Facilities are fully compliant with Requirement R5.

Retirements

None

Justification of Phasing

Requirements R1, R2, R3, R4, and R6 involve evaluation of existing protection system settings and equipment capabilities. Typically, generator protection system setting changes are made during scheduled generator outages. The Implementation Plan allows a five-year window for these changes to be made which corresponds to typical outage cycles. Generating units that have outage cycles that extend longer than five years are not typically base loaded and offer opportunities to effect protection system settings changes during economic shut down periods.

Requirement R5 involves the performance of complete generation facilities (i.e. the prime mover, its fuel supply, and all auxiliary systems). To date, most Generator Owners have not specified this type of performance and the engineering companies designing generating facilities have not designed the facilities to ride through frequency and voltage excursions of the severity specified in PRC-024. In order to allow Generator Owners and architect/engineering companies time to develop new designs to meet R5, the SDT allows six years from regulatory approval for implementation.

Unofficial Comment Form
MOD-026-1

Instructions

Please **DO NOT** use this form for commenting. Please use the electronic comment form to submit comments on the proposed revisions to MOD-026-1. Comments must be submitted by 8 p.m. ET **October 29, 2012**. If you have questions please contact Stephen Crutchfield at Stephen.crutchfield@nerc.net or by telephone at 609-651-9455.

Background Information:

The GVSDT posted the draft standard, MOD-026-1, February 29 – March 29, 2012 for a formal comment period and successive. The GVSDT received valuable feedback from stakeholders regarding improvements to the standard. Many of the suggested edits were incorporated into the revised standard.

The vast majority of the industry commenters agreed with the concept of specifying that validation is not required for an excitation control system or plant volt/var control that does not include an active closed loop voltage regulation function. The GVSDT received comments regarding other aspects of the standard. Several Industry commenters indicated that it was not clear if the table was associated with Attachment 1 or not. In response, the SDT has re-formatted Attachment 1 to make it clear that the table is a part of Attachment 1. Also, some commenters were concerned that Table 1 inferred that plants with complex reactive coordination controllers may be unduly exempted from being applicable. The SDT clarified that for plants that include devices that provide dynamic voltage regulation (such as a STATCOM, DVAR or SVC, commonly found in Renewable Plants), these devices should be included in the model and should be validated. The intent of this language was to exempt only those units or plants that did not contain any closed loop voltage regulation function. The SDT added some clarifying verbiage to the appropriate row in Table 1 that ultimately references Footnote 1 in the standard.

Most of industry commented that they agreed with the guidance provided by the SDT on the periodicity aspects of Attachment 1. Many commenters did not correlate the guidance on the periodicity aspects of Attachment 1 to the examples “above” in the Background section of the Comment Form. Please see the Summary Consideration section for Question 5 as there were several comments regarding the periodicity examples.

The majority of the industry commenters agreed with specifying the capacity factor calculation in Appendix F of the GADS Data Reporting Instructions. Also, many of the commenters pointed out that neither the net or gross calculation was specified in the standard and suggested the SDT use the "net" calculation. As such, the SDT has revised the draft standard to reference the net capacity factor calculation in Appendix F of the GADS Data Reporting Instructions. Finally, the SDT moved the details of the capacity factor exemption concept from a footnote in the Applicability section to a row (Row 7) in the Periodicity Table. The team thought that would be appropriate as the Periodicity Table already included the "equivalent" unit concept (Row 4).

The following modifications to the draft standard were incorporated as a result of industry comments:

1. A significant number of industry commenters opposed the use of the term "bulk power system" in the Applicability section. The SDT did not mean to convey a modification in the breadth of units which would be covered by the standard as "bulk power system" is a term used in the Compliance Registry. But based on the concerns expressed by industry, the SDT has replaced the term "bulk power system" with the NERC defined term "Bulk Electric System".
2. The SDT has refined verbiage and the format in the standard applicability and Part 2.1 to clarify the use of individual and aggregate models for plants.
3. The SDT removed the footnote regarding standby units as industry comments suggested that it did not provide additional clarity to the Applicability.
4. The SDT replaced "Planning Coordinator" with "Transmission Planner" in the standard. The Functional Model for the Transmission Planner is more in line with the task described in the standard.
5. The SDT revised the Applicability section 4.2.4 to make it clear that it applied to technically justified units that meet the NERC Registry criteria. It is emphasized that "technical justification" is defined by demonstrating that the simulated unit or plant response does not match the measured unit or plant response.
6. Subpart 2.2 has been re-worded and merged into Subpart 2.1. The new verbiage makes it clear that the expert performing the model verification has flexibility regarding if the model should be represented by individual unit or plant aggregate models or any combination therein as dictated by the specific situation. This merger also results in appropriate mapping to the VSLs.
7. The SDT has refined section 4.2.1, 4.2.2, and 4.2.3 of the standard applicability.
8. The SDT has re-formatted the Periodicity Table (Attachment 1) to make it clearer that the table is included.
9. Revised the Periodicity Table (Attachment 1) extensively for clarity, including removing specificity regarding when the voltage excursion used for model verification had to be

captured. This resulted in a modification of the required times for re-verifying the model for exception (Requirements R3 and R4) type activities.

10. The SDT made corrections to VSL verbiage (less than or equal to with respect to days late) and replaced Planning Coordinator with Transmission Planner.

11. In Requirement R5, in describing checking the actual equipment to determine if updated model data could be obtained, the expression “walk down” was replaced by “on-site review” of the equipment.

12. The term “inertia” was modified to “total inertia” in Subpart 2.1.3 as some industry commenters expressed concern that reference to “inertia” only would lead to submittal of an inertia constant reflective only of the generator, as opposed to all of the mass attached to the shaft.

13. In Subpart 2.1.1, the specific reference to point of interconnection has been removed. The location where the unit’s response is measured is left to the model verification expert.

14. The second bullet in Requirement R1 has been modified to be the same style and sentence structure used in the first bullet of Requirement R1.

15. The SDT has removed the term “generating plant / Facility” and replaced it with “individual generating plant consisting of multiple generation units that are directly connected at a common BES bus” only from various sections of the applicability section of the standard for clarity.

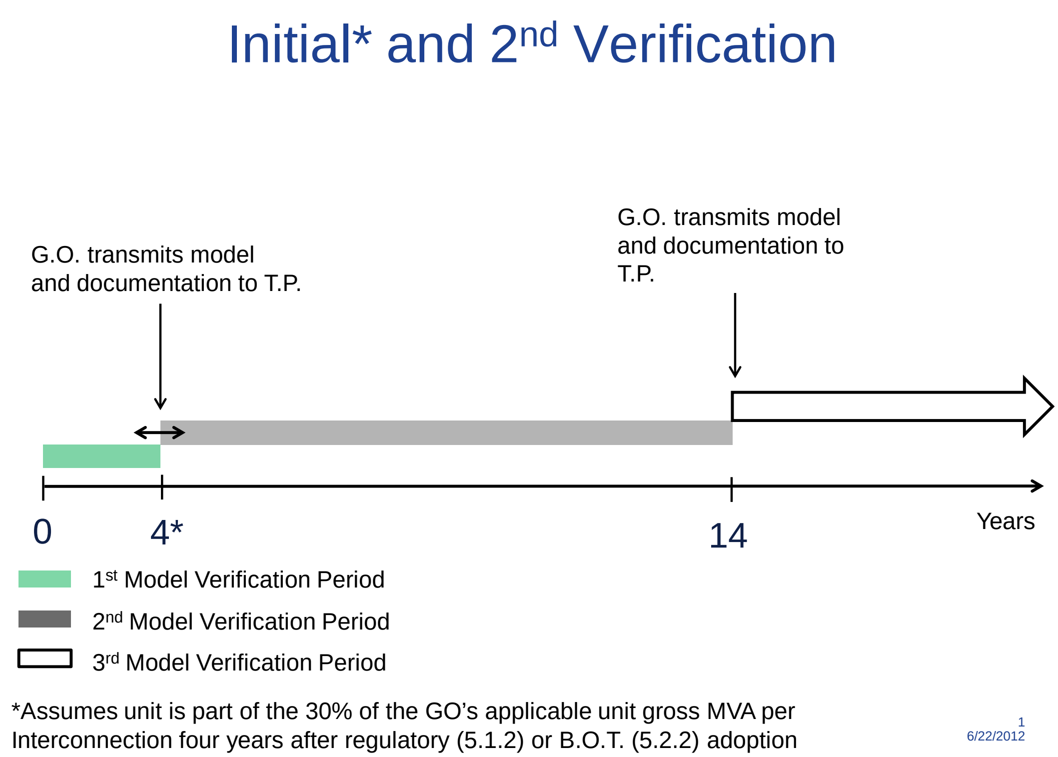
16. The SDT modified the phrase "generator excitation control system and plant volt/var control functions” to “generator excitation control system or plant volt/var control functions” to recognize that the use of the phrase “or” is technically correct the vast majority of the time.

Periodicity Table (Attachment 1) for MOD-026-1:

Based on industry comments from the last posting, the GVSDT modified the Periodicity Table (Attachment 1) to make it to make it significantly simpler and concise. In an effort to re-enforce the resulting modifications detailed in the current draft of the Periodicity Table, the following examples are offered by the GVSDT to aid industry in understanding the proposed model verification periodicity:

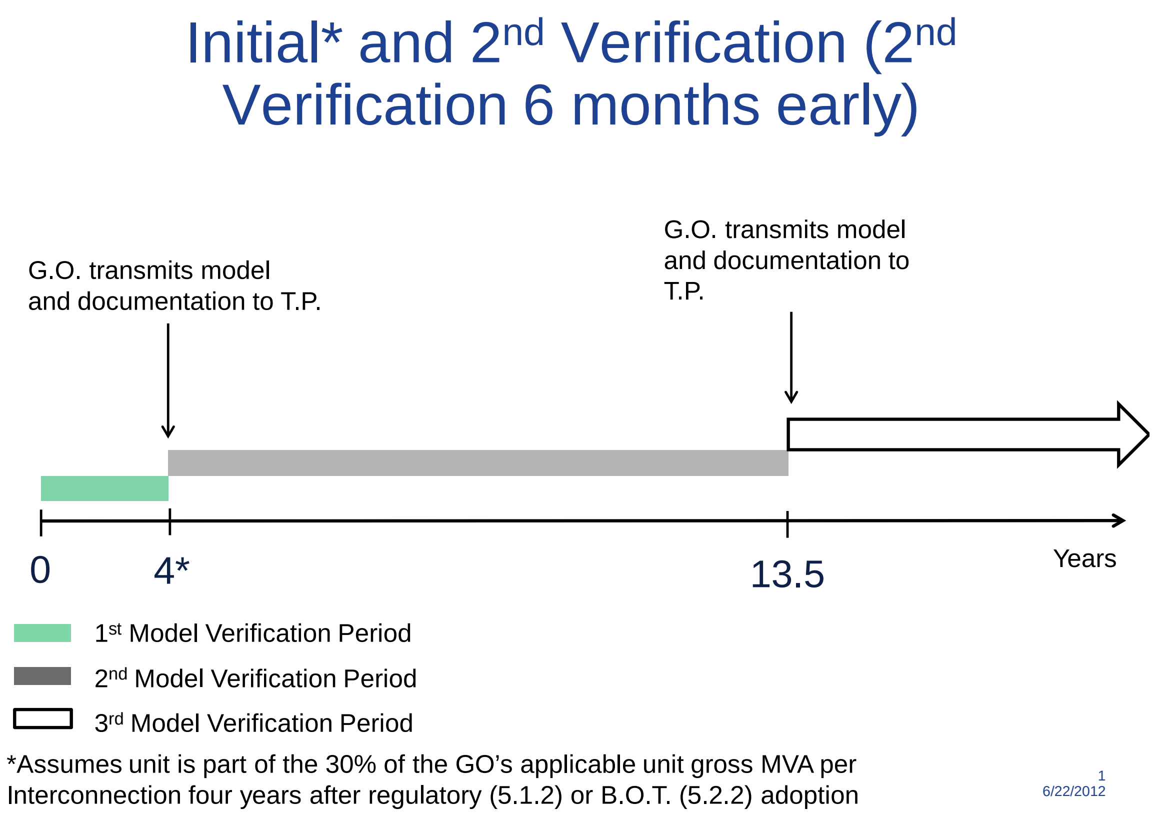
Periodicity Example 1:

The following timeline depicts a model which is initially verified, and then is verified again after a 10-year period. It is assumed that a unit is part of the 30% of the Generator Owners applicable unit's gross MVA per Interconnection four years after regulatory or NERC B.O.T. adoption used to meet the Effective Date requirements for Requirement R2. The requirements detailing activities by exception do not occur (Requirements R3 – R5) – which is expected to be the situation for the majority of the time. Note that the date of the collection of a recording of the actual equipment response to a voltage excursion is not needed to satisfy compliance. The recording of the actual equipment response simply has to occur in a timeframe which allows the GO time to finish verification and subsequently transmit the verified model including the verification documentation and model data by the required dates in the Periodicity Table. For this example, those required dates are Year four (first day of the first calendar quarter following regulatory or B.O.T. approval) – then 10 years after the submittal of the previous verification [Year 14] – then, again, 10 years after the submittal of the previous verification [Year 24]:



Periodicity Example 2:

The second example is much like Example 1. The only difference is that for the second verification, the Generator Owner finished model verification and submitted to its Transmission Planner the verified model including the model verification documentation and model data six months early. Regarding the third verification (which is not shown on the example below), the GO would be required to submit the verified model including the model verification documentation and model data on or before 10 years after the submittal of the previous verification (i.e., Year 23.5 or earlier).



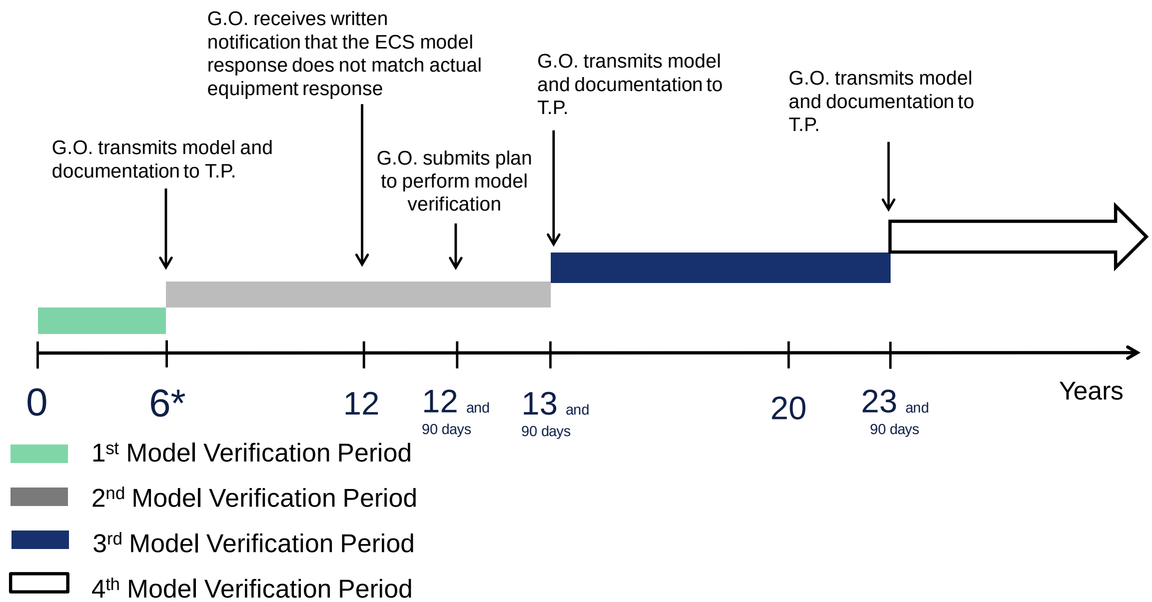
Periodicity Example 3:

In the third example, it is assumed that a unit is part of the 50% of the Generator Owners applicable unit's gross MVA per Interconnection six years after regulatory or NERC B.O.T. adoption used to meet the Effective Date requirements for Requirement R2. Following the initial verification, the third example details a scenario which the SDT anticipates would rarely occur. Specifically, the scenario assumes that at sometime after the initial verification, the Generator Owner receives written notification that there is evidence that the model does not accurately predict the actual response of the equipment. As detailed in Requirement R3, the Generator Owner has 90 days to respond to the notice. The Generator Owner may respond that the model is still appropriate, or submit model changes – or it may submit a plan to re-verify the model. The example below assumes that later – i.e., the Generator Owner submits a plan to re-verify the model on the 90th day.

From that point, per the Periodicity Table, the Generator Owner has 365 days to record and collect equipment response for a voltage excursion, perform model verification, and transmit the model and model verification documentation and data to the Transmission Planner. Regarding the third verification, the GO would be required to submit the verified model including the model verification documentation and model data on or before 10 years after the submittal of the previous verification (i.e., Year 23 plus 90 days or earlier).

Finally, regarding the fourth verification (which is not shown in its entirety on the example below), the GO would be required to submit the verified model including the model verification documentation and model data on or before 10 years after the submittal of the previous verification (i.e., Year 33 plus 90 days or earlier).

Initial Verification*, G.O. receives written comments that model does not predict equipment response



*Assumes unit is part of the 50% of the GO's applicable unit gross MVA per Interconnection six years after regulatory (5.1.3) or B.O.T. (5.2.3) adoption

Background Information

The Generator Verification Standard Drafting Team posted PRC-024-1, Generator Performance During Frequency and Voltage Excursions from February 29 through March 29, 2012 for a 30 day concurrent comment / successive ballot period. The GVSDT received valuable feedback from stakeholders regarding improvements to the standard. Many of the suggested edits were incorporated into the revised standard.

A slight majority of stakeholders were in agreement with the approach taken for Requirement R4. Of the stakeholders who did not agree with the approach, the reasons most often cited were that such estimates would not provide any reliability benefit, the estimates are difficult to calculate, and the time period allowed to respond to a request for an estimate (60 days) is too short. The SDT modified the structure of the requirement to clarify the intent and the limits of what entities could request a performance estimate, but did not change the time period allowed to respond.

A large majority of stakeholders indicated that they did not agree that it is technically achievable for new generation to meet the performance required in Requirement R5. The most common reason stated was that Attachment 1 did not correctly specify the WECC region underfrequency tripping limits. Other objections cited by more than one responder were that the curves in Attachments 1 and 2 are too stringent, that significant R&D work needs to be done on the design of a plant to meet the requirement, and that the cost of building such a plant would be too high with little corresponding gain in grid reliability. The SDT corrected the error in the Attachment 1 underfrequency curve and data table for the Western Interconnection. The SDT did not make any substantive changes to Requirement R5 since the SDT did not feel stakeholders presented valid arguments that the requirement could not be achieved technically, given that similar requirements are already in effect in other parts of the world.

Other specific revisions to the standard are:

- The Effective Date section was modified for Requirements R1, R2, R3, R4, and R6 to reflect a five-year implementation at the request of several stakeholders.
- The wording in Requirement R1 was revised for clarity, Part 1.1 (rate of change of frequency) was removed and new bulleted items were added for consistency with Requirement R2 at the request of several stakeholders.
- Minor changes in the wording in Requirement R2 were made to improve clarity at the request of several stakeholders.
- The structure of Requirement R4 was modified and minor wording changes were made to improve clarity at the request of several stakeholders, though no changes were made to the intent of the requirement.
- Part 5.1 and Subpart 5.1.1 were incorporated into the body of Requirement R5 so that the remaining Parts of this requirement describe exceptions (i.e. allowances to trip).
- Minor wording changes were made at the request of multiple stakeholders to clarify wording in Parts 5.1 – 5.6 of Requirement R5.
- The allowable time to respond to a request for generator protection settings in Requirement R6 was increased from 30 days to 60 days at the request of several stakeholders.
- The Violation Risk Factors for Requirements R1, R2, and R5 were changed from High to Medium at the request of several stakeholders.
- Minor wording changes were made to Measures M3, M4, and M5 were made for clarity at the request of several stakeholders.
- The time frame referenced in Measure M6 was modified to correlate with the change made in Requirement R6.
- The wording in the Data Retention section was revised at the request of one stakeholder and now reflects the wording used in other recently-approved standards.
- Minor changes were made in the VSL's for Requirements R1, R2, R3, and R4 to add clarity or correct errors mentioned by several stakeholders.
- The wording in the Severe VSL for Requirement R5 was revised to add a reference to Parts 5.1 – 5.6 and the tardiness levels in the Requirement R6 VSL's were revised to reflect the change in the requirement.
- The underfrequency curve for the Western Interconnection and corresponding data table were corrected in Attachment 1 at the request of many stakeholders in the WECC region.
- Curves for the ERCOT Interconnection and a corresponding data table were added to Attachment 1 at the request of ERCOT.
- The term "base voltage" was replaced with "nominal operating voltage" in Clarification #1 to Attachment 2 at the request of several stakeholders.

- Minor wording changes were also made to Clarifications #2, and #5 to better convey the intent of the SDT in response to questions presented by several stakeholders.

Violation Risk Factor and Violation Severity Level Assignments

Project 2007-09 Generator Verification

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in MOD-026-1 — Verification of Models and Data for Generator Excitation Control System and Plant Volt/Var Control Functions.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

Justification for Assignment of Violation Risk Factors

The Generator Verification Standard Drafting Team applied the following NERC criteria when proposing VRFs for the requirements under this project:

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

The SDT also considered consistency with the FERC Violation Risk Factor Guidelines for setting VRFs:[1]

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report
The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:[2]

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

Guideline (2) — Consistency within a Reliability Standard
The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) — Consistency among Reliability Standards

---

[1] North American Electric Reliability Corp., 119 FERC ¶ 61,145, order on reh'g and compliance filing, 120 FERC ¶ 61,145 (2007) ("VRF Rehearing Order").
[2] Id. at footnote 15.

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

The following discussion addresses how the SDT considered FERC's VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's Reliability Standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and therefore concentrated its approach on the reliability impact of the requirements.

VRF for MOD-026-1:

There are six requirements in MOD-026-1. Four requirements were assigned a "Lower" VRF while the remaining two were assigned a "Medium" VRF.

VRF for MOD-026-1, Requirement R1:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R1 does not contain Parts. Requirement obligations include actions similar in scope to actions specified in Requirement R6; and all standard requirements specify either an Operations Planning or a Long-term Planning Time Horizon.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar to MOD-004-1, Requirement R9 that has an approved Lower VRF. This requirement is also similar to draft standard MOD-027-1 Requirement R1 which also specifies a Lower VRF.
- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to provide requested information is a requirement that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Therefore the assigned "Lower" VRF is appropriate.

- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R1 high risk objective is to provide requested information. This requirement is administrative in nature for providing instructions and data used for performing model verification. The "Lower" VRF assigned is based on the high risk objective specified.

VRF for MOD-026-1, Requirement R2:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R2 contains Parts specifying supporting obligations for satisfying the main requirement. The VRFs are only applied at the Requirement level and each Requirement Part is treated equally. Requirement obligations include actions similar in scope to actions specified in Requirement R1 and R6; and all standard requirements specify either an Operations Planning or a Long-term Planning Time Horizon.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar with MOD-010-0 and MOD-012-0 Requirements R1 and R2 that have approved VRFs of Medium. This requirement is also similar to draft standard MOD-027-1 Requirement R2 which also specifies a Medium VRF.
- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to verify models in the Long-term Planning Time Horizon is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Therefore the assigned "Medium" VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R2 high risk objective is to verify models per specified periodicity. Requirement Parts and obligations are lower risk elements that ensure main requirement completeness which are administrative in nature consisting of documentation, information revision obligation and submission requirements. The "Medium" VRF assigned is based on the high risk objective specified.

VRF for MOD-026-1, Requirement R3:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R3 does not contain Parts. Requirement obligations include actions similar in scope to actions specified in Requirement R1 and R6; and all standard requirements specify either an Operations Planning or a Long-term Planning Time Horizon.

- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar to MOD-004-1, Requirement R7 and R8 that has an approved Lower VRF. This requirement is also similar to draft standard MOD-027-1 Requirement R3 which also specifies a Lower VRF.
- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to verify models in the Long-term Planning Time Horizon is a requirement that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Therefore the assigned "Lower" VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R3 high risk objective is to provide a written response after receiving notice. The Requirement is administrative in nature consisting of documentation, information revision obligation and submission requirements. The "Lower" VRF assigned is based on the high risk objective specified.

VRF for MOD-026-1, Requirement R4:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R4 does not contain Parts. Requirement obligations include actions similar in scope to actions specified in Requirement R1 and R6; and all standard requirements specify either an Operations Planning or a Long-term Planning Time Horizon.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar to MOD-004-1, Requirement R1 and R2 that has an approved Lower VRF. This requirement is also similar to draft standard MOD-027-1 Requirement R4 which also specifies a Lower VRF.
- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to verify models in the Long-term Planning Time Horizon is a requirement that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Therefore the assigned "Lower" VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R4 high risk objective is to provide revised data after making changes to equipment. The Requirement is administrative in nature consisting of documentation, information revision obligation and submission requirements. The "Lower" VRF assigned is based on the high risk objective specified.

VRF for MOD-026-1, Requirement R5:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R5 contains Parts specifying supporting obligations for satisfying the main requirement. The VRFs are only applied at the Requirement level and each Requirement Part is treated equally. Requirement obligations include actions similar in scope to actions specified in Requirement R1 and R6; and all standard requirements specify either an Operations Planning or a Long-term Planning Time Horizon.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar to MOD-004-1, Requirement R7 and R8 that has an approved Lower VRF. This requirement is also similar to draft standard MOD-027-1 Requirement R3 which also specifies a Lower VRF.
- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to verify models in the Long-term Planning Time Horizon is a requirement that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Therefore the assigned "Lower" VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R5 high risk objective is to provide a written response after receiving a request. Requirement Parts and obligations are lower risk elements that ensure main requirement completeness which are administrative in nature consisting of documentation, information revision obligation and submission requirements. The "Lower" VRF assigned is based on the high risk objective specified.

VRF for MOD-026-1, Requirement R6:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R6 contains Parts specifying supporting obligations for satisfying the main requirement. The VRFs are only applied at the Requirement level and each Requirement Part represents an obligation for ensuring main requirement completeness. Requirement obligations include actions similar in scope to actions specified in Requirement R1; and all standard requirements specify either an Operations Planning or a Long-term Planning Time Horizon.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar with MOD-010-0 and MOD-012-0 Requirements R1 and R2 that have approved VRFs of Medium. This requirement is also similar to draft standard MOD-027-1 Requirement R5 which also specifies a Medium VRF.
- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to identify if a model is useable or not is a requirement that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to

effectively monitor, control, or restore the bulk electric system. Therefore the assigned "Medium" VRF is appropriate.

- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R6 high risk objective is to verify if the model is useable or not. Requirement Parts and obligations are lower risk elements that ensure main requirement completeness which are administrative in nature consisting of documentation and submission requirements. The "Medium" VRF assigned is based on the high risk objective specified.

Justification for Assignment of Violation Severity Levels:

In developing the VSLs for the standards under this project, the SDT anticipated the evidence that would be reviewed during an audit, and developed its VSLs based on the noncompliance an auditor may find during a typical audit. The SDT based its assignment of VSLs on the following NERC criteria:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

FERC's VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in MOD-026-1 meet the FERC Guidelines for assessing VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.

Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

VSLs for MOD-026-1 Requirement R1:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R1.	The NERC VSL guidelines are satisfied by incorporating increments for tardiness VSL elements. The SDT has determined a 30 day "Increments for Tardiness" period is appropriate for standard VSLs proposed.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's incorporate the increments for tardiness methodology. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on timeliness of the action specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action and if information submission is timely. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

VSLs for MOD-026-1 Requirement R2:

R#	Compliance with NERC Revised VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R2.	The NERC VSL guidelines are satisfied by incorporating increments for tardiness with completeness of information required for the main Requirement action. The SDT has determined a 30 day "Increments for Tardiness" period is appropriate for standard VSLs proposed.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's consider completeness of listed parts deemed to possess equal reliability weight and also increments for tardiness. Binary requirements are categorized as severe. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on binary performance, and both completeness and timeliness of the actions and obligations specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action and if information submission is complete. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

VSLs for MOD-026-1 Requirement R3:

R#	Compliance with NERC Revised VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R3.	The NERC VSL guidelines are satisfied by incorporating increments for tardiness VSL elements for the main Requirement action. Actions and obligations specified in the Requirement Parts incorporate a binary element, consideration for omitting required information. The SDT has determined a 30 day “Increments for Tardiness” period is appropriate for standard VSLs proposed.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL’s are a combination of a binary element and increments for tardiness. Binary requirements are categorized as severe. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on binary performance, and both completeness and timeliness of the actions and obligations specified.	Proposed VSL’s do not expand on what is required in the requirement. The VSL’s assigned only consider performing required action and if information submission is both complete and provided in a timely manner. Proposed VSL’s are consistent with the requirement.	Proposed VSL’s are based on a single violation and not a cumulative violation methodology.

VSLs for MOD-026-1 Requirement R4:

R#	Compliance with NERC Revised VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R4.	The NERC VSL guidelines are satisfied by incorporating increments for tardiness VSL elements for the main Requirement action. The SDT has determined a 30 day "Increments for Tardiness" period is appropriate for standard VSLs proposed.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's utilize increments for tardiness rationale. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on timeliness of the actions and obligations specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action and if information submission is complete and provided in a timely manner. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

VSLs for MOD-026-1 Requirement R5:

R#	Compliance with NERC Revised VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R5.	The NERC VSL guidelines are satisfied by incorporating equal multiple parts criteria VSL elements for the main Requirement action. Actions and obligations specified in the Requirement Parts also incorporate increments for tardiness consideration. The SDT has determined a 30 day "Increments for Tardiness" period is appropriate for standard VSLs proposed.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's are a combination of completeness of listed parts deemed to possess equal reliability weight and also increments for tardiness. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on both completeness and timeliness of the actions and obligations specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action and if information submission is both complete and provided in a timely manner. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

VSLs for MOD-026-1 Requirement R6:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R6.	The NERC VSL guidelines are satisfied by incorporating increments for tardiness VSL elements for the Main Requirement action. Actions specified in the Requirement Parts incorporate completeness of the actions and obligations specified. The SDT has determined a 30 day "Increments for Tardiness" period is appropriate for standard VSLs proposed.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's are a combination of completeness of listed parts and also increments for tardiness. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on both completeness and timeliness of the actions and obligations specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action and if information submission is both complete provided in a timely manner. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

NERC
NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Violation Risk Factor and Violation Severity Level Assignments

Project 2007-09 Generator Verification

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in MOD-026-1 — Verification of Models and Data for Generator Excitation Control System and Plant Volt/Var Control Functions.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

Justification for Assignment of Violation Risk Factors

The Generator Verification Standard Drafting Team applied the following NERC criteria when proposing VRFs for the requirements under this project:

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

The SDT also considered consistency with the FERC Violation Risk Factor Guidelines for setting VRFs:[1]

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:[2]

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

Guideline (2) — Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) — Consistency among Reliability Standards

[1] North American Electric Reliability Corp., 119 FERC ¶ 61,145, order on reh'g and compliance filing, 120 FERC ¶ 61,145 (2007) ("VRF Rehearing Order").
[2] Id. at footnote 15.

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

The following discussion addresses how the SDT considered FERC's VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's Reliability Standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and therefore concentrated its approach on the reliability impact of the requirements.

VRF for MOD-026-1:

There are six requirements in MOD-026-1. Four requirements were assigned a "Lower" VRF while the remaining two were assigned a "Medium" VRF.

VRF for MOD-026-1, Requirement R1:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R1 does not contain Parts. Requirement obligations include actions similar in scope to actions specified in Requirement R6; and all standard requirements specify either an Operations Planning or a Long-term Planning Time Horizon.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar to MOD-004-1, Requirement R9 that has an approved Lower VRF. This requirement is also similar to draft standard MOD-027-1 Requirement R1 which also specifies a Lower VRF.
- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to provide requested information is a requirement that ~~is administrative in nature for the planning time frame that~~, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Therefore the assigned "Lower" VRF is appropriate.

- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R1 high risk objective is to provide requested information. This requirement is administrative in nature for providing instructions and data used for performing model verification. The "Lower" VRF assigned is based on the high risk objective specified.

VRF for MOD-026-1, Requirement R2:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R2 contains Parts specifying supporting obligations for satisfying the main requirement. The VRFs are only applied at the Requirement level and each Requirement Part is treated equally. Requirement obligations include actions similar in scope to actions specified in Requirement R1 and R6; and all standard requirements specify either an Operations Planning or a Long-term Planning Time Horizon.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar with MOD-010-0 and MOD-012-0 Requirements R1 and R2 that have approved VRFs of Medium. This requirement is also similar to draft standard MOD-027-1 Requirement R2 which also specifies a Medium VRF.
- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to verify models in the Long-term Planning Time Horizon is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Therefore the assigned "Medium" VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R2 high risk objective is to verify models per specified periodicity. Requirement Parts and obligations are lower risk elements that ensure main requirement completeness which are administrative in nature consisting of documentation, information revision obligation and submission requirements. The "Medium" VRF assigned is based on the high risk objective specified.

VRF for MOD-026-1, Requirement R3:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R3 does not contain Parts. Requirement obligations include actions similar in scope to actions specified in Requirement R1 and R6; and all standard requirements specify either an Operations Planning or a Long-term Planning Time Horizon.

- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar to MOD-004-1, Requirement R7 and R8 that has an approved Lower VRF. This requirement is also similar to draft standard MOD-027-1 Requirement R3 which also specifies a Lower VRF.
- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to verify models in the Long-term Planning Time Horizon is a requirement ~~in a planning time frame~~ that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Therefore the assigned "Lower" VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R3 high risk objective is to provide a written response after receiving notice. The Requirement is administrative in nature consisting of documentation, information revision obligation and submission requirements. The "Lower" VRF assigned is based on the high risk objective specified.

VRF for MOD-026-1, Requirement R4:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R4 does not contain Parts. Requirement obligations include actions similar in scope to actions specified in Requirement R1 and R6; and all standard requirements specify either an Operations Planning or a Long-term Planning Time Horizon.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar to MOD-004-1, Requirement R1 and R2 that has an approved Lower VRF. This requirement is also similar to draft standard MOD-027-1 Requirement R4 which also specifies a Lower VRF.
- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to verify models in the Long-term Planning Time Horizon is a requirement ~~in a planning time frame~~ that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Therefore the assigned "Lower" VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R4 high risk objective is to provide revised data after making changes to equipment. The Requirement is administrative in nature consisting of documentation, information revision obligation and submission requirements. The "Lower" VRF assigned is based on the high risk objective specified.

VRF for MOD-026-1, Requirement R5:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R5 contains Parts specifying supporting obligations for satisfying the main requirement. The VRFs are only applied at the Requirement level and each Requirement Part is treated equally. Requirement obligations include actions similar in scope to actions specified in Requirement R1 and R6; and all standard requirements specify either an Operations Planning or a Long-term Planning Time Horizon.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar to MOD-004-1, Requirement R7 and R8 that has an approved Lower VRF. This requirement is also similar to draft standard MOD-027-1 Requirement R3 which also specifies a Lower VRF.
- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to verify models in the Long-term Planning Time Horizon is a requirement ~~in a planning time frame~~ that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Therefore the assigned "Lower" VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R5 high risk objective is to provide a written response after receiving a request. Requirement Parts and obligations are lower risk elements that ensure main requirement completeness which are administrative in nature consisting of documentation, information revision obligation and submission requirements. The "Lower" VRF assigned is based on the high risk objective specified.

VRF for MOD-026-1, Requirement R6:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R6 contains Parts specifying supporting obligations for satisfying the main requirement. The VRFs are only applied at the Requirement level and each Requirement Part represents an obligation for ensuring main requirement completeness. Requirement obligations include actions similar in scope to actions specified in Requirement R1; and all standard requirements specify either an Operations Planning or a Long-term Planning Time Horizon.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar with MOD-010-0 and MOD-012-0 Requirements R1 and R2 that have approved VRFs of Medium. This requirement is also similar to draft standard MOD-027-1 Requirement R5 which also specifies a Medium VRF.
- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to identify if a model is useable or not is a requirement that ~~is administrative in nature for the planning time frame that~~, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state

or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Therefore the assigned "Medium" VRF is appropriate.

- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R6 high risk objective is to verify if the model is useable or not. Requirement Parts and obligations are lower risk elements that ensure main requirement completeness which are administrative in nature consisting of documentation and submission requirements. The "Medium" VRF assigned is based on the high risk objective specified.

Justification for Assignment of Violation Severity Levels:

In developing the VSLs for the standards under this project, the SDT anticipated the evidence that would be reviewed during an audit, and developed its VSLs based on the noncompliance an auditor may find during a typical audit. The SDT based its assignment of VSLs on the following NERC criteria:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

FERC's VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in MOD-026-1 meet the FERC Guidelines for assessing VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.

Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

VSLs for MOD-026-1 Requirement R1:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R1.	The NERC VSL guidelines are satisfied by incorporating increments for tardiness VSL elements. The SDT has determined a 30 day "Increments for Tardiness" period is appropriate for standard VSLs proposed.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's incorporate the increments for tardiness methodology. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on timeliness of the action specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action and if information submission is timely. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

VSLs for MOD-026-1 Requirement R2:

R#	Compliance with NERC Revised VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R2.	The NERC VSL guidelines are satisfied by incorporating increments for tardiness with completeness of information required for the main Requirement action. The SDT has determined a 30 day "Increments for Tardiness" period is appropriate for standard VSLs proposed.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's consider completeness of listed parts deemed to possess equal reliability weight and also increments for tardiness. Binary requirements are categorized as severe. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on binary performance, and both completeness and timeliness of the actions and obligations specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action and if information submission is complete. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

VSLs for MOD-026-1 Requirement R3:

R#	Compliance with NERC Revised VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R3.	The NERC VSL guidelines are satisfied by incorporating increments for tardiness VSL elements for the main Requirement action. Actions and obligations specified in the Requirement Parts incorporate a binary element, consideration for omitting required information. The SDT has determined a 30 day "Increments for Tardiness" period is appropriate for standard VSLs proposed.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's are a combination of a binary element and increments for tardiness. Binary requirements are categorized as severe. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on binary performance, and both completeness and timeliness of the actions and obligations specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action and if information submission is both complete and provided in a timely manner. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

VSLs for MOD-026-1 Requirement R4:

R#	Compliance with NERC Revised VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R4.	The NERC VSL guidelines are satisfied by incorporating increments for tardiness VSL elements for the main Requirement action. The SDT has determined a 30 day "Increments for Tardiness" period is appropriate for standard VSLs proposed.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's utilize increments for tardiness rationale. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on timeliness of the actions and obligations specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action and if information submission is complete and provided in a timely manner. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

VSLs for MOD-026-1 Requirement R5:

R#	Compliance with NERC Revised VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R5.	The NERC VSL guidelines are satisfied by incorporating equal multiple parts criteria VSL elements for the main Requirement action. Actions and obligations specified in the Requirement Parts also incorporate increments for tardiness consideration. The SDT has determined a 30 day “Increments for Tardiness” period is appropriate for standard VSLs proposed.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL’s are a combination of completeness of listed parts deemed to possess equal reliability weight and also increments for tardiness. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on both completeness and timeliness of the actions and obligations specified.	Proposed VSL’s do not expand on what is required in the requirement. The VSL’s assigned only consider performing required action and if information submission is both complete and provided in a timely manner. Proposed VSL’s are consistent with the requirement.	Proposed VSL’s are based on a single violation and not a cumulative violation methodology.

VSLs for MOD-026-1 Requirement R6:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R6.	The NERC VSL guidelines are satisfied by incorporating increments for tardiness VSL elements for the Main Requirement action. Actions specified in the Requirement Parts incorporate completeness of the actions and obligations specified. The SDT has determined a 30 day "Increments for Tardiness" period is appropriate for standard VSLs proposed.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's are a combination of completeness of listed parts and also increments for tardiness. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on both completeness and timeliness of the actions and obligations specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action and if information submission is both complete provided in a timely manner. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

Project 2007-09 Generator Verification Consideration of Issues and Directives

Project 2007-09 Generator Verification — PRC-024		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
Paragraph 1787 states "… the Commission directs the ERO to modify the Reliability Standard to explicitly require either that all generators are capable of riding through the same set of Category B and C contingencies, as required by wind generators in Order No. 661, or that those generators that cannot ride through be simulated as tripping. "	FERC Order 693	The GVSDT believes that Requirement R2 and the voltage ride through curves in PRC-024 Attachment 2 accomplish this. While the curves were developed based on three phase normally cleared faults located at a generating plant substation (the most severe condition for generating equipment), the curves cover voltages depressed as low as 0.65 per unit for two seconds, which the GVSDT feels will cover the Category B and C events of concern to the Commission. Requirement R5 directs all new generating facilities following approval of this standard to be designed, built and maintained so that they are able to ride through the excursions defined in the standard. For existing units, Requirement R3 allows an exemption from portions of the ride through curves in PRC-024 Attachments 1 and 2 for documented technical reasons, but directs those generators to communicate that limitation to the RC, PC, TOP and TP so its performance can be modeled correctly. In addition, Requirement R4 allows the RC, PC, TOP, or TP to request an estimate of performance (ride through duration) from the GO for a defined excursion. The estimate would cover process upsets to the generating equipment that might result in a delayed trip, even if the

Project 2007-09 Generator Verification — PRC-024		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		generator protection itself did not cause a trip.
Paragraph 1787 also states "… the Commission agrees that NRC requirements should be used when implementing the Reliability Standards."	FERC Order 693	The GVSDT believes that Requirement R3 allows NRC requirements to supersede portions of the voltage and frequency ride through criteria in PRC-024-1. This Requirement allows generators an exemption from portions of the ride through curves for documented technical limitations. The GVSDT believes that NRC requirements qualify as technical limitations for the purposes of this standard.

Violation Risk Factor and Violation Severity Level Assignments

Project 2007-09 Generator Verification

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in PRC-024-1 — Generator Performance During Frequency and Voltage Excursions.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

Justification for Assignment of Violation Risk Factors

The Generator Verification Standard Drafting Team applied the following NERC criteria when proposing VRFs for the requirements under this project:

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

The SDT also considered consistency with the FERC Violation Risk Factor Guidelines for setting VRFs:[1]

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:[2]

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

Guideline (2) — Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) — Consistency among Reliability Standards

[1] North American Electric Reliability Corp., 119 FERC ¶ 61,145, order on reh'g and compliance filing, 120 FERC ¶ 61,145 (2007) ("VRF Rehearing Order").
[2] Id. at footnote 15.

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

The following discussion addresses how the SDT considered FERC's VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's Reliability Standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and therefore concentrated its approach on the reliability impact of the requirements.

VRF for PRC-024-1:

There are six requirements in PRC-024-1. Three of the Requirements (R1, R2, and R5) were assigned a "Medium" VRF and the remaining three requirements were assigned a "Lower" VRF.

VRF for PRC-024-1, Requirement R1:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R1 contains Parts specifying conditions for satisfying the main requirement. The VRFs are only applied at the Requirement level and each Requirement Part is treated equally. Requirement obligations include actions similar in scope to actions specified in Requirement R2 and R5, both of which were assigned a "Medium" VRF.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar in concept with both PRC-012-0 Requirement R1 and PRC-023-1 Requirement R1, both of which require protection coordination or settings. These requirements apply to multiple elements while the requirements of PRC-024-1 apply to a single unit. Violation of this requirement by a single generator could not be construed as directly causing or contributing to BES instability, separation or cascading within any time frame. For a single violation to lead to BES instability, separation or cascading would require other standards requirements to be violated. This requirement is assigned a "Medium" VRF.

- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to ensure a proper frequency "no-trip" operating window is a requirement in the planning time frame that, if violated, is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. . Therefore the assigned "Medium" VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R1 reliability objective is to ensure a proper frequency "no-trip" operating window. Requirement Parts are lower risk condition elements that establish main requirement criteria for completeness. The "Medium" VRF assigned is based on the reliability objective specified.

VRF for PRC-024-1, Requirement R2:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R2 contains Parts specifying conditions for satisfying the main requirement. The VRFs are only applied at the Requirement level and each Requirement Part is treated equally. Requirement obligations include actions similar in scope to actions specified in Requirement R1 and R5, both of which were assigned a "Medium" VRF.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar in concept with both PRC-012-0 Requirement R1 and PRC-023-1 Requirement R1, both of which require protection coordination or settings. These requirements apply to multiple elements while the requirements of PRC-024-1 apply to a single unit. Violation of this requirement by a single generator could not be construed as directly causing or contributing to BES instability, separation or cascading within any time frame. For a single violation to lead to BES instability, separation or cascading would require other standards requirements to be violated. This requirement is assigned a "Medium" VRF.
- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to ensure proper voltage "no-trip" criteria is a requirement in the planning time frame that, if violated, is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. Therefore the assigned "Medium" VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R2 reliability objective is to ensure proper voltage "no-trip" criteria. Requirement Parts are lower risk condition elements that establish main requirement criteria for completeness. The "Medium" VRF assigned is based on the reliability objective specified.

VRF for PRC-024-1, Requirements R3:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R3 contains Parts specifying response expectation and limitation reset conditions for satisfying the main requirement. The VRFs are only applied at the Requirement level and each Requirement Part is treated equally.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar in concept with PRC-006-0 Requirement R1 which specifies documentation requirements. In addition, as is generally the case with reliability standard VRF definitions for documentation and administrative requirements, this requirement is assigned a “Lower” VRF.
- FERC Guideline 4 — Consistency with NERC’s Definition of the VRF Level selected exists. Failure to document limitations preventing compliance is a requirement that is administrative in nature for the planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Therefore the assigned “Lower” VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R3 reliability objective is to document limitations preventing compliance. Requirement Parts and obligations are lower risk elements that ensure main requirement completeness which are administrative in nature consisting of response submission and limitation reset condition requirements. The “Lower” VRF assigned is based on the reliability objective specified.

VRF for PRC-024-1, Requirement R4:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R4 contains Parts that are procedural in nature defining criteria associated with the main requirement. The VRFs are only applied at the Requirement level and each Requirement Part is treated equally.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement requires an estimate of performance and is somewhat similar in concept with both PRC-009-0 Requirement R1 and PRC-014-0 Requirement R2, both of which reference protection analysis or assessment for determining adequacy. In addition, as is generally the case with reliability standard VRF definitions for analysis & assessment planning type requirements, this requirement is assigned a “Lower” VRF.
- FERC Guideline 4 — Consistency with NERC’s Definition of the VRF Level selected exists. Failure to estimate performance during a frequency or voltage excursion is a requirement that is administrative in nature for the planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to

adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Therefore the assigned "Lower" VRF is appropriate.

- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R4 reliability objective is to estimate performance during a frequency or voltage excursion. Requirement Parts and obligations are lower risk procedure based criteria for the main requirement. The "Lower" VRF assigned is based on the reliability objective specified.

VRF for PRC-024-1, Requirements R5:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R5 contains Parts specifying conditions and exceptions for satisfying the main requirement during external events. The VRFs are only applied at the Requirement level and each Requirement Part is treated equally. Requirement obligations include actions similar in scope to actions specified in Requirement R1 and R2, both of which were assigned a "Medium" VRF.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement requires generation to remain connected during external events and as such does not have strong correlation to similar reliability goals listed in different reliability standards. This is similar in scope to Requirement R1 but is applied to new units rather than existing units. Therefore this requirement is assigned a "Medium" VRF.
- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to remain connected during an external event is a requirement during real-time operation that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures. Therefore the assigned "Medium" VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R5 reliability objective is to remain connected during an external event. Requirement Parts specify conditions and exceptions elements that establish main requirement criteria for completeness. The "Medium" VRF assigned is based on the reliability objective specified.

VRF for PRC-024-1, Requirement R6:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R6 does not contain Parts. Requirement obligations specify the type of response and response time frame to be observed.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar in concept with both PRC-007-0 Requirement R3 and PRC-010-0 Requirement R2, both of which require providing information within a specified time frame on request. In addition, as is generally the case with reliability standard VRF definitions for documentation and administrative requirements, this requirement is assigned a “Lower” VRF.
- FERC Guideline 4 — Consistency with NERC’s Definition of the VRF Level selected exists. Failure to provide setting and limitation information as requested is a requirement that is administrative in nature for the planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Therefore the assigned “Lower” VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R6 reliability objective is to provide setting and limitation information as requested. Requirement obligations are lower risk condition elements administrative in nature for ensuring the main requirement is satisfied in a timely manner. The “Lower” VRF assigned is based on the reliability objective specified.

Justification for Assignment of Violation Severity Levels:

In developing the VSLs for the standards under this project, the SDT anticipated the evidence that would be reviewed during an audit, and developed its VSLs based on the noncompliance an auditor may find during a typical audit. The SDT based its assignment of VSLs on the following NERC criteria:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

FERC's VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in PRC-024-1 meet the FERC Guidelines for assessing VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a “binary” type requirement must be a “Severe” VSL.

Do not use ambiguous terms such as “minor” and “significant” to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

VSLs for PRC-024-1 Requirement R1:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R1.	The NERC VSL guidelines are satisfied by incorporating binary VSL elements.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's are a combination of binary elements and are categorized as severe. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on binary performance, and timeliness of the actions and obligations	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action per the conditions specified by listed parts. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

VSLs for PRC-024-1 Requirement R2:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R2.	The NERC VSL guidelines are satisfied by incorporating binary VSL elements.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's are a combination of binary elements and are categorized as severe. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on binary performance, and timeliness of the actions and obligations specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action per the conditions specified by listed parts. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

VSLs for PRC-024-1 Requirement R3:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R3.	The NERC VSL guidelines are satisfied by incorporating increments for tardiness elements.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's incorporate the increments for tardiness methodology. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on timeliness of the action specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action in a timely manner including response obligation and reset conditions specified by listed parts. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

VSLs for PRC-024-1 Requirement R4:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R4.	The NERC VSL guidelines are satisfied by incorporating increments for tardiness.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's reflect increments for tardiness. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on binary performance, and both completeness and timeliness of the actions and obligations specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action in a timely manner per the procedure criteria specified by listed parts. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

VSLs for PRC-024-1 Requirement R5:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R5.	The NERC VSL guidelines are satisfied by incorporating binary VSL elements. Requirement Parts merely identify conditions and exceptions for determining binary VSL status.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's incorporate binary methodology. Binary requirements are categorized as severe. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on binary performance of the actions and obligations specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action per the conditions and exceptions specified by listed parts. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

VSLs for PRC-024-1 Requirement R6:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R6.	The NERC VSL guidelines are satisfied by incorporating increments for tardiness elements.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's incorporate the increments for tardiness methodology. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on timeliness of the action specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action in a timely manner. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

Violation Risk Factor and Violation Severity Level Assignments

Project 2007-09 Generator Verification

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in PRC-024-1 — Generator Performance During Frequency and Voltage Excursions.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

Justification for Assignment of Violation Risk Factors

The Generator Verification Standard Drafting Team applied the following NERC criteria when proposing VRFs for the requirements under this project:

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

The SDT also considered consistency with the FERC Violation Risk Factor Guidelines for setting VRFs:[1]

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report
The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:[2]

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

Guideline (2) — Consistency within a Reliability Standard
The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) — Consistency among Reliability Standards

[1] North American Electric Reliability Corp., 119 FERC ¶ 61,145, order on reh'g and compliance filing, 120 FERC ¶ 61,145 (2007) ("VRF Rehearing Order").
[2] Id. at footnote 15.

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

The following discussion addresses how the SDT considered FERC's VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's Reliability Standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and therefore concentrated its approach on the reliability impact of the requirements.

VRF for PRC-024-1:
There are six requirements in PRC-024-1. Three of the Requirements (R1, R2, and R5) were assigned a "~~High~~Medium" VRF and the remaining three requirements were assigned a "Lower" VRF.

VRF for PRC-024-1, Requirement R1:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R1 contains Parts specifying conditions for satisfying the main requirement. The VRFs are only applied at the Requirement level and each Requirement Part is treated equally. Requirement obligations include actions similar in scope to actions specified in Requirement R2 and R5, both of which were assigned a "Medium" VRF~~; which remaining standard requirements rationally relate by defining documentation, estimation, expectations during external events, and response expectations~~.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar in concept with both PRC-012-0 Requirement R1 and PRC-023-1 Requirement R1, both of which require protection coordination or settings. These requirements apply to multiple elements while the requirements of PRC-024-1 apply to a single unit. Violation of this requirement by a single generator could not be construed as directly causing or contributing to BES instability, separation or cascading within any time frame. For a single violation to lead to BES instability,

separation or cascading would require other standards requirements to be violated. ~~In addition, and as is generally the case with PRC standard VRF definitions, t~~This requirement is assigned a "~~High~~Medium" VRF.

- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to ensure a proper frequency "no-trip" operating window is a requirement in the planning time frame that, if violated, is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. ~~could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition~~. Therefore the assigned "~~High~~Medium" VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R1 ~~high risk~~reliability objective is to ensure a proper frequency "no-trip" operating window. Requirement Parts are lower risk condition elements that establish main requirement criteria for completeness. The "Medium~~High~~" VRF assigned is based on the ~~high risk~~reliability objective specified.

VRF for PRC-024-1, Requirement R2:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R2 contains Parts specifying conditions for satisfying the main requirement. The VRFs are only applied at the Requirement level and each Requirement Part is treated equally. Requirement obligations include actions similar in scope to actions specified in Requirement R1 and R5, both of which were assigned a "Medium" VRF~~; which remaining standard requirements rationally relate by defining documentation, estimation, expectations during external events, and response expectations~~.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar in concept with both PRC-012-0 Requirement R1 and PRC-023-1 Requirement R1, both of which require protection coordination or settings. These requirements apply to multiple elements while the requirements of PRC-024-1 apply to a single unit. Violation of this requirement by a single generator could not be construed as directly causing or contributing to BES instability, separation or cascading within any time frame. For a single violation to lead to BES instability, separation or cascading would require other standards requirements to be violated. ~~In addition, and as is generally the case with PRC standard VRF definitions, t~~This requirement is assigned a "~~High~~Medium" VRF.

- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to ensure proper voltage "no-trip" criteria is a requirement in the planning time frame that, if violated, is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. ~~could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.~~ Therefore the assigned "Medium~~High~~" VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R2 ~~high risk~~reliability objective is to ensure proper voltage "no-trip" criteria. Requirement Parts are lower risk condition elements that establish main requirement criteria for completeness. The "Medium~~High~~" VRF assigned is based on the reliability ~~high risk~~ objective specified.

VRF for PRC-024-1, Requirements R3:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R3 contains Parts specifying response expectation and limitation reset conditions for satisfying the main requirement. The VRFs are only applied at the Requirement level and each Requirement Part is treated equally.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar in concept with PRC-006-0 Requirement R1 which specifies documentation requirements. In addition, as is generally the case with reliability standard VRF definitions for documentation and administrative requirements, this requirement is assigned a "Lower" VRF.
- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to document limitations preventing compliance is a requirement that is administrative in nature for the planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Therefore the assigned "Lower" VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R3 ~~high risk~~reliability objective is to document limitations preventing compliance. Requirement Parts and obligations are lower risk elements that ensure main requirement completeness which are administrative in nature consisting of response submission and limitation reset condition requirements. The "Lower" VRF assigned is based on the ~~high risk~~reliability objective specified.

VRF for PRC-024-1, Requirement R4:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R4 contains Parts that are procedural in nature defining criteria associated with the main requirement. The VRFs are only applied at the Requirement level and each Requirement Part is treated equally.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement requires an estimate of performance and is somewhat similar in concept with both PRC-009-0 Requirement R1 and PRC-014-0 Requirement R2, both of which reference protection analysis or assessment for determining adequacy. In addition, as is generally the case with reliability standard VRF definitions for analysis & assessment planning type requirements, this requirement is assigned a "Lower" VRF.
- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to estimate performance during a frequency or voltage excursion is a requirement that is administrative in nature for the planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Therefore the assigned "Lower" VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R4 ~~high risk~~reliability objective is to estimate performance during a frequency or voltage excursion. Requirement Parts and obligations are lower risk procedure based criteria for the main requirement. The "Lower" VRF assigned is based on the ~~high risk~~reliability objective specified.

VRF for PRC-024-1, Requirements R5:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R5 contains Parts specifying conditions and exceptions for satisfying the main requirement during external events. The VRFs are only applied at the Requirement level and each Requirement Part is treated equally. Requirement obligations include actions similar in scope to actions specified in Requirement R1 and R2, both of which were assigned a "Medium" VRF.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement requires generation to remain connected during external events and as such does not have strong correlation to similar reliability goals listed in different reliability standards. ~~A good approximation in regards to maintaining stable and continuous power operations can be found in standards BAL-002-0 and EOP-008-0; both of which possess a High VRF~~This is similar in scope

to Requirement R1 but is applied to new units rather than existing units. Therefore this requirement is assigned a "Medium~~High~~" VRF.

- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to remain connected during an external event is a requirement during real-time operation that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures. ~~could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures.~~ Therefore the assigned "Medium~~High~~" VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R5 ~~high risk~~reliability objective is to remain connected during an external event. Requirement Parts specify conditions and exceptions elements that establish main requirement criteria for completeness. The "Medium~~High~~" VRF assigned is based on the ~~high risk~~reliability objective specified.

VRF for PRC-024-1, Requirement R6:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R6 does not contain Parts. Requirement obligations specify the type of response and response time frame to be observed.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar in concept with both PRC-007-0 Requirement R3 and PRC-010-0 Requirement R2, both of which require providing information within a specified time frame on request. In addition, as is generally the case with reliability standard VRF definitions for documentation and administrative requirements, this requirement is assigned a "Lower" VRF.
- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to provide setting and limitation information as requested is a requirement that is administrative in nature for the planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Therefore the assigned "Lower" VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R6 ~~high risk~~reliability objective is to provide setting and limitation information as requested. Requirement obligations are lower risk condition elements administrative in nature for ensuring the main requirement is satisfied in a timely manner. The "Lower" VRF assigned is based on the ~~high risk~~reliability objective specified.

Justification for Assignment of Violation Severity Levels:

In developing the VSLs for the standards under this project, the SDT anticipated the evidence that would be reviewed during an audit, and developed its VSLs based on the noncompliance an auditor may find during a typical audit. The SDT based its assignment of VSLs on the following NERC criteria:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

FERC's VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in PRC-024-1 meet the FERC Guidelines for assessing VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.

Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VSLs for PRC-024-1 Requirement R1:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R1.	The NERC VSL guidelines are satisfied by incorporating binary VSL elements.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's are a combination of binary elements and are categorized as severe. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on binary performance, and timeliness of the actions and obligations	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action per the conditions specified by listed parts. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

VSLs for PRC-024-1 Requirement R2:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R2.	The NERC VSL guidelines are satisfied by incorporating binary VSL elements.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's are a combination of binary elements and are categorized as severe. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on binary performance, and timeliness of the actions and obligations specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action per the conditions specified by listed parts. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

VSLs for PRC-024-1 Requirement R3:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R3.	The NERC VSL guidelines are satisfied by incorporating increments for tardiness elements.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's incorporate the increments for tardiness methodology. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on timeliness of the action specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action in a timely manner including response obligation and reset conditions specified by listed parts. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

VSLs for PRC-024-1 Requirement R4:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R4.	The NERC VSL guidelines are satisfied by incorporating increments for tardiness. The Requirement Parts incorporate procedure based criteria elements incorporated as equal multiple parts rationale for completeness of the main Requirement. Requirement Parts are conditions that, if not performed, represent noncompliance of increasing severity based on the number of conditions not observed.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's are a combination of binary elements with additional consideration for completeness of listed parts and also increments for tardiness. Binary requirements are categorized as severe. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on binary performance, and both completeness and timeliness of the actions and obligations specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action in a timely manner per the procedure criteria specified by listed parts. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

VSLs for PRC-024-1 Requirement R5:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R5.	The NERC VSL guidelines are satisfied by incorporating binary VSL elements. Requirement Parts merely identify conditions and exceptions for determining binary VSL status.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's incorporate binary methodology. Binary requirements are categorized as severe. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on binary performance of the actions and obligations specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action per the conditions and exceptions specified by listed parts. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

VSLs for PRC-024-1 Requirement R6:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R6.	The NERC VSL guidelines are satisfied by incorporating increments for tardiness elements.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's incorporate the increments for tardiness methodology. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on timeliness of the action specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action in a timely manner. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

NORTH AMERICAN ELECTRIC RELIABILITY CORPORATION

Standards Announcement

Project 2007-09 – Generator Verification

Successive Ballots and Non-Binding Polls open through 8 p.m. Monday, October 29, 2012

Now Available

Successive ballots are open for the following standards through **8 p.m. Eastern on Monday, October 29, 2012**:

- Draft 3 of **MOD-025-2** – Verification and Data Reporting of Generator Real and Reactive Power Capability and Synchronous Condenser Reactive Power Capability,
- **MOD-027-1** – Verification of Models and Data for Turbine/Governor and Load Control or Active Power/Frequency Control Functions,
- **PRC-019-1** – Coordination of Generating Unit or Plant Capabilities, Voltage Regulating Controls, and Protection,
- Draft 4 of **MOD-026-1** – Verification of Models and Data for Generator Excitation Control Systems Functions and Plant Volt/Var Control Functions, and
- **PRC-024-1** – Generator Performance During Frequency and Voltage Excursions

Instructions
Members of the ballot pools associated with this project may log in and submit their votes for the Standards and opinions in the non-binding polls of the associated VRFs and VSLs by clicking here.

Please read carefully: All stakeholders with comments (both members of the ballot pool as well as other stakeholders, including groups such as trade associations and committees) must submit comments through the electronic comment form links shown below. During the ballot window, balloters who wish to submit comments with their ballot *may no longer enter comments on the balloting screen*, but may still enter the comments through the electronic comment form. Balloters who wish to express support for comments submitted by another entity or group will have an opportunity to enter that information and are not required to answer any other questions.

- MOD-025-2 ballot
- MOD-027-1 ballot
- PRC-019-1 ballot
- MOD-026-1 ballot
- PRC-024-2 ballot

Next Steps
The drafting team will consider all comments received during the formal comment period and successive ballot and, if needed, make revisions to the standards. If the comments do not show the need for significant revisions, the standard will proceed to a recirculation ballot.

Background
The purpose of Project 2007-09 - Generator Verification - is to ensure that: 1) generators will not trip off-line during specified voltage and frequency excursions or as a result of improper coordination between generator-protective relays and generator voltage regulator controls and limit functions (such coordination will include the generating unit's capabilities); and 2) that generator models accurately reflect the generator's capabilities and operating characteristics.

The standard drafting team (SDT) for Project 2007-09 - Generator Verification - based part of its work on two existing NERC Board-approved standards, MOD-024-1 — Verification of Generator Gross and Net Real Power Capability and MOD-025-1 — Verification of Generator Gross and Net Reactive Power Capability. The drafting team moved the Requirements of MOD-024-1 into MOD-025-2, and recommends retiring MOD-024-1 and incorporated industry comments to make improvements to the standards.

The drafting team has also based its work on four draft standards developed by the Phase III & IV SDT that were field tested by four Regions from mid 2006 through mid 2007:

- PRC-019-1 — Coordination of Generator Voltage Regulator Controls with Unit Capabilities and Protection
- PRC-024-1 — Generator Performance During Frequency and Voltage Excursions
- MOD-026-1 — Verification of Models and Data for Generator Excitation Control System Functions
- MOD-027-1 — Verification of Generator Unit Frequency Response

These standards were revised and posted for subsequent comment periods. The drafting team incorporated industry feedback to improve the standards and has posted them for a concurrent comment and ballot period.

Additional information is available on the project page.

Standards Process

The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance, please contact Monica Benson, Standards Development Administrator, at monica.benson@nerc.net or at 404-446-2560.

Standards Announcement

Project 2007-09 Generator Verification

Formal Comment Period Now Open: September 28, 2012 – October 29, 2012

Upcoming:
Successive Ballots and Non-binding Polls: October 19 – October 29, 2012

Now Available

A formal comment period for:

- Draft 3 of **MOD-025-2** – Verification and Data Reporting of Generator Real and Reactive Power Capability and Synchronous Condenser Reactive Power Capability,
- **MOD-027-1** – Verification of Models and Data for Turbine/Governor and Load Control or Active Power/Frequency Control Functions,
- **PRC-019-1** – Coordination of Generating Unit or Plant Capabilities, Voltage Regulating Controls, and Protection,
- Draft 4 of **MOD-026-1** – Verification of Models and Data for Generator Excitation Control Systems Functions and Plant Volt/Var Control Functions, and
- **PRC-024-1** – Generator Performance During Frequency and Voltage Excursions

is open through **8 p.m. Eastern on Monday, October 29, 2012.** Successive ballots of all five Generator Verification standards and non-binding polls of the associated VRFs and VSLs will also be conducted during this period, beginning on **Friday, October 19, 2012** through **8 p.m. Eastern on Monday, October 29, 2012.**

Instructions for Commenting
A formal comment period for all five Generator Verification standards is open through **8 p.m. Eastern on Monday, October 29, 2012.**

Please use the links below to the electronic comment forms to submit comments:

MOD-025-2
MOD-027-1
PRC-019-1
MOD-026-1
PRC-024-1

If you experience any difficulties in using the electronic forms, please contact Monica Benson at monica.benson@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page.

Please read carefully: All stakeholders with comments (both members of the ballot pool as well as other stakeholders, including groups such as trade associations and committees) must submit comments through the electronic comment form links shown above. During the ballot window, balloters who wish to submit comments with their ballot *may no longer enter comments on the balloting screen*, but may still enter the comments through the electronic comment form. Balloters who wish to express support for comments submitted by another entity or group will have an opportunity to enter that information and are not required to answer any other questions.

During the pre-ballot window, members of the ballot pool may communicate with one another by using their "ballot pool list server." (Once the balloting begins, ballot pool members are prohibited from using the ballot pool list servers.) The list servers for this project are:

- MOD-025-2 ballot bp-2007-09_MOD-025-2_in@nerc.com
- MOD-027-1 ballot bp-2007-09_MOD-027-1_in@nerc.com
- PRC-019-1 ballot bp-2007-09_PRC-019-1_in@nerc.com
- MOD-026-1 ballot bp-2007-09_MOD-026-1_in@nerc.com
- PRC-024-1 ballot bp-2007-09_PRC-024-1_in@nerc.com

Next Steps

Successive ballots of all five Generator Verification standards and non-binding polls of the associated VRFs and VSLs will be conducted beginning on Friday October 19, 2012 through 8 p.m. Eastern on Monday, October 29, 2012.

Background

The purpose of Project 2007-09 - Generator Verification - is to ensure that: 1) generators will not trip off-line during specified voltage and frequency excursions or as a result of improper coordination between generator-protective relays and generator voltage regulator controls and limit functions (such coordination will include the generating unit's capabilities); and 2) that generator models accurately reflect the generator's capabilities and operating characteristics.

The standard drafting team (SDT) for Project 2007-09 - Generator Verification - based part of its work on two existing NERC Board-approved standards, MOD-024-1 — Verification of Generator Gross and Net Real Power Capability and MOD-025-1 — Verification of Generator Gross and Net Reactive Power Capability. The drafting team moved the Requirements of MOD-024-1 into MOD-025-2, and

recommends retiring MOD-024-1 and incorporated industry comments to make improvements to the standards.

The drafting team has also based its work on four draft standards developed by the Phase III & IV SDT that were field tested by four Regions from mid 2006 through mid 2007:

- PRC-019-1 — Coordination of Generator Voltage Regulator Controls with Unit Capabilities and Protection
- PRC-024-1 — Generator Performance During Frequency and Voltage Excursions
- MOD-026-1 —Verification of Models and Data for Generator Excitation Control System Functions
- MOD-027-1 — Verification of Generator Unit Frequency Response

These standards were revised and posted for subsequent comment periods. The drafting team incorporated industry feedback to improve the standards and has posted them for a concurrent comment and ballot period.

Additional information is available on the project page.

Next Steps

Successive ballots of all five Generator Verification standards and non-binding polls of the associated VRFs and VSLs will be conducted beginning on Friday October 19, 2012 through 8 p.m. Eastern on Monday, October 29, 2012.

Background

The purpose of Project 2007-09 - Generator Verification - is to ensure that: 1) generators will not trip off-line during specified voltage and frequency excursions or as a result of improper coordination between generator-protective relays and generator voltage regulator controls and limit functions (such coordination will include the generating unit's capabilities); and 2) that generator models accurately reflect the generator's capabilities and operating characteristics.

The standard drafting team (SDT) for Project 2007-09 - Generator Verification - based part of its work on two existing NERC Board-approved standards, MOD-024-1 — Verification of Generator Gross and Net Real Power Capability and MOD-025-1 — Verification of Generator Gross and Net Reactive Power Capability. The drafting team moved the Requirements of MOD-024-1 into MOD-025-2, and

recommends retiring MOD-024-1 and incorporated industry comments to make improvements to the standards.

The drafting team has also based its work on four draft standards developed by the Phase III & IV SDT that were field tested by four Regions from mid 2006 through mid 2007:

- PRC-019-1 — Coordination of Generator Voltage Regulator Controls with Unit Capabilities and Protection
- PRC-024-1 — Generator Performance During Frequency and Voltage Excursions
- MOD-026-1 —Verification of Models and Data for Generator Excitation Control System Functions
- MOD-027-1 — Verification of Generator Unit Frequency Response

These standards were revised and posted for subsequent comment periods. The drafting team incorporated industry feedback to improve the standards and has posted them for a concurrent comment and ballot period.

Additional information is available on the project page.

Standards Process

The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance, please contact Monica Benson,
Standards Process Administrator, at monica.benson@nerc.net or at 404-446-2560.

Standards Announcement

Project 2007-09 – Generator Verification

Successive Ballot Results

Now Available

Successive ballots of all five Generator Verification standards and non-binding polls of the associated VRF/VSLs concluded on Monday, October 29, 2012 (some of the ballots and non-binding polls were extended until a quorum was reached).

Voting statistics for each of the ballots are listed below, and the Ballots Results page provides a link to the detailed results.

Standard	Approval	Non-binding Poll Results
MOD-026-1 – Verification of Models and Data for Generator Excitation System Functions and Plant Volt/Var Control Functions	Quorum: 75.55% Approval: 76.50%	Quorum: 75.88% Supportive Opinions: 79.95%
PRC-024-1 – Generator Performance During Frequency and Voltage Excursions	Quorum: 75.00% Approval: 57.24%	Quorum: 75.40% Supportive Opinions: 55.90%
MOD-025-2 – Verification and Data Reporting of Generator Real and Reactive Power Capability and Synchronous Condenser Reactive Power Capability	Quorum: 83.61% Approval: 68.31%	Quorum: 77.94% Supportive Opinions: 70.72%
MOD-027-1 – Verification of Models and Data for Turbine/Governor and Load Control or Active Power/Frequency Control Functions	Quorum: 82.34% Approval: 71.53%	Quorum: 78.06% Supportive Opinions: 74.18%
PRC-019-1 – Coordination of Generating Unit or Plant Capabilities, Voltage Regulating Controls, and Protection	Quorum: 82.07% Approval: 70.64%	Quorum: 78.51% Supportive Opinions: 69.39%

Next Steps
The standard drafting team (SDT) will consider all comments submitted, and based on the comments will determine whether to make additional changes. If the SDT determines that no substantive changes are required to address the comments on a particular standard, a recirculation ballot of that standard will be conducted. If the SDT determines that substantive changes are required on a standard, the revised standard will be submitted for quality review and subsequently posted for a successive ballot.

Background
The purpose of Project 2007-09 Generator Verification - is to ensure that: 1) generators will not trip off-line during specified voltage and frequency excursions or as a result of improper coordination between generator-protective relays and generator voltage regulator controls and limit functions (such coordination will include the generating unit's capabilities); and 2) that generator models accurately reflect the generator's capabilities and operating characteristics.

The Project 2007-09 Generator Verification SDT based its work on two existing NERC Board-approved standards, MOD-024-1 — Verification of Generator Gross and Net Real Power Capability and MOD-025-1 — Verification of Generator Gross and Net Reactive Power Capability. The SDT has recently moved the Requirements of MOD-024-1 into MOD-025-2, and recommends retiring MOD-024-1.

The SDT has also based its work on four draft standards developed by the Phase III & IV SDT that were field tested by four Regions from mid-2006 through mid-2007:

- PRC-019-1 — Coordination of Generating Unit or Plant Capabilities , Voltage Regulating Controls, and Protection PRC-024-1 — Generator Performance During Frequency and Voltage Excursions
- MOD-026-1 —Verification of Models and Data for Generator Excitation Control System Functions and Plant Volt/Var Control Functions
- MOD-027-1 — Verification of Models and Data for Turbine/Governor and Load Control or Active Power/Frequency Control Functions

Additional details are available on the project page.

Standards Development Process
The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance, please contact Wendy Muller,
Standards Development Administrator, at wendy.muller@nerc.net or at 404-446-2560.

Manitoba Hydro
Yes
None.
Yes
Although Manitoba Hydro agrees with the concept proposed, it is difficult or sometimes impossible to get an exact match between simulated and measured responses. The drafting team should allow for some engineering judgment (for example, if the responses are within 5-10% of each other, the model could be considered to be a reasonable representation).
Section 2.1.2 - Manitoba Hydro suggests revising the text to read as follows: Manufacturer, model number (if available), and type of excitation control system and the plant volt/var control function (if installed). R2.1.4. - Manitoba Hydro proposes that only the text of "Model structure and data for the excitation control system" is kept. An excitation control system consists of generator and excitation system as per IEEE 421.1 and 421.5. 4.2 - The language immediately preceding the bullets is unclear (i.e. 'that meet the following' should possibly be reworded as 'provided they meet the following'). R1 -This requirement would be clearer if rewritten as 'Within 90 calendar days of receiving a written request, each Transmission Owner shall provide to its requesting Generator Owner:' General Comment - Manitoba Hydro has a concern with respect to the phased in implementation measured by percent compliance. We believe that this may lead to a potential for some uncertainty and debate. Does a phased in implementation such as this, do anything to increase reliability?

Applicability section 4.2.2.2 describes an Individual Generating Plant as consisting of multiple generating units that are directly connected at a common BES bus with a total capacity greater than 75 MVA. It would help if there was a proximity element to the definition of "Individual Generating Plant." My question/comment comes from the fact that I have three single unit powerhouses with a combined total capacity greater than 75 MVA connected to a single 115 kV radial line, with several miles of transmission line separating each unit from the other, but the radial line (which is owned by another entity) ultimately terminates at a single (common) point on a BES bus. Attached to this same radial transmission line are a distribution substation and another entity's small hydro plant, so it is not clear how this common point on a BES bus would be characterized.

Oncor does not support the position that the Transmission Planner (TP) is applicable for this standard. In the ERCOT Interconnection, Section 3 and Section 5 of the ERCOT Nodal Operating Guides prescribes the ERCOT ISO to request and receive generation unit performance data, not the TP. Oncor takes the position that a regional variance be granted for the ERCOT Interconnection such that the standard would prescribe that the Planning Authority (PA) only be the only requestor and receiver of unit performance data to support Section 3 and Section 5 of the ERCOT Nodal Operating Guides.
No
Oncor does not support the position that the TP is applicable for this standard. In the ERCOT Interconnection, Section 3 and Section 5 of the ERCOT Nodal Operating Guides prescribes the ERCOT ISO to request and receive generation unit performance data, not the TP. For MOD-026-1 Section 4.2.4, Oncor takes the position that it is the decision of the PA not the TP who determines the basis for NERC applicability. Oncor takes the position that a regional variance be granted for the ERCOT Interconnection such that the applicability determination in Section 4.2.4, be the responsibility of the PA only be the only requestor and receiver of unit performance data to support Section 3 and Section 5 of the ERCOT Nodal Operating Guides.

1. It’s not clear what the difference is between R3 and R5. Suggest combining these into one Requirement. MOD-027-1 which also requires model validation does not have a Requirement similar to R5. 2. Requirement 2.1.1 does not state how much of a step change is required when testing the exciter controls. A commonly used step is 2% but this is not clear.

Suggest the SDT specifically identify or show examples of how to match the percentage thresholds outlined in the Effective Date sections of the Standard and the associated Implementation Plans. Given recent experience with other Standards, it would be helpful for the SDT to establish how the entities can demonstrate meeting the requisite threshold percentages. Over time, we have observed that in some cases percentages were established by the number of devices or units; but in other cases, the measurement has been based upon magnitude of nameplate ratings.

There is a problem with the threshold in the standard of 100MVA units. We would suggest that this be in line with the BES DEF and reduce this threshold to 20MVA. Why has the threshold been increased? If the data has to be provided for LGIA under the Tariff then we should be verifying the data. There is also inconsistency between the

standards posted for comment I.E. PRC-019-1. We would like to see better consistency for the thresholds between all the standards under this project and with the other projects associated with generator thresholds.

Verification requirements would be burdensome, e.g., model response by staged testing or comparison with a system disturbance may be of only limited value. Another basic problem with this standard is the unnecessary back and forth between generation owners and transmission planners in the data development and collection. This standard could be greatly simplified for all involved parties with reporting requirements similar to MOD-025 where the generation owner provides information to the transmission planner upon the installation of new equipment or the modification of existing equipment. Given the above, Transmission Planning recommends a vote against this standard in its present form.

Since GO's typically do not have in-house expertise, they would either have to hire consultants to perform model verification or develop in-house expertise, including acquiring simulation software. Are such simulated models/software available today for this on the market? If not, has time been built into the implementation schedule for allowing such creation—it does not appear so? Also, the first element of the logical AND statement of Attachment 1 Row 4 (the same physical location element). If a GO has identical equipment at different physical locations, they are equivalent. Equivalency of units should be independent of the physical location.
No
It appears that without the word "and" in 4.2.4, this criterion of using NERC registration criteria would "trump" all the other interconnection requirements above. But, with the word "and" it indicates that any of the smaller registered units or blackstart resources would only be included in this standard if the Transmission Planner requires. The term “technically justified” in para. 4.2.4 on p.3 and in R5 is too vague, in that the degree of actual-vs-predicted mismatch triggering MOD-026-1 applicability is not specified. It is also not clear how this comparison is to be made if the Facility did not have to provide a MOD-026 model in the first place. In any event the wording of the R5 Violation Severity Levels should be modified to start the clock only after agreement has been reached that a request is technically justified.
The standard is based on the assumption that it is possible to tune the acceptable models cited in R1 such that their predictions will match actual voltage and reactive power responses to system Disturbances. The yet-to-be-defined acceptable models may not be capable of achieving this goal, however, because standard excitation component models are inadequate to predict with high fidelity the generation system response that is the subject of MOD-026-1. Such models do not take into account, for example, equipment thermal capability limitations and the capping of reactive power output to respect aux bus voltage limits. The SDT is therefore asking for a considerable advancement in the excitation modeling state of the art, to be undertaken in parallel by the owners of every generation unit in North America. This is a doubly daunting task in that GOs often do not have any dynamic modeling software or expertise, much less the ability to invent something new, because the present approach to the subject is that GOs just provide the values of input parameters to the TP, which owns and runs models. Independent GOs (i.e. entities that are not part of a vertically-integrated utility) moreover do not have and cannot obtain information on the system outside the plant battery limits. This circumstance renders them unable to model the plant-T&D interactions associated with Disturbances, and independent GOs may therefore forever remain unable to develop model results that closely match actual Disturbance responses. The approach being taken in MOD-026-1 is consequently viewed as being technically infeasible for the present state of the art as well as unjustified in light of FERC’s March 15, 2012 FFT Order to propose specific standards or requirements that should

be revised or removed [or not enacted in the first place] due to having little effect on reliability or because of compliance burdens. The SDT should instead collaborate with industry associations (EPRI, IEEE, NAGF), equipment OEMs, and modeling services vendors to develop the right tools for the job, and put the new models through trial runs at several plants. These trials should be limited to data-collection means that can be non-invasively employed (e.g. online voltage step-response tests, low-load rejection during normal stop events), and should lead to definition of specific testing means for definition of specific model parameters. The SDT should then put out for voting a standard requiring TOPs to own and run these models, and requiring GOs to provide them the appropriate input data, developed via the non-invasive means stated above. There is presently no definition of the voltage excursion magnitude and intensity or the recording instrumentation sampling rate required for a valid verification event. There are also no specifics regarding how closely the model must match the recorded response or for what period of time, just a requirement that it be deemed "usable" by the TP. Perceived shortcomings in these respects would presumably trigger the Transmission Planner expression of concern described in R3, but it would be better to establish the rules up-front rather than addressing the matter only after a GO has attempted to comply with MOD-026 and been found lacking. It was stated in a 7/29/11 webinar that a signal-to-noise ratio of at least 5:1 is needed for a meaningful validation, but this criterion did not make it into the standard. The term "rotational inertia" in R2.1.3 should be replaced with "inertia constant (H)," the rotational inertia divided by MVA rating, since this is the parameter of interest for stability studies. Either way, the obligation to conduct testing in this respect should be waived for units having an OEM-developed value and no modifications to the rotating components, since rotational inertia can be identified more precisely via calculation than by clocking a post-trip overspeed excursion. The instruction in R4 to notify the TP, "within 180 calendar days of making changes that alter the system response is too vague, despite the attempted clarification in footnote #3, since many activities can have some degree of impact as noted above. Reportable thresholds regarding degree of impact on system response and the expected duration are needed.

We voted "Negative" on this standard the reasons shown below. This FIRST COMMENT was provided for MOD-025-1, MOD-026-1, MOD-027-1, and PRC-019-1. 1.SYNCHRONOUS CONDENSERS: The GVSDT is not working as a "team" with regards to synchronous condensers owned by TOs. The team working on this standard and PRC-019-1 INSIST that they be included as "applicable facilities," while the team working on MOD-026-1 has stated otherwise. We provided this comment to the MOD-026-1 team in the last set of comments: "The exclusion of synchronous condensers (and other reactive devices) in MOD-026-1 per the rationale provided in the Background (with which we agree) states "Synchronous condensers are not currently addressed in the NERC Registry Criteria" However, companion standards under Project 2007-09 (MOD-025-2 and PRC-019-1) are applicable to synchronous condensers. The GVSDT should address this inconsistency." The SDT responded as follows: "The SDT believes that MOD-026 is different from the other standards with respect to synchronous condensers due to the complex

interaction required between the Transmission Planner and the Generator Owner, and thus believes it better to wait for efforts by others to define where synchronous condensers fit in the functional model." In response to a similar comment on MOD-025-2 and PRC-019-1, we received these responses: MOD-025-1: "The GVSDT thanks you for your comment. There was overwhelming industry support (approximately 96%) for inclusion of synchronous condensers at the first posting of MOD-025-2. The Definition of Bulk Electric System (BOT Adoption Jan 2012) includes in "I5 – Static or dynamic devices (excluding generators) dedicated to supplying or absorbing Reactive Power that are connected at 100 kV or higher, or through a dedicated transformer with a high-side voltage of 100 kV or higher, or through a transformer that is designated in Inclusion I2." PRC-019-1: "The SDT feels that it is appropriate to include synchronous condensers because of their similarity to generators in terms of dynamic reactive power supply, voltage control, disturbance response, control functions, and protection systems. For this reason the SDT proposes to apply to the standard to similar size generators and synchronous condensers." We need to see "one" statement from the SDT on the inclusion or exclusion of synchronous condensers that makes sense technically, and soon. This SECOND COMMENT was provided for MOD-025-1, MOD-026-1, MOD-027-1, and PRC-024-1. 2.DATA SHARING POLICY: For all of the MOD standards in this, only Transmission Planners are the recipient of the data developed. We asked that the standard require that the TP be required to share the data with others. The response we received is that the Functional Model requires the TP to share data with the TOP. Unfortunately, the Functional Model is unenforceable. We note that in PRC-024-1, R6 requires the GO to share its data with the RC, PC, TOP, and TO, upon request. Unless the same data is shared across all "modelers," the result will be outdated data in someone's model, which can have a bad result. The team should have one broad "data sharing" policy in the three MOD standards and PRC-024-1. Since the TP receives data in three of the standards, we suggest this language or similar language: The GO shall provide data to its TP within 60 days of its development [describe the data]. The TP shall provide the same data to any RC, PC, TP, or TOP within 60 days of receiving a request for

Ingleside Cogeneration LP (Voting entity Occidental Chemical Corporation)
Yes
Yes
In general, Ingleside Cogeneration LP believes that a good working relationship between the Generator Owner and Transmission Planner includes a reasonable justification for any request that requires time and expense on the part of the other.
Ingleside Cogeneration LP agrees that the ability for Transmission Planners to effectively model and simulate actual system response to voltage transients can lead to reliability improvements. In addition, the technical veracity and implementation time frames in the latest version of MOD-026-1 are far improved over previous versions. However, we are concerned with the aggregate work load that all five standards in Project 2007-09 will place upon our engineering and operations organizations. Each has its own unique purpose, which means unique processes to support them – as well as test results that demonstrate compliance. With so much uncertainty surrounding this program, we cannot agree to proceed without the following items being addressed: 1) All requirements for recurring tests (R2) must contain language that focuses on the strength of the validation process – not the execution. This could be similar to that used in the CIP version 5 standards calling for the Responsible Entity to implement an action "in a manner that identifies, assesses, and corrects deficiencies". Experience has shown that without this preface, auditors will focus on missed due dates, whether or not all check boxes are filled in, and statements showing that every sub-requirement was addressed – even those not applicable to the facility. The CEA's focus needs to be on the entity's commitment to the validation effort, not the documentation. 2) The Compliance organization needs to be engaged in the development process so that industry stakeholders have a sense of how adherence to the standard will be determined. The existing process is disconnected – leading to inconsistent interpretations of the drafting team's original intent. Other projects have begun to post drafts of the RSAWs concurrently with the standards for exactly this reason. The SDT should take note that these modifications are consistent with the risk-based compliance direction that both NERC and FERC support. The intent is to focus industry and regulatory resources on the reliability aspects of the initiative – not its administrative aspects.

For Requirement 6, ATC recommends the wording at the end of the requirement to read “that includes how any of the following criteria are not met:” because the existing wording does not express that the criteria are not met when the model is not usable.
Individual
Ken Gardner
Alberta Electric System Operator (AESO)
1. In section 4.2.2, The AESO considers the existing applicability for model validation to be more appropriate: • Connected to a transmission grid at 60 kV or higher voltage; and • single unit capacity of 10 MVA and larger; or • facilities with aggregate capacity of 20 MVA and larger. 2. Requirement R2, the AESO considers the existing validation period of 5 years to be more appropriate. 3. Requirement R4, as written it appears owners of generating units that plan to change out the excitation control systems are not required to provided preliminary (design) data to the Transmission Planner only validated data. The AESO does not consider this to be appropriate as this preliminary (design) data should be provided to the Transmission Planner in advance of the change.

Anthony Jablonski
ReliabilityFirst
No
ReliabilityFirst believes there is a major disconnect/flaw between the Applicability Section (4.2. Facilities) and Requirement R2, part 2.1. This major flaw will create confusion on which generating units are required to be verified per the standard. ReliabilityFirst offers the following comments for consideration: 1. Requirements R2, Part 2.1 - There is a clear disconnect between the Applicability section of the standard (i.e. individual units/plants greater than 100MVA - Eastern or Quebec Interconnections) and Requirements R2, Part 2.1 which requires”… Verification of an individual unit less than 20 MVA.” Based on the Applicability section, units less than 20 MVA are not applicable under this standard. Furthermore, units under 20 MVA do not fall under the NERC Statement of Compliance Registry Criteria as criteria for registration purposes for GOs and GOPs. 2. Applicability Section 4.2. Facilities – ReliabilityFirst thanks the SDT for their justification for the 100 MVA threshold, but still believes that the Applicability should be consistent with the NERC Statement of Compliance Registry Criteria generator thresholds (i.e. 20 MVA or 75 MVA aggregate connected to the BES). Even though the 100 MVA threshold covers 80% of the connected MVA or greater for each Interconnection (in aggregate), depending on the geographic location (within the BES), that value may be much less. For example, if there is a certain load pocket in which the majority of the connected generation is lest that 100 MVA, the dynamic models would not be required to be verified per this standard. Thus not having verified accurate dynamic models for this specific location could hinder the reliability of the BES. ReliabilityFirst recommends changing the Applicability section to be consistent with the NERC Statement of Compliance Registry Criteria generator thresholds (i.e. 20 MVA or 75 MVA aggregate connected to the BES).
VSL Requirement R6 – ReliabilityFirst still believes the VSL for Requirement R6 is not meeting the intent of FERC VSL Guideline #3 "Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement.” Requirement R6 clearly requires the Transmission Planners to “...notify the Generator Owner... “, while the corresponding VSL states “The Transmission Planner provided a written response to the Generator Owner indicating...” The VSL is adding additional requirements on the TP (i.e. provide written response) which are not required within the actual requirement (nowhere in R6 is the TP required to provide a written response). If it is the intent of the SDT to have the TP provide a written response, ReliabilityFirst recommends adding that language to the requirement.

No
In Row 4, the use of 350 MVA as the cutoff for “sister unit” treatment is not reasonable. We propose the limit can be increased to 500 MVA without any adverse reliability impacts. Also, in Row 5, the allowable time for existing units to be verified following an indication of model problems should be 2 years, rather than 1 year, since existing legacy units may require additional resources to understand and resolve the issues.
No
We propose that the requirements for a “technically justified unit” must also include the technical reasons why the unit under consideration is critical to the reliability of the BES.
1. In 4.2.1.2, the use of the term “directly connected at a common BES bus” suggests that wind farms are not applicable facilities, since wind generators are typically directly connected to a non-BES bus (e.g. 34.5 kv). We suggest that the applicability to wind farms be clarified more explicitly. 2. In R1, the present wording allows for the TP to provide only one of the three types of data, even if the GO requested all three. We suggest removing the wording, “one or more of”. 3. In R1, the present requirement is for the TP to provide instructions to the GO on how to obtain the acceptable models and associated block diagrams and data. We believe that since the TP is very familiar with this data and the GO may not be, it is far simpler and efficient for the TP to provide the actual data on request, not just the instructions on how to obtain it. 4. In R2.1.1, the GO is required to have documentation comparing the “model response” to the “recorded response”, in this case Voltage vs. Time. First, to determine the model response requires the ability to run dynamic studies. Generally the GO does not have the simulation capability or the subject matter experts required to perform dynamic system studies. It would seem that the intent of this requirement is that the GO must expend considerable resources to gain this capability, either internally or by other means. Is this the intent of the SDT? 5. In R3, the requirements for the written response to the TP need clarification. The term “either” would suggest there are two possible responses. However, there appear to be three possible responses. We suggest there needs to be a 4th possible response option for the GO, for the GO to initiate contact with the TP to schedule a meeting to discuss the technical issues with the model. The necessary collaboration between the GO and TP to understand the model deficiencies will require time, thus may require more than the 90 days to reconcile the model issues. 120 days is suggested. 6. In Section 5 Effective Dates: The considerable time and resources needed to get up to speed with model verification suggests there needs to be more time allowed in the earlier phases of the compliance timeline. We suggest using 20 percent in 4 years, 40 percent in 6 years, and 100 percent in 10 years.

Yes
The SDT should consider either removing MOD-026-1 R5 or merge R3 and R5 because a) MOD-026-1 R3 and R5 appear to have the same objective with similar wording and b) MOD-027-1 does not have the equivalent of MOD-026-1 R5. MOD-026-1 R6 ends with "...that includes the following:" yet whatever the SDT intended to follow is missing. Please note that subparts 1 through 3 are referenced in parenthetical statements within the respective requirements and that it does not make sense that these subpart criteria are also what needs to follow "...that includes the following:"

1. Attachment 1, Row Number 4, Recommend deleting “at the same physical location” from the Verification condition. The first condition is recommended to read “Existing applicable unit that is equivalent to another unit(s),” Justification is that if a GO has units that are equivalent and meet the “sister” criteria, the standard does not need to be restricted to the same physical location. The GO identical equipment at different physical locations are still equivalent.
No
1. The GVSDT had good intentions by having a very short requirement. However, I am not sure what the intent is. A few more descriptive words would help greatly.
None
Individual
Michael Falvo
Independent Electricity System Operator

No
The long periods in Attachment 1 introduce too much risk: the modeling assumptions (used to derive operating security limits and to make other operating and planning decisions) do not reflect the actual performance of equipment. It would be better for the standard not only to establish the maximum period that Transmission Planners and Generators Owners to complete tasks but also to require the Transmission Planners to establish shorter periods when necessary to reduce the risk to reliability to an acceptable level. In Ontario, Generator Owners have 30 days to transmit the verified model, documentation and data to the Transmission Planner. Generator Owners are also required to indicate immediately following testing whether the installed equipment performed as expected. This approach has worked well. New or modified equipment must first pass through a connection assessment process to establish whether expected performance will meet requirements. Emerging from this process is the Generator Owner's conditional right to connect provided he meets an obligation to demonstrate the installed equipment behaves as well as assumed in the assessment process. In this way, the risk to reliability is reduced to an acceptable level as the exposure of the decision making process to flawed modeling assumptions is minimized Experience in Ontario has shown that units that were expected to have essentially the same performance often show much larger differences than expected when tested. What seems like small or obscure differences to a Generator Owner can be critical to a Transmission Planner. Row 4 in Attachment 1 should be amended to require the amount of verification on "sister" units to be accepted by the Transmission Planner. Attachment 1 Row 4 that allows for new or existing units that does not include an active closed loop voltage or reactive power control function should be changed. Given the size of the "applicable unit" virtually all units should be on voltage control unless specifically permitted by the Transmission Planner as is the case in Ontario. The adverse effects to reliability of not being on voltage control are well documented (Note1). The standard should be changed to put the onus on the Generator Owner of units not operating in voltage control to demonstrate continued operation in this mode does not have a material adverse effect on reliability. The standard should requirespecify the a process available for moving an "applicable unit" to closed loop voltage control when the Transmission Planner determines this is necessary. Note1: J.D. Hurley, L.N. Bize, C.R. Mummert C.R,The Adverse Effects of Excitation System Var and Power Factor Controllers, IEEE Transactions on Energy Conversion, Vol 14, No. 4, December 1999
Yes
a. No explicit NERC performance requirements for excitation system are a weakness. In Ontario, generating units are required to materially help regulate voltage as the Transmission Planner sets performance requirements for upper and lower ceilings, voltage response time, and stabilizer characteristics. This standard in its present form allows generators to continue to not materially help regulate voltage provided the documentation submitted to Transmission Planner is consistent with this lack of performance. b. In Ontario, experience has been that the models typically used by the Transmission Planner are not commonly employed by Generator Owners. The standard recognizes this in R1 by giving the obligation to the Transmission Planner to provide model block diagrams or data sheets to the Generator Owner. As the Transmission Planner may be unaware of practicable constraints on a unit and the Generator Owner may not be familiar with the reliability models; both parties must reach an accommodation on the details to verify the model. R2 should be changed so the Generator Owner is required to provide a model that has been verified by a method accepted by the Transmission Planner. c. The measured performance of the OEL, UEL, stator current limiter or any other automatic control system that alters the behaviour of the excitation system should be part of the Generator Owner submission to the Transmission Planner as limiter performance can affect reliability decisions. No limiter that imposes more restrictive limits than the required short term field and armature current requirements in ANSI/IEEE 50.13 should be implemented without the Transmission Planner's approval. d. The concept of "applicable unit" should be extended to include static var generators and similar devices. All facilities with an excitation control system and more than 100 MVA of capability should fall under this standard. e. Changes to the generator (e.g. rewinds or active power output increases) will affect excitation system performance. The standard should require re-testing following other modifications that the Transmission Planner can show with simulations will require modifications to the excitation system to improve reliability. For example, turbine replacements often provide increased active power capability. At higher levels of active power, the excitation system can materially change without coordinated changes to over-excitation limiters. f. R2.1 should be amended (see below) to add flexibility to include other practical combinations of units to be used for verification. For example, it can be more practicable to test wind and solar installation one feeder at a time but this is not allowable with the standard in its present form. Each applicable unit's model shall be verified by the Generator Owner using one or more models acceptable to the Transmission Planner. Verification of an individual unit rated less than 20 MVA (gross nameplate rating) may be performed using either an individual unit, a combination of units, or plant aggregate model(s). g. In Ontario we face resistance when our standards exceed NERC requirements. Would it be possible for the SDT in its response to offer its opinion on elements of our comments that are not incorporated into the next version of this standard? For example, if none of our comments can be adopted into the standard, we would appreciate responses such as: "In the opinion of the SDT, having more applicable units on closed loop voltage control, reducing the time to transmit verified information to the Transmission Planner, having specific excitation performance requirements, expanding verified information to include limiters and other devices that affect excitation system performance, and making the requirements in this

standard applicable to wider range of equipment are all practices that will tend to improve reliability." or "In the opinion of the SDT, the requirements in this standard are not intended to preclude continuing or implementing more stringent Transmission Planner requirements" This type of response would help us to continue to augment continent-wide standards with additional requirements to maintain reliability in our part of the interconnection. h. We appreciate the SDT's effort to implement our proposed language changes to remove a potential conflict with the Ontario regulatory practice respecting the effective date of implementing approved standards. The added language, unfortunately, was not added at the appropriate places. We suggest the SDT to move the wording ", or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities," in Section 5.1 to right after "approved by applicable regulatory approval", and move that same wording to right after "following applicable regulatory approval" in Sections 5.2 to 5.4. Also, the same phrase should be appended to each of the four bullets in the Section "In those jurisdictions where regulatory approval is required:" of the Implementation Plan right after "following applicable regulatory approval."

Shammara Hasty
No
We recommend removing the first element of the logical AND statement of Attachment 1 Row 4 (the same physical location element). If a GO has identical equipment at different physical locations, they are equivalent. A sister is a sister independent of the physical location. As long as the equipment is identical, the concept should be allowed to apply regardless of location. The SDT should consider moving the capacity factor exemption information found in Attachment 1, row 7 into the applicability section. The applicability section should allow an entity to be able to determine if the standard applies to them and be able to determine the scope of the facilities affected. It is best for those impacted to immediately know which units are in the scope and not have to realize the scope from a detailed study of the table of Attachment 1. This would allow row 7 of Attachment 1 to be deleted.
Yes
Please add clarifying language to R5 to emphasize that this requirement is addressing units that meet the NERC registry criteria but are smaller than the MVA size specified in the applicability section. Sub-requirement 2.1.4 Is not clear – is this data the model block diagram and its parameters? If so, simply state that. SCS agrees with the modifications to the Periodicity Table as they both simplify and clarify the periodicity.
Group
FirstEnergy
Larry Raczkowski
Yes
Although FirstEnergy (FE) agrees with the revision to Attachment 1, we feel that the capacity factor calculation in Row 7 should be a part of Applicability section 4.2 Facilities. The reader of the standard shouldn't have to get to the last row of an attachment to determine as to whether a unit is exempt or not.
Yes
1. Although we agree with the footnote definition for "technical justification", we would like the term "match" be replaced with "simulates or represents". We feel that these terms give more interpretation when comparing. 2. While we agree that a threshold for unit verification is appropriate, we are not clear as to why there would be different threshold for each Interconnection. The SDT should include a Guidelines and Technical Basis section that explains the geographical differences.
1. FE believes that Requirement 6 in an un-necessary requirement that the Transmission Planner must respond within 90 calendar days that the model is usable. The Transmission Planner should only respond if the information is not usable. We suggest that this requirement should be in a negative perspective and offer the following revision: R6. Each Transmission Planner shall notify the Generator Owner within 90 calendar days of receiving the verified excitation control system or plant volt/var control function model information in accordance with Requirement R2 that the model is not usable (see Sub-requirements 6.1 through 6.5), and shall include a technical description if the model is not usable that includes (but not limited to) the following: [Violation Risk Factor: Medium] [Time Horizon: Operations Planning] 6.1. The excitation control system or plant volt/var control function model fails to initialize during a dynamic simulation along with suggested areas for investigation, 6.2. A listing of parameters that fail the Transmission Planner's data checks, 6.3. A no-disturbance simulation fails to result in non negligible transients ("flat line"), 6.4. For an otherwise stable simulation, a disturbance simulation results in the excitation control and plant volt/var control function model exhibiting an under-damped or critically damped response, or otherwise fails the Transmission Planner's stability criteria. 6.5. The excitation control system or plant volt/var control function model submitted by the Generator Owner is either a user defined model or a model that is not acceptable for use in the Transmission Planner's Regional Reliability Organization footprint. 2. For clarity, Requirements 3 and 5 are confusing and seems to be the same. We feel the that R5 can be removed from MOD-

026. This will also be consistent with the requirements of MOD-027.

1. The standard is based on the assumption that it is possible to tune the acceptable models cited in R1 such that their predictions will match actual voltage and reactive power responses to system Disturbances. The yet-to-be-defined acceptable models may not be capable of achieving this goal, however, because standard excitation component models are inadequate to predict with high fidelity the generation system response that is the subject of MOD-026-1. Such models do not take into account, for example, equipment thermal capability limitations and the capping of reactive power output to respect aux bus voltage limits. The SDT is therefore asking for a considerable advancement in the excitation modeling state of the art, to be undertaken in parallel by the owners of every generation unit in North America. This is a doubly daunting task in that GOs often do not have any dynamic modeling software or expertise, much less the ability to invent something new, because the present approach to the subject is that GOs just provide the values of input parameters to the TP, which owns and runs models. Independent GOs (i.e. deregulated entities that are not part of a vertically-integrated utility) moreover do not have and cannot obtain information on the system outside the plant battery limits. This circumstance renders them unable to model the plant-T&D interactions associated with Disturbances, and independent GOs may therefore forever remain unable to develop model results that closely match actual Disturbance responses. The approach being taken in MOD-026-1 is consequently viewed as being technically infeasible for the present state of the art as well as unjustified in light of FERC's March 15, 2012 FFT Order to propose specific standards or requirements that should be revised or removed [or not enacted in the first place] due to having little effect on reliability or because of compliance burdens. The SDT should instead collaborate with industry associations (EPRI, IEEE, NAGF), equipment OEMs, and modeling services vendors to develop the right tools for the job, and put the new models through trial runs at several plants. These trials should be limited to data-collection means that can be non-invasively employed (e.g. online voltage step-response tests, low-load rejection during normal stop events), and should lead to definition of specific testing means for definition of specific model parameters. The SDT should then put out for voting a standard requiring TOPs to own and run these models, and requiring GOs to provide them the appropriate input data, developed via the non-invasive means stated above. 2. There is presently no definition of the voltage excursion magnitude and intensity or the recording instrumentation sampling rate required for a valid verification event. There are also no specifics regarding how closely the model must match the recorded response or for what period of time, just a requirement that it be deemed "usable" by the TP. The SDT is asking for a blank check, and we cannot agree to regulations for which it is impossible to say at the time of balloting whether or not compliance can be achieved, let alone in a fashion that is justified per the FERC order cited above. Perceived shortcomings in these respects would presumably trigger the Transmission Planner expression of concern described in R3, but it would be better to establish the rules up-front rather than addressing the matter only after a GO has attempted to comply with MOD-026 and been found lacking. It was stated in a 7/29/11 webinar that a signal-to-noise ratio of at least 5:1 is needed for a meaningful validation, but this criterion did not make it into the standard. 3. The term "rotational inertia" in R2.1.3 should be replaced with "inertia constant (H)," the rotational inertia divided by MVA rating, since this is the parameter of interest for stability studies. Either way, the obligation to conduct testing in this respect should be waived for units having an OEM-developed value and no modifications to the rotating components, since rotational inertia can be identified more precisely via calculation than by clocking a post-trip over speed excursion. 4. The term "technically justified" in para. 4.2.4 on p.3 and in R5 is too vague, in that the degree of actual-vs.-predicted mismatch triggering MOD-026-1 applicability is not specified. It is also not clear how this comparison is to be made if the Facility did not have to provide a MOD-026 model in the first place. In any event the wording of the R5 Violation Severity Levels should be modified to start the clock only after agreement has been reached that a request is technically justified. 5. The instruction in R4 to notify the TP, "within 180 calendar days of making changes that alter the system response is too vague, despite the attempted clarification in footnote #3, since many activities can have some degree of impact as noted above. Reportable thresholds regarding degree of impact on system response and the expected duration are needed. 6. Please add clarifying language to R5 to emphasize that this requirement is addressing units that meet the NERC registry criteria but are smaller than the MVA size specified in the applicability section. 7. Sub-requirement 2.1.4 is not clear – is this data the model block diagram and its parameters? If so, simply state that. 8. We recommend removing the first element of the logical AND statement of Attachment 1 Row 4 (the same physical location element). If a GO has identical equipment at different physical locations, they are equivalent. A sister is a sister independent of the physical location. As long as the equipment is identical, the concept should be allowed to apply regardless of location. 9. The SDT should consider moving the capacity factor exemption information found in Attachment 1, row 7 into the applicability section. The applicability section should allow an entity to be able to determine if the standard applies to them and be able to determine the scope of the facilities affected. It is best for those impacted to immediately know which units are in the scope and not have to realize the scope from a detailed study of the table of Attachment 1. This would allow row 7 of Attachment 1 to be deleted.

Utility Services
Utility Services suggests the SDT specifically identify or show examples of how to match the percentage thresholds outlined in the Effective Date sections of the standard and the associated Implementation Plans. Given our recent experience in other standards, it would be helpful for the SDT to establish how the entities can demonstrate meeting the requisite threshold percentages. Over time, we have observed that in some cases, percentages were established by the number of devices or units; but in other cases, the measurement has been based upon magnitude of nameplate ratings.

Mike Garton
Yes
Yes
Dominion agrees with this change; however, is concerned with the phrase "demonstrating that the simulated unit or plant response does not match the measured unit or plant response." The use of the word "match" implies that the simulated response and measures response must be exact, when in fact this will not likely be the case. This language in section 4.2.4 (and other sections) should allow for acceptable variation so compliance can be properly achieved and demonstrated.

Related to our comment on MOD-025, if synchronous condensers are only owned by TOs, then the excitation system of a synchronous condenser would not be verified in MOD-026 because it is only applicable to GOs. FMPA recommends that synchronous condenser excitation systems should be verified through the same process, and as a result, if a synchronous condenser is owned by a TO, then a TO should have applicability to it only for excitation systems on synchronous condensers it may own.

Applicability Section 4.2.4 currently states "A technically justified2 unit that meets NERC registry criteria and is requested by the Transmission Planner." With the reference footnote stating "Technical justification is achieved by the Transmission Planner demonstrating that the simulated unit or plant response does not match the measured unit or plant response." This intended applicability is confusing and implies that the Transmission Planner has the discretion to decide applicability if a previously exempted unit does not meet Transmission Planner decided criteria. Exelon suggests that this be deleted in its entirety. If the GVSDT intent is to pull in other generating units below the MVA threshold criteria based on Transmission Planner discretion, then that should be factored into Applicability Sections 4.2.1 through 4.2.3. In addition, if Section 4.2.4 is also written to negate an exemption based on Transmission Planner discretion then that provision should be factored into Attachment 1 and not into the applicability section.
Exelon again reiterates that the Standard should specifically define the acceptance criteria. The current draft (draft 4) of MOD-026-1 R.3 requires that a Generator Owner provide a written response to its Transmission Planner if the Transmission Planner deems the functional model is not “usable”, if there are technical concerns with the verification documentation, or if the model response did not match the recorded response to a transmission system event. This written response is to contain either the technical basis for maintaining the current model, the model changes, or a plan to perform model verification. It appears from previous comments of the GVSDT that the Generator Owner has final say on the model and the GVSDT has previously responded "that the standard is written so that the Generator Owner “owns’ the model, and as such, even with the peer review process described, the Generator Owner has final say on the voltage excursion used, including sampling rate, for model verification as well as determining if the equipment recorded response satisfactorily matches the model’s predicted response.”

While Exelon agrees with this statement; Exelon again requests that this language be clearly articulated within the body of the Standard or that definitive acceptance criteria be added to the Standard.

Idaho Power System Planning agrees with the revisions made to Attachment 1. Idaho Power Generator Owner- Suggest that "commissioning date" due date requirements be changed to "commercial operation date" to be consistent with other standards.
Yes
Idaho Power System Planning agrees with the revisions made in Section 4.2.4. Idaho Power Generator Owner- The phrase "units that meet the NERC Registry Criteria" has no meaning, since entities and not units are placed on the NERC registry. In addition, demonstrating that a simulated response does not match a measured response is not sufficient technical justification. Additional, technical justification should include demonstration that the different response materially impacts system studes. Additionally, allowing only one year for submission of test results following a technical justification is unreasonable, 5 or 10 years to match the initial implementation time period is more reasonable from the Generator Owner perspective for appropriately planning and scheduling the outage time and work.
1) Technical Justification of units based solely on a simulated response not matching recorded response is insufficient. Technical Jusitification needs to include evidence that the difference in response has a material effect on the conclusions of the relevant system studies. 2) Requiring each Transmission Planner to maintain a list of acceptable models, and then requiring Generator Owners to submit data according to those models is unreasonable. The list of acceptable models needs to be at least regional, if not continent-wide. In addition, some required longevity needs to be specified to allow Generator Owners to appropriately plan and perform the verification work.
Individual
Daniela Hammons
CenterPoint Energy
In R6, CenterPoint Energy recommends changing 90 days to 180 days for a Transmission Planner to notify the Generator Owner that a model is usable or is not usable. Such a change will allow time for model verification through the various regional processes for generator data submittals and dynamic planning case building.

There appears to be a discrepancy between the language in the requirement R4 and its VSL compared to Row 3 of the Attachment 1. In the both requirement and VSL, a 180 day period is stated, while in Row 3 of Attachment 1, a 365 day period is stated.
Yes
(1)We request that papers listed in the references section of the standard are made readily available on the NERC website. (2)There appears to be an extra word “thirty” in both redline and clean versions of the standard under section 5.3 of the Effective Date section of the draft standard. (3)As we understand, part of R1 is for the Transmission Planner to provide instructions on how to obtain the list of acceptable model types for use in dynamic simulations. In this regard, we ask the SDT if this would preclude the use of user-written models? (4)We still have serious concerns about compliance with new MOD-026-1 while compliance with MOD-012-0 and MOD-013-1 is still in effect. We appreciate the SDT considering our comments on this issue in the last draft, but we still disagree about the potential conflicts for the following reasons: (a)The reporting requirements to comply with MOD-012 are dependent upon the data requirements and reporting procedures put in place by their Regional Entity as mandated by MOD-013. This does not provide consistency across the country. (b)We take data reporting under MOD-012 very seriously and incorporate testing in our program to ensure the data is accurate. Consequently, our reporting and compliance with MOD-012 does involve generator testing on a 5 year basis. (c)Any GO that has implemented a MOD-012 compliance program that involves testing that cannot perfectly synchronize with the 10 year testing in this draft of MOD-026 will have a significant burden in scheduling generator testing to satisfy both standards. (5)We strongly request the SDT seriously consider incorporating the current MOD-012/MOD-013 submittal

requirements within MOD-026. This will synchronize the reporting and verification requirements and help minimize the resource burden of compliance with both efforts. At the same time it will create consistency across the country.

(1) While the clarity of Attachment 1 has been improved, we noticed a couple of issues. Note 2 provides guidance for early compliance and we agree that early compliance should be allowable. It establishes that 10 year period begins from the transmittal date. If a GO has data that satisfies the early compliance condition for a verified model and that data is a five years old, the Note would appear to allow the GO to transmit the data to the TP and receive credit for next 10 years effectively creating an initial 15-year re-verification cycle. Is this intended? If not, please provide more guidance for how soon the GO would have to re-verify its model. (2) Row 3 in Attachment 1 states that it applies to initial verification for a newly applicable unit or for an existing applicable unit with a new excitation or plant volt/var control system. However, Requirement R4 also applies to changes to the controls systems. Wouldn't complete replacement be a change? We recommend modifying Attachment 1 to avoid this overlap. (3) Per Requirement R4 and Row 5 in Attachment 1 the GO has 180 days to submit a plan to Transmission Planner to verify the model and then another 365 days to perform the model verification date. That would appear to give the GO approximately a year and half to complete the verification for changes (including replacement) to the control system. Requirement R2 and Row 3 appear to require completion of the verification in 365 days or a year. Please modify the table or requirement to clarify appropriate application.
No
Because NERC and the Regional Entities do not maintain a public list of units that meet the "NERC registry criteria," it is impossible for the Transmission Planner to know for which set of units it may submit a technical justification per R5 and applicability section 4.2.4. The NERC ROP Appendix 5B, Statement of Compliance Registry criteria III.c.1, III.c.2 and III.c.3 each represent fairly "bright lines," where the TP can deduce which units meet these criteria. However, criterion III.c.4 is amorphous and notes on the page 11 of the document give NERC flexibility to deviate from the criteria anyway. Thus, we request that the drafting team either clarify that the "NERC registry criteria" in applicability section 4.2.4 is intended to mean criteria III.c.1, III.c.2 and III.c.3 in section III(c) of Appendix 5B – Statement of Compliance Registry Criteria or that the SDT work with NERC staff to determine how the TP may get a list of units that meet criterion III.c.4 and Note 1.
(1) Thank you for modifying the applicability section. It is greatly improved and is much clearer than the previous version. However, we believe there are a few additional minor refinements necessary. First, generators can be and are part of the Bulk Electric System. Thus, we suggest changing "Facilities that are directly connected to the Bulk Electric System (BES)" to "generation Facilities that are part of the Bulk Electric System." Otherwise, there might be some confusion if the drafting team intends to draw in generators that are not part of the BES. Second, we find the wording "will be collectively referred as an 'applicable unit' that meet the following" confusing. We think the intent was to clarify that an applicable unit is one that is part of the BES and meets criteria established in section 4.2.1, 4.2.2, 4.2.3, and 4.2.4. However, we think the inclusion of the "will be collectively referred as an 'applicable unit'" is superfluous. Because the section is the applicability section, we think this language could be struck for

clarity and the applicable units will be understood to mean those that meet the criteria in section 4.2. As an alternative, the drafting team could explain in a footnote what they mean by the term applicable unit. Third, with the two proposed changes, we think the final wording of section 4.2 after the opening clause should be "generation Facilities that are part of the Bulk Electric System (BES) that meet the following criteria:". (2) In requirement R2, please change "for each applicable unit" to "for each of its applicable units." This is the previous wording and is more correct. The current wording literally says that the GO must provide a verified model for each applicable unit including those it does not own. After all any unit that meets applicability criteria including those owned by other GOs would be an applicable unit. (3) Please specify in M1 that a Transmission Planner may also provide an attestation that no such request was received if this is the case. Use of attestation that an event did not occur is established as an acceptable form of evidence in CAN-0030. Furthermore, precedent has been set in the use of attestations in measures in FAC-003-2 M1 and M2. (4) We continue to believe that the examples provided in the comment form should be included in the standard. Please create an Application Guidelines or Guidelines and Technical Basis section in the standard and add them. This has become common practice with developing standards. We do not understand why the drafting team would not want to retain such information that helps readers understand the standard and that has already been developed. Furthermore, it would make it easier for commenters to see what has changed in the examples because a red-line of the standard is required. Because the examples were contained in the comment form this time and during the previous posting, it is not easy to deduce the changes because there is no red-line. If the examples are not included in the standard, please provide more explanation than was provided during the last response to comments which was that it is not appropriate to include the examples. We do not understand why it is not appropriate. (5) We disagree with the need to retain the latest model verification evidence under Requirement R2 and M2. First, this is not consistent with the Section 3.1.4.2 of Appendix 3c to the NERC Rules of Procedure section which states that the audit will cover the period from the day after the last compliance audit to the end date of the current compliance audit. Since the audit cycle for a GO is six years and the model verification period is 10 years, the GO will have to retain data past its prior audit period. Furthermore, the auditor will have already had an opportunity to review the model verification data during the last audit. Presumably, if they did not find any compliance violations, there should not be a need to review this data again. Thus, the data retention should not exceed the six year audit cycle. (6) How will mothballed units be handled in Attachment 1? If a mothballed unit is returned to service which row in Attachment 1 applies? What if the unit was mothballed before the effective date and returned to service after all stages of the effective dates? What if it was mothballed after an initial verification? How does this affect the next verification date?

Texas Reliability Entity
Yes
As TRE stated in previous comment periods to the standard, we disagree with using the 5% capacity factor (Attachment 1, Row 7) to determine which units need to comply with this Standard. The requirements should apply to all generating units meeting the MVA thresholds, regardless of capacity factor. We recognize this is somewhat alleviated by Requirement R5, which now provides a method for the TP to request a model verification for a unit that has less than 5% net capacity factor if the unit's simulated response fails to match its measured response.
Yes
Should Blackstart units have a specific inclusion as an "applicable unit", regardless of capacity factor or "technical justification"?
1) Considering the proposed new BES definition and the Guidance Document, there may be confusion in determining if a generator is "directly connected" to the BES. Please consider reviewing the language to see if it should instead say "included in" the BES. Note that a BES generator can be connected to the BES by non-BES elements, and arguably not "directly connected" to the BES. See, for example, figures E1-4 and E1-6 in the BES Definition Guidance Document. 2) TRE recommends changing to "Planning Authority or Transmission Planner" in the Functional Entities in Section 4.1.2 instead of "Transmission Planner". This change should be duplicated in the requirements. The change may be needed since the Planning Authority or the Transmission Planner may have the responsibility for modeling the generation data provided by the Generator Owners. 3) The timelines are generally too long, which will result in stale, incorrect and generic data being utilized in modeling systems. Consider shortening timeframes.

No

No comment on this question.
A stated purpose of Generator Verification is “to ensure that generator models accurately reflect the generator’s capabilities and operating characteristics.” Modeling behind-the-meter generation based on gross name-plate ratings will not accurately reflect those assets’ capabilities or operating characteristics, and, in fact, may seriously distort BES expansion plans or other modeling scenarios if name-plate ratings are used. Behind-the-meter generation is a misnomer. It is not comparable to utility or merchant generation in which the primary function is to deliver electric energy to the bulk electric system. The primary function of behind-the-meter generation that employs cogeneration or combined heat and power (CHP) systems is to deliver thermal energy (usually in the form of steam) in support of the load’s process technology. In the case of industrial loads, the capabilities or operating characteristics of that process are a function of the load’s produc tion schedule associated with its products (e.g., chemicals, petroleum, paper, etc.) and independent of conditions on the BES. Any electric power delivered to the BES is a residual by-product of the industrial process and generally a small fraction of the name-plate rating of the generator. Section III.c.4 of the Statement of Compliance Registry Criteria (v.5) and Exclusion E2 of the revised BES definition both recognize this fundamental characteristic of behind-the-meter generation and that is why neither document uses name-plate rating as a useful metric for behind-the-meter generation. The GVSDT is urged to do the same.

Cowlitz supports the comments put together by the NAGF SRT: 1. We recommend removing the first element of the logical AND statement of Attachment 1 Row 4 (the same physical location element). If a GO has identical equipment at different physical locations, they are equivalent. A sister is a sister independent of the physical location. As long as the equipment is identical, the concept should be allowed to apply regardless of location. 2. The SDT should consider moving the capacity factor exemption information found in Attachment 1, row 7 into the applicability section. The applicability section should allow an entity to be able to determine if the standard applies to them and be able to determine the scope of the facilities affected. It is best for those impacted to immediately know which units are in the scope and not have to realize the scope from a detailed study of the table of Attachment 1. This would allow row 7 of Attachment 1 to be deleted.
No
Cowlitz is unsure if it is possible to accurately model generation such that modeling software will be able to predict actual plant response to a disturbance. The Standard may create a never ending circle of requests from the TP for improved modeling data. Cowlitz understands that modeling software is still in its infancy, and more research and testing is needed to explore the boundaries between achievable modeling and where unrealistic goals exist.
Cowlitz supports the comments put together by the NAGF SRT: 1. The standard is based on the assumption that it is possible to tune the acceptable models cited in R1 such that their predictions will match actual voltage and reactive power responses to system Disturbances. The yet-to-be-defined acceptable models may not be capable of achieving this goal, however, because standard excitation component models are inadequate to predict with high fidelity the generation system response that is the subject of MOD-026-1. Such models do not take into account, for example, equipment thermal capability limitations and the capping of reactive power output to respect aux bus voltage limits. The SDT is therefore asking for a considerable advancement in the excitation modeling state of the art, to be undertaken in parallel by the owners of every generation unit in North America. This is a doubly daunting task in that GOs often do not have any dynamic modeling software or expertise, much less the ability to invent something new, because the present approach to the subject is that GOs just provide the values of input parameters to the TP, which owns and runs models. Independent GOs (i.e. deregulated entities that are not part of a vertically-integrated utility) moreover do not have and cannot obtain information on the system outside the plant battery limits. This circumstance renders them unable to model the plant-T&D interactions associated with Disturbances, and independent GOs may therefore forever remain unable to develop model results that closely match actual Disturbance responses. The approach being taken in MOD-026-1 is consequently viewed as being technically infeasible for the present state of the art as well as unjustified in light of FERC’s March 15, 2012 FFT Order to propose specific standards or requirements that should be revised or removed [or not enacted in the first place] due to having little effect on reliability or because of compliance burdens. The SDT should instead collaborate with industry associations (EPRI, IEEE, NAGF), equipment OEMs, and modeling services vendors to develop the right tools for the job, and put the new models through trial runs at several plants. These trials should be limited to data-collection means that can be non-invasively employed (e.g. online voltage stepresponse tests, low-load rejection during normal stop events), and should lead to definition of specific testing means for definition

of specific model parameters. The SDT should then put out for voting a standard requiring TOPs to own and run these models, and requiring GOs to provide them the appropriate input data, developed via the non-invasive means stated above. 2. There is presently no definition of the voltage excursion magnitude and intensity or the recording instrumentation sampling rate required for a valid verification event. There are also no specifics regarding how closely the model must match the recorded response or for what period of time, just a requirement that it be deemed "usable" by the TP. The SDT is asking for a blank check, and we cannot agree to regulations for which it is impossible to say at the time of balloting whether or not compliance can be achieved, let alone in a fashion that is justified per the FERC order cited above. Perceived shortcomings in these respects would presumably trigger the Transmission Planner expression of concern described in R3, but it would be better to establish the rules up-front rather than addressing the matter only after a GO has attempted to comply with MOD-026 and been found lacking. It was stated in a 7/29/11 webinar that a signal-to-noise ratio of at least 5:1 is needed for a meaningful validation, but this criterion did not make it into the standard. 3. The term "rotational inertia" in R2.1.3 should be replaced with "inertia constant (H)," the rotational inertia divided by MVA rating, since this is the parameter of interest for stability studies. Either way, the obligation to conduct testing in this respect should be waived for units having an OEM-developed value and no modifications to the rotating components, since rotational inertia can be identified more precisely via calculation than by clocking a post-trip over speed excursion. 4. The term "technically justified" in para. 4.2.4 on p.3 and in R5 is too vague, in that the degree of actual-vs.-predicted mismatch triggering MOD-026-1 applicability is not specified. It is also not clear how this comparison is to be made if the Facility did not have to provide a MOD-026 model in the first place. In any event the wording of the R5 Violation Severity Levels should be modified to start the clock only after agreement has been reached that a request is technically justified. 6. 5. The instruction in R4 to notify the TP, "within 180 calendar days of making changes that alter the system response is too vague, despite the attempted clarification in footnote #3, since many activities can have some degree of impact as noted above. Reportable thresholds regarding degree of impact on system response and the expected duration are needed. 6. Please add clarifying language to R5 to emphasize that this requirement is addressing units that meet the NERC registry criteria but are smaller than the MVA size specified in the applicability section. 7. Sub-requirement 2.1.4 is not clear – is this data the model block diagram and its parameters? If so, simply state that.

Row 3 requires model transmittal "within 365 calendar days after commissioning the unit". It is not acceptable in terms of system reliability for a large unit to be operating on the system for 365 days after commissioning without a verified model. FERC approved ISO Tariff language also calls for provision of the model prior to Commercial Operation. The standard would not meet the requirements of the Tariff. Row 7 discusses capacity factor. The capacity factor reference has been removed from the requirements. If the capacity factor is still to be used this is unacceptable from a reliability standpoint. Large generators that have a low capacity factor will be required to operate under extreme conditions when the system is most stressed. A verified model should be provided regardless of capacity factor given this consideration.
Kathleen Goodman
ISO-New England
No
This means that the Transmission Planner can only call for verification following a system event. It is counter to reliability to have to wait for an event to occur to then request verification. The footnote should be revised to include wording for the Transmission Planner to demonstrate an effect on the BES. Certain generators under 100 MVA could affect the BES and with this language verification could then take place.
Kathleen Goodman
ISO-New England
Requirement R1 may bring out some concern over the copyrighted models supplied by the simulation software

vendors. Hopefully this can be worked out with the vendors.

Requirement R2.1.3 should indicate the requirement for the total combined turbine/generator inertia constant. Simulations need to study the combined inertia of the turbine and generator not just the generator.
A requirement R2.1.7 should be added to require verification of generator excitation limiter settings.

A requirement R2.1.8 should be added to require verification of supplementary voltage control inputs.

Requirement R3 only requires a "written response" from a Generator Owner to the Transmission Planners notification that a model is not useable. Wording must be included so that ultimately the Generator Owner shall provide a "usable model" to the Transmission Planner.

Requirement R4 must be modified so that models are provided prior to making changes in the excitation control system or plant volt/var control function. It is counter to system reliability to allow generators to modify and subsequently operate equipment without notifying the Transmission Planner.

Footnote 6 should be modified to include ability for the Transmission Planner to require a verified model from a generator under the size threshold if the generator impacts the BES.

Requirement R6 sub-requirement wording should be changed to indicate the Transmission Planner shall notify the Generator Owner if the excitation model does not initialize, a no-disturbance simulation results in transients or a disturbance simulation results in a model exhibiting negative damping.

I would recommend that the standard applicability be narrowed to BES units only. The way I read the standard draft it would apply to all generating units. This seems to be a significant cost and amount of work for smaller units that will not have a great impact on the BES. I would suggest that in the applicability section of the standard that the BES unit definitions be used (greater than 85MVA, connected >100kV, etc).

R4 requires the GO to provide the Transmission Planner an estimate of the time duration a generator will stay on during a frequency or voltage excursion. It appears this question would already be answered in complying with R2 when the GO verifies the relay settings against the graphs in Attachment 2. It's also not clear whether R4 is to be accomplished before or after a request from the Transmission Planner. It is recommended R4 be removed. If it is not removed, add "…if requested." at the end of the first sentence.
This Standard is similar to the PRC-006-NPCC-1 and PRC-006-SERC-01 Automatic Underfrequency Load Shedding Standards. PRC-024-1 requires continuous operation at >59.5 Hz. PRC-006-NPCC-1 requires continuous operation at >59.0 Hz. This is confusing. These three Standards should be coordinated or the GO applicability should be removed from PRC-006-NPCC-1 and PRC-006-SERC-01.

Suggest the SDT specifically identify or show examples of how to match the percentage thresholds outlined in the Effective Date sections of the Standard and the associated Implementation Plans. Given recent experience with

other Standards, it would be helpful for the SDT to establish how the entities can demonstrate meeting the requisite threshold percentages. Over time, we have observed that in some cases percentages were established by the number of devices or units; but in other cases, the measurement has been based upon magnitude of nameplate ratings. Regarding the Table for the Quebec Interconnection in Attachment 1, the data should read: High Frequency Duration Frequency (Hz) Time (Sec) Greater than 66.0 Instantanous Trip Greater than 63.0 5 Greater than 61.5 90 Greater than 60.6 660 Less than or equal to 60.6 Continuous Operation Low Frequency Duration Frequency (Hz) Time (Sec) Less than 55.5 Instantaneous Trip Less than 56.5 0.35 Less than 57.0 2 Less than 57.5 10 Less than 58.5 90 Less than 59.4 660 Greater than or equal to 59.4 Continuous Operation Wind generation is included in the table as has been previously confirmed with the Drafting Team.

Manitoba Hydro noticed that the “clean” and “redline” versions of the standard are inconsistent. Both 4.1. and 4.2. should be removed from the “redline” version since both are redundant (included in the text of R4.).
VSLs - The VSLs for R1, R2 and R5 have been omitted for both Low, Moderate and High. Is there any rationale for this omission? Attachment 1 - Attachment 1 in MOD-026 and MOD-027 assist in adding clarity to the periodicity of exciter and turbine/governor model testing. These attachments also allow low capacity factor units and equivalent units connected at the same location to not be tested every 10 years, which is prudent. Manitoba Hydro would like the drafting team to consider whether conditions in row numbers 1-5 and 7 in attachment 1 of MOD-026 could also be applied to standards PRC-019, MOD-025 and possibly PRC-024. R1 and R2 - The requirement speaks about the ‘unit’ tripping but the sub requirements speak about the ‘Generation’ tripping – is this not inconsistent? R1 and R2 - 1. The language in R2 currently reads, “Each Generator Owner that has generator voltage protective relaying activated to trip its generating unit shall set its protective relaying such that the voltage protective relaying does not trip as a result of a voltage excursion (at the point of interconnection) caused by an event on the transmission system external to the generating plant that remains within the “no trip zone” of PRC-024 Attachment 2 or within the voltage recovery characteristics of a location-specific Transmission Planner’s study if the Transmission Planner allows less stringent voltage relay settings than those required to meet PRC-024 Attachment 2 subject to the following exceptions”. Manitoba Hydro made the following comment to draft 3 of PRC-024-1 during /29/12-03/29/12 commenting period, “R1 - the facility interconnection document required through FAC-001 should supersede Attachment 1 in order to best address local area issues. R1 should be revised to specify this.” The drafting team responded, “The SDT was charged with creating continent-wide requirements for frequency and voltage excursions and believes that consistency will not occur if various Transmission Service Providers apply various “no trip zones.” Requirement R1, therefore, should not be dictated by FAC-001.” Even though the drafting stated that other standards (eg. FAC-001) shouldn’t set continent wide settings, the drafting team has permitted less stringent voltage relay settings in R2 as long as it is accompanied by a Transmission Planning study. Manitoba Hydro understands that continent wide-standards are preferred but there should be flexibility for local area considerations as has been done in R2. Manitoba Hydro requests the drafting team consider the following language added to R1: …or within the frequency recovery characteristics of a location-specific Transmission Planner’s study

if the Transmission Planner allows different (more or less stringent) frequency relay settings than those required to meet PRC-024 Attachment 1… And the following modification to R2: …or within the voltage recovery characteristics of a location-specific Transmission Planner's study if the Transmission Planner allows different (more or less stringent) voltage relay settings than those required to meet PRC-024 Attachment 2… 2. The drafting team has removed the following exception in R1, "A generating unit or generating plant is allowed to trip within the "no trip zone" if the frequency rate of change is more than 2.5 Hz/sec." What is the technical basis for removing this exception? Is the intent that no tripping in the "no trip zone" is permitted regardless of the potential rate of change of frequency? There were no comments on this item in the last draft. R2 - The first bullet has a typo – 'tripping' should be changed to 'trip'. R3 - This requirement requires that Generator Owners document each 'known' equipment limitation. The word 'known' can be legally ambiguous - known to whom? actual knowledge or 'should have known', 'could have known'? R5 - The text of footnote 5 has been deleted, but the footnote remains. General Comments: 1. Manitoba Hydro has a concern with respect to the phased in implementation measured by percent compliance. We believe that this may lead to a potential for some uncertainty and debate. Does a phased in implementation such as this, do anything to increase reliability? 2. Attachment 1 of MOD-026-1 (Note 2) and M0D-027-1 (Note 3) contain a section titled "Consideration for early Compliance" with language pertaining to previous testing and model verification which were completed under the applicable regional policies, guidelines or criteria or which are compliant with the requirements of the standard. Manitoba Hydro recommends that similar language be included in the other standards (PRC-019-1, MOD-025-2 and PRC-024-1).

An additional "may trip" exclusion is needed for R1 and R2 related to properly set V/Hz relaying. Does R6 refer to ALL generator trips? This should be limited to Protection System relaying set to trip on over/under voltage or over/under frequency, or over volts/Hertz, not ALL generator trips. Note: Depending on approval dates, R6 may repeat requirements that are being developed in revisions to PRC-001 and/or PRC-027. Not really protection related: The additional costs involved for re-designing generating stations under R5 so that every control subsystem can ride through the excursions defined by the attached curves is not economically justifiable considering the very small probability of a voltage and/or frequency excursion occurring. It is inappropriate to support approval of such a requirement until the technical issues that would require changes to the industry standards for plant systems and equipment are resolved.

This FIRST comment was provided for MOD-025-1, MOD-026-1, MOD-027-1, and PRC-024-1. 1.DATA SHARING POLICY: For all of the MOD standards in this, only Transmission Planners are the recipient of the data developed. We asked that the standard require that the TP be required to share the data with others. The response we received is that the Functional Model requires the TP to share data with the TOP. Unfortunately, the Functional Model is unenforceable. We note that in PRC-024-1, R6 requires the GO to share its data with the RC, PC, TOP, and TO, upon request. Unless the same data is shared across all "modelers," the result will be outdated data in someone's model, which can have a bad result. The team should have one broad "data sharing" policy in the three MOD standards and PRC-024-1. Since the TP receives data in three of the standards, we suggest this language or similar language: "The GO shall provide data to its TP within 60 days of its development [describe the data]. The TP shall provide the same data to any RC, PC, TP, or TOP within 60 days of receiving a request for it." 2.We do NOT believe that R5, which sets requirements for new generators (including balance-of-plant equipment) to the requirements in Attachment 1 and Attachment 2, has been appropriately vetted by the SDT. Many stakeholders are unfamiliar with the performance capability of new generators, including the cost of achieving the performance requirements in R5. Therefore, the SDT should develop additional expert information to confirm that the requirements in R5 represent the norm for new generation. We suggest that the SDT reach out to the NERC Planning Committee, who in turn may research this topic with the IEEE and the North American Generator Forum and develop a report on their findings. With all due respect to the SDT, until stakeholders have independent confirmation regarding R5, it will be difficult for them to accept it.

Xcel Energy would like to point out that the high frequency duration curves for the Eastern, ERCOT, and Quebec Interconnections exceed the allowable short-term frequencies specified in IEEE C50.13 and IEC 60034 which the OEM's use to design their generators. Attachment 1 should be modified to meet the IEEE and IEC standards. Also, Xcel Energy continues to believe that Requirement R5 would result in a large cost increase in the cost of building new generating units which would defer resources that could be better used elsewhere to improve grid reliability. Xcel recommends that this requirement be revised such that if a generating unit did trip during a voltage or frequency excursion, the Generator Owner investigate the cause and develop a corrective action plan to address the trip.

Unlike MOD-026-1, which requires some amount of justification from the requesting entity before action must be taken, PRC-024-1 R4 requires compliance without any regard to the Generator Owner's resource availability. In general, Ingleside Cogeneration LP believes that a good working relationship between the Generator Owner and Transmission Planner includes a reasonable justification for any request that requires time and expense on the part of the other.
Ingleside Cogeneration LP agrees that Transmission Planners and other operating entities must be able to rely on a generator's availability when voltage and frequency transients occur at the interconnection point. However, we are not convinced that the project teams assertion that all technologies can accommodate the ride-through thresholds posed in PRC-024-1 R5 simply because some European nations already require them. This trivializes a major concern that a generator and all its auxiliary systems must remain online while severe stress is imposed upon mechanical systems spinning at high speeds. Our vendors are telling us that they don't know if they can accommodate the specified thresholds – and they have decades of engineering experience behind their assessments. In addition, we are concerned with the aggregate work load that all five standards in Project 2007-09 will place upon our engineering and operations organizations. Each has its own unique purpose, which means unique processes to support them – as well as results that demonstrate compliance. With so much uncertainty surrounding this program, we cannot agree to proceed without the following items being addressed: 1) All requirements that look for evidence that a unit does not trip in response to a transient (R5) must contain language that focuses on the strength of the process – not the actual performance. This could be similar to that used in the CIP version 5 standards calling for the Responsible Entity to implement an action "in a manner that identifies, assesses, and corrects deficiencies". Experience has shown that without this preface, auditors will automatically assess a violation regardless of whether the trip was necessary to protect equipment or safety. The CEA's focus

needs to be on the entity's commitment to establishing the necessary ride-through settings over the longer term. 2) The Compliance organization needs to be engaged in the development process so that industry stakeholders have a sense of how adherence to the standard will be determined. The existing process is disconnected – leading to inconsistent interpretations of the drafting team's original intent. Other projects have begun to post drafts of the RSAWs concurrently with the standards for exactly this reason. The SDT should take note that these modifications are consistent with the risk-based compliance direction that both NERC and FERC support. The intent is to focus industry and regulatory resources on the reliability aspects of the initiative – not its administrative aspects.

In Requirement 3.1 – ATC recommends replacing the wording of "shall communicate the documented equipment limitiation" with "shall communicate the documented equipment limitiation and the expected duration of the limitation, if it is known". The addition of expected limitation duration could be valuable reliability information.
Individual
Anthony Jablonski
ReliabilityFirst votes in the affirmative for this standard because the standard further enhances reliability by ensuring that generating units remain connected during frequency excursions. Even though ReliabilityFirst votes in the affirmative, we offer the following comments for consideration: VSL Requirement R5 – ReliabilityFirst still believes the VSL for Requirement R5 is not meeting the intent of FERC VSL Guideline #3 "Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement." Requirement R5 states "Each Generator Owner shall design, build, and maintain its new unit or new generating plant so that it will not trip due to a frequency excursion or voltage excursion." The VSL states "The Generator Owner's generator tripped due to a Frequency Excursion within the no-trip parameters set forth in attachment 1". Based on the FERC Guideline #3, the language in the requirement is not consistent with the associated VSL. It is not a violation of Requirement R5 if the generator tripped offline within the no-trip parameters, rather it is a violation if the GO failed to design, build, and maintain its new unit or new generating plant so that it will not trip due to a frequency excursion or voltage excursion within the no-trip parameters set forth in Attachment 1. Furthermore the SDT noted in the response to comments that the VSL relates to Measure M5. ReliabilityFirst would like to remind the SDT that based on the NERC definition of VSL (as noted in the NERC Standard Processes Manual), "VSLs define the degree to which compliance with a Requirement was not achieved." There is no mention of VSLs being written based on the measurement of the requirement. ReliabilityFirst recommends either modifying the requirement or VSL so they both use consistent language.

R4 should be removed entirely from this standard. R4 appears to add no reliability benefit beyond what is already prescribed in R3. Documentation of equipment limitations as possible causes for tripping within the no-trip zones of Attachments 1 and 2 will allow PCs and other entities to check for instances where UFLS effectiveness or system voltage recovery might be compromised by possible early tripping of generators due to factors other than relay settings.As these benefits seem to be the intent of R3, R4 does not appear to add any useful information beyond what would already be supplied under R3. We further expect that GOs will be unable to devise the required estimates of time duration without detailed simulations of generating unit and auxiliary system performance (the explicit statement that detailed studies are not required notwithstanding) during the specified frequency or voltage excursion profilesto be supplied to them. Were these intended to be trajectories rather than profiles?
1) R1: Should R2, first bullet point exception have a similar counterpart in R1? 2) R2: Does footnote 2 also apply to R2 fourth bullet point? 3) R3: On the last bullet we suggest the word "nameplate" be removed from the sentence. 4) R5: AEP believes that the requirement of R5 for new units and plants to not trip within the no-trip zone of Attachment 1 is reasonable, and has precedence in existing reliability region guidelines. To not trip within the no-trip zone of the Attachment 2 is another matter. AEP maintains that Attachment 2 is inappropriate as a requirement on new conventional generation. When AEP previously raised objection to the reference to

Attachment 2 by R5, the SDT replied: "The SDT is charged with implementing the reliability improvement recommendations from FERC Order 693 and the 2003 Northeast Blackout Report. The SDT is working under the assumption that when industry approved the SAR for this project it agreed that the standard provided a reliability gain." We note that Order 693, paragraph 1787 does require generation to ride through B and C contingencies. However (and we reference the Consideration of Issues and Directives table associated with PRC-024), Order 661 was superceded by 661-A which removed the voltage ride-through curves of the sort as Attachment 2. The SDT is justifying the imposition of an unprecedented (in North America) and onerous requirement on the basis of outdated information. Moreover, the SAR for Project 2007-09 was a general authorization to proceed with standard development on the subject of generator performance during frequency and voltage excursions, not an authorization to require the specific voltage-ride through requirement for new generation now proposed in R5. Please reconsider the justification for this requirement. The SDT further replied: "If the Transmission Planner for a new generation facility can provide the voltage profile for that specific site, then per Part 5.2 the Generator Owner can design his new facility to ride through that profile even if it is less stringent (i.e. uses faster clearing and faster voltage recovery) than Attachment 2. The voltage envelope described in Attachment 2 provides equipment OEM's with an outer boundary on the voltage stress they have to design for." The exception enabled by the second bullet point of R5 may cause a nonuniform level of reliability. If one transmission planner presents a less stringent voltage ride-through characteristic (we assume this would be simulation based--R2, Part 2.2 does not exist) to a potential generator than the TP next door, who for lack of time or resources falls back on Attachment 2, then at best, a nonuniform level of reliability would result. Shouldn't there be some uniformity on what generating units are obligated to acheive? We mention this point, not that the exception be removed, but that the requirement of Attachment 2 for new generation, which has not been seen as necessary for reliability in the past, be removed. The SDT further replied to our concern over cost to comply: "There are similar voltage ride through requirements already in effect in parts of Europe and Asia. The SDT is charged with implementing the reliability improvement recommendations from FERC Order 693 and the 2003 Northeast Blackout Report. The SDT agrees that generating units designed and built to meet Requirement R5 will be more costly than those that cannot meet this reliability goal. The SDT is not in a position to place a monetary value on the consequent reliability gain. The SDT is working under the assumption that when industry approved the SAR for this project it agreed that the standard provided a reliability gain." The SDT is in error in thinking that the reference to Attachment 2 in R5 is necessary to implement Order 693 or to fulfill the intent of the SAR as noted above. We also question the propriety of adding a new reliability standard requirement without precedent in North America irrespective of any consideration of the cost to comply, and a proposed requirement that will certainly act to disfavor new conventional generation compared to what has always been accepted design practice for conventional generation in the past. The SDT needs to provide a relevent technical argument for the new level of reliability and not an appeal to what other parts of the world may be doing. 5) If R5 remains in this standard, its associated measure needs to be changed so that evidence would need to be provided for only those unit trips that occurred during a voltage or frequency excursion. As currently written, evidence would need to be provided for every unit trip, which is both unnecessary and unduly burdensome. 6) R6: As currently drafted, all requests would require continual updates unless otherwise exempted. This should be changed so that all requested are treated as a onetime request unless otherwise specified by the requesting entity.

Yes
No
We maintain that there is no reliability driven need for R4. Also, such estimates would be of limited accuracy. Should such an estimate be deemed useful, it can be requested informally among the appropriate entities. Standards and associated requirements must be reserved for those items more critical to BES reliability
1. In R2, it is not specified whether the voltage ride-through curve (Attachment 2) refers to three-phase voltages or any one phase. This makes an enormous difference in the ability of equipment to withstand the sag. More importantly, the extreme voltage ride through requirements do not appear to be technically feasible to achieve for coal and gas-fired turbine-generators. The voltage ride-through requirements should be re-examined to verify they are justified by reliability need, and separated from the more critical frequency coordination requirements. We believe that a separate standard is needed for the voltage requirements, which are not as clearly justified or supported by existing equipment. 2. R2 consists of a single sentence with over 100 words. This needs to be corrected. 3. In R3 and associated M3, the GO is responsible to document equipment limitations that prevent the unit from meeting the frequency and voltage performance curves. However, it is not uncommon for the generating unit to experience problems in a wide variey of plant systems which result in unit trips. Thus the GO is not necessarily aware of the source of these less frequent unit trips caused by external events, such as transmission system faults, and associated voltage sags. Therefore this requirement needs to also apply to the Transmission Owner. The TO (or TP) should be required to identify those events within its system that may have adversely affected generating units. Only then can the GO be responsible to identity its equipment limitations. Without this joint responsibility, this requirement should be removed. 4. In R3.1, the requirement is for the GO to communicate

equipment limitations to four different entities. This requirement is in the long-term planning horizon, and therefore the communication should be limited to the TP only, and not the other entities. The TP is the primary recipient, and they can pass the information to the other entities as necessary, as described in the NERC Functional Model. In addition, the time requirement of 30 days is unreasonably short; we suggest that 90 days would be sufficient for this long-term planning requirement. 5. In R5, it does not appear that new thermal plants can meet these requirements, which have largely been developed for wind farms, especially Attachment 2. The auxiliary systems of such plants cannot be quaranteed to meet the performance curves, apart from a strong cooperative effort by equipment suppliers to design these requirements into the equipment. There need to be industry standards (e.g., IEEE) in place before this requirement is ready for industry use, such as performance standards for equipment like variable-speed drives, for one example.

1. We appreciate the SDT's effort in making clarifying changes to the Implementation Plan to separate the effective dates for jurisdictions where regulatory is and isn't required. And we understand that the phrase "following applicable regulatory authority" includes regulatory bodies from Canadian provinces requiring regulatory body approval. However, the separation alone and leaving the phrase "following applicable regulatory authority" unchanged do not address the situation in Ontario where (a) regulatory approval is required" but (b) the effective dates are not necessarily tied with the effective dates indicated in the Sub-Section that applies to those jurisdictions where regulatory is required.In other words, the proposed languageonly partially reflects Canadian regulatory framework and we suggest additional wording, as described below. We request the following phrase be added to each sentence under the "In those jurisdictions where regulatory approval is required" of the Implementation Plan: ", or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities." right after "following applicable regulatory approval". The revised first bullet, for example, will read: • By the first day of the first calendar quarter, two calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner shall have verified at least 40 percent of its applicable Facilities are fully compliant with Requirements R1, R2, R3, R4, and R6. And the same change to each of the sentences in Section A5.1 of the standard should also be made. 2. The impact of disconnecting a generating unit less than 20 MVA or a generation plant less than 75 MVA during frequency or voltage excursions is very limited. We suggest to add the following facility thresholds into the applicability section: a. Generating unit with a gross nameplate rating greater than 20 MVA b. Generating plant with an aggregated gross nameplate rating greater than 75 MVA 3. There is a typo on the R2 footnote on "protective relaying". It should be 2 instead of 1.

Recommend that the R4 be enhanced to give more detail on how to satisfy this requirement. As significant as R4 is, the Generator Owners need more guidance than what is currently stated.
1. The technical justification for the need of a plant performance criteria appears to be based on issues with early design wind generation. The technical considerations at these types of generation stations are different than steam turbine generation plants, which require heavy induction loads to support operation and these loads are sensitive to upsets in voltage and frequency. The technical implications of the plant performance are not clear. Recommend generating a separate SAR and bring in industry technical SMEs such as IEEE, EPRI, Equipment OEMs, Power Plant Design entities, technical acadamia, etc. to assist in the technical analysis and standard development. 2. Likewise, industry technical SMEs such as IEEE, EPRI, Equipment OEMs, Power Plant Design entities, technical acadamia, etc. can develop acceptable methods to determine the capability of a plant to ride through grid transients. 3. The following are IEEE Electric Machines Committee comments for PRC-024-1 consideration The IEEE Electric Machinery Committee hosted a discussion topic on "Grid Code Impact on Electric Machine Design" in San Diego at this year's Power Engineering Society meeting and offers the following input. • Minor changes in the Under-frequency Ride Through Curve are suggested to better match existing machine design standards in IEEE C50????. • The PRC-024 Voltage Ride Through criteria is technically not ready to be a standard, for the following reasons; 1. PRC-024 VR capability may not be available at any price. BES reliability enhancements requiring technological advances should be addressed with industry groups (e.g. ASME, IEEE) and OEMs to develop commercially available products before appearing as requirements in reliability standards. It is believed the cost of complying with wider standards might increase main generator machine costs as much as 25%, which is not insignificant.

This should only be required if there is a defined local system need for higher standards and that these costs should be considered against the cost of other possible resolutions. 2. A specific concern in this respect regarding the ride-through capability being sought in PRC-024 R3-5 is that auxiliary buses may drop-out and cause a unit to trip for the excursions specified, which go well beyond the industry's present design criteria, even if the protective relay settings nominally allow such transients. It may be unrealistic to expect that the dynamic behavior of all 4160V and 460V systems in new plant can be dynamically modeled to a degree allowing one to obtain non-drop-out guarantees from equipment suppliers and EPC firms for extreme transients such as 2.0 seconds at 65% voltage, or that the same can be done for existing plants to allow identification of limiting components and accurate estimates of performance. 3. The voltage ride through was originally intended to address early deficiencies in wind generation design only and it doesn't make sense to apply such a broad curve to steam plants. The concerns that led to the VRT curve for wind have been addressed by new vintage wind plant designs and thus, the EMC does not believe there is not driving need for a standard VRT criteria. • The VRT issue is holding up addressing other significant issues addressed by PRC-024 (relay setting coordination and frequency ride through). The VRT should be pulled out of PRC-024 and a new SAR drafted to address the voltage performance aspects if this is really needed for reliability. • More clarity in defining plant MVARs available to support grid voltage is needed. Specifically, generation plants have not been designed to operate outside a normal band of 95 to 105% on the generator terminals. GSU settings are typically chosen to optimize MVAR support under normal operations, however is not reasonable to assume the full leading or lagging reactive support would be available under normal grid conditions.

An additional "may trip" exclusion is needed for R1 and R2 related to V/Hz set properly to limit overexcitation of generators or transformers. Please consider a requirement for the TP to perform location-specific system voltage recovery studies referenced in R2. This should be a requirement for the TP prior to requiring the severe voltage profile of Attachment 2. Both the exemption of existing units using the exceptions in R1 and R2 for "documented and communicated equipment limitations" and "the estimation of time a unit will remain connected" per R4 are problematical. Power plants exhibit a tendency for have drum level fluctuations, air/flue gas flow oscillations, or other plant subsystem instability during system disturbances which are not defined in OEM literature. It is generally not possible to determine when such problems will occur especially if a disturbance involves cycling above and below the rated frequency within the Attachment 1 boundaries. The same is true regarding predicting transient fluctuations of auxiliary system bus voltages. These voltage fluctuations affect power distribution equipment in the power plant by contactor or control relay drop-out, major auxiliary equipment stalls, etc. Predicting when a plant trip will occur due to these types of power plant system responses is problematic. The "10% power increase" exemption loss (in the last bullet item of R3.1) may effectively ban entire classes of equipment or prevent units from ever receiving capacity and efficiency enhancements. We object to R5 – the additional costs involved for re-designing generating stations so that every control subsystem can ride through the excursions defined by the attached curves is not economically justifiable considering the very small probability of a voltage and/or frequency excursion occurring. Furthermore, we believe it is fundamentally inappropriate to support approval of such a requirement until the technical issues that would require changes to the industry standards for plant systems and equipment are resolved. We recommend this requirement be removed so the standard can move forward to address the shorter term goals that are achievable. Further commentsi regarding R5: Currently, there exist too many engineering challenges to permit the requirement of R5. These include the following: Fan and pump performance will be affected at the frequency limits of Att. 1, and below-rated voltage per Att. 2 may cause this equipment to stall, causing main flame trips, high/low duct pressure trips, drum level oscillations below the low water cut-out point and the like. This is especially the case if cycling above and below the rated frequency during Disturbances (but within the limits of Att. 1) magnifies system oscillations or drives automatic control systems unstable. Auxiliary equipment contactors and energized control relays are likely to drop-out at the off-design voltage values specified in Att. 2 of PRC-024-1, especially if the high-side voltage swings specified in this standard are magnified at plant MV and LV aux buses. This dropout will occur within a few cycles. The basis of compliance for new units is simply, "will not trip," i.e. covering all issues cited above plus any unpredictable other factors that may take units down. It is not realistic to expect such sweeping guarantees to be available on a system-wide basis, even if some individual pieces of equipment can ostensibly comply with Atts. 1 and 2, effectively shutting-down the new powerplant industry unless an owner were willing to take unbounded risk. This will require revision of, not only plant equipment standards, but "plant system" standards. Even if we could certify all of the components, you cannot guarantee once they are implemented into a system they will respond as planned. Disturbances are likely to cause frequency and voltage to simultaneously deviate from the rated values, and it is unclear how this combination of factors will be addressed in assessing compliance with the stands-

separate basis of Att. 1 and Att. 2 in this standard. The SDT stated in their previous PRC-024 Consideration of Comments that grid requirements similar to R5 are already in effect in parts of Europe. U.S. standards still prevail for design, construction, and operation of plants in the U.S. We believe it is inappropriate to implement a national standard requiring U.S. plants be designed to the requirements of R5 until the industry can demonstrate through additional research, development, and revision of the plant equipment and system standards that such requirements can be practically met. Please consider requirements for TO to address the frequency and voltage excursions in the transmission system in order to arrest the abnormal condition locally. Does R6 refer to ALL generator trips? This should be limited to Protection System relaying set to trip on over/under voltage or over/under frequency, or over volts/Hertz, not ALL generator trips. Also , this requirement may repeat requirements that are being developed in revisions to PRC-001. It is inconceivable that most plants can ride through a + or - 10% voltage excursion for 10 minutes per PRC-024, Attachment 2. Almost all would have to take exception. All of our nuclear plants would trip as would the new nuclear plant currently under construction.

Should part 4.2 read Idntificatoin of the basis rather than Identification of the bases
WECC is concerned that Requirement R3 of PRC-024-1, which requires Generator Owners to document each known equipment limitation that prevents a generating unit from meeting the frequency requirements of Requirement R1 may be in conflict with or less stringent than the requirement in the WECC Off-Nominal Frequency Load Shedding Plan that requires Generator Owners that have generators that do not meet the frequency requirements to automatically trip load to match the anticipated generation loss or have contractual relationships providing for automatic load shedding. The concern is that Generator Owners may interpret Requirement R3 of PRC-024 to relieve them of their obligations under the WECC Coordinated Off-Nominal Load Shedding Plan. This is a concern because the original design and subsequent simulations conducted to validate the effectiveness of the WECC Off-Nominal Frequency Load Shedding Plan reflect simulation of the generator underfrequency and overfrequency operation requirements, and any deviations from these requirements would invalidate the effectiveness studies and could potentially require modifications to the existing approved WECC Coordinated Plan.

1.The risk of incurring resonant vibration of steam turbine last-stage blades is generally related to blade length, so the off-frequency ride-through criteria in Att. 1 of PRC-024-1 are a concern for larger units. Nuclear plants in particular may be required to operate not only outside of OEM recommendations but at conditions that are unsafe. 2.Some gas turbines may experience surge or combustion upsets (including flame-out) at the off-speed conditions of Att. 1, in addition to potentially incurring blade vibration issues similar to those described above. 3.Auxiliary equipment contactors are likely to drop-out at the off-design voltage values specified in Att. 2 of PRC-024-1, especially if the high-side voltage swings specified in this standard are magnified at plant MV and LV aux buses. 4.Fan and pump performance will be affected at the frequency limits of Att. 1, and below-rated voltage per Att. 2 may cause this equipment to stall, causing main flame trips, high/low duct pressure trips, drum level oscillations below the low water cut-out point and the like. This is especially the case if cycling above and below the rated frequency during Disturbances (but within the limits of Att. 1) magnifies system oscillations or drives automatic control systems unstable. 5. The prohibition against tripping for existing units applies not just to actuation of Protection Systems but to “protective relaying,” which per footnote #1 in PRC-024 includes “protective functions within control systems…based on frequency or voltage inputs.” It is unclear whether or not this definition covers contactor drop-out or actuation of fan stall protection systems at extreme under-voltage conditions. 6.The basis of compliance for new units is simply, “will not trip,” i.e. covering all issues cited above plus any unpredictable other factors that may take units down. It is not realistic to expect such sweeping guarantees to be available on a system-wide basis, even if some individual pieces of equipment can ostensibly comply with Atts. 1 and 2, effectively shutting-down the new power plant industry unless an owner were willing to take unbounded risk. 7. A “will not trip” obligation may also effectively ban entire classes of equipment, including combined cycle plants (as regards the chances of incurring lean blow-out) and (as mentioned earlier) nuclear facilities. It is noteworthy in this respect that environmental regulators have for decades been pushing gas turbine dry low-NOx combustors to the brink of instability during even steady-state operation, with inevitable negative implications for survival of Disturbances. Greater consideration of BES reliability may be needed, but doing so by issuing dueling regulations would not constitute an appropriate approach. 8. M5 causes new-unit tripping due to frequency or voltage excursions within PRC-024 limits to constitute a violation, but it seems unlikely to expect an “or” event. That is, Disturbances are likely to cause frequency and voltage to simultaneously deviate from the rated values, and it is unclear how this combination of factors will be addressed in assessing compliance with the stands-separate basis

of Att. 1 and Att. 2 in this standard. 9. The grandfathering of existing units in R1 and R2 for, "documented and communicated equipment limitations," is problematical; since the propensity to incur drum level fluctuations, air/flue gas flow oscillations and the like during Disturbances will not be defined in OEM literature, nor is it generally possible to predict by calculations when such problems will occur, especially if a Disturbance involves cycling between above and below the rated frequency (but within the Att. 1 boundaries). The same is true regarding predicting transient fluctuations of aux bus voltages, ref. risk of contactor drop-out and stalling major auxiliary equipment. 10. The concern above applies also to having to make reference per R3 to, "study results, experience from an actual event, or manufacturers advisory." Few if any GOs are likely to possess such documentation for Disturbances as extreme as those specified in Att. 1 and Att. 2. The list of types of evidence in R3 is not exclusive, but it is difficult to imagine alternative forms of hard evidence that could be developed other than for the comparatively few plants that possess high-fidelity simulators. 11. The same concerns regarding availability of information apply for the, "estimate of the time duration the existing generation unit will remain connected," in R4. Relying on "sound engineering judgment" is permitted, and R4 states that "detailed unit performance studies are not required;" but the word "sound" implies that the estimate is to be based on accurate data, and how such information could be developed without a detailed study is unclear. 12. Confusion is created by making grandfathering, "in accordance with Requirement R3," in R1 and R2 of PRC-024-1; while R3 excludes, "limitations that are caused by generator frequency and voltage protective relays." Are such protective relays meant to correspond to the "protective relaying" discussed above? It is semantically unclear whether or not any grandfathering is actually being allowed. 13. The exemption take-back in the last bullet item of R3.1 (a 10% increase in nameplate capacity) again may effectively ban entire classes of equipment, or at least prevent units from ever receiving capacity and efficiency enhancements. 14. Steam turbine off-frequency limits are generally set by OEMs lifetime limits as regards duration, but there is no discussion in PRC-024-1 as to how often the specified excursions may occur, leaving users with ostensibly compliant equipment still at risk if major upsets take place more often than had been anticipated. 15. An additional "may trip" exclusion is needed for R1 and R2 related to V/Hz set properly to limit over excitation of generators or transformers. 16. Objection to R5 – the additional costs involved for re-designing generating stations so that every control subsystem can ride through the excursions defined by the attached curves is not economically justifiable considering the very small probability of a voltage and/or frequency excursion occurring. Furthermore, we believe it is fundamentally inappropriate to support approval of such a requirement until the technical issues that would require changes to the industry standards for plant systems and equipment are resolved. We recommend this requirement be removed so the standard can move forward to address the shorter term goals that are achievable. 17. Does R6 refer to ALL generator trips? This should be limited to Protection System relaying set to trip on over/under voltage or over/under frequency, or over volts/Hertz, not ALL generator trips. Also, this requirement may repeat requirements that are being developed in revisions to PRC-001. 18. It is inconceivable that most plants can ride through a + or - 10% voltage excursion for 10 minutes per PRC-024, Attachment 2. Almost all would have to take exceptions.

Utility Services suggests the SDT specifically identify or show examples of how to match the percentage thresholds outlined in the Effective Date sections of the standard and the associated Implementation Plans. Given our recent experience in other standards, it would be helpful for the SDT to establish how the entities can demonstrate

meeting the requisite threshold percentages. Over time, we have observed that in some cases, percentages were established by the number of devices or units; but in other cases, the measurement has been based upon magnitude of nameplate ratings.

Project 2007-09 Generator Verification includes draft standard PRC-024, Generator Performance During Frequency and Voltage Excursions. Requirements R3 and R4 are for existing generating units. R3 allows an exemption from portions of the ride through curves in PRC-024 Attachments 1 and 2 for documented cases where generator protective relaying cannot be set, and directs those generators to communicate that limitation to the RC, PC, TOP and TP so its performance can be modeled correctly. R4 requires a Generator Owner to estimate the time duration for remaining on-line based on a Transmission Planner's dynamic study. Requirement R5 directs all new generating facilities to be designed, built and maintained so that they are able to ride through the excursions defined in Attachment 1 and 2. Voltage Ride-Through Background In FERC Order 661 (June 2, 2005), Final Rule on Interconnection for Wind Energy, the Commission adopted a low voltage ride-through standard for wind generators, but provided that a wind plant is required to meet the standard only if the Transmission Provider shows, in the System Impact Study, that low voltage ride-through capability is needed to ensure safety or reliability. The standard, if applicable, requires the wind generator to stay online for specified time periods and at associated voltage levels where there is a disturbance on the transmission system. Several entities requested rehearing of various aspects of the low voltage ride-through requirement and standard included in the Final Rule. In FERC Order 661-A (December 12, 2005) page 2, the Commission noted "that the standard interconnection procedures and agreement were based on the needs of traditional generation facilities and that a different approach might be more appropriate for generators relying on other technologies, such as wind plants. Accordingly, the Commission granted certain clarifications, and also added a blank Appendix G to the standard Large Generation Interconnection Agreement (LGIA) for future adoption of requirements specific to other technologies." The Commission went on to adopt in Appendix G to the LGIP limited special interconnection procedures applicable to wind plants only. The basis for the change to the standard regarding voltage ride through starts with FERC Order 693, Paragraph 1787 (March 16, 2007), which states "… the Commission directs the ERO to modify the Reliability Standard to explicitly require either that all generators are capable of riding through the same set of Category B and C contingencies, as required by wind generators in Order No. 661, or that those generators that cannot ride through be simulated as tripping. " Discussion, Voltage Ride-Through Although FERC Order 661-A does make a provision for future adoption of voltage ridethrough requirements for all generators, the Order is careful to differentiate between wind generation technologies and other, traditional generation facilities. No instruction is given for other technologies in the Order. Nowhere in any of the FERC Orders (661, 661A, 693) is there a single requirement for non-wind generators to meet ride-through requirements. Docket No. RM05-4-000 (Order No. 661) discusses this subject directly. The Notice of Proposed Rulemaking (NOPR) Interconnection for Wind Energy and Other Alternative Technologies dated January 24, 2005, sought comments on certain specific issues, including whether there are other non-synchronous technologies, or other technologies in addition to wind, that should also be covered by the proposed Appendix G. In FERC Order No. 661, the Final Rule on Interconnection for Wind Energy, the Commission noted "These technical requirements for the interconnection of wind plants recognize the unique design and operating characteristics of wind plants,1 their increasing size and increasing level of penetration on some transmission systems, and the effects they have on the transmission system." Further, they wrote, "The Final Rule Appendix G we adopt here applies only to the interconnection of wind plants. The Commission does not believe at this time that the standard procedures and technical requirements in this Final Rule are appropriate for other alternative generating technologies that may supply over 20 MW at one Point of Interconnection. The standard procedures and technical requirements adopted here recognize the unique characteristics of wind plants, including the fact that they use induction generators, consist of several or numerous small generators connected to a collector system, and do not respond to grid disturbances in the same manner as large conventional generators." The Final Rule also noted that while low voltage ride-through capability is needed for wind plants, it is less of a concern for large synchronous generating facilities because most of these facilities are equipped with automatic voltage control devices to increase output during low voltage events. The Commission concluded that the Final Rule Appendix G exceptions to the LGIP and 1 As noted above,

wind plants over 20 MW in total size are subject to the standard technical requirements in the Final Rule Appendix G. These wind plants are generally made up of several small induction wind generating turbines, laid out over a large area, and connected through a medium-voltage collector system. This collector system is connected to the low voltage side of the step-up transformer, which is then connected to the transmission system at a single Point of Interconnection. LGIA apply only to large wind plants. Appendix G was designed around the special needs and design characteristics of wind generators. The Appendix G provisions adopted "focuses on the special characteristics of large wind plants, particularly the fact that they utilize many induction generators connected to the transmission system at a single point through a medium-voltage collector system. The Commission has not found at this time that any other technologies, including the solar generators without fueled backup …, have similar characteristics." The Project 2007-09 Generator Verification Standard Drafting Team has presented the current draft of the standard as a technology-neutral version, ignoring the fact that power plant performance in asynchronous vs. synchronous units for transmission excursions are significantly different and are technology dissimilar for reasons of voltage regulation ability and plant auxiliary design. • The NERC System Protection and Control Subcommittee wrote, in previous comments, "FERC 661-A is a wind generator facility ride-through performance criterion, not a synchronous generator relay setting requirement. They cannot be considered as being the same. This requirement in PRC-024 should only apply to non-synchronous machines." • Constellation Power wrote, "The idea of a ride-through curve originated with wind farms, and is not conceptually appropriate. For example, this approach is not conceptually appropriate for cylindrical rotor synchronous machines." • PPL Energy commented, "PPL is concerned with the following concepts in the standard: 1) The standard applies equally to asynchronous and synchronous machines, salient pole and round rotor machines, photovoltaic, and other resources and as such the standard does not appear to recognize that these technologies respond differently to voltage and frequency excursions." • AEP posited "The proposed VRT criteria requires more study and analyses before introducing it so broadly in this standard for other than for wind turbine generators for which it has already been applied." • Pacificorp offered "Many European generator interconnection standards and requirements include different voltage ride-through requirements for synchronous and non-synchronous generation. PacifiCorp is concerned that the SDT has inappropriately developed a "one-size fits all" standard applicable to all generation platforms." Furthermore, OEM's have not yet developed a solution to voltage ride through for nonwind generators. Assured compliance with PRC-024 may not be available at any price. BES reliability enhancements requiring technological advances should be addressed with industry groups (e.g. ASME, IEEE) and OEMs to develop commercially available products before appearing as requirements in reliability standards. Regulation should not come before a solution is available. A specific concern in this respect regarding the ride-through capability being sought in PRC-024 R3-5 is that auxiliary buses may drop-out and cause a unit to trip for the excursions specified, which go well beyond the industry's present design criteria, even if the protective relay settings nominally allow such transients. It may be unrealistic to expect that the dynamic behavior of medium and low voltage auxiliary systems in a plant can be accurately modeled. • In response to numerous questions on the feasibility of a plant design with the new voltage and frequency ride through curves, the Standard Drafting Team responded that "The implementation schedule calls for six years beyond approval of the standard before Requirement R5 goes into effect. The SDT believes this is enough time to develop the required designs." Thus the SDT has recognized that the technology to comply does not exist today. • Southern Company noted that "We highly doubt that the requirement is technically feasible based on our experience with vendors and the various technical requirements and modifications that would have to be made to make sure that low or high voltage ride thru is possible. Complicating factors include the many different equipment suppliers, limited control of manufacturing standards by the purchasers, and continuing changes in technology must be considered to be able to determine whether or not all plant sub-systems can ride through. The economic impact and technical feasibility of this requirement has not yet been considered by suppliers." • Duke Energy states in their comments, "An R&D effort should be considered to investigate steam plant ride through capabilities if a criteria is needed." • Indiana Municipal Power Agency questioned whether the technology to meet this requirement was currently available to a newly built generating facility. "To force such a requirement on newly built generating facilities at this time, one is speculating that the technology will be available. Can we risk reliability of the grid on such speculation (Generator Owners not building generating facilities because they cannot meet this requirement)? What if the technology is not available?" • In a previous posting of the standard, GenOn Energy suggested "It does not appear that the SDT has carefully considered the possible impact of Attachment 2 on plant electrical auxiliary motors and contactors. The SDT should ask a power plant engineering company the impact on the electrical auxiliaries of an 800MW coal unit with a scrubber." If a solution is identified prior to implementation, preliminary estimates suggest the potential cost of complying with wider standards might increase machine costs as much as 25%, which is not insignificant. The result would be a considerable increase in capital and O&M2 costs for new (non-wind) generation due to increased equipment costs to meet more robust design specifications. The increase in costs, in combination with the compliance risk associated with not having a technical solution available at time of construction, will likely discourage new power plant construction outside of wind generation. This barrier to new construction could lead to mid-term reliability concerns, particularly in markets already stressed with tight reserve margins. Finally, the Standard Drafting Team has not demonstrated a grid-wide reliability gap justifying the need for voltage ride through for traditional (non-wind) generators. • The US Bureau of Reclamation noted "We believe there is no convincing reliability based rationale to expand the scope of the FERC Order via this standard to include synchronous machines, noting that Generators are already required (PRC-001-1) to coordinate settings with the host Transmission Operator." Both EPRI and IEEE have held discussions on this topic and have expressed concerns related to those issues noted previously. While these legitimate concerns about voltage ride through requirements for non-wind generators are being debated, they are also holding up other significant issues to be addressed by PRC-024 such as relay setting coordination and frequency ride through. Discussion, Frequency Ride-Through The risk of incurring resonant vibration of steam turbine last-stage blades is generally related to blade length, so the off-frequency ride-through criteria in Att. 1 of PRC-024-1 are a concern for larger units. Nuclear plants in particular may be required to operate not only outside of OEM recommendations but at conditions that are unsafe. Please see in this respect the SERC Generation Subcommittee Nuclear Plant Review of PRC- 024 Curves presentation made at the SERC Engineering Committee Meeting of March 16, 2011 at Charlotte, NC. Steam turbine off-frequency limits are moreover generally subject to lifetime duration limits, but there is no discussion in PRC-024-1 as to how often the specified excursions may occur, leaving users with ostensibly compliant equipment still at risk if major upsets take place more often than had been anticipated. Some gas turbines may experience surge or combustion upsets (including flame-out) at the off-speed conditions of Att. 1, in addition to potentially incurring blade vibration issues similar to those described above. 2 Additional costs associated with maintaining voltage sensitive equipment (power transformer, rotating equipment, breaker controls, etc.). Fan and pump performance will be affected at the frequency limits of Att. 1, and belowrated voltage per Att. 2 may cause this equipment to stall, causing main flame trips, high/low duct pressure trips, drum level oscillations below the low water cut-out point and the like. This is especially the case if cycling above and below the rated frequency during Disturbances (but within the limits of Att. 1) magnifies system oscillations or drives automatic control systems unstable. The basis of compliance for new units is simply, "will not trip," i.e. covering all issues cited above plus any unpredictable other factors that may take units down. It is not realistic to expect such sweeping guarantees to be available on a system-wide basis, even if some individual pieces of equipment can ostensibly comply with Atts. 1 and 2, effectively shutting-down the new power plant industry unless an owner were willing to take unbounded risk. A "will not trip" obligation may also effectively ban entire classes of equipment, including combined cycle plants (as regards the chances of incurring lean blow-out) and (as mentioned earlier) nuclear facilities. It is noteworthy in this respect that environmental regulators have for decades been pushing gas turbine dry low-NOx combustors to the brink of instability during even steady-state operation, with inevitable negative implications for survival of Disturbances, and there were in fact many gas turbine flameout trips during the blackout of '03. Greater consideration of BES reliability may be needed, but doing so by issuing dueling regulations would not constitute an appropriate approach. That is, we believe that passage of PRC-024 in its present form would cause the available design room between environmental and NERC regulations for gas turbines to become less than zero, so merely allowing time for development of new designs is not a solution. NERC, the EPA, OEMs and industry groups need to develop a mutually acceptable set of performance requirements. Other Concerns M5 of PRC-024 causes new-unit tripping due to frequency or voltage excursions within the specified limits to constitute a violation, but it is unlikely that "or" events would occur. That is, Disturbances are likely to cause frequency and voltage to simultaneously deviate from the rated values, and it is unclear how this combination of factors would be addressed in assessing compliance with the stands-separate basis of Att. 1 and Att. 2 in this standard. The grandfathering of existing units in R1 and R2 for, "documented and communicated equipment limitations," is problematical; since the propensity to incur drum level fluctuations, air/flue gas flow oscillations, flame-out and the like during Disturbances will not be defined in OEM literature, nor is it possible to predict by calculations when such problems will occur, especially if a complex Disturbance involves cycling between above and below the rated frequency (but within the Att. 1 boundaries). The same is true Page 8 of 8 regarding predicting transient fluctuations of aux bus voltages, ref. risk of contactor drop-out and stalling major auxiliary equipment. The concern above applies also to having to make reference per R3 to, "study results, experience from an actual event, or manufacturers advisory." Few if any GOs are likely to possess such documentation for Disturbances as extreme as those specified in Att. 1 and Att. 2. The list of types of evidence in R3 is not exclusive; but it is difficult to imagine alternative forms of hard evidence that could be developed, other than for the comparatively few plants that possess high-fidelity dynamic simulators. The same concerns regarding availability of information apply for the, "estimate of the time duration the existing generation unit will remain connected," in R4. Relying on "sound engineering judgment" is permitted, and R4 states that "detailed unit performance studies are not required;" but the word "sound" implies that the estimate is to be based on accurate data, and such information could be developed only via a detailed study (which, as noted above, would be impossible to perform). The prohibition against tripping for existing units applies not just to actuation of Protection Systems but to "protective relaying," which per footnote #1 in PRC-024 includes "protective functions within control systems…based on frequency or voltage inputs." It is unclear whether or not this definition covers contactor drop-out or actuation of fan stall protection systems at extreme under-voltage conditions. Confusion is created by making grandfathering of protective relay settings, "in accordance with Requirement R3," in R1 and R2 of PRC-024-1; while R3 excludes, "limitations that are caused by generator frequency and voltage protective relays." It is semantically unclear whether or not any grandfathering is actually being allowed. The exemption take-back in the last bullet item of R3.1 (a 10% increase in nameplate capacity) again may again effectively ban entire classes of equipment, or at least prevent units from ever receiving capacity and efficiency enhancements. Conclusion & Recommendation Based on the issues discussed above, the SRT recommends against adoption of Draft 4 (dated Oct. 4, 2012) of PRC-024-1. Furthermore, the SRT recommends that a deputation of NAGF members meet with the SDT for the purpose of developing a mutually-acceptable draft standard. This effort should include discussions with OEMs and industry groups regarding identifying the technical state of the art, and also with environmental regulators, if necessary, for achieving suitable emissions vs. BES reliability balance.

Mahmood Safi
Yes
Yes
Footnote 1, which is referenced in R1 and R2, has two separate purposes: one is to provide a definition of frequency or voltage protective relaying, and the other is to state that each Generator Owner is not required to have frequency or voltage protective relaying installed or activated on its unit. Accordingly, it should be split into two separate sentences. We recommend that Footnote 1 be replaced by the following paragraph: Frequency or voltage protective relaying includes but is not limited to frequency and voltage protective functions for discrete relays, volts per hertz relays evaluated at nominal frequency, impedance relays, voltage controlled overcurrent relays, multi-function protective devices or protective functions within control systems that directly trip or provide tripping signals to the generator based on frequency, speed, or voltage inputs. Each Generator Owner is not required to have frequency or voltage protective relaying installed or activated on its unit. Note the addition of the word "speed" in the definition of frequency or voltage protective relaying.

seattle city light
paul haase
No
Seattle City Light votes NO because it is unclear the type of data the Reliability Coordinator, Planning Coordinator, Transmission Planner, and/or Transmission Operator is to provide the Generator Operator. Until Reliability Coordinators, Transmission Planners, Planning Coordinators, and/or Transmission Operators agree to and approve acceptable simulations and dynamic models, it is difficult for Seattle City Light to approve this standard. There are requirements included in R4 and R5 that have not been communicated with Generator Operators in the past, and without agreement about simulations and models, it is simply too unclear.
Reliability Coordinator, Planning Coordinator, Transmission Operator and Transmission Planner should be added to the Applicability section because one or another of these are asked in R4 to provide information to the Generator Operator to begin the evaluations.

Consumers Energy's previous comments - “Related to undervoltage criteria, the 18 cycle at 45% of generator voltage would put a great deal of strain on the plant auxiliary systems and that may not be something these systems are able to withstand. The same would be true of a fault that produces 65% voltage at the generator terminals for 2 seconds. These comments relate specifically to Consumers Energy. However, it is likely that many others have similar equipment and would have the same issues. Please also note that the proposed standard does not align with ANSI C37.102, IEEE Guide for AC Generator Protection or with the NERC Technical Reference Document entitled Power Plant and Transmission System Protection Coordination.” Previous SDT reply - Thank you for your comments. Please note that the voltage levels specified in Attachment 2 are at the point of interconnection to the transmission system. They would not correlate directly with the auxiliary bus voltages, especially if the auxiliaries are unit-connected. The SDT does not believe this proposed standard is in conflict with either the IEEE or the NERC documents cited. Please inform the SDT of the specifics of your concerns. We believe our comments still apply. Specific to the fault that produces 65% voltage at the generator terminals for 2 seconds, plant auxliary equipment would not be able to withstand such a drop for the specified duration and would fall offline.

Idaho Power System Planning agrees with the revised VRFs for R1, R2 and R5.
Yes
Idaho Power System Planning agrees with the revisions made to R4.
Requirement R1 and R2: Idaho Power System Planning comments that the GVSDT clarify if this standard applies to voltage or frequency elements only or if it applies to all generator protection elements as suggested in footnote 1. Requirement R5: Idaho Power System Planning comments that the GVSDT consider adding an exception to Requirement R5 that generation may trip if the Generator Owner has a documented over/under frequency limitation that cannot meet the stepped “no trip” curve shown in Attachment 1 provided that the Generator Owner and Transmission Operator have a documented mitigation plan approved by the Reliability Coordinator to trip equal load for instances of anticipated generation loss (similar to Item 13 of the WECC Off-Nominal Frequency Load Shedding Plan). Page 20: Idaho Power System Planning comments that the GVDST should clarify if Items 6a-6c are expected to be met simultaneously as it is not likely that a generator be capable of operating at full load (Pmax) and 0.95 pf lagging continuously. Idaho Power System Planning comments that the GVDST consider a 0.95 leading power factor condition in addition to the item included in Items 6a-6c. Requirement R6 is overly burdensome with questionable impact on reliability. Items 6a-6c on page 20 are not consistent with nor relevant to normal relay setting development practice. Initial operating points should be developed from good engineering judgement, not prescribed in this way.

No
In response to Exelon's (and other commenter's) concern that 60 calendar days was not a reasonable amount of time to perform a study in response to a written request from a RC, PC, TOP or TP, the GVSDT stated that it has "modified the structure of the requirement to clarify the intent and the limits of what entities could request a performance estimate;" but the GVSDT was not in agreement with changing the time period allowed to respond. Although the GVSDT states that "[d]etailed unit performance studies are not required to develop the estimate," Exelon continues to maintain that 60 calendar days is not a reasonable amount of time to perform a study of this magnitude based on the predicted scope. Specifically, nuclear generating units have extensive calculations related to how internal systems will respond to frequency and voltage excursions. Exelon believes it is inappropriate to short cycle or challenge the rigorous process required by the Nuclear Regulatory Commission (NRC) at a nuclear generating unit for any such study. In addition, depending on the complexity of the transient requested by the transmission entity, a nuclear generating unit may not have the in-house expertise to perform such a study and

may be required to hire an outside vendor.
Exelon is concerned that there are no set criteria for the transients nor any guidelines in the Standard on the number of requests that the RC, PC, TOP or TP could ask for. This is problematic in that the generating units could be subject to multiple requests for different combinations of transients without any cost benefit or justification. Exelon therefore suggests that the GVSDT evaluate adding language to the Standard that includes a provision for a set periodicity in which the transmission entities can request such data (e.g., an annual request or following a significant event on the transmission system). Exelon previously requested that the GVSDT split the Off Normal Frequency Capability Curve (Attachment 1) be split into separate tables for each Interconnect to make it easier to read. The response from the GVSDT states that they do not believe adding more graphs would add clarification since there are separate data tables. Although Exelon agrees that you could reference the data tables to ensure you are following the correct curve; unless the Off Normal Frequency Capability Curve is printed in color it is difficult to distinguish which line corresponds to which interconnection. Exelon still maintains that for clarity that each data table for each Interconnection should have a separate corresponding graph.

(a) To improve clarity, CenterPoint Energy recommends deleting the second and third sentences of the first paragraph of R4. CenterPoint Energy does not agree that a Reliability Coordinator, Planning Coordinator, Transmission Operator, or Transmission Planner should provide a voltage or frequency profile at the point of interconnection that is determined by dynamic simulation. Different types of simulated events will produce different voltage and frequency excursions. Also, even the same type of event will produce different voltage and frequency excursion “profiles” as the system changes over time. (b) While deleting the second and third sentences of the first paragraph of R4 would provide clarity, it would nevertheless be problematic for reliability because it does not impose any minimum frequency or voltage ride-through requirements for existing generation stations. Failure of a generator to ride-through at least some minimum threshold of frequency and voltage excursions places the reliability burden solely on transmission entities and makes is difficult to compensate for the generator’s failure to perform.
(a) In R2 and R5, CenterPoint Energy recommends that “external to the generating plant” be deleted in the phrase “…caused by an event on the transmission system external to the generating plant…” We believe this could cause confusion, as some could consider the transmission interconnection substation as part of the generating plant. Also, such wording is not needed, as both requirements include the following clarifying language: “Generation may trip if clearing a system fault necessitates disconnecting a generating unit.” (b) CenterPoint Energy cannot support this version of PRC-024 because it does not impose any minimum frequency or voltage ride-through requirements for existing generation stations. Failure of a generator to ride-through at least some minimum threshold of frequency and voltage excursions places the reliability burden solely on transmission entities. This makes is difficult to compensate for the generator’s failure to perform and, therefore, is problematic for BES reliability.

Yes
(1)We commend the GVSDT for considering and addressing our previous comments, and making several changes that improve this proposed standard. (2)In R1 and R2, please add “Generation may trip by properly set volts per hertz protection if a system over excitation abnormality necessitates disconnecting a generating unit.” (3)Based on the GVSDT response to our previous comments we understand the purpose of R6 is to be studies. Given this study purpose, please change “and Transmission Planner” to “or Transmission Planner”, delete “monitors or” and replace “unless otherwise directed by the requesting Reliability Coordinator, Planning Coordinator, Transmission Operator, or Transmission Planner” with “while the requestor’s study is underway”. We believe that it is burdensome for the GO to have to indefinitely continue to send setting changes to the requesting entity. When the requesting entity begins another periodic study, they’ll request them again. Therefore, we request that R6 should then read: “Each Generator Owner shall provide its generator protection trip settings to the Reliability Coordinator, Planning Coordinator, Transmission Operator or Transmission Planner (that models the associated unit), within 60 calendar days of receipt of a written request for the data, and within 60 calendar days of any change to those previously requested trip settings while the requestor’s study is underway.” (4)We believe that M5 expects the GO to retain evidence that proves the negative and is therefore burdensome. Generators trip for many reasons; most of them have to do with the mechanical system. We request that the SDT append “by the generator frequency or voltage protective relaying” after “each unit trip”, and add “or that no such unit trips occurred within the Data Retention period” at the end. M5 should then read: “Each Generator Owner shall have evidence, such as dated unit output

records, trip investigation reports or disturbance monitoring records, showing that each unit trip by the generator frequency or voltage protective relaying did not result from a frequency excursion or voltage excursion as specified in Requirement R5, or evidence that a listed exception applied, or that no such unit trips occurred within the Data Retention period.” (5)VSL’s in R3, R4, and R6 are set up with 10 day increments between the different severity levels, rather than a more typical 30 day increment. (6)As a general comment, NERC should make all the papers listed in the references section of the standard readily available on their website.

Luminant
Brenda Hampton
Yes
No
Because R4 is only requiring an estimate of a unit’s ability to ride through an excursion developed by a planner, the generator owner should only state if the unit is or is not capable of staying on-line. R4 should be written to follow the FERC order. It is recommended that R4 be written as such. R4) Each Generator Owner of a generating unit shall respond within 60 days of receipt of a written request by the requesting entity (Reliability Coordinator, Planning Coordinator, Transmission Operator, or Transmission Planner that monitors or models the associated generating unit) stating if generating unit(s) or plant is or is not expected to ride through a frequency or voltage excursion based on a dynamic simulation provided by the requestor.
The following is a copy of a white paper that was sent to generator owners and other industry organizations on requirements R4 and R5. At the end of the paper are Luminant’s recommendations for this standard. NERC Reliability Standards Project 2007-09 Generator Verification PRC-024 Generator Performance During Frequency and Voltage Excursions October 22, 2012 Introduction Project 2007-09 Generator Verification includes draft standard PRC-024, Generator Performance During Frequency and Voltage Excursions. Requirements R3 and R4 are for existing generating units. R3 allows an exemption from portions of the ride through curves in PRC-024 Attachments 1 and 2 for documented cases where generator protective relaying cannot be set and directs those generators to communicate that limitation to the RC, PC, TOP and TP so its performance can be modeled correctly. R4 requires a Generator Owner to estimate the time duration for remaining on-line based on a Transmission Planner’s dynamic study. Requirement R5 directs all new generating facilities to be designed, built and maintained so that they are able to ride through the excursions defined in Attachment 1 and 2. Background In FERC Order 661 (June 2, 2005), Final Rule on Interconnection for Wind Energy, the Commission adopted a low voltage ride-through standard for wind generators, but provided that a wind plant is required to meet the standard only if the Transmission Provider shows, in the System Impact Study, that low voltage ride-through capability is needed to ensure safety or reliability. The standard, if applicable, requires the wind plant to stay online for specified time periods and at associated voltage levels where there is a disturbance on the transmission system. Several entities requested rehearing of various aspects of the low voltage ride-through requirement and standard included in the Final Rule. In FERC Order 661-A (December 12, 2005) page 2, the Commission noted “that the standard interconnection procedures and agreement were based on the needs of traditional generation facilities and that a different approach might be more appropriate for generators relying on other technologies, such as wind plants. Accordingly, the Commission granted certain clarifications, and also added a blank Appendix G to the standard Large Generation Interconnection Agreement (LGIA) for future adoption of requirements specific to other technologies.” The Commission went on to adopt in Appendix G to the LGIP limited special interconnection procedures applicable to wind plants only. The basis for the change to the standard regarding voltage ride through starts with FERC Order 693, Paragraph 1787 (March 16, 2007), which states “… the Commission directs the ERO to modify the Reliability Standard to explicitly require either that all generators are capable of riding through the same set of Category B and C contingencies, as required by wind generators in Order No. 661, or that those generators that cannot ride through be simulated as tripping. “ Discussion / Reliability Impact Although FERC Order 661-A does make a provision for future adoption of voltage ride-through requirements for all generators, the Order is careful to differentiate between wind generation technologies and other, traditional generation facilities. No instruction is given for other technologies in the Order. Nowhere in any of the FERC Orders (661, 661A, 693) is there a single requirement for non-wind generators to meet ride-through requirements. Docket No. RM05-4-000

(Order No. 661) discusses this subject directly. The Notice of Proposed Rulemaking (NOPR) Interconnection for Wind Energy and Other Alternative Technologies dated January 24, 2005, sought comments on certain specific issues, including whether there are other non-synchronous technologies, or other technologies in addition to wind, that should also be covered by the proposed Appendix G. In FERC Order No. 661, the Final Rule on Interconnection for Wind Energy, the Commission noted "These technical requirements for the interconnection of wind plants recognize the unique design and operating characteristics of wind plants, their increasing size and increasing level of penetration on some transmission systems, and the effects they have on the transmission system." Further, they wrote, "The Final Rule Appendix G we adopt here applies only to the interconnection of wind plants. The Commission does not believe at this time that the standard procedures and technical requirements in this Final Rule are appropriate for other alternative generating technologies that may supply over 20 MW at one Point of Interconnection. The standard procedures and technical requirements adopted here recognize the unique characteristics of wind plants, including the fact that they use induction generators, consist of several or numerous small generators connected to a collector system, and do not respond to grid disturbances in the same manner as large conventional generators." The Final Rule also noted that while low voltage ride-through capability is needed for wind plants, it is less of a concern for large synchronous generating facilities because most of these facilities are equipped with automatic voltage control devices to increase output during low voltage events. The Commission concluded that the Final Rule Appendix G exceptions to the LGIP and LGIA apply only to large wind plants. Appendix G was designed around the special needs and design characteristics of wind generators. The Appendix G provisions adopted "focuses on the special characteristics of large wind plants, particularly the fact that they utilize many induction generators connected to the transmission system at a single point through a medium-voltage collector system. The Commission has not found at this time that any other technologies, including the solar generators without fueled backup …, have similar characteristics." The Project 2007-09 Generator Verification Standard Drafting Team has presented the current draft of the standard as a technology-neutral version, ignoring the fact that power plant performance in asynchronous vs. synchronous units for transmission excursions are significantly different and are technology dissimilar for reasons of voltage regulation ability and plant auxiliary design. • The NERC System Protection and Control Subcommittee wrote, in previous comments, "FERC 661-A is a wind generator facility ride-through performance criterion, not a synchronous generator relay setting requirement. They cannot be considered as being the same. This requirement in PRC-024 should only apply to non-synchronous machines." • Constellation Power wrote, "The idea of a ride-through curve originated with wind farms, and is not conceptually appropriate. For example, this approach is not conceptually appropriate for cylindrical rotor synchronous machines." • PPL Energy commented, "PPL is concerned with the following concepts in the standard: 1) The standard applies equally to asynchronous and synchronous machines, salient pole and round rotor machines, photovoltaic, and other resources and as such the standard does not appear to recognize that these technologies respond differently to voltage and frequency excursions." • AEP posited "The proposed VRT criteria requires more study and analyses before introducing it so broadly in this standard for other than for wind turbine generators for which it has already been applied." • Pacificorp offered "Many European generator interconnection standards and requirements include different voltage ride-through requirements for synchronous and non-synchronous generation. PacifiCorp is concerned that the SDT has inappropriately developed a "one-size fits all" standard applicable to all generation platforms." Furthermore, OEM's have not yet developed a solution to voltage ride through for non-wind generators. Assured compliance with PRC-024 may not be available at any price. BES reliability enhancements requiring technological advances should be addressed with industry groups (e.g. ASME, IEEE) and OEMs to develop commercially available products before appearing as requirements in reliability standards. Regulation should not come before a solution is available. A specific concern in this respect regarding the ride-through capability being sought in PRC-024 R3-5 is that auxiliary buses may drop-out and cause a unit to trip for the excursions specified, which go well beyond the industry's present design criteria, even if the protective relay settings nominally allow such transients. It may be unrealistic to expect that the dynamic behavior of medium and low voltage auxiliary systems in a plant can be accurately modeled. • In response to numerous questions on the feasibility of a plant design with the new voltage and frequency ride through curves, the Standard Drafting Team responded that "The implementation schedule calls for six years beyond approval of the standard before Requirement R5 goes into effect. The SDT believes this is enough time to develop the required designs." Thus the SDT has recognized that the technology to comply does not exist today. • Southern Company noted that "We highly doubt that the requirement is technically feasible based on our experience with vendors and the various technical requirements and modifications that would have to be made to make sure that low or high voltage ride thru is possible. Complicating factors include the many different equipment suppliers, limited control of manufacturing standards by the purchasers, and continuing changes in technology must be considered to be able to determine whether or not all plant sub-systems can ride through. The economic impact and technical feasibility of this requirement has not yet been considered by suppliers." • Duke Energy states in their comments, "An R&D effort should be considered to investigate steam plant ride through capabilities if a criteria is needed." • Indiana Municipal Power Agency questioned whether the technology to meet this requirement was currently available to a newly built generating facility. "To force such a requirement on newly built generating facilities at this time, one is speculating that the technology will be available. Can we risk reliability of the grid on such speculation (Generator Owners not building generating facilities because they cannot meet this requirement)? What if the technology is not available?" • In a previous posting of the standard, GenOn Energy suggested "It does not appear that the SDT has carefully considered the possible impact of Attachment 2 on plant electrical auxiliary motors and contactors. The SDT should ask a power plant engineering company the

impact on the electrical auxiliaries of an 800MW coal unit with a scrubber.” If a solution is identified prior to implementation, preliminary estimates suggest the potential cost of complying with wider standards might increase machine costs as much as 25%, which is not insignificant. The result would be a considerable increase in capital and O&M costs for new (non-wind) generation due to increased equipment costs to meet more robust design specifications. The increase in costs, in combination with the compliance risk associated with not having a technical solution available at time of construction, will likely discourage new power plant construction outside of wind generation. This barrier to new construction could lead to mid-term reliability concerns, particularly in markets already stressed with tight reserve margins. Finally, the Standard Drafting Team has not demonstrated a grid-wide reliability gap justifying the need for voltage ride through for traditional (non-wind) generators. • The US Bureau of Reclamation noted “We believe there is no convincing reliability based rationale to expand the scope of the FERC Order via this standard to include synchronous machines, noting that Generators are already required (PRC-001-1) to coordinate settings with the host Transmission Operator.” Both EPRI and IEEE have held discussions on this topic and have expressed concerns related to those issues noted previously. While these legitimate concerns about voltage ride through requirements for non-wind generators are being debated, they are also holding up other significant issues to be addressed by PRC-024 such as relay setting coordination and frequency ride through. Summary and Conclusion The Standard Drafting Team should remove Requirements R4 and R5 from the current version of PRC-024 to facilitate passage of the more critical elements of the standard such as voltage and frequency relay setting requirements. The current technology neutral draft standard PRC-024 is inconsistent with the intent of FERC Order 661 -A in that it applies “equal” requirements to all generators, rather than requirements solely for wind generators which is the focus of the FERC Order. The Standard must recognize that wind generators and traditional generation facilities are technologically dissimilar and, therefore, cannot be treated the same in this instance. With no technology currently commercially available to provide guaranteed voltage ride through capabilities for traditional generation, the standard should not require this (unavailable) technology be in place in order to meet the requirements of the standard. When the technology becomes available, a new SAR may be drafted to address the voltage performance aspects of non-wind generators if an identified reliability gap exists. The new Cost Effective Analysis Process can be used at that time to evaluate the costs and benefits associated with the new requirement, as well as facilitate consideration of alternative methods to achieve the reliability objective which may result in less implementation costs and resource expenditures.

Yes
Yes
1) R5: New generation units may not be able to meet this requirement if auxiliary systems are included. While the standard allows for a temporary or retroactive exemption, it is a difficult task to design and build a new plant and take into account the myriad of pumps, fans, dampers, control systems, instrumentation, etc. that could possible trip the unit during a low frequency or low voltage event. The SDT may want to consider removing the language “and plants (including auxiliary systems)” from the first sentence of this requirement. If the SDT maintains this requirement, consideration should be given to utilizing a lower VSL other than Severe. Additionally, considering the proposed efinition of BES, is the auxiliary system phrase applicable? 2) As written, the standard will apply across all types of BES-defined generation units (Individual generating unit greater than 20 MVA directly connected to the bulk power system, generating plant/ facility consisting of one or more units that are connected to the bulk power system at a common bus with total generation greater than 75 MVA, etc.) regardless of fuel type. Based on this applicability, fossil-fueled conventional units and variable resources (wind, solar, hydro, etc.) must meet the same voltage/frequency criteria. Is this the intent of the SDT? Voltage ride-through capabilities can vary significantly between fossil-fueled plants and wind plants due to their technical dissimilarities. Attempting to apply a single criteria to both will lead to technical difficulties between synchronously-connected and asynchronously-connected machines, as each responds differently voltage disturbances. Attempting a one-size-fits-all approach is inappropriate for this type of standard. The standard should recognize that wind generators and traditional generation facilities are technologically dissimilar and, therefore, cannot be treated the same in this instance. 3) If a Generator Owner has a limitation that is communicated but failed to set its frequency protective relaying to not operate, is that a violation? 4) Has there been any consideration of providing separate capability curve figures for each Interconnection?

(1) We question the value of this requirement and suggest it should be struck. While knowing how long a generator will remain connected following a voltage or frequency excursion might be useful to a planning engineer conducting dynamic simulations, we do not see how it helps the RC, BA or TOP. The RC, BA or TOP's System Operator will not likely take any action as a result of such information. Rather, they will wait to see if the unit trips before taking additional action because there is no guarantee the unit will trip. Then, they will already be taking actions to minimize the stress regardless of whether they suspect that a unit may trip due to a voltage or frequency excursion. System Operators always have to be prepared to respond to events but simply cannot be expected to respond to every possible event because most simply don't happen and it would be an unreasonable expectation of System Operator. Even if the System Operator knew that a unit might trip in a short time frame due to a voltage or frequency excursion, they simply do not know when such an excursion might or even will occur and likely would not take preemptive action. Because System Operators are responsible for monitoring many aspects of the BES, it would be a waste of time to have them speculating whether or not a unit is going to trip. The system operator only needs to know how to react and mitigate the event if a unit does in fact trip. Furthermore, the RC, BA, and TOP already operate the system to withstand the loss of a unit so any unit that would trip due to such an excursion would not cause a problem. Upon the actual unit trip, then the RC, BA and TOP can reposition the system if necessary to prepare for the next contingency. When information is supplied to a System Operator that does not require them to do something it becomes "noise" which provides no value. (2) IRO-010-1a and TOP-003-2 already allow the RC and TOP to request necessary data from the Generator Owner through their data specification and have the authority to compel the Generator Owner to provide the data. Thus, if this data is needed the RC and TOP will include it in their data specifications. As a result, supplying the portion of R4 that requires data to be supplied to the RC and TOP is redundant and unnecessary. (3) What level of voltage or frequency excursion is intended to be covered by this requirement? It does not appear to be specified.
(1) We appreciate that the second bullet allows that TP to provide a less stringent voltage envelope for R5. However, it is not clear if the TP can provide a more stringent envelope. We believe a more stringent voltage envelope should not be allowed. Please clarify. (2) We continue to believe that requirement R5 needs to be modified to recognize that equipment will not always be new and may develop limitations as it ages. These limitations may prevent the generator from meeting the voltage and frequency envelopes defined in Attachment 1 and 2. (3) Requirement R6 should be struck. First, the TOP and RC already have the capability to request such data in its data specification from the GO through IRO-010-1a and TOP-003-2 which also compels the GO to comply with the data specification. Thus, if the TO and GO need the data they will write it into their data specifications. Second, this requirement is the type of requirement that the Project 2013-02 Paragraph 81 drafting team has proposed eliminating in response to the FERC approval order of the FFT process. Specifically, the requirement meets the Administrative, Purely Reporting and Redundant criteria for the project. It only has to meet one criterion to be proposed for retirement. It is imperative that drafting teams refrain from developing requirements that a future team will retire. (4) This standard needs to be aligned with the recent NERC compliance enforcement initiatives (i.e. internal controls, entity impact evaluation, elimination of zero-defect expectations). The VSL for Requirement R5 makes it clear that every time a "new unit" (i.e. does not meet footnote 2) trips, an evaluation needs to be conducted to determine if the unit tripped for a voltage or frequency excursion that is inside the no trip zone. To refocus NERC efforts on compliance, the recent compliance enforcement initiatives would allow that GO to make this determination and correct any performance deficiencies without the need to self-report a violation. These approaches are being written into the standards (CIP, COM-003, etc.). We suggest the drafting team coordinate with the appropriate NERC personnel to adopt a similar approach for this requirement. (5) Because the voltage envelope is based on assumptions listed on page 20, the VSLs for R5 need to clarify that if a unit does trip in the no trip zone and the system does not reflect these assumptions that this does not represent a violation. For instance, if a synchronous condenser or capacitor (bullet 7 on page 20) is not available that was assumed to be available when evaluating protection relay settings, why would the GO be held accountable for its unit tripping during a voltage excursion? It followed the assumptions set out in the standard. (6) Why is the defined term Protection System not used throughout the standard rather than "protective relaying"? We recommend adopting the NERC Glossary Term for consistency. (7) We continue to believe that performance requirements for new units should be part of the interconnection process. As a result, R5 should either be struck or it should be moved to FAC-001 which governs standards for facility connection requirements. (8) Requirement R3 and R6 are the types of requirements the Project 2013-02 Paragraph 81 drafting team is proposing to eliminate. They have established a set of criteria to identify requirements with little to minimal reliability impact. Both of these requirements meet one or more of the following criteria: Administrative, Purely Documentation, Purely Reporting, or Little, if any, value as a reliability requirement. Please review all proposed requirements against this criteria and remove requirements as appropriate. While we believe R3 should be removed, we do understand there is a need to document equipment limitations for R1 and R2. We believe the existing associated bullets in R1 and R2 will satisfactorily address the need to document limitations and that the reference to R3 could simply be struck. (9) Please remove the RC and TOP from Part 3.1 of R3. Inclusion of the RC and TOP is redundant with IRO-010-1a and TOP-003-2 which require the RC and TOP to develop data specifications. If they need this data, it should be included in their data specification. (10) Please remove "as specified by Requirement R6" in the first half of the R6 VSLs. We found it confusing when it was not included in the second half. (11) Please copy footnote 1 from R1 on to the page with R2. It was not immediately clear that he footnote in R2 was actually on the previous page.

The Protective Relay coordination portions of this standard are not being contested. It is not clear how the evaluations should be performed to determine the ability to ride through grid transients. A standard should NOT be written to require this until research has been done to document an appropriate approach to doing these evaluations. It is suggested that plant performance requirements be removed from this Protection System (PRC) standard. If this is required to support grid reliability, then a new SAR should be written to develop those plant performance requirements.
Looking at the Table for the Eastern Interconnection in Attachment 1 of the Standard, this table does not correlate to our company procedures for EOP-003, in which generators are expected to isolate from the system anytime the frequency goes to 58.2 Hz or lower. The risk of incurring resonant vibration of steam turbine last-stage blades is generally related to blade length, so the off-frequency ride-through criteria in Att. 1 of PRC-024-1 are a concern for larger units. Nuclear plants in particular may be required to operate not only outside of OEM recommendations but at conditions that are unsafe. Please see in this respect the SERC Generation Subcommittee Nuclear Plant Review of PRC-024 Curves presentation made at the SERC Engineering Committee Meeting of March 16, 2011 at Charlotte, NC. Some gas turbines may experience surge or combustion upsets (including flame-out) at the off-speed conditions of Att. 1, in addition to potentially incurring blade vibration issues similar to those described above. See also in this respect the AREVA NP White Paper on PRC-24. Auxiliary equipment contactors are likely to drop-out at the off-design voltage values specified in Att. 2 of PRC-024-1, especially if the high-side voltage swings specified in this standard are magnified at plant MV and LV aux buses. Fan and pump performance will be affected at the frequency limits of Att. 1, and below-rated voltage per Att. 2 may cause this equipment to stall, causing main flame trips, high/low duct pressure trips, drum level oscillations below the low water cut-out point and the like. This is especially the case if cycling above and below the rated frequency during Disturbances (but within the limits of Att. 1) magnifies system oscillations or drives automatic control systems unstable. The prohibition against tripping for existing units applies not just to actuation of Protection Systems but to “protective relaying,” which per footnote #1 in PRC-024 includes “protective functions within control systems…based on frequency or voltage inputs.” It is unclear whether or not this definition covers contactor drop-out or actuation of fan stall protection systems at extreme under-voltage conditions. The basis of compliance for new units is simply, “will not trip,” i.e. covering all issues cited above plus any unpredictable other factors that may take units down. It is not realistic to expect such sweeping guarantees to be available on a system-wide basis, even if some individual pieces of equipment can ostensibly comply with Atts. 1 and 2, effectively shutting-down the new powerplant industry unless an owner were willing to take unbounded risk. A “will not trip” obligation may also effectively ban entire classes of equipment, including combined cycle plants (as regards the chances of incurring lean blow-out) and (as mentioned earlier) nuclear facilities. “It is noteworthy in this respect that environmental regulators have for decades been tightening gas turbine dry low-NOx combustor emissions limits, taking these devices to the brink of instability during even steady-state operation, with inevitable negative implications for survival of Disturbances, and there were in fact many gas turbine flame-out trips during the blackout of ’03. That is, the EPA and NERC may be trying to achieve divergent and even incompatible goals, so merely allowing time for development of new designs is not a solution. NERC, NAGF, the EPA, OEMs and industry groups should develop a mutually acceptable set of performance requirements.” M5 causes new-unit tripping due to frequency or voltage excursions within PRC-024 limits to constitute a violation, but it seems unlikely to expect an “or” event. That is, Disturbances are likely to cause frequency and voltage to simultaneously deviate from the rated values, and it is unclear how this combination of factors will be addressed in assessing compliance with the stands-separate basis of Att. 1 and Att. 2 in this standard. The grandfathering of existing units in R1 and R2 for, “documented and communicated equipment limitations,” is problematical; since the propensity to incur drum level fluctuations, air/flue gas flow oscillations and the like during Disturbances will not be defined in OEM literature, nor is it generally possible to predict by calculations when such problems will occur, especially if a Disturbance involves cycling between above and below the rated frequency (but within the Att. 1 boundaries). The same is true regarding predicting transient fluctuations of aux bus voltages, ref. risk of contactor drop-out and stalling major auxiliary equipment. The concern above applies also to having to make reference per R3 to, “study results, experience from an actual event, or manufacturer’s advisory.” Few if any GOs are likely to possess such documentation for Disturbances as extreme as those specified in Att. 1 and Att. 2. The list of types of evidence in R3 is not exclusive, but it is difficult to imagine alternative forms of hard evidence that could be developed other than for the comparatively few plants that possess high-fidelity simulators. Confusion is created by making grandfathering, “in accordance with Requirement R3,” in R1 and R2 of PRC-024-1; while R3 excludes, “limitations that are caused by generator frequency and voltage protective relays.” Are such protective relays meant to correspond to the “protective

relaying" discussed above? It is unclear whether or not any grandfathering is actually being allowed. The exemption take-back in the last bullet item of R3.1 (a 10% increase in nameplate capacity) again may effectively ban entire classes of equipment, or at least prevent units from ever receiving capacity and efficiency enhancements. Steam turbine off-frequency limits are generally set by OEMs lifetime limits as regards duration, but there is no discussion in PRC-024-1 as to how often the specified excursions may occur, leaving users with ostensibly compliant equipment still at risk if major upsets take place more often than had been anticipated.

We agree that a GO can meet the requirements in R1 & R2 and use R3 to note any known limitations. We do not feel the GO can provide any meaningful estimate of overall plant performance beyond meeting the first three requirements. The complexity of what is being asked is simply too great.
We much prefer a performance based, RBS approach using the internal controls process than the approach taken by the SDT. We would prefer to evaluate post event trips for compliance with the settings rather than keep extensive, zero-defect compliance documentation for all unit settings. (Intentional Space).... Specific Comments: It appears that R1 & R2 are meant to be "document the settings" requirements since they refer to the Long-term Planning Time Horizon and M1 & M2 ask for settings documentation. The requirements themselves suggest that compliance is evaluated based on actual events, though. For instance, the first bullet in R1 mentions "..impending or actual loss of synchronism.." which would not be evaluated in the Long-term Planning Time Horizon. R2 states "…such that the voltage protective relaying does not trip…" which again implies evaluating the results of an actual event. R1 & R2 are not clearly pre-event documentation only or post event analysis only – they currently try to have it both ways. Please correct this. (Intentional Space).... We agree with the compliance approach used in R5 and encourage the SDT to use this same approach for requirements R1 & R2. SMUD recommends the following changes the the 5th bullet of R5: (Intentional Space).... "Generation may trip if the Generator Owner has a temporary exemption granted by its Reliability Coordinator based on a documented equipment limitation. If a legitimate equipment limitation is identified following a plant trip caused by a frequency or voltage excursion, the Reliability Coordinator shall grant a retroactive exemption for the identified limitation." (Intentional Space).... The stuck language lends itself to arbritaray determinations and, where no fix is possible, automatically forces a non-compliance situation for an unknown condition. (Intentional Space).... We disagree with R6. First, the GO must provide the generator protection trip settings – this phrasing is not limited to voltage or frequency trip points, but ALL trip settings. This is unreasonable. Second, the GO should not be subjected to an indefinite requirement to constantly update an entity that sends a single written request. By the requirements in this standard, the various Coordinators and Planners know that the plant's trip settings must follow the curves. Why isn't this enough? If the Coordinators or Planners want specific setting data, they should be required to ask for it each time. Otherwise, they should model the plant as meeting the curves contained in this standard.

As currently drafted, Requirement R4 appears to dictate an analysis for all inflection-points in unit performance, for a continuum of frequency and voltage excursions, and taking into account all of the underlying auxiliary equipment's control systems and settings. We see this current draft's Requirement R4 wording as a creating a much greater expectation, than estimating the duration-times for the curves at the specific inflection-points given in Attachments 1 & 2 of this Standard.
Requirement R3 qualifies "each known equipment limitation". Measure M3 omits the "known" qualifier, stating the expectation of measurement is to have "any equipment limitations" documented. Is the expection for "any" to mean "some", or "all known"?

No
1) It is unclear if this requirement is to be only upon request, and if requests will be related to the same ride through criteria or a different set specified by the TP. Need to clarify how this aspect will be executed. 2) Refer to discussion in our response to Question 3 below about industry concerns with the technical viability of plant performance standards.
1) Feedback from the IEEE Electric Machines Committee and Siemens (a generator equipment OEM) serve as the bases for these statements and are included below. PRC-024 was orignially intended to address a relay setting/coordination issue. This appears to be addressed by the current draft of the standard. However, the issues related to plant survivability or performance are more complex. It is not appropriate to attempt to address these issues in a PRC standard. The addition of plant performance aspects appear to be driven by FERC as evidenced by the minutes of the May 2009 meeting - see http://www.nerc.com/docs/standards/dt/GVSDTnotes052809.pdf. 2) According to attendees at the IEEE EMC meeting, much of the technical justification for the need of a plant performance criteria was based on issues with early design wind generation, however the technical considerations at these types of generation stations are different that steam turbine generation plants, which require heavy induction loads to support operation. These loads are sensitive to upsets in voltage and frequency. The technical implications of the plant performance are not clear and thus this issues should not be standardized at this point in time. It is recommended that the plant performance aspects be removed from the PRC standard and a new SAR be written to address plant performance requirements. This approach would support pulling in the various design expertise (IEEE, Equipment OEMs, Power Plant Design entities, etc) needed to develop a technically correct ride through criteria. 3) There also is a need to develop industry accepted methods to determine the capability of a plant to ride through grid transients prior to this becoming a mandatory standard. 4) It appears the +/- 5 % of the rated generator voltage constraint has been removed from the voltage ride thru criteria. Depending on the tap of the GSU, this might be more limiting than the HVRT curve. SDT should consider keeping the constraint. 5) Related to #5 in the curve clarifications - What is the intend of changing from RMS to crest voltages for the HVRT? What is a crest phase-to-phase voltage? 6) Related to #6 in the curve clarifications - Voltage relays may not ride through HV or LV disturbances as intended if the curves are not compensated for the rated capabilities of the machine. It would be better to compensate the LVRT curve for operation at the B point on the D-Curve and the HVRT curve for operation at the C point on the D-curve. 7) V/Hz relay should be evaluated in the frequency domain at maximum rated voltage, typically 105%. 8) Has any consideration been given to addressing the frequency and voltage excursions in the transmission system in order to arrest the situation locally? 9) Information from IEEE Electric Machinery Committee discussion topic “Grid Code Impact on Electric Machine Design” (San Diego 2012 – Papers from the session with supporting information are available): A) PRC-024 VR capability may not be available at any price. BES reliability enhancements requiring technological advances should be addressed with industry groups (e.g. ASME, IEEE) and OEMs to develop commercially available products before appearing as requirements in reliability standards. It is believed the cost of complying with wider standards might increase main generator machine costs as much as 25%, which is not insignificant. This should only be required if there is a defined local system need for higher standards and that these costs should be considered against the cost of other possible resolutions. B) A specific concern in this respect regarding the ride-through capability being sought in PRC-024 R3-5 is that auxiliary buses may drop-out and cause a unit to trip for the excursions specified, which go well beyond the industry's present design criteria, even if the protective relay settings nominally allow such transients. It may be unrealistic to expect that the dynamic behavior of all 4160V and 460V systems in new plant can be dynamically modeled to a degree allowing one to obtain non-drop-out guarantees from equipment suppliers and EPC firms for extreme transients such as 2.0 seconds at 65% voltage, or that the same can be done for existing plants to allow identification of limiting components and accurate estimates of performance. C) The voltage ride through was originally intended to address early deficiencies in wind generation design only and it doesn’t make sense to apply such a broad curve to steam plants. The concerns that led to the VRT curve for wind have been addressed by new vintage wind plant designs and thus, the EMC does not believe there is a driving need for a standard VRT criteria. 10) The VRT issue is holding up addressing other significant issues addressed by PRC-024 (relay setting coordination and frequency ride through). The VRT should be pulled out of PRC-024 and a new SAR drafted to address the voltage performance aspects if this is really needed for reliability. 11) Information from Siemens (Generator OEM) perspective: A) Regarding PRC-024, the LVRT curves (on Attachment 1) are subject to misinterpretation, since they seem to imply a very slow, stepped voltage recovery rather than a set of roughly equivalent faults. The curve needs some elaboration and supplemental explanation. B) The proposed PRC-024 draft allows certain exemptions (e.g., loss of field and loss of synchronism) that are not permitted in the stability assessment of wind plants. This appears to be in conflict with the FERC 693 mandate for technology-neutral ride-through requirements, since wind turbines have no analogous exceptions. Indeed, the reason for the LVRT standard applied to wind turbines was because of the characteristic of induction generator wind turbines to lose synchronism at low voltages. C) The Abnormal Frequency ride through curves of PRC-024 (on Attachment 2) have not been coordinated with the equipment standards and exceed the overfrequency limits in the equipment standards in most cases. D) Further on PRC-024, there is only one reference explicitly cited, yet there are several implicitly cited (e.g., frequency limits) and there are well-known conflicts with equipment standards. The sources of the frequency limits and equipment standard limits should be cited in publicly available documents. Where, for

example, are the Eastern Grid and ERCOT overfrequency requirements? They are not generally known. They should be explicitly cited. E) The LVRT curves stipulate that the stability assessment be performed at rated lagging power factor. This is not a conservative assumption. It should be justified, not simply asserted as standard practice.

The proposed language lacks clarity in what data is needed in order for a TOP to comply with the requirement to provide trip settings to the RRO/RC/Transmssion Planners. We recommend that regions develop further specific "no-trip" regions specific to their area of the Interconnection.

Requirement R4 is clear, however it can take 60 calendar days simply to find and retain a consulting firm who is qualified to provide the estimated data to the requesting entity. This will require the GO to perform defensive compliance, that is, to attempt to aquire data before a request is submitted in order to meet the tight two-month response time. There is no provision to allow the GO to negociate a time frame with the requesting entity.
Cowlitz supports the comments from the NAGF SRT: 1. The risk of incurring resonant vibration of steam turbine last-stage blades is generally related to blade length, so the off-frequency ride-through criteria in Att. 1 of PRC-024-1 are a concern for larger units. Nuclear plants in particular may be required to operate not only outside of OEM recommendations but at conditions that are unsafe. 2. Some gas turbines may experience surge or combustion upsets (including flame-out) at the off-speed conditions of Att. 1, in addition to potentially incurring blade vibration issues similar to those described above. 3. Auxiliary equipment contactors are likely to drop-out at the off-design voltage values specified in Att. 2 of PRC-024-1, especially if the high-side voltage swings specified in this standard are magnified at plant MV and LV aux buses. 4. Fan and pump performance will be affected at the frequency limits of Att. 1, and below-rated voltage per Att. 2 may cause this equipment to stall, causing main flame trips, high/low duct pressure trips, drum level oscillations below the low water cut-out point and the like. This is especially the case if cycling above and below the rated frequency during Disturbances (but within the limits of Att. 1) magnifies system oscillations or drives automatic control systems unstable. 5. The prohibition against tripping for existing units applies not just to actuation of Protection Systems but to "protective relaying," which per footnote #1 in PRC-024 includes "protective functions within control systems…based on frequency or voltage inputs." It is unclear whether or not this definition covers contactor drop-out or actuation of fan stall protection systems at extreme under-voltage conditions. 6. The basis of compliance for new units is simply, "will not trip," i.e. covering all issues cited above plus any unpredictable other factors that may take units down. It is not realistic to expect such sweeping guarantees to be available on a system-wide basis, even if some individual pieces of equipment can ostensibly comply with Atts. 1 and 2, effectively shuttingdown the new power plant industry unless an owner is willing to take unbounded risk. 7. A "will not trip" obligation may also effectively ban entire classes of equipment, including combined cycle plants (as regards the chances of incurring lean blow-out) and (as mentioned earlier) nuclear facilities. It is noteworthy in this respect that environmental regulators have for decades been pushing gas turbine dry low-NOx combustors to the brink of instability during even steady-state operation, with inevitable negative implications for survival of Disturbances. Greater consideration of BES reliability may be needed, but doing so by issuing dueling regulations would not constitute an appropriate approach. 8. M5 causes new-unit tripping due to frequency or voltage excursions within PRC-024 limits to constitute a violation, but it seems unlikely to expect an "or" event. That is, Disturbances are likely to cause frequency and voltage to simultaneously deviate from the rated values, and it is unclear how this combination of factors will be addressed in assessing compliance with the stands-separate basis of Att. 1 and Att. 2 in this standard. 9. The grandfathering of existing units in R1 and R2 for, "documented and communicated equipment limitations," is problematical; since the propensity to incur drum level fluctuations, air/flue gas flow oscillations and the like during Disturbances will not be defined in OEM literature, nor is it generally possible to predict by calculations when such problems will occur, especially if a Disturbance involves cycling between above and below the rated frequency (but within the Att. 1 boundaries). The same is true regarding predicting transient fluctuations of aux bus voltages, ref. risk of

contactor drop-out and stalling major auxiliary equipment. 10. The concern above applies also to having to make reference per R3 to, "study results, experience from an actual event, or manufacturers advisory." Few if any GOs are likely to possess such documentation for Disturbances as extreme as those specified in Att. 1 and Att. 2. The list of types of evidence in R3 is not exclusive, but it is difficult to imagine alternative forms of hard evidence that could be developed other than for the comparatively few plants that possess high-fidelity simulators. 11. The same concerns regarding availability of information apply for the, "estimate of the time duration the existing generation unit will remain connected," in R4. Relying on "sound engineering judgment" is permitted, and R4 states that "detailed unit performance studies are not required;" but the word "sound" implies that the estimate is to be based on accurate data, and how such information could be developed without a detailed study is unclear. 12. Confusion is created by making grandfathering, "in accordance with Requirement R3," in R1 and R2 of PRC-024-1; while R3 excludes, "limitations that are caused by generator frequency and voltage protective relays." Are such protective relays meant to correspond to the "protective relaying" discussed above? It is semantically unclear whether or not any grandfathering is actually being allowed. 13. The exemption take-back in the last bullet item of R3.1 (a 10% increase in nameplate capacity) again may effectively ban entire classes of equipment, or at least prevent units from ever receiving capacity and efficiency enhancements. 14. Steam turbine off-frequency limits are generally set by OEMs lifetime limits as regards duration, but there is no discussion in PRC-024-1 as to how often the specified excursions may occur, leaving users with ostensibly compliant equipment still at risk if major upsets take place more often than had been anticipated. 15. An additional "may trip" exclusion is needed for R1 and R2 related to V/Hz set properly to limit over excitation of generators or transformers. 16. Objection to R5 – the additional costs involved for re-designing generating stations so that every control subsystem can ride through the excursions defined by the attached curves is not economically justifiable considering the very small probability of a voltage and/or frequency excursion occurring. Furthermore, we believe it is fundamentally inappropriate to support approval of such a requirement until the technical issues that would require changes to the industry standards for plant systems and equipment are resolved. We recommend this requirement be removed so the standard can move forward to address the shorter term goals that are achievable. 17. Does R6 refer to ALL generator trips? This should be limited to Protection System relaying set to trip on over/under voltage or over/under frequency, or over volts/Hertz, not ALL generator trips. Also, this requirement may repeat requirements that are being developed in revisions to PRC-001. 18. It is inconceivable that most plants can ride through a + or - 10% voltage excursion for 10 minutes per PRC-024, Attachment 2. Almost all would have to take exception.

BrightSource is voting affirmative with the understanding that individual Regions can have requirements that are more stringent than NERC Standards. Therefore, even though R3 only requires GOs to "document each known equipment limitation (excluding limitations that are caused by generator frequency and voltage protective relays) that prevents a generating unit, from meeting the criteria in Requirements R1 or R2 ….", it does not relieve the GOs of their obligations under the WECC Coordinated Off-Nominal Load Shedding Plan for generators that connects to the Western Interconnection.

Consideration of Comments

Project 2007-09 Generator Verification
MOD-026-1

The Project 2007-09 Generator Verification Standard Drafting Team (GVSDT) thanks all commenters who submitted comments on the proposed revisions to MOD-026-1. The standard was posted for a 30-day public comment period from September 28, 2012 through October 31, 2012. Stakeholders were asked to provide feedback on the standard and associated documents through a special electronic comment form. There were 45 sets of comments, including comments from approximately 150 different people from approximately 97 companies representing 8 of the 10 Industry Segments as shown in the table on the following pages.

All comments submitted may be reviewed in their original format on the standard's project page.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Mark Lauby, at 404-446-2560 or at mark.lauby@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

Summary Consideration

The majority of commenters agreed with the revisions to Attachment 1 that were made in response to comments in the previous posting. No modifications were made to the draft standard as a result of industry comments for Question 1.

The majority of industry agreed with the revised language to make it clear that technically justified units were limited to units that meet the NERC Registry criteria thresholds and that "technical justification" is defined by demonstrating that the simulated unit or plant response does not match the measured unit or plant response. No modifications were made to the draft standard as a result of industry comments for Question 2.

The following clarifications were made to the standard in response to industry comments:

- Included the term "impedance compensation" to Footnote 1 in the description of what constitutes an excitation control system for synchronous machines.

[1] The appeals process is in the Standard Processes Manual: http://www.nerc.com/files/Appendix_3A_StandardsProcessesManual_20120131.pdf

- The SDT has clarified Section 4.2.4 in the Applicability Section as follows: "A technically justified unit that meets NERC registry criteria but is not otherwise included in the above Applicability sections 4.2.1, 4.2.2, or 4.2.3 and is requested by the Transmission Planner."
- The wording, "… or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities …" in Section 5.1 was moved to right after, "… approved by applicable regulatory authorities …" And that same wording was moved to right after, "… following applicable regulatory approval …" in Sections 5.2 to 5.4. Also, the same phrase was appended to each of the four bullets in the Effective Dates Section, "In those jurisdictions where regulatory approval is required:" of the Implementation Plan right after, "… following applicable regulatory approval ..."
- In the Effective Date section 5.3, the word "thirty" after the word "quarter" was inserted in the standard by mistake. As such, the SDT removed the word "thirty."
- Revised the first sentence in R1 to read: "Each Transmission Planner shall provide the following requested information to the Generator Owner within 90 calendar days of receiving a written request:" Stakeholders believed the previous language was not as clear as it could be, so the GVSDT made this revision.
- The SDT has refined the applicable portion of Part 2.1 to read: "Verification for individual units rated less than 20 MVA (gross nameplate rating) in a generating plant (per Section 4.2.1.2, 4.2.2.2, or 4.2.3.2) may be performed using either individual unit or aggregate unit model(s), or both." This ties the requirement to the applicability of the standard per stakeholder request.
- Refined sub part 2.1.2 to read: "Manufacturer, model number (if available), and type of the excitation control system including, but not limited to static, AC brushless, DC rotating, and/or the plant volt/var control function (if installed)."
- Clarified that the response by the Transmission Planner to the Generator Owner concerning the results of testing the model useability is required to be a written response (R6). Also, for ease of reading, moved the last sentence in the requirement to after the Requirement Parts 1-3.

Index to Questions, Comments, and Responses

1. The GVSDT has revised Attachment 1 based on stakeholder comments. Do you agree with this revision? If not, please explain in the comment area below. 12

2. The GVSDT has revised the Applicability section 4.2.4 to make it clear that it applied to technically justified units that meet the NERC Registry criteria. It is emphasized that “technical justification” is defined by demonstrating that the simulated unit or plant response does not match the measured unit or plant response. Do you agree with these revisions? If not, please explain in the comment area below. 28

3. Do you have any other comment, not expressed in questions above, for the GVSDT? 40

The Industry Segments are:

1 — Transmission Owners

2 — RTOs, ISOs

3 — Load-serving Entities

4 — Transmission-dependent Utilities

5 — Electric Generators

6 — Electricity Brokers, Aggregators, and Marketers

7 — Large Electricity End Users

8 — Small Electricity End Users

9 — Federal, State, Provincial Regulatory or other Government Entities

10 — Regional Reliability Organizations, Regional Entities

1. The GVSDT has revised Attachment 1 based on stakeholder comments. Do you agree with this revision? If not, please explain in the comment area below.

Summary Consideration: The majority of commenters agreed with the revisions to Attachment 1. No modifications were made to the draft standard as a result of industry comments for Question 1.

Organization	Yes or No	Question 1 Comment
ACES Power Marketing Standards Collaborators	No	(1) While the clarity of Attachment 1 has been improved, we noticed a couple of issues. Note 2 provides guidance for early compliance and we agree that early compliance should be allowable. It establishes that 10 year period begins from the transmittal date. If a GO has data that satisfies the early compliance condition for a verified model and that data is a five years old, the Note would appear to allow the GO to transmit the data to the TP and receive credit for next 10 years effectively creating an initial 15-year re-verification cycle. Is this intended? If not, please provide more guidance for how soon the GO would have to re-verify its model. **Response: The intent of Attachment 1 Note 1 is to establish the recurring 10-year unit verification period start date assuming no consideration for early compliance. Consideration for early compliance is addressed in Note 2. This allows early compliance for a 10-year period. The 10-year period begins when model verification is specified to be "complete" per the regional policies, guidelines, or criteria that were in force. If early compliance is sought based on existing verification compliant with the requirements of this standard, as the SDT strove to write the standard such that the "how's" are specified and not the "what's", the modeling expert is expected to responsibly manage the time between the data**

Organization	Yes or No	Question 1 Comment
		used to verify the model and the subsequent verification and the transmittal of the verified model, documentation, and data to the Transmission Planner. (2) Row 3 in Attachment 1 states that it applies to initial verification for a newly applicable unit or for an existing applicable unit with a new excitation or plant volt/var control system. However, Requirement R4 also applies to changes to the controls systems. Wouldn't complete replacement be a change? We recommend modifying Attachment 1 to avoid this overlap. **Response: The SDT feels like the distinction of a complete replacement of an excitation system merits its own row in Attachment 1 as there is no doubt that this would result in the need to verify the model and is applicable to Requirement 2 and not Requirement 4. The SDT believes that we have achieved stakeholder consensus on the current language of the standard.** (3) Per Requirement R4 and Row 5 in Attachment 1 the GO has 180 days to submit a plan to Transmission Planner to verify the model and then another 365 days to perform the model verification date. That would appear to give the GO approximately a year and half to complete the verification for changes (including replacement) to the control system. Requirement R2 and Row 3 appear to require completion of the verification in 365 days or a year. Please modify the table or requirement to clarify appropriate application. **Response: The time lines for Requirements R2 and R4 are different as the Requirements are different. Requirement R4 specifies the need for model verification due to changes to the excitation control system and plant volt/var control function that alter the equipment response characteristic, and allows 180 days to determine if the model needs to be verified or if the submission of updated data is sufficient. Attachment 1**

Organization	Yes or No	Question 1 Comment
		addresses the required periodicity and acceptable time delays to remain compliant (365 days for activities described in R4 assuming for R4 that the Generator Owner decided that they will verify the model). Conversely, R2 specifies the periodic required model verification and thus no time needs to be allotted to determine if the model needs to be verified – as it must be verified at least once every 10 years. Attachment 1 goes on to specify the required time or anniversary date for which verification per R2 is required.
Response: The GVSDT thanks you for your comments. Please see responses above.		
Tennessee Valley Authority	No	1. Attachment 1, Row Number 4, Recommend deleting “at the same physical location” from the Verification condition. The first condition is recommended to read “Existing applicable unit that is equivalent to another unit(s),” Justification is that if a GO has units that are equivalent and meet the “sister” criteria, the standard does not need to be restricted to the same physical location. The GO identical equipment at different physical locations are still equivalent.
Response: The GVSDT thanks you for your comments. The SDT notes the general agreement among industry with using the proxy unit approach. The SDT respectfully maintains that the “same physical location” requirement is necessary since it provides a strong indication of similarity of equipment and settings (which could be verified by the same field personnel during a single site review). For example, a GO/GOP could own/operate otherwise similar equipment physically located in vastly different geographic locations with substantially different Reliability Coordinator or Transmission Operator requirements (e.g., requirement for PSS in-service). To ensure all GO/GOP equipment meets standard intent, the SDT maintains the “same physical location” requirement is necessary.		
Cowlitz PUD	No	Cowlitz supports the comments put together by the NAGF SRT:1. We recommend removing the first element of the logical AND statement of Attachment 1Row 4 (the same physical location element). If a GO has

Organization	Yes or No	Question 1 Comment
		identical equipment at differentphysical locations, they are equivalent. A sister is a sister independent of the physicallocation. As long as the equipment is identical, the concept should be allowed to applyregardless of location. **Response: The SDT notes the general agreement among industry with using the proxy unit approach. The SDT respectfully maintains that the "same physical location" requirement is necessary since it provides a strong indication of similarity of equipment and settings (which could be verified by the same field personnel during a single site review). For example, a GO/GOP could own/operate otherwise similar equipment physically located in vastly different geographic locations with substantially different Reliability Coordinator or Transmission Operator requirements (e.g., requirement for PSS in-service). To ensure all GO/GOP equipment meets standard intent, the SDT maintains the "same physical location" requirement is necessary.** 2. The SDT should consider moving the capacity factor exemption information found inAttachment 1, row 7 into the applicability section. The applicability section should allow anentity to be able to determine if the standard applies to them and be able to determine thescope of the facilities affected. It is best for those impacted to immediately know which unitsare in the scope and not have to realize the scope from a detailed study of the table ofAttachment 1. This would allow row 7 of Attachment 1 to be deleted. **Response: The SDT decided to place all the scenarios that effectively "exempt" otherwise applicable units in Attachment 1 for clarity. The SDT believes that we have achieved stakeholder consensus on the current language of the standard.**
Response: The GVSDT thanks you for your comments. Please see responses above.		

Organization	Yes or No	Question 1 Comment
Wisconsin Electric Power Company	No	In Row 4, the use of 350 MVA as the cutoff for "sister unit" treatment is not reasonable. We propose the limit can be increased to 500 MVA without any adverse reliability impacts. **Response: Based on industry comments in a previous posting, the SDT raised the proxy unit cutoff from 250 MVA to 350 MVA. This cutoff will enable the inclusion of many steam units at sites with multiple and identical CC plants. The SDT believes that it has achieved stakeholder consensus on the current proxy unit MVA threshold.** Also, in Row 5, the allowable time for existing units to be verified following an indication of model problems should be 2 years, rather than 1 year, since existing legacy units may require additional resources to understand and resolve the issues. **Response: The language and timing in Attachment 1 have been vetted through several comment periods. The SDT believes that we have achieved stakeholder consensus on the current language and timing in Attachment 1 of the standard.**
Response: The GVSDT thanks you for your comments. Please see responses above.		
Oncor Electric Delivery Company	No	Oncor does not support the position that the Transmission Planner (TP) is applicable for this standard. In the ERCOT Interconnection, Section 3 and Section 5 of the ERCOT Nodal Operating Guides prescribes the ERCOT ISO to request and receive generation unit performance data, not the TP.Oncor takes the position that a regional variance be granted for the ERCOT Interconnection such that the standard would prescribe that the Planning Authority (PA) only be the only requestor and receiver of unit performance data to support Section 3 and Section 5 of the ERCOT Nodal Operating Guides. **Response: Regarding the responsibilities assigned to the Transmission**

Organization	Yes or No	Question 1 Comment
		Planner in the draft standard, the SDT believes standard language lines up well with the vast majority of entity business practices in effect regarding the interactions between generation and transmission entities when collaborating on generator dynamic models. There are defined NERC processes outside the GV SDT effort where entities can request a regional variance. Alternatively, the Transmission Planner could delegate the responsibility to another such as its Planning Authority.
Response: The GVSDT thanks you for your comments. Please see responses above.		
PPL Corporation NERC Registered Affiliates	No	Since GO's typically do not have in-house expertise, they would either have to hire consultants to perform model verification or develop in-house expertise, including acquiring simulation software. Are such simulated models/software available today for this on the market? If not, has time been built into the implementation schedule for allowing such creation-it does not appear so? **Response: Generator Owners own the equipment. As such, Generator Owners have access to the equipment, along with access to the equipment's Original Equipment Manufacturer for assistance with technical issues. Historically, the Transmission Planner and Generator Owner entities used to work for the same company, but in today's functional model environment, Transmission Planners often work for a different company than the generation entity. As such, the stated access advantages for the generation entity do not transfer to the Transmission Planner.** **Simulation software is available on the market, and there are consultants available with the necessary expertise to develop the required model data. Additionally, the SDT members believe the implementation plan provides ample time to develop the necessary capability. Significant portions of the power system are already performing routine model data**

Organization	Yes or No	Question 1 Comment
		validation. Also, the first element of the logical AND statement of Attachment 1 Row 4 (the same physical location element). If a GO has identical equipment at different physical locations, they are equivalent. Equivalency of units should be independent of the physical location. **Response: The SDT notes the general agreement among industry with using the proxy unit approach. The SDT respectfully maintains that the "same physical location" requirement is necessary since it provides a strong indication of similarity of equipment and settings (which could be verified by the same field personnel during a single site walk down). For example, a GO/GOP could own/operate otherwise similar equipment physically located in vastly different geographic locations with substantially different Reliability Coordinator or Transmission Operator requirements (e.g., requirement for PSS in-service). To ensure all GO/GOP equipment meets standard intent, the SDT maintains the "same physical location" requirement is necessary.**
Response: The GVSDT thanks you for your comments. Please see responses above.		
Independent Electricity System Operator	No	The long periods in Attachment 1 introduce too much risk: the modeling assumptions (used to derive operating security limits and to make other operating and planning decisions) do not reflect the actual performance of equipment. It would be better for the standard not only to establish the maximum period that Transmission Planners and Generators Owners to complete tasks but also to require the Transmission Planners to establish shorter periods when necessary to reduce the risk to reliability to an acceptable level. In Ontario, Generator Owners have 30 days to transmit the verified model, documentation and data to the Transmission Planner. Generator Owners are also required to indicate immediately following testing whether the installed equipment performed as expected. This

Organization	Yes or No	Question 1 Comment
		approach has worked well. New or modified equipment must first pass through a connection assessment process to establish whether expected performance will meet requirements. Emerging from this process is the Generator Owner's conditional right to connect provided he meets an obligation to demonstrate the installed equipment behaves as well as assumed in the assessment process. In this way, the risk to reliability is reduced to an acceptable level as the exposure of the decision making process to flawed modeling assumptions is minimized. Experience in Ontario has shown that units that were expected to have essentially the same performance often show much larger differences than expected when tested. What seems like small or obscure differences to a Generator Owner can be critical to a Transmission Planner. **Response: The time periods in Attachment 1 have been vetted through several comment periods. The SDT believes that we have achieved stakeholder consensus on the current language and time periods in Attachment 1 of the standard.** Row 4 in Attachment 1 should be amended to require the amount of verification on "sister" units to be accepted by the Transmission Planner. **Response: The SDT notes the general agreement among industry with using the proxy unit approach. The SDT respectfully maintains that the "same physical location" requirement provides a strong indication of similarity of equipment and settings (which could be verified by the same field personnel during a single site walk down). The SDG believes that the verification conditions listed in Row 4 Attachment 1 are sufficient to assure that the Generator owner would be aware if there were differences between the units at the same location that would affect the model data.** Attachment 1 Row 4 that allows for new or existing units that does not include an active closed loop voltage or reactive power control function

Organization	Yes or No	Question 1 Comment
		should be changed. Given the size of the "applicable unit" virtually all units should be on voltage control unless specifically permitted by the Transmission Planner as is the case in Ontario. The adverse effects to reliability of not being on voltage control are well documented (Note1). The standard should be changed to put the onus on the Generator Owner of units not operating in voltage control to demonstrate continued operation in this mode does not have a material adverse effect on reliability. The standard should requirespecify the a process available for moving an "applicable unit" to closed loop voltage control when the Transmission Planner determines this is necessary.Note1: J.D. Hurley, L.N. Bize, C.R. Mummert C.R,The Adverse Effects of Excitation System Var and Power Factor Controllers, IEEE Transactions on Energy Conversion, Vol 14, No. 4, December 1999 **Response: The SAR for this draft standard calls for the verification of the generator's excitation system model data. Performance or operational requirements are beyond the scope of this standard. Note that the SDT assumes that you meant to refer to Attachment 1 Row 6, not Row 4.**
Response: The GVSDT thanks you for your comments. Please see responses above.		
Ameren	No	There appears to be a discrepancy between the language in the requirement R4 and its VSL compared to Row 3 of the Attachment 1. In the both requirement and VSL, a 180 day period is stated, while in Row 3 of Attachment 1, a 365 day period is stated.
Response: The GVSDT thanks you for your comments. R4 requires a Generator Owner to provide revised model data or plans to perform model verification within 180 days of changes to the equipment. If the Generator Owner chooses to plan to perform model verification, then when that model verification plan is submitted to the Transmission Planner, then in accordance with Requirement 2, Row 5 of Attachment 1 would specify that the Generator Owner has an additional 365 days to actually perform		

Organization	Yes or No	Question 1 Comment
the verification – including transmitting the verified model, documentation, and data to the Transmission Planner.		
Southern Company	No	We recommend removing the first element of the logical AND statement of Attachment 1 Row 4 (the same physical location element). If a GO has identical equipment at different physical locations, they are equivalent. A sister is a sister independent of the physical location. As long as the equipment is identical, the concept should be allowed to apply regardless of location. **Response: The SDT notes the general agreement among industry with using the proxy unit approach. The SDT respectfully maintains that the "same physical location" requirement is necessary since it provides a strong indication of similarity of equipment and settings (which could be verified by the same field personnel during a single site review). For example, a GO/GOP could own/operate otherwise similar equipment physically located in vastly different geographic locations with substantially different Reliability Coordinator or Transmission Operator requirements (e.g., requirement for PSS in-service). To ensure all GO/GOP equipment meets standard intent, the SDT maintains the "same physical location" requirement is necessary.** The SDT should consider moving the capacity factor exemption information found in Attachment 1, row 7 into the applicability section. The applicability section should allow an entity to be able to determine if the standard applies to them and be able to determine the scope of the facilities affected. It is best for those impacted to immediately know which units are in the scope and not have to realize the scope from a detailed study of the table of Attachment 1. This would allow row 7 of Attachment 1 to be deleted. **Response: The SDT decided to place all the scenarios that effectively "exempt" otherwise applicable units in Attachment 1 for clarity. The SDT**

Organization	Yes or No	Question 1 Comment
		believes that we have achieved stakeholder consensus on the current language of the standard.
Response: The GVSDT thanks you for your comments. Please see responses above.		
Cogentrix Energy	No	We recommend removing the first element of the logical AND statement of Attachment 1Row 4 (the same physical location element). If a GO has identical equipment at different physical locations, they are equivalent. A sister is a sister independent of the physical location. As long as the equipment is identical, the concept should be allowed to apply regardless of location. **Response: The SDT notes the general agreement among industry with using the proxy unit approach. The SDT respectfully maintains that the "same physical location" requirement is necessary since it provides a strong indication of similarity of equipment and settings (which could be verified by the same field personnel during a single site review). For example, a GO/GOP could own/operate otherwise similar equipment physically located in vastly different geographic locations with substantially different Reliability Coordinator or Transmission Operator requirements (e.g., requirement for PSS in-service). To ensure all GO/GOP equipment meets standard intent, the SDT maintains the "same physical location" requirement is necessary.** The SDT should consider moving the capacity factor exemption information found in Attachment 1, row 7 into the applicability section. The applicability section should allow an entity to be able to determine if the standard applies to them and be able to determine the scope of the facilities affected. It is best for those impacted to immediately know which units are in the scope and not have to realize the scope from a detailed study of the table of Attachment 1. This would allow row 7 of Attachment 1 to be deleted.

Organization	Yes or No	Question 1 Comment
		Response: The SDT decided to place all the scenarios that effectively "exempt" otherwise applicable units in Attachment 1 for clarity. The SDT believes that we have achieved stakeholder consensus on the current language of the standard.
Response: The GVSDT thanks you for your comments. Please see responses above.		
ISO-New England	No	Row 3 requires model transmittal "within 365 calendar days after commissioning the unit". It is not acceptable in terms of system reliability for a large unit to be operating on the system for 365 days after commissioning without a verified model. FERC approved ISO Tariff language also calls for provision of the model prior to Commercial Operation. The standard would not meet the requirements of the Tariff. Row 7 discusses capacity factor. The capacity factor reference has been removed from the requirements. If the capacity factor is still to be used this is unacceptable from a reliability standpoint. Large generators that have a low capacity factor will be required to operate under extreme conditions when the system is most stressed. A verified model should be provided regardless of capacity factor given this consideration.
Response: The GVSDT thanks you for your comments. This standard addresses model verification, not the submittal of preliminary design models. Model verification can occur only after the equipment is installed. The standard does not address development of the original model during the equipment commissioning process. As discussed in the Comment Form with the first posting of the draft MOD-026 standard, the SDT considered the extent of the facilities to be verified and how to reflect this in the "applicability" of this proposed standard. As a basis, the SDT recognized that the excitation system models and model data are already collected through the processes identified in MOD-012 and MOD-013. These models and data should, with few exceptions, already result in a quality dynamics database. However, as confirmed through the Field Test, performing the activities specified in the draft standard is expected to result in an improvement of the accuracy of the exciter models used in dynamic simulations. Utilizing engineering judgment, based in part on recent entity experiences in verifying excitation system models, the SDT is		

Organization	Yes or No	Question 1 Comment
proposing to require verification of excitation systems associated with 80% or greater of the connected MVA per Interconnection. Therefore, specific MVA thresholds corresponding to 80% of connected MVA or greater for each Interconnection are proposed. It is recognized that certain boundaries within an interconnection, such as BA boundaries, may have more or less than 80% of the connected MVA. **The SDT further believes that a minimum unit interconnection of >100 kV, consistent with the Compliance Registry Guideline, is appropriate. Finally, the SDT believes that the standard should apply to units with a capacity factor such that they are on-line 400 hours or greater a year. The SDT believes that these thresholds will result in substantial accuracy improvement to the excitation models and associated Reliability based limits determined by dynamic simulations, while not unduly mandating costly and time consuming verification efforts. Footnote 4 (footnote 2 in the current draft) is intended to allow the Transmission Planner to request model information, possibly leading to model verification, for units which fall within the NERC Compliance Registry but are not of the base Applicability of this proposed standard.** **Also, the SDT does recognize that Regional variances can be considered if a Region desires to include additional unit MVA in this standard.**		
FirstEnergy	Yes	Although FirstEnergy (FE) agrees with the revision to Attachment 1, we feel that the capacity factor calculation in Row 7 should be a part of Applicability section 4.2 Facilities. The reader of the standard shouldn't have to get to the last row of an attachment to determine as to whether a unit is exempt or not.
Response: The GVSDT thanks you for your comments. The SDT decided to place all the scenarios that effectively "exempt" otherwise applicable units in Attachment 1 for clarity. The SDT believes that we have achieved stakeholder consensus on the current language of the standard.		
Texas Reliability Entity	Yes	As TRE stated in previous comment periods to the standard, we disagree with using the 5% capacity factor (Attachment 1, Row 7) to determine which units need to comply with this Standard. The requirements should apply to all generating units meeting the MVA thresholds, regardless of capacity factor. We recognize this is somewhat alleviated by Requirement

Organization	Yes or No	Question 1 Comment
		R5, which now provides a method for the TP to request a model verification for a unit that has less than 5% net capacity factor if the unit's simulated response fails to match its measured response.
Response: The GVSDT thanks you for your comments. The SDT believes that there is negligible reliability to be gained by testing units with capacity factor of less than 5%. The added cost of testing is not justified. As you have noted, R5 does provide a method for TP to request model verification for a unit if the simulated response fails to match the measured response. The SDT believes that we have achieved stakeholder consensus on the current language of the standard.		
Idaho Power Company	Yes	Idaho Power System Planning agrees with the revisions made to Attachment 1.Idaho Power Generator Owner- Suggest that "commissioning date" due date requirements be changed to "commercial operation date" to be consistent with other standards.
Response: The GVSDT thanks you for your comments. The language in Attachment 1 has been vetted through several comment periods. The SDT believes that we have achieved stakeholder consensus on the current language of the standard.		
Duke Energy	Yes	We recommend removing the first element of the logical AND statement of Attachment 1 Row 4 (the same physical location element). If a GO has identical equipment at different physical locations, they are equivalent. Equivalency of units is independent of the physical location.
Response: The GVSDT thanks you for your comments. The SDT notes the general agreement among industry with using the proxy unit approach. The SDT respectfully maintains that the "same physical location" requirement is necessary since it provides a strong indication of similarity of equipment and settings (which could be verified by the same field personnel during a single site review). For example, a GO/GOP could own/operate otherwise similar equipment physically located in vastly different geographic locations with substantially different Reliability Coordinator or Transmission Operator requirements (e.g., requirement for PSS in-		

Organization	Yes or No	Question 1 Comment
service). To ensure all GO/GOP equipment meets standard intent, the SDT maintains the "same physical location" requirement is necessary.

Georgia Transmission Corporation	Yes	

2. **The GVSDT has revised the Applicability section 4.2.4 to make it clear that it applied to technically justified units that meet the NERC Registry criteria. It is emphasized that "technical justification" is defined by demonstrating that the simulated unit or plant response does not match the measured unit or plant response. Do you agree with these revisions? If not, please explain in the comment area below.**

Summary Consideration: The majority of industry agreed with the revised language to make it clear that technically justified units were limited to units that meet the NERC Registry criteria thresholds and that "technical justification" is defined by demonstrating that the simulated unit or plant response does not match the measured unit or plant response. No modifications were made to the draft standard as a result of industry comments for Question 2.

Organization	Yes or No	Question 2 Comment
Tennessee Valley Authority	No	1. The GVSDT had good intentions by having a very short requirement. However, I am not sure what the intent is. A few more descriptive words would help greatly.
Response: Thank you for your review. Please note that the modification of language was made to the Applicability section.		
Exelon Corporation and its affiliates	No	Applicability Section 4.2.4 currently states "A technically justified2 unit that meets NERC registry criteria and is requested by the Transmission Planner." With the reference footnote stating "Technical justification is achieved by the Transmission Planner demonstrating that the simulated unit or plant response does not match the measured unit or plant response."This intended applicability is confusing and implies that the Transmission Planner has the discretion to decide applicability if a previously exempted unit does not meet Transmission Planner decided criteria. Exelon suggests that this be deleted in its entirety. If the GVSDT intent is to pull in other generating units below the MVA threshold criteria based on Transmission Planner discretion, then that should be factored into Applicability Sections 4.2.1 through 4.2.3. In addition, if Section 4.2.4 is also written to negate an exemption based on Transmission Planner discretion then that provision should be factored into

Organization	Yes or No	Question 2 Comment
		Attachment 1 and not into the applicability section.
Response: The GVSDT thanks you for your comment. The associated Requirement R5 does allow the TP a means to pursue additional model information if the model's predicted response does not match the actual equipment response. The SDT believes this is a reasonable way to allow the TP to pursue model information in the rare instances where there is an issue with a model that is not part of the base applicability. Additionally, the SDT has clarified Section 4.2.4 in the Applicability Section as follows: "A technically justified unit that meets NERC registry criteria but is not otherwise included in the above Applicability sections 4.2.1, 4.2.2, or 4.2.3 and is requested by the Transmission Planner."		
ACES Power Marketing Standards Collaborators	No	Because NERC and the Regional Entities do not maintain a public list of units that meet the "NERC registry criteria," it is impossible for the Transmission Planner to know for which set of units it may submit a technical justification per R5 and applicability section 4.2.4. The NERC ROP Appendix 5B, Statement of Compliance Registry criteria III.c.1, III.c.2 and III.c.3 each represent fairly "bright lines," where the TP can deduce which units meet these criteria. However, criterion III.c.4 is amorphous and notes on the page 11 of the document give NERC flexibility to deviate from the criteria anyway. Thus, we request that the drafting team either clarify that the "NERC registry criteria" in applicability section 4.2.4 is intended to mean criteria III.c.1, III.c.2 and III.c.3 in section III(c) of Appendix 5B - Statement of Compliance Registry Criteria or that the SDT work with NERC staff to determine how the TP may get a list of units that meet criterion III.c.4 and Note 1.
Response: The GVSDT thanks you for your comment. The intent of the verbiage is that all four criteria (III.c.1, III.c.2, III.c.3, and III.c.4) apply in combination with proof that the unit actual response does not match the model predicted response. In order to find out if a unit that is not otherwise meets the thresholds of III.c.1 – III.c.3 is included (per III.c.4), the team suggests that the applicable Transmission Planner can either check with the Region or NERC.		
Cowlitz PUD	No	Cowlitz is unsure if it is possible to accurately model generation such that modeling software will be able to predict actual plant response to a disturbance. The Standard may create a never ending circle of requests from the TP for improved modeling data. Cowlitz understands that modeling software is still in its infancy, and

Organization	Yes or No	Question 2 Comment
		more research and testing is needed to explore the boundaries between achievable modeling and where unrealistic goals exist.
Response: The GVSDT thanks you for your comment. Excitation control system model verification is well established and documented. Some of those documents are referenced in Section G of the standard, including IEEE 421.2 Guide for Identification, Testing, and Evaluation of the Dynamic Performance of Excitation Control Systems. The acceptable models referenced in Requirement 1 will predominately consist of standard library models included in software manufacturer dynamic simulation packages and are well known and understood – many are models developed by IEEE. Information on the transmission system beyond the point of interconnection is not required. EPRI has developed software which supports non invasive ambient monitoring for model verification that is successfully being used by a number of entities. Other developers have also developed similar software. While it is true that many generators do not currently have necessary expertise, this expertise can be developed or hired. Proper software can be purchased to analyze the modeled response – utility grade dynamic simulation software used by Transmission Planners for regional and inter-regional studies does not have to be purchased. This standard has already undergone a NERC field test in the Summer of 2007 – one of the conclusions was that performing the activities specified in the draft standard will improve accuracy of the exciter model used in dynamic simulation. Entities from four regions participated, and all successfully completed the field test which validated that performing the activities specified in the draft standard will improve accuracy of the exciter model used in dynamic simulation.		
PPL Corporation NERC Registered Affiliates	No	It appears that without the word "and" in 4.2.4, this criterion of using NERC registration criteria would "trump" all the other interconnection requirements above. But, with the word "and" it indicates that any of the smaller registered units or blackstart resources would only be included in this standard if the Transmission Planner requires. The term “technically justified” in para. 4.2.4 on p.3 and in R5 is too vague, in that the degree of actual-vs-predicted mismatch triggering MOD-026-1 applicability is not specified. It is also not clear how this comparison is to be made if the Facility did not have to provide a MOD-026 model in the first place. In any event the wording of the R5 Violation Severity Levels should be modified to start the clock only after agreement has been reached that a request is technically justified.
Response: The GVSDT thanks you for your comment. The associated Requirement R5 does allow the TP a means to pursue		

Organization	Yes or No	Question 2 Comment
additional model information if the model's predicted response does not match the actual equipment response. Models do exist for these units through the processes defined in MOD-012 and 013, though they may not have been verified. The SDT believes this is a reasonable way to allow the TP to pursue model information in the rare instances where there is an issue with a model that is not part of the base applicability. Regarding the desire for criteria for mismatch, the standard states "what is required" but not "how to accomplish what is required." The SDT considered ways to quantify a method for evaluating how well the equipment's measured response matches the model's predicted response for this and other requirements. However, a generally accepted technique or criteria for making this quantitative assessment does not exist. The SDT believes use of the term "match" is appropriate because the Webster's dictionary defines "match" as something that is equal or similar to another. The SDT believes the existing wording of the VSL for R5 regarding when the clock starts is fair for all stakeholders and provides a well-defined and measurable initiation point. Also, the SDT believes that the activities described in R5 will rarely occur. One reason why this will rarely occur is because the only units that could be subjected to this requirement are those which are above the thresholds in the NERC Registry Criteria but are below the thresholds specified in the Applicability (Section 4). When they do occur, if the Transmission Planner obtains the recording of an event and subsequently perform a post mortem analysis and the results show that the response of the actual equipment does not match the predicted response of the model, the SDT believes that there will be no doubt that the unit fits the requirement of being declared "technically justified." If a fundamental error occurs that is discovered in the process, then the Transmission Planner will have no choice but to promptly remove their request (i.e., as there is not sustainable evidence that the unit meets the "technically justified" criteria).		
Oncor Electric Delivery Company	No	Oncor does not support the position that the TP is applicable for this standard. In the ERCOT Interconnection, Section 3 and Section 5 of the ERCOT Nodal Operating Guides prescribes the ERCOT ISO to request and receive generation unit performance data, not the TP. For MOD-026-1 Section 4.2.4, Oncor takes the position that it is the decision of the PA not the TP who determines the basis for NERC applicability.Oncor takes the position that a regional variance be granted for the ERCOT Interconnection such that the applicability determination in Section 4.2.4, be the responsibility of the PA only be the only requestor and receiver of unit performance data to support Section 3 and Section 5 of the ERCOT Nodal Operating Guides.

Organization	Yes or No	Question 2 Comment
Response: The GVSDT thanks you for your comments. Regarding the responsibilities assigned to the Transmission Planner in the draft standard, the SDT believes standard language lines up well with the vast majority of entity business practices in effect regarding the interactions between generation and transmission entities when collaborating on generator dynamic models. There are defined NERC processes outside the GV SDT effort where entities can request a regional variance. Alternatively, the Transmission Planner could delegate the responsibility to another such as its Planning Authority.		
ReliabilityFirst	No	ReliabilityFirst believes there is a major disconnect/flaw between the Applicability Section (4.2. Facilities) and Requirement R2, part 2.1. This major flaw will create confusion on which generating units are required to be verified per the standard. ReliabilityFirst offers the following comments for consideration:1. Requirements R2, Part 2.1 - There is a clear disconnect between the Applicability section of the standard (i.e. individual units/plants greater than 100MVA - Eastern or Quebec Interconnections) and Requirements R2, Part 2.1 which requires"... Verification of an individual unit less than 20 MVA." Based on the Applicability section, units less than 20 MVA are not applicable under this standard. Furthermore, units under 20 MVA do not fall under the NERC Statement of Compliance Registry Criteria as criteria for registration purposes for GOs and GOPs. **Response: The intent of the SDT is to allow the model verification expert to use any combination of individual or aggregate models in the verification of plants. The SDT has modified the applicable portion of Part 2.1 to read: "Verification for individual units rated less than 20 MVA (gross nameplate rating) in a generating plant (per Section 4.2.1.2, 4.2.2.2, or 4.2.3.2) may be performed using either individual unit or aggregate unit model(s) or both."** 2. Applicability Section 4.2. Facilities - ReliabilityFirst thanks the SDT for their justification for the 100 MVA threshold, but still believes that the Applicability should be consistent with the NERC Statement of Compliance Registry Criteria generator thresholds (i.e. 20 MVA or 75 MVA aggregate connected to the BES). Even though the 100 MVA threshold covers 80% of the connected MVA or greater for each Interconnection (in aggregate), depending on the geographic location (within the

Organization	Yes or No	Question 2 Comment
		BES), that value may be much less. For example, if there is a certain load pocket in which the majority of the connected generation is lest that 100 MVA, the dynamic models would not be required to be verified per this standard. Thus not having verified accurate dynamic models for this specific location could hinder the reliability of the BES. ReliabilityFirst recommends changing the Applicability section to be consistent with the NERC Statement of Compliance Registry Criteria generator thresholds (i.e. 20 MVA or 75 MVA aggregate connected to the BES). **Response: As discussed in the Comment Form with the first posting of the draft MOD-026 standard, the SDT considered the extent of the facilities to be verified and how to reflect this in the "applicability" of this proposed standard. As a basis, the SDT recognized that the excitation system models and model data are already collected through the processes identified in MOD-012 and MOD-013. These models and data should, with few exceptions, already result in a quality dynamics database. However, as confirmed through the Field Test, performing the activities specified in the draft standard is expected to result in an improvement of the accuracy of the exciter models used in dynamic simulations. Utilizing engineering judgment, based in part on recent entity experiences in verifying excitation system models, the SDT is proposing to require verification of excitation systems associated with 80% or greater of the connected MVA per Interconnection. Therefore, specific MVA thresholds corresponding to 80% of connected MVA or greater for each Interconnection are proposed. It is recognized that certain boundaries within an interconnection, such as BA boundaries, may have more or less than 80% of the connected MVA.** **The SDT further believes that a minimum unit interconnection of >100 kV, consistent with the Compliance Registry Guidelines, is appropriate. Finally, the SDT believes that the standard should apply to units with a capacity factor such that they are on-line 400 hours or greater a year. The SDT believes that these three applicability thresholds will result in substantial accuracy improvement to the excitation models and associated Reliability-based limits determined by dynamic simulations, while not unduly mandating costly and time consuming verification**

Organization	Yes or No	Question 2 Comment
		efforts. Footnote 4 (footnote 2 in the current draft) is intended to allow the Transmission Planner to request model information, possibly leading to model verification, for units which fall within the NERC Compliance Registry but are not of the base Applicability of this proposed standard. Also, the SDT does recognize that Regional variances can be considered if a Region desires to include additional unit MVA in this standard.
Response: The GVSDT thanks you for your comments. Please see responses above.		
Cogentrix Energy	No	The term "technically justified" in para. 4.2.4 on p.3 and in R5 is too vague, in that thedegree of actual-vs.-predicted mismatch triggering MOD-026-1 applicability is not specified.It is also not clear how this comparison is to be made if the Facility did not have to provide aMOD-026 model in the first place. In any event the wording of the R5 Violation SeverityLevels should be modified to start the clock only after agreement has been reached that arequest is technically justified.
Response: The GVSDT thanks you for your comments. The associated Requirement R5 does allow the TP a means to pursue additional model information if the model's predicted response does not match the actual equipment response. Models do exist for these units through the processes defined in MOD-012 and 013, though they may not have been verified. The SDT believes this is a reasonable way to allow the TP to pursue model information in the rare instances where there is an issue with a model that is not part of the base applicability. Regarding the desire for criteria for mismatch, the standard states "what is required" but not "how to accomplish what is required." The SDT considered ways to quantify a method for evaluating how well the equipment's measured response matches the model's predicted response for this and other requirements. However, a generally accepted technique or criteria for making this quantitative assessment does not exist. The SDT believes use of the term "match" is appropriate because the Webster's dictionary defines "match" as something that is equal or similar to another. **The SDT believes the existing wording of the VSL for R5 regarding when the clock starts is fair for all stakeholders and provides a well-defined and measurable initiation point. Also, the SDT believes that the activities described in R5 will rarely occur. One reason why this will rarely occur is because the only units that could be subjected to this requirement are those which are above the thresholds in the NERC Registry Criteria but are below the thresholds specified in the Applicability (Section 4). Organization	Yes or No	Question 2 Comment
that there will be no doubt that the unit fits the requirement of being declared "technically justified." If a fundamental error occurs that is discovered in the process, then the Transmission Planner will have no choice but to promptly withdraw its request (i.e., as there is not sustainable evidence that the unit meets the "technically justified" criteria).		
Wisconsin Electric Power Company	No	We propose that the requirements for a "technically justified unit" must also include the technical reasons why the unit under consideration is critical to the reliability of the BES.
Response: The GVSDT thanks you for your comment. Regarding provision of a reason the unit is critical to reliability, R5 has undergone several modifications around this point. The SDT believes the existing R5 language strikes the best compromise to equitably satisfy all stakeholders as it allows Transmission Planners a way to request revised model data or a model verification.		
ISO-New England	No	This means that the Transmission Planner can only call for verification following a system event. It is counter to reliability to have to wait for an event to occur to then request verification. The footnote should be revised to include wording for the Transmission Planner to demonstrate an effect on the BES. Certain generators under 100 MVA could affect the BES and with this language verification could then take place.
Response: The GVSDT thanks you for your comments. The associated Requirement R5 does allow the TP a means to pursue additional model information if the model's predicted response does not match the actual equipment response. The SDT believes this is a reasonable way to allow the TP to pursue model information in the rare instances where there is an issue with a model that is not part of the base applicability. **Regarding provision of wording for the Transmission Planner to demonstrate an effect on the BES, R5 has undergone several modifications around this point. The SDT believes the existing R5 language strikes the best compromise to equitably satisfy all stakeholders as it allows Transmission Planners a way to request revised model data or a model verification for models that meet or exceed the NERC registry criteria thresholds but is below the standard's base applicability.**		
FirstEnergy	Yes	1. Although we agree with the footnote definition for "technical justification", we would like the term "match" be replaced with "simulates or represents". We feel

<table>
<tr><th>Organization</th><th>Yes or No</th><th>Question 2 Comment</th></tr>
<tr><td></td><td></td><td>that these terms give more interpretation when comparing.

2. While we agree that a threshold for unit verification is appropriate, we are not clear as to why there would be different threshold for each Interconnection. The SDT should include a Guidelines and Technical Basis section that explains the geographical differences.</td></tr>
<tr><td colspan="3">Response: The GVSDT thanks you for your comments.
1: The SDT believes use of the term “match” is appropriate because the Webster’s dictionary defines “match” as something that is equal or similar to another.
2: The individual unit and aggregate plant ratings used in the applicability section were carefully derived for each Interconnection to capture validation of approximately 80% of the total installed base in that region. The selection of these applicability requirements intend to strike the most reasonable balance between managing the costs to perform tests and validation vs. ultimately assuring that the reliability of the Bulk System is not compromised due to poor models. This concept has been validated through industry comments from prior postings of the draft standard.</td></tr>
<tr><td>Manitoba Hydro</td><td>Yes</td><td>Although Manitoba Hydro agrees with the concept proposed, it is difficult or sometimes impossible to get an exact match between simulated and measured responses. The drafting team should allow for some engineering judgment (for example, if the responses are within 5-10% of each other, the model could be considered to be a reasonable representation).</td></tr>
<tr><td colspan="3">Response: The GVSDT thanks you for your comments. Regarding the use of the term ”match,” there is no explicit requirement for quality of match between test and simulation in the determination of a technically justified unit. Regarding the second half of the comment beginning with a desire for acceptance criteria, the standard states “what is required” but not “how to accomplish what is required.” The SDT considered ways to quantify a method for evaluating how well the equipment’s measured response matches the model’s predicted response for this and other requirements. However, a generally accepted technique or criteria for making this quantitative assessment does not exist.
Finally, in part, the SDT believes use of the term “match” is appropriate because the Webster’s dictionary defines “match” as</td></tr>
</table>

Organization	Yes or No	Question 2 Comment
something that is equal or similar to another.		
Dominion	Yes	Dominion agrees with this change; however, is concerned with the phrase “demonstrating that the simulated unit or plant response does not match the measured unit or plant response.” The use of the word “match” implies that the simulated response and measures response must be exact, when in fact this will not likely be the case. This language in section 4.2.4 (and other sections) should allow for acceptable variation so compliance can be properly achieved and demonstrated.
Response: The GVSDT thanks you for your comments. Regarding the use of the term ”match” to describe the expectations of model verification by the Generator Owner, there is no explicit requirement for quality of match between test and simulation in the determination of a technically justified unit. Regarding the second half of the comment beginning with a desire for acceptance criteria, the standard states “what is required” but not “how to accomplish what is required.” The SDT considered ways to quantify a method for evaluating how well the equipment’s measured response matches the model’s predicted response for this and other requirements. However, a generally accepted technique or criteria for making this quantitative assessment does not exist. **Finally, in part, the SDT believes use of the term “match” is appropriate because the Webster’s dictionary defines “match” as something that is equal or similar to another.**		
Idaho Power Company	Yes	Idaho Power System Planning agrees with the revisions made in Section 4.2.4.Idaho Power Generator Owner- The phrase "units that meet the NERC Registry Criteria" has no meaning, since entities and not units are placed on the NERC registry. In addition, demonstrating that a simulated response does not match a measured response is not sufficient technical justification. Additional, technical justification should include demonstration that the different response materially impacts system studes. Additionally, allowing only one year for submission of test results following a technical justification is unreasonable, 5 or 10 years to match the initial implementation time period is more reasonable from the Generator Owner perspective for appropriately planning and scheduling the outage time and work.
Response: The GVSDT thanks you for your comments. The SDT believes the language regarding units that meet NERC Registry		

Organization	Yes or No	Question 2 Comment
(emphasis) "Criteria" is clear – as criteria is not referring to entities that may (or may not) be required to register in the NERC Registry as a Generator Owner. Regarding provision of a reason the different response materially impacts system studies, R5 has undergone several modifications around this point. The SDT believes the existing R5 language strikes the best compromise to equitably satisfy all stakeholders as it allows Transmission Planners a way to request revised model data or a model verification for models that meet or exceed the NERC registry criteria thresholds but is below the standard's base applicability. Also, the SDT believes one year is sufficient time to verify the model. Online step in voltage tests or ambient monitoring are techniques which do not require unit outages to implement.		
Ingleside Cogeneration LP (Voting entity Occidental Chemical Corporation)	Yes	In general, Ingleside Cogeneration LP believes that a good working relationship between the Generator Owner and Transmission Planner includes a reasonable justification for any request that requires time and expense on the part of the other.
Response: The GVSDT thanks you for your comment.		
Texas Reliability Entity	Yes	Should Blackstart units have a specific inclusion as an "applicable unit", regardless of capacity factor or "technical justification"?
Response: The GVSDT thanks you for your comments. The SDT has not included Blackstart units in the base Applicability.

3. Do you have any other comment, not expressed in questions above, for the GVSDT?

Summary Consideration:

The following modifications were made to the standard in response to industry comments to Question 3:

In the Effective Date section 5.3, the word “thirty” after the word “quarter” was inserted in the standard by mistake. As such, the SDT removed the word “thirty.”

The wording, “… or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities …” in Section 5.1 was moved to right after “approved by applicable regulatory authorities …” And that same wording was moved to right after, “… following applicable regulatory approval …” in Sections 5.2 to 5.4. Also, the same phrase was appended to each of the four bullets in the Effective Dates Section, “In those jurisdictions where regulatory approval is required:” of the Implementation Plan right after, “… following applicable regulatory approval …”

The SDT has clarified Section 4.2.4 in the Applicability Section as follows: “A technically justified unit that meets NERC registry criteria but is not otherwise included in the above Applicability sections 4.2.1, 4.2.2, or 4.2.3 and is requested by the Transmission Planner.”

The SDT has refined the applicable portion of Part 2.1 to read: “Verification for individual units rated less than 20 MVA (gross nameplate rating) in a generating plant (per Section 4.2.1.2, 4.2.2.2, or 4.2.3.2) may be performed using either individual unit or aggregate unit model(s) or both.” This ties the requirement to the applicability of the standard per stakeholder request.

Refined sub part 2.1.2 to read: “Manufacturer, model number (if available), and type of the excitation control system including, but not limited to static, AC brushless, DC rotating, and/or the plant volt/var control function (if installed).”

Clarified that the response by the Transmission Planner to the Generator Owner concerning the results of testing the model useability is required to be a written response (R6). Also, for ease of reading, moved the last sentence in the requirement to after the parts.

Revised the first sentence in R1 to read: “Each Transmission Planner shall provide the following requested information to the Generator Owner within 90 calendar days of receiving a written request.”

Included the term “impedance compensation” to Footnote 1 in the description of what constitutes a excitation control system for synchronous machines.

Organization	Question 3 Comment

Organization	Question 3 Comment
ACES Power Marketing Standards Collaborators	(1) Thank you for modifying the applicability section. It is greatly improved and is much clearer than the previous version. However, we believe there are a few additional minor refinements necessary. First, generators can be and are part of the Bulk Electric System. Thus, we suggest changing “Facilities that are directly connected to the Bulk Electric System (BES)” to “generation Facilities that are part of the Bulk Electric System.” Otherwise, there might be some confusion if the drafting team intends to draw in generators that are not part of the BES. Second, we find the wording “will be collectively referred as an ‘applicable unit’ that meet the following” confusing. We think the intent was to clarify that an applicable unit is one that is part of the BES and meets criteria established in section 4.2.1, 4.2.2, 4.2.3, and 4.2.4. However, we think the inclusion of the “will be collectively referred as an ‘applicable unit’” is superfluous. Because the section is the applicability section, we think this language could be struck for clarity and the applicable units will be understood to mean those that meet the criteria in section 4.2. As an alternative, the drafting team could explain in a footnote what they mean by the term applicable unit. Third, with the two proposed changes, we think the final wording of section 4.2 after the opening clause should be “generation Facilities that are part of the Bulk Electric System (BES) that meet the following criteria:”. **Response: The SDT believe that the term “directly connected to the Bulk Electric System” is appropriate as that is the verbiage used in the Statement of Compliance Registry Criteria. The reason for utilizing the term “applicable unit” is that it is used in other portions of the standard and allows a simple reference to the base Applicability for each Interconnection.** (2) In requirement R2, please change “for each applicable unit” to “for each of its applicable units.” This is the previous wording and is more correct. The current wording literally says that the GO must provide a verified model for each applicable unit including those it does not own. After all any unit that meets applicability criteria including those owned by other GOs would be an applicable unit. **Response: The SDT believe that the use of the phrase “for each applicable unit” being placed in a sentence immediately after the phrase “Each Generator Owner shall provide” clearly conveys the intent that the applicable units being referenced are those which belong to each Generator Owner. Also, note that the term “applicable unit” is defined for the content of this standard in**

Organization	Question 3 Comment
	the Applicability section. (3) Please specify in M1 that a Transmission Planner may also provide an attestation that no such request was received if this is the case. Use of attestation that an event did not occur is established as an acceptable form of evidence in CAN-0030. Furthermore, precedent has been set in the use of attestations in measures in FAC-003-2 M1 and M2. **Response: As you stated, compliance recognizes that an attestation is an acceptable form of evidence. As such, including that in the Measures is repetitive.** (4) We continue to believe that the examples provided in the comment form should be included in the standard. Please create an Application Guidelines or Guidelines and Technical Basis section in the standard and add them. This has become common practice with developing standards. We do not understand why the drafting team would not want to retain such information that helps readers understand the standard and that has already been developed. Furthermore, it would make it easier for commenters to see what has changed in the examples because a red-line of the standard is required. Because the examples were contained in the comment form this time and during the previous posting, it is not easy to deduce the changes because there is no red-line. If the examples are not included in the standard, please provide more explanation than was provided during the last response to comments which was that it is not appropriate to include the examples. We do not understand why it is not appropriate. **Response: The examples provided were for clarification, and the SDT does not believe that all possible scenarios are considered. The SDT does not believe the examples are appropriate for inclusion in the standard itself. Also, the sections that you referred to as being an appropriate location to include the examples are not part of this standard's format. We believe that majority of stakeholders do not have a desire to include these examples in the standard.** (5) We disagree with the need to retain the latest model verification evidence under Requirement R2 and M2. First, this is not consistent with the Section 3.1.4.2 of Appendix 3c to the NERC Rules of Procedure section which states that the audit will cover the period from the day after the last compliance audit to the end date of the current compliance audit. Since the audit cycle for a GO is six years and the model verification period is 10 years, the GO will have to retain data past its prior

Organization	Question 3 Comment
	audit period. Furthermore, the auditor will have already had an opportunity to review the model verification data during the last audit. Presumably, if they did not find any compliance violations, there should not be a need to review this data again. Thus, the data retention should not exceed the six year audit cycle. **The SDT believes that once the recurring 10-year periodicity is established, that the Generator Owner has to maintain records regarding the last verification to be able to demonstrate that they conducted a valid verification within the last 10 years. As written, this follows the Data Retention guidelines. The alternative is to shorten the periodicity to six years. However, as confirmed by industry comments in prior postings, the SDT believe that the 10-year periodicity has overwhelming industry consensus.** (6) How will mothballed units be handled in Attachment 1? If a mothballed unit is returned to service which row in Attachment 1 applies? What if the unit was mothballed before the effective date and returned to service after all stages of the effective dates? What if it was mothballed after an initial verification? How does this affect the next verification date? **Response: If the unit was mothballed before the effective date of the standard, upon coming out of retirements, Row 3 would be applicable. In all cases, after the initial verification, at a minimum, the 10-year periodicity would apply. Thus, if a unit was mothballed for years 5 – 7, the model would still need to be verified with the documentation and data to the Transmission Planner at year 10.**
Response: The GVSDT thanks you for your comments. Please see responses above.	
Ameren	(1)We request that papers listed in the references section of the standard are made readily available on the NERC website. **Response: The papers are readily available as documented in the references. Due to copyright limitations, many of the documents cannot be made available on the NERC website.** (2)There appears to be an extra word “thirty” in both redline and clean versions of the standard under section 5.3 of the Effective Date section of the draft standard.

Organization	Question 3 Comment
	Response: The extra "thirty" has been removed in the current draft of the standard. (3)As we understand, part of R1 is for the Transmission Planner to provide instructions on how to obtain the list of acceptable model types for use in dynamic simulations. In this regard, we ask the SDT if this would preclude the use of user-written models? **Response: The standard does not preclude user written models however the model must be on the list approved by the Transmission Planner.** (4)We still have serious concerns about compliance with new MOD-026-1 while compliance with MOD-012-0 and MOD-013-1 is still in effect. We appreciate the SDT considering our comments on this issue in the last draft, but we still disagree about the potential conflicts for the following reasons:(a)The reporting requirements to comply with MOD-012 are dependent upon the data requirements and reporting procedures put in place by their Regional Entity as mandated by MOD-013. This does not provide consistency across the country. (b)We take data reporting under MOD-012 very seriously and incorporate testing in our program to ensure the data is accurate. Consequently, our reporting and compliance with MOD-012 does involve generator testing on a 5 year basis. (c)Any GO that has implemented a MOD-012 compliance program that involves testing that cannot perfectly synchronize with the 10 year testing in this draft of MOD-026 will have a significant burden in scheduling generator testing to satisfy both standards.(5)We strongly request the SDT seriously consider incorporating the current MOD-012/MOD-013 submittal requirements within MOD-026. This will synchronize the reporting and verification requirements and help minimize the resource burden of compliance with both efforts. At the same time it will create consistency across the country. **Response: MOD-012 and MOD-013 contain data submittal requirements that require submission of the latest dynamic model data for generator, excitation system, voltage regulator, power system stabilizer and turbine-governor. MOD-026 requires model verification including submittal of the verified excitation system dynamic model and data.**
Response: The GVSDT thanks you for your comment. Please see responses above.	
Idaho Power Company	1) Technical Justification of units based solely on a simulated response not matching recorded

Organization	Question 3 Comment
	response is insufficient. Technical Justification needs to include evidence that the difference in response has a material effect on the conclusions of the relevant system studies. **Response: Regarding provision to include evidence that the difference in response has a material effect on the conclusions of the relevant system studies, R5 has undergone several modifications around this point. The SDT believes the existing R5 language strikes the best compromise to equitably satisfy all stakeholders as it allows Transmission Planners a way to request revised model data or a model verification for models that meet or exceed the NERC registry criteria thresholds but is below the standard's base applicability.** 2) Requiring each Transmission Planner to maintain a list of acceptable models, and then requiring Generator Owners to submit data according to those models is unreasonable. The list of acceptable models needs to be at least regional, if not continent-wide. In addition, some required longevity needs to be specified to allow Generator Owners to appropriately plan and perform the verification work. **Response: Since the Transmission Planner is the user of the models, the models must be acceptable to the Transmission Planner in order to be deemed useful. The list of models in the vast majority of the time will be models included in major manufacturer dynamic simulation software vendor libraries and they have a high correlation with other dynamic simulation software vendor model libraries and those developed via IEEE.**
Response: The GVSDT thanks you for your comment. Please see responses above.	
Texas Reliability Entity	1) Considering the proposed new BES definition and the Guidance Document, there may be confusion in determining if a generator is "directly connected" to the BES. Please consider reviewing the language to see if it should instead say "included in" the BES. Note that a BES generator can be connected to the BES by non-BES elements, and arguably not "directly connected" to the BES. See, for example, figures E1-4 and E1-6 in the BES Definition Guidance Document. **Response: The SDT believe that the term "directly connected to the Bulk Electric System" is appropriate as that is the verbiage used in the Statement of Compliance Registry Criteria.** 2) TRE recommends changing to "Planning Authority or Transmission Planner" in the Functional

Organization	Question 3 Comment
	Entities in Section 4.1.2 instead of "Transmission Planner". This change should be duplicated in the requirements. The change may be needed since the Planning Authority or the Transmission Planner may have the responsibility for modeling the generation data provided by the Generator Owners. **Response: The reporting structure of the standard has been vetted through multiple comment periods and the GVSDT believes that the Transmission Planner is the appropriate entity. The GVSDT believes that we have achieved stakeholder consensus on the current language of the standard.** 3) The timelines are generally too long, which will result in stale, incorrect and generic data being utilized in modeling systems. Consider shortening timeframes. **Response: The timelines contained in the standard has been vetted through multiple comment periods and the GVSDT believes that we have achieved stakeholder consensus on the current language of the standard.**
Response: The GVSDT thanks you for your comment. Please see responses above.	
Wisconsin Electric Power Company	1. In 4.2.1.2, the use of the term "directly connected at a common BES bus" suggests that wind farms are not applicable facilities, since wind generators are typically directly connected to a non-BES bus (e.g. 34.5 kv). We suggest that the applicability to wind farms be clarified more explicitly. **Response: The SDT believe that the term "directly connected to the Bulk Electric System" is appropriate as that is the verbiage used in the Statement of Compliance Registry Criteria.** 2. In R1, the present wording allows for the TP to provide only one of the three types of data, even if the GO requested all three. We suggest removing the wording, "one or more of". **Response: Based on your comment, the SDT revised the first sentence in R1 to read: "Each Transmission Planner shall provide the following requested information to the Generator Owner within 90 calendar days of receiving a written request:"** 3. In R1, the present requirement is for the TP to provide instructions to the GO on how to obtain the acceptable models and associated block diagrams and data. We believe that since the TP is very familiar with this data and the GO may not be, it is far simpler and efficient for the TP to provide the

Organization	Question 3 Comment
	actual data on request, not just the instructions on how to obtain it. **Response: Transmission Planners ordinarily have license agreements that do not permit them to provide the block diagrams and data sheets directly to the generator owner. However, the software manufacturers have indicated that they will make accommodations so that Generator Owners without software licenses can receive the block diagrams and data sheets.** 4. In R2.1.1, the GO is required to have documentation comparing the "model response" to the "recorded response", in this case Voltage vs. Time. First, to determine the model response requires the ability to run dynamic studies. Generally the GO does not have the simulation capability or the subject matter experts required to perform dynamic system studies. It would seem that the intent of this requirement is that the GO must expend considerable resources to gain this capability, either internally or by other means. Is this the intent of the SDT? **Response: Excitation control system model verification is well established and documented. Some of those documents are referenced in Section G of the standard, including IEEE 421.2 Guide for Identification, Testing, and Evaluation of the Dynamic Performance of Excitation Control Systems. The acceptable models referenced in Requirement 1 will predominately consist of standard library models included in software manufacturer dynamic simulation packages and are well known and understood – many are models developed by IEEE. Information on the transmission system beyond the point of interconnection is not required. EPRI has developed software which supports non invasive ambient monitoring for model verification that is successfully being used by a number of entities. Other developers have also developed similar software. While it is true that many generators do not currently have necessary expertise, this expertise can be developed or hired - or the Generator Owner can enter into agreements with its Transmission Planner, though the Generator Owner will still be responsible from a compliance perspective. Proper software can be purchased to analyze the modeled response – utility grade dynamic simulation software used by Transmission Planners for regional and inter-regional studies does not have to be purchased.** 5. In R3, the requirements for the written response to the TP need clarification. The term "either" would suggest there are two possible responses. However, there appear to be three possible responses. We suggest there needs to be a 4th possible response option for the GO, for the GO to

Organization	Question 3 Comment
	initiate contact with the TP to schedule a meeting to discuss the technical issues with the model. The necessary collaboration between the GO and TP to understand the model deficiencies will require time, thus may require more than the 90 days to reconcile the model issues. 120 days is suggested. **Response: The SDT believes that the sentence containing the word "either" clearly lists the three written response options afforded to the Generator Owner. Merriam-Webster dictionary defines "either" when used as a conjunction as, "Used as a function word before two or more coordinate words, phrases, or clauses joined usually by or to indicate that what immediately follows is the first of two or more alternatives." The SDT believes that 90 days is sufficient time to for the Generator Owner to discuss model issues with the Transmission Planner. The SDT believes all parties will be equally motivated to work through model verification issues.** 6. In Section 5 Effective Dates: The considerable time and resources needed to get up to speed with model verification suggests there needs to be more time allowed in the earlier phases of the compliance timeline. We suggest using 20 percent in 4 years, 40 percent in 6 years, and 100 percent in 10 years. **Response: The SDT believes the effective dates have been well vetted in previous postings and that we have achieved stakeholder consensus on the current language of the standard.**
Response: The GVSDT thanks you for your comment. Please see responses above.	
Dynegy	1. It's not clear what the difference is between R3 and R5. Suggest combining these into one Requirement. MOD-027-1 which also requires model validation does not have a Requirement similar to R5.2. Requirement 2.1.1 does not state how much of a step change is required when testing the exciter controls. A commonly used step is 2% but this is not clear.
Response: The GVSDT thanks you for your comment. The peer review type activities in R3 are for units which have been verified per the standard, or the verification process is on-going, but there are potential issues regarding that verification process. The associated Requirement R5 does allow the TP a means to pursue additional model information if the model's predicted response does not match the actual equipment response for units that are above the threshold in the current NERC Registry Criteria but	

Organization	Question 3 Comment
	below the standard's base Applicability MVA thresholds. The SDT believes this is a reasonable way to allow the TP to pursue model information in the rare instances where there is an issue with a model that is not part of the base applicability. Additionally, the SDT has clarified Section 4.2.4 in the Applicability Section as follows: "A technically justified unit that meets NERC registry criteria but is not otherwise included in the above Applicability sections 4.2.1, 4.2.2, or 4.2.3 and is requested by the Transmission Planner." Regarding step change magnitude to test the exciter controls, the SDT believes that the method used to verify the model should be determined by those doing the model verification. The testing expert will determine the voltage excursion magnitude to use during testing and other details regarding how to do the test.
Essential Power, LLC	1. The standard is based on the assumption that it is possible to tune the acceptable models cited in R1 such that their predictions will match actual voltage and reactive power responses to system Disturbances. The yet-to-be-defined acceptable models may not be capable of achieving this goal, however, because standard excitation component models are inadequate to predict with high fidelity the generation system response that is the subject of MOD-026-1. Such models do not take into account, for example, equipment thermal capability limitations and the capping of reactive power output to respect aux bus voltage limits. The SDT is therefore asking for a considerable advancement in the excitation modeling state of the art, to be undertaken in parallel by the owners of every generation unit in North America. This is a doubly daunting task in that GOs often do not have any dynamic modeling software or expertise, much less the ability to invent something new, because the present approach to the subject is that GOs just provide the values of input parameters to the TP, which owns and runs models. Independent GOs (i.e. deregulated entities that are not part of a vertically-integrated utility) moreover do not have and cannot obtain information on the system outside the plant battery limits. This circumstance renders them unable to model the plant-T&D interactions associated with Disturbances, and independent GOs may therefore forever remain unable to develop model results that closely match actual Disturbance responses. The approach being taken in MOD-026-1 is consequently viewed as being technically infeasible for the present state of the art as well as unjustified in light of FERC's March 15, 2012 FFT Order to propose specific standards or requirements that should be revised or removed [or not enacted in the first place] due to having little effect on reliability or because of compliance burdens. The SDT should instead collaborate with industry associations (EPRI, IEEE, NAGF), equipment OEMs, and modeling services vendors to develop the right tools for the job, and put the new models through trial runs at several plants. These trials should be limited to data-collection means that can be non-invasively employed

Organization	Question 3 Comment
	(e.g. online voltage step-response tests, low-load rejection during normal stop events), and should lead to definition of specific testing means for definition of specific model parameters. The SDT should then put out for voting a standard requiring TOPs to own and run these models, and requiring GOs to provide them the appropriate input data, developed via the non-invasive means stated above. **Response: Excitation control system model verification is well established and documented. Some of those documents are referenced in Section G of the standard, including IEEE 421.2 Guide for Identification, Testing, and Evaluation of the Dynamic Performance of Excitation Control Systems. The acceptable models referenced in Requirement 1 will predominately consist of standard library models included in software manufacturer dynamic simulation packages and are well known and understood – many are models developed by IEEE. Information on the transmission system beyond the point of interconnection is not required. EPRI has developed software which supports non invasive ambient monitoring for model verification that is successfully being used by a number of entities. Other developers have also developed similar software. While it is true that many generators do not currently have necessary expertise, this expertise can be developed or hired. Proper software can be purchased to analyze the modeled response – utility grade dynamic simulation software used by Transmission Planners for regional and inter-regional studies does not have to be purchased. This standard has already undergone a NERC field test in the Summer of 2007 – one of the conclusions was that performing the activities specified in the draft standard will improve accuracy of the exciter model used in dynamic simulation. Entities from four regions participated, and all successfully completed the field test which validated that performing the activities specified in the draft standard will improve accuracy of the exciter model used in dynamic simulation.** 2. There is presently no definition of the voltage excursion magnitude and intensity or the recording instrumentation sampling rate required for a valid verification event. There are also no specifics regarding how closely the model must match the recorded response or for what period of time, just a requirement that it be deemed “usable” by the TP. The SDT is asking for a blank check, and we cannot agree to regulations for which it is impossible to say at the time of balloting whether or not compliance can be achieved, let alone in a fashion that is justified per the FERC order cited above. Perceived shortcomings in these respects would presumably trigger the Transmission Planner

Organization	Question 3 Comment
	expression of concern described in R3, but it would be better to establish the rules up-front rather than addressing the matter only after a GO has attempted to comply with MOD-026 and been found lacking. It was stated in a 7/29/11 webinar that a signal-to-noise ratio of at least 5:1 is needed for a meaningful validation, but this criterion did not make it into the standard. **Response: The SDT believes that we have achieved stakeholder consensus on the current language of the standard through the previous comment periods. The SDT believes specifying a voltage excursion magnitude is prescriptive. The testing expert will determine the voltage excursion magnitude to use during testing. Also the SDT consciously avoided specifying the quality of match between model and test a) to avoid risk of being over-prescriptive and too restrictive and b) because an industry accepted quantification of "match" does not exist. The focus is solely on "what" is required, not "how" it's done.** 3. The term "rotational inertia" in R2.1.3 should be replaced with "inertia constant (H)," the rotational inertia divided by MVA rating, since this is the parameter of interest for stability studies. Either way, the obligation to conduct testing in this respect should be waived for units having an OEM-developed value and no modifications to the rotating components, since rotational inertia can be identified more precisely via calculation than by clocking a post-trip over speed excursion. **Response: The SDT believes that we have achieved stakeholder consensus on the current language of the standard through the previous comment periods.** 4. The term "technically justified" in para. 4.2.4 on p.3 and in R5 is too vague, in that the degree of actual-vs.-predicted mismatch triggering MOD-026-1 applicability is not specified. It is also not clear how this comparison is to be made if the Facility did not have to provide a MOD-026 model in the first place. In any event the wording of the R5 Violation Severity Levels should be modified to start the clock only after agreement has been reached that a request is technically justified. **Response: The associated Requirement R5 does allow the TP a means to pursue additional model information if the model's predicted response does not match the actual equipment response. Models do exist for these units through the processes defined in MOD-012 and 013, though they may not have been verified. The SDT believes this is a reasonable way to allow the TP to pursue model information in the rare instances where there is an issue with a model that is not part of**

Organization	Question 3 Comment
	the base applicability. Regarding the desire for criteria for mismatch, the standard states "what is required" but not "how to accomplish what is required." The SDT considered ways to quantify a method for evaluating how well the equipment's measured response matches the model's predicted response for this and other requirements. However, a generally accepted technique or criteria for making this quantitative assessment does not exist. The SDT believes use of the term "match" is appropriate because the Webster's dictionary defines "match" as something that is equal or similar to another. **The SDT believes the existing wording of the VSL for R5 regarding when the clock starts is fair for all stakeholders and provides a well-defined and measurable initiation point. Also, the SDT believes that the activities described in R5 will rarely occur. One reason why this will rarely occur is because the only units that could be subjected to this requirement are those which are above the thresholds in the NERC Registry Criteria but are below the thresholds specified in the Applicability (Section 4). When they do occur, if the Transmission Planner obtains the recording of an event and subsequently perform a post mortem analysis and the results show that the response of the actual equipment does not match the predicted response of the model, the SDT believes that there will be no doubt that the unit fits the requirement of being declared "technically justified." If a fundamental error occurs that is discovered in the process, then the Transmission Planner will have no choice but to promptly remove their request (i.e., as there is not sustainable evidence that the unit meets the "technically justified" criteria).** We propose that the requirements for a "technically justified unit" must also include the technical reasons why the unit under consideration is critical to the reliability of the BES. **Response: Regarding provision of a reason the unit is critical to reliability, R5 has undergone several modifications around this point. The SDT believes the existing R5 language strikes the best compromise to equitably satisfy all stakeholders as it allows Transmission Planners a way to request revised model data or a model verification.** 5. The instruction in R4 to notify the TP, "within 180 calendar days of making changes that alter the system response is too vague, despite the attempted clarification in footnote #3, since many activities can have some degree of impact as noted above. Reportable thresholds regarding degree

Organization	Question 3 Comment
	of impact on system response and the expected duration are needed. **Response: The SDT believes that we have achieved stakeholder consensus on the current language of the standard. The SDT believes specifying reportable thresholds for an infinite number of possible permutations is not practical for a standard.** 6. Please add clarifying language to R5 to emphasize that this requirement is addressing units that meet the NERC registry criteria but are smaller than the MVA size specified in the applicability section. **Response: Thank you for pointing out the need to include further clarification. The SDT has clarified Section 4.2.4 in the Applicability Section as follows: "A technically justified unit that meets NERC registry criteria but is not otherwise included in the above Applicability sections 4.2.1, 4.2.2, or 4.2.3 and is requested by the Transmission Planner."** 7. Sub-requirement 2.1.4 is not clear - is this data the model block diagram and its parameters? If so, simply state that. **Response: The phrase "model structure" refers to a block diagram without parameter values, thus the SDT feels like the language in R2.1.4 is clear. The SDT believes that we have achieved stakeholder consensus on the current language of the standard.** 8. We recommend removing the first element of the logical AND statement of Attachment 1 Row 4 (the same physical location element). If a GO has identical equipment at different physical locations, they are equivalent. A sister is a sister independent of the physical location. As long as the equipment is identical, the concept should be allowed to apply regardless of location. **Response: The SDT notes the general agreement among industry with using the proxy unit approach. The SDT respectfully maintains that the "same physical location" requirement is necessary since it provides a strong indication of similarity of equipment and settings (which could be verified by the same field personnel during a single site walk down). For example, a GO/GOP could own/operate otherwise similar equipment physically located in vastly different geographic locations with substantially different Reliability Coordinator or Transmission Operator requirements (e.g., requirement for PSS in-service).**

Organization	Question 3 Comment
	9. The SDT should consider moving the capacity factor exemption information found in Attachment 1, row 7 into the applicability section. The applicability section should allow an entity to be able to determine if the standard applies to them and be able to determine the scope of the facilities affected. It is best for those impacted to immediately know which units are in the scope and not have to realize the scope from a detailed study of the table of Attachment 1. This would allow row 7 of Attachment 1 to be deleted. **Response: The SDT decided to place all the scenarios that effectively "exempt" otherwise applicable units in Attachment 1 for clarity. The SDT believes that we have achieved stakeholder consensus on the current language of the standard.**
Response: The GVSDT thanks you for your comment. Please see responses above.	
Cogentrix Energy	1. The standard is based on the assumption that it is possible to tune the acceptable models cited in R1 such that their predictions will match actual voltage and reactive power responses to system Disturbances. The yet-to-be-defined acceptable models may not be capable of achieving this goal, however, because standard excitation component modelsare inadequate to predict with high fidelity the generation system response that is the subject of MOD-026-1. Such models do not take into account, for example, equipment thermal capability limitations and the capping of reactive power output to respect aux bus voltage limits. The SDT is therefore asking for a considerable advancement in the excitation modeling state of the art, to be undertaken in parallel by the owners of every generation unit in North America. This is a doubly daunting task in that GOs often do not have any dynamic modeling software or expertise, much less the ability to invent something new, because the present approach to the subject is that GOs just provide the values of input parameters to the TP, which owns and runs models. Independent GOs (i.e. deregulated entities that are not part of a vertically-integrated utility)moreover do not have and cannot obtain information on the system outside the plant battery limits. Response: The GVSDT thanks you for your comment. Please see responses above.	
FirstEnergy	1. FE believes that Requirement 6 in an un-necessary requirement that the Transmission Planner must respond within 90 calendar days that the model is usable. The Transmission Planner should only respond if the information is not usable. We suggest that this requirement should be in a negative perspective and offer the following revision:R6. Each Transmission Planner shall notify the Generator Owner within 90 calendar days of receiving the verified excitation control system or plant volt/var control function model information in accordance with Requirement R2 that the model is not usable (see Sub-requirements 6.1 through 6.5), and shall include a technical description if the model is not usable that includes (but not limited to) the following: [Violation Risk Factor: Medium] [Time Horizon: Operations Planning] 6.1. The excitation control system or plant volt/var control function model fails to initialize during a dynamic simulation along with suggested areas for investigation, 6.2. A listing of parameters that fail the Transmission Planner's data checks, 6.3. A no-disturbance simulation fails to result in non negligible transients ("flat line"), 6.4. For an otherwise stable simulation, a disturbance simulation results in the excitation control and plant volt/var control function model exhibiting an under-damped or critically damped response, or otherwise fails the Transmission Planner's stability criteria.6.5. The excitation control system or plant volt/var control function model submitted by the Generator Owner is either a user defined model or a model that is not acceptable for use in the Transmission Planner's Regional Reliability Organization footprint. **Response: The SDT believes that the level of specificity in R6 sub parts is adequate as drafted. Based on your and another commenters input, the SDT agreed that the sentence needed clarification. As such, the SDT decided to break the sentence up, with the first sentence ending at**

Organization	Question 3 Comment
	the next to last use of the word "usable" and we moved that last sentence to after the three criteria. The last sentence now reads: If the model is not usable, the Transmission Planner shall provide a technical description of why the model is not usable. Also, for ease of reading, the SDT moved the last sentence in the requirement to after the parts. 2. For clarity, Requirements 3 and 5 are confusing and seems to be the same. We feel the that R5 can be removed from MOD-026. This will also be consistent with the requirements of MOD-027. **Response: The peer review type activities in R3 are for units which have been verified per the standard, or the verification process is on-going, but there are potential issues regarding that verification process. The associated Requirement R5 does allow the TP a means to pursue additional model information if the model's predicted response does not match the actual equipment response for units that are above the threshold in the current NERC Registry Criteria but below the standard's base Applicability MVA thresholds. The SDT believes this is a reasonable way to allow the TP to pursue model information in the rare instances where there is an issue with a model that is not part of the base applicability. Additionally, the SDT has clarified Section 4.2.4 in the Applicability Section as follows: "A technically justified unit that meets NERC registry criteria but is not otherwise included in the above Applicability sections 4.2.1, 4.2.2, or 4.2.3 and is requested by the Transmission Planner."**
Response: The GVSDT thanks you for your comment. Please see responses above.	
Alberta Electric System Operator (AESO)	1. In section 4.2.2, The AESO considers the existing applicability for model validation to be more appropriate: o Connected to a transmission grid at 60 kV or higher voltage; and o single unit capacity of 10 MVA and larger; or o facilities with aggregate capacity of 20 MVA and larger. **Response: As discussed in the Comment Form with the first posting of the draft MOD-026 standard, the SDT considered the extent of the facilities to be verified and how to reflect this in the "applicability" of this proposed standard. As a basis, the SDT recognized that the excitation system models and model data are already collected through the processes identified in MOD-012 and MOD-013. These models and data should, with few exceptions, already result in a quality dynamics database. However, as confirmed through the Field Test, performing the activities specified in the draft standard is expected to result in an improvement of the accuracy of the**

Organization	Question 3 Comment
	exciter models used in dynamic simulations. Utilizing engineering judgment, based in part on recent entity experiences in verifying excitation system models, the SDT is proposing to require verification of excitation systems associated with 80% or greater of the connected MVA per Interconnection. Therefore, specific MVA and kV thresholds corresponding to 80% of connected MVA or greater for each Interconnection are proposed. The SDT believes that we have achieved stakeholder consensus on the current language of the standard. 2. Requirement R2, the AESO considers the existing validation period of 5 years to be more appropriate. **Response: The SDT believes that re-verification every 5 years is unnecessary. This position is supported by an overwhelming majority of comments received from the industry. As such, the SDT believes that we have achieved stakeholder consensus on the current language of the standard.** 3. Requirement R4, as written it appears owners of generating units that plan to change out the excitation control systems are not required to provided preliminary (design) data to the Transmission Planner only validated data. The AESO does not consider this to be appropriate as this preliminary (design) data should be provided to the Transmission Planner in advance of the change. **Response: This standard addresses model verification, not the submittal of preliminary design models. Model verification can occur only after the equipment is installed. The standard does not address development of the original model during the equipment commissioning process. The SDT believes that we have achieved stakeholder consensus on the current language of the standard.**
Response: The GVSDT thanks you for your comment. Please see responses above.	
ExxonMobil Research and Engineering	A stated purpose of Generator Verification is “to ensure that generator models accurately reflect the generator’s capabilities and operating characteristics.” Modeling behind-the-meter generation based on gross name-plate ratings will not accurately reflect those assets’ capabilities or operating characteristics, and, in fact, may seriously distort BES expansion plans or other modeling scenarios if name-plate ratings are used. Behind-the-meter generation is a misnomer. It is not comparable to utility or merchant generation in which the primary function is to deliver electric energy to the bulk

Organization	Question 3 Comment
	electric system. The primary function of behind-the-meter generation that employs cogeneration or combined heat and power (CHP) systems is to deliver thermal energy (usually in the form of steam) in support of the load's process technology. In the case of industrial loads, the capabilities or operating characteristics of that process are a function of the load's production schedule associated with its products (e.g., chemicals, petroleum, paper, etc.) and independent of conditions on the BES. Any electric power delivered to the BES is a residual by-product of the industrial process and generally a small fraction of the name-plate rating of the generator. Section III.c.4 of the Statement of Compliance Registry Criteria (v.5) and Exclusion E2 of the revised BES definition both recognize this fundamental characteristic of behind-the-meter generation and that is why neither document uses name-plate rating as a useful metric for behind-the-meter generation. The GVSDT is urged to do the same.
Response: The GVSDT thanks you for your comment. The GVSDT has used a subset of the registry criteria to identify applicable Facilities. If a unit meets the sub set of the registry criteria it is obligated to comply with the standard.	
Independent Electricity System Operator	a. No explicit NERC performance requirements for excitation system are a weakness. In Ontario, generating units are required to materially help regulate voltage as the Transmission Planner sets performance requirements for upper and lower ceilings, voltage response time, and stabilizer characteristics. This standard in its present form allows generators to continue to not materially help regulate voltage provided the documentation submitted to Transmission Planner is consistent with this lack of performance. **Response: The SAR for this draft standard calls for the verification of the generator's excitation system model data. Performance or operational requirements are beyond the scope of this standard.** b. In Ontario, experience has been that the models typically used by the Transmission Planner are not commonly employed by Generator Owners. The standard recognizes this in R1 by giving the obligation to the Transmission Planner to provide model block diagrams or data sheets to the Generator Owner. As the Transmission Planner may be unaware of practicable constraints on a unit and the Generator Owner may not be familiar with the reliability models; both parties must reach

Organization	Question 3 Comment
	an accommodation on the details to verify the model. R2 should be changed so the Generator Owner is required to provide a model that has been verified by a method accepted by the Transmission Planner. **Response: The SDT believes that we have achieved stakeholder consensus on the current language of the standard. The SDT believes that the method used to verify the model should be determined by those doing the model verification, and that the transmission planner should only be concerned with the result, which is a correct model for the equipment. The testing expert will determine the voltage excursion magnitude to use during testing and other details regarding how to do the test. Also the SDT consciously avoided specifying the quality of match between model and test a) to avoid risk of being over-prescriptive and too restrictive and b) because an industry accepted quantification of "match" does not exist. The focus is solely on "what" is required, not "how" it's done.** c. The measured performance of the OEL, UEL, stator current limiter or any other automatic control system that alters the behaviour of the excitation system should be part of the Generator Owner submission to the Transmission Planner as limiter performance can affect reliability decisions. No limiter that imposes more restrictive limits than the required short term field and armature current requirements in ANSI/IEEE 50.13 should be implemented without the Transmission Planner's approval. **Response: The SAR for this draft standard calls for the verification of the generator's excitation system model data. Performance or operational requirements are beyond the scope of this standard.** d. The concept of "applicable unit" should be extended to include static var generators and similar devices. All facilities with an excitation control system and more than 100 MVA of capability should fall under this standard. **Response: Static Var generators and other similar devices, such as Synchronous condensers, are not currently addressed in the NERC Registry Criteria. On an MVA capacity basis, the penetration of Synchronous condensers in North America is extremely low. It is common for Transmission Owners to be the owners of synchronous condensers. As such, the peer review draft requirements**

Organization	Question 3 Comment
	would not make sense. Synchronous condensers do not generate real power as a source of revenue so Transmission Owners paying for synchronous condenser installation and maintenance do so for dynamic voltage support; most likely to extend a dynamic voltage security limit. As such, The Transmission Owner is highly motivated to understand and model synchronous condenser dynamic behavior. Based on this understanding the SDT has decided that with the current structure of the Compliance Registry Criteria, if there is a need to develop a Reliability Standard to model the expected behavior of dynamic voltage devices typically owned by Transmission entities, then a more appropriate strategy is to include Synchronous Condensers along with other transmission system dynamic reactive devices (such as SVCs, STATCOMs, etc.) into a separate SAR. e. Changes to the generator (e.g. rewinds or active power output increases) will affect excitation system performance. The standard should require re-testing following other modifications that the Transmission Planner can show with simulations will require modifications to the excitation system to improve reliability. For example, turbine replacements often provide increased active power capability. At higher levels of active power, the excitation system can materially change without coordinated changes to over-excitation limiters. **Response: For the example given, increased active power would require an alteration in the Interconnection Agreement – and similar to a new unit, the transmission entity should be able to dictate terms which state activities that must be completed so that the increase in power can be reliably delivered to the transmission system – including any protection and/or limiter setting changes and any needed re-verification of models. The SDT believes that the vast majority of scenarios that could cause an alteration of excitation control system response changes that should drive a re-verification of models are captured in R4 and the corresponding footnote number 5. The SDT believes that we have achieved stakeholder consensus on the current language of the standard.** f. R2.1 should be amended (see below) to add flexibility to include other practical combinations of units to be used for verification. For example, it can be more practicable to test wind and solar installation one feeder at a time but this is not allowable with the standard in its present form. Each applicable unit's model shall be verified by the Generator Owner using one or more models acceptable to the Transmission Planner. Verification of an individual unit rated less than 20 MVA

Organization	Question 3 Comment
	(gross nameplate rating) may be performed using either an individual unit, a combination of units, or plant aggregate model(s). **Response: The SDT thanks you for your comment. Based on your comment, the SDT has modified the applicable portion of Part 2.1 to read: "Verification for individual units rated less than 20 MVA (gross nameplate rating) in a generating plant (per Section 4.2.1.2, 4.2.2.2, or 4.2.3.2) may be performed using either individual unit or aggregate unit model(s) or both."** g. In Ontario we face resistance when our standards exceed NERC requirements. Would it be possible for the SDT in its response to offer its opinion on elements of our comments that are not incorporated into the next version of this standard? For example, if none of our comments can be adopted into the standard, we would appreciate responses such as: "In the opinion of the SDT, having more applicable units on closed loop voltage control, reducing the time to transmit verified information to the Transmission Planner, having specific excitation performance requirements, expanding verified information to include limiters and other devices that affect excitation system performance, and making the requirements in this standard applicable to wider range of equipment are all practices that will tend to improve reliability." Or "In the opinion of the SDT, the requirements in this standard are not intended to preclude continuing or implementing more stringent Transmission Planner requirements "This type of response would help us to continue to augment continent-wide standards with additional requirements to maintain reliability in our part of the interconnection. **Response: The SDT does believe that the requirements in this standard provide a floor and that individual regions or transmission entities, through venues such as interconnection agreements, can implement more stringent requirements. Unfortunately, the SDT scope is limited to drafting a national standard.** h. We appreciate the SDT's effort to implement our proposed language changes to remove a potential conflict with the Ontario regulatory practice respecting the effective date of implementing approved standards. The added language, unfortunately, was not added at the appropriate places. We suggest the SDT to move the wording " , or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities," in Section 5.1 to right after "approved by applicable regulatory approval", and move that same wording to right after "following applicable

Organization	Question 3 Comment
	regulatory approval" in Sections 5.2 to 5.4.Also, the same phrase should be appended to each of the four bullets in the Section "In those jurisdictions where regulatory approval is required:" of the Implementation Plan right after "following applicable regulatory approval." **Response: We have made the requested edits.**
Response: The GVSDT thanks you for your comment. Please see responses above.	
South Feather Power Project	Applicability section 4.2.2.2 describes an Individual Generating Plant as consisting of multiple generating units that are directly connected at a common BES bus with a total capacity greater than 75 MVA. It would help if there was a proximity element to the definition of "Individual Generating Plant." My question/comment comes from the fact that I have three single unit powerhouses with a combined total capacity greater than 75 MVA connected to a single 115 kV radial line, with several miles of transmission line separating each unit from the other, but the radial line (which is owned by another entity) ultimately terminates at a single (common) point on a BES bus. Attached to this same radial transmission line are a distribution substation and another entity's small hydro plant, so it is not clear how this common point on a BES bus would be characterized.
Response: The GVSDT thanks you for your comment. The SDT believes that the current language is clear. Regarding your specific circumstance, if the three single unit powerhouses are interconnected to a common BES bus with an aggregate capacity greater than specified in the Applicability section for an individual generating plant, then that plant does meet the draft standard's threshold. If the three single unit powerhouses are not connected to a common bus, but are tapped at buses on various locations of the radial line, then their Applicability would be based on the individual unit thresholds in the Applicability section of the draft standard.	
Cowlitz PUD	Cowlitz supports the comments put together by the NAGF SRT:1. The standard is based on the assumption that it is possible to tune the acceptable modelscited in R1 such that their predictions will match actual voltage and reactive powerresponses to system Disturbances. The yet-to-be-defined acceptable models may not becapable of achieving this goal, however, because standard excitation component modelsare inadequate to predict with high fidelity the generation system

Organization	Question 3 Comment
	response that is thesubject of MOD-026-1. Such models do not take into account, for example, equipmentthermal capability limitations and the capping of reactive power output to respect aux busvoltage limits.The SDT is therefore asking for a considerable advancement in the excitation modelingstate of the art, to be undertaken in parallel by the owners of every generation unit in NorthAmerica. This is a doubly daunting task in that GOs often do not have any dynamicmodeling software or expertise, much less the ability to invent something new, because thepresent approach to the subject is that GOs just provide the values of input parameters tothe TP, which owns and runs models.Independent GOs (i.e. deregulated entities that are not part of a vertically-integrated utility)moreover do not have and cannot obtain information on the system outside the plant batterylimits. This circumstance renders them unable to model the plant-T&D interactionsassociated with Disturbances, and independent GOs may therefore forever remain unable todevelop model results that closely match actual Disturbance responses.The approach being taken in MOD-026-1 is consequently viewed as being technicallyinfeasible for the present state of the art as well as unjustified in light of FERC's March 15,2012 FFT Order to propose specific standards or requirements that should be revised orremoved [or not enacted in the first place] due to having little effect on reliability or becauseof compliance burdens.The SDT should instead collaborate with industry associations (EPRI, IEEE, NAGF),equipment OEMs, and modeling services vendors to develop the right tools for the job, andput the new models through trial runs at several plants. These trials should be limited todata-collection means that can be non-invasively employed (e.g. online voltage stepresponsetests, low-load rejection during normal stop events), and should lead to definitionof specific testing means for definition of specific model parameters. The SDT should thenput out for voting a standard requiring TOPs to own and run these models, and requiringGOs to provide them the appropriate input data, developed via the non-invasive meansstated above. **Response: Excitation control system model verification is well established and documented. Some of those documents are referenced in Section G of the standard, including IEEE 421.2 Guide for Identification, Testing, and Evaluation of the Dynamic Performance of Excitation Control Systems. The acceptable models referenced in Requirement 1 will predominately consist of standard library models included in software manufacturer dynamic simulation packages and are well known and understood – many are models developed by IEEE. Information on the**

Organization	Question 3 Comment
	transmission system beyond the point of interconnection is not required. EPRI has developed software which supports non invasive ambient monitoring for model verification that is successfully being used by a number of entities. Other developers have also developed similar software. While it is true that many generators do not currently have necessary expertise, this expertise can be developed or hired. Proper software can be purchased to analyze the modeled response – utility grade dynamic simulation software used by Transmission Planners for regional and inter-regional studies does not have to be purchased. This standard has already undergone a NERC field test in the Summer of 2007 – one of the conclusions was that performing the activities specified in the draft standard will improve accuracy of the exciter model used in dynamic simulation. Entities from four regions participated, and all successfully completed the field test which validated that performing the activities specified in the draft standard will improve accuracy of the exciter model used in dynamic simulation. 2. There is presently no definition of the voltage excursion magnitude and intensity or therecording instrumentation sampling rate required for a valid verification event. There arealso no specifics regarding how closely the model must match the recorded response or forwhat period of time, just a requirement that it be deemed “usable” by the TP. The SDT isasking for a blank check, and we cannot agree to regulations for which it is impossible tosay at the time of balloting whether or not compliance can be achieved, let alone in afashion that is justified per the FERC order cited above.Perceived shortcomings in these respects would presumably trigger the TransmissionPlanner expression of concern described in R3, but it would be better to establish the rulesup-front rather than addressing the matter only after a GO has attempted to comply withMOD-026 and been found lacking. It was stated in a 7/29/11 webinar that a signal-to-noise ratio of at least 5:1 is needed for a meaningful validation, but this criterion did not make itinto the standard. **Response: The SDT believes that we have achieved stakeholder consensus on the current language of the standard. The SDT believes specifying a voltage excursion magnitude is prescriptive. The testing expert will determine the voltage excursion magnitude to use during testing. Also the SDT consciously avoided specifying the quality of match between model and test a) to avoid risk of being over-prescriptive and too restrictive and b) because an industry accepted quantification of “match” does not exist. The focus is solely on “what” is required, not “how” it’s**

Organization	Question 3 Comment
	done. 3. The term "rotational inertia" in R2.1.3 should be replaced with "inertia constant (H)," therotational inertia divided by MVA rating, since this is the parameter of interest for stabilitystudies. Either way, the obligation to conduct testing in this respect should be waived forunits having an OEM-developed value and no modifications to the rotating components,since rotational inertia can be identified more precisely via calculation than by clocking apost-trip over speed excursion. **Response: The SDT believes that we have achieved stakeholder consensus on the current language of the standard.** 4. The term "technically justified" in para. 4.2.4 on p.3 and in R5 is too vague, in that thedegree of actual-vs.-predicted mismatch triggering MOD-026-1 applicability is not specified.It is also not clear how this comparison is to be made if the Facility did not have to provide aMOD-026 model in the first place. In any event the wording of the R5 Violation SeverityLevels should be modified to start the clock only after agreement has been reached that arequest is technically justified. 6. **Response: The associated Requirement R5 does allow the TP a means to pursue additional model information if the model's predicted response does not match the actual equipment response. Models do exist for these units through the processes defined in MOD-012 and 013, though they may not have been verified. The SDT believes this is a reasonable way to allow the TP to pursue model information in the rare instances where there is an issue with a model that is not part of the base applicability. Regarding the desire for criteria for mismatch, the standard states "what is required" but not "how to accomplish what is required." The SDT considered ways to quantify a method for evaluating how well the equipment's measured response matches the model's predicted response for this and other requirements. However, a generally accepted technique or criteria for making this quantitative assessment does not exist. The SDT believes use of the term "match" is appropriate because the Webster's dictionary defines "match" as something that is equal or similar to another.** **The SDT believes the existing wording of the VSL for R5 regarding when the clock starts is fair for all stakeholders and provides a well-defined and measurable initiation point. Also, the SDT**

Organization	Question 3 Comment
	believes that the activities described in R5 will rarely occur. One reason why this will rarely occur is because the only units that could be subjected to this requirement are those which are above the thresholds in the NERC Registry Criteria but are below the thresholds specified in the Applicability (Section 4). When they do occur, if the Transmission Planner obtains the recording of an event and subsequently perform a post mortem analysis and the results show that the response of the actual equipment does not match the predicted response of the model, the SDT believes that there will be no doubt that the unit fits the requirement of being declared "technically justified." If a fundamental error occurs that is discovered in the process, then the Transmission Planner will have no choice but to promptly remove their request (i.e., as there is not sustainable evidence that the unit meets the "technically justified" criteria). 5. The instruction in R4 to notify the TP, "within 180 calendar days of making changes thatalter the system response is too vague, despite the attempted clarification in footnote #3,since many activities can have some degree of impact as noted above. Reportable thresholds regarding degree of impact on system response and the expected duration are needed. **Response: The SDT believes that we have achieved stakeholder consensus on the current language of the standard. The SDT believes specifying reportable thresholds for an infinite number of possible permutations is not practical for a standard.** 6. Please add clarifying language to R5 to emphasize that this requirement is addressing units that meet the NERC registry criteria but are smaller than the MVA size specified in the applicability section. **Response: Thank you for pointing out the need to include further clarification. The SDT has clarified Section 4.2.4 in the Applicability Section as follows: "A technically justified unit that meets NERC registry criteria but is not otherwise included in the above Applicability sections 4.2.1, 4.2.2, or 4.2.3 and is requested by the Transmission Planner."** 7. Sub-requirement 2.1.4 is not clear - is this data the model block diagram and its parameters? If so, simply state that. **Response: The phrase "model structure" refers to a block diagram without parameter values, thus the SDT feels like the language in R2.1.4 is clear. The SDT believes that we have achieved**

Organization	Question 3 Comment
	stakeholder consensus on the current language of the standard.
Response: The GVSDT thanks you for your comments. Please see responses above.	
Exelon Corporation and its affiliates	Exelon again reiterates that the Standard should specifically define the acceptance criteria. The current draft (draft 4) of MOD-026-1 R.3 requires that a Generator Owner provide a written response to its Transmission Planner if the Transmission Planner deems the functional model is not “usable”, if there are technical concerns with the verification documentation, or if the model response did not match the recorded response to a transmission system event. This written response is to contain either the technical basis for maintaining the current model, the model changes, or a plan to perform model verification. It appears from previous comments of the GVSDT that the Generator Owner has final say on the model and the GVSDT has previously responded "that the standard is written so that the Generator Owner “owns’ the model, and as such, even with the peer review process described, the Generator Owner has final say on the voltage excursion used, including sampling rate, for model verification as well as determining if the equipment recorded response satisfactorily matches the model’s predicted response.” While Exelon agrees with this statement; Exelon again requests that this language be clearly articulated within the body of the Standard or that definitive acceptance criteria be added to the Standard.
Response: Thank you for your comment. The SDT believes that we have achieved stakeholder consensus on the current language of the standard. The SDT believes specifying a voltage excursion magnitude is prescriptive. The testing expert will determine the voltage excursion magnitude to use during testing. Also the SDT consciously avoided specifying the quality of match between model and test a) to avoid risk of being over-prescriptive and too restrictive and b) because an industry accepted quantification of “match” does not exist. The focus is solely on “what” is required, not “how” it is done. Finally, the SDT has drafted the standard is such a manner that the Generator Owner is the “owner” of the model.	
American Transmission Company	For Requirement 6, ATC recommends the wording at the end of the requirement to read “that includes how any of the following criteria are not met:” because the existing wording does not express that the criteria are not met when the model is not usable.

Organization	Question 3 Comment
Response: Thank you for your comment. The SDT agreed that the sentence needed clarification. As such, the SDT decided to break the sentence up, with the first sentence ending at the next to last use of the word "usable." The second sentence now reads: The TP will provide a technical description of why the model is not usable.	
CenterPoint Energy	In R6, CenterPoint Energy recommends changing 90 days to 180 days for a Transmission Planner to notify the Generator Owner that a model is usable or is not usable. Such a change will allow time for model verification through the various regional processes for generator data submittals and dynamic planning case building.
Response: Thank you for your comment. The SDT believes that 90 days is sufficient time for the Transmission Planner to notify the Generator Owner, and that we have achieved stakeholder consensus on the current language and timing specification contained in the standard.	
Ingleside Cogeneration LP (Voting entity Occidental Chemical Corporation)	Ingleside Cogeneration LP agrees that the ability for Transmission Planners to effectively model and simulate actual system response to voltage transients can lead to reliability improvements. In addition, the technical veracity and implementation time frames in the latest version of MOD-026-1 are far improved over previous versions. However, we are concerned with the aggregate work load that all five standards in Project 2007-09 will place upon our engineering and operations organizations. Each has its own unique purpose, which means unique processes to support them - as well as test results that demonstrate compliance. With so much uncertainty surrounding this program, we cannot agree to proceed without the following items being addressed:1) All requirements for recurring tests (R2) must contain language that focuses on the strength of the validation process - not the execution. This could be similar to that used in the CIP version 5 standards calling for the Responsible Entity to implement an action "in a manner that identifies, assesses, and corrects deficiencies". Experience has shown that without this preface, auditors will focus on missed due dates, whether or not all check boxes are filled in, and statements showing that every sub-requirement was addressed - even those not applicable to the facility. The CEA's focus needs to be on the entity's commitment to the validation effort, not the documentation.2) The Compliance organization needs to be engaged in the development process so that industry

<table>
<tr><th>Organization</th><th>Question 3 Comment</th></tr>
<tr><td></td><td>stakeholders have a sense of how adherence to the standard will be determined. The existing process is disconnected - leading to inconsistent interpretations of the drafting team's original intent. Other projects have begun to post drafts of the RSAWs concurrently with the standards for exactly this reason. The SDT should take note that these modifications are consistent with the risk-based compliance direction that both NERC and FERC support. The intent is to focus industry and regulatory resources on the reliability aspects of the initiative - not its administrative aspects.</td></tr>
<tr><td colspan="2">Response: The GVSDT thanks you for your comments. Your issues relate to the "Find, Fix and Track" process that was most notably incorporated in the CIP body of standards. For example, CIP-003-5, Requirement R2 states: "Each Responsible Entity for its assets identified in CIP-002-5, Requirement R1, Part R1.3, shall implement, in a manner that identifies, assesses, and corrects deficiencies, one or more documented cyber security policies that collectively address the following topics, and review and obtain CIP Senior Manager approval for those policies at least once every 15 calendar months." This requirement relates to a specific program that addresses a wide range of topics, including documentation of the processes involved. The requirements of MOD-026 are to simply verify the model and provide that model to the Transmission Planner. Under this standard, the responsible entity either performed the verification and reported it or they didn't. There is no inherent program deficiency that can be identified and corrected. The GVSDT does not believe that this approach is applicable to the requirements that we have developed.</td></tr>
<tr><td>Oncor Electric Delivery Company</td><td>Oncor does not support the position that the TP is applicable for this standard. In the ERCOT Interconnection, Section 3 and Section 5 of the ERCOT Nodal Operating Guides prescribes the ERCOT ISO to request and receive generation unit performance data, not the TP. Oncor takes the position that a regional variance be granted for the ERCOT Interconnection such that the standard would prescribe that the PA only be the only requestor and receiver of unit performance data to support Section 3 and Section 5 of the ERCOT Nodal Operating Guides.</td></tr>
<tr><td colspan="2">Response: Thank you for your comment. Regarding the responsibilities assigned to the Transmission Planner in the draft standard, the SDT believes standard language lines up well with the vast majority of entity business practices in effect regarding the interactions between generation and transmission entities when collaborating on generator dynamic models. There are defined NERC processes outside the GV SDT effort where entities can request a regional variance. Alternatively, the Transmission</td></tr>
</table>

Organization	Question 3 Comment
Planner could delegate the responsibility to another such as its Planning Authority	
Southern Company	Please add clarifying language to R5 to emphasize that this requirement is addressing units that meet the NERC registry criteria but are smaller than the MVA size specified in the applicability section. **Response: Thank you for pointing out the need to include further clarification. The SDT has clarified Section 4.2.4 in the Applicability Section as follows: "A technically justified unit that meets NERC registry criteria but is not otherwise included in the above Applicability sections 4.2.1, 4.2.2, or 4.2.3 and is requested by the Transmission Planner."** Sub-requirement 2.1.4 Is not clear - is this data the model block diagram and its parameters? If so, simply state that.SCS agrees with the modifications to the Periodicity Table as they both simplify and clarify the periodicity. **Response: The phrase "model structure" refers to a block diagram without parameter values, thus the SDT feels like the language in R2.1.4 is clear. The SDT believes that we have achieved stakeholder consensus on the current language of the standard. Thank you for your positive comment regarding the modifications to the Periodicity Table.**
Response: Thank you for your comment. Please see responses above.	
Florida Municipal Power Agency	Related to our comment on MOD-025, if synchronous condensers are only owned by TOs, then the excitation system of a synchronous condenser would not be verified in MOD-026 because it is only applicable to GOs. FMPA recommends that synchronous condenser excitation systems should be verified through the same process, and as a result, if a synchronous condenser is owned by a TO, then a TO should have applicability to it only for excitation systems on synchronous condensers it may own.
Response: The GVSDT thanks you for your comment. Synchronous condensers are not currently addressed in the NERC Registry Criteria. On an MVA capacity basis, the penetration of Synchronous condensers in North America is extremely low. It is common for Transmission Owners to be the owners of synchronous condensers. As such, the peer review draft requirements would not make sense. The MOD-025 standard addresses steady state modeling but does not contain peer review requirements so the GVSDT	

Organization	Question 3 Comment
believes incorporating synchronous condensers into the MOD-025 standard is a better fit. Synchronous condensers do not generate real power as a source of revenue so Transmission Owners paying for synchronous condenser installation and maintenance do so for dynamic voltage support; most likely to extend a dynamic voltage security limit. As such, The Transmission Owner is highly motivated to understand and model synchronous condenser dynamic behavior. Based on this understanding the SDT has decided that with the current structure of the Compliance Registry Criteria, if there is a need to develop a Reliability Standard to model the expected behavior of dynamic voltage devices typically owned by Transmission entities, then a more appropriate strategy is to include Synchronous Condensers along with other transmission system dynamic reactive devices (such as SVCs, STATCOMs, etc.) into a separate SAR.	
Manitoba Hydro	Section 2.1.2 - Manitoba Hydro suggests revising the text to read as follows: Manufacturer, model number (if available), and type of excitation control system and the plant volt/var control function (if installed). **Response: Based on your comment, the SDT realized that the sentence could be refined and as such refined the sentence in sub part 2.1.2 read: "Manufacturer, model number (if available), and type of the excitation control system including, but not limited to static, AC brushless, DC rotating, and/or the plant volt/var control function (if installed)."** R2.1.4. - Manitoba Hydro proposes that only the text of "Model structure and data for the excitation control system" is kept. An excitation control system consists of generator and excitation system as per IEEE 421.1 and 421.5. 4.2 – **Response: The SDT believes that we have achieved stakeholder consensus on the current language of the standard. Note that the SDT did add the term "impedance compensation" to Footnote 1 in the description of what constitutes a excitation control system for synchronous machines – the SDT believes that calling out "impedance compensation' is important as determined in its role in previous events.** The language immediately preceding the bullets is unclear (i.e. 'that meet the following' should possibly be reworded as 'provided they meet the following'). **Response: The SDT has modified the applicable portion of Part 2.1 to read: "Verification for individual units rated less than 20 MVA (gross nameplate rating) in a generating plant (per Section**

Organization	Question 3 Comment
	4.2.1.2, 4.2.2.2, or 4.2.3.2) may be performed using either individual unit or aggregate unit model(s) or both." R1 -This requirement would be clearer if rewritten as 'Within 90 calendar days of receiving a written request, each Transmission Owner shall provide to its requesting Generator Owner: **Response: The SDT did modify R1 so that it now reads: Each Transmission Planner shall provide the following requested information to the Generator Owner within 90 calendar days of receiving a written request:** 'General Comment - Manitoba Hydro has a concern with respect to the phased in implementation measured by percent compliance. We believe that this may lead to a potential for some uncertainty and debate. Does a phased in implementation such as this, do anything to increase reliability? **Response: The percentages in the Effective Date section refer to the entity's applicable unit gross MVA for each Interconnection. The SDT believes that the calculation of the percentages will be trivial, and will allow Generator Owners flexibility as compared to a "number " or "percentage" of units approach.**
Response: The GVSDT thanks you for your comment. Please see responses above.	
Northeast Power Coordinating Council	Suggest the SDT specifically identify or show examples of how to match the percentage thresholds outlined in the Effective Date sections of the Standard and the associated Implementation Plans. Given recent experience with other Standards, it would be helpful for the SDT to establish how the entities can demonstrate meeting the requisite threshold percentages. Over time, we have observed that in some cases percentages were established by the number of devices or units; but in other cases, the measurement has been based upon magnitude of nameplate ratings. **Response: The percentages in the Effective Date section refer to the entity's applicable unit gross MVA for each Interconnection. The SDT believes this is a clear designation that the thresholds are determined by the percent of unit gross MVA and not by the number of devices. This does mean that the total applicable unit MVA per Interconnection, as specified in Section 4.2 (Applicability / Facilities) will have to be determined by the Generator Owner. The SDT believes that we have**

Organization	Question 3 Comment
	achieved stakeholder consensus on the current language of the standard.
Response: The GVSDT thanks you for your comment.	
American Electric Power	The SDT should consider either removing MOD-026-1 R5 or merge R3 and R5 because a) MOD-026-1 R3 and R5 appear to have the same objective with similar wording and b) MOD-027-1 does not have the equivalent of MOD-026-1 R5.MOD-026-1 R6 ends with "...that includes the following:" yet whatever the SDT intended to follow is missing. Please note that subparts 1 through 3 are referenced in parenthetical statements within the respective requirements and that it does not make sense that these subpart criteria are also what needs to follow "...that includes the following:"
Response: The GVSDT thanks you for your comment. The peer review type activities in R3 are for units which have been verified per the standard, or the verification process is on-going, but there are potential issues regarding the model. The associated Requirement R5 does allow the TP a means to pursue model information from additional units if the model's predicted response does not match the actual equipment response for units that are above the threshold in the current NERC Registry Criteria but below the standard's base Applicability MVA thresholds. The SDT believes this is a reasonable way to allow the TP to pursue model information in the rare instances where there is an issue with a model that is not part of the base applicability. Additionally, the SDT has clarified Section 4.2.4 in the Applicability Section as follows: "A technically justified unit that meets NERC registry criteria but is not otherwise included in the above Applicability sections 4.2.1, 4.2.2, or 4.2.3 and is requested by the Transmission Planner." A requirement equivalent to MOD-026 R5 is not being proposed for MOD-027-1. It is extremely unlikely that the turbine/governor and load control or active power/frequency control system will contribute to a stability limit. Also, governor response is not consistent from one frequency excursion event to the next. Therefore, the SDT did not feel that such a Requirement in MOD-027-1 was necessary. Regarding the comment for Requirement 6, the SDT agreed that the sentence needed clarification. As such, the SDT decided to break the sentence up, with the first sentence ending at the next to last use of the word "usable." The second sentence now reads: The TP will provide a technical description of why the model is not usable. The SDT believes this will clarify the confusion that you pointed out.	
PPL Corporation NERC Registered Affiliates	The standard is based on the assumption that it is possible to tune the acceptable models cited in R1 such that their predictions will match actual voltage and reactive power responses to system

Organization	Question 3 Comment
	Disturbances. The yet-to-be-defined acceptable models may not be capable of achieving this goal, however, because standard excitation component models are inadequate to predict with high fidelity the generation system response that is the subject of MOD-026-1. Such models do not take into account, for example, equipment thermal capability limitations and the capping of reactive power output to respect aux bus voltage limits. The SDT is therefore asking for a considerable advancement in the excitation modeling state of the art, to be undertaken in parallel by the owners of every generation unit in North America. This is a doubly daunting task in that GOs often do not have any dynamic modeling software or expertise, much less the ability to invent something new, because the present approach to the subject is that GOs just provide the values of input parameters to the TP, which owns and runs models. Independent GOs (i.e. entities that are not part of a vertically-integrated utility) moreover do not have and cannot obtain information on the system outside the plant battery limits. This circumstance renders them unable to model the plant-T&D interactions associated with Disturbances, and independent GOs may therefore forever remain unable to develop model results that closely match actual Disturbance responses. The approach being taken in MOD-026-1 is consequently viewed as being technically infeasible for the present state of the art as well as unjustified in light of FERC's March 15, 2012 FFT Order to propose specific standards or requirements that should be revised or removed [or not enacted in the first place] due to having little effect on reliability or because of compliance burdens. The SDT should instead collaborate with industry associations (EPRI, IEEE, NAGF), equipment OEMs, and modeling services vendors to develop the right tools for the job, and put the new models through trial runs at several plants. These trials should be limited to data-collection means that can be non-invasively employed (e.g. online voltage step-response tests, low-load rejection during normal stop events), and should lead to definition of specific testing means for definition of specific model parameters. The SDT should then put out for voting a standard requiring TOPs to own and run these models, and requiring GOs to provide them the appropriate input data, developed via the non-invasive means stated above. **Response: Excitation control system model is well established and documented. Some of those documents are referenced in Section G of the standard, including IEEE 421.2 Guide for Identification, Testing, and Evaluation of the Dynamic Performance of Excitation Control Systems. The acceptable models referenced in Requirement 1 will predominately consist of standard library**

Organization	Question 3 Comment
	models included in software manufacturer dynamic simulation packages and are well known and understood – many are models developed by IEEE. Information on the transmission system beyond the point of interconnection is not required. EPRI has developed software which supports non invasive ambient monitoring for model verification that is successfully being used by a number of entities. Other developers have also developed similar software. While it is true that many generators do not currently have necessary expertise, this expertise can be developed or hired. Proper software can be purchased to analyze the modeled response – utility grade dynamic simulation software used by Transmission Planners for regional and inter-regional studies does not have to be purchased. This standard has already undergone a NERC field test in the Summer of 2007 – one of the conclusions was that performing the activities specified in the draft standard will improve accuracy of the exciter model used in dynamic simulation. Entities from four regions participated, and all successfully completed the field test which validated that performing the activities specified in the draft standard will improve accuracy of the exciter model used in dynamic simulation. There is presently no definition of the voltage excursion magnitude and intensity or the recording instrumentation sampling rate required for a valid verification event. There are also no specifics regarding how closely the model must match the recorded response or for what period of time, just a requirement that it be deemed “usable” by the TP. Perceived shortcomings in these respects would presumably trigger the Transmission Planner expression of concern described in R3, but it would be better to establish the rules up-front rather than addressing the matter only after a GO has attempted to comply with MOD-026 and been found lacking. It was stated in a 7/29/11 webinar that a signal-to-noise ratio of at least 5:1 is needed for a meaningful validation, but this criterion did not make it into the standard. **Response: The SDT believes that we have achieved stakeholder consensus on the current language of the standard. The SDT believes specifying a voltage excursion magnitude is prescriptive. The testing expert will determine the voltage excursion magnitude to use during testing. Also the SDT consciously avoided specifying the quality of match between model and test a) to avoid risk of being over-prescriptive and too restrictive and b) because an industry accepted quantification of “match” does not exist. The focus is solely on “what” is required, not “how” it’s**

Organization	Question 3 Comment
	done. The term "rotational inertia" in R2.1.3 should be replaced with "inertia constant (H)," the rotational inertia divided by MVA rating, since this is the parameter of interest for stability studies. Either way, the obligation to conduct testing in this respect should be waived for units having an OEM-developed value and no modifications to the rotating components, since rotational inertia can be identified more precisely via calculation than by clocking a post-trip overspeed excursion. **Response: The SDT believes that we have achieved stakeholder consensus on the current language of the standard.** The instruction in R4 to notify the TP, "within 180 calendar days of making changes that alter the system response is too vague, despite the attempted clarification in footnote #3, since many activities can have some degree of impact as noted above. Reportable thresholds regarding degree of impact on system response and the expected duration are needed. **The SDT believes that we have achieved stakeholder consensus on the current language of the standard. The SDT believes specifying reportable thresholds for an infinite number of possible permutations is not practical for a standard.**
Response: The GVSDT thanks you for your comment. Please see responses above.	
Southwest Power Pool Reliability Standards Development Team	There is a problem with the threshold in the standard of 100MVA units. We would suggest that this be in line with the BES DEF and reduce this threshold to 20MVA. Why has the threshold been increased? If the data has to be provided for LGIA under the Tariff then we should be verifying the data. There is also inconsistency between the standards posted for comment I.E. PRC-019-1. We would like to see better consistency for the thresholds between all the standards under this project and with the other projects associated with generator thresholds.
Response: The GVSDT thanks you for your comment. The individual unit and aggregate plant ratings used in the applicability section were carefully derived for each Interconnection to capture validation of approximately 80% of the total installed base in that region. The selection of these applicability requirements intend to strike the most reasonable balance between managing the	

Organization	Question 3 Comment
costs to perform tests and validation vs. ultimately assuring that the reliability of the Bulk System is not compromised due to poor models. It is recognized that boundaries within an interconnection can be drawn that can result in more or less than 80% of the connected MVA. However, R5 allows the TP to request the GO to perform a model review, if the unit is not included in the base Applicability but if that unit which is equal to or greater than the thresholds in the NERC Registry Criteria. **Regarding your comment asking for better consistency for the thresholds between all the standards under the GV SDT effort, each individual standard was developed based on the reliability needs and benefits that each specific standard requires. There are fundamental differences in the types of verifications required under each standard. Therefore, the reliability needs for each standard will not necessarily be the same, nor will the applicable facilities necessarily be the same.**	
Duke Energy	Typo - In the Effective Date section 5.3, strike the word “thirty” after the word “quarter” in the fourth line in the clean version.
Response: The GVSDT thanks you for your comment. The extra “thirty” has been removed in the current draft of the standard.	
Utility Services	Utility Services suggests the SDT specifically identify or show examples of how to match the percentage thresholds outlined in the Effective Date sections of the standard and the associated Implementation Plans. Given our recent experience in other standards, it would be helpful for the SDT to establish how the entities can demonstrate meeting the requisite threshold percentages. Over time, we have observed that in some cases, percentages were established by the number of devices or units; but in other cases, the measurement has been based upon magnitude of nameplate ratings.
Response: The GVSDT thanks you for your comment. The percentages in the Effective Date section refer to the entity’s applicable unit gross MVA for each Interconnection. The SDT believes this is a clear designation that the thresholds are determined by the percent of unit gross MVA and not by the number of units. The SDT believes that we have achieved stakeholder consensus on the current language of the standard.	
NIPSCO	Verification requirements would be burdensome, e.g., model response by staged testing or

Organization	Question 3 Comment
	comparison with a system disturbance may be of only limited value. Another basic problem with this standard is the unnecessary back and forth between generation owners and transmission planners in the data development and collection. This standard could be greatly simplified for all involved parties with reporting requirements similar to MOD-025 where the generation owner provides information to the transmission planner upon the installation of new equipment or the modification of existing equipment. Given the above, Transmission Planning recommends a vote against this standard in its present form.
Response: The GVSDT thanks you for your comment. The SDT believes peer review is an essential part of the model verification process irrespective of criteria or guidelines available from industry since peer review provides the Transmission Planner an opportunity to review the data and identify problems or errors with information provided. This peer review process is not necessary for the validation of unit steady state parameters, but is necessary for dynamic model verification to ensure accurate models that are compatible with dynamic simulation programs. Also, the SDT believes that the recording of the unit's response to a staged open or closed step in voltage test and/or an ambient voltage event is of great value and can be used to verify the model. Note that utilizing ambient monitoring inherently removes the need for any staged testing.	
ReliabilityFirst	VSL Requirement R6 - ReliabilityFirst still believes the VSL for Requirement R6 is not meeting the intent of FERC VSL Guideline #3 "Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement." Requirement R6 clearly requires the Transmission Planners to "...notify the Generator Owner... ", while the corresponding VSL states "The Transmission Planner provided a written response to the Generator Owner indicating..." The VSL is adding additional requirements on the TP (i.e. provide written response) which are not required within the actual requirement (nowhere in R6 is the TP required to provide a written response). If it is the intent of the SDT to have the TP provide a written response, ReliabilityFirst recommends adding that language to the requirement.
Response: The GVSDT thanks you for your comment. The GVSDT has made the requested edit in R6 indicating that the response by the Transmission Planner to the Generator Owner is required to be a written response.	

Organization	Question 3 Comment
PSEG	We voted “Negative” on this standard the reasons shown below.This FIRST COMMENT was provided for MOD-025-1, MOD-026-1, MOD-027-1, and PRC-019-1.1.SYNCHRONOUS CONDENSERS: The GVSDT is not working as a “team” with regards to synchronous condensers owned by TOs. The team working on this standard and PRC-019-1 INSIST that they be included as “applicable facilities,” while the team working on MOD-026-1 has stated otherwise. We provided this comment to the MOD-026-1 team in the last set of comments:”The exclusion of synchronous condensers (and other reactive devices) in MOD-026-1 per the rationale provided in the Background (with which we agree) states “Synchronous condensers are not currently addressed in the NERC Registry Criteria” However, companion standards under Project 2007-09 (MOD-025-2 and PRC-019-1) are applicable to synchronous condensers. The GVSDT should address this inconsistency.”The SDT responded as follows:”The SDT believes that MOD-026 is different from the other standards with respect to synchronous condensers due to the complex interaction required between the Transmission Planner and the Generator Owner, and thus believes it better to wait for efforts by others to define where synchronous condensers fit in the functional model.”In response to a similar comment on MOD-025-2 and PRC-019-1, we received these responses:MOD-025-1: “The GVSDT thanks you for your comment. There was overwhelming industry support (approximately 96%) for inclusion of synchronous condensers at the first posting of MOD-025-2. The Definition of Bulk Electric System (BOT Adoption Jan 2012) includes in “I5 - Static or dynamic devices (excluding generators) dedicated to supplying or absorbing Reactive Power that are connected at 100 kV or higher, or through a dedicated transformer with a high-side voltage of 100 kV or higher, or through a transformer that is designated in Inclusion I2.”PRC-019-1: “The SDT feels that it is appropriate to include synchronous condensers because of their similarity to generators in terms of dynamic reactive power supply, voltage control, disturbance response, control functions, and protection systems. For this reason the SDT proposes to apply to the standard to similar size generators and synchronous condensers.”We need to see “one” statement from the SDT on the inclusion or exclusion of synchronous condensers that makes sense technically, and soon.This **Response: The GVSDT is indeed working as a “team” with these standards. Each individual standard was developed based on the reliability needs and benefits that each specific standard requires. There are fundamental differences in the types of verifications required under each standard. Therefore, the reliability needs for each standard will not necessarily be the same, nor**

Organization	Question 3 Comment
	will the applicable facilities necessarily be the same. Given the response by industry in a prior posting, the GVSDT concludes that stakeholder consensus has been achieved with respect to not including synchronous condensers in the current draft of MOD-026, given the qualifications that follow: **Synchronous condensers are not currently addressed in the NERC Registry Criteria. On an MVA capacity basis, the penetration of Synchronous condensers in North America is extremely low. It is common for Transmission Owners to be the owners of synchronous condensers. As such, the peer review draft requirements would not make sense. The MOD-025 standard addresses steady state modeling but does not contain peer review requirements so the GVSDT believes incorporating synchronous condensers into the MOD-025 standard is a better fit. Synchronous condensers do not generate real power as a source of revenue so Transmission Owners paying for synchronous condenser installation and maintenance do so for dynamic voltage support; most likely to extend a dynamic voltage security limit. As such, The Transmission Owner is highly motivated to understand and model synchronous condenser dynamic behavior. Based on this understanding the SDT has decided that with the current structure of the Compliance Registry Criteria, if there is a need to develop a Reliability Standard to model the expected behavior of dynamic voltage devices typically owned by Transmission entities, then a more appropriate strategy is to include Synchronous Condensers along with other transmission system dynamic reactive devices (such as SVCs, STATCOMs, etc.) into a separate SAR.** SECOND COMMENT was provided for MOD-025-1, MOD-026-1, MOD-027-1, and PRC-024-1.2.DATA SHARING POLICY: For all of the MOD standards in this, only Transmission Planners are the recipient of the data developed. We asked that the standard require that the TP be required to share the data with others. The response we received is that the Functional Model requires the TP to share data with the TOP. Unfortunately, the Functional Model is unenforceable. We note that in PRC-024-1, R6 requires the GO to share its data with the RC, PC, TOP, and TO, upon request. Unless the same data is shared across all "modelers," the result will be outdated data in someone's model, which can have a bad result. The team should have one broad "data sharing" policy in the three MOD standards and PRC-024-1. Since the TP receives data in three of the standards, we suggest this language or similar language: The GO shall provide data to its TP within 60 days of its development [describe the data]. The TP shall provide the same data to any RC, PC, TP, or TOP within 60 days of

Organization	Question 3 Comment
	receiving a request for **Response: The GVSDT has written the requirements of this body of standards based on the NERC Reliability Functional Model. The requirements of Reliability Standards MOD-010-0. MOD-011-0, MOD-012-0 and MOD-013-1 address the requirement for steady state and dynamic models (which are planning models) and the dissemination of these models to appropriate entities. The data to build Real-time models that are necessary for reliability and used by Reliability Coordinators and Transmission Operators are addressed in standards IRO-010-1a and TOP-003-2 respectively. The GVSDT does not see any reason to include duplicative requirements in this standard.**
Response: The GVSDT thanks you for your comment. Please see responses above.	
ISO-New England	Requirement R1 may bring out some concern over the copyrighted models supplied by the simulation software vendors. Hopefully this can be worked out with the vendors. **Response: The software manufacturers have indicated that they will make accommodations so that generator owners without software licenses can receive the block diagrams and data sheets.** Requirement R2.1.3 should indicate the requirement for the total combined *turbine*/generator inertia constant. Simulations need to study the combined inertia of the turbine and generator not just the generator. **Response: The SDT believes that the term used in the draft standard, total rotational inertia, clearly conveys that it is the entire inertia that is connected to the shaft driving both the turbine and the generator and any other mass.** A requirement R2.1.7 should be added to require verification of generator excitation limiter settings. **Response: The SDT believes that the specificity in Part 2.1.3 includes any model data that is relevant to the verification of the excitation control system.** A requirement R2.1.8 should be added to require verification of supplementary voltage control inputs. **Response: The SDT believes that the specificity in Part 2.1.3 includes any model data that is**

Organization	Question 3 Comment
	relevant to the verification of the excitation control system Requirement R3 only requires a "written response" from a Generator Owner to the Transmission Planners notification that a model is not useable. Wording must be included so that ultimately the Generator Owner shall provide a "usable model" to the Transmission Planner. **Response: Requirement R3 is a "peer review" type requirement to ensure cooperation between the Generator Owner and the Transmission Planner. The SDT believes peer review is an essential part of the model verification process since the peer review provides the Transmission Planner an opportunity to request the Generator Owner to review the data and assist in identifying problems or errors with information provided. The SDT believes that all entities will be equally motivated to resolve model issues. This process was over whelming supported by Industry based on their responses in prior postings.** Requirement R4 must be modified so that models are provided prior to making changes in the excitation control system or plant volt/var control function. It is counter to system reliability to allow generators to modify and subsequently operate equipment without notifying the Transmission Planner. **Response: This standard addresses model verification, not the submittal of preliminary design models. Model verification can occur only after the equipment changes are implemented. The standard does not address development of the original model during the equipment commissioning process. The SDT believes that we have achieved stakeholder consensus on the current language of the standard.** Footnote 6 should be modified to include ability for the Transmission Planner to require a verified model from a generator under the size threshold if the generator impacts the BES. **Response: Regarding provision of a reason the unit impacts the BES, R5 and Footnote 6 have undergone several modifications around this point. The SDT believes the existing R5 and Footnote 6 language strikes the best compromise to equitably satisfy all stakeholders as it allows Transmission Planners a way to request revised model data or a model verification for models that meet or exceed the NERC registry criteria thresholds but is below the standard's base applicability.**

Organization	Question 3 Comment
	Requirement R6 sub-requirement wording should be changed to indicate the Transmission Planner shall notify the Generator Owner if the excitation model *does not* initialize, a no-disturbance simulation results in transients or a disturbance simulation results in a model exhibiting negative damping. **Response: The SDT has modified the language in R6 and we believe that the new language will address your concerns.**
Response: The GVSDT thanks you for your comment. Please see responses above.

RELIABILITY CORPORATION

Consideration of Comments

Project 2007-09 Generator Verification
PRC-024-1

The Project 2007-09 Generator Verification Standard Drafting Team (GVSDT) thanks all commenters who submitted comments on the proposed revisions to PRC-024-1. The standard was posted for a 30-day public comment period from September 28, 2012 through October 31, 2012. Stakeholders were asked to provide feedback on the standard and associated documents through a special electronic comment form. There were 54 sets of comments, including comments from approximately 149 different people from approximately 78 companies representing 9 of the 10 Industry Segments as shown in the table on the following pages.

All comments submitted may be reviewed in their original format on the standard's project page.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Mark Lauby, at 404-446-2560 or at mark.lauby@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

[1] The appeals process is in the Standard Processes Manual: http://www.nerc.com/files/Appendix_3A_StandardsProcessesManual_20120131.pdf

Summary Consideration

During the last posting period, the GVSDT had revised the VRFs for Requirements R1, R2 and the original R5 to “medium” and asked stakeholders if they agreed with the proposed VRFs. The GVSDT did not receive any comments on this revision and all stakeholders agreed with the revised VRFs.

The GVSDT revised R4 to improve clarity. A majority of the stakeholders agreed that the revision had improved clarity. Some stakeholders were still unclear if the activities described in this requirement were to be performed by request only, so the SDT rearranged the sentences to make that more clear. Some stakeholders pointed out the RCs and TOPs can request such information via requirements in other standards (IRO-010-1a and TOP-003-2), so these two functional entities were removed from this requirement.

Based on comments from a majority of stakeholders, Requirement R5 (along with its associated Measure M5 and VSL’s) was removed from the Standard. The SDT believes that Requirement R4 achieves the reliability objective of Paragraph 1787 of FERC Order 693 that Requirement R5 was written to address. Other changes were made in response to comments from several stakeholders including:

- Additional wording in the Effective Date section for jurisdictions where regulatory approval is required to address the situation in some Canadian provinces.
- A modification to the high frequency allowable trip point in Attachment 1 for the Eastern and ERCOT Interconnections to match IEEE and IEC standards for generator manufacturers.
- A modification to the final voltage value of the low voltage curve and time duration of Attachment 2 to coordinate with the requirements of PRC-025 Generator Relay Loadability.
- Rearrangement of the sentences in Requirement R4 to better clarify that developing the estimate of performance is to be done only on request of certain planning entities.
- Removal of the Reliability Coordinator and Transmission Operator from the list of functional entities who can request a performance estimate in Requirement R4 and protection settings information in Requirement R6 to eliminate duplication with standards IRO-010 and TOP-003.
- Various wording changes made to improve consistent use of terminology and to improve readability.

Several stakeholders pointed out that a portion of the allowable high frequency trip curve for the Eastern, ERCOT, and Quebec Interconnections (Attachment 1) exceeded the off-nominal frequency limits in IEEE C50.13 and IEC 60034 that are used by equipment manufacturers to design generators.

The drafting team revised the high frequency portion of the curve from zero to two seconds for the Eastern and ERCOT Interconnections to meet the IEEE and IEC standards. This leaves no margin between the high frequency allowance for UFLS designers in frequency overshoot for that amount of time, but the drafting team feels this is acceptable.

Index to Questions, Comments, and Responses

1. The GVSDT revised the VRFs for Requirements R1, R2 and R5 to “medium”. Do you agree with this revision? If not, please explain in the comment area below. 13
2. The GVSDT revised R4 to improve clarity. Do you agree with this revision? If not, please explain in the comment area below. 16
3. Do you have any other comment, not expressed in questions above, for the GVSDT? 28

The Industry Segments are:

BrightSource Energy	Yes	

2. The GVSDT revised R4 to improve clarity. Do you agree with this revision? If not, please explain in the comment area below.

Summary Consideration: A majority of the stakeholders agreed that the revision had improved clarity. Some stakeholders were still unclear if the activities described in this requirement were to be performed by request only, so the SDT rearranged the sentences to make that more clear. Some stakeholders pointed out the RCs and TOPs can request such information via requirements in other standards, so these two functional entities were removed from this requirement.

Organization	Yes or No	Question 2 Comment
Tennessee Valley Authority	No	Recommend that the R4 be enhanced to give more detail on how to satisfy this requirement. As significant as R4 is, the Generator Owners need more guidance than what is currently stated.
Response: The SDT thanks you for your comment. The SDT does not believe the requirements should be prescriptive as to how to accomplish the reliability goals. We agree some level of technical guidance can be developed, but that it should not be in the standard.		
seattle city light	No	Seattle City Light votes NO because it is unclear the type of data the Reliability Coordinator, Planning Coordinator, Transmission Planner, and/or Transmission Operator is to provide the Generator Operator. Until Reliability Coordinators, Transmission Planners, Planning Coordinators, and/or Transmission Operators agree to and approve acceptable simulations and dynamic models, it is difficult for Seattle City Light to approve this standard. There are requirements included in R4 and R5 that have not been communicated with Generator Operators in the past, and without agreement about simulations and models, it is simply too unclear.
Response: The SDT thanks you for your comment. Based on comments from you and numerous other stakeholders the SDT has decided to remove Requirement R5 from the next draft of the standard. The SDT believes that Requirement R4 meets the reliability objective of the directive in Paragraph 1787 of FERC Order 693. In addition, the SDT agrees with stakeholders who		

Organization	Yes or No	Question 2 Comment
indicated that the additional resources that would be required to design, build, operate and maintain synchronous generating facilities that could ride through any of the defined excursions without fail would not justify the resulting incremental gain in grid reliability. From a low voltage ride-through perspective, the occurrence of severe transmission system faults in the immediate vicinity of a generation facility is rare and the history of transmission faults causing trips of generating facilities is similarly rare. From a frequency excursion perspective, turbines and generators currently on the market easily meet the requirements for coordinating with UFLS programs when challenged with typical frequency excursions. While there have been issues with frequency oscillations in some cases (e.g., lean fuel blowout), the SDT believes that these types of issues can be resolved by market forces without the need for a requirement in a reliability standard. As noted, the SDT feels Requirement R4 must remain in the standard in order to satisfy the requirements of the SAR to meet the directives of FERC Order 693 – in this case Paragraph 1787 of the Order.		
Luminant	No	Because R4 is only requiring an estimate of a unit's ability to ride through an excursion developed by a planner, the generator owner should only state if the unit is or is not capable of staying on-line. R4 should be written to follow the FERC order. It is recommended that R4 be written as such. R4) Each Generator Owner of a generating unit shall respond within 60 days of receipt of a written request by the requesting entity (Reliability Coordinator, Planning Coordinator, Transmission Operator, or Transmission Planner that monitors or models the associated generating unit) stating if generating unit(s) or plant is or is not expected to ride through a frequency or voltage excursion based on a dynamic simulation provided by the requestor.
Response: The SDT thanks you for your comment. The SDT believes there is merit in the estimate of the amount of time following an event that the unit would remain connected and has elected to leave the wording as is.		
ACES Power Marketing Standards Collaborators	No	(1) We question the value of this requirement and suggest it should be struck. While knowing how long a generator will remain connected following a voltage or frequency excursion might be useful to a planning engineer conducting dynamic simulations, we do not see how it helps the RC, BA or TOP. The RC, BA or TOP's System Operator will not likely take any action as a result of such information. Rather, they will wait to see if the unit trips before taking additional action because

Organization	Yes or No	Question 2 Comment
		there is no guarantee the unit will trip. Then, they will already be taking actions to minimize the stress regardless of whether they suspect that a unit may trip due to a voltage or frequency excursion. System Operators always have to be prepared to respond to events but simply cannot be expected to respond to every possible event because most simply don't happen and it would be an unreasonable expectation of System Operator. Even if the System Operator knew that a unit might trip in a short time frame due to a voltage or frequency excursion, they simply do not know when such an excursion might or even will occur and likely would not take preemptive action. Because System Operators are responsible for monitoring many aspects of the BES, it would be a waste of time to have them speculating whether or not a unit is going to trip. The system operator only needs to know how to react and mitigate the event if a unit does in fact trip. Furthermore, the RC, BA, and TOP already operate the system to withstand the loss of a unit so any unit that would trip due to such an excursion would not cause a problem. Upon the actual unit trip, then the RC, BA and TOP can reposition the system if necessary to prepare for the next contingency. When information is supplied to a System Operator that does not require them to do something it becomes "noise" which provides no value. **Please note that the BA function is not listed within this standard. The RC and TOP have been removed from this requirement per your comment below to eliminate redundancy with the other standards you cited. As you note in this comment, the time duration between initiation of an event and a unit trip is of value to a PC or TP doing stability studies and has been retained in Requirement R4.** (2) IRO-010-1a and TOP-003-2 already allow the RC and TOP to request necessary data from the Generator Owner through their data specification and have the authority to compel the Generator Owner to provide the data. Thus, if this data is needed the RC and TOP will include it in their data specifications. As a result, supplying the portion of R4 that requires data to be supplied to the RC and TOP is redundant and unnecessary. **The SDT agrees with your comment and has removed the RC and TOP from Requirement R4. As you note, these entities still may obtain the information via the requirements in the other cited standards.**

<table>
<tr><th>Organization</th><th>Yes or No</th><th>Question 2 Comment</th></tr>
<tr><td></td><td></td><td>(3) What level of voltage or frequency excursion is intended to be covered by this requirement? It does not appear to be specified. The requirement specifies that the requesting entity is to provide the Generator Owner with the voltage or frequency excursion profile to be evaluated.</td></tr>
<tr><td colspan="3">Response: The SDT thanks you for your comment. See responses to your specific comments above.</td></tr>
<tr><td>PPL Corporation NERC Registered Affiliates</td><td>No</td><td>The Protective Relay coordination portions of this standard are not being contested. It is not clear how the evaluations should be performed to determine the ability to ride through grid transients. A standard should NOT be written to require this until research has been done to document an appropriate approach to doing these evaluations. It is suggested that plant performance requirements be removed from this Protection System (PRC) standard. If this is required to support grid reliability, then a new SAR should be written to develop those plant performance requirements.</td></tr>
<tr><td colspan="3">Response: The SDT thanks you for your comment. Based on comments from you and numerous other stakeholders the SDT has decided to remove Requirement R5 from the next draft of the standard. The SDT believes that Requirement R4 meets the reliability objective of the directive in Paragraph 1787 of FERC Order 693. In addition, the SDT agrees with stakeholders who indicated that the additional resources that would be required to design, build, operate and maintain synchronous generating facilities that could ride through any of the defined excursions without fail would not justify the resulting incremental gain in grid reliability. From a low voltage ride-through perspective, the occurrence of severe transmission system faults in the immediate vicinity of a generation facility is rare and the history of transmission faults causing trips of generating facilities is similarly rare. <tr><td>Associated Electric Cooperative, Inc. - JRO00088</td><td>No</td><td>As currently drafted, Requirement R4 appears to dictate an analysis for all inflection-points in unit performance, for a continuum of frequency and voltage excursions, and</td></tr>
</table>

Organization	Yes or No	Question 2 Comment
		taking into account all of the underlying auxiliary equipment's control systems and settings. We see this current draft's Requirement R4 wording as a creating a much greater expectation, than estimating the duration-times for the curves at the specific inflection-points given in Attachments 1 & 2 of this Standard.
Response: The SDT thanks you for your comment. The requirement specifies that the requesting entity is to provide the Generator Owner with the voltage or frequency excursion profile to be evaluated. The Generator Owner is not expected to arbitrarily evaluate all possible voltage and frequency excursion profiles.		
Duke Energy	No	1) It is unclear if this requirement is to be only upon request, and if requests will be related to the same ride through criteria or a different set specified by the TP. Need to clarify how this aspect will be executed. **The wording of the Requirement has been rearranged to help clarify that the estimate is to be provided only upon request.** 2) Refer to discussion in our response to Question 3 below about industry concerns with the technical viability of plant performance standards.
Response: The SDT thanks you for your comment. See responses to your specific comments above and at Question 3.		
ISO RTO Council Standards Review Committee	No	The proposed language lacks clarity in what data is needed in order for a TOP to comply with the requirement to provide trip settings to the RRO/RC/Transmssion Planners. We recommend that regions develop further specific "no-trip" regions specific to their area of the Interconnection.
Response: The SDT thanks you for your comment. There is no language in Requirement R4 for the TOP to provide any information to the RRO, RC, or Transmission Planner. If the TOP requests a Generator Owner to evaluate the ride-through performance of a particular generating facility, then that TOP must provide the GO with the specific transmission system voltage excursion profile or frequency excursion profile to be evaluated as stated in this requirement.		
Dynegy	No	R4 requires the GO to provide the Transmission Planner an estimate of the time duration a generator will stay on during a frequency or voltage excursion. It appears

Organization	Yes or No	Question 2 Comment
		this question would already be answered in complying with R2 when the GO verifies the relay settings against the graphs in Attachment 2. It's also not clear whether R4 is to be accomplished before or after a request from the Transmission Planner. It is recommended R4 be removed. If it is not removed, add "...if requested." at the end of the first sentence.
Response: The SDT thanks you for your comment. The requesting entity (Transmission Planner or Planning Coordinator) might be aware of the trip set points for the Generator Protection System as specified in Requirements R1 and R2, but Requirement R4 specifically states that the Generator Owner must consider the performance of the auxiliary systems when providing the estimate to the requesting planner. The expectation is that the protection will not operate during an excursion but the plant may still trip due to process upsets caused by auxiliary systems reaction to the excursion. The wording in Requirement R4 has been rearranged to clarify that the estimate is to be provided only upon request.		
Ingleside Cogeneration LP (voting under entity name Occidental Chemical Corporation)	No	Unlike MOD-026-1, which requires some amount of justification from the requesting entity before action must be taken, PRC-024-1 R4 requires compliance without any regard to the Generator Owner's resource availability. In general, Ingleside Cogeneration LP believes that a good working relationship between the Generator Owner and Transmission Planner includes a reasonable justification for any request that requires time and expense on the part of the other.
Response: The SDT thanks you for your comment. The Generator Owner must perform the verification activities described in MOD-026-1 on a 10-year basis, absent any justification from any entity. The SDT congratulates Ingleside for maintaining a good relationship with your Transmission Planner. The Transmission Planners on the SDT indicate that a request for an estimate would likely only be for facilities that appear to be critical to stability immediately following an excursion.		
American Electric Power	No	R4 should be removed entirely from this standard. R4 appears to add no reliability benefit beyond what is already prescribed in R3. Documentation of equipment limitations as possible causes for tripping within the no-trip zones of Attachments 1 and 2 will allow PCs and other entities to check for instances where UFLS effectiveness or system voltage recovery might be compromised by possible early tripping of generators due to factors other than relay settings. As these benefits

Organization	Yes or No	Question 2 Comment
		seem to be the intent of R3, R4 does not appear to add any useful information beyond what would already be supplied under R3. We further expect that GOs will be unable to devise the required estimates of time duration without detailed simulations of generating unit and auxiliary system performance (the explicit statement that detailed studies are not required notwithstanding) during the specified frequency or voltage excursion profiles to be supplied to them. Were these intended to be trajectories rather than profiles?
Response: The SDT thanks you for your comment. The SDT feels Requirement R4 is needed to comply with the SAR for this project that mandates the SDT consider directives in FERC Order 693 – in this case Paragraph 1787. The intent of Requirement R3 is to allow owners of generating facilities to set protection to operate inside the "No Trip Zone" of Attachments 1 or 2 if there is a known limitation that prevents operation in a portion of the "Zone" (e.g., a manufacturer's bulletin describing a limitation on operating below certain frequencies). The Generator Owner must communicate these settings that fall inside the "No Trip Zone" to the appropriate entities that model the facility for stability contingencies. This does not mean the entities modeling the facility are aware of how the facility might react when the performance of the auxiliary systems are considered, which is the intent of Requirement R4. No change made to the requirement.		
Wisconsin Electric Power Company	No	We maintain that there is no reliability driven need for R4. Also, such estimates would be of limited accuracy. Should such an estimate be deemed useful, it can be requested informally among the appropriate entities. Standards and associated requirements must be reserved for those items more critical to BES reliability
Response: The SDT thanks you for your comment. The SDT feels Requirement R4 is needed to comply with the SAR for this project that mandates the SDT consider directives in FERC Order 693 – in this case Paragraph 1787. Accurately modeling the performance of generating facilities can impact stability assessments. No change made to the requirement.		
Exelon Corporation and its affiliates	No	In response to Exelon's (and other commenter's) concern that 60 calendar days was not a reasonable amount of time to perform a study in response to a written request from a RC, PC, TOP or TP, the GVSDT stated that it has "modified the structure of the requirement to clarify the intent and the limits of what entities could request a performance estimate;" but the GVSDT was not in agreement with changing the time

Organization	Yes or No	Question 2 Comment
		period allowed to respond. Although the GVSDT states that "[d]etailed unit performance studies are not required to develop the estimate," Exelon continues to maintain that 60 calendar days is not a reasonable amount of time to perform a study of this magnitude based on the predicted scope. Specifically, nuclear generating units have extensive calculations related to how internal systems will respond to frequency and voltage excursions. Exelon believes it is inappropriate to short cycle or challenge the rigorous process required by the Nuclear Regulatory Commission (NRC) at a nuclear generating unit for any such study. In addition, depending on the complexity of the transient requested by the transmission entity, a nuclear generating unit may not have the in-house expertise to perform such a study and may be required to hire an outside vendor.
Response: The SDT thanks you for your comment. The SDT has made it clear in responses to similar comments during previous postings that the SDT does not believe extensive studies or dynamic simulations are required to comply with this requirement. Such studies would achieve only a very minimal increase in the reliability of the estimate given the number of variables involved.		
CenterPoint Energy	No	(a) To improve clarity, CenterPoint Energy recommends deleting the second and third sentences of the first paragraph of R4. CenterPoint Energy does not agree that a Reliability Coordinator, Planning Coordinator, Transmission Operator, or Transmission Planner should provide a voltage or frequency profile at the point of interconnection that is determined by dynamic simulation. Different types of simulated events will produce different voltage and frequency excursions. Also, even the same type of event will produce different voltage and frequency excursion "profiles" as the system changes over time. **The SDT feels that if the Generator Owner is not provided an excursion profile, the GO would not know what profile to evaluate. The curves in Attachments 1 and 2 are frequency and voltage magnitude vs. allowable time duration envelopes that encompass the set of possible profiles that could occur. They are not actual excursion profiles.** (b) While deleting the second and third sentences of the first paragraph of R4 would provide clarity, it would nevertheless be problematic for reliability because it does

Organization	Yes or No	Question 2 Comment
		not impose any minimum frequency or voltage ride-through requirements for existing generation stations. Failure of a generator to ride-through at least some minimum threshold of frequency and voltage excursions places the reliability burden solely on transmission entities and makes is difficult to compensate for the generator's failure to perform. **The SDT believes that existing generating facilities have a good track record of riding through voltage and frequency excursions. Cascading outages caused by trips of multiple generating facilities due to a single event are extremely rare. The SDT does not believe the recommended requirement is necessary.**
Response: The SDT thanks you for your comment. See responses to your specific comments above.		
SMUD	No	We agree that a GO can meet the requirements in R1 & R2 and use R3 to note any known limitations. We do not feel the GO can provide any meaningful estimate of overall plant performance beyond meeting the first three requirements. The complexity of what is being asked is simply too great.
Response: The SDT thanks you for your comment. The SDT believes a reasonable estimate can be achieved by determining what auxiliary equipment would cause a turbine or generator trip if that equipment were to shut down due to an excursion. Fans, pumps, compressors, etc., that could cause process upsets if they shut down due to contactor dropout during low voltage or slow down due to frequency decay could be looked at and a worst case estimate developed. The SDT realizes that this type of evaluation may not reflect what happens in actuality, but it will probably be conservative (from the planner's perspective). Performing extensive (and expensive) dynamic simulations would bring only marginal improvement in the accuracy of the estimate given the large number of variables involved.		
Cowlitz PUD	No	Requirement R4 is clear, however it can take 60 calendar days simply to find and retain a consulting firm who is qualified to provide the estimated data to the requesting entity. This will require the GO to perform defensive compliance, that is, to attempt to aquire data before a request is submitted in order to meet the tight two-month response time. There is no provision to allow the GO to negociate a time frame with the requesting entity.

Organization	Yes or No	Question 2 Comment
Response: The SDT thanks you for your comment. The SDT believes the plant staff should be able to provide a reasonable estimate that satisfies Requirement R4. If they identify which auxiliary equipment (pumps, fans, etc.) would cause a generator trip if that equipment drops out due to voltage excursion, then identify the one that would cause the trip the fastest (e.g., would a boiler pressure excursion due to loss of a fan cause a trip faster than a boiler drum level excursion due to loss of a pump). If Cowlitz still feels the need to contract a consultant, perhaps the contract could be negotiated ahead of time.		
Dominion	Yes	R4.1. and R4.2. are listed in the redline standard, but not in the clean version of the standard.
Response: The SDT thanks you for your comment. The SDT is aware that the redline version does have issues. Please refer to the clean version for the most accurate information.		
Manitoba Hydro	Yes	Manitoba Hydro noticed that the “clean” and “redline” versions of the standard are inconsistent. Both 4.1. and 4.2. should be removed from the “redline” version since both are redundant (included in the text of R4.).
Response: The SDT thanks you for your comment. The SDT is aware that the redline version does have issues. Please refer to the clean version for the most accurate information.		
Idaho Power Company	Yes	Idaho Power System Planning agrees with the revisions made to R4.
Response: The SDT thanks you for your comment.

Response: The SDT thanks you for your comment. The word “bases” is the plural of “basis”.		

3. Do you have any other comment, not expressed in questions above, for the GVSDT?

Summary Consideration: Based on comments from a majority of stakeholders, Requirement R5 (along with its associated Measure M5 and VSL's) was removed from the Standard. The SDT believes that Requirement R4 achieves the reliability objective of Paragraph 1787 of FERC Order 693 that Requirement R5 was written to address. Other changes were made in response to comments from several stakeholders including:

- **Additional wording in the Effective Date section for jurisdictions where regulatory approval is required to address the situation in some Canadian provinces.**
- **A modification to the high frequency allowable trip point in Attachment 1 for the Eastern and ERCOT Interconnections to match IEEE and IEC standards for generator manufacturers.**
- **A modification to the final voltage value of the low voltage curve and time duration of Attachment 2 to coordinate with the requirements of PRC-025 Generator Relay Loadability.**
- **Rearrangement of the sentences in Requirement R4 to better clarify that developing the estimate of performance is to be done only on request of certain planning entities.**
- **Removal of the Reliability Coordinator and Transmission Operator from the list of functional entities who can request a performance estimate in Requirement R4 and protection settings information in Requirement R6 (now R5) to eliminate duplication with standards IRO-010 and TOP-003.**
- **Various wording changes made to improve consistent use of terminology and to improve readability.**

Several stakeholders pointed out that a portion of the allowable high frequency trip curve for the Eastern, ERCOT, and Quebec Interconnections (Attachment 1) exceeded the off-nominal frequency limits in IEEE C50.13 and IEC 60034 that are used by equipment manufacturers to design generators. The drafting team revised the high frequency portion of the curve from zero to two seconds for the Eastern and ERCOT Interconnections to meet the IEEE and IEC standards. This leaves no margin between the high frequency allowance for UFLS designers in frequency overshoot for that amount of time, but the drafting team feels this is acceptable.

Organization	Yes or No	Question 3 Comment
ACES Power Marketing		(1) We appreciate that the second bullet allows that TP to provide a less stringent voltage envelope for R5. However, it is not clear if the TP can provide a more

Organization	Yes or No	Question 3 Comment
Standards Collaborators		stringent envelope. We believe a more stringent voltage envelope should not be allowed. Please clarify. **While Standard PRC-024 (R2 and R5) allows the TP to provide a less stringent voltage envelope, the TP cannot enforce a more stringent voltage envelope.** (2) We continue to believe that requirement R5 needs to be modified to recognize that equipment will not always be new and may develop limitations as it ages. These limitations may prevent the generator from meeting the voltage and frequency envelopes defined in Attachment 1 and 2. **Based on comments from you and numerous other stakeholders the SDT has decided to remove Requirement R5 from the next draft of the standard. The SDT believes that Requirement R4 meets the reliability objective of the directive in Paragraph 1787 of FERC Order 693. In addition, the SDT agrees with stakeholders who indicated that the additional resources that would be required to design, build, operate and maintain synchronous generating facilities that could ride through any of the defined excursions without fail would not justify the resulting incremental gain in grid reliability. From a low voltage ride-through perspective, the occurrence of severe transmission system faults in the immediate vicinity of a generation facility is rare and the history of transmission faults causing trips of generating facilities is similarly rare. From a frequency excursion perspective, turbines and generators currently on the market easily meet the requirements for coordinating with UFLS programs when challenged with typical frequency excursions. While there have been issues with frequency oscillations in some cases (e.g., lean fuel blowout), the SDT believes that these types of issues can be resolved by market forces without the need for a requirement in a reliability standard.** (3) Requirement R6 should be struck. First, the TOP and RC already have the capability to request such data in its data specification from the GO through IRO-010-1a and TOP-003-2 which also compels the GO to comply with the data specification. Thus, if the TO and GO need the data they will write it into their data specifications. Second, this requirement is the type of requirement that the Project 2013-02

Organization	Yes or No	Question 3 Comment
		Paragraph 81 drafting team has proposed eliminating in response to the FERC approval order of the FFT process. Specifically, the requirement meets the Administrative, Purely Reporting and Redundant criteria for the project. It only has to meet one criterion to be proposed for retirement. It is imperative that drafting teams refrain from developing requirements that a future team will retire. **Based on comments from you and numerous stakeholders the SDT has decided to modify the wording for requirement R4 and (previous) R6 to include data requests from Planning Coordinators or Transmission Planners not Transmission Operators or Reliability Coordinators.** (4) This standard needs to be aligned with the recent NERC compliance enforcement initiatives (i.e. internal controls, entity impact evaluation, elimination of zero-defect expectations). The VSL for Requirement R5 makes it clear that every time a "new unit" (i.e. does not meet footnote 2) trips, an evaluation needs to be conducted to determine if the unit tripped for a voltage or frequency excursion that is inside the no trip zone. To refocus NERC efforts on compliance, the recent compliance enforcement initiatives would allow that GO to make this determination and correct any performance deficiencies without the need to self-report a violation. These approaches are being written into the standards (CIP, COM-003, etc.). We suggest the drafting team coordinate with the appropriate NERC personnel to adopt a similar approach for this requirement. **Based on comments from you and numerous other stakeholders the SDT has decided to remove Requirement R5 from the next draft of the standard. The SDT believes that Requirement R4 meets the reliability objective of the directive in Paragraph 1787 of FERC Order 693. In addition, the SDT agrees with stakeholders who indicated that the additional resources that would be required to design, build, operate and maintain synchronous generating facilities that could ride through any of the defined excursions without fail would not justify the resulting incremental gain in grid reliability. 		facility is rare and the history of transmission faults causing trips of generating facilities is similarly rare. From a frequency excursion perspective, turbines and generators currently on the market easily meet the requirements for coordinating with UFLS programs when challenged with typical frequency excursions. While there have been issues with frequency oscillations in some cases (e.g., lean fuel blowout), the SDT believes that these types of issues can be resolved by market forces without the need for a requirement in a reliability standard. (5) Because the voltage envelope is based on assumptions listed on page 20, the VSLs for R5 need to clarify that if a unit does trip in the no trip zone and the system does not reflect these assumptions that this does not represent a violation. For instance, if a synchronous condenser or capacitor (bullet 7 on page 20) is not available that was assumed to be available when evaluating protection relay settings, why would the GO be held accountable for its unit tripping during a voltage excursion? It followed the assumptions set out in the standard. **Based on comments from you and numerous other stakeholders the SDT has decided to remove Requirement R5 from the next draft of the standard. The SDT believes that Requirement R4 meets the intent of the directive in Paragraph 1787 of FERC Order 693. In addition, the SDT agrees with stakeholders who indicated that the additional resources that would be required to design, build, operate and maintain synchronous generating facilities that could ride through any of the defined excursions without fail would not justify the resulting incremental gain in grid reliability. From a low voltage ride-through perspective, the occurrence of severe transmission system faults in the immediate vicinity of a generation facility is rare and the history of transmission faults causing trips of generating facilities is similarly rare. Organization	Yes or No	Question 3 Comment
		the need for a requirement in a reliability standard. (6) Why is the defined term Protection System not used throughout the standard rather than "protective relaying"? We recommend adopting the NERC Glossary Term for consistency. **The SDT used the phrase protective relaying within the standard rather than Protective System, because Protective System is a broad definition in which communications, dc power supplies, and includes protective relays. Protective relaying is more applicable to this specific standard.** (7) We continue to believe that performance requirements for new units should be part of the interconnection process. As a result, R5 should either be struck or it should be moved to FAC-001 which governs standards for facility connection requirements. **Based on comments from you and numerous other stakeholders the SDT has decided to remove Requirement R5 from the next draft of the standard. The SDT believes that Requirement R4 meets the reliability objective of the directive in Paragraph 1787 of FERC Order 693. In addition, the SDT agrees with stakeholders who indicated that the additional resources that would be required to design, build, operate and maintain synchronous generating facilities that could ride through any of the defined excursions without fail would not justify the resulting incremental gain in grid reliability. Organization	Yes or No	Question 3 Comment
		(8) Requirement R3 and R6 are the types of requirements the Project 2013-02 Paragraph 81 drafting team is proposing to eliminate. They have established a set of criteria to identify requirements with little to minimal reliability impact. Both of these requirements meet one or more of the following criteria: Administrative, Purely Documentation, Purely Reporting, or Little, if any, value as a reliability requirement. Please review all proposed requirements against this criteria and remove requirements as appropriate. While we believe R3 should be removed, we do understand there is a need to document equipment limitations for R1 and R2. We believe the existing associated bullets in R1 and R2 will satisfactorily address the need to document limitations and that the reference to R3 could simply be struck. **The SDT has reviewed the criteria for removing requirements per Paragraph 81 and determined that the requirements of PRC-024 do not meet the applicable criteria. In order to be considered for removal, a requirement has to meet Item A as well as at least one part of Item B (see P81 team criteria document). The requirements of PRC-024 do not meet Item A and therefore are not eligible for inclusion.** (9) Please remove the RC and TOP from Part 3.1 of R3. Inclusion of the RC and TOP is redundant with IRO-010-1a and TOP-003-2 which require the RC and TOP to develop data specifications. If they need this data, it should be included in their data specification. **The reference of the Reliability Coordinator and Transmission Operator is applicable for Part 3.1 of R3 as this sub requirement is applicable for the Generator Owner to communicate the documented equipment limitation, or the removal of a previously documented equipment limitation, to its Reliability Coordinator, Planning Coordinator, Transmission Operator and Transmission Planner. No other standard or subsection of this standard covers this requirement.** (10) Please remove “as specified by Requirement R6” in the first half of the R6 VSLs. We found it confusing when it was not included in the second half. **For clarity, applicable changes will be made to the VSLs for R6 (now R5).**

Organization	Yes or No	Question 3 Comment
		(11) Please copy footnote 1 from R1 on to the page with R2. It was not immediately clear that he footnote in R2 was actually on the previous page. **The document has been modified to include footnote 1 on the same page as R1 and R2.**
Response: Thank you for your comments. Please see responses to specific comments above.		
Ameren		We commend the GVSDT for considering and addressing our previous comments, and making several changes that improve this proposed standard. (1)In R1 and R2, please add “Generation may trip by properly set volts per hertz protection if a system over excitation abnormality necessitates disconnecting a generating unit.” **The voltage ride-through time duration curve (Attachment 2) takes into account properly set volts per hertz relays, assuming that the frequency is 60 Hertz and adjustments are made to the magnitude of the high voltage curve in proportion to deviations of frequency below normal.** (2)Based on the GVSDT response to our previous comments we understand the purpose of R6 is to be studies. Given this study purpose, please change “and Transmission Planner” to “or Transmission Planner”, delete “monitors or” and replace “unless otherwise directed by the requesting Reliability Coordinator, Planning Coordinator, Transmission Operator, or Transmission Planner” with “while the requestor’s study is underway”. We believe that it is burdensome for the GO to have to indefinitely continue to send setting changes to the requesting entity. When the requesting entity begins another periodic study, they’ll request them again. Therefore, we request that R6 should then read: “Each Generator Owner shall provide its generator protection trip settings to the Reliability Coordinator, Planning Coordinator, Transmission Operator or Transmission Planner (that models the associated unit), within 60 calendar days of receipt of a written request for the data, and within 60 calendar days of any change to those previously requested trip settings

Organization	Yes or No	Question 3 Comment
		while the requestor's study is underway." **Based on comments from you and other stakeholders the SDT has made applicable changes to each of the PRC-024 requirements.** (3)We believe that M5 expects the GO to retain evidence that proves the negative and is therefore burdensome. Generators trip for many reasons; most of them have to do with the mechanical system. We request that the SDT append "by the generator frequency or voltage protective relaying" after "each unit trip", and add "or that no such unit trips occurred within the Data Retention period" at the end. M5 should then read: "Each Generator Owner shall have evidence, such as dated unit output records, trip investigation reports or disturbance monitoring records, showing that each unit trip by the generator frequency or voltage protective relaying did not result from a frequency excursion or voltage excursion as specified in Requirement R5, or evidence that a listed exception applied, or that no such unit trips occurred within the Data Retention period." **Since Requirement R5 has been removed from the standard, Measure M5 has been removed as well.** (4)VSL's in R3, R4, and R6 are set up with 10 day increments between the different severity levels, rather than a more typical 30 day increment. **The 10-day increments in R3, R4 and R6 (now R5) are based on VSL development guidelines provided by NERC. The SDT so feels that the 10-day increment is appropriate for this standard.** (5)As a general comment, NERC should make all the papers listed in the references section of the standard readily available on their website. **While this request would aid in understanding a given standard, copyright restriction prevent NERC from satisfying this request.**

Response: Thank you for your comments. Please see responses to specific comments above.

Organization	Yes or No	Question 3 Comment
CenterPoint Energy		(a) In R2 and R5, CenterPoint Energy recommends that "external to the generating plant" be deleted in the phrase "...caused by an event on the transmission system external to the generating plant..." We believe this could cause confusion, as some could consider the transmission interconnection substation as part of the generating plant. Also, such wording is not needed, as both requirements include the following clarifying language: "Generation may trip if clearing a system fault necessitates disconnecting a generating unit." **While the phrase "external to the generating plant" may cause some confusion, the STD felt that this phrase clearly defines which transmission facilities would be subject to evaluation, in the event that transmission and generation facilities are intertwined.** (b) CenterPoint Energy cannot support this version of PRC-024 because it does not impose any minimum frequency or voltage ride-through requirements for existing generation stations. Failure of a generator to ride-through at least some minimum threshold of frequency and voltage excursions places the reliability burden solely on transmission entities. This makes is difficult to compensate for the generator's failure to perform and, therefore, is problematic for BES reliability. **The SDT has not seen evidence that lack of ride through capability in existing generation facilities is causing frequent cascading outages. The SDT believes the resources required to retrofit existing plants to meet your recommendation could be better used to improve grid reliability elsewhere.**
Response: Thank you for your comments. Please see responses to specific comments above.		
American Electric Power		1) R1: Should R2, first bullet point exception have a similar counterpart in R1? **The allowance under R2, bullet one, to trip a unit due to SPS operation is characteristic of a system event that would have voltage implications. The SDT is not aware of a SPS scheme that trips due to a frequency initiated event.**

Organization	Yes or No	Question 3 Comment
		2) R2: Does footnote 2 also apply to R2 fourth bullet point? **Footnote 2 is related to existing units, but has been eliminated from the updated standard.** 3) R3: On the last bullet we suggest the word “nameplate” be removed from the sentence. **“Nameplate” is accepted industry terminology for defining the capacity of generating units; therefore, the word will not be removed from the standard.** 4) R5: AEP believes that the requirement of R5 for new units and plants to not trip within the no â€trip zone of Attachment 1 is reasonable, and has precedence in existing reliability region guidelines. To not trip within the no â€trip zone of the Attachment 2 is another matter. AEP maintains that Attachment 2 is inappropriate as a requirement on new conventional generation. When AEP previously raised objection to the reference to Attachment 2 by R5, the SDT replied: "The SDT is charged with implementing the reliability improvement recommendations from FERC Order 693 and the 2003 Northeast Blackout Report. The SDT is working under the assumption that when industry approved the SAR for this project it agreed that the standard provided a reliability gain."We note that Order 693, paragraph 1787 does require generation to ride through B and Ccontingencies. However (and we reference the Consideration of Issues and Directives tablea ssociated with PRCâ€024), Order 661 was superceded by 661â€A which removed the voltage rideâ€through curves of the sort as Attachment 2. The SDT is justifying the imposition of an unprecedented (in North America) and onerous requirement on the basis of outdated information. Moreover, the SAR for Project 2007â€09 was a general authorization to proceed with standard development on the subject of generator performance during frequency and voltage excursions, not an authorization to require the specific voltageâ€ride through requirement for new generation now proposed in R5. Please reconsider the justification for this requirement. The SDT further replied: "If the Transmission Planner for a new generation facility can provide the voltage profile for that specific site, then per Part 5.2 the Generator Owner can design his new facility to

Organization	Yes or No	Question 3 Comment
		ride through that profile even if it is less stringent (i.e. uses faster clearing and faster voltage recovery) than Attachment 2. The voltage envelope described in Attachment 2 provides equipment OEM's with an outer boundary on the voltage stress they have to design for. "The exception enabled by the second bullet point of R5 may cause a nonuniform level of reliability. If one transmission planner presents a less stringent voltage rideâ€through characteristic (we assume this would be simulation basedâ€â€R2, Part 2.2 does not exist) to a potential generator than the TP next door, who for lack of time or resources falls back on Attachment 2, then at best, a nonuniform level of reliability would result. Shouldn't there be some uniformity on what generating units are obligated to acheive? We mention this point, not that the exception be removed, but that the requirement of Attachment 2 for new generation, which has not been seen as necessary for reliability in the past, be removed. The SDT further replied to our concern over cost to comply: "There are similar voltage ride through requirements already in effect in parts of Europe and Asia. The SDT is charged with implementing the reliability improvement recommendations from FERC Order 693 and the 2003 Northeast Blackout Report. The SDT agrees that generating units designed and built to meet Requirement R5 will be more costly than those that cannot meet this reliability goal. The SDT is not in a position to place a monetary value on the consequent reliability gain. The SDT is working under the assumption that when industry approved the SAR for this project it agreed that the standard provided a reliability gain. "The SDT is in error in thinking that the reference to Attachment 2 in R5 is necessary to implement Order 693 or to fulfill the intent of the SAR as noted above. We also question the propriety of adding a new reliability standard requirement without precedent in North America irrespective of any consideration of the cost to comply, and a proposed requirement that will certainly act to disfavor new conventional generation compared to what has always been accepted design practice for conventional generation in the past. The SDT needs to provide a relevent technical argument for the new level of reliability and not an appeal to what other parts of the world may be doing. **Based on comments from you and numerous other stakeholders the SDT has**

Organization	Yes or No	Question 3 Comment
		decided to remove Requirement R5 from the next draft of the standard. The SDT believes that Requirement R4 meets the reliability objective of the directive in Paragraph 1787 of FERC Order 693. In addition, the SDT agrees with stakeholders who indicated that the additional resources that would be required to design, build, operate and maintain synchronous generating facilities that could ride through any of the defined excursions without fail would not justify the resulting incremental gain in grid reliability. From a low voltage ride-through perspective, the occurrence of severe transmission system faults in the immediate vicinity of a generation facility is rare and the history of transmission faults causing trips of generating facilities is similarly rare. From a frequency excursion perspective, turbines and generators currently on the market easily meet the requirements for coordinating with UFLS programs when challenged with typical frequency excursions. While there have been issues with frequency oscillations in some cases (e.g., lean fuel blowout), the SDT believes that these types of issues can be resolved by market forces without the need for a requirement in a reliability standard. 5) If R5 remains in this standard, its associated measure needs to be changed so that evidence would need to be provided for only those unit trips that occurred during a voltage or frequency excursion. As currently written, evidence would need to be provided for every unit trip, which is both unnecessary and unduly burdensome. **Based on comments from you and numerous other stakeholders the SDT has decided to remove Requirement R5 from the next draft of the standard. The SDT believes that Requirement R4 meets the reliability objective of the directive in Paragraph 1787 of FERC Order 693. In addition, the SDT agrees with stakeholders who indicated that the additional resources that would be required to design, build, operate and maintain synchronous generating facilities that could ride through any of the defined excursions without fail would not justify the resulting incremental gain in grid reliability. 		generators currently on the market easily meet the requirements for coordinating with UFLS programs when challenged with typical frequency excursions. While there have been issues with frequency oscillations in some cases (e.g., lean fuel blowout), the SDT believes that these types of issues can be resolved by market forces without the need for a requirement in a reliability standard. 6) R6: As currently drafted, all requests would require continual updates unless otherwise exempted. This should be changed so that all requested are treated as a onetime request unless otherwise specified by the requesting entity. **Response: The SDT thanks you for your comment. The requestor would only be asking for trip settings for those protective functions that are used in the stability model. The requestor would need to know when changes are made to these settings so that his model remains accurate. If it is a one-time study, the requestor has the option of informing the Generator Owner of this at the time of the request per the language in the requirement.**
Response: Thank you for your comments. Please see responses to specific comments above.		
Duke Energy		1) Feedback from the IEEE Electric Machines Committee and Siemens (a generator equipment OEM) serve as the bases for these statements and are included below. PRC-024 was orignially intended to address a relay setting/coordination issue. This appears to be addressed by the current draft of the standard. However, the issues related to plant survivability or performance are more complex. It is not appropriate to attempt to address these issues in a PRC standard. The addition of plant performance aspects appear to be driven by FERC as evidenced by the minutes of the May 2009 meeting - see http://www.nerc.com/docs/standards/dt/GVSDTnotes052809.pdf. **Based on comments from you and numerous other stakeholders the SDT has decided to remove the performance Requirement R5 from the next draft of the standard. The SDT believes that Requirement R4 meets the reliability objective of the directive in Paragraph 1787 of FERC Order 693. In addition, the SDT agrees with stakeholders**

Organization	Yes or No	Question 3 Comment
		who indicated that the additional resources that would be required to design, build, operate and maintain synchronous generating facilities that could ride through any of the defined excursions without fail would not justify the resulting incremental gain in grid reliability. From a low voltage ride-through perspective, the occurrence of severe transmission system faults in the immediate vicinity of a generation facility is rare and the history of transmission faults causing trips of generating facilities remote (e.g., more than one bus away) from the fault is similarly rare. From a frequency excursion perspective, turbines and generators currently on the market easily meet the requirements for coordinating with UFLS programs when challenged with typical frequency excursions. While there have been issues with frequency oscillations in some cases (e.g., lean fuel blowout), the SDT believes that these types of issues can be resolved by market forces without the need for a requirement in a reliability standard. 2) According to attendees at the IEEE EMC meeting, much of the technical justification for the need of a plant performance criteria was based on issues with early design wind generation, however the technical considerations at these types of generation stations are different that steam turbine generation plants, which require heavy induction loads to support operation. These loads are sensitive to upsets in voltage and frequency. The technical implications of the plant performance are not clear and thus this issues should not be standardized at this point in time. It is recommended that the plant performance aspects be removed from the PRC standard and a new SAR be written to address plant performance requirements. This approach would support pulling in the various design expertise (IEEE, Equipment OEMs, Power Plant Design entities, etc) needed to develop a technically correct ride through criteria. **See response below** 3) There also is a need to develop industry accepted methods to determine the capability of a plant to ride through grid transients prior to this becoming a mandatory standard. **See response below.** 4) It appears the +/- 5 % of the rated generator voltage constraint has been removed

Organization	Yes or No	Question 3 Comment
		from the voltage ride thru criteria. Depending on the tap of the GSU, this might be more limiting than the HVRT curve. SDT should consider keeping the constraint. **The standard is limited to relay settings during the first 4 seconds of a disturbance. Attachment 2 does reference "Return to voltage between 0.95 PU and 1.05 PU dependent on automatic or manual changes to the system."** 5) Related to #5 in the curve clarifications - What is the intend of changing from RMS to crest voltages for the HVRT? What is a crest phase-to-phase voltage? **Clarification #5 addresses concerns raised by equipment manufactures that many types of equipment are more sensitive to the crest voltage than to RMS voltage. Basing the standard only on RMS voltage would require equipment to be designed for unknown conditions.** 6) Related to #6 in the curve clarifications - Voltage relays may not ride through HV or LV disturbances as intended if the curves are not compensated for the rated capabilities of the machine. It would be better to compensate the LVRT curve for operation at the B point on the D-Curve and the HVRT curve for operation at the C point on the D-curve. **The curves are voltage duration envelopes based on transmission system voltages. It is up to the GO to evaluate the generator relay setting based on the range of expected initial conditions to assure that the relays will not operate for the envelope of transmission voltages in Attachment 2.** 7) V/Hz relay should be evaluated in the frequency domain at maximum rated voltage, typically 105%. **The SDT agrees that your suggestion is valid, but would argue that they may be evaluated at 60 Hz with the allowance to operate at proportionally lower voltage with lower frequencies. No change made.** 8) Has any consideration been given to addressing the frequency and voltage excursions in the transmission system in order to arrest the situation locally?

Organization	Yes or No	Question 3 Comment
		The standard applies to Generators Owners. Consideration has been given to transmission system based solutions in R2 where the Transmission Planner can specify less stringent conditions for a specific generator. The UFLS systems designed per standard PRC-006-1 accomplish the suggested activity for frequency excursions. Voltage excursions caused by faults on the transmission system cannot realistically be arrested. 9) Information from IEEE Electric Machinery Committee discussion topic "Grid Code Impact on Electric Machine Design" (San Diego 2012 - Papers from the session with supporting information are available): A) PRC-024 VR capability may not be available at any price. BES reliability enhancements requiring technological advances should be addressed with industry groups (e.g. ASME, IEEE) and OEMs to develop commercially available products before appearing as requirements in reliability standards. It is believed the cost of complying with wider standards might increase main generator machine costs as much as 25%, which is not insignificant. This should only be required if there is a defined local system need for higher standards and that these costs should be considered against the cost of other possible resolutions. B) A specific concern in this respect regarding the ride-through capability being sought in PRC-024 R3-5 is that auxiliary buses may drop-out and cause a unit to trip for the excursions specified, which go well beyond the industry's present design criteria, even if the protective relay settings nominally allow such transients. It may be unrealistic to expect that the dynamic behavior of all 4160V and 460V systems in new plant can be dynamically modeled to a degree allowing one to obtain non-drop-out guarantees from equipment suppliers and EPC firms for extreme transients such as 2.0 seconds at 65% voltage, or that the same can be done for existing plants to allow identification of limiting components and accurate estimates of performance. C) The voltage ride through was originally intended to address early deficiencies in wind generation design only and it doesn't make sense to apply such a broad curve to steam plants. The concerns that led to the VRT curve for wind have been addressed by new vintage wind plant designs and thus, the EMC does not believe there is a driving need for a standard VRT criteria. **See response below.**

Organization	Yes or No	Question 3 Comment
		10) The VRT issue is holding up addressing other significant issues addressed by PRC-024 (relay setting coordination and frequency ride through). The VRT should be pulled out of PRC-024 and a new SAR drafted to address the voltage performance aspects if this is really needed for reliability. **See response below.** 11) Information from Siemens (Generator OEM) perspective: A) Regarding PRC-024, the LVRT curves (on Attachment 1) are subject to misinterpretation, since they seem to imply a very slow, stepped voltage recovery rather than a set of roughly equivalent faults. The curve needs some elaboration and supplemental explanation. **Attachment 1 and 2 provide frequency and voltage duration envelopes, not an expected frequency or voltage profile. The curves do not imply a very slow or stepped frequency or voltage recovery. The Clarifications included with the attachment curves provide the requested clarification. See especially Voltage Ride-Through Curve Clarification #3** B) The proposed PRC-024 draft allows certain exemptions (e.g., loss of field and loss of synchronism) that are not permitted in the stability assessment of wind plants. This appears to be in conflict with the FERC 693 mandate for technology-neutral ride-through requirements, since wind turbines have no analogous exceptions. Indeed, the reason for the LVRT standard applied to wind turbines was because of the characteristic of induction generator wind turbines to lose synchronism at low voltages. **The SDT agrees with you fully that wind turbines provide superior reliability benefits for the power system which industry has indicated that conventional generators simply cannot supply. Based on comments from stakeholders the performance requirements that currently apply to wind plants through FERC Order 661 were not extended to conventional generators in this standard.** **R1 provides analogs exemptions for both synchronous and power electronic based equipment.** C) The Abnormal Frequency ride through curves of PRC-024 (on Attachment 2) have

Organization	Yes or No	Question 3 Comment
		not been coordinated with the equipment standards and exceed the overfrequency limits in the equipment standards in most cases. **The Abnormal Frequency ride through curves on Attachment 1 have been adjusted to match IEEE and IEC requirements.** D) Further on PRC-024, there is only one reference explicitly cited, yet there are several implicitly cited (e.g., frequency limits) and there are well-known conflicts with equipment standards. The sources of the frequency limits and equipment standard limits should be cited in publicly available documents. Where, for example, are the Eastern Grid and ERCOT overfrequency requirements? They are not generally known. They should be explicitly cited. **The Abnormal Frequency ride through curves on Attachment 1 have been adjusted to match IEEE and IEC requirements. References for curves have been added to the standard.** E) The LVRT curves stipulate that the stability assessment be performed at rated lagging power factor. This is not a conservative assumption. It should be justified, not simply asserted as standard practice. **It is not the most conservative but it is a typical operating point.**
Response: The SDT thanks you for your comment. Based on comments from you and numerous other stakeholders the SDT has decided to remove Requirement R5 from the next draft of the standard. The SDT believes that Requirement R4 meets the reliability objective of the directive in Paragraph 1787 of FERC Order 693. In addition, the SDT agrees with stakeholders who indicated that the additional resources that would be required to design, build, operate and maintain synchronous generating facilities that could ride through any of the defined excursions without fail would not justify the resulting incremental gain in grid reliability. From a low voltage ride-through perspective, the occurrence of severe transmission system faults in the immediate vicinity of a generation facility is rare and the history of transmission faults causing trips of generating facilities remote (e.g., more than one bus away) from the fault is similarly rare. From a frequency excursion perspective, turbines and generators currently on the market easily meet the requirements for coordinating with UFLS programs when challenged with typical frequency excursions. While there have been issues with frequency oscillations in some cases (e.g., lean fuel blowout), the SDT believes that these types of issues can be resolved by market forces without the need for a requirement in a reliability standard. This directly addresses		

Organization	Yes or No	Question 3 Comment
your comments 2, 3, 9, 10. Please see other responses above.		
Texas Reliability Entity		1) R5: New generation units may not be able to meet this requirement if auxiliary systems are included. While the standard allows for a temporary or retroactive exemption, it is a difficult task to design and build a new plant and take into account the myriad of pumps, fans, dampers, control systems, instrumentation, etc. that could possible trip the unit during a low frequency or low voltage event. The SDT may want to consider removing the language "and plants (including auxiliary systems)" from the first sentence of this requirement. If the SDT maintains this requirement, consideration should be given to utilizing a lower VSL other than Severe. Additionally, considering the proposed definition of BES, is the auxiliary system phrase applicable? **Based on comments from you and numerous other stakeholders the SDT has decided to remove Requirement R5 from the next draft of the standard. The SDT believes that Requirement R4 meets the reliability objective of the directive in Paragraph 1787 of FERC Order 693. In addition, the SDT agrees with stakeholders who indicated that the additional resources that would be required to design, build, operate and maintain synchronous generating facilities that could ride through any of the defined excursions without fail would not justify the resulting incremental gain in grid reliability. From a low voltage ride-through perspective, the occurrence of severe transmission system faults in the immediate vicinity of a generation facility is rare and the history of transmission faults causing trips of generating facilities remote (e.g., more than one bus away) from the fault is similarly rare. From a frequency excursion perspective, turbines and generators currently on the market easily meet the requirements for coordinating with UFLS programs when challenged with typical frequency excursions. While there have been issues with frequency oscillations in some cases (e.g., lean fuel blowout), the SDT believes that these types of issues can be resolved by market forces without the need for a requirement in a reliability standard.** 2) As written, the standard will apply across all types of BES-defined generation units

Organization	Yes or No	Question 3 Comment
		(Individual generating unit greater than 20 MVA directly connected to the bulk power system, generating plant/ facility consisting of one or more units that are connected to the bulk power system at a common bus with total generation greater than 75 MVA, etc.) regardless of fuel type. Based on this applicability, fossil-fueled conventional units and variable resources (wind, solar, hydro, etc.) must meet the same voltage/frequency criteria. Is this the intent of the SDT? Voltage ride-through capabilities can vary significantly between fossil-fueled plants and wind plants due to their technical dissimilarities. Attempting to apply a single criteria to both will lead to technical difficulties between synchronously-connected and asynchronously-connected machines, as each responds differently voltage disturbances. Attempting a one-size-fits-all approach is inappropriate for this type of standard. The standard should recognize that wind generators and traditional generation facilities are technologically dissimilar and, therefore, cannot be treated the same in this instance. **Yes, the intent of the standard is to be technology neutral and apply to all types of generation, as directed by FERC in Paragraph 1787 of FERC Order 693.** 3) If a Generator Owner has a limitation that is communicated but failed to set its frequency protective relaying to not operate, is that a violation? **The Generator Owner is allowed to set a protective relay to operate within the "No Trip Zone" for that portion of the Zone that applies to the equipment limitation that has been communicated per Requirement R3.** 4) Has there been any consideration of providing separate capability curve figures for each Interconnection? **The SDT considered having separate off-nominal frequency curves for each interconnection but elected to include a single curve in the standard. The individual tables provide more accurate information that would be used for determining relay settings.**
Response: Thank you for your comments. Please see responses to specific comments above.		

Organization	Yes or No	Question 3 Comment
Wisconsin Electric Power Company		1. In R2, it is not specified whether the voltage ride-through curve (Attachment 2) refers to three-phase voltages or any one phase. This makes an enormous difference in the ability of equipment to withstand the sag. More importantly, the extreme voltage ride through requirements do not appear to be technically feasible to achieve for coal and gas-fired turbine-generators. The voltage ride-through requirements should be re-examined to verify they are justified by reliability need, and separated from the more critical frequency coordination requirements. We believe that a separate standard is needed for the voltage requirements, which are not as clearly justified or supported by existing equipment. **The voltage ride-through curves are voltage magnitude vs. duration which would encompass both three-phase and single-phase faults on the transmission system. The duration of the curves in Attachment 2 has been shortened form 10 minutes to 4 seconds to coordinate with the Generator Relay Loadability standard (PRC-025). Following the excursion defined in PRC-024 Attachment 2, the steady-state stressed system conditions described in PRC-025 would apply. Based on comments from you and numerous other stakeholders the SDT has decided to remove Requirement R5 from the next draft of the standard, eliminating the voltage ride through performance requirement for future generating facilities.** 2. R2 consists of a single sentence with over 100 words. This needs to be corrected. **The SDT feels that R2 is clearly written and expresses the reliability objective.** 3. In R3 and associated M3, the GO is responsible to document equipment limitations that prevent the unit from meeting the frequency and voltage performance curves. However, it is not uncommon for the generating unit to experience problems in a wide variety of plant systems which result in unit trips. Thus the GO is not necessarily aware of the source of these less frequent unit trips caused by external events, such as transmission system faults, and associated voltage sags. Therefore this requirement needs to also apply to the Transmission Owner. The TO (or TP) should be required to identify those events within its system that may

Organization	Yes or No	Question 3 Comment
		have adversely affected generating units. Only then can the GO be responsible to identity its equipment limitations. Without this joint responsibility, this requirement should be removed. **The GO is responsible for documenting equipment limitations that require generator protection to be set to operate within the "No Trip Zone" of Attachments 1 or 2 based on the frequency and voltage at the point of interconnection regardless of the transmission system event which caused the voltage or frequency deviation. The Transmission Owner and Transmission Planner do not have the information about the Generator Owners' equipment to make the assessment being recommended. This has always been the responsibility of the Generator Owner.** 4. In R3.1, the requirement is for the GO to communicate equipment limitations to four different entities. This requirement is in the long-term planning horizon, and therefore the communication should be limited to the TP only, and not the other entities. The TP is the primary recipient, and they can pass the information to the other entities as necessary, as described in the NERC Functional Model. In addition, the time requirement of 30 days is unreasonably short; we suggest that 90 days would be sufficient for this long-term planning requirement. **The SDT feels that 30 days is a reasonable amount of time to compile and send the required information and that sending the material to the four entities is not an unreasonable burden.** 5. In R5, it does not appear that new thermal plants can meet these requirements, which have largely been developed for wind farms, especially Attachment 2. The auxiliary systems of such plants cannot be quaranteed to meet the performance curves, apart from a strong cooperative effort by equipment suppliers to design these requirements into the equipment. There need to be industry standards (e.g., IEEE) in place before this requirement is ready for industry use, such as performance standards for equipment like variable-speed drives, for one example.

Response: The SDT thanks you for your comment. Please see responses above.		
Tennessee Valley Authority		1. The technical justification for the need of a plant performance criteria appears to be based on issues with early design wind generation. The technical considerations at these types of generation stations are different than steam turbine generation plants, which require heavy induction loads to support operation and these loads are sensitive to upsets in voltage and frequency. The technical implications of the plant performance are not clear. Recommend generating a separate SAR and bring in industry technical SMEs such as IEEE, EPRI, Equipment OEMs, Power Plant Design entities, technical acadamia, etc. to assist in the technical analysis and standard development.

Organization	Yes or No	Question 3 Comment
		2. Likewise, industry technical SMEs such as IEEE, EPRI, Equipment OEMs, Power Plant Design entities, technical acadamia, etc. can develop acceptable methods to determine the capability of a plant to ride through grid transients. 3. The following are IEEE Electric Machines Committee comments for PRC-024-1 considerationThe IEEE Electric Machinery Committee hosted a discussion topic on “Grid Code Impact on Electric Machine Design” in San Diego at this year’s Power Engineering Society meeting and offers the following input. o Minor changes in the Under-frequency Ride Through Curve are suggested to better match existing machine design standards in IEEE C50????. o The PRC-024 Voltage Ride Through criteria is technically not ready to be a standard, for the following reasons; 1. PRC-024 VR capability may not be available at any price. BES reliability enhancements requiring technological advances should be addressed with industry groups (e.g. ASME, IEEE) and OEMs to develop commercially available products before appearing as requirements in reliability standards. It is believed the cost of complying with wider standards might increase main generator machine costs as much as 25%, which is not insignificant. This should only be required if there is a defined local system need for higher standards and that these costs should be considered against the cost of other possible resolutions. 2. A specific concern in this respect regarding the ride-through capability being sought in PRC-024 R3-5 is that auxiliary buses may drop-out and cause a unit to trip for the excursions specified, which go well beyond the industry's present design criteria, even if the protective relay settings nominally allow such transients. It may be unrealistic to expect that the dynamic behavior of all 4160V and 460V systems in new plant can be dynamically modeled to a degree allowing one to obtain non-drop-out guarantees from equipment suppliers and EPC firms for extreme transients such as 2.0 seconds at 65% voltage, or that the same can be done for existing plants to allow identification of limiting components and accurate estimates of performance. 3. The voltage ride through was originally intended to address early deficiencies in wind generation design only and it doesn’t make sense to apply such a broad curve to steam plants. The concerns that led to the VRT curve for wind have been addressed by new vintage wind plant designs and thus, the EMC does not

Organization	Yes or No	Question 3 Comment
		believe there is not driving need for a standard VRT criteria. o The VRT issue is holding up addressing other significant issues addressed by PRC-024 (relay setting coordination and frequency ride through). The VRT should be pulled out of PRC-024 and a new SAR drafted to address the voltage performance aspects if this is really needed for reliability. o More clarity in defining plant MVARs available to support grid voltage is needed. Specifically, generation plants have not been designed to operate outside a normal band of 95 to 105% on the generator terminals. GSU settings are typically chosen to optimize MVAR support under normal operations, however is not reasonable to assume the full leading or lagging reactive support would be available under normal grid conditions.
Response: The SDT thanks you for your comments. Based on comments from you and numerous other stakeholders the SDT has decided to remove Requirement R5 from the next draft of the standard. The SDT believes that Requirement R4 meets the reliability objective of the directive in Paragraph 1787 of FERC Order 693. In addition, the SDT agrees with stakeholders who indicated that the additional resources that would be required to design, build, operate and maintain synchronous generating facilities that could ride through any of the defined excursions without fail would not justify the resulting incremental gain in grid reliability. From a low voltage ride-through perspective, the occurrence of severe transmission system faults in the immediate vicinity of a generation facility is rare and the history of transmission faults causing trips of generating facilities remote (e.g., more than one bus away) from the fault is similarly rare. From a frequency excursion perspective, turbines and generators currently on the market easily meet the requirements for coordinating with UFLS programs when challenged with typical frequency excursions. While there have been issues with frequency oscillations in some cases (e.g., lean fuel blowout), the SDT believes that these types of issues can be resolved by market forces without the need for a requirement in a reliability standard. The Abnormal Frequency ride-through curves on Attachment 1 have been adjusted to match IEEE and IEC requirements. References for curves have been added to the standard.		
Independent Electricity System Operator		1. We appreciate the SDT's effort in making clarifying changes to the Implementation Plan to separate the effective dates for jurisdictions where regulatory is and isn't required. And we understand that the phrase "following applicable regulatory authority" includes regulatory bodies from Canadian provinces requiring regulatory body approval. However, the separation alone and leaving the phrase "following

Organization	Yes or No	Question 3 Comment
		applicable regulatory authority" unchanged do not address the situation in Ontario where (a) regulatory approval is required" but (b) the effective dates are not necessarily tied with the effective dates indicated in the Sub-Section that applies to those jurisdictions where regulatory is required. In other words, the proposed language only partially reflects Canadian regulatory framework and we suggest additional wording, as described below. We request the following phrase be added to each sentence under the "In those jurisdictions where regulatory approval is required" of the Implementation Plan: ", or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities." right after "following applicable regulatory approval". The revised first bullet, for example, will read: o By the first day of the first calendar quarter, two calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner shall have verified at least 40 percent of its applicable Facilities are fully compliant with Requirements R1, R2, R3, R4, and R6. And the same change to each of the sentences in Section A5.1 of the standard should also be made. **The SDT agrees with your suggestion and has included the requested language.** 2. The impact of disconnecting a generating unit less than 20 MVA or a generation plant less than 75 MVA during frequency or voltage excursions is very limited. We suggest to add the following facility thresholds into the applicability section: a. Generating unit with a gross nameplate rating greater than 20 MVA b. Generating plant with an aggregated gross nameplate rating greater than 75 MVA **The applicability for this standard is based on the Registry Criteria, so your suggested change is already included.** 3. There is a typo on the R2 footnote on "protective relaying". It should be 2 instead of 1. **This is supposed to be the same footnote as in R1, as it applies to both requirements.**

Organization	Yes or No	Question 3 Comment
Response: The SDT thanks you for your comment. Please see responses above.		
Essential Power, LLC		1.The risk of incurring resonant vibration of steam turbine last-stage blades is generally related to blade length, so the off-frequency ride-through criteria in Att. 1 of PRC-024-1 are a concern for larger units. Nuclear plants in particular may be required to operate not only outside of OEM recommendations but at conditions that are unsafe. **R3 allows the GO to document, and provide to the documentation to the Reliability Coordinator, Planning Coordinator, Transmission Operator and Transmission Planner, the known equipment limitations which will not allow the equipment to meet the criteria of Attachments 1 and 2. This allows the Generator Owner to set protection to trip the generator inside the "No Trip Zone" for the specific limitations communicated. These would include both of your examples (protecting the turbine from operating at low frequencies that the OEM has specified will damage the turbine and for operating under conditions prohibited by the NRC).** 2.Some gas turbines may experience surge or combustion upsets (including flame-out) at the off-speed conditions of Att. 1, in addition to potentially incurring blade vibration issues similar to those described above. **When the upsets described above can be proven as true limitations, then R3 allows the GO to document, and provide to the documentation to the Reliability Coordinator, Planning Coordinator, Transmission Operator and Transmission Planner, the known equipment limitations which will not allow the equipment to meet the criteria of Attachments 1 and 2.** 3.Auxiliary equipment contactors are likely to drop-out at the off-design voltage values specified in Att. 2 of PRC-024-1, especially if the high-side voltage swings specified in this standard are magnified at plant MV and LV aux buses. **Auxiliary equipment contactors are not considered part of the generator protection as defined for Requirements R1 and R2 in this standard. The Generator Owner will need to take into consideration the performance of this equipment during voltage or frequency excursions only if requested to provide the estimate contained in**

Organization	Yes or No	Question 3 Comment
		Requirement R4. 4.Fan and pump performance will be affected at the frequency limits of Att. 1, and below-rated voltage per Att. 2 may cause this equipment to stall, causing main flame trips, high/low duct pressure trips, drum level oscillations below the low water cut-out point and the like. This is especially the case if cycling above and below the rated frequency during Disturbances (but within the limits of Att. 1) magnifies system oscillations or drives automatic control systems unstable. **While frequency and voltage protective relaying or functions will be set per Attachments 1 and 2 of PRC-024-1, the GO will need to take into consideration the above mentioned equipment only if requested to provide the estimate contained in R4.** 5. The prohibition against tripping for existing units applies not just to actuation of Protection Systems but to "protective relaying," which per footnote #1 in PRC-024 includes "protective functions within control systems...based on frequency or voltage inputs." It is unclear whether or not this definition covers contactor drop-out or actuation of fan stall protection systems at extreme under-voltage conditions**. The definition of protective relaying and protective functions does not cover contactor drop-out or actuation of fan stall protection systems.** 6.The basis of compliance for new units is simply, "will not trip," i.e. covering all issues cited above plus any unpredictable other factors that may take units down. It is not realistic to expect such sweeping guarantees to be available on a system-wide basis, even if some individual pieces of equipment can ostensibly comply with Atts. 1 and 2, effectively shutting-down the new power plant industry unless an owner were willing to take unbounded risk**. Based on comments from you and numerous other stakeholders the SDT has decided to remove Requirement R5 from the next draft of the standard. The SDT believes that Requirement R4 meets the reliability objective of the directive in Paragraph 1787 of FERC Order 693. In addition, the SDT agrees with stakeholders who indicated that the additional resources that would be required to design, build, operate and maintain synchronous generating facilities that could ride through any of the defined excursions without fail would not justify**

Organization	Yes or No	Question 3 Comment
		the resulting incremental gain in grid reliability. From a low voltage ride-through perspective, the occurrence of severe transmission system faults in the immediate vicinity of a generation facility is rare and the history of transmission faults causing trips of generating facilities is similarly rare. From a frequency excursion perspective, turbines and generators currently on the market easily meet the requirements for coordinating with UFLS programs when challenged with typical frequency excursions. While there have been issues with frequency oscillations in some cases (e.g., lean fuel blowout), the SDT believes that these types of issues can be resolved by market forces without the need for a requirement in a reliability standard. 7. A “will not trip” obligation may also effectively ban entire classes of equipment, including combined cycle plants (as regards the chances of incurring lean blow-out) and (as mentioned earlier) nuclear facilities. It is noteworthy in this respect that environmental regulators have for decades been pushing gas turbine dry low-NOx combustors to the brink of instability during even steady-state operation, with inevitable negative implications for survival of Disturbances. Greater consideration of BES reliability may be needed, but doing so by issuing dueling regulations would not constitute an appropriate approach**. See answer to 6 regarding the removal of R5 from the previously posted standard.** 8. M5 causes new-unit tripping due to frequency or voltage excursions within PRC-024 limits to constitute a violation, but it seems unlikely to expect an “or” event. That is, Disturbances are likely to cause frequency and voltage to simultaneously deviate from the rated values, and it is unclear how this combination of factors will be addressed in assessing compliance with the stands-separate basis of Att. 1 and Att. 2 in this standard. **See answer to 6 regarding the removal of R5 from the previously posted standard.** 9. The grandfathering of existing units in R1 and R2 for, “documented and communicated equipment limitations,” is problematical; since the propensity to incur drum level fluctuations, air/flue gas flow oscillations and the like during Disturbances

Organization	Yes or No	Question 3 Comment
		will not be defined in OEM literature, nor is it generally possible to predict by calculations when such problems will occur, especially if a Disturbance involves cycling between above and below the rated frequency (but within the Att. 1 boundaries). The same is true regarding predicting transient fluctuations of aux bus voltages, ref. risk of contactor drop-out and stalling major auxiliary equipment. **The exemptions in requirement R3 based on requirement R1 and R2 relay settings apply only to equipment protected by generator protective relaying and not relaying associated with in-plant equipment.** 10. The concern above applies also to having to make reference per R3 to, "study results, experience from an actual event, or manufacturers advisory." Few if any GOs are likely to possess such documentation for Disturbances as extreme as those specified in Att. 1 and Att. 2. The list of types of evidence in R3 is not exclusive, but it is difficult to imagine alternative forms of hard evidence that could be developed other than for the comparatively few plants that possess high-fidelity simulators. **The generator owner will be required to support the exemption by documentation but this only applies to equipment that is protected by generator protective relaying only. The equipment manufacturer should provide operating limitation documentation with the equipment.** 11. The same concerns regarding availability of information apply for the, "estimate of the time duration the existing generation unit will remain connected," in R4. Relying on "sound engineering judgment" is permitted, and R4 states that "detailed unit performance studies are not required;" but the word "sound" implies that the estimate is to be based on accurate data, and how such information could be developed without a detailed study is unclear. **Requirement R4 was worded to address the concern that detailed studies are not required. The entity should use available data and its knowledge of the plant design to develop an estimate.** 12. Confusion is created by making grandfathering, "in accordance with Requirement R3," in R1 and R2 of PRC-024-1; while R3 excludes, "limitations that are caused by generator frequency and voltage protective relays." Are such protective relays meant

Organization	Yes or No	Question 3 Comment
		to correspond to the "protective relaying" discussed above? It is semantically unclear whether or not any grandfathering is actually being allowed. **The exemptions in requirement R3 are based on the inability of a generating unit meeting the criteria in Requirements R1 or R2. Inability to set existing protection to meet these Requirements does not constitute a valid reason for setting the protection to trip the generator within the no-trip zone in Attachments 1 and 2.** 13. The exemption take-back in the last bullet item of R3.1 (a 10% increase in nameplate capacity) again may effectively ban entire classes of equipment, or at least prevent units from ever receiving capacity and efficiency enhancements. **If an entity replaces a piece of equipment that is causing a limitation per Requirement R3 and increases capacity by 10%, it must address the limitations. This is analogous to New Source Standards for pollution control.** 14. Steam turbine off-frequency limits are generally set by OEMs lifetime limits as regards duration, but there is no discussion in PRC-024-1 as to how often the specified excursions may occur, leaving users with ostensibly compliant equipment still at risk if major upsets take place more often than had been anticipated. **The drafting team realizes that multiple under/over frequency events may occur that result is turbine blade loss of life resulting in an entity changing relay settings that effectively allows for tripping in the no trip zone. If this were to occur, the entity would supply documentation that supports exemption in requirement R3.** 15. An additional "may trip" exclusion is needed for R1 and R2 related to V/Hz set properly to limit over excitation of generators or transformers. **Volts per hertz relaying is evaluated in requirement R2 as a voltage relay with a constant 60 hertz frequency. Per Clarification #4, the high voltage portion of the curves in Attachment 2 should be lowered proportionately for evaluating at frequencies lower than 60 Hz.** 16. Objection to R5 - the additional costs involved for re-designing generating stations so that every control subsystem can ride through the excursions defined by the attached curves is not economically justifiable considering the very small probability

Organization	Yes or No	Question 3 Comment
		of a voltage and/or frequency excursion occurring. Furthermore, we believe it is fundamentally inappropriate to support approval of such a requirement until the technical issues that would require changes to the industry standards for plant systems and equipment are resolved. We recommend this requirement be removed so the standard can move forward to address the shorter term goals that are achievable. **Based on comments from you and numerous other stakeholders the SDT has decided to remove Requirement R5 from the next draft of the standard. The SDT believes that Requirement R4 meets the reliability objective of the directive in Paragraph 1787 of FERC Order 693. In addition, the SDT agrees with stakeholders who indicated that the additional resources that would be required to design, build, operate and maintain synchronous generating facilities that could ride through any of the defined excursions without fail would not justify the resulting incremental gain in grid reliability. From a low voltage ride-through perspective, the occurrence of severe transmission system faults in the immediate vicinity of a generation facility is rare and the history of transmission faults causing trips of generating facilities is similarly rare. From a frequency excursion perspective, turbines and generators currently on the market easily meet the requirements for coordinating with UFLS programs when challenged with typical frequency excursions. While there have been issues with frequency oscillations in some cases (e.g., lean fuel blowout), the SDT believes that these types of issues can be resolved by market forces without the need for a requirement in a reliability standard.** 17. Does R6 refer to ALL generator trips? This should be limited to Protection System relaying set to trip on over/under voltage or over/under frequency, or over volts/Hertz, not ALL generator trips. Also, this requirement may repeat requirements that are being developed in revisions to PRC-001. **Although unlikely, there may be cases where a planner may require relay settings from other generator protective functions to perform studies. It is to the Generator Owner's advantage with little burden to provide such data for a Transmission Planner's study to be as accurate as possible.** 18. It is inconceivable that most plants can ride through a + or - 10% voltage

Organization	Yes or No	Question 3 Comment
		excursion for 10 minutes per PRC-024, Attachment 2. Almost all would have to take exceptions. **The curves in Attachment 2 have been revised and shortened from 600 seconds to 4 seconds in order to coordinate better with the Generator Relay Loadability standard (PRC-025). The philosophy is that PRC-024 applies during excursions and PRC-025 applies subsequently during steady-state stressed system conditions.**
Response: The SDT thanks you for your comments. See individual responses to your questions above.		
Pepco Holdings Inc		A footnote 2 reference to qualify the term "existing generating unit" should also be included in the last bullet in Requirement R2.Also, the language in footnote 2 should begin with "Includes ..." rather than "To include..."
Response: The SDT thanks you for your comments. Due to the SDT removing the ride-thru provisions of R5 in the previously posted version of this standard, the term "existing generating unit" and the footnote has been removed from the next draft.		
SERC Reliability Corp		An additional "may trip" exclusion is needed for R1 and R2 related to properly set V/Hz relaying. **The SDT reviewed IEEE standards and published OEM V/Hz capabilities and believes that the high voltage curve (in conjunction with Clarification #4) allow V/Hz protection to be set to protect the equipment while still meeting the requirements of this standard without additional exclusions .** Does R6 refer to ALL generator trips? This should be limited to Protection System relaying set to trip on over/under voltage or over/under frequency, or over volts/Hertz, not ALL generator trips. Note: Depending on approval dates, R6 may repeat requirements that are being developed in revisions to PRC-001 and/or PRC-027. **The GO must provide all requested protective settings. These settings would be those that are included in the planner's stability models. It is important for grid stability that these stability models contain accurate information. The SDT does not see this as an undue burden. No such settings reporting requirements exist in PRC-001 or PRC-027.**

Organization	Yes or No	Question 3 Comment
		Not really protection related: The additional costs involved for re-designing generating stations under R5 so that every control subsystem can ride through the excursions defined by the attached curves is not economically justifiable considering the very small probability of a voltage and/or frequency excursion occurring. It is inappropriate to support approval of such a requirement until the technical issues that would require changes to the industry standards for plant systems and equipment are resolved. **Based on comments from you and numerous other stakeholders the SDT has decided to remove Requirement R5 from the next draft of the standard. The SDT believes that Requirement R4 meets the reliability objective of the directive in Paragraph 1787 of FERC Order 693. In addition, the SDT agrees with stakeholders who indicated that the additional resources that would be required to design, build, operate and maintain synchronous generating facilities that could ride through any of the defined excursions without fail would not justify the resulting incremental gain in grid reliability. From a low voltage ride-through perspective, the occurrence of severe transmission system faults in the immediate vicinity of a generation facility is rare and the history of transmission faults causing trips of generating facilities is similarly rare. From a frequency excursion perspective, turbines and generators currently on the market easily meet the requirements for coordinating with UFLS programs when challenged with typical frequency excursions. While there have been issues with frequency oscillations in some cases (e.g., lean fuel blowout), the SDT believes that these types of issues can be resolved by market forces without the need for a requirement in a reliability standard.**
Response: The SDT thanks you for your comments. See individual responses to your questions above.		
Southern Company		1) An additional “may trip” exclusion is needed for R1 and R2 related to V/Hz set properly to limit overexcitation of generators or transformers. **The SDT reviewed IEEE standards and published OEM V/Hz capabilities and believes that the high voltage curve (in conjunction with Clarification #4) allow V/Hz protection to be set to protect the equipment while still meeting the requirements of this standard**

Organization	Yes or No	Question 3 Comment
		without additional exclusions . 2) Please consider a requirement for the TP to perform location-specific system voltage recovery studies referenced in R2. This should be a requirement for the TP prior to requiring the severe voltage profile of Attachment 2. **The SDT feels the profile of Attachment 2 can be accomplished by the vast majority of applicable generating units. The GO may request the voltage recovery characteristics of a location-specific Transmission Planner's study for any generating unit.** 3) Both the exemption of existing units using the exceptions in R1 and R2 for "documented and communicated equipment limitations" and "the estimation of time a unit will remain connected" per R4 are problematical. Power plants exhibit a tendency for have drum level fluctuations, air/flue gas flow oscillations, or other plant subsystem instability during system disturbances which are not defined in OEM literature. It is generally not possible to determine when such problems will occur especially if a disturbance involves cycling above and below the rated frequency within the Attachment 1 boundaries. The same is true regarding predicting transient fluctuations of auxiliary system bus voltages. These voltage fluctuations affect power distribution equipment in the power plant by contactor or control relay drop-out, major auxiliary equipment stalls, etc. Predicting when a plant trip will occur due to these types of power plant system responses is problematic. **The SDT agrees with your comment, but believes that the wording of R4, "The Generator Owner may develop the estimates based on experience, actual event histories, or sound engineering judgment," allows the GO to provide an estimate.** 4) The "10% power increase" exemption loss (in the last bullet item of R3.1) may effectively ban entire classes of equipment or prevent units from ever receiving capacity and efficiency enhancements. . **If an entity replaces a piece of equipment that is causing a limitation per Requirement R3 and increases capacity by 10%, it must address the limitations. This is analogous to New Source Standards for pollution control.** 5) We object to R5 - the additional costs involved for re-designing generating stations

Organization	Yes or No	Question 3 Comment
		so that every control subsystem can ride through the excursions defined by the attached curves is not economically justifiable considering the very small probability of a voltage and/or frequency excursion occurring. Furthermore, we believe it is fundamentally inappropriate to support approval of such a requirement until the technical issues that would require changes to the industry standards for plant systems and equipment are resolved. We recommend this requirement be removed so the standard can move forward to address the shorter term goals that are achievable. Further commentsi regarding R5: Currently, there exist too many engineering challenges to permit the requirement of R5. These include the following:Fan and pump performance will be affected at the frequency limits of Att. 1, and below-rated voltage per Att. 2 may cause this equipment to stall, causing main flame trips, high/low duct pressure trips, drum level oscillations below the low water cut-out point and the like. This is especially the case if cycling above and below the rated frequency during Disturbances (but within the limits of Att. 1) magnifies system oscillations or drives automatic control systems unstable.Auxiliary equipment contactors and energized control relays are likely to drop-out at the off-design voltage values specified in Att. 2 of PRC-024-1, especially if the high-side voltage swings specified in this standard are magnified at plant MV and LV aux buses. This dropout will occur within a few cycles.The basis of compliance for new units is simply, “will not trip,” i.e. covering all issues cited above plus any unpredictable other factors that may take units down. It is not realistic to expect such sweeping guarantees to be available on a system-wide basis, even if some individual pieces of equipment can ostensibly comply with Atts. 1 and 2, effectively shutting-down the new powerplant industry unless an owner were willing to take unbounded risk. This will require revision of, not only plant equipment standards, but “plant system” standards. Even if we could certify all of the components, you cannot guarantee once they are implemented into a system they will respond as planned. Disturbances are likely to cause frequency and voltage to simultaneously deviate from the rated values, and it is unclear how this combination of factors will be addressed in assessing compliance with the stands-separate basis of Att. 1 and Att. 2 in this standard.The SDT stated in

Organization	Yes or No	Question 3 Comment
		their previous PRC-024 Consideration of Comments that grid requirements similar to R5 are already in effect in parts of Europe. U.S. standards still prevail for design, construction, and operation of plants in the U.S. We believe it is inappropriate to implement a national standard requiring U.S. plants be designed to the requirements of R5 until the industry can demonstrate through additional research, development, and revision of the plant equipment and system standards that such requirements can be practically met. **Based on comments from you and numerous other stakeholders the SDT has decided to remove Requirement R5 from the next draft of the standard. The SDT believes that Requirement R4 meets the reliability objective of the directive in Paragraph 1787 of FERC Order 693. In addition, the SDT agrees with stakeholders who indicated that the additional resources that would be required to design, build, operate and maintain synchronous generating facilities that could ride through any of the defined excursions without fail would not justify the resulting incremental gain in grid reliability. From a low voltage ride-through perspective, the occurrence of severe transmission system faults in the immediate vicinity of a generation facility is rare and the history of transmission faults causing trips of generating facilities is similarly rare. From a frequency excursion perspective, turbines and generators currently on the market easily meet the requirements for coordinating with UFLS programs when challenged with typical frequency excursions. While there have been issues with frequency oscillations in some cases (e.g., lean fuel blowout), the SDT believes that these types of issues can be resolved by market forces without the need for a requirement in a reliability standard.** 6) Please consider requirements for TO to address the frequency and voltage excursions in the transmission system in order to arrest the abnormal condition locally. **The standard applies to Generators Owners. Consideration has been given to transmission system based solutions in R2 where the Transmission Planner can specify less stringent conditions for a specific generator. The UFLS systems designed per standard PRC-006-1 accomplish the suggested activity for frequency excursions. Voltage excursions caused by faults on the transmission system cannot**

Organization	Yes or No	Question 3 Comment
		realistically be arrested. 7) Does R6 refer to ALL generator trips? This should be limited to Protection System relaying set to trip on over/under voltage or over/under frequency, or over volts/Hertz, not ALL generator trips. Also , this requirement may repeat requirements that are being developed in revisions to PRC-001. **The GO must provide all requested protective settings. These settings would be those that are included in the planner's stability models. It is important for grid stability that these stability models contain accurate information. The SDT does not see this as an undue burden. No such settings reporting requirements exist in PRC-001 or PRC-027.** 8) It is inconceivable that most plants can ride through a + or - 10% voltage excursion for 10 minutes per PRC-024, Attachment 2. Almost all would have to take exception. All of our nuclear plants would trip as would the new nuclear plant currently under construction. **The curves in Attachment 2 have been revised and shortened from 600 seconds to 4 seconds in order to coordinate better with the Generator Relay Loadability standard (PRC-025). The philosophy is that PRC-024 applies during excursions and PRC-025 applies subsequently during steady-state stressed system conditions.**
Response: The SDT thanks you for your comments. See individual responses to your questions above.		
BrightSource Energy		BrightSource is voting affirmative with the understanding that individual Regions can have requirements that are more stringent than NERC Standards. Therefore, even though R3 only requires GOs to "document each known equipment limitation (excluding limitations that are caused by generator frequency and voltage protective relays) that prevents a generating unit, from meeting the criteria in Requirements R1 or R2 ....", it does not relieve the GOs of their obligations under the WECC Coordinated Off-Nominal Load Shedding Plan for generators that connects to the Western Interconnection.
Response: The SDT thanks you for your comment and agrees with its content.		

Organization	Yes or No	Question 3 Comment
Consumers Energy		Consumers Energy's previous comments - "Related to undervoltage criteria, the 18 cycle at 45% of generator voltage would put a great deal of strain on the plant auxiliary systems and that may not be something these systems are able to withstand. The same would be true of a fault that produces 65% voltage at the generator terminals for 2 seconds. These comments relate specifically to Consumers Energy. However, it is likely that many others have similar equipment and would have the same issues. Please also note that the proposed standard does not align with ANSI C37.102, IEEE Guide for AC Generator Protection or with the NERC Technical Reference Document entitled Power Plant and Transmission System Protection Coordination."Previous SDT reply - Thank you for your comments. Please note that the voltage levels specified in Attachment 2 are at the point of interconnection to the transmission system. They would not correlate directly with the auxiliary bus voltages, especially if the auxiliaries are unit-connected. The SDT does not believe this proposed standard is in conflict with either the IEEE or the NERC documents cited. Please inform the SDT of the specifics of your concerns." We believe our comments still apply. Specific to the fault that produces 65% voltage at the generator terminals for 2 seconds, plant auxliary equipment would not be able to withstand such a drop for the specified duration and would fall offline.
Response: The SDT thanks you for your comments. The SDT does not believe this proposed standard is in conflict with either the IEEE or the NERC documents cited. The SDT believes that the wording of R4, "The Generator Owner may develop the estimates based on experience, actual event histories, or sound engineering judgment," will allow the GO to provide an estimate. However, if the GO feels his equipment is not capable of meeting the undervoltage criteria of Attachment 2, then R3 would apply. Also, note that Attachment 2 has been modified for the next draft and now only extends to 4 seconds.		
Cowlitz PUD		Cowlitz supports the comments from the NAGF SRT: 1. The risk of incurring resonant vibration of steam turbine last-stage blades is generally related to blade length, so the off-frequency ride-through criteria in Att. 1 of PRC-024-1 are a concern for larger units. Nuclear plants in particular may be required to operate not only outside of OEM recommendations but at conditions

Organization	Yes or No	Question 3 Comment
		that are unsafe. **Requirement R3 allows the GO to document, and provide to the documentation to the Reliability Coordinator, Planning Coordinator, Transmission Operator and Transmission Planner, the known equipment limitations which require generator protection to be set to trip inside the no-trip zone of Attachments 1 and 2.** 2. Some gas turbines may experience surge or combustion upsets (including flame-out) at the off-speed conditions of Att. 1, in addition to potentially incurring blade vibration issues similar to those described above. **Requirement R3 allows the GO to document, and provide to the documentation to the Reliability Coordinator, Planning Coordinator, Transmission Operator and Transmission Planner, the known equipment limitations which require generator protection to be set to trip inside the no-trip zone of Attachments 1 and 2.** 3. Auxiliary equipment contactors are likely to drop-out at the off-design voltage values specified in Att. 2 of PRC-024-1, especially if the high-side voltage swings specified in this standard are magnified at plant MV and LV aux buses. **Auxiliary equipment contactors are not considered part of the generator protection as defined for Requirements R1 and R2 in this standard. The Generator Owner will need to take into consideration the performance of this equipment during voltage or frequency excursions only if requested to provide the estimate contained in Requirement R4** 4. Fan and pump performance will be affected at the frequency limits of Att. 1, and below-rated voltage per Att. 2 may cause this equipment to stall, causing main flame trips, high/low duct pressure trips, drum level oscillations below the low water cut-out point and the like. This is especially the case if cycling above and below the rated frequency during Disturbances (but within the limits of Att. 1) magnifies system oscillations or drives automatic control systems unstable. **Fans and pumps are not considered part of the generator protection as defined for Requirements R1 and R2 in this standard. The Generator Owner will need to take**

Organization	Yes or No	Question 3 Comment
		into consideration the performance of this equipment during voltage or frequency excursions only if requested to provide the estimate contained in Requirement R4. 5. The prohibition against tripping for existing units applies not just to actuation of Protection Systems but to "protective relaying," which per footnote #1 in PRC-024 includes "protective functions within control systems...based on frequency or voltage inputs." It is unclear whether or not this definition covers contactor drop-out or actuation of fan stall protection systems at extreme under-voltage conditions. **The definition of protective relaying and protective functions does not cover contactor drop-out or actuation of fan stall protection systems.** 6. The basis of compliance for new units is simply, "will not trip," i.e. covering all issues cited above plus any unpredictable other factors that may take units down. It is not realistic to expect such sweeping guarantees to be available on a system-wide basis, even if some individual pieces of equipment can ostensibly comply with Atts. 1 and 2, effectively shutting down the new power plant industry unless an owner is willing to take unbounded risk. **Based on comments from you and numerous other stakeholders the SDT has decided to remove Requirement R5 from the next draft of the standard. The SDT believes that Requirement R4 meets the reliability objective of the directive in Paragraph 1787 of FERC Order 693. In addition, the SDT agrees with stakeholders who indicated that the additional resources that would be required to design, build, operate and maintain synchronous generating facilities that could ride through any of the defined excursions without fail would not justify the resulting incremental gain in grid reliability. From a low voltage ride-through perspective, the occurrence of severe transmission system faults in the immediate vicinity of a generation facility is rare and the history of transmission faults causing trips of generating facilities is similarly rare. From a frequency excursion perspective, turbines and generators currently on the market easily meet the requirements for coordinating with UFLS programs when challenged with typical frequency excursions. While**

Organization	Yes or No	Question 3 Comment
		there have been issues with frequency oscillations in some cases (e.g., lean fuel blowout), the SDT believes that these types of issues can be resolved by market forces without the need for a requirement in a reliability standard. 7. A "will not trip" obligation may also effectively ban entire classes of equipment, including combined cycle plants (as regards the chances of incurring lean blow-out) and (as mentioned earlier) nuclear facilities. It is noteworthy in this respect that environmental regulators have for decades been pushing gas turbine dry low-NOx combustors to the brink of instability during even steady-state operation, with inevitable negative implications for survival of Disturbances. Greater consideration of BES reliability may be needed, but doing so by issuing dueling regulations would not constitute an appropriate approach. **See answer to 6 regarding the removal of R5 from the previously posted standard.** 8. M5 causes new-unit tripping due to frequency or voltage excursions within PRC-024 limits to constitute a violation, but it seems unlikely to expect an "or" event. That is, Disturbances are likely to cause frequency and voltage to simultaneously deviate from the rated values, and it is unclear how this combination of factors will be addressed in assessing compliance with the stands-separate basis of Att. 1 and Att. 2 in this standard. **See answer to 6 regarding the removal of R5 from the previously posted standard.** 9. The grandfathering of existing units in R1 and R2 for, "documented and communicated equipment limitations," is problematical; since the propensity to incur drum level fluctuations, air/flue gas flow oscillations and the like during Disturbances will not be defined in OEM literature, nor is it generally possible to predict by calculations when such problems will occur, especially if a Disturbance involves cycling between above and below the rated frequency (but within the Att. 1 boundaries). The same is true regarding predicting transient fluctuations of aux bus voltages, ref. risk of contactor drop-out and stalling major auxiliary equipment. **The exemptions in requirement R3 based on requirement R1 and R2 relay settings**

Organization	Yes or No	Question 3 Comment
		apply only to equipment protected by generator protective relaying and not relaying associated with in-plant equipment. 10. The concern above applies also to having to make reference per R3 to, "study results, experience from an actual event, or manufacturers advisory." Few if any GOs are likely to possess such documentation for Disturbances as extreme as those specified in Att. 1 and Att. 2. The list of types of evidence in R3 is not exclusive, but it is difficult to imagine alternative forms of hard evidence that could be developed other than for the comparatively few plants that possess high-fidelity simulators. **The SDT believes this would typically apply to limitations documented by OEM bulletins or by regulatory (e.g., NRC) operating restrictions which are generally available to Generator Owners. A Generator Owner may have performed a finite element analysis of a set of turbine blades to determine off-nominal frequency capability. While the SDT acknowledges this would be unusual, the intent of the wording in Requirement R3 was not to limit the type of evidence.** 11. The same concerns regarding availability of information apply for the, "estimate of the time duration the existing generation unit will remain connected," in R4. Relying on "sound engineering judgment" is permitted, and R4 states that "detailed unit performance studies are not required;" but the word "sound" implies that the estimate is to be based on accurate data, and how such information could be developed without a detailed study is unclear. **Requirement R4 was written to address the concern that detailed studies are not required. The entity should use available data and its knowledge of the plant design to develop an estimate.** 12. Confusion is created by making grandfathering, "in accordance with Requirement R3," in R1 and R2 of PRC-024-1; while R3 excludes, "limitations that are caused by generator frequency and voltage protective relays." Are such protective relays meant to correspond to the "protective relaying" discussed above? It is semantically unclear whether or not any grandfathering is actually being allowed.

Organization	Yes or No	Question 3 Comment
		The exemptions in requirement R3 are based on the inability of a generating unit meeting the criteria in Requirements R1 or R2. Inability to set existing protection to meet these Requirements does not constitute a valid reason for setting the protection to trip the generator within the no-trip zone in Attachments 1 and 2. 13. The exemption take-back in the last bullet item of R3.1 (a 10% increase in nameplate capacity) again may effectively ban entire classes of equipment, or at least prevent units from ever receiving capacity and efficiency enhancements. **If an entity replaces a piece of equipment that is causing a limitation per Requirement R3 and increases capacity by 10%, it must address the limitations. This is analogous to New Source Standards for pollution control.** 14. Steam turbine off-frequency limits are generally set by OEMs lifetime limits as regards duration, but there is no discussion in PRC-024-1 as to how often the specified excursions may occur, leaving users with ostensibly compliant equipment still at risk if major upsets take place more often than had been anticipated. **The drafting team realizes that multiple under/over frequency events may occur that result is turbine blade loss of life resulting in an entity changing relay settings that effectively allows for tripping in the no trip zone. If this were to occur, the entity would supply documentation that supports exemption in requirement R3.** 15. An additional “may trip” exclusion is needed for R1 and R2 related to V/Hz set properly to limit over excitation of generators or transformers. **Volts per hertz relaying is evaluated in requirement R2 as a voltage relay with a constant 60 hertz frequency. If the relay cannot be set according to Attachment 2, an exemption is allowed using requirement R3.** 16. Objection to R5 - the additional costs involved for re-designing generating stations so that every control subsystem can ride through the excursions defined by the attached curves is not economically justifiable considering the very small probability of a voltage and/or frequency excursion occurring. Furthermore, we believe it is fundamentally inappropriate to support approval of such a requirement

Organization	Yes or No	Question 3 Comment
		until the technical issues that would require changes to the industry standards for plant systems and equipment are resolved. We recommend this requirement be removed so the standard can move forward to address the shorter term goals that are achievable. **Based on comments from you and numerous other stakeholders the SDT has decided to remove Requirement R5 from the next draft of the standard. The SDT believes that Requirement R4 meets the reliability objective of the directive in Paragraph 1787 of FERC Order 693. In addition, the SDT agrees with stakeholders who indicated that the additional resources that would be required to design, build, operate and maintain synchronous generating facilities that could ride through any of the defined excursions without fail would not justify the resulting incremental gain in grid reliability. From a low voltage ride-through perspective, the occurrence of severe transmission system faults in the immediate vicinity of a generation facility is rare and the history of transmission faults causing trips of generating facilities is similarly rare. From a frequency excursion perspective, turbines and generators currently on the market easily meet the requirements for coordinating with UFLS programs when challenged with typical frequency excursions. Organization	Yes or No	Question 3 Comment
		excursion for 10 minutes per PRC-024, Attachment 2. Almost all would have to take exception. **Requirement R4 has been revised and the reference to 10 minutes has been removed.**
Response: The drafting team thanks you for your comments. Please see the answers to each comment above.		
Exelon Corporation and its affiliates		1) Exelon is concerned that there are no set criteria for the transients nor any guidelines in the Standard on the number of requests that the RC, PC, TOP or TP could ask for. This is problematic in that the generating units could be subject to multiple requests for different combinations of transients without any cost benefit or justification. Exelon therefore suggests that the GVSDT evaluate adding language to the Standard that includes a provision for a set periodicity in which the transmission entities can request such data (e.g., an annual request or following a significant event on the transmission system). **Requirement R4 was revised that requests may only be sent from a Planning Coordinator or Transmission Planner. In the event that multiple requests are received, it is permissible to use the initial response for each request.** 2) Exelon previously requested that the GVSDT split the Off Normal Frequency Capability Curve (Attachment 1) be split into separate tables for each Interconnect to make it easier to read. The response from the GVSDT states that they do not believe adding more graphs would add clarification since there are separate data tables. Although Exelon agrees that you could reference the data tables to ensure you are following the correct curve; unless the Off Normal Frequency Capability Curve is printed in color it is difficult to distinguish which line corresponds to which interconnection. Exelon still maintains that for clarity that each data table for each Interconnection should have a separate corresponding graph. **The drafting team realizes that the frequency graph may be difficult to follow but**

Organization	Yes or No	Question 3 Comment
		believes that adding the table to assist in clarifying the data points alleviates the need for multiple graphs.
Response: The drafting team thanks you for your comments. Please see the answers to each comment above.		
Omaha Public Power District		Footnote 1, which is referenced in R1 and R2, has two separate purposes: one is to provide a definition of frequency or voltage protective relaying, and the other is to state that each Generator Owner is not required to have frequency or voltage protective relaying installed or activated on its unit. Accordingly, it should be split into two separate sentences. We recommend that Footnote 1 be replaced by the following paragraph: Frequency or voltage protective relaying includes but is not limited to frequency and voltage protective functions for discrete relays, volts per hertz relays evaluated at nominal frequency, impedance relays, voltage controlled overcurrent relays, multi-function protective devices or protective functions within control systems that directly trip or provide tripping signals to the generator based on frequency, speed, or voltage inputs. Each Generator Owner is not required to have frequency or voltage protective relaying installed or activated on its unit. Note the addition of the word “speed” in the definition of frequency or voltage protective relaying.
Response: The drafting team thanks you for your comment. The drafting team believes that the footnote has sufficient clarity on examples of relays included in the standard and an entity is not required to install or activate any of the protective functions.		
Wolverine Power Cooperative		I would recommend that the standard applicability be narrowed to BES units only. The way I read the standard draft it would apply to all generating units. This seems to be a significant cost and amount of work for smaller units that will not have a great impact on the BES. I would suggest that in the applicability section of the standard that the BES unit definitions be used (greater than 85MVA, connected >100kV, etc).
Response: The drafting team thanks you for your comment. The drafting team believes that all units without exception for a registered Generation Owner are required to comply with this standard.		

Organization	Yes or No	Question 3 Comment
American Transmission Company		In Requirement 3.1 - ATC recommends replacing the wording of "shall communicate the documented equipment limitation" with "shall communicate the documented equipment limitation and the expected duration of the limitation, if it is known". The addition of expected limitation duration could be valuable reliability information.
Response: The drafting team thanks you for your comment. The SDT believes that in the vast majority of cases, the limitations are effectively permanent so providing information on the expected duration would be of little value.		
Ingleside Cogeneration LP (voting under entity name Occidental Chemical Corporation)		Ingleside Cogeneration LP agrees that Transmission Planners and other operating entities must be able to rely on a generator's availability when voltage and frequency transients occur at the interconnection point. However, we are not convinced that the project teams assertion that all technologies can accommodate the ride-through thresholds posed in PRC-024-1 R5 simply because some European nations already require them. This trivializes a major concern that a generator and all its auxiliary systems must remain online while severe stress is imposed upon mechanical systems spinning at high speeds. Our vendors are telling us that they don't know if they can accommodate the specified thresholds - and they have decades of engineering experience behind their assessments. In addition, we are concerned with the aggregate work load that all five standards in Project 2007-09 will place upon our engineering and operations organizations. Each has its own unique purpose, which means unique processes to support them - as well as results that demonstrate compliance. **Based on comments from you and numerous other stakeholders the SDT has decided to remove Requirement R5 from the next draft of the standard. The SDT believes that Requirement R4 meets the reliability objective of the directive in Paragraph 1787 of FERC Order 693. In addition, the SDT agrees with stakeholders who indicated that the additional resources that would be required to design, build, operate and maintain synchronous generating facilities that could ride through any of the defined excursions without fail would not justify the resulting incremental gain in grid reliability. From a low voltage ride-through perspective, the occurrence**

Organization	Yes or No	Question 3 Comment
		of severe transmission system faults in the immediate vicinity of a generation facility is rare and the history of transmission faults causing trips of generating facilities is similarly rare. From a frequency excursion perspective, turbines and generators currently on the market easily meet the requirements for coordinating with UFLS programs when challenged with typical frequency excursions. While there have been issues with frequency oscillations in some cases (e.g., lean fuel blowout), the SDT believes that these types of issues can be resolved by market forces without the need for a requirement in a reliability standard. With so much uncertainty surrounding this program, we cannot agree to proceed without the following items being addressed: 1) All requirements that look for evidence that a unit does not trip in response to a transient (R5) must contain language that focuses on the strength of the process - not the actual performance. This could be similar to that used in the CIP version 5 standards calling for the Responsible Entity to implement an action "in a manner that identifies, assesses, and corrects deficiencies". Experience has shown that without this preface, auditors will automatically assess a violation regardless of whether the trip was necessary to protect equipment or safety. The CEA's focus needs to be on the entity's commitment to establishing the necessary ride-through settings over the longer term. 2) The Compliance organization needs to be engaged in the development process so that industry stakeholders have a sense of how adherence to the standard will be determined. The existing process is disconnected - leading to inconsistent interpretations of the drafting team's original intent. Other projects have begun to post drafts of the RSAWs concurrently with the standards for exactly this reason. The SDT should take note that these modifications are consistent with the risk-based compliance direction that both NERC and FERC support. The intent is to focus industry and regulatory resources on the reliability aspects of the initiative - not its administrative aspects. **Your issues (1 & 2 above) relate to the "Find, Fix and Track" process that was**

Organization	Yes or No	Question 3 Comment
		most notably incorporated in the CIP body of standards. For example, CIP-003-5, Requirement R2 states:"Each Responsible Entity for its assets identified in CIP-002-5, Requirement R1, Part R1.3, shall implement, in a manner that *identifies, assesses, and corrects deficiencies*, one or more documented cyber security policies that collectively address the following topics, and review and obtain CIP Senior Manager approval for those policies at least once every 15 calendar months:" This requirement relates to a specific program that addresses a wide range of topics, including documentation of the processes involved. The requirements of PCR-024 are to ensure that generators remain in service during frequency and voltage excursions and providing others with information about limitations. There is no inherent program deficiency that can be identified and corrected. The GVSDT does not believe that this approach is applicable to the requirements that we have developed.
Response: The drafting team thanks you for your comments. Please see the answers to each comment above.		
JEA		JEA supports the comments of the NAGF and believes that the SDT team should accept a request by the NAGF to have a joint meeting to discuss and resolve the many differences since these differences are so substantial that the usual iterative process will be excessively long. We also support NAGF's suggestion to evaluate these standards using the Cost Effective Analysis Process.
Response: The SDT thanks you for your comment. No such request for a joint meeting has been received by the SDT. However, based on comments from you and numerous other stakeholders the SDT has decided to remove Requirement R5 from the next draft of the standard. The SDT believes that Requirement R4 meets the reliability objective of the directive in Paragraph 1787 of FERC Order 693. In addition, the SDT agrees with stakeholders who indicated that the additional resources that would be required to design, build, operate and maintain synchronous generating facilities that could ride through any of the defined excursions without fail would not justify the resulting incremental gain in grid reliability. From a low voltage ride-through perspective, the occurrence of severe transmission system faults in the immediate vicinity of a generation facility is rare and the history of transmission faults causing trips of generating facilities is similarly rare. From a frequency excursion perspective, turbines and generators currently on		

Organization	Yes or No	Question 3 Comment
the market easily meet the requirements for coordinating with UFLS programs when challenged with typical frequency excursions. While there have been issues with frequency oscillations in some cases (e.g., lean fuel blowout), the SDT believes that these types of issues can be resolved by market forces without the need for a requirement in a reliability standard.		
PPL Corporation NERC Registered Affiliates		1) Looking at the Table for the Eastern Interconnection in Attachment 1 of the Standard, this table does not correlate to our company procedures for EOP-003, in which generators are expected to isolate from the system anytime the frequency goes to 58.2 Hz or lower. The risk of incurring resonant vibration of steam turbine last-stage blades is generally related to blade length, so the off-frequency ride-through criteria in Att. 1 of PRC-024-1 are a concern for larger units. Nuclear plants in particular may be required to operate not only outside of OEM recommendations but at conditions that are unsafe. Please see in this respect the SERC Generation Subcommittee Nuclear Plant Review of PRC-024 Curves presentation made at the SERC Engineering Committee Meeting of March 16, 2011 at Charlotte, NC. **Generating unit(s) may trip within a portion of the “no trip zone” of PRC-024 Attachment 1 or Attachment 2 for documented and communicated equipment limitations in accordance with Requirement R3.** 2) Some gas turbines may experience surge or combustion upsets (including flame-out) at the off-speed conditions of Att. 1, in addition to potentially incurring blade vibration issues similar to those described above. See also in this respect the AREVA NP White Paper on PRC-24.Auxiliary equipment contactors are likely to drop-out at the off-design voltage values specified in Att. 2 of PRC-024-1, especially if the high-side voltage swings specified in this standard are magnified at plant MV and LV aux buses.Fan and pump performance will be affected at the frequency limits of Att. 1, and below-rated voltage per Att. 2 may cause this equipment to stall, causing main flame trips, high/low duct pressure trips, drum level oscillations below the low water cut-out point and the like. This is especially the case if cycling above and below the rated frequency during Disturbances (but

Organization	Yes or No	Question 3 Comment
		within the limits of Att. 1) magnifies system oscillations or drives automatic control systems unstable. The prohibition against tripping for existing units applies not just to actuation of Protection Systems but to “protective relaying,” which per footnote #1 in PRC-024 includes “protective functions within control systems...based on frequency or voltage inputs.” It is unclear whether or not this definition covers contactor drop-out or actuation of fan stall protection systems at extreme under-voltage conditions .The basis of compliance for new units is simply, “will not trip,” i.e. covering all issues cited above plus any unpredictable other factors that may take units down. It is not realistic to expect such sweeping guarantees to be available on a system-wide basis, even if some individual pieces of equipment can ostensibly comply with Atts. 1 and 2, effectively shutting-down the new power plant industry unless an owner were willing to take unbounded risk. A “will not trip” obligation may also effectively ban entire classes of equipment, including combined cycle plants (as regards the chances of incurring lean blow-out) and (as mentioned earlier) nuclear facilities. “It is noteworthy in this respect that environmental regulators have for decades been tightening gas turbine dry low-NOx combustor emissions limits, taking these devices to the brink of instability during even steady-state operation, with inevitable negative implications for survival of Disturbances, and there were in fact many gas turbine flame-out trips during the blackout of ‘03. That is, the EPA and NERC may be trying to achieve divergent and even incompatible goals, so merely allowing time for development of new designs is not a solution. NERC, NAGF, the EPA, OEMs and industry groups should develop a mutually acceptable set of performance requirements.” **Generating unit(s) may trip within a portion of the “no trip zone” of PRC-024 Attachment 1 or Attachment 2 for documented and communicated equipment limitations in accordance with Requirement R3.** 3) M5 causes new-unit tripping due to frequency or voltage excursions within PRC-

Organization	Yes or No	Question 3 Comment
		024 limits to constitute a violation, but it seems unlikely to expect an "or" event. That is, Disturbances are likely to cause frequency and voltage to simultaneously deviate from the rated values, and it is unclear how this combination of factors will be addressed in assessing compliance with the stands-separate basis of Att. 1 and Att. 2 in this standard. **Based on comments from you and numerous other stakeholders the SDT has decided to remove Requirement R5 from the next draft of the standard. The SDT believes that Requirement R4 meets the reliability objective of the directive in Paragraph 1787 of FERC Order 693. In addition, the SDT agrees with stakeholders who indicated that the additional resources that would be required to design, build, operate and maintain synchronous generating facilities that could ride through any of the defined excursions without fail would not justify the resulting incremental gain in grid reliability. From a low voltage ride-through perspective, the occurrence of severe transmission system faults in the immediate vicinity of a generation facility is rare and the history of transmission faults causing trips of generating facilities is similarly rare. From a frequency excursion perspective, turbines and generators currently on the market easily meet the requirements for coordinating with UFLS programs when challenged with typical frequency excursions. While there have been issues with frequency oscillations in some cases (e.g., lean fuel blowout), the SDT believes that these types of issues can be resolved by market forces without the need for a requirement in a reliability standard.** 4) The grandfathering of existing units in R1 and R2 for, "documented and communicated equipment limitations," is problematical; since the propensity to incur drum level fluctuations, air/flue gas flow oscillations and the like during Disturbances will not be defined in OEM literature, nor is it generally possible to predict by calculations when such problems will occur, especially if a Disturbance involves cycling between above and below the rated frequency (but within the Att. 1 boundaries). The same is true regarding predicting transient fluctuations of aux bus voltages, ref. risk of contactor drop-out and stalling major auxiliary equipment. The concern above applies also to having to make reference per R3

Organization	Yes or No	Question 3 Comment
		to, "study results, experience from an actual event, or manufacturer's advisory." Few if any GOs are likely to possess such documentation for Disturbances as extreme as those specified in Att. 1 and Att. 2. The list of types of evidence in R3 is not exclusive, but it is difficult to imagine alternative forms of hard evidence that could be developed other than for the comparatively few plants that possess high-fidelity simulators. **R1, R2, and R3 now apply to all units, existing and new. R5, previously written for "new" units, has been deleted.** 5) Confusion is created by making grandfathering, "in accordance with Requirement R3," in R1 and R2 of PRC-024-1; while R3 excludes, "limitations that are caused by generator frequency and voltage protective relays." Are such protective relays meant to correspond to the "protective relaying" discussed above? It is unclear whether or not any grandfathering is actually being allowed. **The exclusion of the relays listed is so that they alone are not allowed to be the reason that the unit is permitted to trip.** 6) The exemption take-back in the last bullet item of R3.1 (a 10% increase in nameplate capacity) again may effectively ban entire classes of equipment, or at least prevent units from ever receiving capacity and efficiency enhancements. Steam turbine off-frequency limits are generally set by OEMs lifetime limits as regards duration, but there is no discussion in PRC-024-1 as to how often the specified excursions may occur, leaving users with ostensibly compliant equipment still at risk if major upsets take place more often than had been anticipated. **If an entity replaces a piece of equipment that is causing a limitation per Requirement R3 and increases capacity by 10%, it must address the limitations. This is analogous to New Source Standards for pollution control.**
Response: Thank you for your comments. Please find responses to your individual comments above.		

Organization	Yes or No	Question 3 Comment
Cogentrix Energy		1) Project 2007-09 Generator Verification includes draft standard PRC-024, Generator Performance During Frequency and Voltage Excursions. Requirements R3 and R4 are for existing generating units. R3 allows an exemption from portions of the ride through curves in PRC-024 Attachments 1 and 2 for documented cases where generator protective relaying cannot be set, and directs those generators to communicate that limitation to the RC, PC, TOP and TP so its performance can be modeled correctly. R4requires a Generator Owner to estimate the time duration for remaining on-line based on a Transmission Planner's dynamic study. Requirement R5 directs all new generating facilities to be designed, built and maintained so that they are able to ride through the excursions defined in Attachment 1 and 2.Voltage Ride-Through Background In FERC Order 661 (June 2, 2005), Final Rule on Interconnection for Wind Energy, the Commission adopted a low voltage ride-through standard for wind generators, but provided that a wind plant is required to meet the standard only if the Transmission Provider shows, in the System Impact Study, that low voltage ride-through capability is needed to ensure safety or reliability. The standard, if applicable, requires the wind generator to stay online for specified time periods and at associated voltage levels where there is a disturbance on the transmission system. Several entities requested rehearing of various aspects of the low voltage ride-through requirement and standard included in the Final Rule. In FERC Order 661-A (December12, 2005) page 2, the Commission noted "that the standard interconnection procedures and agreement were based on the needs of traditional generation facilities and that a different approach might be more appropriate for generators relying on other technologies, such as wind plants. Accordingly, the Commission granted certain clarifications, and also added a blank Appendix G to the standard Large Generation Interconnection Agreement (LGIA) for future adoption of requirements specific to other technologies." The Commission went on to adopt in Appendix G to the LGIP limited special interconnection procedures applicable to wind plants only. The basis for the change to the standard regarding voltage ride through starts with FERC Order

Organization	Yes or No	Question 3 Comment
		693, Paragraph 1787 (March 16, 2007), which states "... the Commission directs the ERO to modify the Reliability Standard to explicitly require either that all generators are capable of riding through the same set of Category B and C contingencies, as required by wind generators in Order No. 661, or that those generators that cannot ride through be simulated as tripping. "Discussion, Voltage Ride-Through Although FERC Order 661-A does make a provision for future adoption of voltage ride through requirements for all generators, the Order is careful to differentiate between wind generation technologies and other, traditional generation facilities. No instruction is given for other technologies in the Order. Nowhere in any of the FERC Orders (661,661A, 693) is there a single requirement for non-wind generators to meet ride-through requirements. Docket No. RM05-4-000 (Order No. 661) discusses this subject directly. The Notice of Proposed Rulemaking (NOPR) Interconnection for Wind Energy and Other Alternative Technologies dated January 24, 2005, sought comments on certain specific issues, including whether there are other non-synchronous technologies, or other technologies in addition to wind, that should also be covered by the proposed Appendix G. In FERC Order No. 661, the Final Rule on Interconnection for Wind Energy, the Commission noted "These technical requirements for the interconnection of wind plants recognize the unique design and operating characteristics of wind plants,1 their increasing size and increasing level of penetration on some transmission systems, and the effects they have on the transmission system." Further, they wrote, "The Final Rule Appendix G we adopt here applies only to the interconnection of wind plants. The Commission does not believe at this time that the standard procedures and technical requirements in this Final Rule are appropriate for other alternative generating technologies that may supply over 20 MW at one Point of Interconnection. The standard procedures and technical requirements adopted here recognize the unique characteristics of wind plants, including the fact that they use induction generators, consist of several or numerous small generators connected to a collector system, and do not respond to grid disturbances in the same manner as

Organization	Yes or No	Question 3 Comment
		large conventional generators. ”The Final Rule also noted that while low voltage ride-through capability is needed for wind plants, it is less of a concern for large synchronous generating facilities because most of these facilities are equipped with automatic voltage control devices to increase output during low voltage events. The Commission concluded that the Final Rule Appendix G exceptions to the LGIP and1 As noted above, wind plants over 20 MW in total size are subject to the standard technical requirements in the Final Rule Appendix G. These wind plants are generally made up of several small induction wind generating turbines, laid out over a large area, and connected through a medium voltage collector system. This collectors ystem is connected to the low voltage side of the step-up transformer, which is then connected to the transmission system at a single Point of Interconnection. LGIA apply only to large wind plants. Appendix G was designed around the special needs and design characteristics of wind generators. The Appendix G provisions adopted “focuses on the special characteristics of large wind plants, particularly the fact that they utilize many induction generators connected to the transmission system at a single point through a medium-voltage collector system. The Commission has not found at this time that any other technologies, including the solar generators without fueled backup ..., have similar characteristics.” The Project 2007-09 Generator Verification Standard Drafting Team has presented the current draft of the standard as a technology-neutral version, ignoring the fact that power plant performance in asynchronous vs. synchronous units for transmission excursions are significantly different and are technology dissimilar for reasons of voltage regulation ability and plant auxiliary design. The NERC System Protection and Control Subcommittee wrote, in previous comments, “FERC 661-A is a wind generator facility ride-through performance criterion, not a synchronous generator relay setting requirement. They cannot be considered as being the same. This requirement in PRC-024 should only apply to non-synchronous machines.” Constellation Power wrote, “The idea of a ride-through curve originated with wind farms, and is not conceptually appropriate. For example, this approach is not conceptually

Organization	Yes or No	Question 3 Comment
		appropriate for cylindrical rotor synchronous machines.” PPL Energy commented, “PPL is concerned with the following concepts in the standard: 1) The standard applies equally to asynchronous and synchronous machines, salient pole and round rotor machines, photovoltaic, and other resources and as such the standard does not appear to recognize that these technologies respond differently to voltage and frequency excursions.” AEP posited “The proposed VRT criteria requires more study and analyses before introducing it so broadly in this standard for other than for wind turbine generators for which it has already been applied.” Pacificorp offered “Many European generator interconnection standards and requirements include different voltage ride-through requirements for synchronous and non-synchronous generation. PacifiCorp is concerned that the SDT has inappropriately developed a “one-size fits all” standard applicable to all generation platforms.” Furthermore, OEM’s have not yet developed a solution to voltage ride through for non-wind generators. Assured compliance with PRC-024 may not be available at any price. BES reliability enhancements requiring technological advances should be addressed with industry groups (e.g. ASME, IEEE) and OEMs to develop commercially available products before appearing as requirements in reliability standards. Regulation should not come before a solution is available. A specific concern in this respect regarding the ride-through capability being sought in PRC-024 R3-5 is that auxiliary buses may drop-out and cause a unit to trip for the excursions specified, which go well beyond the industry's present design criteria, even if the protective relay settings nominally allow such transients. It may be unrealistic to expect that the dynamic behavior of medium and low voltage auxiliary systems in a plant can be accurately modeled. In response to numerous questions on the feasibility of a plant design with the new voltage and frequency ride through curves, the Standard Drafting Team responded that “The implementation schedule calls for six years beyond approval of the standard before Requirement R5 goes into effect. The SDT believes this is enough time to develop the required designs.” Thus the SDT has recognized that the technology to comply does not exist today. Southern Company noted that

Organization	Yes or No	Question 3 Comment
		"We highly doubt that the requirement is technically feasible based on our experience with vendors and the various technical requirements and modifications that would have to be made to make sure that low or high voltage ride thru is possible. Complicating factors include the many different equipment suppliers, limited control of manufacturing standards by the purchasers, and continuing changes in technology must be considered to be able to determine whether or not all plant sub-systems can ride through. The economic impact and technical feasibility of this requirement has not yet been considered by suppliers." Duke Energy states in their comments, "An R&D effort should be considered to investigate steam plant ride through capabilities if a criteria is needed." Indiana Municipal Power Agency questioned whether the technology to meet this requirement was currently available to a newly built generating facility. "To force such a requirement on newly built generating facilities at this time, one is speculating that the technology will be available. Can we risk reliability of the grid on such speculation (Generator Owners not building generating facilities because they cannot meet this requirement)? What if the technology is not available?" In a previous posting of the standard, GenOn Energy suggested "It does not appear that the SDT has carefully considered the possible impact of Attachment2 on plant electrical auxiliary motors and contactors. The SDT should ask a power plant engineering company the impact on the electrical auxiliaries of an 800MW coal unit with a scrubber." If a solution is identified prior to implementation, preliminary estimates suggest the potential cost of complying with wider standards might increase machine costs as much as 25%, which is not insignificant. The result would be a considerable increase in capital and O&M costs for new (non-wind) generation due to increased equipment costs to meet more robust design specifications. The increase in costs, in combination with the compliance risk associated with not having a technical solution available at time of construction, will likely discourage new power plant construction outside of wind generation. This barrier to new construction could lead to mid-term reliability concerns, particularly in markets already stressed with tight reserve

Organization	Yes or No	Question 3 Comment
		margins. Finally, the Standard Drafting Team has not demonstrated a grid-wide reliability gap justifying the need for voltage ride through for traditional (non-wind) generators. The US Bureau of Reclamation noted "We believe there is no convincing reliability based rationale to expand the scope of the FERC Order via this standard to include synchronous machines, noting that Generators are already required (PRC-001-1) to coordinate settings with the host Transmission Operator." Both EPRI and IEEE have held discussions on this topic and have expressed concerns related to those issues noted previously. While these legitimate concerns about voltage ride through requirements for non-wind generators are being debated, they are also holding up other significant issues to be addressed by PRC-024 such as relay setting coordination and frequency ride through. **Based on comments from you and numerous other stakeholders the SDT has decided to remove Requirement R5 from the next draft of the standard. The SDT believes that Requirement R4 meets the reliability objective of the directive in Paragraph 1787 of FERC Order 693. In addition, the SDT agrees with stakeholders who indicated that the additional resources that would be required to design, build, operate and maintain synchronous generating facilities that could ride through any of the defined excursions without fail would not justify the resulting incremental gain in grid reliability. From a low voltage ride-through perspective, the occurrence of severe transmission system faults in the immediate vicinity of a generation facility is rare and the history of transmission faults causing trips of generating facilities is similarly rare. From a frequency excursion perspective, turbines and generators currently on the market easily meet the requirements for coordinating with UFLS programs when challenged with typical frequency excursions. While there have been issues with frequency oscillations in some cases (e.g., lean fuel blowout), the SDT believes that these types of issues can be resolved by market forces without the need for a requirement in a reliability standard.** **Additionally, Requirements R1, R2, and R3 now are applicable to all generating**

Organization	Yes or No	Question 3 Comment
		units, not only existing units. The time frame of the voltage ride thru curve of Attachment 2 has been reduced to 4 seconds. 2) Discussion, Frequency Ride-Through The risk of incurring resonant vibration of steam turbine last-stage blades is generally related to blade length, so the off-frequency ride-through criteria in Att. 1 of PRC-024-1are a concern for larger units. Nuclear plants in particular may be required to operate not only outside of OEM recommendations but at conditions that are unsafe. Please see in this respect the SERC Generation Subcommittee Nuclear Plant Review of PRC-024 Curves presentation made at the SERC Engineering Committee Meeting of March16, 2011 at Charlotte, NC. Steam turbine off-frequency limits are moreover generally subject to lifetime duration limits, but there is no discussion in PRC-024-1 as to how often the specified excursions may occur, leaving users with ostensibly compliant equipment still at risk if major upsets take place more often than had been anticipated. Some gas turbines may experience surge or combustion upsets (including flame-out) at the off-speed conditions of Att. 1, in addition to potentially incurring blade vibration issues similar to those described above. **Generating unit(s) may trip within a portion of the "no trip zone" of PRC-024 Attachment 1 or Attachment 2 for documented and communicated equipment limitations in accordance with Requirement R3.** 3) Additional costs associated with maintaining voltage sensitive equipment (power transformer, rotating equipment, breaker controls, etc.). Fan and pump performance will be affected at the frequency limits of Att. 1, and below rated voltage per Att. 2 may cause this equipment to stall, causing main flame trips, high/low duct pressure trips, drum level oscillations below the low water cut-out point and the like. This is especially the case if cycling above and below the rated frequency during Disturbances (but within the limits of Att. 1) magnifies system oscillations or drives automatic control systems unstable. The basis of compliance

Organization	Yes or No	Question 3 Comment
		for new units is simply, “will not trip,” i.e. covering all issues cited above plus any unpredictable other factors that may take units down. It is not realistic to expect such sweeping guarantees to be available on a system-wide basis, even if some individual pieces of equipment can ostensibly comply with Atts. 1 and 2,effectively shutting-down the new power plant industry unless an owner were willing to take unbounded risk. A “will not trip” obligation may also effectively ban entire classes of equipment, including combined cycle plants (as regards the chances of incurring lean blow-out) and (as mentioned earlier) nuclear facilities. It is noteworthy in this respect that environmental regulators have for decades been pushing gas turbine dry low-NOx combustors to the brink of instability during even steady-state operation, with inevitable negative implications for survival of Disturbances, and there were in fact many gas turbine flameout ttrips during the blackout of ‘03. Greater consideration of BES reliability may be needed, but doing so by issuing dueling regulations would not constitute an appropriate approach. That is, we believe that passage of PRC-024 in its present form would cause the available design room between environmental and NERC regulations for gas turbines to become less than zero, so merely allowing time for development of new designs is not a solution. NERC, the EPA, OEMs and industry groups need to develop a mutually acceptable set of performance requirements. **Based on comments from you and numerous other stakeholders the SDT has decided to remove Requirement R5 from the next draft of the standard. The SDT believes that Requirement R4 meets the reliability objective of the directive in Paragraph 1787 of FERC Order 693. In addition, the SDT agrees with stakeholders who indicated that the additional resources that would be required to design, build, operate and maintain synchronous generating facilities that could ride through any of the defined excursions without fail would not justify the resulting incremental gain in grid reliability. While there have been issues with frequency oscillations in some cases (e.g., lean fuel blowout), the SDT believes that these types of issues can be resolved by market forces without the

Organization	Yes or No	Question 3 Comment
		need for a requirement in a reliability standard. 5) The grandfathering of existing units in R1 and R2 for, "documented and communicated equipment limitations," is problematical; since the propensity to incur drum level fluctuations, air/flue gas flow oscillations, flame-out and the like during Disturbances will not be defined in OEM literature, nor is it possible to predict by calculations when such problems will occur, especially if a complex Disturbance involves cycling between above and below the rated frequency (but within the Att. 1 boundaries). The same is true Page 8 of 8 regarding predicting transient fluctuations of aux bus voltages, ref. risk of contactor drop-out and stalling major auxiliary equipment. The concern above applies also to having to make reference per R3 to, "study results, experience from an actual event, or manufacturers advisory." Few if any GOs are likely to possess such documentation for Disturbances as extreme as those specified in Att. 1and Att. 2. The list of types of evidence in R3 is not exclusive; but it is difficult to imagine alternative forms of hard evidence that could be developed, other than for the comparatively few plants that possess high-fidelity dynamic simulators. **Generating unit(s) may trip within a portion of the "no trip zone" of PRC-024 Attachment 1 or Attachment 2 for documented and communicated equipment limitations in accordance with Requirement R3. Requirements R1, R2, and R3 now are applicable to all generating units, not only existing units.** 6) The same concerns regarding availability of information apply for the, "estimate of the time duration the existing generation unit will remain connected," in R4. Relying on "sound engineering judgment" is permitted, and R4 states that "detailed unit performance studies are not required;" but the word "sound" implies that the estimate is to be based on accurate data, and such information could be developed only via a detailed study (which, as noted above, would be impossible to perform).

Organization	Yes or No	Question 3 Comment
		The methods of determination listed within R4 are provided to emphasize that detailed studies are not required. 7) The prohibition against tripping for existing units applies not just to actuation of Protection Systems but to "protective relaying," which per footnote #1 in PRC-024 includes "protective functions within control systems...based on frequency or voltage inputs." It is unclear whether or not this definition covers contactor drop-out or actuation of fan stall protection systems at extreme under-voltage conditions. Confusion is created by making grandfathering of protective relay settings, "in accordance with Requirement R3," in R1 and R2 of PRC-024-1; while R3 excludes, "limitations that are caused by generator frequency and voltage protective relays." It is semantically unclear whether or not any grandfathering is actually being allowed. **Footnote 1 does not cover the items you have listed above. The exclusion of the relays listed is so that they alone are not allowed to be the reason that the unit is permitted to trip.** 8) The exemption take-back in the last bullet item of R3.1 (a 10% increase in nameplate capacity) again may again effectively ban entire classes of equipment, or at least prevent units from ever receiving capacity and efficiency enhancements. **If an entity replaces a piece of equipment that is causing a limitation per Requirement R3 and increases capacity by 10%, it must address the limitations. This is analogous to New Source Standards for pollution control.** 9) Conclusion & Recommendation Based on the issues discussed above, the SRT recommends against adoption of Draft4 (dated Oct. 4, 2012) of PRC-024-1. Furthermore, the SRT recommends that a deputation of NAGF members meet with the SDT for the purpose of developing a mutually-acceptable draft standard. This effort should include discussions with OEMs and industry groups regarding identifying the technical state of the art, and also with environmental regulators,

Organization	Yes or No	Question 3 Comment
		if necessary, for achieving suitable emissions vs. BES reliability balance. **The GVSDT has had many active participants throughout the life of the project representing generator owners and operators, as well as OEMs. All meetings to develop this standard have been open to all participants. The drafting team has considered each comment received on this standard during each posting and made appropriate revisions. Based on your comments and the comments of numerous other stakeholders, the SDT has decided to remove Requirement R5 from the next draft of the standard. The SDT believes that Requirement R4 meets the reliability objective of the directive in Paragraph 1787 of FERC Order 693. In addition, the SDT agrees with stakeholders who indicated that the additional resources that would be required to design, build, operate and maintain synchronous generating facilities that could ride through any of the defined excursions without fail would not justify the resulting incremental gain in grid reliability. From a low voltage ride-through perspective, the occurrence of severe transmission system faults in the immediate vicinity of a generation facility is rare and the history of transmission faults causing trips of generating facilities is similarly rare. From a frequency excursion perspective, turbines and generators currently on the market easily meet the requirements for coordinating with UFLS programs when challenged with typical frequency excursions. While there have been issues with frequency oscillations in some cases (e.g., lean fuel blowout), the SDT believes that these types of issues can be resolved by market forces without the need for a requirement in a reliability standard.**
Response: Thank you for your comments. Please find responses to your individual comments above.		
seattle city light		Reliability Coordinator, Planning Coordinator, Transmission Operator and Transmission Planner should be added to the Applicability section because one or another of these are asked in R4 to provide information to the Generator Operator to

Organization	Yes or No	Question 3 Comment
		begin the evaluations.
Response: These entities were not added to the Applicability because a request for the data specified in R4 may or may not be desired by the parties. Mention of the RC and TOP have been removed from R4.		
ReliabilityFirst		ReliabilityFirst votes in the affirmative for this standard because the standard further enhances reliability by ensuring that generating units remain connected during frequency excursions. Even though ReliabilityFirst votes in the affirmative, we offer the following comments for consideration: VSL Requirement R5 - ReliabilityFirst still believes the VSL for Requirement R5 is not meeting the intent of FERC VSL Guideline #3 "Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement." Requirement R5 states "Each Generator Owner shall design, build, and maintain its new unit or new generating plant so that it will not trip due to a frequency excursion or voltage excursion." The VSL states "The Generator Owner's generator tripped due to a Frequency Excursion within the no-trip parameters set forth in attachment 1". Based on the FERC Guideline #3, the language in the requirement is not consistent with the associated VSL. It is not a violation of Requirement R5 if the generator tripped offline within the no-trip parameters, rather it is a violation if the GO failed to design, build, and maintain its new unit or new generating plant so that it will not trip due to a frequency excursion or voltage excursion within the no-trip parameters set forth in Attachment 1. Furthermore the SDT noted in the response to comments that the VSL relates to Measure M5. ReliabilityFirst would like to remind the SDT that based on the NERC definition of VSL (as noted in the NERC Standard Processes Manual), "VSLs define the degree to which compliance with a Requirement was not achieved." There is no mention of VSLs being written based on the measurement of the requirement. ReliabilityFirst recommends either modifying the requirement or VSL so they both use consistent language.
Response: Based on comments from numerous stakeholders the SDT has decided to remove Requirement R5 from the next draft		

Organization	Yes or No	Question 3 Comment
of the standard. In doing this, Measure M5 and the VSL's for Requirement R5 also have been removed.		
Idaho Power Company		1) Requirement R1 and R2: Idaho Power System Planning comments that the GVSDT clarify if this standard applies to voltage or frequency elements only or if it applies to all generator protection elements as suggested in footnote 1. **Footnote 1 clarifies which protective relaying is included in the scope of R1 and R2.** 2) Requirement R5:Idaho Power System Planning comments that the GVSDT consider adding an exception to Requirement R5 that generation may trip if the Generator Owner has a documented over/under frequency limitation that cannot meet the stepped "no trip" curve shown in Attachment 1 provided that the Generator Owner and Transmission Operator have a documented mitigation plan approved by the Reliability Coordinator to trip equal load for instances of anticipated generation loss (similar to Item 13 of the WECC Off-Nominal Frequency Load Shedding Plan). **Based on comments from you and numerous other stakeholders the SDT has decided to remove Requirement R5 from the next draft of the standard. The SDT believes that Requirement R4 meets the reliability objective of the directive in Paragraph 1787 of FERC Order 693. In addition, the SDT agrees with stakeholders who indicated that the additional resources that would be required to design, build, operate and maintain synchronous generating facilities that could ride through any of the defined excursions without fail would not justify the resulting incremental gain in grid reliability. From a low voltage ride-through perspective, the occurrence of severe transmission system faults in the immediate vicinity of a generation facility is rare and the history of transmission faults causing trips of generating facilities is similarly rare. From a frequency excursion perspective, turbines and generators currently on the market easily meet the requirements for coordinating with UFLS programs when challenged with typical frequency excursions. While there have been issues with frequency oscillations in some cases (e.g., lean fuel blowout), the SDT believes that these types of issues can be resolved by market forces**

Organization	Yes or No	Question 3 Comment
		without the need for a requirement in a reliability standard. 3) Page 20: Idaho Power System Planning comments that the GVDST should clarify if Items 6a-6c are expected to be met simultaneously as it is not likely that a generator be capable of operating at full load (Pmax) and 0.95 pf lagging continuously. Idaho Power System Planning comments that the GVDST consider a 0.95 leading power factor condition in addition to the item included in Items 6a-6c. **The load point specified in Clarifications 6a-6c are provided to enable the calculation of the generator bus voltage during the periods of transmission system voltage exclusion described by the curve of Attachment 2. It is presumed to be typical of the normal operating condition of many generators. As the generator over/undervoltage relays are often connected to generator bus PTs, this calculation is necessary to determine their operating characteristic during transmission system voltage excursions. The SDT believes that this load point is adequate for determining if the voltage relays will operate during these conditions.** 4) Requirement R6 is overly burdensome with questionable impact on reliability. **This requirement is only applicable after a request has been made to the GO. The RC and TOP have been removed from this requirement as those parties have the ability to ask for this type of information through IRO-010 and/or TOP-003. The requesting entities would be using the information in stability studies. Having accurate information for these standards has a significant impact on grid reliability.** 5) Items 6a-6c on page 20 are not consistent with nor relevant to normal relay setting development practice. Initial operating points should be developed from good engineering judgment, not prescribed in this way. **The SDT believes that the use of this operating point will provide an adequate solution for determining the voltage relay response to a transmission system voltage excursion. Note that the automatic voltage regulator response has not been addressed in this calculation method. In consideration of this response,**

Organization	Yes or No	Question 3 Comment
		the load point specified will yield a conservative result.
Response: Thank you for your comments. Please find responses to your individual comments above.		
Associated Electric Cooperative, Inc. - JRO00088		Requirement R3 qualifies "each known equipment limitation". Measure M3 omits the "known" qualifier, stating the expectation of measurement is to have "any equipment limitations" documented. Is the expection for "any" to mean "some", or "all known"?
Response: Thank you for your comments. "Known" has been added to M3. The expectation is that any and all known equipment limitations be documented.		
Northeast Power Coordinating Council		1) Suggest the SDT specifically identify or show examples of how to match the percentage thresholds outlined in the Effective Date sections of the Standard and the associated Implementation Plans. Given recent experience with other Standards, it would be helpful for the SDT to establish how the entities can demonstrate meeting the requisite threshold percentages. Over time, we have observed that in some cases percentages were established by the number of devices or units; but in other cases, the measurement has been based upon magnitude of nameplate ratings. **The requirements are written generally on a generating unit basis. For plants that are in the scope due to an aggregate of small units, those should be counted on a complete facility basis. From the total number of individual units and aggregate facilities, one can simply calculate a ratio of number completed versus total number.** 2) Regarding the Table for the Quebec Interconnection in Attachment 1, the data should read: High Frequency Duration Frequency (Hz) Time (Sec)Greater than 66.0 Instantanous Trip Greater than 63.0 5Greater than 61.5 90Greater than 60.6 660Less than or equal to 60.6 Continuous Operation Low Frequency Duration Frequency (Hz) Time (Sec)Less than 55.5

Organization	Yes or No	Question 3 Comment
		Instantaneous Trip Less than 56.5 0.35Less than 57.0 2Less than 57.5 10Less than 58.5 90Less than 59.4 660Greater than or equal to 59.4 Continuous Operation Wind generation is included in the table as has been previously confirmed with the Drafting Team. **The operator symbols found in the Quebec table for frequency/time match the note found on Attachment 1 regarding the boundary lines. The "no trip zone" does not include the lines.**
Response: Thank you for your comments. Please find responses to your individual comments above.		
Luminant		The following is a copy of a white paper that was sent to generator owners and other industry organizations on requirements R4 and R5. At the end of the paper are Luminant's recommendations for this standard. NERC Reliability Standards Project 2007-09 Generator Verification PRC-024 Generator Performance During Frequency and Voltage Excursions October 22, 2012 Introduction Project 2007-09 Generator Verification includes draft standard PRC-024, Generator Performance During Frequency and Voltage Excursions. Requirements R3 and R4 are for existing generating units. R3 allows an exemption from portions of the ride through curves in PRC-024 Attachments 1 and 2 for documented cases where generator protective relaying cannot be set and directs those generators to communicate that limitation to the RC, PC, TOP and TP so its performance can be modeled correctly. R4 requires a Generator Owner to estimate the time duration for remaining on-line based on a Transmission Planner's dynamic study. Requirement R5 directs all new generating facilities to be designed, built and maintained so that they are able to ride through the excursions defined in Attachment 1 and 2. Background In FERC Order 661 (June 2, 2005), Final Rule on Interconnection for Wind Energy, the Commission adopted a low voltage ride-through standard for wind generators, but provided that a wind plant is required to meet the standard only if the Transmission Provider shows, in the System Impact Study, that low voltage ride-through capability is needed to ensure safety or reliability. The standard, if applicable, requires the wind plant to stay online for

Organization	Yes or No	Question 3 Comment
		specified time periods and at associated voltage levels where there is a disturbance on the transmission system. Several entities requested rehearing of various aspects of the low voltage ride-through requirement and standard included in the Final Rule. In FERC Order 661-A (December 12, 2005) page 2, the Commission noted "that the standard interconnection procedures and agreement were based on the needs of traditional generation facilities and that a different approach might be more appropriate for generators relying on other technologies, such as wind plants. Accordingly, the Commission granted certain clarifications, and also added a blank Appendix G to the standard Large Generation Interconnection Agreement (LGIA) for future adoption of requirements specific to other technologies." The Commission went on to adopt in Appendix G to the LGIP limited special interconnection procedures applicable to wind plants only.The basis for the change to the standard regarding voltage ride through starts with FERC Order 693, Paragraph 1787 (March 16, 2007), which states "... the Commission directs the ERO to modify the Reliability Standard to explicitly require either that all generators are capable of riding through the same set of Category B and C contingencies, as required by wind generators in Order No. 661, or that those generators that cannot ride through be simulated as tripping. "Discussion / Reliability Impact Although FERC Order 661-A does make a provision for future adoption of voltage ride-through requirements for all generators, the Order is careful to differentiate between wind generation technologies and other, traditional generation facilities. No instruction is given for other technologies in the Order. Nowhere in any of the FERC Orders (661, 661A, 693) is there a single requirement for non-wind generators to meet ride-through requirements. Docket No. RM05-4-000 (Order No. 661) discusses this subject directly. The Notice of Proposed Rulemaking (NOPR) Interconnection for Wind Energy and Other Alternative Technologies dated January 24, 2005, sought comments on certain specific issues, including whether there are other non-synchronous technologies, or other technologies in addition to wind, that should also be covered by the proposed Appendix G.In FERC Order No. 661, the Final Rule on Interconnection for Wind Energy, the Commission noted "These technical requirements for the interconnection

Organization	Yes or No	Question 3 Comment
		of wind plants recognize the unique design and operating characteristics of wind plants, their increasing size and increasing level of penetration on some transmission systems, and the effects they have on the transmission system.” Further, they wrote, “The Final Rule Appendix G we adopt here applies only to the interconnection of wind plants. The Commission does not believe at this time that the standard procedures and technical requirements in this Final Rule are appropriate for other alternative generating technologies that may supply over 20 MW at one Point of Interconnection. The standard procedures and technical requirements adopted here recognize the unique characteristics of wind plants, including the fact that they use induction generators, consist of several or numerous small generators connected to a collector system, and do not respond to grid disturbances in the same manner as large conventional generators.” The Final Rule also noted that while low voltage ride-through capability is needed for wind plants, it is less of a concern for large synchronous generating facilities because most of these facilities are equipped with automatic voltage control devices to increase output during low voltage events. The Commission concluded that the Final Rule Appendix G exceptions to the LGIP and LGIA apply only to large wind plants. Appendix G was designed around the special needs and design characteristics of wind generators. The Appendix G provisions adopted “focuses on the special characteristics of large wind plants, particularly the fact that they utilize many induction generators connected to the transmission system at a single point through a medium-voltage collector system. The Commission has not found at this time that any other technologies, including the solar generators without fueled backup ..., have similar characteristics.” The Project 2007-09 Generator Verification Standard Drafting Team has presented the current draft of the standard as a technology-neutral version, ignoring the fact that power plant performance in asynchronous vs. synchronous units for transmission excursions are significantly different and are technology dissimilar for reasons of voltage regulation ability and plant auxiliary design. o The NERC System Protection and Control Subcommittee wrote, in previous comments, “FERC 661-A is a wind generator facility ride-through performance criterion, not a synchronous generator

Organization	Yes or No	Question 3 Comment
		relay setting requirement. They cannot be considered as being the same. This requirement in PRC-024 should only apply to non-synchronous machines.” o Constellation Power wrote, “The idea of a ride-through curve originated with wind farms, and is not conceptually appropriate. For example, this approach is not conceptually appropriate for cylindrical rotor synchronous machines.” o PPL Energy commented, “PPL is concerned with the following concepts in the standard: 1) The standard applies equally to asynchronous and synchronous machines, salient pole and round rotor machines, photovoltaic, and other resources and as such the standard does not appear to recognize that these technologies respond differently to voltage and frequency excursions.” o AEP posited “The proposed VRT criteria requires more study and analyses before introducing it so broadly in this standard for other than for wind turbine generators for which it has already been applied.” o Pacificorp offered “Many European generator interconnection standards and requirements include different voltage ride-through requirements for synchronous and non-synchronous generation. PacifiCorp is concerned that the SDT has inappropriately developed a “one-size fits all” standard applicable to all generation platforms.” Furthermore, OEM’s have not yet developed a solution to voltage ride through for non-wind generators. Assured compliance with PRC-024 may not be available at any price. BES reliability enhancements requiring technological advances should be addressed with industry groups (e.g. ASME, IEEE) and OEMs to develop commercially available products before appearing as requirements in reliability standards. Regulation should not come before a solution is available. A specific concern in this respect regarding the ride-through capability being sought in PRC-024 R3-5 is that auxiliary buses may drop-out and cause a unit to trip for the excursions specified, which go well beyond the industry's present design criteria, even if the protective relay settings nominally allow such transients. It may be unrealistic to expect that the dynamic behavior of medium and low voltage auxiliary systems in a plant can be accurately modeled. o In response to numerous questions on the feasibility of a plant design with the new voltage and frequency ride through curves, the Standard Drafting Team responded that “The implementation schedule calls for

Organization	Yes or No	Question 3 Comment
		six years beyond approval of the standard before Requirement R5 goes into effect. The SDT believes this is enough time to develop the required designs." Thus the SDT has recognized that the technology to comply does not exist today. o Southern Company noted that "We highly doubt that the requirement is technically feasible based on our experience with vendors and the various technical requirements and modifications that would have to be made to make sure that low or high voltage ride thru is possible. Complicating factors include the many different equipment suppliers, limited control of manufacturing standards by the purchasers, and continuing changes in technology must be considered to be able to determine whether or not all plant sub-systems can ride through. The economic impact and technical feasibility of this requirement has not yet been considered by suppliers." o Duke Energy states in their comments, "An R&D effort should be considered to investigate steam plant ride through capabilities if a criteria is needed." o Indiana Municipal Power Agency questioned whether the technology to meet this requirement was currently available to a newly built generating facility. "To force such a requirement on newly built generating facilities at this time, one is speculating that the technology will be available. Can we risk reliability of the grid on such speculation (Generator Owners not building generating facilities because they cannot meet this requirement)? What if the technology is not available?" o In a previous posting of the standard, GenOn Energy suggested "It does not appear that the SDT has carefully considered the possible impact of Attachment 2 on plant electrical auxiliary motors and contactors. The SDT should ask a power plant engineering company the impact on the electrical auxiliaries of an 800MW coal unit with a scrubber." If a solution is identified prior to implementation, preliminary estimates suggest the potential cost of complying with wider standards might increase machine costs as much as 25%, which is not insignificant. The result would be a considerable increase in capital and O&M costs for new (non-wind) generation due to increased equipment costs to meet more robust design specifications. The increase in costs, in combination with the compliance risk associated with not having a technical solution available at time of construction, will likely discourage new power plant construction outside of wind

Organization	Yes or No	Question 3 Comment
		generation. This barrier to new construction could lead to mid-term reliability concerns, particularly in markets already stressed with tight reserve margins. Finally, the Standard Drafting Team has not demonstrated a grid-wide reliability gap justifying the need for voltage ride through for traditional (non-wind) generators. o The US Bureau of Reclamation noted “We believe there is no convincing reliability based rationale to expand the scope of the FERC Order via this standard to include synchronous machines, noting that Generators are already required (PRC-001-1) to coordinate settings with the host Transmission Operator.” Both EPRI and IEEE have held discussions on this topic and have expressed concerns related to those issues noted previously. While these legitimate concerns about voltage ride through requirements for non-wind generators are being debated, they are also holding up other significant issues to be addressed by PRC-024 such as relay setting coordination and frequency ride through. Summary and Conclusion The Standard Drafting Team should remove Requirements R4 and R5 from the current version of PRC-024 to facilitate passage of the more critical elements of the standard such as voltage and frequency relay setting requirements. The current technology neutral draft standard PRC-024 is inconsistent with the intent of FERC Order 661 -A in that it applies “equal” requirements to all generators, rather than requirements solely for wind generators which is the focus of the FERC Order. The Standard must recognize that wind generators and traditional generation facilities are technologically dissimilar and, therefore, cannot be treated the same in this instance. With no technology currently commercially available to provide guaranteed voltage ride through capabilities for traditional generation, the standard should not require this (unavailable) technology be in place in order to meet the requirements of the standard. When the technology becomes available, a new SAR may be drafted to address the voltage performance aspects of non-wind generators if an identified reliability gap exists. The new Cost Effective Analysis Process can be used at that time to evaluate the costs and benefits associated with the new requirement, as well as facilitate consideration of alternative methods to achieve the reliability objective which may result in less implementation costs and resource expenditures.

Organization	Yes or No	Question 3 Comment
Response: Thank you for your comments. Based on comments from you and numerous other stakeholders the SDT has decided to remove Requirement R5 from the next draft of the standard. The SDT believes that Requirement R4 meets the reliability objective of the directive in Paragraph 1787 of FERC Order 693. In addition, the SDT agrees with stakeholders who indicated that the additional resources that would be required to design, build, operate and maintain synchronous generating facilities that could ride through any of the defined excursions without fail would not justify the resulting incremental gain in grid reliability. From a low voltage ride-through perspective, the occurrence of severe transmission system faults in the immediate vicinity of a generation facility is rare and the history of transmission faults causing trips of generating facilities is similarly rare. From a frequency excursion perspective, turbines and generators currently on the market easily meet the requirements for coordinating with UFLS programs when challenged with typical frequency excursions. While there have been issues with frequency oscillations in some cases (e.g., lean fuel blowout), the SDT believes that these types of issues can be resolved by market forces without the need for a requirement in a reliability standard.		
TransAlta Centralia Generation LLC		The UFLS curves for Eastern Interconnection and Quebec Interconnection are different from those curves on NPCC Directory 12. Which one to be compliant?
Response: The SDT thanks you for your comment. The curve for the Eastern Interconnection coordinates with the requirements for UFLS system design documented in PRC-006-1. If the generator frequency protection is set in accordance with Attachment 1 of PRC-024, it should coordinate with the local UFLS program. The Quebec Interconnection does have unique requirements the information for Quebec was provided by Hydro Quebec and is also found in PRC-006-1.		
PSEG		1) This FIRST comment was provided for MOD-025-1, MOD-026-1, MOD-027-1, and PRC-024-1.1.DATA SHARING POLICY: For all of the MOD standards in this, only Transmission Planners are the recipient of the data developed. We asked that the standard require that the TP be required to share the data with others. The response we received is that the Functional Model requires the TP to share data with the TOP. Unfortunately, the Functional Model is unenforceable. We note that in PRC-024-1, R6 requires the GO to share its data with the RC, PC, TOP, and TO, upon request. Unless the same data is shared across all “modelers,” the result will be outdated data in someone’s model, which can have a bad result. The team should have one broad

Organization	Yes or No	Question 3 Comment
		"data sharing" policy in the three MOD standards and PRC-024-1. Since the TP receives data in three of the standards, we suggest this language or similar language: "The GO shall provide data to its TP within 60 days of its development [describe the data]. The TP shall provide the same data to any RC, PC, TP, or TOP within 60 days of receiving a request for it." **The information discussed in PRC-024 of potential interest to planners (generator voltage and frequency protection system settings) is not necessarily included in all models. The SDT feels the current wording is adequate to allow those planners who need the information to obtain it from the Generator Owners. Note that the SDT has removed the RC and TOP from data reporting requirements described in Requirements R4 and R5 (previously R6). This was done in response to stakeholders who pointed out that these functional entities can request this information via standards IRO-010 (RC) and TOP-003 (TOP).** 2) We do NOT believe that R5, which sets requirements for new generators (including balance-of-plant equipment) to the requirements in Attachment 1 and Attachment 2, has been appropriately vetted by the SDT. Many stakeholders are unfamiliar with the performance capability of new generators, including the cost of achieving the performance requirements in R5. Therefore, the SDT should develop additional expert information to confirm that the requirements in R5 represent the norm for new generation. We suggest that the SDT reach out to the NERC Planning Committee, who in turn may research this topic with the IEEE and the North American Generator Forum and develop a report on their findings. With all due respect to the SDT, until stakeholders have independent confirmation regarding R5, it will be difficult for them to accept it. **Based on comments from you and numerous other stakeholders the SDT has decided to remove Requirement R5 from the next draft of the standard. The SDT believes that Requirement R4 meets the reliability objective of the directive in Paragraph 1787 of FERC Order 693. In addition, the SDT agrees with stakeholders who indicated that the additional resources that would be required to design, build,**

Organization	Yes or No	Question 3 Comment
		operate and maintain synchronous generating facilities that could ride through any of the defined excursions without fail would not justify the resulting incremental gain in grid reliability. From a low voltage ride-through perspective, the occurrence of severe transmission system faults in the immediate vicinity of a generation facility is rare and the history of transmission faults causing trips of generating facilities is similarly rare. From a frequency excursion perspective, turbines and generators currently on the market easily meet the requirements for coordinating with UFLS programs when challenged with typical frequency excursions. While there have been issues with frequency oscillations in some cases (e.g., lean fuel blowout), the SDT believes that these types of issues can be resolved by market forces without the need for a requirement in a reliability standard.
Response: The SDT thanks you for your comment. See answers to your specific questions above.		
Dynegy		This Standard is similar to the PRC-006-NPCC-1 and PRC-006-SERC-01 Automatic Underfrequency Load Shedding Standards. PRC-024-1 requires continuous operation at >59.5 Hz. PRC-006-NPCC-1 requires continuous operation at >59.0 Hz. This is confusing. These three Standards should be coordinated or the GO applicability should be removed from PRC-006-NPCC-1 and PRC-006-SERC-01.
Response: The SDT thanks you for your comment. Regional standards may be more stringent than the continent-wide NERC standards. PRC-024-1 is the controlling document in regions that do not have an equivalent regional standard.		
Utility Services		Utility Services suggests the SDT specifically identify or show examples of how to match the percentage thresholds outlined in the Effective Date sections of the standard and the associated Implementation Plans. Given our recent experience in other standards, it would be helpful for the SDT to establish how the entities can demonstrate meeting the requisite threshold percentages. Over time, we have observed that in some cases, percentages were established by the number of devices or units; but in other cases, the measurement has been based upon magnitude of nameplate ratings.

Organization	Yes or No	Question 3 Comment
Response: The SDT thanks you for your comment. The percentage numbers refer to the number of applicable generating facilities (units or aggregate plants). This is the default interpretation in lieu of any other description in the standard.		
Manitoba Hydro		1) VSLs - The VSLs for R1, R2 and R5 have been omitted for both Low, Moderate and High. Is there any rationale for this omission? **Compliance with R1 and R2 is binary (i.e., the relays are either set to ride through the defined excursion or they are not). NERC requires binary compliance requirements to be assigned to the Severe level only.** 2) Attachment 1 - Attachment 1 in MOD-026 and MOD-027 assist in adding clarity to the periodicity of exciter and turbine/governor model testing. These attachments also allow low capacity factor units and equivalent units connected at the same location to not be tested every 10 years, which is prudent. Manitoba Hydro would like the drafting team to consider whether conditions in row numbers 1-5 and 7 in attachment 1 of MOD-026 could also be applied to standards PRC-019, MOD-025 and possibly PRC-024. **The SDT does not believe the cited attachments in MOD-026 and MOD-027 apply to PRC-024.** 3) R1 and R2 - The requirement speaks about the 'unit' tripping but the sub requirements speak about the 'Generation' tripping - is this not inconsistent? **The SDT agrees and has made the wording consistently use "generating unit(s)".** 4) R1 and R2 -1. The language in R2 currently reads, "Each Generator Owner that has generator voltage protective relaying activated to trip its generating unit shall set its protective relaying such that the voltage protective relaying does not trip as a result of a voltage excursion (at the point of interconnection) caused by an event on the transmission system external to the generating plant that remains within the "no trip zone" of PRC-024 Attachment 2 or within the voltage recovery characteristics of a location-specific Transmission Planner's study if the Transmission Planner allows less stringent voltage relay settings than those required to meet PRC-024 Attachment 2 subject to the following exceptions". Manitoba Hydro made the following comment to draft 3 of PRC-024-1 during /29/12-03/29/12 commenting period, "R1 - the facility

Organization	Yes or No	Question 3 Comment
		interconnection document required through FAC-001 should supersede Attachment 1 in order to best address local area issues. R1 should be revised to specify this." The drafting team responded, "The SDT was charged with creating continent-wide requirements for frequency and voltage excursions and believes that consistency will not occur if various Transmission Service Providers apply various "no trip zones." Requirement R1, therefore, should not be dictated by FAC-001." Even though the drafting stated that other standards (eg. FAC-001) shouldn't set continent wide settings, the drafting team has permitted less stringent voltage relay settings in R2 as long as it is accompanied by a Transmission Planning study. Manitoba Hydro understands that continent wide-standards are preferred but there should be flexibility for local area considerations as has been done in R2. Manitoba Hydro requests the drafting team consider the following language added to R1: ...or within the frequency recovery characteristics of a location-specific Transmission Planner's study if the Transmission Planner allows different (more or less stringent) frequency relay settings than those required to meet PRC-024 Attachment 1...And the following modification to R2:...or within the voltage recovery characteristics of a location-specific Transmission Planner's study if the Transmission Planner allows different (more or less stringent) voltage relay settings than those required to meet PRC-024 Attachment 2... **The SDT does not see where frequency recovery characteristics apply as long as the frequency remains within the envelope required by the UFLS standard (PRC-006-1). The NERC standard does not preclude more stringent voltage recovery profiles from being used under the requirements of a LGIA or regional standard.** 5) The drafting team has removed the following exception in R1, "A generating unit or generating plant is allowed to trip within the "no trip zone" if the frequency rate of change is more than 2.5 Hz/sec." What is the technical basis for removing this exception? Is the intent that no tripping in the "no trip zone" is permitted regardless of the potential rate of change of frequency? There were no comments on this item in the last draft. **There have been comments about the rate of change of frequency caveat in the past. The SDT was challenged by FERC to justify the value of 2.5**

Organization	Yes or No	Question 3 Comment
		Hz/sec. While this is a default value for Aurora scenario protective devices, the SDT could not provide any other justification for this value and felt obligated to remove it. The SDT would appreciate any assistance from Manitoba Hydro to justify the 2.5 Hz/sec (or any other number MH can support). 6) R2 - The first bullet has a typo - 'tripping' should be changed to 'trip'. **The redline version that was posted did have this error but the clean version (that the SDT uses) indicates the change was already made. No change required.** 7) R3 - This requirement requires that Generator Owners document each 'known' equipment limitation. The word 'known' can be legally ambiguous - known to whom? actual knowledge or 'should have known', 'could have known'? **The intent is that the Generator Owner can set protection to operate inside the "No Trip Zone" for limitations he is aware of (i.e., "known" limitations). He would not be able to do this for limitations he is not aware of (unknown limitations). The SDT believes that the most common use of this allowance is for older steam turbines that have limited low frequency operating capability as defined by the equipment manufacturer.** 8) R5 - The text of footnote 5 has been deleted, but the footnote remains. **This is an artifact of the redline function. If you look at the clean version you will see that this has been addressed.** 9) General Comments: 1. Manitoba Hydro has a concern with respect to the phased in implementation measured by percent compliance. We believe that this may lead to a potential for some uncertainty and debate. Does a phased in implementation such as this, do anything to increase reliability? **The SDT believes the phased implementation plan allows Generator Owners to implement any changes in protection system settings during normally scheduled unit outages.** 10) 2. Attachment 1 of MOD-026-1 (Note 2) and M0D-027-1 (Note 3) contain a section titled "Consideration for early Compliance" with language pertaining to previous testing and model verification which were completed under the applicable

Organization	Yes or No	Question 3 Comment
		regional policies, guidelines or criteria or which are compliant with the requirements of the standard. Manitoba Hydro recommends that similar language be included in the other standards (PRC-019-1, MOD-025-2 and PRC-024-1). **There are no verification tests involved with PRC-024-1, so the cited section does not apply to this standard.**
Response: The SDT thanks you for your comment. See answers to your specific questions above.		
SMUD		1) We much prefer a performance based, RBS approach using the internal controls process than the approach taken by the SDT. We would prefer to evaluate post event trips for compliance with the settings rather than keep extensive, zero-defect compliance documentation for all unit settings. (Intentional Space).... **Based on comments from you and numerous other stakeholders the SDT has decided to remove Requirement R5 from the next draft of the standard. The SDT believes that Requirement R4 meets the reliability objective of the directive in Paragraph 1787 of FERC Order 693. In addition, the SDT agrees with stakeholders who indicated that the additional resources that would be required to design, build, operate and maintain synchronous generating facilities that could ride through any of the defined excursions without fail would not justify the resulting incremental gain in grid reliability. From a low voltage ride-through perspective, the occurrence of severe transmission system faults in the immediate vicinity of a generation facility is rare and the history of transmission faults causing trips of generating facilities is similarly rare. From a frequency excursion perspective, turbines and generators currently on the market easily meet the requirements for coordinating with UFLS programs when challenged with typical frequency excursions. While there have been issues with frequency oscillations in some cases (e.g., lean fuel blowout), the SDT believes that these types of issues can be resolved by market forces without the need for a requirement in a reliability standard.** 2) Specific Comments: It appears that R1 & R2 are meant to be “document the settings” requirements since they refer to the Long-term Planning Time Horizon and

Organization	Yes or No	Question 3 Comment
		M1 & M2 ask for settings documentation. The requirements themselves suggest that compliance is evaluated based on actual events, though. For instance, the first bullet in R1 mentions “..impending or actual loss of synchronism..” which would not be evaluated in the Long-term Planning Time Horizon. R2 states “...such that the voltage protective relaying does not trip...” which again implies evaluating the results of an actual event. R1 & R2 are not clearly pre-event documentation only or post event analysis only - they currently try to have it both ways. Please correct this.(Intentional Space).... **Requirements R1 and R2 are not simply to document settings, but rather to ensure the protection is set so that it does not operate to trip the generator for voltage and frequency excursions that remain within the no-trip zones described in Attachments 1 and 2.** 3) We agree with the compliance approach used in R5 and encourage the SDT to use this same approach for requirements R1 & R2 **The SDT believes the compliance approach used in Requirements R1 and R2 is adequate. Requirement R5 has been removed (see response to next comment).** 4) SMUD recommends the following changes the the 5th bullet of R5: (Intentional Space)....”Generation may trip if the Generator Owner has a temporary exemption granted by its Reliability Coordinator based on a documented equipment limitation. If a legitimate equipment limitation is identified following a plant trip caused by a frequency or voltage excursion, the Reliability Coordinator shall grant a retroactive exemption for the identified limitation.” (Intentional Space)....The stuck language lends itself to arbitrary determinations and, where no fix is possible, automatically forces a non-compliance situation for an unknown condition.(Intentional Space).... **Based on comments from you and numerous other stakeholders the SDT has decided to remove Requirement R5 from the next draft of the standard. The SDT believes that Requirement R4 meets the reliability objective of the directive in Paragraph 1787 of FERC Order 693. In addition, the SDT agrees with stakeholders who indicated that the additional resources that would be required to design, build, operate and maintain synchronous generating facilities that could ride through any of the defined excursions without fail would not justify the resulting incremental**

Organization	Yes or No	Question 3 Comment
		gain in grid reliability. From a low voltage ride-through perspective, the occurrence of severe transmission system faults in the immediate vicinity of a generation facility is rare and the history of transmission faults causing trips of generating facilities is similarly rare. From a frequency excursion perspective, turbines and generators currently on the market easily meet the requirements for coordinating with UFLS programs when challenged with typical frequency excursions. While there have been issues with frequency oscillations in some cases (e.g., lean fuel blowout), the SDT believes that these types of issues can be resolved by market forces without the need for a requirement in a reliability standard. 6) We disagree with R6. First, the GO must provide the generator protection trip settings - this phrasing is not limited to voltage or frequency trip points, but ALL trip settings. This is unreasonable. Second, the GO should not be subjected to an indefinite requirement to constantly update an entity that sends a single written request. By the requirements in this standard, the various Coordinators and Planners know that the plant's trip settings must follow the curves. Why isn't this enough? If the Coordinators or Planners want specific setting data, they should be required to ask for it each time. Otherwise, they should model the plant as meeting the curves contained in this standard. **Based on comments from other stakeholders, the SDT has removed two of the possible requestors from Requirement R6. The SDT would like to point out that the planners that design UFLS systems require the frequency trip setting information and that PRC-006 specifically links to this reporting requirement in PRC-024. The SDT does not believe having to report other protection settings information imposes an undue burden on the Generator Owner if so requested.**
Response: The SDT thanks you for your comment. See answers to your specific questions above.		
Western Electricity Coordinating Council		WECC is concerned that Requirement R3 of PRC-024-1, which requires Generator Owners to document each known equipment limitation that prevents a generating unit from meeting the frequency requirements of Requirement R1 may be in conflict

Organization	Yes or No	Question 3 Comment
		with or less stringent than the requirement in the WECC Off-Nominal Frequency Load Shedding Plan that requires Generator Owners that have generators that do not meet the frequency requirements to automatically trip load to match the anticipated generation loss or have contractual relationships providing for automatic load shedding. The concern is that Generator Owners may interpret Requirement R3 of PRC-024 to relieve them of their obligations under the WECC Coordinated Off-Nominal Load Shedding Plan. This is a concern because the original design and subsequent simulations conducted to validate the effectiveness of the WECC Off-Nominal Frequency Load Shedding Plan reflect simulation of the generator underfrequency and overfrequency operation requirements, and any deviations from these requirements would invalidate the effectiveness studies and could potentially require modifications to the existing approved WECC Coordinated Plan.
Response: The SDT thanks you for your comment. Regional Entities are able to implement requirements via regional standards that are more stringent than the continent-wide NERC standards. PRC-024-1 does not preclude WECC from setting the requirement described. The SDT does wonder how a generator can selectively trip load that matches a dynamically changing generation output.		
Xcel Energy		1) Xcel Energy would like to point out that the high frequency duration curves for the Eastern, ERCOT, and Quebec Interconnections exceed the allowable short-term frequencies specified in IEEE C50.13 and IEC 60034 which the OEM's use to design their generators. Attachment 1 should be modified to meet the IEEE and IEC standards. **The high frequency curve for the Eastern and ERCOT Interconnections in Attachment 1 have been revised to meet the cited IEEE and IEC standards. Quebec has a unique situation and their generators are hydro-electric units that are able to meet their high frequency requirements.** 2) Also, Xcel Energy continues to believe that Requirement R5 would result in a large cost increase in the cost of building new generating units which would defer resources that could be better used elsewhere to improve grid reliability. Xcel recommends that this requirement be revised such that if a generating unit did trip

Organization	Yes or No	Question 3 Comment
		during a voltage or frequency excursion, the Generator Owner investigate the cause and develop a corrective action plan to address the trip. **Based on comments from you and numerous other stakeholders the SDT has decided to remove Requirement R5 from the next draft of the standard. The SDT believes that Requirement R4 meets the reliability objective of the directive in Paragraph 1787 of FERC Order 693. In addition, the SDT agrees with stakeholders who indicated that the additional resources that would be required to design, build, operate and maintain synchronous generating facilities that could ride through any of the defined excursions without fail would not justify the resulting incremental gain in grid reliability. From a low voltage ride-through perspective, the occurrence of severe transmission system faults in the immediate vicinity of a generation facility is rare and the history of transmission faults causing trips of generating facilities is similarly rare. From a frequency excursion perspective, turbines and generators currently on the market easily meet the requirements for coordinating with UFLS programs when challenged with typical frequency excursions. While there have been issues with frequency oscillations in some cases (e.g., lean fuel blowout), the SDT believes that these types of issues can be resolved by market forces without the need for a requirement in a reliability standard.**
Response: The SDT thanks you for your comment. See answers to your specific questions above.

END OF REPORT

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. SAR posted for comment (April 20–May 21, 2007).
2. Revised SAR and response to comments posted.
3. Revised SAR and response to comments approved by SC (June 14, 2007).
4. SDT appointed on (August 18, 2007).
5. Initial draft of PRC-024-1 was posted for a 45 day formal comment period (February 17 – April 2, 2009).
6. Draft 2 of PRC-024-1 was posted for a 45 day concurrent comment and ballot period from June 15 – August 1, 2011.
7. Draft 3 of PRC-024-1 was posted for a 30 day concurrent comment and successive ballot period from February 29 – March 29, 2012.
8. Draft 4 of PRC-024-1 was posted for a 30 day concurrent comment and successive ballot period from September 28 – October 31, 2012.

Proposed Action Plan and Description of Current Draft:

This is the fifth draft of the standard and includes Time Horizons, Data Retention, Violation Risk Factors, and Violation Severity Levels. This fifth posting is for a 30-day comment and successive ballot period.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Develop responses to comments and develop fifth version draft standard.	December 2012
2. Post response to comments and conduct successive ballot.	December 2012
3. Develop responses to ballot comments.	January 2013
4. Post responses to comments and conduct recirculation ballot.	January 2013

5. BOT adoption.	February 2013
6. File with regulatory authorities.	March 2013

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None

A. Introduction

1. **Title:** Generator Performance During Frequency and Voltage Excursions

2. **Number:** **PRC-024-1**

3. **Purpose:** Ensure generating units remain connected during frequency and voltage excursions and ensure expected generating unit performance during frequency and voltage excursions is communicated to Reliability Coordinators, Planning Coordinators, Transmission Operators and Transmission Planners for accurate system modeling.

4. **Applicability:**

   4.1. Generator Owner

5. **Effective Date:**

   5.1. In those jurisdictions where regulatory approval is required:

   5.1.1 By the first day of the first calendar quarter, two calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner shall have verified at least 40 percent of its Facilities are fully compliant with Requirements R1, R2, R3, R4, and R5.

   5.1.2 By the first day of the first calendar quarter, three calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner shall have verified at least 60 percent of its Facilities are fully compliant with Requirements R1, R2, R3, R4, and R5.

   5.1.3 By the first day of the first calendar quarter, four calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner shall have verified at least 80 percent of its Facilities are fully compliant with Requirements R1, R2, R3, R4, and R5.

   5.1.4 By the first day of the first calendar quarter, five calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner shall have verified 100 percent of its Facilities are fully compliant with Requirements R1, R2, R3, R4, and R5.

   5.2. In those jurisdictions where regulatory approval is not required:

   5.2.1 By the first day of the first calendar quarter, two calendar years following Board of Trustees approval, each Generator Owner shall have verified at least 40 percent of its Facilities are fully compliant with Requirements R1, R2, R3, R4, and R5.

5.2.2 By the first day of the first calendar quarter, three calendar years following Board of Trustees approval, each Generator Owner shall have verified at least 60 percent of its Facilities are fully compliant with Requirements R1, R2, R3, R4, and R5.

5.2.3 By the first day of the first calendar quarter, four calendar years following Board of Trustees approval, each Generator Owner shall have verified at least 80 percent of its Facilities are fully compliant with Requirements R1, R2, R3, R4, and R5.

5.2.4 By the first day of the first calendar quarter, five calendar years following Board of Trustees approval, each Generator Owner shall have verified 100 percent of its Facilities are fully compliant with Requirements R1, R2, R3, R4, and R5.

B. Requirements

R1. Each Generator Owner that has generator frequency protective relaying[1] activated to trip its generating unit(s) shall set such protective relaying so that the frequency protective relaying does not operate to trip the generating unit(s) within the "no trip zone" of PRC-024 Attachment 1, subject to the following exceptions: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

- Generating unit(s) may trip if the protective functions (such as out-of-step functions or loss-of-field functions) operate due to an impending or actual loss of synchronism or due to instability in power conversion control equipment.
- Generating unit(s) may trip if clearing a system fault necessitates disconnecting the generating unit.
- Generating unit(s) may trip within a portion of the "no trip zone" of PRC-024 Attachment 1 for documented and communicated equipment limitations in accordance with Requirement R3.

R2. Each Generator Owner that has generator voltage protective relaying[1] activated to trip its generating unit(s) shall set its protective relaying such that the voltage protective relaying does not trip as a result of a voltage excursion (at the point of interconnection[2]) caused by an event on the transmission system external to the generating plant that remains within the "no trip zone" of PRC-024 Attachment 2 or within the voltage recovery characteristics of a location-specific Transmission Planner's study if the Transmission Planner allows less stringent voltage relay settings than those required to meet PRC-024 Attachment 2 subject to the following exceptions : *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

- Generating unit(s) may trip in accordance with a Special Protection System (SPS) or Remedial Action Scheme (RAS).
- Generating unit(s) may trip if clearing a system fault necessitates disconnecting (a) generating unit(s).
- Generating unit(s) may trip by action of protective functions (such as out-of-step functions or loss-of-field functions) that operate due to an impending or actual loss

[1] Each Generator Owner is not required to have frequency or voltage protective relaying (including but not limited to frequency and voltage protective functions for discrete relays, volts per hertz relays evaluated at nominal frequency, multi-function protective devices or protective functions within control systems that directly trip or provide tripping signals to the generator based on frequency or voltage inputs) installed or activated on its unit.

[2] For the purposes of this standard, point of interconnection means the transmission (high voltage) side of the generator step-up or collector transformer.

of synchronism or, for asynchronous generating units, due to instability in power conversion control equipment.

- Generating unit(s) may trip within a portion of the "no trip zone" of PRC-024 Attachment 2 for documented and communicated equipment limitations in accordance with Requirement R3.

R3. Each Generator Owner shall document each known equipment limitation[3] that prevents a generating unit from meeting the criteria in Requirements R1 or R2 including (but not limited to) study results, experience from an actual event, or manufacturer's advisory *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*.

3.1. The Generator Owner shall communicate the documented equipment limitation, or the removal of a previously documented equipment limitation, to its Reliability Coordinator, Planning Coordinator, Transmission Operator and Transmission Planner within 30 calendar days of any of the following:

- Identification of an equipment limitation.
- Repair of the equipment causing the limitation that removes the limitation.
- Replacement of the equipment causing the limitation with equipment that removes the limitation.
- Modification or upgrade of the equipment causing the limitation that results in an increase of generator nameplate capacity rating greater than 10 percent (cumulative from the first effective date of this Standard).

R4. Within 60 calendar days of receipt of a written request from a Planning Coordinator or Transmission Planner, each Generator Owner shall provide an estimate of the time duration which the generating unit(s) will remain connected (including the performance of the auxiliary systems) if the unit(s) were to experience a frequency or voltage excursion. The voltage or frequency profile at the point of interconnection is provided by a Planning Coordinator or Transmission Planner that models the associated generating unit(s) and which has requested the time duration estimate.

If the Generator Owner expects the generating unit(s) will remain connected for the duration of the profile of the excursion provided, the estimate should indicate the generating unit(s) is not expected to trip. The Generator Owner may develop the estimates based on experience, actual event histories, or sound engineering judgment. Detailed generating unit(s) performance studies are not required to develop the estimate. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

[3] Excludes limitations that are caused by the generator frequency and voltage protective relays themselves.

R5. Each Generator Owner shall provide its generator protection trip settings to the Planning Coordinator or Transmission Planner (that models the associated unit), within 60 calendar days of receipt of a written request for the data, and within 60 calendar days of any change to those previously requested trip settings unless otherwise directed by the requesting Planning Coordinator or Transmission Planner. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

C. Measures

M1. Each Generator Owner shall have evidence that generator frequency protective relays have been set in accordance with Requirement R1 such as dated setting sheets, calibration sheets, or other documentation.

M2. Each Generator Owner shall have that generator voltage protective relays have been set in accordance with Requirement R2 evidence such as dated setting sheets, voltage-time curves, calibration sheets, coordination plots or dynamic simulation studies.

M3. Each Generator Owner shall have evidence that it has documented and communicated any known equipment limitations (excluding limitations that are caused by generator frequency and voltage protective relays) that resulted in an exception to Requirements R1 or R2 in accordance with Requirement R3 such as a dated email or letter that contains such documentation as study results, experience from an actual event, or manufacturer's advisory.

M4. Each Generator Owner shall have evidence that an estimate of the time duration of its existing generating unit(s) as a result of a frequency excursion or voltage excursion has been communicated in accordance with Requirement R4, such as a copy of the estimate of time duration report and correspondence, such as dated e-mails, or other documentation and copies of any requests it has received for that information.

M5. Each Generator Owner shall have evidence that it communicated generator protective relay settings to a requesting entity within 60 calendar days of a request or change in setting(s) in accordance with Requirement R5, such as dated e-mails, correspondence or other evidence and copies of any requests it has received for that information..

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

The Regional Entity shall serve as the Compliance Enforcement Authority unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases, the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.

1.2. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Generator Owner shall retain evidence of compliance with Requirement R1 through R5, Measures M1 through M5; for 3 years or until the next audit, whichever is longer.

If a Generator Owner is found non-compliant, the Generator Owner shall keep information related to the non-compliance until mitigation is complete and approved for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

1.4. Additional Compliance Information

None

2. Violation Severity Levels

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	N/A	N/A	N/A	The Generator Owner that has frequency protection activated to trip a generating unit has no documented and communicated equipment limitation per Requirement R3 and failed to set its generator frequency protective relaying so that it does not trip within the criteria listed in Requirement R1
R2	N/A	N/A	N/A	The Generator Owner with voltage protective relaying activated to trip a generating unit has no documented and communicated equipment limitation per Requirement R3 and failed to set its voltage protective relaying so that it does not trip as a result of a voltage excursion at the point of interconnection, caused by an event external to the plant per the criteria specified in Requirement R2

Voltage Ride-Through Curve Clarifications

Curve Details:

1. The per unit voltage base for these curves is the nominal operating voltage specified by the Transmission Planner in the analysis of the reliability of the Interconnected Transmission Systems at the point of interconnection to the Bulk Electric System (BES).
2. The curves depicted were derived based on three-phase transmission system zone 1 faults with Normal Clearing not exceeding 9 cycles. The curves apply to voltage excursions regardless of the type of initiating event.
3. The envelope within the curves represents the cumulative voltage duration at the point of interconnection with the BES. For example, if the voltage exceeds 1.15 pu at 0.3 seconds after a fault, does not exceed 1.2 pu voltage, and returns below 1.15 pu at 0.4 seconds, then the cumulative time the voltage is above 1.15 pu voltage is 0.1 seconds and is within the no trip zone of the curve.
4. The curves depicted assume system frequency is 60 Hertz. Adjust the magnitude of the high voltage curve in proportion to deviations of frequency below normal.
5. Voltages in the curve assume minimum fundamental frequency phase-to-ground or phase-to-phase voltage for the low voltage duration curve and the greater of maximum RMS or crest phase-to-phase voltage for the high voltage duration curve.

Evaluating Protective Relay Settings:

1. Use the following assumptions to evaluate voltage protection relay setting calculations on the static case for steady state initial conditions:
    a. All of the units connected to the same transformer are online and operating,
    b. All of the units are at full nameplate real-power output.
    c. Power factor is 0.95 lagging (i.e. supplying reactive power to the system) as measured at the generator terminals).
2. Evaluate voltage protection relay settings assuming that additional installed generating plant reactive support equipment (such as static VAr compensators, synchronous condensers, or capacitors) is available and operating normally.
3. Evaluate voltage protection relay settings accounting for the actual tap settings of transformers between the generator terminals and the point of interconnection.

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. SAR posted for comment (April 20–May 21, 2007).
2. Revised SAR and response to comments posted.
3. Revised SAR and response to comments approved by SC (June 14, 2007).
4. SDT appointed on (August 18, 2007).
5. Initial draft of PRC-024-1 was posted for a 45 day formal comment period (February 17 – April 2, 2009).
6. Draft 2 of PRC-024-1 was posted for a 45 day concurrent comment and ballot period from June 15 – August 1, 2011.
7. Draft 3 of PRC-024-1 was posted for a 30 day concurrent comment and successive ballot period from February 29 – March 29, 2012.
~~7.~~8. Draft 4 of PRC-024-1 was posted for a 30 day concurrent comment and successive ballot period from September 28 – October 31, 2012.

Proposed Action Plan and Description of Current Draft:

This is the fifth ~~ourth~~ draft of the standard and includes Time Horizons, Data Retention, Violation Risk Factors, and Violation Severity Levels. This fifth~~ourth~~ posting is for a 30-day comment and successive ballot period.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Develop responses to comments and develop ~~third~~ fifth version draft standard.	December ~~April – July~~ 2012
2. Post response to comments and conduct successive ballot.	~~October Nov~~ December 2012
3. Develop responses to ballot comments.	~~December 2012 –~~ January 2013

4. Post responses to comments and conduct recirculation ballot.	January ~~February~~ 2013
5. BOT adoption.	~~March~~ February 2013
6. File with regulatory authorities.	~~April~~March 2013

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None

A. Introduction

1. **Title:** Generator Performance During Frequency and Voltage Excursions

2. **Number:** **PRC-024-1**

3. **Purpose:** Ensure generating units remain connected during frequency and voltage excursions and ensure expected generating unit performance during frequency and voltage excursions is communicated to Reliability Coordinators, Planning Coordinators, Transmission Operators and Transmission Planners for accurate system modeling.

4. **Applicability:**

   4.1. Generator Owner

5. **Effective Date:**

   5.1. In those jurisdictions where regulatory approval is required:

   5.1.1 By the first day of the first calendar quarter, two calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner shall have verified at least 40 percent of its Facilities are fully compliant with Requirements R1, R2, R3, R4, and R5~~6~~.

   5.1.2 By the first day of the first calendar quarter, three calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner shall have verified at least 60 percent of its Facilities are fully compliant with Requirements R1, R2, R3, R4, and R5~~6~~.

   5.1.3 By the first day of the first calendar quarter, four calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner shall have verified at least 80 percent of its Facilities are fully compliant with Requirements R1, R2, R3, R4, and R5~~6~~.

   5.1.4 By the first day of the first calendar quarter, five calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner shall have verified 100 percent of its Facilities are fully compliant with Requirements R1, R2, R3, R4, and ~~R6~~R5.

~~**5.1.5** By the first day of the first calendar quarter, six calendar years following applicable regulatory approval, each Generator Owner shall have verified 100 percent of its Facilities are fully compliant with Requirement R5.~~

5.2. In those jurisdictions where regulatory approval is not required:

5.2.1 By the first day of the first calendar quarter, two calendar years following Board of Trustees approval, each Generator Owner shall have verified at least 40 percent of its Facilities are fully compliant with Requirements R1, R2, R3, R4, and R5~~6~~.

5.2.2 By the first day of the first calendar quarter, three calendar years following Board of Trustees approval, each Generator Owner shall have verified at least 60 percent of its Facilities are fully compliant with Requirements R1, R2, R3, R4, and R5~~6~~.

5.2.3 By the first day of the first calendar quarter, four calendar years following Board of Trustees approval, each Generator Owner shall have verified at least 80 percent of its Facilities are fully compliant with Requirements R1, R2, R3, R4, and R5~~6~~.

5.2.4 By the first day of the first calendar quarter, five calendar years following Board of Trustees approval, each Generator Owner shall have verified 100 percent of its Facilities are fully compliant with Requirements R1, R2, R3, R4, and R5~~6~~.

5.2.5 ~~By the first day of the first quarter, six calendar years following Board of Trustees approval, each Generator Owner shall have verified 100 percent of its Facilities are fully compliant with Requirement R5~~.

B. Requirements

R1. Each Generator Owner that has generator frequency protective relaying[1] activated to trip its generating unit(s) shall set such protective relaying so that the frequency protective relaying does not operate to trip the generating unit(s) within the “no trip zone” of PRC-024 Attachment 1, subject to the following exceptions: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

- Generating unit(s) ~~on~~ may trip if the protective functions (such as out-of-step functions or loss-of-field functions) operate due to an impending or actual loss of synchronism or due to instability in power conversion control equipment.
- Generating unit(s) ~~on~~ may trip if clearing a system fault necessitates disconnecting the generating unit~~on~~.
- Generating unit(s) ~~on~~ may trip within a portion of the “no trip zone” of PRC-024 Attachment 1 for documented and communicated equipment limitations in accordance with Requirement R3 ~~for an existing generating unit[2]~~.

R2. Each Generator Owner that has generator voltage protective relaying[1]~~[1]~~ activated to trip its generating unit(s) shall set its protective relaying such that the voltage protective relaying does not trip as a result of a voltage excursion (at the point of interconnection[3]) caused by an event on the transmission system external to the generating plant that remains within the “no trip zone” of PRC-024 Attachment 2 or within the voltage recovery characteristics of a location-specific Transmission Planner’s study if the Transmission Planner allows less stringent voltage relay settings than those required to meet PRC-024 Attachment 2 subject to the following exceptions : *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

- ~~Generation~~Generating unit(s) may trip in accordance with a Special Protection System (SPS) or Remedial Action Scheme (RAS).

---

[1] Each Generator Owner is not required to have frequency or voltage protective relaying (including but not limited to frequency and voltage protective functions for discrete relays, volts per hertz relays evaluated at nominal frequency, ~~impedance relays, voltage controlled overcurrent relays,~~ multi-function protective devices or protective functions within control systems that directly trip or provide tripping signals to the generator based on frequency or voltage inputs) installed or activated on its unit.

~~[2] To include generating units previously commissioned, or generating units under construction, or generating units with an executed interconnection agreement or power purchase agreement by the effective date of PRC-024-1 Requirement R5.~~

[3] For the purposes of this standard, point of interconnection means the transmission (high voltage) side of the generator step-up or collector transformer.

- ~~Generation~~Generating unit(s) may trip if clearing a system fault necessitates disconnecting (a) generating unit(s).
- ~~Generation~~Generating unit(s) may trip by action of protective functions (such as out-of-step functions or loss-of-field functions) that operate due to an impending or actual loss of synchronism or, for asynchronous generating units, due to instability in power conversion control equipment.
- ~~Generation~~Generating unit(s) may trip within a portion of the "no trip zone" of PRC-024 Attachment 2 for documented and communicated equipment limitations in accordance with Requirement R3~~ for an existing generating unit~~.

R3. Each Generator Owner ~~of an existing generating unit~~ shall document each known equipment limitation[4] ~~(excluding limitations that are caused by generator frequency and voltage protective relays)~~ that prevents a generating unit~~,~~ from meeting the criteria in Requirements R1 or R2 including (but not limited to) study results, experience from an actual event, or manufacturer's advisory *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*.

3.1. The Generator Owner shall communicate the documented equipment limitation, or the removal of a previously documented equipment limitation, to its Reliability Coordinator, Planning Coordinator, Transmission Operator and Transmission Planner within 30 calendar days of any of the following ~~identifying the equipment limitation or when either of the following occurs~~:

- Identification of an equipment limitation.
- Repair of ~~T~~the equipment causing the limitation that removes the limitation.
- ~~is repaired or replaced~~ Replacement of the equipment causing the limitation with equipment that removes the limitation.
- Modification or upgrade of ~~T~~the equipment causing the limitation ~~is modified or upgraded~~ that results~~ing~~ in an increase of generator nameplate capacity rating greater than 10 percent (cumulative from the first effective date of this Standard).

R4. Within 60 calendar days of receipt of a written request from a Planning Coordinator or Transmission Planner, e~~E~~ach Generator Owner ~~of an existing generating unit~~ shall provide an estimate of the time duration which the~~ existing~~ generating unit(s) will remain connected (~~consider~~including the performance of the auxiliary systems~~ as well as the generator~~) if the unit(s) were to experience a frequency or voltage excursion. The voltage or frequency profile at the point of interconnection is ~~determined by dynamic simulation~~ provided by a ~~Reliability Coordinator,~~ Planning Coordinator~~, Transmission Operator~~ or

[4] Excludes limitations that are caused by the generator frequency and voltage protective relays themselves.

Transmission Planner that ~~monitors or~~ models the associated generating unit(s) and which has requested the time duration estimate. ~~The estimate is to be provided to the requesting Reliability Coordinator, Planning Coordinator, Transmission Owner, or Transmission Planner within 60 calendar days of receipt of a written request.~~

If the Generator Owner expects the ~~existing~~ generating unit(s) will remain connected for the duration of the profile of the excursion provided~~longer than 10 minutes~~, the estimate should indicate the generating~~existing~~ unit(s) is not expected to trip. The Generator Owner may develop the estimates based on experience, actual event histories, or sound engineering judgment. Detailed generating unit(s) performance studies are not required to develop the estimate. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

~~**R5.** Each Generator Owner shall design, build, and maintain new[5] generating units and plants (including auxiliary systems) consistent with the parameters set forth in PRC-024 Attachments 1 and 2, such that the generation, when operating at or above the minimum sustainable generation threshold (and for a generating plant consisting of multiple units with total generation greater than 75 MVA gross aggregate nameplate rating, when the generating plant is producing at least 20 percent of the plant's aggregate nameplate capacity) will not trip due to a frequency excursion or voltage excursion at the point of interconnection, caused by an event on the transmission system external to the generating plant, subject to the following exceptions: *[Violation Risk Factor: Medium] [Time Horizon: Real-time Operations]*~~

- ~~For a new generating plant consisting of multiple units less than 20 MVA each with total plant generation greater than 75 MVA (gross aggregate nameplate rating), up to 10 percent of the individual generating units may disconnect as a result of the frequency or voltage excursion.~~
- ~~If the Transmission Planner has provided the Generator Owner with location-specific voltage recovery characteristics as described in Requirement R2, Part 2.2, then the generation may operate to a less stringent voltage ride-through performance criterion than the duration curve identified in PRC-024 Attachment 2 consistent with those provided characteristics.~~
- ~~Generation may trip if this action is designed as part of a Special Protection System (SPS) or Remedial Action Scheme (RAS).~~
- ~~Generation may trip if clearing a system fault necessitates disconnecting the generation.~~

[5] ~~Excluding generators referenced in PRC-024-1 Footnote 2.~~

- ~~Generation may trip if the Generator Owner has a temporary exemption granted by its Reliability Coordinator based on a documented equipment limitation. If an equipment limitation is identified following a plant trip caused by a frequency or voltage excursion, the Reliability Coordinator may grant a retroactive temporary exemption for that limitation if the Generator Owner develops and implements an acceptable plan to address the limitation.~~
- ~~Generation may trip if the protective functions (such as out-of-step functions or loss-of-field functions) operate due to an impending or actual loss of synchronism or, for asynchronous generating units, due to instability in power conversion control equipment.~~

~~R6.~~R5. Each Generator Owner shall provide its generator protection trip settings to the ~~Reliability Coordinator,~~ Planning Coordinator~~, Transmission Operator~~ or ~~and~~ Transmission Planner (that ~~monitors or~~ models the associated unit), within 60 calendar days of receipt of a written request for the data, and within 60 calendar days of any change to those previously requested trip settings unless otherwise directed by the requesting ~~Reliability Coordinator,~~ Planning Coordinator~~, Transmission Operator,~~ or Transmission Planner. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

C. Measures

M1. Each Generator Owner shall have evidence that generator frequency protective relays have been set in accordance with Requirement R1 such as dated setting sheets, calibration sheets, or other documentation~~, that generator frequency protective relays have been set in accordance with Requirement R1~~.

M2. Each Generator Owner shall have that generator voltage protective relays have been set in accordance with Requirement R2 evidence such as dated setting sheets, voltage-time curves, calibration sheets, coordination plots or dynamic simulation studies~~, that generator voltage protective relays have been set in accordance with Requirement R2~~.

M3. Each Generator Owner shall have evidence that it has documented and communicated any known equipment limitations (excluding limitations that are caused by generator frequency and voltage protective relays) that resulted in an exception to Requirements R1 or R2 in accordance with Requirement R3 such as a dated email or letter that contains such documentation as study results, experience from an actual event, or manufacturer's advisory.

M4. Each Generator Owner shall have evidence ~~such as a copy of the estimate of time duration report and correspondence, such as dated e-mails, or other documentation~~ that an estimate of the time duration of its existing generating unit(s) as a result of a frequency excursion or voltage excursion has been communicated in accordance with Requirement

R4, such as a copy of the estimate of time duration report and correspondence, such as dated e-mails, or other documentation and copies of any requests it has received for that information.

~~**M5.** Each Generator Owner shall have evidence, such as dated unit output records, trip investigation reports or disturbance monitoring records, showing that each unit trip did not result from a frequency excursion or voltage excursion as specified in Requirement R5, or evidence that a listed exception applied.~~

~~**M6.**~~**M5.** Each Generator Owner shall have evidence ~~such as dated e-mails, correspondence or other evidence~~ that it communicated generator protective relay settings to a requesting entity within 60 calendar days of a request or change in setting(s) in accordance with Requirement R5~~6~~, such as dated e-mails, correspondence or other evidence and copies of any requests it has received for that information..

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

The Regional Entity shall serve as the Compliance E~~e~~nforcement A~~a~~uthority unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases, the ERO or a Regional E~~e~~ntity approved by FERC or other applicable governmental authority shall serve as the CEA.

1.2. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Generator Owner shall retain evidence of compliance with Requirement R1 through R5~~6~~, Measures M1 through M5~~6~~; for 3 years or until the next audit, whichever is longer.

If a Generator Owner is found non-compliant, the Generator Owner shall keep information related to the non-compliance until mitigation is complete and approved for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

1.4. Additional Compliance Information

None

2. Violation Severity Levels

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	N/A	N/A	N/A	The Generator Owner that has frequency protection activated to trip a generating unit has no documented and communicated equipment limitation per Requirement R3 and failed to set its generator frequency protective relaying so that it does not trip within the criteria listed in Requirement R1
R2	N/A	N/A	N/A	The Generator Owner with voltage protective relaying activated to trip a generating unit has no documented and communicated equipment limitation per Requirement R3 and failed to set its voltage protective relaying so that it does not trip as a result of a voltage excursion at the point of interconnection, caused by an event external to the plant per the criteria specified in Requirement R2
R3	The Generator Owner documented the known non-protection system equipment limitation that prevented it from meeting the criteria in Requirement R1 or R2 and	The Generator Owner documented the known non-protection system equipment limitation that prevented it from meeting the criteria in Requirement R1 or R2 and	The Generator Owner documented the known non-protection system equipment limitation that prevented it from meeting the criteria in Requirement R1 or R2 and	The Generator Owner failed to document any known non-protection system equipment limitation that prevented it from meeting the criteria in Requirement R1 or R2.

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL
	communicated the documented limitation to its Reliability Coordinator, Planning Coordinator, Transmission Operator and Transmission Planner more than 30 calendar days but less than or equal to 40 calendar days of identifying the limitation.	communicated the documented limitation to its Reliability Coordinator, Planning Coordinator, Transmission Operator and Transmission Planner more than 40 calendar days but less than or equal to 50 calendar days of identifying the limitation.	communicated the documented limitation to its Reliability Coordinator, Planning Coordinator, Transmission Operator and Transmission Planner more than 50 calendar days but less than or equal to 60 calendar days of identifying the limitation.	OR The Generator Owner failed to communicate the documented limitation to its Reliability Coordinator, Planning Coordinator, Transmission Operator and Transmission Planner within 60 calendar days of identifying the limitation.
R4	The Generator Owner provided an estimate of a unit's performance more than 60 calendar days but less than or equal to 70 calendar days of a written request.	The Generator Owner provided an estimate of a unit's performance more than 70 calendar days but less than or equal to 80 calendar days of a written request.	The Generator Owner provided an estimate of a unit's performance more than 80 calendar days but less than or equal to 90 calendar days of a written request.	The Generator Owner failed to provide an estimate of a unit's performance within 90 calendar days of a written request. .
~~**R5**~~	~~N/A~~	~~N/A~~	~~N/A~~	~~The Generator Owner's generator tripped due to a frequency excursion within the no-trip parameters set forth in Attachment 1 and did not meet any of the exceptions specified in the bulleted list within Requirement R5.~~

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL
				~~OR~~ ~~The Generator Owner's generator tripped due to a voltage excursion within the no-trip parameters set forth in Attachment 2 and did not meet any of the exceptions specified in the bulleted list within Requirement R5.~~
R5~~6~~	The Generator Owner provided its generator protection trip settings ~~as specified by Requirement R6~~ more than 60 calendar days but less than or equal to 70 calendar days of any change to those trip settings. OR The Generator Owner provided trip settings more than 60 calendar days but less than or equal to 70 calendar days of a written request.	The Generator Owner provided its generator protection trip settings ~~as specified by Requirement R6~~ more than 70 calendar days but less than or equal to 80 calendar days of any change to those trip settings. OR The Generator Owner provided trip settings more than 70 calendar days but less than or equal to 80 calendar days of a written request.	The Generator Owner provided its generator protection trip settings ~~as specified by Requirement R6~~ more than 80 calendar days but less than or equal to 90 calendar days of any change to those trip settings. OR The Generator Owner provided trip settings more than 80 calendar days but less than or equal to 90 calendar days of a written request.	The Generator Owner failed to provide its generator protection trip settings ~~as specified by Requirement R6~~ within 90 calendar days of any change to those trip settings. OR The Generator Owner failed to provide trip settings within 90 calendar days of a written request for the data.

Voltage Ride-Through Curve Clarifications

Curve Details:

1. The per unit voltage base for these curves is the nominal operating voltage specified by the Transmission Planner in the analysis of the reliability of the Interconnected Transmission Systems at the point of interconnection to the Bulk Electric System (BES).
2. The curves depicted were derived based on three-phase transmission system zone 1 faults with Normal Clearing not exceeding 9 cycles. The curves apply to voltage excursions regardless of the type of initiating event.
3. The envelope within the curves represents the cumulative voltage duration at the point of interconnection with the BES. For example, if the voltage exceeds 1.15 pu at 0.3 seconds after a fault, does not exceed 1.2 pu voltage, and returns below 1.15 pu at 0.4 seconds, then the cumulative time the voltage is above 1.15 pu voltage is 0.1 seconds and is within the no trip zone of the curve.
4. The curves depicted assume system frequency is 60 Hertz. Adjust the magnitude of the high voltage curve in proportion to deviations of frequency below normal.
5. Voltages in the curve assume minimum fundamental frequency phase-to-ground or phase-to-phase voltage for the low voltage duration curve and the greater of maximum RMS or crest phase-to-phase voltage for the high voltage duration curve.

Evaluating Protective Relay Settings:

1. Use the following assumptions to evaluate voltage protection relay setting calculations on the static case for steady state initial conditions:
   a. All of the units connected to the same transformer are online and operating,
   b. All of the units are at full nameplate real-power output.
   c. Power factor is 0.95 lagging (i.e. supplying reactive power to the system) as measured at the generator terminals).
2. Evaluate voltage protection relay settings assuming that additional installed generating plant reactive support equipment (such as static VAr compensators, synchronous condensers, or capacitors) is available and operating normally.
3. Evaluate voltage protection relay settings accounting for the actual tap settings of transformers between the generator terminals and the point of interconnection.

Implementation Plan

Project 2007-09 Generator Verification

Implementation Plan for PRC-024-1, Generator Performance During Frequency and Voltage Excursions

Approvals Required

PRC-024-1 – Generator Performance During Frequency and Voltage Excursions.

According to its Implementation Plan, PRC-006-1, Requirement R4 (see project 2007-01, Underfrequency Load Shedding) does not become effective until PRC-024 becomes effective. Upon the effective date of PRC-024-1, R4 of PRC-006-1 will also go into effect.

Prerequisite Approvals

Conforming Changes to Other Standards

None

Effective Dates

In those jurisdictions where regulatory approval is required:

- By the first day of the first calendar quarter, two calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner shall have verified at least 40 percent of its applicable Facilities are fully compliant with Requirements R1, R2, R3, R4, and R5.

- By the first day of the first calendar quarter, three calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to

such ERO governmental authorities, each Generator Owner shall have verified at least 60 percent of its applicable Facilities are fully compliant with Requirements R1, R2, R3, R4, and R5.

- By the first day of the first calendar quarter, four calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner shall have verified at least 80 percent of its applicable Facilities are fully compliant with Requirements R1, R2, R3, R4, and R5.

- By the first day of the first calendar quarter, five calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner shall have verified 100 percent of its applicable Facilities are fully compliant with Requirements R1, R2, R3, R4, and R5.

In those jurisdictions where regulatory approval is not required:

- By the first day of the first calendar quarter, two calendar years following Board of Trustees approval, each Generator Owner shall have verified at least 40 percent of its applicable Facilities are fully compliant with Requirements R1, R2, R3, R4, and R5.

- By the first day of the first calendar quarter, three calendar years following Board of Trustees approval, each Generator Owner shall have verified at least 60 percent of its applicable Facilities are fully compliant with Requirements R1, R2, R3, R4, and R5.

- By the first day of the first calendar quarter, four calendar years following Board of Trustees approval, each Generator Owner shall have verified at least 80 percent of its applicable Facilities are fully compliant with Requirements R1, R2, R3, R4, and R5.

- By the first day of the first calendar quarter, five calendar years following Board of Trustees approval, each Generator Owner shall have verified 100 percent of its applicable Facilities are fully compliant with Requirements R1, R2, R3, R4, and R5.

Retirements

None

Justification of Phasing

Requirements R1, R2, R3, R4, and R5 involve evaluation of existing protection system settings and equipment capabilities. Typically, generator protection system setting changes are made during scheduled generator outages. The Implementation Plan allows a five-year window for these changes to be made which corresponds to typical outage cycles. Generating units that have outage cycles that extend longer than five years are not typically base loaded and offer opportunities to effect protection system settings changes during economic shut down periods.

- ~~By the first day of the first quarter, six calendar years following Board of Trustees approval, each Generator Owner shall have verified 100 percent of its applicable Facilities are fully compliant with Requirement R5.~~

Retirements

None

Justification of Phasing

Requirements R1, R2, R3, R4, and R5~~6~~ involve evaluation of existing protection system settings and equipment capabilities. Typically, generator protection system setting changes are made during scheduled generator outages. The Implementation Plan allows a five-year window for these changes to be made which corresponds to typical outage cycles. Generating units that have outage cycles that extend longer than five years are not typically base loaded and offer opportunities to effect protection system settings changes during economic shut down periods.

~~Requirement R5 involves the performance of complete generation facilities (i.e. the prime mover, its fuel supply, and all auxiliary systems). To date, most Generator Owners have not specified this type of performance and the engineering companies designing generating facilities have not designed the facilities to ride through frequency and voltage excursions of the severity specified in PRC-024. In order to allow Generator Owners and architect/engineering companies time to develop new designs to meet R5, the SDT allows six years from regulatory approval for implementation.~~

Project 2007-09 Generator Verification PRC-024-1 Generator Performance During Frequency and Voltage Excursions

Unofficial Comment Form

Instructions

Please **DO NOT** use this form for commenting. Please use the electronic comment form to submit comments on the proposed revisions to PRC-024-1. Comments must be submitted by by 8 p.m. ET **January 11, 2013**. If you have questions please contact Stephen Crutchfield at stephen.crutchfield@nerc.net or by telephone at [609-651-9455].

Background Information

The Generator Verification Standard Drafting Team posted PRC-024-1 - Generator Performance During Frequency and Voltage Excursions, from September 28 through October 31, 2012 for a 30-day concurrent comment/successive ballot period. The GVSDT received valuable feedback from stakeholders regarding improvements to the standard. Many of the suggested edits were incorporated into the revised standard.

The GVSDT also previously revised R4 to improve clarity. A majority of the stakeholders agreed that the revision had improved clarity. Some stakeholders were still unclear if the activities described in this requirement were to be performed by request only, so the SDT rearranged the sentences to clarify that the activities were to be performed upon request. Some stakeholders pointed out the RCs and TOPs can request such information via requirements in other standards (IRO-010-1a and TOP-003-2), so these two functional entities were removed from this requirement, as well as R6.

Based on comments from a majority of stakeholders, Requirement R5 (along with its associated Measure M5 and VSL's) was removed from the Standard. The SDT believes that Requirement R4 achieves the reliability objective of Paragraph 1787 of FERC Order 693 that Requirement R5 was written to address. Other changes were made in response to comments from several stakeholders including:

- Additional wording in the Effective Date section for jurisdictions where regulatory approval is required to address the situation in some Canadian provinces.
- A modification to the high frequency allowable trip point in Attachment 1 for the Eastern and ERCOT Interconnections to match IEEE and IEC standards for generator manufacturers.

- A modification to the final voltage value of the low voltage curve and time duration of Attachment 2 to coordinate with the requirements of PRC-025 Generator Relay Loadability.
- Reference to impedance relays and voltage controlled overcurrent relays was removed from Footnote 1 to eliminate overlap and possible coordination conflict with PRC-025 Generator Relay Loadability.
- Rearrangement of the sentences in Requirement R4 to better clarify that developing the estimate of performance is to be done only upon request of certain planning entities.
- Removal of the Reliability Coordinator and Transmission Operator from the list of functional entities who can request a performance estimate in Requirement R4 and protection settings information in Requirement R6 to eliminate duplication with standards IRO-010 and TOP-003.
- Various wording changes made to improve consistent use of terminology and to improve readability.

Several stakeholders pointed out that a portion of the allowable high frequency trip curve for the Eastern, ERCOT, and Quebec Interconnections (Attachment 1) exceeded the off-nominal frequency limits in IEEE C50.13 and IEC 60034 that are used by equipment manufacturers to design generators. The drafting team revised the high frequency portion of the curve from zero to two seconds for the Eastern and ERCOT Interconnections to meet the IEEE and IEC standards. This leaves no margin between the high frequency allowance for UFLS designers in frequency overshoot for that amount of time, but the drafting team feels this is acceptable.

Coordination with Phase 2 of Relay Loadability – Generation Drafting Team (Project 2010-13.2)

In the previous draft of this standard the voltage ride-through curves in Attachment 2 extended out for 600 seconds before returning to normal operating voltages (95% – 105% of nominal). Also, the final step in the low voltage recovery curve was at 90% of nominal after three seconds. Commenters to the Generator Relay Loadability project pointed out that this could potentially cause conflicts with coordination of settings for relay loadability, since they need to be evaluated for steady-state stressed system conditions of voltages at 85% of nominal. In response, the drafting team has moved the final step of the low voltage recovery curve down from 90% to 85% at three seconds and has shortened the curves so that they end at four seconds. The drafting team believes this clarifies the intent of this standard to address the transient conditions without conflicting with steady state relay loadability.

You do not have to answer all questions. Enter all comments in simple text format. Formatting such as bullets and font changes will not be retained.

NERC

Questions

1. The GVSDT has removed Requirement R5 from the standard. The standard drafting team believes that Requirement R4 meets the reliability objective of the directive in Paragraph 1787 of FERC Order 693. In addition, the SDT agrees with stakeholders who indicated that the additional resources that would be required to design, build, operate and maintain synchronous generating facilities that could ride through any of the defined excursions without fail would not justify the resulting incremental gain in grid reliability. Do you agree with this revision? If not, please explain in the comment area below.

   ☐ Yes

   ☐ No

Project 2007-09 Generator Verification Consideration of Issues and Directives

Project 2007-09 Generator Verification — PRC-024		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
Paragraph 1787 states "… the Commission directs the ERO to modify the Reliability Standard to explicitly require either that all generators are capable of riding through the same set of Category B and C contingencies, as required by wind generators in Order No. 661, or that those generators that cannot ride through be simulated as tripping. "	FERC Order 693	The GVSDT believes that Requirement R2 and the voltage ride through curves in PRC-024 Attachment 2 accomplish this. While the curves were developed based on three phase normally cleared faults located at a generating plant substation (the most severe condition for generating equipment), the curves cover voltages depressed as low as 0.65 per unit for two seconds, which the GVSDT feels will cover the Category B and C events of concern to the Commission. Requirement R3 allows an exemption from portions of the ride through curves in PRC-024 Attachments 1 and 2 for documented technical reasons, but directs those generators to communicate that limitation to the PC and TP so its performance can be modeled correctly. In addition, Requirement R4 allows the PC or TP to request an estimate of performance (ride through duration) from the GO for a defined excursion. The estimate would cover process upsets to the generating equipment that might result in a delayed trip, even if the generator protection itself did not cause a trip.

Project 2007-09 Generator Verification — PRC-024		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
Paragraph 1787 also states "… the Commission agrees that NRC requirements should be used when implementing the Reliability Standards."	FERC Order 693	The GVSDT believes that Requirement R3 allows NRC requirements to supersede portions of the voltage and frequency ride through criteria in PRC-024-1. This Requirement allows generators an exemption from portions of the ride through curves for documented technical limitations. The GVSDT believes that NRC requirements qualify as technical limitations for the purposes of this standard.

Violation Risk Factor and Violation Severity Level Assignments

Project 2007-09 Generator Verification

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in PRC-024-1 — Generator Performance During Frequency and Voltage Excursions.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

Justification for Assignment of Violation Risk Factors

The Generator Verification Standard Drafting Team applied the following NERC criteria when proposing VRFs for the requirements under this project:

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

The SDT also considered consistency with the FERC Violation Risk Factor Guidelines for setting VRFs:[1]

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report
The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:[2]

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

Guideline (2) — Consistency within a Reliability Standard
The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) — Consistency among Reliability Standards

[1] North American Electric Reliability Corp., 119 FERC ¶ 61,145, order on reh'g and compliance filing, 120 FERC ¶ 61,145 (2007) ("VRF Rehearing Order").
[2] Id. at footnote 15.

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

The following discussion addresses how the SDT considered FERC's VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's Reliability Standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and therefore concentrated its approach on the reliability impact of the requirements.

VRF for PRC-024-1:
There are five requirements in PRC-024-1. Two of the Requirements (R1, and R2) were assigned a "Medium" VRF and the remaining three requirements were assigned a "Lower" VRF.

VRF for PRC-024-1, Requirement R1:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R1 contains Parts specifying conditions for satisfying the main requirement. The VRFs are only applied at the Requirement level and each Requirement Part is treated equally. Requirement obligations include actions similar in scope to actions specified in Requirement R2 and R5, both of which were assigned a "Medium" VRF.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar in concept with both PRC-012-0 Requirement R1 and PRC-023-1 Requirement R1, both of which require protection coordination or settings. These requirements apply to multiple elements while the requirements of PRC-024-1 apply to a single unit. Violation of this requirement by a single generator could not be construed as directly causing or contributing to BES instability, separation or cascading within any time frame. For a single violation to lead to BES instability, separation or cascading would require other standards requirements to be violated. This requirement is assigned a "Medium" VRF.

- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to ensure a proper frequency "no-trip" operating window is a requirement in the planning time frame that, if violated, is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. . Therefore the assigned "Medium" VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R1 reliability objective is to ensure a proper frequency "no-trip" operating window. Requirement Parts are lower risk condition elements that establish main requirement criteria for completeness. The "Medium" VRF assigned is based on the reliability objective specified.

VRF for PRC-024-1, Requirement R2:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R2 contains Parts specifying conditions for satisfying the main requirement. The VRFs are only applied at the Requirement level and each Requirement Part is treated equally. Requirement obligations include actions similar in scope to actions specified in Requirement R1 and R5, both of which were assigned a "Medium" VRF.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar in concept with both PRC-012-0 Requirement R1 and PRC-023-1 Requirement R1, both of which require protection coordination or settings. These requirements apply to multiple elements while the requirements of PRC-024-1 apply to a single unit. Violation of this requirement by a single generator could not be construed as directly causing or contributing to BES instability, separation or cascading within any time frame. For a single violation to lead to BES instability, separation or cascading would require other standards requirements to be violated. This requirement is assigned a "Medium" VRF.
- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to ensure proper voltage "no-trip" criteria is a requirement in the planning time frame that, if violated, is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. Therefore the assigned "Medium" VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R2 reliability objective is to ensure proper voltage "no-trip" criteria. Requirement Parts are lower risk condition elements that establish main requirement criteria for completeness. The "Medium" VRF assigned is based on the reliability objective specified.

VRF for PRC-024-1, Requirements R3:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R3 contains Parts specifying response expectation and limitation reset conditions for satisfying the main requirement. The VRFs are only applied at the Requirement level and each Requirement Part is treated equally.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar in concept with PRC-006-0 Requirement R1 which specifies documentation requirements. In addition, as is generally the case with reliability standard VRF definitions for documentation and administrative requirements, this requirement is assigned a "Lower" VRF.
- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to document limitations preventing compliance is a requirement that is administrative in nature for the planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Therefore the assigned "Lower" VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R3 reliability objective is to document limitations preventing compliance. Requirement Parts and obligations are lower risk elements that ensure main requirement completeness which are administrative in nature consisting of response submission and limitation reset condition requirements. The "Lower" VRF assigned is based on the reliability objective specified.

VRF for PRC-024-1, Requirement R4:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R4 contains Parts that are procedural in nature defining criteria associated with the main requirement. The VRFs are only applied at the Requirement level and each Requirement Part is treated equally.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement requires an estimate of performance and is somewhat similar in concept with both PRC-009-0 Requirement R1 and PRC-014-0 Requirement R2, both of which reference protection analysis or assessment for determining adequacy. In addition, as is generally the case with reliability standard VRF definitions for analysis & assessment planning type requirements, this requirement is assigned a "Lower" VRF.
- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to estimate performance during a frequency or voltage excursion is a requirement that is administrative in nature for the planning time frame that, if violated, would not, under the

emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Therefore the assigned “Lower” VRF is appropriate.

- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R4 reliability objective is to estimate performance during a frequency or voltage excursion. Requirement Parts and obligations are lower risk procedure based criteria for the main requirement. The “Lower” VRF assigned is based on the reliability objective specified.

VRF for PRC-024-1, Requirement R5:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R5 does not contain Parts. Requirement obligations specify the type of response and response time frame to be observed.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar in concept with both PRC-007-0 Requirement R3 and PRC-010-0 Requirement R2, both of which require providing information within a specified time frame on request. In addition, as is generally the case with reliability standard VRF definitions for documentation and administrative requirements, this requirement is assigned a "Lower" VRF.
- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to provide setting and limitation information as requested is a requirement that is administrative in nature for the planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Therefore the assigned "Lower" VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R5 reliability objective is to provide setting and limitation information as requested. Requirement obligations are lower risk condition elements administrative in nature for ensuring the main requirement is satisfied in a timely manner. The "Lower" VRF assigned is based on the reliability objective specified.

Justification for Assignment of Violation Severity Levels:

In developing the VSLs for the standards under this project, the SDT anticipated the evidence that would be reviewed during an audit, and developed its VSLs based on the noncompliance an auditor may find during a typical audit. The SDT based its assignment of VSLs on the following NERC criteria:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

FERC's VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in PRC-024-1 meet the FERC Guidelines for assessing VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.

Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VSLs for PRC-024-1 Requirement R1:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R1.	The NERC VSL guidelines are satisfied by incorporating binary VSL elements.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's are a combination of binary elements and are categorized as severe. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on binary performance, and timeliness of the actions and obligations	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action per the conditions specified by listed parts. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

VSLs for PRC-024-1 Requirement R2:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R2.	The NERC VSL guidelines are satisfied by incorporating binary VSL elements.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's are a combination of binary elements and are categorized as severe. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on binary performance, and timeliness of the actions and obligations specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action per the conditions specified by listed parts. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

VSLs for PRC-024-1 Requirement R3:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R3.	The NERC VSL guidelines are satisfied by incorporating increments for tardiness elements.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's incorporate the increments for tardiness methodology. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on timeliness of the action specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action in a timely manner including response obligation and reset conditions specified by listed parts. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

VSLs for PRC-024-1 Requirement R4:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R4.	The NERC VSL guidelines are satisfied by incorporating increments for tardiness.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's reflect increments for tardiness. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on binary performance, and both completeness and timeliness of the actions and obligations specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action in a timely manner per the procedure criteria specified by listed parts. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

VSLs for PRC-024-1 Requirement R5:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R6.	The NERC VSL guidelines are satisfied by incorporating increments for tardiness elements.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's incorporate the increments for tardiness methodology. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on timeliness of the action specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action in a timely manner. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

Violation Risk Factor and Violation Severity Level Assignments

Project 2007-09 Generator Verification

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in PRC-024-1 — Generator Performance During Frequency and Voltage Excursions.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

Justification for Assignment of Violation Risk Factors

The Generator Verification Standard Drafting Team applied the following NERC criteria when proposing VRFs for the requirements under this project:

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

The SDT also considered consistency with the FERC Violation Risk Factor Guidelines for setting VRFs:[1]

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report
The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:[2]

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

Guideline (2) — Consistency within a Reliability Standard
The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) — Consistency among Reliability Standards

[1] North American Electric Reliability Corp., 119 FERC ¶ 61,145, order on reh'g and compliance filing, 120 FERC ¶ 61,145 (2007) ("VRF Rehearing Order").
[2] Id. at footnote 15.

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

The following discussion addresses how the SDT considered FERC's VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's Reliability Standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and therefore concentrated its approach on the reliability impact of the requirements.

VRF for PRC-024-1:

There are five ~~six~~ requirements in PRC-024-1. Two ~~hree~~ of the Requirements (R1, and R2~~, and R5~~) were assigned a "Medium" VRF and the remaining three requirements were assigned a "Lower" VRF.

VRF for PRC-024-1, Requirement R1:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R1 contains Parts specifying conditions for satisfying the main requirement. The VRFs are only applied at the Requirement level and each Requirement Part is treated equally. Requirement obligations include actions similar in scope to actions specified in Requirement R2 and R5, both of which were assigned a "Medium" VRF.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar in concept with both PRC-012-0 Requirement R1 and PRC-023-1 Requirement R1, both of which require protection coordination or settings. These requirements apply to multiple elements while the requirements of PRC-024-1 apply to a single unit. Violation of this requirement by a single generator could not be construed as directly causing or contributing to BES instability, separation or cascading within any time frame. For a single violation to lead to BES instability, separation or cascading would require other standards requirements to be violated. This requirement is assigned a "Medium" VRF.

- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to ensure a proper frequency "no-trip" operating window is a requirement in the planning time frame that, if violated, is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. . Therefore the assigned "Medium" VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R1 reliability objective is to ensure a proper frequency "no-trip" operating window. Requirement Parts are lower risk condition elements that establish main requirement criteria for completeness. The "Medium" VRF assigned is based on the reliability objective specified.

VRF for PRC-024-1, Requirement R2:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R2 contains Parts specifying conditions for satisfying the main requirement. The VRFs are only applied at the Requirement level and each Requirement Part is treated equally. Requirement obligations include actions similar in scope to actions specified in Requirement R1 and R5, both of which were assigned a "Medium" VRF.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar in concept with both PRC-012-0 Requirement R1 and PRC-023-1 Requirement R1, both of which require protection coordination or settings. These requirements apply to multiple elements while the requirements of PRC-024-1 apply to a single unit. Violation of this requirement by a single generator could not be construed as directly causing or contributing to BES instability, separation or cascading within any time frame. For a single violation to lead to BES instability, separation or cascading would require other standards requirements to be violated. This requirement is assigned a "Medium" VRF.
- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to ensure proper voltage "no-trip" criteria is a requirement in the planning time frame that, if violated, is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. Therefore the assigned "Medium" VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R2 reliability objective is to ensure proper voltage "no-trip" criteria. Requirement Parts are lower risk condition elements that establish main requirement criteria for completeness. The "Medium" VRF assigned is based on the reliability objective specified.

VRF for PRC-024-1, Requirements R3:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R3 contains Parts specifying response expectation and limitation reset conditions for satisfying the main requirement. The VRFs are only applied at the Requirement level and each Requirement Part is treated equally.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar in concept with PRC-006-0 Requirement R1 which specifies documentation requirements. In addition, as is generally the case with reliability standard VRF definitions for documentation and administrative requirements, this requirement is assigned a "Lower" VRF.
- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to document limitations preventing compliance is a requirement that is administrative in nature for the planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Therefore the assigned "Lower" VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R3 reliability objective is to document limitations preventing compliance. Requirement Parts and obligations are lower risk elements that ensure main requirement completeness which are administrative in nature consisting of response submission and limitation reset condition requirements. The "Lower" VRF assigned is based on the reliability objective specified.

VRF for PRC-024-1, Requirement R4:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R4 contains Parts that are procedural in nature defining criteria associated with the main requirement. The VRFs are only applied at the Requirement level and each Requirement Part is treated equally.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement requires an estimate of performance and is somewhat similar in concept with both PRC-009-0 Requirement R1 and PRC-014-0 Requirement R2, both of which reference protection analysis or assessment for determining adequacy. In addition, as is generally the case with reliability standard VRF definitions for analysis & assessment planning type requirements, this requirement is assigned a "Lower" VRF.
- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to estimate performance during a frequency or voltage excursion is a requirement that is administrative in nature for the planning time frame that, if violated, would not, under the

emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Therefore the assigned “Lower” VRF is appropriate.

- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R4 reliability objective is to estimate performance during a frequency or voltage excursion. Requirement Parts and obligations are lower risk procedure based criteria for the main requirement. The “Lower” VRF assigned is based on the reliability objective specified.

~~VRF for PRC-024-1, Requirements R5:~~

- ~~FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R5 contains Parts specifying conditions and exceptions for satisfying the main requirement during external events. The VRFs are only applied at the Requirement level and each Requirement Part is treated equally. Requirement obligations include actions similar in scope to actions specified in Requirement R1 and R2, both of which were assigned a “Medium” VRF.~~
- ~~FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement requires generation to remain connected during external events and as such does not have strong correlation to similar reliability goals listed in different reliability standards. This is similar in scope to Requirement R1 but is applied to new units rather than existing units. Therefore this requirement is assigned a “Medium” VRF.~~
- ~~FERC Guideline 4 — Consistency with NERC’s Definition of the VRF Level selected exists. Failure to remain connected during an external event is a requirement during real-time operation that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures. Therefore the assigned “Medium” VRF is appropriate.~~
- ~~FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R5 reliability objective is to remain connected during an external event. Requirement Parts specify conditions and exceptions elements that establish main requirement criteria for completeness. The “Medium” VRF assigned is based on the reliability objective specified.~~

VRF for PRC-024-1, Requirement R5~~6~~:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R5~~6~~ does not contain Parts. Requirement obligations specify the type of response and response time frame to be observed.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar in concept with both PRC-007-0 Requirement R3 and PRC-010-0 Requirement R2, both of which require providing information within a specified time frame on request. In addition, as is generally the case with reliability standard VRF definitions for documentation and administrative requirements, this requirement is assigned a “Lower” VRF.
- FERC Guideline 4 — Consistency with NERC’s Definition of the VRF Level selected exists. Failure to provide setting and limitation information as requested is a requirement that is administrative in nature for the planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Therefore the assigned “Lower” VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R5~~6~~ reliability objective is to provide setting and limitation information as requested. Requirement obligations are lower risk condition elements administrative in nature for ensuring the main requirement is satisfied in a timely manner. The “Lower” VRF assigned is based on the reliability objective specified.

Justification for Assignment of Violation Severity Levels:

In developing the VSLs for the standards under this project, the SDT anticipated the evidence that would be reviewed during an audit, and developed its VSLs based on the noncompliance an auditor may find during a typical audit. The SDT based its assignment of VSLs on the following NERC criteria:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

FERC's VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in PRC-024-1 meet the FERC Guidelines for assessing VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a “binary” type requirement must be a “Severe” VSL.

Do not use ambiguous terms such as “minor” and “significant” to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

VSLs for PRC-024-1 Requirement R1:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R1.	The NERC VSL guidelines are satisfied by incorporating binary VSL elements.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's are a combination of binary elements and are categorized as severe. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on binary performance, and timeliness of the actions and obligations	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action per the conditions specified by listed parts. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

VSLs for PRC-024-1 Requirement R2:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R2.	The NERC VSL guidelines are satisfied by incorporating binary VSL elements.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's are a combination of binary elements and are categorized as severe. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on binary performance, and timeliness of the actions and obligations specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action per the conditions specified by listed parts. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

VSLs for PRC-024-1 Requirement R3:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R3.	The NERC VSL guidelines are satisfied by incorporating increments for tardiness elements.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's incorporate the increments for tardiness methodology. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on timeliness of the action specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action in a timely manner including response obligation and reset conditions specified by listed parts. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

VSLs for PRC-024-1 Requirement R4:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R4.	The NERC VSL guidelines are satisfied by incorporating increments for tardiness.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's reflect increments for tardiness. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on binary performance, and both completeness and timeliness of the actions and obligations specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action in a timely manner per the procedure criteria specified by listed parts. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

~~***VSLs for PRC-024-1 Requirement R5:***~~

~~R#~~	~~Compliance with NERC VSL Guidelines~~	~~Guideline 1~~ ~~Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance~~	~~Guideline 2~~ ~~Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties~~ ~~Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent~~ ~~Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language~~	~~Guideline 3~~ ~~Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement~~	~~Guideline 4~~ ~~Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations~~
~~R5.~~	~~The NERC VSL guidelines are satisfied by incorporating binary VSL elements. Requirement Parts merely identify conditions and exceptions for determining binary VSL status.~~	~~This is a new Requirement and does not have a prior level of compliance.~~	~~Proposed VSL's incorporate binary methodology. Binary requirements are categorized as severe. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on binary performance of the actions and obligations specified.~~	~~Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action per the conditions and exceptions specified by listed parts. Proposed VSL's are consistent with the requirement.~~	~~Proposed VSL's are based on a single violation and not a cumulative violation methodology.~~

VSLs for PRC-024-1 Requirement R~~5~~6:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R6.	The NERC VSL guidelines are satisfied by incorporating increments for tardiness elements.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's incorporate the increments for tardiness methodology. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on timeliness of the action specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action in a timely manner. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

RELIABILITY CORPORATION

Standards Announcement

Project 2007-09 Generator Verification
PRC-024-1

Successive Ballot and Non-binding Poll is now open through Friday, January 11, 2013

Now Available

A successive ballot of **PRC-024-1** and non-binding poll of the associated VRFs and VSLs is now open through **8 p.m**. **Eastern on Friday, January 11, 2013**.

The other four standards in this project were posted for a recirculation ballot and the results were announced on December 21, 2012.

Instructions
Members of the ballot pools associated with this project may log in and submit their vote for the standard and opinion in the non-binding poll of the associated VRFs and VSLs by clicking here.

Next Steps
The ballot results will be announced and posted on the project page. The drafting team will consider all comments received during the formal comment period and, if needed, make revisions to the standard. If the comments do not show the need for significant revisions, the standard will proceed to a recirculation ballot.

Background
The purpose of Project 2007-09 - Generator Verification is to ensure that: 1) generators will not trip off-line during specified voltage and frequency excursions or as a result of improper coordination between generator-protective relays and generator voltage regulator controls and limit functions (such coordination will include the generating unit's capabilities); and 2) that generator models accurately reflect the generator's capabilities and operating characteristics.

The standard drafting team (SDT) for Project 2007-09 - Generator Verification - based part of its work on two existing NERC Board-approved standards, MOD-024-1 — Verification of Generator Gross and Net Real Power Capability and MOD-025-1 — Verification of Generator Gross and Net Reactive Power Capability. The drafting team moved the Requirements of MOD-024-1 into MOD-025-2, and recommends retiring MOD-024-1 and incorporated industry comments to make improvements to the standards.

The drafting team has also based its work on four draft standards developed by the Phase III & IV SDT that were field tested by four Regions from mid-2006 through mid-2007:

- PRC-019-1 — Coordination of Generator Voltage Regulator Controls with Unit Capabilities and Protection
- PRC-024-1 — Generator Performance During Frequency and Voltage Excursions
- MOD-026-1 — Verification of Models and Data for Generator Excitation Control System Functions
- MOD-027-1 — Verification of Generator Unit Frequency Response

Additional information is available on the project page.

Standards Process

The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance, please contact Monica Benson,
Standards Development Administrator, at monica.benson@nerc.net or at 404-446-2560.

Standards Announcement

Project 2007-09 Generator Verification
PRC-024-1

Formal Comment Period: December 12, 2012 – January 11, 2013

Upcoming:
Successive Ballot and Non Binding Poll: January 2, 2013 – January 11, 2013

Now Available

A 30-day formal comment period is open for **PRC-024-1** – Generator Performance During Frequency and Voltage Excursions through **8 p.m. Eastern on Friday, January 11, 2013**.

A successive ballot of **PRC-024-1** and non-binding poll of the associated VRFs and VSLs will be conducted beginning on **Wednesday, January 2, 2013 through 8 p.m**. **Eastern on Friday, January 11, 2013**.

The remaining four standards in this project are being posted for recirculation ballots from December 12, 2012 through December 21, 2012. A separate announcement will be sent for these recirculation ballots.

Instructions for Commenting
A formal comment period for **PRC-024-1** is open through **8 p.m. Eastern on Friday, January 11, 2013**. Please use this electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Wendy Muller at wendy.muller@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page.

Next Steps
The drafting team will consider all comments received during the formal comment period and successive ballot and, if needed, make revisions to the standard. If the comments do not show the need for significant revisions, the standard will proceed to a recirculation ballot.

Background
The purpose of Project 2007-09 - Generator Verification is to ensure that: 1) generators will not trip off-line during specified voltage and frequency excursions or as a result of improper coordination between generator-protective relays and generator voltage regulator controls and limit functions (such

coordination will include the generating unit's capabilities); and 2) that generator models accurately reflect the generator's capabilities and operating characteristics.

The standard drafting team (SDT) for Project 2007-09 - Generator Verification - based part of its work on two existing NERC Board-approved standards, MOD-024-1 — Verification of Generator Gross and Net Real Power Capability and MOD-025-1 — Verification of Generator Gross and Net Reactive Power Capability. The drafting team moved the Requirements of MOD-024-1 into MOD-025-2, and recommends retiring MOD-024-1 and incorporated industry comments to make improvements to the standards.

Standards Announcement

Project 2007-09 Generator Verification
PRC-024-1

Successive Ballot and Non-Binding Poll Results

Now Available

A successive ballot of **PRC-024-1** and non-binding poll of the associated VRFs and VSLs concluded at **8 p.m. Eastern on Friday, January 11, 2013**.

Voting statistics for each ballot are listed below, and the Ballot Results page provides a link to the detailed results.

Approval (Updated)	Non-binding Poll Results (Updated)
Quorum: 78.16% Approval: 60.31%	Quorum: 76.38% Supportive Opinions: 55.68%

Next Steps

The drafting team will consider all comments received during the formal comment period to determine the next steps.

Background

The purpose of Project 2007-09 - Generator Verification is to ensure that: 1) generators will not trip off-line during specified voltage and frequency excursions or as a result of improper coordination between generator-protective relays and generator voltage regulator controls and limit functions (such coordination will include the generating unit's capabilities); and 2) that generator models accurately reflect the generator's capabilities and operating characteristics.

The standard drafting team (SDT) for Project 2007-09 - Generator Verification - based part of its work on two existing NERC Board-approved standards, MOD-024-1 — Verification of Generator Gross and Net Real Power Capability and MOD-025-1 — Verification of Generator Gross and Net Reactive Power Capability. The drafting team moved the Requirements of MOD-024-1 into MOD-025-2, and recommends retiring MOD-024-1 and incorporated industry comments to make improvements to the standards.

The drafting team has also based its work on four draft standards developed by the Phase III & IV SDT that were field tested by four Regions from mid-2006 through mid-2007:

- PRC-019-1 — Coordination of Generator Voltage Regulator Controls with Unit Capabilities and Protection
- PRC-024-1 — Generator Performance During Frequency and Voltage Excursions
- MOD-026-1 — Verification of Models and Data for Generator Excitation Control System Functions
- MOD-027-1 — Verification of Generator Unit Frequency Response

Additional information is available on the project page.

Standards Process

The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance, please contact Monica Benson,
Standards Development Administrator, at monica.benson@nerc.net or at 404-446-2560.

APS agreed with the draft Standard however, we voted no because of the Violation Severity Levels (VSL) associated with this Standard. Only 10 days spacing between various levels of the VSL is inappropriate and not justified. A 30 days delay in providing the requested information does not represent a significant reliability risk. In addition, other draft Standards, for example Project 2007-09 MOD and PRC-019, provides a 30 to 90 days separation between various levels of the VSL. In our opinion each VSL severity level should be at least 30 days apart.

Ken Gardner
Alberta Electric System Operator
No
The AESO disagrees with this requirement being removed from Draft 5 and believes that new generating must be required to be designed, built and maintained in compliance with PRC-024-1 unless it is due to equipment failure and in such cases the owner of the generating unit must report failure to the ISO with a plan to address the failure.
No
The AESO disagrees with the use of 85% and supports the values as expressed previously in draft 4 of PRC-024-1. Transmission systems are designed to operate between 90% to 110% and not down to 85%, as such we do not expect generators to ride through voltages as low as 85% for an extended period of time. In particular, as NERC has left the 85% duration open ended, it is unclear how long a generating unit is to remain on-line under this condition. In addition, there appears to be a discrepancy in Attachment 2 where the "Curve Data Points" table identify a low voltage ride through duration of 600 seconds for <0.90 pu voltage and the "Voltage Ride Through Time Duration Curve" shows this to occur <0.85 pu voltage. Based on the explanation above, the table should be updated accordingly.
Individual
John Bee
Exelon Corporation and its affiliates
Exelons negative vote is based on the following: Exelon reiterates that nuclear generating units must comply with a rigorous process of evaluation to meet requirements of the Nuclear Regulatory Commission (NRC). The response by the SDT in the Consideration of Comments dated 12/7/12 that "the SDT does not believe extensive studies or dynamic simulations are required to comply with this requirement" does not address the fact that NRC licensed nuclear generating units must also comply with the requirements of the NRC. Exelon again does not agree that 60 calendar days is a reasonable amount of time to perform any such analysis.

The NAGF agrees with the removal of R5, but is still concerned with the criteria stated in R4. R4 allows using, “experience, actual event histories, or sound engineering judgment,” to determine how long units will remain connected during disturbances. It is understood that detailed calculations are not required, but the word “sound” implies that the estimates are to have some reasonable degree of authority, and the needed information for such inputs is generally not available. An unwarrantedly optimistic forecast could be worse than no input at all; so, until and unless a really huge disturbance is recorded, the only fact-based prognosis that could be made regarding the excursions in Atts. 1 and 2 of PRC-024 would be to say for every unit, “Tripping may occur whenever ANSI C84.1 emergency voltage variation boundaries (+/-10%) are exceeded, and whenever frequency fluctuations exceed the normal, minor magnitude typically encountered,” (the latter statement applies particularly for gas turbines with dry low-NOx combustors). We believe that this represents sound engineering judgment, but a person with (perhaps unjustified) expectations of something more quantitative might not agree. NERC requirements and their associated measures should leave all parties with one, clear concept of what it takes to achieve compliance, and for PRC-024 to reach this goal R4 should be deleted or at least it should state that “No concrete data on which to base judgments – assume tripping,” is an acceptable response.
Yes
Yes
Yes
The NAGF also recommend the following changes to Footnote 1. The expression, “protective functions within control systems…based on frequency or voltage inputs,” should be replaced with, “control system frequency or voltage trip setpoints.” It is unclear whether or not the present statement covers such events as contactor drop-out at extreme under-voltage or actuation of fan stall protection run-back during under-frequency operation. This change is important, because R2 allows units to trip within the no-trip zone only in accordance with R3, and R3 in turn pertains to a, “known equipment limitation…including (but not limited to) study results, experience from an actual event, or manufacturer’s advisory.” Tripping from unknown frequency or voltage-related limitations therefore evidently constitutes a violation, and predicting if and when every contactor in a plant will drop-out for example is not possible.
a. Confusion is created by making exemptions, “in accordance with Requirement R3,” in R1 and R2 of PRC-024-1; while R3 excludes, “limitations that are caused by generator frequency and voltage protective relays.” Are such “protective relays” meant to correspond to the “protective relaying” discussed above? It is semantically unclear whether or not any exemptions are actually being allowed. It has been said in discussions with the SDT that no grandfathering of voltage or frequency relaying is intended, and exemptions covered in R3 are for other equipment limitations such as low frequency sensitive turbine blades. This only adds to the confusion, however, since equipment limitations are (or at least should be) where over/under-frequency protection system settings come from. If a turbine OEM states that a unit must trip within one second at 2.5% overspeed, for example, then the 81O relay is set for 60 cycles at 61.5 Hz. We believe that R1, R2 and R3 would be completely harmonious if the SDT were to remove footnote 3, “Excludes limitations that are caused by the generator frequency and voltage protective relays themselves.” Alternatively, if the intent was to require that settings have a grounding in equipment limitations and not be based on guesswork or corporate policy, a more direct way of saying so should be developed . b. The rationale for the last bullet item of R3.1 (reporting a 10% increase in nameplate capacity) is unclear, and it could be interpreted as requiring that units previously having restrictions be pulled into no-exemptions status. This is an appropriate course of action where possible, and increasing fossil unit output 10% is likely to require replacing the L0 blades, in which case achieving Att. 1 compliance shouldn’t be a problem for the less-demanding interconnections. These components might not pass muster in the West (no instantaneous tripping until 57.0 Hz), however, and some designs would definitely not qualify in Quebec (55.5 Hz). This could be even more of an issue for the very long L0 blades of nuclear units. Regarding gas turbines, firing temperature increases and compressor massflow uprates (e.g. zero-staging) can cause the 10% threshold to be reached without necessarily affecting original-unit frequency limits, particularly if dealing with a new model that was initially rated at substantially less than the expected capability pending confirmation of prototype unit performance in service. Expanding the frequency range for this type of equipment may not be feasible, since there is often no alternative to OEM blading (especially for the more recent models). That is, one cannot shop around for blading with PRC-024-compliant resonance avoidance. The issue also involves compressor surge margin at low speed and turbine overload at high speed, which may lock-in original frequency restrictions even if more-tolerant blading becomes available. c. Steam turbine off-frequency limits are generally set by OEMs as lifetime limits regarding duration, but there is no discussion in PRC-024-1 as to how often the specified excursions may occur. Our understanding is that it is acceptable for units that once met Att. 1 of PRC-024 to start reporting (and periodically increasing) will-trip exceptions as fatigue life is progressively consumed, but it would be best to make this matter explicit in the standard rather than requiring each GO to formulate its own interpretation. d. The scope of the generator protection trip settings reported in R5 should be limited to the protective relaying specified in R1, R2, and footnote 1. It is believed that responding to a request for data is acceptable, but the burden of having to provide an additional response within 60 days of any change to previously reported trip settings is unduly burdensome. It is believed that recurring requests by the PC or TP should be the mechanism for additional reporting.

Steam turbine off-frequency limits are generally set by OEMs as lifetime limits regarding duration, but there is no discussion in PRC-024-1 as to how often the specified excursions may occur. Our understanding is that it is acceptable for units that once met Att. 1 of PRC-024 to start reporting (and periodically increasing) will-trip exceptions as fatigue life is progressively consumed, but it would be best to make this matter explicit in the standard rather than requiring each GO to formulate its own interpretation. d. The scope of the generator protection trip settings reported in R5 should be limited to the protective relaying specified in R1, R2, and footnote 1. It is believed that responding to a request for data is acceptable, but the burden of having to provide an additional response within 60 days of any change to previously reported trip settings is unduly burdensome. It is believed that recurring requests by the PC or TP should be the mechanism for additional reporting.
Individual
Louis C. Guidry
Cleco
Yes
Cleco is concerned the approach is too prescriptive given the numerous variables associated with generator performance and protection. We recommend the elimination of requirements R1 and R2 in their entirety. We further recommend requirement R3 be modified so that the generator owner is required to develop a unit capability curve for frequency and voltage based on equipment limitations and protection requirements and provide this information to the appropriate users. This approach emphasizes equipment preservation and safety while retaining predictability of unit performance for system modeling. We would also like an example for how to evaluate Volts/Hertz protection for the proposed voltage curve.
Individual
Michelle DAntuono
Ingleside Cogeneration LP
Yes
Ingleside Cogeneration LP is firmly in agreement with the removal of the ride-through performance requirement (R5) from PRC-024-1. Although we understand the intent to guarantee generation availability for a set of voltage and frequency transients, the project team has correctly determined that the costs far outweigh the benefits. In our view, this is in keeping with the spirit of the

Cost Effective Analysis Process, Paragraph 81, and other risk-based compliance initiatives that were initiated to maintain that careful balance.
While we were pleased to see the removal of R5 from PRC-024, there is still some question as to the basic necessity for this standard, PRC-001, now PRC-027, requires extensive coordination of protection system relay setting between GOs and TOs. Interconnection agreements also require following voltach schedules, etc. This is a case of over regulation and portential conflicts between standards, something Paragraph 81 initiative is supposed to oppose. Also, there is no explicit FERC directive that requires this standard.

The SDT has addressed all of our comments by changing several items that improve the standard, and especially important to us was removing R5 & M5. However, the SDT did not alter the VSL from the 10 day escalation for R3 through R5, and used the NERC guidance as their reason. NERC guidance also allows for a population based severity escalation, which we believe is more appropriate for characterizing the severity in situations such as this, and so we recommend using this approach. We suggest allowing up to 5% for Low, 5 to 10% for Moderate, 10 to 15% for High, and greater than 15% for Severe. For example, change the R4 Lower VSL to “The Generator Owner provided an estimate for less than 100% but more than 95% of its units’ performance within 60 calendar days of a written request” and change R4 Moderate VSL to “The Generator Owner provided an estimate for 95% or less, but more than 90% of its units’ performance within 60 calendar days of a written request.”

1. The word "evidence" is missing in Measure M2. Also in Measure M2, the wording should be changed to add the phrase, "... or other documentation", to the list of acceptable evidence for Requirement R2. Measure M1 allows "other documentation" as evidence, and this should be true for Measure M2 also. 2. We disagree that the applicability of this standard needs to be to all generators regardless of size or connection voltage. Only generators connected to the Bulk Electric System should be applicable. The efforts needed to meet these requirements will be significant, and should not be required for every generating unit. Please verify your understanding of the referenced FERC order, because resources are limited.

Our concern is by eliminating the instantaneous high frequency overshoot margin that you could cause an unintended cascading event on the system. For example when you drop load it could cause an instantaneous unit trip, due to instantaneous high frequency on the unit, which would then cause an under frequency load trip. We would suggest that the drafting team let the regions investigate before approving this reduction in the margin for this time period and standard as a whole.
No
We would like to see consistency between the voltage ride through curve and the off nominal frequency capability curve in the log scale. The last draft was consistent and we wonder why the drafting team changed the voltage ride through curve to a linear depiction?
Yes

Appelbaum
The VRF for R1 and R2 should be High not Medium. The Drafting team in the VRF justification document states [Start quote] This requirement is similar in concept with both PRC-012-0 Requirement R1 and PRC-023-1 Requirement R1, both of which require protection coordination or settings. These requirements apply to multiple elements while the requirements of PRC-024-1 apply to a single unit. Violation of this requirement by a single generator could not be construed as directly causing or contributing to BES instability, separation or cascading within any time frame. For a single violation to lead to BES instability, separation or cascading would require other standards requirements to be violated.[End Quote] I disagree with the assertion. PRC-023 is violated if one relay is incorrectly set regardless of the number of elements it is protecting. The same applies to PRC-024, a failure to set one relay will effect one generator. Also for PRC-023 a single violation would not lead to BES cascade but that reasoning did not prevent a VRF of High to be established for PRC-023. Applying consistent reasoning to PRC-024 would mean that the single generator argument to reduce the VRF to medium wuld not apply.

Applicability should only be to those units meeting NERC registration criteria. Per Footnote 4, the “point of interconnection means the transmission (high voltage) side of the generator step-up or collector transformer.” As the SDT is probably aware, many generator protective relays measure voltage on the generation (low voltage) side of the transformer. It seems that guidance may

be needed to reconcile generation (low voltage) side measurements with a standard whose requirements are based upon transmission (high voltage) side voltage. In R2, the phrase “less stringent” may not be clear enough language. For example, could “less stringent” mean 96-104%, rather than 95-105%, which is our assumption? Or, could it mean 94-106%? Why are auxiliary systems mentioned in R4 but not in R1, R2, and R5? In R5, remove parentheses around “that models the associated unit.” The parentheses seem to be inconsistent with similar text in R4. In M2, move ‘evidence’ to before “that generator voltage…” Attachment 2, Curve Detail 3, may need some better clarification. Regarding Attachment 2, Curve Detail 4, does that mean a GO must base relay settings on the lowest expected frequency deviation? What is an example of how and when Detail 4 should be applied? Regarding Attachment 2, Curve Detail 5, by stating “RMS or crest”, does this mean that a GO must consider harmonics? Most simulations only consider the fundamental frequency component. In these cases, the per unit crest and RMS voltage should be identical. Clarification is requested. Examples are needed to support the application of Attachment 2, Evaluating Protective Relay Settings. R1, R2, and the diagram in Attachment 2 appear to be fairly straightforward. However, the Voltage Ride-Through Curve Clarifications page (last page) seems to confuse, not clarify. This last page seems to undermine the apparent simplicity of the rest of the standard with respect to voltage protective relay settings. In Attachment 2, the Curve Data Points table needs to be updated to reflect the Voltage Ride-Through Time Duration Curve. Tacoma Power appreciates the opportunity to provide comments, and thanks you for consideration of our comments.

We are concerned about how this change may impact the how the system responds to frequency excursions. Please refer to our comment in question 5.
Yes
Yes
In order for the industry to support the proposed change to the high frequency trip curve in Attachment 1, we propose that the SDT provide the technical justification and an assessment of the system impacts as a result of the proposed change so operators are aware of and manage the resultant system response. We believe the standards should be based upon actual technical data rather than conditions represented in the IEEE and IEC standards.

ReliabilityFirst

ReliabilityFirst votes in the affirmative for this standard because the standard further enhances reliability by ensuring that generating units remain connected during frequency excursions. Even though ReliabilityFirst votes in the affirmative, we offer the following comment for consideration: 1. Requirement R3 Part 3.1 a. To be consistent with the changes made to Requirement R4 and new R5 (removal of Reliability Coordinator and Transmission Operator), ReliabilityFirst recommends removing references to the Reliability Coordinator and Transmission Operator from Requirement R3 Part 3.1 as well. Requirement R3 is long-term planning requirement and communication of the documented equipment limitations to these entities should not be required.

Yes. First, the standard as presented is greatly improved from the prior version. The hard work of the SDT is apparent. However, there still are a few issues which should be resolved with the standard. First, the 10% trigger for removing exemptions is too low. GE markets products for their gas turbines which can raise output more than 10% through software changes. This could place a turbine into no exemptions space while it still contained blades subject to failure at frequencies within the no trip zone. The 10% threshold should be raised or the standard reworded to note that software changes do not trigger the requirement. Secondly, the phrase "manufacturers advisory" is too vague. One reasonable person may read the phrase as "a statement in the OEM materials which places limits on the frequencies the machine can tolerate", while another reasonable person would define it as "a specific bulletin or technical information letter which advises of a finding about the equipment". GE 7FA OEM documents, for example, state that the turbine is "very sensitive to abnormal frequencies" and that recommendations "should be carefully studied and followed". Would this document, coupled with an engineer determining an overfrequency relay setting of 60.5 with 60 cycle delay, be enough to allow that setting? Would something like this be subject to individual auditor determination? If the latter is true, the wording should be changed, as requirements should clearly guide the entity in making a determination of the allowable action. Finally, if a steam turbine which is driven by steam generated from gas turbine exhaust is required to trip within the no-trip zone due to equipment limitations, does this allow those gas turbines to trip within the no trip zone also, in order to prevent damage to the steam turbine condenser? Can their protective settings for overfrequency be set at the same point as the required steam turbine settings, or would an entity have to add logic to their system to trip in response to the activation of the steam turbine overfrequency trip instead of their own overfrequency relay?

We agree with the overall approach taken, however we are concerned that the standard repeatedly references "protective relaying" while Footnote 1 clarifies that protective relaying could be discrete relays as well as protective functions within control systems. The term "protective relay" is widely accepted amongst engineers as meaning a discrete relay. AEP recommends the SDT utilize the term "protective functions" throughout the standard to clearly identify that the scope of the standard extends beyond discrete relays. AEP recommends that the time allowed to meet R 3.1 be extended to 60 calendar days, aligning it with R4 and R5. AEP recommends R4 and R5 be revised to read "within 60 calendar days or an agreed upon schedule". The data sought by the PC or Transmission Planner might be quite large for some utilities. In this case, it would be advantageous to allow the GO to work with the requesting party to develop a timeline that meets the needs of the requesting party without being overly burdensome to the GO. We believe the intent of the SDT in requiring the GO to provide updates on any previously requested trip settings in R5 was to ensure that the PC and TP are notified of any changes to the R1 and R2 applicable trips. If this is accurate, we suggest revising R5 to require the GO to update the PC and TP within 60 days of installation of new trips or changes to existing trips to which R1 and R2 applies, not solely those trip settings previously requested by the PC and TP. Doing so removes the obligation of the GO to track which trip settings were part of a previous request. This change will also eliminate the possibility of the TP or PC not being made aware of a newly installed applicable trip within a timely fashion. Should the 10 percent generator nameplate capacity increase stipulation in the last (fourth) bullet point under R3.1 be removed? We do not see that the stipulation is relevant to the question of what limitation is causing a given generating unit to not satisfy R1 or R2 criteria. Perhaps the point should read as follows: “Modification or upgrade of the equipment causing the limitation that removes or changes the limitation.” With reference to R4, would it make sense for the TP or PC to specify Attachments 1 and 2 as the profiles for the purpose of collecting time duration estimates, or should the term “profile” instead be “trajectory”? From the viewpoint of the TP or PC, receiving duration estimates with respect to the Attachments would be advantageous, particularly when coordinating generator off-nominal frequency tripping with UFLS. However, a single duration estimate seems more compatible with a frequency or voltage trajectory. Which is the SDT’s intent?
Individual

Manitoba Hydro
Yes
Yes
(1) R4 – the word ‘for’ is missing between duration and which. (2) R4, second paragraph – the requirement hinges on what the GO ‘expects’ may happen, is very subjective. It will be hard for the MRO to measure compliance on this point. The phrase ‘for the duration of the profile of the excursion’ is new and not language that appears anywhere else in R4. It’s not clear what it means. We would suggest using language that appears in the first paragraph of R4 so this is consistent. (3) R5 – allows the Planning Coordinator or Transmission Planner to request that settings must be provided within some time frame other than 60 days if they so direct. Theoretically this could be 1 day as there are no parameters put on what the PC or TP may direct. (4) R5 - doesn’t provide for a time frame other than 60 days which the requirement does. (5) M2 - the word 'evidence' should be placed after ‘have’

and not after ‘R2’. (6) M3 – language doesn’t seem to reflect revisions made to R3. For example, ‘excluding limitations…’ is still in M3 but deleted from R3. (7) M4 – language doesn’t seem to reflect revisions made to R4. For example, the description of the generating units differs. (8) M5 – does not contemplate that it may be some time frame other than 60 days as R5 permits. (9) Compliance, 1.1 – CEA is used in the last sentence but never defined. The acronym is not used again, so it’s likely easiest to not define it and use Compliance Enforcement Authority each time. (10) VSLs, R1 and R2 – the wording of the VSL is problematic as it ties the violation to a violation of R3 which the requirement itself does not do.

Recommend that the R4 be enhanced to give more detail on how to satisfy this requirement. As significant as R4 is, the Generator Owners need more guidance than what is currently stated.
1. The technical justification for the need of a plant performance criteria appears to be based on issues with early design wind generation. The technical considerations at these types of generation stations are different than steam turbine generation plants, which require heavy induction loads to support operation and these loads are sensitive to upsets in voltage and frequency. The technical implications of the plant performance are not clear. Recommend generating a separate SAR and bring in industry technical SMEs such as IEEE, EPRI, Equipment OEMs, Power Plant Design entities, technical acadamia, etc. to assist in the technical analysis and standard development. 2. Likewise, industry technical SMEs such as IEEE, EPRI, Equipment OEMs, Power Plant Design entities, technical acadamia, etc. can develop acceptable methods to determine the capability of a plant to ride through grid transients. 3. The following are IEEE Electric Machines Committee comments for PRC-024-1 consideration The IEEE Electric Machinery Committee hosted a discussion topic on “Grid Code Impact on Electric Machine Design” in San Diego at this year’s Power Engineering Society meeting and offers the following input. • Minor changes in the Under-frequency Ride Through Curve are suggested to better match existing machine design standards in IEEE C50????. • The PRC-024 Voltage Ride Through criteria is technically not ready to be a standard, for the following reasons; 1. PRC-024 VR capability may not be available at any price. BES reliability enhancements requiring technological advances should be addressed with industry groups (e.g. ASME, IEEE) and OEMs to develop commercially available products before appearing as requirements in reliability standards. It is believed the cost of complying with wider standards might increase main generator machine costs as much as 25%, which is not insignificant. This should only be required if there is a defined local system need for higher standards and that these costs should be considered against the cost of other possible resolutions. 2. A specific concern in this respect regarding the ride-through capability being sought in PRC-024 R3-5 is that auxiliary buses may drop-out and cause a unit to trip for the excursions specified, which go well beyond the industry's present design criteria, even if the protective relay settings nominally allow such transients. It may be unrealistic to expect that the dynamic behavior of all 4160V and 460V systems in new plant can be dynamically modeled to a degree allowing one to obtain non-dropout guarantees from equipment suppliers and EPC firms for extreme transients such as 2.0 seconds at 65% voltage, or that the same can be done for existing plants to allow identification of limiting components and accurate estimates of performance. 3. The voltage ride through was originally intended to address early deficiencies in wind generation design only and it doesn’t make sense to apply such a broad curve to steam plants. The concerns that led to the VRT curve for wind have been addressed by new vintage wind plant designs and thus, the EMC does not believe there is not driving need for a standard VRT criteria. • The VRT issue is holding up addressing other significant issues addressed by PRC -024 (relay setting coordination and frequency ride through). The VRT should be pulled out of PRC-024 and a new SAR drafted to address the voltage performance aspects if this is really needed for reliability. • More clarity in defining plant MVARs available to support grid voltage is needed. Specifically, generation plants have not been designed to operate outside a normal band of 95 to 105% on the generator terminals. GSU settings are typically chosen to optimize MVAR support under normal operations, however is not reasonable to assume the full leading or lagging reactive support would be available under normal grid conditions.

The NAGF agrees with the removal of R5, but is still concerned with the criteria stated in R4. R4 allows using, “experience, actual event histories, or sound engineering judgment,” to determine how long units will remain connected during disturbances. It is understood that detailed calculations are not required, but the word “sound” implies that the estimates are to have some reasonable degree of authority, and the needed information for such inputs is generally not available. An unwarrantedly optimistic forecast could be worse than no input at all; so, until and unless a really huge disturbance is recorded, the only fact-based prognosis that could be made regarding the excursions in Atts. 1 and 2 of PRC-024 would be to say for every unit, “Tripping may occur whenever ANSI C84.1 emergency voltage variation boundaries (+/-10%) are exceeded, and whenever frequency fluctuations exceed the normal, minor magnitude typically encountered,” (the latter statement applies particularly for gas turbines with dry low-NOx combustors). We believe that this represents sound engineering judgment, but a person with (perhaps unjustified) expectations of something more quantitative might not agree. NERC requirements and their associated measures should leave all parties with one, clear concept of what it takes to achieve compliance, and for PRC-024 to reach this goal R4 should be deleted or at least it should state that “No concrete data on which to base judgments – assume tripping,” is an acceptable response.
Yes
Yes

Yes
The NAGF also recommend the following changes to Footnote 1. The expression, “protective functions within control systems…based on frequency or voltage inputs,” should be replaced with, “control system frequency or voltage trip setpoints.” It is unclear whether or not the present statement covers such events as contactor drop-out at extreme under-voltage or actuation of fan stall protection run-back during under-frequency operation. This change is important, because R2 allows units to trip within the no-trip zone only in accordance with R3, and R3 in turn pertains to a, “known equipment limitation…including (but not limited to) study results, experience from an actual event, or manufacturer’s advisory.” Tripping from unknown frequency or voltage-related limitations therefore evidently constitutes a violation, and predicting if and when every contactor in a plant will drop-out for example is not possible.
a. Confusion is created by making exemptions, “in accordance with Requirement R3,” in R1 and R2 of PRC-024-1; while R3 excludes, “limitations that are caused by generator frequency and voltage protective relays.” Are such “protective relays” meant to correspond to the “protective relaying” discussed above? It is semantically unclear whether or not any exemptions are actually being allowed. It has been said in discussions with the SDT that no grandfathering of voltage or frequency relaying is intended, and exemptions covered in R3 are for other equipment limitations such as low frequency sensitive turbine blades. This only adds to the confusion, however, since equipment limitations are (or at least should be) where over/under-frequency protection system settings come from. If a turbine OEM states that a unit must trip within one second at 2.5% overspeed, for example, then the 81O relay is set for 60 cycles at 61.5 Hz. We believe that R1, R2 and R3 would be completely harmonious if the SDT were to remove footnote 3, “Excludes limitations that are caused by the generator frequency and voltage protective relays themselves.” Alternatively, if the intent was to require that settings have a grounding in equipment limitations and not be based on guesswork or corporate policy, a more direct way of saying so should be developed . b. The rationale for the last bullet item of R3.1 (reporting a 10% increase in nameplate capacity) is unclear, and it could be interpreted as requiring that units previously having restrictions be pulled into no-exemptions status. This is an appropriate course of action where possible, and increasing fossil unit output 10% is likely to require replacing the L0 blades, in which case achieving Att. 1 compliance shouldn’t be a problem for the less-demanding interconnections. These components might not pass muster in the West (no instantaneous tripping until 57.0 Hz), however, and some designs would definitely not qualify in Quebec (55.5 Hz). This could be even more of an issue for the very long L0 blades of nuclear units. Regarding gas turbines, firing temperature increases and compressor massflow uprates (e.g. zero-staging) can cause the 10% threshold to be reached without necessarily affecting original-unit frequency limits, particularly if dealing with a new model that was initially rated at substantially less than the expected capability pending confirmation of prototype unit performance in service. Expanding the frequency range for this type of equipment may not be feasible, since there is often no alternative to OEM blading (especially for the more recent models). That is, one cannot shop around for blading with PRC-024-compliant resonance avoidance. The issue also involves compressor surge margin at low speed and turbine overload at high speed, which may lock-in original frequency restrictions even if more-tolerant blading becomes available. c. Steam turbine off-frequency limits are generally set by OEMs as lifetime limits regarding duration, but there is no discussion in PRC-024-1 as to how often the specified excursions may occur. Our understanding is that it is acceptable for units that once met Att. 1 of PRC-024 to start reporting (and periodically increasing) will-trip exceptions as fatigue life is progressively consumed, but it would be best to make this matter explicit in the standard rather than requiring each GO to formulate its own interpretation.

a) The effective date in Section 5.1.4 should be increased to seven years. The typical major outage cycle for base load units can be as long as 7 to 9 years, based upon the unit and its history. b) In the “Consideration of Issues and Directives” document, it is stated that the GVSDT believes that R3 allows NRC requirements to supercede portions of the voltage and frequency ride through criteria in PRC-024-1, and that NRC requirements qualify as technical limitations for the purposes of this standard. We believe that additional clarity is needed in the text of Requirement R3 regarding allowable limitations other than equipment limitations, such as NRC technical specification limits and perhaps environmental permit limitations as well. c) Additional clarity is needed in Requirement R4. Is R4 intended to serve as a means to obtain more information from a Generator Owner about limitations identified pursuant to R3? Is the voltage or frequency profile to be provided by the Planning Coordinator or Transmission Planner different from Attachments 1&2? d) Requirement R4 states that the Generator owner may develop estimates based upon “sound engineering judgment”. R4 should more clearly indicate the extent of “due diligence” effort that is expected in order to support an estimate based on “sound engineering judgment”. e) On Attachment 2, Evaluating Protective Relay Settings, 1.c states that “Power factor is 0.95 lagging (i.e. supplying reactive power to the system) as measured at the generator terminals.” We believe that compensating all generator voltage relaying for a loading of rated power at 0.95pf lagging is dangerous, as this could indicate coordination margin to the HVRT when there is none. The worst case coordinating conditions for the HVRT are not the same as for the LVRT. The current version of the standard is prescribing a method that will lead to miscoordination between the HVRT curve and overvoltage relays (59 & 24 elements). We recommend generator undervoltage relaying be evaluated at rated power at rated powerfactor, and generator overvoltage relaying be evaluated at rated power at .95pf leading. There can be more than a 10% difference in POI voltage under these two sets of conditions. f) In the VRF and VSL Assignment document, the R6 should be corrected to R5 (typo)

WILL SMITH
MIDWEST RELIABILITY ORGANIZATION
Yes
Yes
Could the drafting team please clarify the risk to the BES by leaving no margin for frequency overshoot? The NSRF was unsure if reducing the no trip margin above the IEEE / IEC design limits really represented a reliability risk to the BES. If generator units do overshoot the IEEE / IEC curve and remain on-line without damage, that doesn't appear to be a reliability risk. If the generator should trip to avoid damage from a frequency overshoot above the IEEE / IEC curve for which the unit was designed, that would also appear to be better for reliability, even if the unit does trip.
Yes
The NERC generator relay loadability standards don't appear to state times, so changing the curves from 600 seconds to 3 and 4 seconds is a step in the right direction but could still lead to conflicts unless this standard or PRC-025 is amended. In a relay world that typically operates in cycles, 3 to 4 seconds is still a very long time and the NSRF believes that conflicts are still possible unless both standards are coordinated carefully. It is inappropriate to force entities to chose which standard to potentially violate. Please make sure that the associated graphs and curves data points within the table match each other.
Yes
In R3, the NSRF recommends that 30 day requirement be replaced with "in a timely manner not to exceed 90 days". This is predicated on the low VRF and low risk of impacting the BES. While some deadlines are necessary in NERC standards, large frequency and voltage ecursions are rare and there would be little to no reliability difference if R3 changes were communicated in a time frame longer than 30 days. In R3, the fourth bullet, delete (cumulative from the first effective date of this standard). This creates an unnecessary compliance tracking burden. Entities must forever memorialize all equipment capability from the effective date of the proposed standard such as 2014. There is no reason to track all possible equipment changes in 2044 back to 2014 to show that a 10% upgrade has not occurred is pieces throughout the years. Transmission and generation upgrades are usually lumped and somewhat large as it is usually cost prohibitive to increase generator capability. The reliability benefit is to recognize when a large change in the limitation occurred, not to track a cumulative 10%. Is the SDT referring to only the limiting element that needs to be tracked?

PPL Generation, LLC on behalf of its Supply NERC Registered Entities
No
Although PPL Companies agree with the removal of R5, PPL is still concerned with the following criteria stated in R4. R4 allows using, "experience, actual event histories, or sound engineering judgment," to determine how long units will remain connected during disturbances. It is understood that detailed calculations are not required, but the word "sound" implies that the estimates are to have some reasonable degree of authority, and the needed information for such inputs is generally not available. An unwarrantedly optimistic forecast could be worse than no input at all; so, until and unless a really huge disturbance is recorded, the only fact-based prognosis we could make regarding the excursions in Atts. 1 and 2 of PRC-024 would be to say for every unit in the fleet, "Tripping may occur whenever ANSI C84.1 emergency voltage variation boundaries (+/-10%) are exceeded, and whenever frequency fluctuations exceed the normal, minor magnitude typically encountered," (the latter statement applies particularly for gas turbines with dry low-NOx combustors). We believe that this represents sound engineering judgment, but a person with (perhaps unjustified) expectations of something more quantitative might not agree. NERC requirements and their associated measures should leave all parties with one, clear concept of what it takes to achieve compliance. For R4 to reach this goal we believe that PRC-024 Measure 4 should state that "No concrete data on which to base judgments – assume tripping," is an acceptable measure for R4.
No
Yes
Yes
The PPL Companies also recommend the following changes to Footnote 1. The expression, "protective functions within control systems…based on frequency or voltage inputs," should be replaced with, "control system frequency or voltage trip setpoints." It is unclear whether or not the present statement covers such events as contactor drop-out at extreme under-voltage or actuation of fan stall protection run-back during under-frequency operation. This change is important, because R2 allows units to trip within the no-trip zone only in accordance with R3, and R3 in turn pertains to a, "known equipment limitation…including (but not limited to) study results, experience from an actual event, or manufacturer's advisory." Tripping from unknown frequency or voltage-related limitations therefore evidently constitutes a violation, and predicting if and when every contactor in a plant will drop-out for example is not possible.
Confusion is created by making grandfathering (exceptions), "in accordance with Requirement R3," in R1 and R2 of PRC-024-1; while R3 excludes, "limitations that are caused by generator frequency and voltage protective relays." Are such "protective relays" meant to correspond to the "protective relaying" discussed above? It is semantically unclear whether or not any grandfathering is actually being allowed. It has been said in discussions with the SDT that there is no grandfathering of voltage-relaying or frequency-relaying intended, and exemptions covered in R3 are for other equipment limitations such as low frequency sensitive turbine blades. This only adds to the confusion, however, since equipment limitations is in fact where our over/under-frequency protection system settings come from. If a turbine OEM notifies us that a unit must trip within one second at 2.5% overspeed, for

example, then our 81O relay is set for 60 cycles at 61.5 Hz. We believe that R1, R2 and R3 would be completely harmonious if the SDT were to remove footnote 3, “Excludes limitations that are caused by the generator frequency and voltage protective relays themselves.” Alternatively, if the intent was to require that settings have a grounding in equipment limitations and not be based on historical practice with an unknown technical basis, a more direct way of saying so should be developed. The rationale for the last bullet item of R3.1 (reporting a 10% increase in nameplate capacity) is unclear, and it could be interpreted as requiring that units previously having restrictions be pulled into no-exemptions status. This is an appropriate course of action where possible, and increasing fossil unit output 10% is likely to require replacing the L0 blades, in which case achieving Att. 1 compliance shouldn’t be a problem for the less-demanding interconnections. These components might not pass muster in the West (no instantaneous tripping until 57.0 Hz), however, and some designs would definitely not qualify in Quebec (55.5 Hz). This could be even more of an issue for the very long L0 blades of nuclear units. Regarding gas turbines, firing temperature increases and compressor massflow uprates (e.g. zero-staging) can cause the 10% threshold to be reached without necessarily affecting original-unit frequency limits, particularly if dealing with a new model that was initially rated at substantially less than the expected capability pending confirmation of prototype unit performance in service. Expanding the frequency range for this type of equipment may not be feasible, since there is often no alternative to OEM blading (especially for the more recent models). That is, one cannot shop around for blading with PRC-024-compliant resonance avoidance. The issue also involves compressor surge margin at low speed and turbine overload at high speed, which may lock-in original frequency restrictions even if more-tolerant blading becomes available. It would be acceptable if R3.1 or a footnote stated that “Resubmittal of the exemption documentation when reporting a 10% increase in nameplate capacity is required, but the removal of the exemption status is not required as part of the 10% increase in nameplate capacity.” Steam turbine off-frequency limits are generally set by OEMs as lifetime limits regarding duration, but there is no discussion in PRC-024-1 as to how often the specified excursions may occur. Our understanding is that it is acceptable for units that once met Att. 1 of PRC-024 to start reporting (and periodically increasing) will-trip exceptions as fatigue life is progressively consumed, but it would be best to make this matter explicit in the standard rather than requiring each GO to formulate its own interpretation. The scope of the generator protection trip settings reported in R5 should be limited to the protective relaying specified in R1, R2, and footnote 1. It is believed that responding to a request for data is acceptable, but the burden of having to provide an additional response within 60 days of any change to previously reported trip settings is unduly burdensome. It is believed that recurring requests by the PC or TP should be the mechanism for additional reporting.
Individual
Joe Tarantino
Sacramento Municipal Utility District
Yes
1) Sacramento Municipal Utility District (SMUD) believes the applicability section should be revised to only cover those units defined by the BES Definition. As currently drated Generator Owners that are registered under the NERC Registry Criteria along with other non-registered generator owners are subject to this standard causing an enforcement issue. 2) SMUD thanks the SDT for their response to our comment on R6 (now R5) during the last posting. However, SMUD wishes reiterate our disagreement with a requirement mandates ALL generator protection settings. SMUD also find it problematic to allow a single request by the PC or TP to create an indefinite requirement to report any relay change. SMUD believes R5 should be limited in its applicationto only frequency or voltage settings that directly correspond with the measure the PC or TP implement in their studies.

Yes
Most frequency relays have voltage supervision. There is no voltage supervision requirement for frequency relays specified in the standard. For the voltage relay settings the ride through is given as 9 cycles at 0 volts. Where did the 9 cycles come from?
Individual
Mike Hendrix
Idaho Power Company
Idaho Power’s Power Supply group feels that Requirements 1 through 4 accomplish the purpose of PRC-024 and that Requirement 5 is not necessary and in fact creates an on-going obligation for the generation owner to continually provide relay settings to the Transmission Planner within 60 days of any change to those settings regardless of the relay setting changes impact on reliability and even if the changed settings remain in compliance with R1 and R2 of the standard. However, Idaho Power’s System Planning group feels that Requirement 4 is not a sufficient mechanism to collect the desired data and removal of R5 will limit the Planning Authority’s ability to request relay modeling data from both Idaho Power and non-Idaho Power Generator Owners. R5 will make it a

compliance obligation for GOs, to provide the required data when requested by a PA/PC or TP in a timely manner, or following a change in relay settings on a generator for which said data had previously been requested. Idaho Power notes the Measure 2 should read: Each Generator Owner shall have evidence that generator voltage protective relays have been set in accordance with Requirement R2 such as dated setting sheets, voltage-time curves, calibration sheets, coordination plots or dynamic simulation studies." Idaho Power comments that reference to the Planning Coordinator entity throughout the PRC-024 standard should be replaced with the term Planning Authority to be consistent with the NERC Glossary of Terms.

1) Add the word "evidence" between "shall have" and "that" in M2 (to match the wording of M1). 2) We believe that R4, due to the uncertainty of speculating the probability of the unit ride-thru/trip when exposed to transmission system voltage and frequency excursions described by Attachment 1 and Attachment 2, will not yield beneficial information in support of the BES reliability. 3) The scope of the generator protection trip settings reported in R5 should be limited to the protective relaying specified in R1, R2, and footnote 1. 4) Delete the word "nameplate" on item 1.b on the last page of the draft standard under "Evaluating Protective Relay Settings" for voltage excursions. The language "full real-power output" enables GOs to use the best "full load MW" values they have for their units for plant-specific studies.

Comment 1; Generator protective relays are connected to the potential transformers on the generator side of the GSU transformer. The interconnection point is defined by the standard on the transmission side of the GSU. The voltage and frequency charts in the attachments are requirements at the interconnection point. Therefore the standard prevents the use of existing generator protective relays for voltage or frequency protection. The standard and attachment charts should be redrafted to represent the interconnect point on the generator side of the GSU so existing multifunction relays can be used for voltage and frequency protection. Comment 2; Requirement 5 states "Generator Owner shall provide its generator protection trip settings to the Planning Coordinator, etc". In the context of this standard I would assume that generator protection trip settings would be those settings relative to voltage or frequency protection and for example would not include back up distance settings. The standard should be modified to clarify which generator protective relay settings are required for compliance.

Joylyn Faust
Consumers Energy Company
No
Consumers Energy is resubmitting our original comments as we feel they still pertain. “Related to undervoltage criteria, the 18 cycle at 45% of generator voltage would put a great deal of strain on the plant auxiliary systems and that may not be something these systems are able to withstand. The same would be true of a fault that produces 65% voltage at the generator terminals for 2 seconds. These comments relate specifically to Consumers Energy. However, it is likely that many others have similar equipment and would have the same issues. Please also note that the proposed standard does not align with ANSI C37.102, IEEE Guide for AC Generator Protection or with the NERC Technical Reference Document entitled Power Plant and Transmission System Protection Coordination.” Previous SDT reply - Thank you for your comments. Please note that the voltage levels specified in Attachment 2 are at the point of interconnection to the transmission system. They would not correlate directly with the auxiliary bus voltages, especially if the auxiliaries are unit-connected. The SDT does not believe this proposed standard is in conflict with either the IEEE or the NERC documents cited. Please inform the SDT of the specifics of your concerns.” We believe our comments still apply. Specific to the fault that produces 65% voltage at the generator terminals for 2 seconds, plant auxiliary equipment would not be able to withstand such a drop for the specified duration and would fall offline. SDT Reply - The SDT thanks you for your comments. The SDT does not believe this proposed standard is in conflict with either the IEEE or the NERC documents cited. The SDT believes that the wording of R4, "The Generator Owner may develop the estimates based on experience, actual event histories, or sound engineering judgment," will allow the GO to provide an estimate. However, if the GO feels his equipment is not capable of meeting the undervoltage criteria of Attachment 2, then R3 would apply. Also, note that Attachment 2 has been modified for the next draft and now only extends to 4 seconds.

American Wind Energy Association
No
AWEA does not support this revision, but does not wish to hold up the standards development process for PRC-024. AWEA strongly supported keeping the standard as a generator performance standard, believing that the standard would result in improved electric reliability. AWEA also supports NERC taking the lead in setting national reliability standards, instead of the far less efficient outcome of individual regions advancing their own reliability standards. Under FERC Order 661A, the wind industry is currently subject to more stringent voltage and frequency ride-through standards than other generation types, and keeping PRC-024 as a generator performance standard would have helped to level the playing field in this regard.

BPA believes that the standard should combine bullet 3 into bullet 2 in R3.1 (and modify bullet 3 to notify when equipment has been replaced for whatever reason) • Identification of an equipment limitation. • Repair or replacement of the equipment causing

the limitation that removes the limitation. • Replacement of the equipment causing the limitation. (modification)
Individual
Brad Harris
CenterPoint Energy
No
CenterPoint Energy previously expressed concern that the proposed standard does not impose any minimum frequency or voltage ride-through requirements for existing generating stations. With this proposed revision, the standard will not even impose any minimum requirements for new generating stations. Failure of a generating unit to ride-through at least some minimum threshold of frequency and voltage excursions places the reliability burden solely on transmission entities. This makes is difficult to compensate for the generator's failure to perform and, therefore, is problematic for BES reliability.
No
CenterPoint Energy agrees with lowering the low voltage recovery curve down from 90% to 85% at three seconds; however, CenterPoint Energy is concerned with truncating the curves at 4 seconds due to undervoltage load shedding (UVLS) and relay loadability factors. For coordination with UVLS systems, CenterPoint Energy recommends the curve be extended to at least 10 seconds. Additionally, the purpose of relay loadability standards is to allow sufficient time for system operators to take corrective actions. Based on the purpose of relay loadability, CenterPoint Energy believes the curves should remain extended through 600 seconds.
No
CenterPoint Energy does not agree with removing references to impedance relays and voltage controlled overcurrent relays in Footnote 1, as we are concerned that there could be some differences between relay loadability and low voltage ride-through. Voltages at 85% of nominal and emergency current levels are used for calculating relay set points for relay loadability. For low voltage ride-through, impedance relays and voltage controlled overcurrent relays would need to be evaluated at voltage levels as low as 0% of nominal and at short circuit fault current levels. Instead of removing these relays from Footnote 1 at this late point in the development of PRC-024, CenterPoint Energy suggests that this be addressed by the SDT for PRC-025 Generator Relay Loadability. The PRC-025 SDT has the appropriate subject matter expertise to fully vet whether these types of relays should be removed from PRC-024.
CenterPoint Energy does not agree that a Planning Coordinator or a Transmission Planner should be required to provide a voltage or frequency profile at the point of interconnection that is determined by dynamic simulation and, instead, recommends that the voltage or frequency profiles in Attachment 1 and Attachment 2 be referenced. Different types of simulated events will produce different voltage and frequency excursions. Also, even the same type of event will produce different voltage and frequency excursion "profiles" as the system changes over time. Therefore, the voltage or frequency profiles in Attachment 1 and Attachment 2 should be used.

Thank you for making this change.
No
While we are not opposed to this change per se and do not offer any suggested alternatives, we would like to see a technical justification for why this is acceptable. The only rationale we can find is that the drafting team believes this is acceptable. No explanation for why this is acceptable was offered.
No
(1) We support shortening the voltage curve to four seconds to reflect the purpose of the standard to ride through voltage excursions which covers a transient time period. Furthermore, it reflects that the future PRC-025 will focus on steady state voltage limits. (2) We do not believe it is necessary to raise the performance bar for this standard by lowering the lower voltage curve to match the 0.85 pu voltage that is proposed to apply in the future PRC-025. First, having a requirement to ride through a voltage excursion to 0.9 pu for four seconds does not represent a conflict with PRC-025. It is simply less stringent than PRC-025. If PRC-025 requires more stringent performance using 0.85 pu for steady-state, that value can be set in that standard. Matching the proposed 0.85 pu in the proposed PRC-025 presumes that this is what the ultimate outcome of the PRC-025 standard will be. If PRC-025 were to end up with a 0.9 pu voltage requirement in the standard, then the standards again would not match. Second, no technical justification for changing the lower voltage ride through curve to 0.85 pu has been provided. If there is no technical justification to make the curve more stringent, it should not be made more stringent to simply match another proposed standard. Third, the overlap of the standards has been removed by striking load-affective protection functions such as impedance relays and voltage controlled overcurrent relays from this proposed PRC-024. How does the conflict in voltage performance exist when the standards apply to different equipment types? The load-affective protection will not be covered in proposed PRC-025 and will focus on steady-state conditions whereas the PRC-024 will focus on voltage excursions which are transient in nature and will apply to non-load affective protection performance.
Yes
(1) The data retention period is too long and is not consistent with the "Change State Element Paper No. 3 – Establish Compliance Data Requirements" whitepaper that NERC recently published as part of the reliability assurance initiative (RAI). It states that the retention period is the longer of three years or until the next audit. In effect, this makes the data retention period approximately six years since GOs are on a six year audit cycle. We believe this is simply too long a data retention period to demonstrate compliance and potentially refocuses audits on backwards looking changes that have no impact to reliability. Consider a generator

that may undergo multiple setting changes. Is it necessary to retain all setting changes over this period or only the most recent ones that indicate the generator is currently set to ride through voltage and frequency excursions? Retaining historical settings that have been changed does nothing to support reliability and only perpetuates the paper driven compliance culture rather than a culture of reliability. (2) This standard needs to be aligned with the recent NERC compliance enforcement initiatives (i.e. internal controls, entity impact evaluation, and elimination of zero-defect expectations). The VSLs for Requirements R1 and R2 could be read to require self-reporting of every unit that tripped for a voltage or frequency excursion inside the no trip zone. To refocus NERC efforts on compliance, the recent reliability assurance initiative would allow that GO to make this determination and correct any performance deficiencies without the need to self-report a violation. These approaches are being written into the standards (CIP, COM-003, etc.). We suggest the drafting team coordinate with the appropriate NERC personnel to adopt a similar approach for this standard. (3) Because the voltage envelope is based on assumptions listed on page 19, the VSLs for R1 and R2 need to clarify that if a unit does trip in the no trip zone and the actual system conditions do not match these assumptions that the trip does not represent a violation. For instance, if a synchronous condenser or capacitor (bullet 2 under “Evaluating Protective Relay Settings” on page 19) is not available that was assumed to be available when evaluating protection relay settings, why would the GO be held accountable for its unit tripping during a voltage excursion? It followed the assumptions set out in the standard. (4) The response to our previous comments that requirement R3 and R5 are the types of requirements the Project 2013-02 Paragraph 81 drafting team is proposing to eliminate indicated that they do not meet criteria A. This implies that these requirements do provide significant reliability support. However, no justification for how they provide significant reliability support was provided. Please explain how a requirement such as R3 that requires documentation and communication supports reliability. Requirement R1 already allows a GO an exception for documented and communicated equipment limitations. Because compliance is driven by evidence, the GO would have to document the limitation and communicate the limitation per the third bullet in Requirement R1. A separate requirement is simply not needed and “does little, if anything, to benefit or protect the reliable operation of the BES” above and beyond Requirement R1. The VSLs even seem to support this position since they focus primarily on the number of days late a registered entity has performed the task. Any further need to communicate the limitations could be rolled into the third bullet of Requirement R1. Requirement R5 is similarly situated requirement. Please explain how this requirement provides significant reliability support and, thus, does not meet criterion A. While we agree that generator protection settings changes need to be communicated, we simply do not see how a specific requirement to communicate them supports reliability. A requirement is not needed for every single task that should be completed. The requirement continues to perpetuate the paper driven compliance approach that NERC has recognized needs to change and is in the process of changing. If the drafting team believes, the requirement is still needed, we suggest including it as part of requirements R1 and R2.

AECI appreciates this SDT’s demonstrated attention to industry feedback. Draft 5 PRC-024 R1 Bullet 3, COMMENT: AECI appreciates this “catch-all” being in there, and we hope it is worded to adequately cover any other technically justifiable plant relay settings the SDT failed to mention, that intentionally operate within the industry’s Attachment 1 No Trip zones. However we are concerned that R1’s and Bullet #3’s collective wording may specifically exclude any other protective relay settings outside of Bullet #1 and Bullet #2, including those specifically designed for other plant equipment limitations. (R2 Bullets #3 & #4 seem to provide better flexibility for what we failed to think of in this draft 5.) Draft 5 PRC-024 page 14, Attachment 1, Curve Data Points:, Eastern Interconnection, COMMENT: It just seems that even without a fluxuating frequency profile, the Eastern Interconnection’s frequency-bounded curves, functionally-declared within that table’s middle-row, can make a calculation for compliance with Requirements R1 & R4 a bit challenging. (Page 17’s first bullet#3, providing clarity around evaluating step-wise voltage excursions, provided some insight into what is currently drafted for Requirements R1 and R4 in conjunction with Attachment 1, where these continuous Eastern Interconnection curves are in play, and actual plant performance studies and results are analyzed.) While we expect to evaluate plant performance only around our known discrete plant relay settings, we are a bit concerned for the way this Standard’s non-discrete duration-functions might be leveraged against the industry when actual events occur. Draft 5 PRC-024 page 17, Attachment 2, Voltage Ride-Through Curve Clarifications, Curve Details:, Bullet3:, REPLACE: “voltage exceeds", WITH: “voltage first exceeds”, RATIONALE: Further clarity as to why duration is only 0.1 seconds in this example. Draft 5 PRC-024 page 17, Attachment 2, Voltage Ride-through Curve Clarifications, Curve Details:, Bullet4:, REPLACE: “proportion to deviations of frequency below normal ”, WITH: “proportion to below-normal deviations within the provided frequency profile", RATIONALE: Clarity that adjustment is made for study-related frequency profiles provided in conjunction with a request, and not for immediately experienced voltage deviations as they occur. Draft 5 PRC-024 page 17, Attachment 2, Voltage Ride-Through Curve Clarifications, Evaluating Protective Relay Settings:, Bullet 1.c. REPLACE: “terminals).”, WITH: “terminals.”, RATIONALE: Balanced parentheticals

The 60 calendar day requirement in Requirement 5 for a Generator Owner to respond to a written request from its Transmission Planner or Planning Coordinator for generator protection trip settings, is too long. Because of the critical nature of this information, prolonging assessing system coordination can result in an unnecessary risk to the reliability of the Bulk Electric System. Oncor requests that this time requirement be shortened to 30 days.

Yes
Yes
(1) We agree with the changes made to the Voltage Ride Through Curve in Attachment 2. However, we note that the Curve Data Points table in Attachment 2 does not reflect corresponding updates, thus producing inconsistency between the graphic and tabular voltage ride through specifications. Please reconcile the differences to make both specifications consistent. (2) Suggest adding the prefix “POI” to the graph title such that it reads “ POI Voltage Ride-Through….” – adding the prefix makes it explicitly clear that the curve does not apply to the generator terminal voltage. This clear distinction is important to eliminate potential confusion since the relay loadability options in PRC-025 allow using either POI voltage (85%) or generator terminal voltage (95%). (3) Suggest enhancing the verbiage in the text-box in the voltage ride-through curve as follows to clarify that it applies to continuous operation and using “system adjustments” instead of “changes to the system”. Suggested verbiage is: “Voltage for continuous operation (> 600 seconds) will be restored between 0.95 pu and 1.05 pu by automatic and/or manual system adjustments”.
Yes
(1) It is not apparent why the verbiage preceding and following the parenthetical text in Footnote 1 – that is, “Each GO is not required to have frequency or voltage protective relaying installed or activated on its unit.” – Is essential. This applicability exclusion is sufficiently clear in the verbiage of the requirements R1 and R2, which states “Each GO that has generator protective relaying activated to trip its generating unit(s)…”. Can a GO possibly activate a protective relay that is not installed? Therefore it seems redundant to include the applicability exclusion in the footnote and we suggest omitting it. (2) Suggest simplifying Footnote 1 as follows by retaining only the parenthetical text since it sufficiently captures the footnote’s primary intent --- suggested footnote text is “ 1 Including but not limited to frequency and voltage protective functions….….. to the generator based on frequency or voltage inputs.”
Suggest improving consistency between R1 and R2 verbiage by addressing the following editorial comments: (a) Not sure why the qualifying phrase “… as a result of voltage excursion (at the point of interconnection)…” is used in R2 but no corresponding qualification is used in R1? If this specificity for voltage excursion is needed in R2, then shouldn’t it also be needed for frequency excursions in R1? (b) Re-order the bulleted exceptions under R1 and R2 such that they appear in the same sequence in both requirements – this will make it easier for the uninitiated reader to observe that R1 and R2 share 3 common exceptions and R2 has one additional exception. (c) Readability and comprehension of R2 will be significantly enhanced if it is simplified by splitting it into 2 or more shorter sentences. Its existing structure – a very long, compound sentence of more than 100 words – is not conducive to easy comprehension and is prone to ambiguities in interpretation, leading to compliance confusion. (d) R1 states “Each GO…. shall set <such> protective relaying <so> that the…. does not <operate to> trip” whereas R2 states “Each GO….. shall set <its> protective relaying <such> that the…. does not trip”. It is hard to detect any good reason for the choice of words <such> and <so> in R1 versus <its> and <such> in R2, or for choosing to say <operate to> trip in R1 versus omitting that phrase in R2. Suggest identical lead-in sentences unless there is a good reason for the variations.

Cowlitz PUD
No
Cowlitz agrees with the removal of R5, but is still concerned with the criteria stated in R4. R4 allows using “experience, actual event histories, or sound engineering judgment,” to determine how long units will remain connected given a PC or TP excursion profile. It is understood that detailed calculations are not required, but the word “sound” implies that the estimates are to have some reasonable degree of authority. Again Cowlitz points out that engineering staff is not available for small entities and must be contracted. Since the Standard does not limit the PC and TP on the severity of the excursion profile that can be submitted to the GO for a time duration estimate, there is no possible way to prepare for a worst case scenario. The Standard does not allow for the GO to negotiate a more reasonable time frame to submit a response to the requesting entity, and as such places undue burden on the GO to solicit contractor/consultant services in a short time frame. Further, the statement “sound engineering judgment” is

subjective and open to much question as to when compliance has been achieved. NERC requirements and their associated measures should leave all parties with one, clear concept of what it takes to achieve compliance, and for PRC-024 to reach this goal R4 should be deleted, or at the very least allow for engineering judgment (without "sound") and limit the excursion profile to cover generators operating under the exception provisions of the Standard. Further, the Standard should allow the requestors to judge responses as adequate or not, and if not satisfied request further substantiating evidence that is reasonable.
Yes
Yes
Yes
Cowlitz also recommends Footnote 1 be clarified concerning the expression "…protective functions within control systems that directly trip or provide tripping signals to the generator based on frequency or voltage inputs." It is unclear whether or not this statement covers such events as contactor drop-out at extreme under-voltage or actuation of fan stall protection run-back during under-frequency operation. Cowlitz suggests a change to "…protective functions within control systems specifically programmed to provide frequency or voltage protection trip points…" This change is important, because R2 allows units to trip within the no-trip zone only in accordance with R3, and R3 in turn pertains to a, "known equipment limitation…including (but not limited to) study results, experience from an actual event, or manufacturer's advisory." Tripping from unknown frequency or voltage-related limitations therefore evidently constitutes a violation, and predicting if and when every contactor in a plant will drop-out for example is not possible.
(A) Confusion is created by making exemptions, "in accordance with Requirement R3," in R1 and R2 of PRC-024-1; while R3 excludes, "limitations that are caused by generator frequency and voltage protective relays." Are such "protective relays" meant to correspond to the "protective relaying" discussed above? It is semantically unclear whether or not any exemptions are actually being allowed. It has been said in discussions with the SDT that no grandfathering of voltage or frequency relaying is intended, and exemptions covered in R3 are for other equipment limitations such as low frequency sensitive turbine blades. This only adds to the confusion, however, since equipment limitations are (or at least should be) where over/under-frequency protection system settings come from. If a turbine OEM states that a unit must trip within one second at 2.5% over speed, for example, then the 81O relay is set for 60 cycles at 61.5 Hz. We believe that R1, R2 and R3 would be completely harmonious if the SDT were to remove footnote 3, "Excludes limitations that are caused by the generator frequency and voltage protective relays themselves." Alternatively, if the intent was to require that settings have a grounding in equipment limitations and not be based on guesswork or corporate policy, a more direct way of saying so should be developed.******(B) The rationale for the last bullet item of R3.1 (reporting a 10% increase in nameplate capacity) is unclear, and it could be interpreted as requiring that units previously having restrictions be pulled into no-exemptions status. This is an appropriate course of action where possible, and increasing fossil unit output 10% is likely to require replacing the L0 blades, in which case achieving Att. 1 compliance shouldn't be a problem for the less-demanding interconnections. These components might not pass muster in the West (no instantaneous tripping until 57.0 Hz), however, and some designs would definitely not qualify in Quebec (55.5 Hz). This could be even more of an issue for the very long L0 blades of nuclear units. Regarding gas turbines, firing temperature increases and compressor mass flow uprates (e.g. zero-staging) can cause the 10% threshold to be reached without necessarily affecting original-unit frequency limits, particularly if dealing with a new model that was initially rated at substantially less than the expected capability pending confirmation of prototype unit performance in service. Expanding the frequency range for this type of equipment may not be feasible, since there is often no alternative to OEM blading (especially for the more recent models). That is, one cannot shop around for blading with PRC-024-compliant resonance avoidance. The issue also involves compressor surge margin at low speed and turbine overload at high speed, which may lock-in original frequency restrictions even if more-tolerant blading becomes available.******(C) Steam turbine off-frequency limits are generally set by OEMs as lifetime limits regarding duration, but there is no discussion in PRC-024-1 as to how often the specified excursions may occur. Our understanding is that it is acceptable for units that once met Att. 1 of PRC-024 to start reporting (and periodically increasing) will-trip exceptions as fatigue life is progressively consumed, but it would be best to make this matter explicit in the standard rather than requiring each GO to formulate its own interpretation.******(D) The scope of the generator protection trip settings reported in R5 should be limited to the protective relaying specified in R1, R2, and footnote 1. It is believed that responding to a request for data is acceptable, but the burden of having to provide an additional response within 60 days of any change to previously reported trip settings is unduly burdensome. It is believed that recurring requests by the PC or TP should be the mechanism for additional reporting.

RELIABILITY CORPORATION

Consideration of Comments

Generator Verification Project 2007-09

The Generator Verification Drafting Team thanks all commenters who submitted comments on the proposed revisions to PRC-024-1. This standard was posted for a 30-day public comment period from December 12, 2012 through January 11, 2013. Stakeholders were asked to provide feedback on the standard and associated documents through a special electronic comment form. There were 49 sets of comments, including comments from approximately 143 different people from approximately 98 companies representing all 10 Industry Segments as shown in the table on the following pages.

All comments submitted may be reviewed in their original format on the standard's project page.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Mark Lauby, at 404-446-2560 or at mark.lauby@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

Summary Consideration: The vast majority of stakeholders agreed with the removal of R5 from the standard. Several stakeholders suggested that there were issues with R4. These commenters pointed out that the requirement was ambiguous and provided no discernible reliability benefit while subjecting entities to potential compliance violations for making optimistic estimations. Stakeholders believe that the use of language such as "sound engineering judgment" is subject to interpretation and vague. Based on these comments, the GVSDT removed R4 from the standard. PRC-024-1 is now a relay setting standard.

Minority issue: Under FERC Order 661A, the wind industry is currently subject to more stringent voltage and frequency ride-through standards than other generation types, and keeping PRC-024 as a generator performance standard would have helped to level the playing field in this regard. The proposed draft of PRC-024 does not accomplish this. The GVSDT points out that the requirements contained in FERC Order 661A are enforced through Generator Interconnection Agreements and not NERC Standards.

A large majority of stakeholders agreed with the change made to Attachment 1. Some stakeholders questioned the potential impact this change might make due to the elimination of the margin between the allowable UFLS overshoot and the generator overfrequency trip setpoints. The GVSDT pointed out that setting overfrequency tripping at this point would be allowed under the previous curve as a technically-based exemption under Requirement R3 and the change made removes a conflict with internationally-recognized technical standards.

[1] The appeals process is in the Standard Processes Manual: http://www.nerc.com/files/Appendix_3A_StandardsProcessesManual_20120131.pdf

Most stakeholders agreed with the revisions to the voltage ride-through curves in Attachment 2. Several stakeholders had concerns with the low voltage ride-through criteria being lowered to 85% for the 3-4 second interval. Stakeholders pointed out that transmission systems are designed to operate between 90% to 110% and not down to 85% and as such we do not expect generators to ride through voltages as low as 85% for an extended period of time. The GVSDT agrees with these comments and has revised the voltage ride-through chart 85% voltage level to the original 90%. This is due to removing all generator loadability relays from PRC-024 allowing the relay setting criteria for loadability to be in PRC-025. The 85% point-of-interconnection voltage for relay loadability for transmission and generation relays remains in their respective standards (PRC-023 for transmission and PRC-025 for generator). The majority of comments expressed agreement with the removal of loadability relays from PRC-024. One commentator recommended that the Generator Relay Loadability drafting team vet the removal of these relay types from Footnote 1. The GVSDT had previous discussions with that drafting team and they concurred with the revision to PRC-024.

Stakeholders provided valuable input regarding suggested improvements to language within the standard. Based on these comments, the following improvements were made to the draft standard:

- Removed Requirement R4 from the standard because of ambiguous language and limited reliability benefit.
- Revised the title of the standard to “Generator Frequency and Voltage Protective Relay Settings” and the Purpose Statement to “Ensure Generator Owners set their generator protective relays such that generating units remain connected during defined frequency and voltage excursions.
- Revised “generating unit(s)” to “applicable generating unit(s)” to reflect that the standard only applies to units that meet the registry criteria.
- Added “regulatory or” language regarding limitations to reflect that NERC, environmental or regulatory requirements may cause a limitation in generator performance.
- Revised Requirement R2 so that the sentences were shorter and easier to read, and made conforming language changes in Requirement R1.
- Removed the last bullet from Requirement R3 and added a new bullet referencing frequency impacts on turbines as follows: “Creation or adjustment of an equipment limitation caused by consumption of the cumulative turbine life-time frequency excursion allowance.”
- Revised Requirement R5 (now R4) to indicate that the trip settings to be provided are only those “associated with Requirements R1 and R2” and not all relays.
- Revised the measures based on requirement revisions.
- Updated the VSLs for R3 and R4 to allow 30 day increments between levels rather than the original 10 days. This comports with other standards developed under this project.
- Updated the table in Attachment 2 (this was missed in the previous revision).

- Made clarifying revisions to "Voltage Ride-Through Curve Clarifications" on the last page of the standard.
- Clarified Footnote 3 to: "Excludes limitations that are caused by the setting capability of the generator frequency and voltage protective relays themselves but does not exclude limitations originating in the equipment that they protect."

Index to Questions, Comments, and Responses

Table of Contents

1. The GVSDT has removed Requirement R5 from the standard. The standard drafting team believes that Requirement R4 meets the reliability objective of the directive in Paragraph 1787 of FERC Order 693. In addition, the SDT agrees with stakeholders who indicated that the additional resources that would be required to design, build, operate and maintain synchronous generating facilities that could ride through any of the defined excursions without fail would not justify the resulting incremental gain in grid reliability. Do you agree with this revision? If not, please explain in the comment area below. 13
2. Several stakeholders pointed out that a portion of the allowable high frequency trip curve for the Eastern, ERCOT, and Quebec Interconnections (Attachment 1) exceeded the off-nominal frequency limits in IEEE C50.13 and IEC 60034 that are used by equipment manufacturers to design generators. The drafting team revised the high frequency portion of the curve from zero to two seconds for the Eastern and ERCOT Interconnections to meet the IEEE and IEC standards. This leaves no margin between the high frequency allowance for UFLS designers in frequency overshoot for that amount of time, but the drafting team feels this is acceptable. Do you agree with this change? If not, please provide specific suggestions for change in the comment area. 22
3. In the previous draft of this standard the voltage ride-through curves in Attachment 2 extended out for 600 seconds before returning to normal operating voltages (95% – 105% of nominal). Also, the final step in the low voltage recovery curve was at 90% of nominal after three seconds. Commenters to the Generator Relay Loadability project pointed out that this could potentially cause conflicts with coordination of settings for relay loadability, since they need to be evaluated for stressed system conditions of voltages at 85% of nominal. In response, the drafting team has moved the final step of the low voltage recovery curve down from 90% to 85% at three seconds and has shortened the curves so that they end at four seconds. The drafting team believes this clarifies the intent of this standard to address the transient conditions without conflicting with relay loadability. Do you agree with this approach? If not, please provide specific suggestions for change in the comment area. 27
4. Footnote 1 has been revised to remove reference to impedance relays and voltage controlled overcurrent relays which are load-affected protective functions. This was done to remove overlap and potential conflict of coordination with the Generator Relay Loadability project. Do you agree with this approach? If not, please provide specific suggestions for change in the comment area. 34
5. Do you have any other comment, not expressed in questions above, for the GVSDT?.................. 41

1. **The GVSDT has removed Requirement R5 from the standard. The standard drafting team believes that Requirement R4 meets the reliability objective of the directive in Paragraph 1787 of FERC Order 693. In addition, the SDT agrees with stakeholders who indicated that the additional resources that would be required to design, build, operate and maintain synchronous generating facilities that could ride through any of the defined excursions without fail would not justify the resulting incremental gain in grid reliability. Do you agree with this revision? If not, please explain in the comment area below.**

Summary Consideration: The vast majority of stakeholders agreed with the removal of R5 from the standard. Several stakeholders suggested that there were issues with R4. These commenters pointed out that the requirement was ambiguous and provided no discernible reliability benefit while subjecting entities to potential compliance violations for making optimistic estimations. Stakeholders believe that the use of language such as "sound engineering judgment" is subject to interpretation and vague. Based on these comments, the GVSDT removed R4 from the standard. PRC-024-1 is now a relay setting standard.

Minority issue: Under FERC Order 661A, the wind industry is currently subject to more stringent voltage and frequency ride-through standards than other generation types, and keeping PRC-024 as a generator performance standard would have helped to level the playing field in this regard. The proposed draft of PRC-024 does not accomplish this. The GVSDT points out that the requirements contained in FERC Order 661A are enforced through Generator Interconnection Agreements and not NERC Standards.

Organization	Yes or No	Question 1 Comment
Tennessee Valley Authority	No	Recommend that the R4 be enhanced to give more detail on how to satisfy this requirement. As significant as R4 is, the Generator Owners need more guidance than what is currently stated.
Response: The GVSDT thanks you for your comment. Based on industry input the GVSDT has removed Requirement R4 from the standard. The standard drafting team believes that Requirement R3 meets the reliability objective of the directive in Paragraph 1787 of FERC Order 693. In addition, the SDT agrees with stakeholders who indicated that the additional resources that would be required to provide an estimate of the time duration the generating unit(s) will remain connected if the unit(s) was to experience a frequency or voltage excursion would not justify the resulting incremental gain in grid reliability.		
PPL Corporation NERC Registered Affiliates	No	Although PPL Companies agree with the removal of R5, PPL is still concerned with the following criteria stated in R4. R4 allows using,

Organization	Yes or No	Question 1 Comment
		“experience, actual event histories, or sound engineering judgment,” to determine how long units will remain connected during disturbances. It is understood that detailed calculations are not required, but the word “sound” implies that the estimates are to have some reasonable degree of authority, and the needed information for such inputs is generally not available. An unwarrantedly optimistic forecast could be worse than no input at all; so, until and unless a really huge disturbance is recorded, the only fact-based prognosis we could make regarding the excursions in Atts. 1 and 2 of PRC-024 would be to say for every unit in the fleet, “Tripping may occur whenever ANSI C84.1 emergency voltage variation boundaries (+/-10%) are exceeded, and whenever frequency fluctuations exceed the normal, minor magnitude typically encountered,” (the latter statement applies particularly for gas turbines with dry low-NOx combustors). We believe that this represents sound engineering judgment, but a person with (perhaps unjustified) expectations of something more quantitative might not agree. NERC requirements and their associated measures should leave all parties with one, clear concept of what it takes to achieve compliance. For R4 to reach this goal we believe that PRC-024 Measure 4 should state that “No concrete data on which to base judgments - assume tripping,” is an acceptable measure for R4.
Response: The GVSDT thanks you for your comment. Based on industry input the GVSDT has removed Requirement R4 from the standard. The standard drafting team believes that Requirement R3 meets the reliability objective of the directive in Paragraph 1787 of FERC Order 693. In addition, the SDT agrees with stakeholders who indicated that the additional resources that would be required to provide an estimate of the time duration the generating unit(s) will remain connected if the unit(s) was to experience a frequency or voltage excursion would not justify the resulting incremental gain in grid reliability.		
Alberta Electric System Operator	No	The AESO disagrees with this requirement being removed from Draft 5 and believes that new generating must be required to be designed, built and maintained in compliance with PRC-024-1 unless it is due to equipment failure and in such cases the owner of the generating unit must report

Organization	Yes or No	Question 1 Comment
		failure to the ISO with a plan to address the failure.
Response: The GVSDT thanks you for your comment. While the GVSDT understands your concern, the team has decided that inclusion of a plant performance requirement in a relay setting standard is inappropriate.		
We Energies	No	The NAGF agrees with the removal of R5, but is still concerned with the criteria stated in R4. R4 allows using, "experience, actual event histories, or sound engineering judgment," to determine how long units will remain connected during disturbances. It is understood that detailed calculations are not required, but the word "sound" implies that the estimates are to have some reasonable degree of authority, and the needed information for such inputs is generally not available. An unwarrantedly optimistic forecast could be worse than no input at all; so, until and unless a really huge disturbance is recorded, the only fact-based prognosis that could be made regarding the excursions in Atts. 1 and 2 of PRC-024 would be to say for every unit, "Tripping may occur whenever ANSI C84.1 emergency voltage variation boundaries (+/-10%) are exceeded, and whenever frequency fluctuations exceed the normal, minor magnitude typically encountered," (the latter statement applies particularly for gas turbines with dry low-NOx combustors). We believe that this represents sound engineering judgment, but a person with (perhaps unjustified) expectations of something more quantitative might not agree. NERC requirements and their associated measures should leave all parties with one, clear concept of what it takes to achieve compliance, and for PRC-024 to reach this goal R4 should be deleted or at least it should state that "No concrete data on which to base judgments - assume tripping," is an acceptable response.
Essential Power, LLC	No	We agree with the removal of R5, but am still concerned with the criteria stated in R4. R4 allows using, "experience, actual event histories, or sound engineering judgment," to determine how long units will remain connected during disturbances. It is understood that detailed calculations are not

Organization	Yes or No	Question 1 Comment
		required, but the word “sound” implies that the estimates are to have some reasonable degree of authority, and the needed information for such inputs is generally not available. An unwarrantedly optimistic forecast could be worse than no input at all; so, until and unless a really huge disturbance is recorded, the only fact-based prognosis that could be made regarding the excursions in Atts. 1 and 2 of PRC-024 would be to say for every unit, “Tripping may occur whenever ANSI C84.1 emergency voltage variation boundaries (+/-10%) are exceeded, and whenever frequency fluctuations exceed the normal, minor magnitude typically encountered,” (the latter statement applies particularly for gas turbines with dry low-NOx combustors). We believe that this represents sound engineering judgment, but a person with (perhaps unjustified) expectations of something more quantitative might not agree. NERC requirements and their associated measures should leave all parties with one, clear concept of what it takes to achieve compliance, and for PRC-024 to reach this goal R4 should be deleted or at least it should state that “No concrete data on which to base judgments - assume tripping,” is an acceptable response.
Cogentrix Energy Power Management, LLC	No	The NAGF agrees with the removal of R5, but is still concerned with the criteria stated in R4. R4 allows using, “experience, actual event histories, or sound engineering judgment,” to determine how long units will remain connected during disturbances. It is understood that detailed calculations are not required, but the word “sound” implies that the estimates are to have some reasonable degree of authority, and the needed information for such inputs is generally not available. An unwarrantedly optimistic forecast could be worse than no input at all; so, until and unless a really huge disturbance is recorded, the only fact-based prognosis that could be made regarding the excursions in Atts. 1 and 2 of PRC-024 would be to say for every unit, “Tripping may occur whenever ANSI C84.1 emergency voltage variation boundaries (+/-10%) are exceeded, and whenever frequency fluctuations exceed the normal, minor magnitude typically encountered,”

Organization	Yes or No	Question 1 Comment
		(the latter statement applies particularly for gas turbines with dry low-NOx combustors). We believe that this represents sound engineering judgment, but a person with (perhaps unjustified) expectations of something more quantitative might not agree. NERC requirements and their associated measures should leave all parties with one, clear concept of what it takes to achieve compliance, and for PRC-024 to reach this goal R4 should be deleted or at least it should state that “No concrete data on which to base judgments - assume tripping,” is an acceptable response.
Cowlitz PUD	No	Cowlitz agrees with the removal of R5, but is still concerned with the criteria stated in R4. R4 allows using “experience, actual event histories, or sound engineering judgment,” to determine how long units will remain connected given a PC or TP excursion profile. It is understood that detailed calculations are not required, but the word “sound” implies that the estimates are to have some reasonable degree of authority. Again Cowlitz points out that engineering staff is not available for small entities and must be contracted. Since the Standard does not limit the PC and TP on the severity of the excursion profile that can be submitted to the GO for a time duration estimate, there is no possible way to prepare for a worst case scenario. The Standard does not allow for the GO to negotiate a more reasonable time frame to submit a response to the requesting entity, and as such places undue burden on the GO to solicit contractor/consultant services in a short time frame. Further, the statement “sound engineering judgment” is subjective and open to much question as to when compliance has been achieved. NERC requirements and their associated measures should leave all parties with one, clear concept of what it takes to achieve compliance, and for PRC-024 to reach this goal R4 should be deleted, or at the very least allow for engineering judgment (without “sound”) and limit the excursion profile to cover generators operating under the exception provisions of the Standard. Further, the Standard should allow the requestors to judge responses as adequate or not, and if not satisfied

Organization	Yes or No	Question 1 Comment
		request further substantiating evidence that is reasonable.
Response: The GVSDT thanks you for your comments. Based on industry input the GVSDT has removed Requirement R4 from the standard. The standard drafting team believes that Requirement R3 meets the reliability objective of the directive in Paragraph 1787 of FERC Order 693. In addition, the SDT agrees with stakeholders who indicated that the additional resources that would be required to provide an estimate of the time duration the generating unit(s) will remain connected if the unit(s) was to experience a frequency or voltage excursion would not justify the resulting incremental gain in grid reliability.		
American Wind Energy Association	No	AWEA does not support this revision, but does not wish to hold up the standards development process for PRC-024. AWEA strongly supported keeping the standard as a generator performance standard, believing that the standard would result in improved electric reliability. AWEA also supports NERC taking the lead in setting national reliability standards, instead of the far less efficient outcome of individual regions advancing their own reliability standards. Under FERC Order 661A, the wind industry is currently subject to more stringent voltage and frequency ride-through standards than other generation types, and keeping PRC-024 as a generator performance standard would have helped to level the playing field in this regard.
Response: The GVSDT thanks you for your comment and support of this standard development process. The team has decided that inclusion of a plant performance requirement in a relay setting standard is inappropriate. This proposed standard is consistent across technologies in that it does not impose voltage or frequency ride through requirements on any generators. The GVSDT points out that the requirements contained in FERC Order 661A are enforced through Generator Interconnection Agreements and not NERC Standards.		
CenterPoint Energy	No	CenterPoint Energy previously expressed concern that the proposed standard does not impose any minimum frequency or voltage ride-through requirements for existing generating stations. With this proposed revision, the standard will not even impose any minimum requirements for new generating stations. Failure of a generating unit to ride-through at least

Organization	Yes or No	Question 1 Comment
		some minimum threshold of frequency and voltage excursions places the reliability burden solely on transmission entities. This makes is difficult to compensate for the generator's failure to perform and, therefore, is problematic for BES reliability.
Response: The GVSDT thanks you for your comment and understands your concern. The team has decided that inclusion of a plant performance requirement in a relay setting standard is inappropriate.		
ACES Standards Collaborators	Yes	Thank you for making this change.
Response: The GVSDT thanks you for your comment.		
Ingleside Cogeneration LP	Yes	Ingleside Cogeneration LP is firmly in agreement with the removal of the ride-through performance requirement (R5) from PRC-024-1. Although we understand the intent to guarantee generation availability for a set of voltage and frequency transients, the project team has correctly determined that the costs far outweigh the benefits. In our view, this is in keeping with the spirit of the Cost Effective Analysis Process, Paragraph 81, and other risk-based compliance initiatives that were initiated to maintain that careful balance.
Response: The GVSDT thanks you for your comment.

Arizona Public Service Company		APS agreed with the draft Standard however, we voted no because of the Violation Severity Levels (VSL) associated with this Standard. Only 10 days spacing between various levels of the VSL is inappropriate and not justified. A 30 days delay in providing the requested information does not represent a significant reliability risk. In addition, other draft Standards, for example Project 2007-09 MOD and PRC-019, provides a 30 to 90 days separation between various levels of the VSL. In our opinion each VSL severity level should be at least 30 days apart.
Response: The GVSDT thanks you for your comment. The standard has been modified to provide 30 days increments between VSL levels as requested.		

2. **Several stakeholders pointed out that a portion of the allowable high frequency trip curve for the Eastern, ERCOT, and Quebec Interconnections (Attachment 1) exceeded the off-nominal frequency limits in IEEE C50.13 and IEC 60034 that are used by equipment manufacturers to design generators. The drafting team revised the high frequency portion of the curve from zero to two seconds for the Eastern and ERCOT Interconnections to meet the IEEE and IEC standards. This leaves no margin between the high frequency allowance for UFLS designers in frequency overshoot for that amount of time, but the drafting team feels this is acceptable. Do you agree with this change? If not, please provide specific suggestions for change in the comment area.**

Summary Consideration: A large majority of stakeholders agreed with the change made to Attachment 1. Some stakeholders questioned the potential impact this change might make due to the elimination of the margin between the allowable UFLS overshoot and the generator overfrequency trip setpoints. The GVSDT pointed out that setting overfrequency tripping at this point would be allowed under the previous curve as a technically-based exemption under Requirement R3 and the change made removes a conflict with internationally-recognized technical standards.

Organization	Yes or No	Question 2 Comment
Southwest Power Pool Reliability Standards Development Group	No	Our concern is by eliminating the instantaneous high frequency overshoot margin that you could cause an unintended cascading event on the system. For example when you drop load it could cause an instantaneous unit trip, due to instantaneous high frequency on the unit, which would then cause an under frequency load trip. We would suggest that the drafting team let the regions investigate before approving this reduction in the margin for this time period and standard as a whole.
Response: The GVSDT thanks you for your comment. Since virtually all generators in North America are built to IEEE C50.13 and/or IEC 60034, the GVSDT believes that, absent the change in the high frequency curve, Generator Owners who decide to set overfrequency protection would claim the exemption allowed under Requirement R3 to set the protection to meet the IEEE or IEC standard. The GVSDT further believes that the NERC reliability standards should respect existing industry technical standards.		
IRC Standards Review	No	We are concerned about how this change may impact the how the system responds

Organization	Yes or No	Question 2 Comment
Committee		to frequency excursions. Please refer to our comment in question 5.
Response: The GVSDT thanks you for your comment. Please see the response to your comment in Question 5.		
ACES Standards Collaborators	No	While we are not opposed to this change per se and do not offer any suggested alternatives, we would like to see a technical justification for why this is acceptable. The only rationale we can find is that the drafting team believes this is acceptable. No explanation for why this is acceptable was offered.
Response: The GVSDT thanks you for your comment. Since virtually all generators in North America are built to IEEE C50.13 and/or IEC 60034, the GVSDT believes that, absent the change in the high frequency curve, Generator Owners who decide to set overfrequency protection would claim the exemption allowed under Requirement R3 to set the protection to meet the IEEE or IEC standard. The GVSDT further believes that the NERC reliability standards should respect existing industry technical standards.		
Independent Electricity System Operator	No	This should be confirmed with the UFLS designers in conjunction with PRC-006 and PRC-006-NPCC to see how this is coordinated with the frequency overshoot for that amount of time.
Response: The GVSDT thanks you for your comment. Since virtually all generators in North America are built to IEEE C50.13 and/or IEC 60034, the GVSDT believes that, absent the change in the high frequency curve, Generator Owners who decide to set overfrequency protection would claim the exemption allowed under Requirement R3 to set the protection to meet the IEEE or IEC standard. This allowance has been in all drafts of the PRC-024 standard, so the UFLS designers should already have been aware of the possibility. Several regions already recognized the limitation created by the IEEE and IEC standards and have already adjusted their UFLS program requirements accordingly. The GVSDT further believes that the NERC reliability standards should respect existing industry technical standards. In the event a particular region believes the IEEE and IEC limits are unworkable, a more restrictive regional standard may be written to address the issue, but the GVSDT does not feel it is wise to mandate this across the continent.		
PPL Corporation NERC Registered Affiliates	No	

Organization	Yes or No	Question 2 Comment
ISO New England Inc.	No	
MRO NSRF	Yes	Could the drafting team please clarify the risk to the BES by leaving no margin for frequency overshoot? The NSRF was unsure if reducing the no trip margin above the IEEE / IEC design limits really represented a reliability risk to the BES. If generator units do overshoot the IEEE / IEC curve and remain on-line without damage, that doesn't appear to be a reliability risk. If the generator should trip to avoid damage from a frequency overshoot above the IEEE / IEC curve for which the unit was designed, that would also appear to be better for reliability, even if the unit does trip.
Response: The GVSDT thanks you for your comment. The potential risk would be to an area that may island with more generation than load (due to the configuration of the initial separation or due to load shedding) causing the frequency to rise. UFLS designers are supposed to limit the frequency overshoot to 61.8 Hz. Generators with overfrequency protection set to that value may trip, causing frequency to drop more dramatically than expected due to governor action. The GVSDT agrees with your assessment that preventing damage to generating equipment does improve reliability.

Arizona Public Service Company		APS agreed with the draft Standard however, we voted no because of the Violation Severity Levels (VSL) associated with this Standard. Only 10 days spacing between various levels of the VSL is inappropriate and not justified. A 30 days delay in providing the requested information does not represent a significant reliability risk. In addition, other draft Standards, for example Project 2007-09 MOD and PRC-019, provides a 30 to 90 days separation between various levels of the VSL. In our opinion each VSL severity level should be at least 30 days apart.
Response: The GVSDT thanks you for your comment. The GVSDT agrees and has changed the time increment to 30 days in the VSL's for Requirements R3 and R4 (previously R5). Requirement R4 from Draft 5 has been removed.		

3. **In the previous draft of this standard the voltage ride-through curves in Attachment 2 extended out for 600 seconds before returning to normal operating voltages (95% – 105% of nominal). Also, the final step in the low voltage recovery curve was at 90% of nominal after three seconds. Commenters to the Generator Relay Loadability project pointed out that this could potentially cause conflicts with coordination of settings for relay loadability, since they need to be evaluated for stressed system conditions of voltages at 85% of nominal. In response, the drafting team has moved the final step of the low voltage recovery curve down from 90% to 85% at three seconds and has shortened the curves so that they end at four seconds. The drafting team believes this clarifies the intent of this standard to address the transient conditions without conflicting with relay loadability. Do you agree with this approach? If not, please provide specific suggestions for change in the comment area.**

Summary Consideration: Most stakeholders agreed with the revisions to the voltage ride-through curves in Attachment 2. Several stakeholders had concerns with the low voltage ride-through criteria being lowered to 85% for the 3-4 second interval. Stakeholders pointed out that transmission systems are designed to operate between 90% to 110% and not down to 85% and as such we do not expect generators to ride through voltages as low as 85% for an extended period of time. The GVSDT agrees with these comments and has revised the voltage ride-through chart 85% voltage level to the original 90%. This is due to removing all generator loadability relays from PRC-024 allowing the relay setting criteria for loadability to be in PRC-025. The 85% point-of-interconnection voltage for relay loadability for transmission and generation relays remains in their respective standards (PRC-023 for transmission and PRC-025 for generator).

Organization	Yes or No	Question 3 Comment
Southwest Power Pool Reliability Standards Development Group	No	We would like to see consistency between the voltage ride through curve and the off nominal frequency capability curve in the log scale. The last draft was consistent and we wonder why the drafting team changed the voltage ride through curve to a linear depiction?
Response: The GVSDT thanks you for your comment. The SDT believes that since the voltage curves were shortened to 4 seconds to address the transient conditions without conflicting with relay loadability, a linear depiction is adequate.		
ACES Standards Collaborators	No	(1) We support shortening the voltage curve to four seconds to reflect the purpose of the standard to ride through voltage excursions which covers a transient time

Organization	Yes or No	Question 3 Comment
		period. Furthermore, it reflects that the future PRC-025 will focus on steady state voltage limits. (2) We do not believe it is necessary to raise the performance bar for this standard by lowering the lower voltage curve to match the 0.85 pu voltage that is proposed to apply in the future PRC-025. First, having a requirement to ride through a voltage excursion to 0.9 pu for four seconds does not represent a conflict with PRC-025. It is simply less stringent than PRC-025. If PRC-025 requires more stringent performance using 0.85 pu for steady-state, that value can be set in that standard. Matching the proposed 0.85 pu in the proposed PRC-025 presumes that this is what the ultimate outcome of the PRC-025 standard will be. If PRC-025 were to end up with a 0.9 pu voltage requirement in the standard, then the standards again would not match. Second, no technical justification for changing the lower voltage ride through curve to 0.85 pu has been provided. If there is no technical justification to make the curve more stringent, it should not be made more stringent to simply match another proposed standard. Third, the overlap of the standards has been removed by striking load-affective protection functions such as impedance relays and voltage controlled overcurrent relays from this proposed PRC-024. How does the conflict in voltage performance exist when the standards apply to different equipment types? The load-affective protection will not be covered in proposed PRC-025 and will focus on steady-state conditions whereas the PRC-024 will focus on voltage excursions which are transient in nature and will apply to non-load affective protection performance.
Response: The GVSDT thanks you for your comment. In response to part 2 of the comment, The SDT agrees with your comment and has revised the voltage ride-through chart 85% voltage level to the original 90%. This is due to removing all generator loadability relays from PRC-024 allowing the relay setting criteria for loadability to be in PRC-025. The 85% point-of-interconnection voltage for relay loadability for transmission and generation relays remains in their respective standards (PRC-023 for transmission and PRC-025 for generator).		
Alberta Electric System Operator	No	The AESO disagrees with the use of 85% and supports the values as expressed previously in draft 4 of PRC-024-1. Transmission systems are designed to operate

Organization	Yes or No	Question 3 Comment
		between 90% to 110% and not down to 85%, as such we do not expect generators to ride through voltages as low as 85% for an extended period of time. In particular, as NERC has left the 85% duration open ended, it is unclear how long a generating unit is to remain on-line under this condition. In addition, there appears to be a discrepancy in Attachment 2 where the "Curve Data Points" table identify a low voltage ride through duration of 600 seconds for <0.90 pu voltage and the "Voltage Ride Through Time Duration Curve" shows this to occur <0.85 pu voltage. Based on the explanation above, the table should be updated accordingly.
Response: The GVSDT thanks you for your comment. The SDT agrees with your comment and has revised the voltage ride-through chart 85% voltage level to the original 90%. This is due to removing all generator loadability relays from PRC-024 allowing the relay setting criteria for loadability to be in PRC-025. The 85% point-of-interconnection voltage for relay loadability for transmission and generation relays remains in their respective standards (PRC-023 for transmission and PRC-025 for generator). The Voltage Ride-Through Time Duration Table has been updated.		
CenterPoint Energy	No	CenterPoint Energy agrees with lowering the low voltage recovery curve down from 90% to 85% at three seconds; however, CenterPoint Energy is concerned with truncating the curves at 4 seconds due to undervoltage load shedding (UVLS) and relay loadability factors. For coordination with UVLS systems, CenterPoint Energy recommends the curve be extended to at least 10 seconds. Additionally, the purpose of relay loadability standards is to allow sufficient time for system operators to take corrective actions. Based on the purpose of relay loadability, CenterPoint Energy believes the curves should remain extended through 600 seconds.
Response: The GVSDT thanks you for your comment. Based on other industry comments, the chart has been returned to the 90% level found in the previous draft. This is due to removing all generator loadability relays from PRC-024 allowing the relay setting criteria for loadability to be in PRC-025. The 85% point-of-interconnection voltage for relay loadability for transmission and generation relays remains in their respective standards (PRC-023 for transmission and PRC-025 for generator). The SDT shortened the voltage curves to 4 seconds to address the transient conditions without conflicting with relay loadability standards. The Voltage Ride-Through Time Duration Table has been updated.		

Organization	Yes or No	Question 3 Comment
Consumers Energy Company	No	
Northeast Power Coordinating Council	Yes	The Curve Data Points table on page 18 of Draft 5 has not been updated to reflect the changes mentioned above.
Response: The GVSDT thanks you for your comment. The "curve data points" table of Attachment 2 has been corrected.		
Dominion	Yes	Draft 5 Page 16 (clean version) the Curve Data Points table has not been updated to reflect the changes mentioned in question #3 above. Dominion agrees with the changes provide this modification is made.
Response: The GVSDT thanks you for your comment. The "curve data points" table of Attachment 2 has been corrected.		
ISO New England Inc.	Yes	The curve data points chart was not revised when the drawing (including timescale) was revised. This leads to confusion however overall the change shown in the curve to 0.85 is acceptable.
Response: The GVSDT thanks you for your comment. The "curve data points" table of Attachment 2 has been corrected.		
MRO NSRF	Yes	The NERC generator relay loadability standards don't appear to state times, so changing the curves from 600 seconds to 3 and 4 seconds is a step in the right direction but could still lead to conflicts unless this standard or PRC-025 is amended. In a relay world that typically operates in cycles, 3 to 4 seconds is still a very long time and the NSRF believes that conflicts are still possible unless both standards are coordinated carefully. It is inappropriate to force entities to choose which standard to potentially violate. Please make sure that the associated graphs and curves data points within the table match each other.
Response: The GVSDT thanks you for your comment. Based on other industry comments, the chart has been returned to the 90% level found in the previous draft. This is due to removing all generator loadability relays from PRC-024 allowing the relay setting criteria for loadability to be in PRC-025. The 85% point-of-interconnection voltage for relay loadability for transmission and		

Organization	Yes or No	Question 3 Comment
generation relays remains in their respective standards (PRC-023 for transmission and PRC-025 for generator). The SDT shortened the voltage curves to 4 seconds to address the transient conditions without conflicting with relay loadability standards. The curve data points table of Attachment 2 has been corrected.		
Xcel Energy	Yes	(1) We agree with the changes made to the Voltage Ride Through Curve in Attachment 2. However, we note that the Curve Data Points table in Attachment 2 does not reflect corresponding updates, thus producing inconsistency between the graphic and tabular voltage ride through specifications. Please reconcile the differences to make both specifications consistent. **The curve data points table of Attachment 2 has been corrected.** (2) Suggest adding the prefix "POI" to the graph title such that it reads " POI Voltage Ride-Through...." - adding the prefix makes it explicitly clear that the curve does not apply to the generator terminal voltage. This clear distinction is important to eliminate potential confusion since the relay loadability options in PRC-025 allow using either POI voltage (85%) or generator terminal voltage (95%). **The prefix "POI" is used on the percentage of voltage legend on the right hand side of the graph in Attachment 2, the SDT believes this is adequate.** (3) Suggest enhancing the verbiage in the text-box in the voltage ride-through curve as follows to clarify that it applies to continuous operation and using "system adjustments" instead of "changes to the system". Suggested verbiage is: "Voltage for continuous operation (> 600 seconds) will be restored between 0.95 pu and 1.05 pu by automatic and/or manual system adjustments". **The curve is limited to 4 seconds in time and the GVSDT has removed the text box in question from the curve because it is no longer applicable.**
Response: The GVSDT thanks you for your comment. Please see responses to the individual comments above.

Arizona Public Service Company		APS agreed with the draft Standard however, we voted no because of the Violation Severity Levels (VSL) associated with this Standard. Only 10 days spacing between various levels of the VSL is inappropriate and not justified. A 30 days delay in providing the requested information does not represent a significant reliability risk. In addition, other draft Standards, for example Project 2007-09 MOD and PRC-019, provides a 30 to 90 days separation between various levels of the VSL. In our opinion each VSL severity level should be at least 30 days apart.
Response: The GVSDT thanks you for your comment. The GVSDT agrees and has made the requested revision to the VSLs.		

4. **Footnote 1 has been revised to remove reference to impedance relays and voltage controlled overcurrent relays which are load-affected protective functions. This was done to remove overlap and potential conflict of coordination with the Generator Relay Loadability project. Do you agree with this approach? If not, please provide specific suggestions for change in the comment area.**

Summary Consideration: The majority of comments were in agreement with the removal of loadability relays from PRC-024.

One commentator recommended that the Generator Relay Loadability drafting team vet the removal of these relay types from Footnote 1. The GVSDT had previous discussions with that drafting team and they concurred with the revision to PRC-024.

Organization	Yes or No	Question 4 Comment
Independent Electricity System Operator	No	The standard clearly specifies in R1 and R2 that frequency and voltage relaying should not operate within "no trip zone". Footnote 1 should be completely removed since is only an incomplete list of the possible generator protections.
Response: The GVSDT thanks you for your comment. The footnote clarifies that a Generator Owner is not required to install frequency or voltage relaying as a result of this standard. The drafting team declines to remove Footnote 1 because it clarifies that generator relays or protective functions that have inputs of frequency and voltage are to be considered as part of PRC-024.		
CenterPoint Energy	No	CenterPoint Energy does not agree with removing references to impedance relays and voltage controlled overcurrent relays in Footnote 1, as we are concerned that there could be some differences between relay loadability and low voltage ride-through. Voltages at 85% of nominal and emergency current levels are used for calculating relay set points for relay loadability. For low voltage ride-through, impedance relays and voltage controlled overcurrent relays would need to be evaluated at voltage levels as low as 0% of nominal and at short circuit fault current levels. Instead of removing these relays from Footnote 1 at this late point in the development of PRC-024, CenterPoint Energy suggests that this be addressed by the SDT for PRC-025 Generator Relay Loadability. The PRC-025 SDT has the appropriate

Organization	Yes or No	Question 4 Comment
		subject matter expertise to fully vet whether these types of relays should be removed from PRC-024.
Response: The GVSDT thanks you for your comment. The drafting team discussed the loadability relays that were in PRC-024 with the PRC-025 drafting team before the recent posting. As a result of the discussion, it was agreed that PRC-025 would contain the necessary criteria for evaluating relay settings based on generator loading and field forcing along with 85% voltage at the point of interconnection. The voltage ride-through curve in PRC-024 has a voltage profile for voltage recovery after fault clearing and does not consider generator loading. The relay coordination draft standard (PRC-027) would take into consideration relay coordination between the Generator Owner and the Transmission Owner. Therefore, it was permissible to remove the loadability relays from PRC-024.		
PPL Corporation NERC Registered Affiliates	Yes	The PPL Companies also recommend the following changes to Footnote 1. The expression, “protective functions within control systems...based on frequency or voltage inputs,” should be replaced with, “control system frequency or voltage trip setpoints.” It is unclear whether or not the present statement covers such events as contactor drop-out at extreme under-voltage or actuation of fan stall protection run-back during under-frequency operation. This change is important, because R2 allows units to trip within the no-trip zone only in accordance with R3, and R3 in turn pertains to a, “known equipment limitation...including (but not limited to) study results, experience from an actual event, or manufacturer’s advisory.” Tripping from unknown frequency or voltage-related limitations therefore evidently constitutes a violation, and predicting if and when every contactor in a plant will drop-out for example is not possible.
We Energies	Yes	The NAGF also recommend the following changes to Footnote 1. The expression, “protective functions within control systems...based on frequency or voltage inputs,” should be replaced with, “control system frequency or voltage trip setpoints.” It is unclear whether or not the present statement covers such events as contactor drop-out at extreme under-voltage or actuation of fan stall protection run-back during under-frequency operation. This change is important, because R2 allows units to trip within the no-trip zone only in accordance with R3, and R3 in turn pertains to a,

Organization	Yes or No	Question 4 Comment
		"known equipment limitation...including (but not limited to) study results, experience from an actual event, or manufacturer's advisory." Tripping from unknown frequency or voltage-related limitations therefore evidently constitutes a violation, and predicting if and when every contactor in a plant will drop-out for example is not possible.
Essential Power, LLC	Yes	We recommend the following changes to Footnote 1. The expression, "protective functions within control systems...based on frequency or voltage inputs," should be replaced with, "control system frequency or voltage trip setpoints." It is unclear whether or not the present statement covers such events as contactor drop-out at extreme under-voltage or actuation of fan stall protection run-back during under-frequency operation. This change is important, because R2 allows units to trip within the no-trip zone only in accordance with R3, and R3 in turn pertains to a, "known equipment limitation...including (but not limited to) study results, experience from an actual event, or manufacturer's advisory." Tripping from unknown frequency or voltage-related limitations therefore evidently constitutes a violation, and predicting if and when every contactor in a plant will drop-out for example is not possible.
Cowlitz PUD	Yes	Cowlitz also recommends Footnote 1 be clarified concerning the expression "...protective functions within control systems that directly trip or provide tripping signals to the generator based on frequency or voltage inputs." It is unclear whether or not this statement covers such events as contactor drop-out at extreme under-voltage or actuation of fan stall protection run-back during under-frequency operation. Cowlitz suggests a change to "...protective functions within control systems specifically programmed to provide frequency or voltage protection trip points..." This change is important, because R2 allows units to trip within the no-trip zone only in accordance with R3, and R3 in turn pertains to a, "known equipment limitation...including (but not limited to) study results, experience from an actual event, or manufacturer's advisory." Tripping from unknown frequency or voltage-related limitations therefore evidently constitutes a violation, and predicting if and

Organization	Yes or No	Question 4 Comment
		when every contactor in a plant will drop-out for example is not possible.
Cogentrix Energy Power Management, LLC	Yes	The NAGF also recommend the following changes to Footnote 1. The expression, “protective functions within control systems...based on frequency or voltage inputs,” should be replaced with, “control system frequency or voltage trip setpoints.” It is unclear whether or not the present statement covers such events as contactor drop-out at extreme under-voltage or actuation of fan stall protection run-back during under-frequency operation. This change is important, because R2 allows units to trip within the no-trip zone only in accordance with R3, and R3 in turn pertains to a, “known equipment limitation...including (but not limited to) study results, experience from an actual event, or manufacturer’s advisory.” Tripping from unknown frequency or voltage-related limitations therefore evidently constitutes a violation, and predicting if and when every contactor in a plant will drop-out for example is not possible.
Response: The GVSDT thanks you for your comment. The GVSDT had follow-up conversations with members of the NAGF and reached a consensus on dealing with this issue. The GVSDT has revised R3 by adding “relay setting” into the requirement for clarity as follows: **R3. Each Generator Owner shall document each known regulatory or equipment limitation that prevents an applicable generating unit from meeting the *relay setting* criteria in Requirements R1 or R2 including (but not limited to) study results, experience from an actual event, or manufacturer’s advisory.**		
Xcel Energy	Yes	(1) It is not apparent why the verbiage preceding and following the parenthetical text in Footnote 1 - that is, “Each GO is not required to have frequency or voltage protective relaying installed or activated on its unit.” - Is essential. This applicability exclusion is sufficiently clear in the verbiage of the requirements R1 and R2, which states “Each GO that has generator protective relaying activated to trip its generating unit(s)...”. Can a GO possibly activate a protective relay that is not installed? Therefore it seems redundant to include the applicability exclusion in the footnote and we suggest omitting it.

Organization	Yes or No	Question 4 Comment
		The footnote was intended to add clarity that a Generator Owner is not required to activate a protective function in a digital relay. For example, if a digital relay has an option to activate an under-voltage relay option and the Generator Owner elects to not use this function, this standard does not require the Generator Owner to activate and set it according to the ride through curve. (2) Suggest simplifying Footnote 1 as follows by retaining only the parenthetical text since it sufficiently captures the footnote's primary intent --- suggested footnote text is " 1 Including but not limited to frequency and voltage protective functions......... to the generator based on frequency or voltage inputs." **The footnote clarifies that a Generator Owner is not required to install frequency or voltage relaying as a result of this standard. The concept of "including but not limited to frequency and voltage protective functions" clarifies that the protection may be performed by a protective relay, or are protection options available inside a control system. The final portion of the sentence inside the parenthetical which states, "generator based on frequency or voltage inputs" defines whether the protective function is considered as part of the standard.**

Arizona Public Service Company		APS agreed with the draft Standard however, we voted no because of the Violation Severity Levels (VSL) associated with this Standard. Only 10 days spacing between various levels of the VSL is inappropriate and not justified. A 30 days delay in providing the requested information does not represent a significant reliability risk. In addition, other draft Standards, for example Project 2007-09 MOD and PRC-019, provides a 30 to 90 days separation between various levels of the VSL. In our opinion each VSL severity level should be at least 30 days apart.
Response: The GVSDT thanks you for your comment. The GVSDT agrees and has made the requested revision to the VSLs.		

5. **Do you have any other comment, not expressed in questions above, for the GVSDT?**

Summary Consideration: Stakeholders provided valuable input regarding suggested improvements to language within the standard. Based on these comments, the following improvements were made to the draft standard:

- Removed Requirement R4 from the standards because of ambiguous language and dubious reliability benefit.
- Revised the title of the standard to "Generator Frequency and Voltage Protective Relay Settings" and the Purpose Statement to "Ensure Generator Owners set their generator protective relays such that generating units remain connected during defined frequency and voltage excursions.
- Revised "generating unit(s)" to "applicable generating unit(s)" to reflect that the standard only applies to units that meet the registry criteria.
- Added "regulatory or" language regarding limitations to reflect that NERC, environmental or regulatory requirements may cause a limitation in generator performance.
- Revised Requirement R2 so that the sentences were shorter and easier to read, and made conforming changes to Requirement R1.
- Removed the last bullet from Requirement R3 and added and new bullet referencing frequency impacts on turbines as follows: "Creation or adjustment of an equipment limitation caused by consumption of the cumulative turbine life-time frequency excursion allowance."
- Revised Requirement R5 (now R4) to indicate that the trip settings to be provided are only those "associated with Requirements R1 and R2" and not all relays.
- Revised the measures based on requirement revisions.
- Updated the VSLs for Requirements R3 and R4 to allow 30 day increments between levels rather than the original 10 days. This comports with other standards developed under this project.
- Updated the table in Attachment 2 (this was missed in the previous revision).
- Made clarifying revisions to "Voltage Ride-Through Curve Clarifications" on the last page of the standard.
- Clarified Footnote 3 to: "Excludes limitations that are caused by the setting capability of the generator frequency and voltage protective relays themselves but does not exclude limitations originating in the equipment that they protect."

Organization	Yes or No	Question 5 Comment
Southern Company		1) Add the word "evidence" between "shall have" and "that" in M2 (to match the wording of M1). **The GVSDT agrees and has made the suggested revision.** 2) We believe that R4, due to the uncertainty of speculating the probability of the unit ride-thru/trip when exposed to transmission system voltage and frequency excursions described by Attachment 1 and Attachment 2, will not yield beneficial information in support of the BES reliability. **R4 has been removed from the standard.** 3) The scope of the generator protection trip settings reported in R5 should be limited to the protective relaying specified in R1, R2, and footnote 1. **R5, Draft 5 (R4, Draft 6) has been modified to clarify this: R4: Each Generator Owner shall provide its generator protection trip settings associated with Requirements R1 and R2 to the Planning Coordinator or Transmission Planner (that models the associated unit), within 60 calendar days of receipt of a written request for the data, and within 60 calendar days of any change to those previously requested trip settings unless directed by the requesting Planning Coordinator or Transmission Planner that the reporting of relay setting changes is not required.** 4) Delete the word "nameplate" on item 1.b on the last page of the draft standard under "Evaluating Protective Relay Settings" for voltage excursions. The language "full real-power output" enables GOs to use the best "full load MW" values they have for their units for plant-specific studies. **Clarification #1 has been modified to allow flexibility in choosing the loading conditions for the unit under study. Please see the revision: Use either the following assumptions or loading conditions that are believed to be the most probable for the unit under study to evaluate voltage protection relay setting calculations on the static case for steady state initial conditions.**

Organization	Yes or No	Question 5 Comment
Response: The GVSDT thanks you for your comment. Please see responses above.		
ACES Standards Collaborators		(1) The data retention period is too long and is not consistent with the "Change State Element Paper No. 3 - Establish Compliance Data Requirements" whitepaper that NERC recently published as part of the reliability assurance initiative (RAI). It states that the retention period is the longer of three years or until the next audit. In effect, this makes the data retention period approximately six years since GOs are on a six year audit cycle. We believe this is simply too long a data retention period to demonstrate compliance and potentially refocuses audits on backwards looking changes that have no impact to reliability. Consider a generator that may undergo multiple setting changes. Is it necessary to retain all setting changes over this period or only the most recent ones that indicate the generator is currently set to ride through voltage and frequency excursions? Retaining historical settings that have been changed does nothing to support reliability and only perpetuates the paper driven compliance culture rather than a culture of reliability. **The GVSDT has used the boilerplate language provided by NERC Staff that is approved for use in standards. The whitepaper that you cite has not been approved for implementation. Auditors are still going to review the entire period until the RAI process is actually implemented and the burden is still on the entity to show compliance.** (2) This standard needs to be aligned with the recent NERC compliance enforcement initiatives (i.e. internal controls, entity impact evaluation, and elimination of zero-defect expectations). The VSLs for Requirements R1 and R2 could be read to require self-reporting of every unit that tripped for a voltage or frequency excursion inside the no trip zone. To refocus NERC efforts on compliance, the recent reliability assurance initiative would allow that GO to make this determination and correct any performance deficiencies without the need to self-report a violation. These approaches are being written into the standards (CIP, COM-003, etc.). We suggest the drafting team coordinate with the appropriate NERC personnel to adopt a similar

Organization	Yes or No	Question 5 Comment
		approach for this standard. **Requirements 1 and 2 are relay setting criteria requirements. Should there be an equipment limitation requiring that the relay settings of R1 and R2 be set in the "no trip zone" of Attachment 1 or 2, it is permissible to do so provided that the limitation is documented and communicated to the appropriate entity identified in R3. A violation of R1, R2, or R3 is either that the relays are not set according to the criteria of R1 or R2, or that documentation of the limitation (preventing the relays to be set according to R1 and R2) has not been communicated to the appropriate entity as required by R3.** (3) Because the voltage envelope is based on assumptions listed on page 19, the VSLs for R1 and R2 need to clarify that if a unit does trip in the no trip zone and the actual system conditions do not match these assumptions that the trip does not represent a violation. For instance, if a synchronous condenser or capacitor (bullet 2 under "Evaluating Protective Relay Settings" on page 19) is not available that was assumed to be available when evaluating protection relay settings, why would the GO be held accountable for its unit tripping during a voltage excursion? It followed the assumptions set out in the standard. **The clarifications have been revised to allow flexibility in the loading conditions when evaluating relaying settings. Please see the revised evaluation assumptions: "Use either the following assumptions or loading conditions that are believed to be the most probable for the unit under study to evaluate voltage protection relay setting calculations on the static case for steady state initial conditions."** (4) The response to our previous comments that requirement R3 and R5 are the types of requirements the Project 2013-02 Paragraph 81 drafting team is proposing to eliminate indicated that they do not meet criteria A. This implies that these requirements do provide significant reliability support. However, no justification for how they provide significant reliability support was provided. Please explain how a requirement such as R3 that requires documentation and communication supports reliability. Requirement R1 already allows a GO an exception for documented and

Organization	Yes or No	Question 5 Comment
		communicated equipment limitations. Because compliance is driven by evidence, the GO would have to document the limitation and communicate the limitation per the third bullet in Requirement R1. A separate requirement is simply not needed and "does little, if anything, to benefit or protect the reliable operation of the BES" above and beyond Requirement R1. The VSLs even seem to support this position since they focus primarily on the number of days late a registered entity has performed the task. Any further need to communicate the limitations could be rolled into the third bullet of Requirement R1. Requirement R5 is similarly situated requirement. Please explain how this requirement provides significant reliability support and, thus, does not meet criterion A. While we agree that generator protection settings changes need to be communicated, we simply do not see how a specific requirement to communicate them supports reliability. A requirement is not needed for every single task that should be completed. The requirement continues to perpetuate the paper driven compliance approach that NERC has recognized needs to change and is in the process of changing. If the drafting team believes, the requirement is still needed, we suggest including it as part of requirements R1 and R2. **Unless the GO indicates through communication to the TP (R3) that a particular unit will trip for voltage or frequency excursions not exceeding the "no trip zone" of the two attachments to the standard, the TP may not model the generator performance accurately, which may produce system simulations that are not valid. These erroneous studies could lead to actions (or inactions) that could affect system reliability.** **In the end, the requirement to document and communicate the limitations (and relay settings which are in the "no trip zone") have to be documented and communicated. It is more efficient to list these requirements once (in R3) rather than twice (in R1 and R2).**
Response: The GVSDT thanks you for your comment. Please see responses above.		

Organization	Yes or No	Question 5 Comment
Manitoba Hydro		(1) R4 - the word 'for' is missing between duration and which. **R4 has been removed from the standard.** (2) R4, second paragraph - the requirement hinges on what the GO 'expects' may happen, is very subjective. It will be hard for the MRO to measure compliance on this point. The phrase 'for the duration of the profile of the excursion' is new and not language that appears anywhere else in R4. It's not clear what it means. We would suggest using language that appears in the first paragraph of R4 so this is consistent. **R4 has been removed from the standard.** (3) R5 - allows the Planning Coordinator or Transmission Planner to request that settings must be provided within some time frame other than 60 days if they so direct. Theoretically this could be 1 day as there are no parameters put on what the PC or TP may direct. **The direction from the PC or TP was meant to be associated with the reporting of changes to the relay settings, not a change to the schedule. The requirement has been revised to clarify this: "Each Generator Owner shall provide its generator protection trip settings associated with Requirements R1 and R2 to the Planning Coordinator or Transmission Planner (that models the associated unit), within 60 calendar days of receipt of a written request for the data, and within 60 calendar days of any change to those previously requested trip settings unless directed by the requesting Planning Coordinator or Transmission Planner that the reporting of relay setting changes are not required."** (4) R5 - doesn't provide for a time frame other than 60 days which the requirement does. **The revision cited above addresses this concern.** (5) M2 - the word 'evidence' should be placed after 'have' and not after 'R2'. **The suggested revision has been made.**

Organization	Yes or No	Question 5 Comment
		(6) M3 - language doesn't seem to reflect revisions made to R3. For example, 'excluding limitations...' is still in M3 but deleted from R3. **Footnote 3 was revised to clarify the "excluding limitations…", and M3 has been revised to point to Footnote 3.** (7) M4 - language doesn't seem to reflect revisions made to R4. For example, the description of the generating units differs. **R4 / M4 have been removed from the standard.** (8) M5 - does not contemplate that it may be some time frame other than 60 days as R5 permits. **R5 has been revised to indicate that the "unless otherwise directed" phrase pertains to the reporting of changes rather than to the schedule.** (9) Compliance, 1.1 - CEA is used in the last sentence but never defined. The acronym is not used again, so it's likely easiest to not define it and use Compliance Enforcement Authority each time. **This has been corrected by adding (CEA) after Compliance Enforcement Authority in the first sentence.** (10) VSLs, R1 and R2 - the wording of the VSL is problematic as it ties the violation to a violation of R3 which the requirement itself does not do. **R1 and R2 specify exemptions to allow tripping in the "no trip zones" provided that the valid limitation is documented and communicated as specified in R3. Because this appears in R1 and R2, it is appropriate for it to appear in the VSL for R1 and R2.**
Response: The GVSDT thanks you for your comment. Please see responses above.		
Sacramento Municipal Utility District		1) Sacramento Municipal Utility District (SMUD) believes the applicability section should be revised to only cover those units defined by the BES Definition. As currently drafted Generator Owners that are registered under the NERC Registry

Organization	Yes or No	Question 5 Comment
		Criteria along with other non-registered generator owners are subject to this standard causing an enforcement issue. **While the Applicability of Generator Owners conveys that units meeting the NERC registration criteria, and thus the BES, only are subject to the standard, for additional clarity, the SDT has inserted additional explicit language. Specifically, as appropriate, the use of the word "unit(s)" in the requirements was modified to read "applicable unit(s)"** 2) SMUD thanks the SDT for their response to our comment on R6 (now R5) during the last posting. However, SMUD wishes reiterate our disagreement with a requirement mandates ALL generator protection settings. SMUD also find it problematic to allow a single request by the PC or TP to create an indefinite requirement to report any relay change. SMUD believes R5 should be limited in its application to only frequency or voltage settings that directly correspond with the measure the PC or TP implement in their studies. **The scope of the relays whose settings are to be supplied to the PC and TP has been revised to limit the scope of relays as you suggest. The revised requirement reads: "R4. Each Generator Owner shall provide its applicable generator protection trip settings *associated with Requirements R1 and R2* to the Planning Coordinator or Transmission Planner that models the associated unit…"**
Response: The GVSDT thanks you for your comment. Please see responses above.		
Wisconsin Electric Power Company		1. The word "evidence" is missing in Measure M2. Also in Measure M2, the wording should be changed to add the phrase, "... or other documentation", to the list of acceptable evidence for Requirement R2. Measure M1 allows "other documentation" as evidence, and this should be true for Measure M2 also. **"Evidence" has been corrected in M2.** **"or other documentation" has been added to M2.**

Organization	Yes or No	Question 5 Comment
		2. We disagree that the applicability of this standard needs to be to all generators regardless of size or connection voltage. Only generators connected to the Bulk Electric System should be applicable. The efforts needed to meet these requirements will be significant, and should not be required for every generating unit. Please verify your understanding of the referenced FERC order, because resources are limited. **While the Applicability of Generator Owners conveys that units meeting the NERC registration criteria, and thus the BES, only are subject to the standard, for additional clarity, the SDT has inserted additional explicit language. Specifically, as appropriate, the use of the word "unit(s)" in the requirements was modified to read "applicable unit(s)"**
Response: The GVSDT thanks you for your comment. Please see responses above.		
Tennessee Valley Authority		1. The technical justification for the need of a plant performance criteria appears to be based on issues with early design wind generation. The technical considerations at these types of generation stations are different than steam turbine generation plants, which require heavy induction loads to support operation and these loads are sensitive to upsets in voltage and frequency. The technical implications of the plant performance are not clear. Recommend generating a separate SAR and bring in industry technical SMEs such as IEEE, EPRI, Equipment OEMs, Power Plant Design entities, technical academia, etc. to assist in the technical analysis and standard development. **That is the direction that the SDT has chosen to follow as Requirement R4 has been removed from the current draft of the standard.** 2. Likewise, industry technical SMEs such as IEEE, EPRI, Equipment OEMs, Power Plant Design entities, technical academia, etc. can develop acceptable methods to determine the capability of a plant to ride through grid transients.

Organization	Yes or No	Question 5 Comment
		That is the direction that the SDT has chosen to follow as Requirement R4 has been removed from the current draft of the standard. 3. The following are IEEE Electric Machines Committee comments for PRC-024-1considerationThe IEEE Electric Machinery Committee hosted a discussion topic on “Grid Code Impact on Electric Machine Design” in San Diego at this year’s Power Engineering Society meeting and offers the following input. o Minor changes in the Under-frequency Ride Through Curve are suggested to better match existing machine design standards in IEEE C50????. o The PRC-024 Voltage Ride Through criteria is technically not ready to be a standard, for the following reasons;1. PRC-024 VR capability may not be available at any price. BES reliability enhancements requiring technological advances should be addressed with industry groups (e.g. ASME, IEEE) and OEMs to develop commercially available products before appearing as requirements in reliability standards. It is believed the cost of complying with wider standards might increase main generator machine costs as much as25%, which is not insignificant. This should only be required if there is a defined local system need for higher standards and that these costs should be considered against the cost of other possible resolutions.2. A specific concern in this respect regarding the ride-through capability being sought in PRC-024 R3-5 is that auxiliary buses may drop-out and cause a unit to trip for the excursions specified, which go well beyond the industry's present design criteria, even if the protective relay settings nominally allow such transients. It may be unrealistic to expect that the dynamic behavior of all 4160V and 460V systems in new plant can be dynamically modeled to a degree allowing one to obtain non-dropout guarantees from equipment suppliers and EPC firms for extreme transients such as 2.0 seconds at 65% voltage, or that the same can be done for existing plants to allow identification of limiting components and accurate estimates of performance.3. The voltage ride through was originally intended to address early deficiencies in wind generation design only and it doesn’t make sense to apply such a broad curve to steam plants. The concerns

Organization	Yes or No	Question 5 Comment
		that led to the VRT curve for wind have been addressed by new vintage wind plant designs and thus, the EMC does not believe there is not driving need for a standard VRT criteria. o The VRT issue is holding up addressing other significant issues addressed by PRC-024 (relay setting coordination and frequency ride through). The VRT should be pulled out of PRC-024 and a new SAR drafted to address the voltage performance aspects if this is really needed for reliability. o More clarity in defining plant MVARs available to support grid voltage is needed. Specifically, generation plants have not been designed to operate outside a normal band of 95 to 105% on the generator terminals. GSU settings are typically chosen to optimize MVAR support under normal operations, however is not reasonable to assume the full leading or lagging reactive support would be available under normal grid conditions. **R4 has been removed from the current draft of the standard. The standard is now essentially a relay setting standard only. Generator performance requirements may or may not be dealt with in the future in other developments projects.**
Response: The GVSDT thanks you for your comment. Please see responses above.		
Duke Energy		a) The effective date in Section 5.1.4 should be increased to seven years. The typical major outage cycle for base load units can be as long as 7 to 9 years, based upon the unit and its history. **The SDT believes that five years is the correct number. The SDT notes that the maximum allowable interval for relay calibration in PRC-005-2 is six years. In addition, the SDT believes a major outage would not be necessary to effect a change in relay settings if that is what is necessary to comply with this standard.** b) In the “Consideration of Issues and Directives” document, it is stated that the

Organization	Yes or No	Question 5 Comment
		GVSDT believes that R3 allows NRC requirements to supersede portions of the voltage and frequency ride through criteria in PRC-024-1, and that NRC requirements qualify as technical limitations for the purposes of this standard. We believe that additional clarity is needed in the text of Requirement R3 regarding allowable limitations other than equipment limitations, such as NRC technical specification limits and perhaps environmental permit limitations as well. **The SDT agrees and has added the words "…regulatory or…" before "… technical equipment limitation…" to address your concern.** c) Additional clarity is needed in Requirement R4. Is R4 intended to serve as a means to obtain more information from a Generator Owner about limitations identified pursuant to R3? Is the voltage or frequency profile to be provided by the Planning Coordinator or Transmission Planner different from Attachments 1&2? **Requirement R4 has been removed from this standard.** d) Requirement R4 states that the Generator owner may develop estimates based upon "sound engineering judgment". R4 should more clearly indicate the extent of "due diligence" effort that is expected in order to support an estimate based on "sound engineering judgment". **Requirement R4 has been removed from this standard.** e) On Attachment 2, Evaluating Protective Relay Settings, 1.c states that "Power factor is 0.95 lagging (i.e. supplying reactive power to the system) as measured at the generator terminals." We believe that compensating all generator voltage relaying for a loading of rated power at 0.95pf lagging is dangerous, as this could indicate coordination margin to the HVRT when there is none. The worst case coordinating conditions for the HVRT are not the same as for the LVRT. The current version of the standard is prescribing a method that will lead to miscoordination between the HVRT curve and overvoltage relays (59 & 24 elements). We recommend generator undervoltage relaying be evaluated at rated power at rated power factor, and generator overvoltage relaying be evaluated at rated power at .95pf leading. There

Organization	Yes or No	Question 5 Comment
		can be more than a 10% difference in POI voltage under these two sets of conditions. **The cited clarification specified the initial condition for the generator prior to an event that causes a voltage excursion. The words "… or loading conditions that are believed to be the most probable for the unit under study…" have been added to allow evaluation of the relay settings under conditions other than full load at 95% lagging power factor.** f) In the VRF and VSL Assignment document, the R6 should be corrected to R5 (typo) **The typo has been corrected.**
Response: The GVSDT thanks you for your comment. Please see responses above.		
Cowlitz PUD		(A) Confusion is created by making exemptions, "in accordance with Requirement R3," in R1 and R2 of PRC-024-1; while R3 excludes, "limitations that are caused by generator frequency and voltage protective relays." Are such "protective relays" meant to correspond to the "protective relaying" discussed above? It is semantically unclear whether or not any exemptions are actually being allowed. It has been said in discussions with the SDT that no grandfathering of voltage or frequency relaying is intended, and exemptions covered in R3 are for other equipment limitations such as low frequency sensitive turbine blades. This only adds to the confusion, however, since equipment limitations are (or at least should be) where over/under-frequency protection system settings come from. If a turbine OEM states that a unit must trip within one second at 2.5% over speed, for example, then the 81O relay is set for 60 cycles at 61.5 Hz. We believe that R1, R2 and R3 would be completely harmonious if the SDT were to remove footnote 3, "Excludes limitations that are caused by the generator frequency and voltage protective relays themselves." Alternatively, if the intent was to require that settings have a grounding in equipment limitations and not be based on guesswork or corporate policy, a more direct way of saying so should be developed.****** (B) The rationale for the last bullet item of R3.1 (reporting a 10% increase in

Organization	Yes or No	Question 5 Comment
		nameplate capacity) is unclear, and it could be interpreted as requiring that units previously having restrictions be pulled into no-exemptions status. This is an appropriate course of action where possible, and increasing fossil unit output 10% is likely to require replacing the L0 blades, in which case achieving Att. 1 compliance shouldn't be a problem for the less-demanding interconnections. These components might not pass muster in the West (no instantaneous tripping until 57.0 Hz), however, and some designs would definitely not qualify in Quebec (55.5 Hz). This could be even more of an issue for the very long L0 blades of nuclear units. Regarding gas turbines, firing temperature increases and compressor mass flow uprates (e.g. zero-staging) can cause the 10% threshold to be reached without necessarily affecting original-unit frequency limits, particularly if dealing with a new model that was initially rated at substantially less than the expected capability pending confirmation of prototype unit performance in service. Expanding the frequency range for this type of equipment may not be feasible, since there is often no alternative to OEM blading (especially for the more recent models). That is, one cannot shop around for blading with PRC-024-compliant resonance avoidance. The issue also involves compressor surge margin at low speed and turbine overload at high speed, which may lock-in original frequency restrictions even if more-tolerant blading becomes available.****** (C) Steam turbine off-frequency limits are generally set by OEMs as lifetime limits regarding duration, but there is no discussion in PRC-024-1 as to how often the specified excursions may occur. Our understanding is that it is acceptable for units that once met Att. 1 of PRC-024 to start reporting (and periodically increasing) will-trip exceptions as fatigue life is progressively consumed, but it would be best to make this matter explicit in the standard rather than requiring each GO to formulate its own interpretation.****** (D) The scope of the generator protection trip settings reported in R5 should be limited to the protective relaying specified in R1, R2, and footnote 1. It is believed that responding to a request for data is acceptable, but the burden of having to provide an additional response within 60 days of any change to previously reported

Organization	Yes or No	Question 5 Comment
		trip settings is unduly burdensome. It is believed that recurring requests by the PC or TP should be the mechanism for additional reporting.
Essential Power, LLC		a. Confusion is created by making exemptions, “in accordance with Requirement R3,” in R1 and R2 of PRC-024-1; while R3 excludes, “limitations that are caused by generator frequency and voltage protective relays.” Are such “protective relays” meant to correspond to the “protective relaying” discussed above? 		blading becomes available. c. Steam turbine off-frequency limits are generally set by OEMs as lifetime limits regarding duration, but there is no discussion in PRC-024-1 as to how often the specified excursions may occur. Our understanding is that it is acceptable for units that once met Att. 1 of PRC-024 to start reporting (and periodically increasing) will-trip exceptions as fatigue life is progressively consumed, but it would be best to make this matter explicit in the standard rather than requiring each GO to formulate its own interpretation. d. The scope of the generator protection trip settings reported in R5 should be limited to the protective relaying specified in R1, R2, and footnote 1. It is believed that responding to a request for data is acceptable, but the burden of having to provide an additional response within 60 days of any change to previously reported trip settings is unduly burdensome. It is believed that recurring requests by the PC or TP should be the mechanism for additional reporting.
PPL Corporation NERC Registered Affiliates		Confusion is created by making grandfathering (exceptions), "in accordance with Requirement R3," in R1 and R2 of PRC-024-1; while R3 excludes, "limitations that are caused by generator frequency and voltage protective relays." Are such "protective relays" meant to correspond to the "protective relaying" discussed above? It is semantically unclear whether or not any grandfathering is actually being allowed. It has been said in discussions with the SDT that there is no grandfathering of voltage-relaying or frequency-relaying intended, and exemptions covered in R3 are for other equipment limitations such as low frequency sensitive turbine blades. This only adds to the confusion, however, since equipment limitations is in fact where our over/under-frequency protection system settings come from. If a turbine OEM notifies us that a unit must trip within one second at 2.5% overspeed, for example, then our 81O relay is set for 60 cycles at 61.5 Hz. We believe that R1, R2 and R3 would be completely harmonious if the SDT were to remove footnote 3, "Excludes

Organization	Yes or No	Question 5 Comment
		limitations that are caused by the generator frequency and voltage protective relays themselves." Alternatively, if the intent was to require that settings have a grounding in equipment limitations and not be based on historical practice with an unknown technical basis, a more direct way of saying so should be developed. The rationale for the last bullet item of R3.1 (reporting a 10% increase in nameplate capacity) is unclear, and it could be interpreted as requiring that units previously having restrictions be pulled into no-exemptions status. This is an appropriate course of action where possible, and increasing fossil unit output 10% is likely to require replacing the L0 blades, in which case achieving Att. 1 compliance shouldn't be a problem for the less-demanding interconnections. These components might not pass muster in the West (no instantaneous tripping until 57.0 Hz), however, and some designs would definitely not qualify in Quebec (55.5 Hz). This could be even more of an issue for the very long L0 blades of nuclear units. Regarding gas turbines, firing temperature increases and compressor massflow uprates (e.g. zero-staging) can cause the 10% threshold to be reached without necessarily affecting original-unit frequency limits, particularly if dealing with a new model that was initially rated at substantially less than the expected capability pending confirmation of prototype unit performance in service. Expanding the frequency range for this type of equipment may not be feasible, since there is often no alternative to OEM blading (especially for the more recent models). That is, one cannot shop around for blading with PRC-024-compliant resonance avoidance. The issue also involves compressor surge margin at low speed and turbine overload at high speed, which may lock-in original frequency restrictions even if more-tolerant blading becomes available. It would be acceptable if R3.1 or a footnote stated that "Resubmittal of the exemption documentation when reporting a 10% increase in nameplate capacity is required, but the removal of the exemption status is not required as part of the 10% increase in nameplate capacity." Steam turbine off-frequency limits are generally set by OEMs as lifetime limits

Organization	Yes or No	Question 5 Comment
		regarding duration, but there is no discussion in PRC-024-1 as to how often the specified excursions may occur. Our understanding is that it is acceptable for units that once met Att. 1 of PRC-024 to start reporting (and periodically increasing) will-trip exceptions as fatigue life is progressively consumed, but it would be best to make this matter explicit in the standard rather than requiring each GO to formulate its own interpretation. The scope of the generator protection trip settings reported in R5 should be limited to the protective relaying specified in R1, R2, and footnote 1. It is believed that responding to a request for data is acceptable, but the burden of having to provide an additional response within 60 days of any change to previously reported trip settings is unduly burdensome. It is believed that recurring requests by the PC or TP should be the mechanism for additional reporting.

Response: The GVSDT thanks you for your comment.

a. The GVSDT has decided to retain footnote 3 as it is a necessary clarification to Requirement R3. We have revised the footnote 3 to address your comment: "Excludes limitations that are caused by setting capability of the generator frequency and voltage protective relays themselves but does not exclude limitations originating in the equipment that they protect."

b. We have removed the last bullet from R3.

c. Requirement R3 provides the exemption for equipment limitations, which include off-frequency limits. Accrued off-frequency excursions are a valid equipment limitation and would be addressed in Requirement R3 but it is not required that this be done. We have added a bullet to R3 as: "• Creation or adjustment of an equipment limitation caused by consumption of the cumulative turbine life-time frequency excursion allowance."

d. The GVSDT intended for this requirement to include only those relays. We have added "associated with Requirements R1 and R2" to the requirement.

e. The GVSDT does not think that reporting relay setting changes within 60 days of a change is a burden. The TP and PC need to be made aware of the changes as soon as practical.

Organization	Yes or No	Question 5 Comment
Cogentrix Energy Power Management, LLC		a. Confusion is created by making exemptions, “in accordance with Requirement R3,” in R1 and R2 of PRC-024-1; while R3 excludes, “limitations that are caused by generator frequency and voltage protective relays.” Are such “protective relays” meant to correspond to the “protective relaying” discussed above? It is semantically unclear whether or not any exemptions are actually being allowed. It has been said in discussions with the SDT that no grandfathering of voltage or frequency relaying is intended, and exemptions covered in R3 are for other equipment limitations such as low frequency sensitive turbine blades. This only adds to the confusion, however, since equipment limitations are (or at least should be) where over/under-frequency protection system settings come from. If a turbine OEM states that a unit must trip within one second at 2.5% overspeed, for example, then the 81O relay is set for 60 cycles at 61.5 Hz. We believe that R1, R2 and R3 would be completely harmonious if the SDT were to remove footnote 3, “Excludes limitations that are caused by the generator frequency and voltage protective relays themselves.” Alternatively, if the intent was to require that settings have a grounding in equipment limitations and not be based on guesswork or corporate policy, a more direct way of saying so should be developed . b. The rationale for the last bullet item of R3.1 (reporting a 10% increase in nameplate capacity) is unclear, and it could be interpreted as requiring that units previously having restrictions be pulled into no-exemptions status. This is an appropriate course of action where possible, and increasing fossil unit output 10% is likely to require replacing the L0 blades, in which case achieving Att. 1 compliance shouldn’t be a problem for the less-demanding interconnections. These components might not pass muster in the West (no instantaneous tripping until 57.0 Hz), however, and some designs would definitely not qualify in Quebec (55.5 Hz). This could be even more of an issue for the very long L0 blades of nuclear units. Regarding gas turbines, firing temperature increases and compressor massflow uprates (e.g. zero-staging) can cause the 10% threshold to be reached without necessarily affecting original-unit frequency limits, particularly if dealing with a new model that was initially rated at substantially less than the expected capability

Associated Electric Cooperative, Inc. - JRO00088		AECI appreciates this SDT's demonstrated attention to industry feedback. Draft 5 PRC-024 R1 Bullet 3, COMMENT: AECI appreciates this "catch-all" being in there, and we hope it is worded to adequately cover any other technically justifiable

Organization	Yes or No	Question 5 Comment
		plant relay settings the SDT failed to mention, that intentionally operate within the industry's Attachment 1 No Trip zones. However we are concerned that R1's and Bullet #3's collective wording may specifically exclude any other protective relay settings outside of Bullet #1 and Bullet #2, including those specifically designed for other plant equipment limitations. (R2 Bullets #3 & #4 seem to provide better flexibility for what we failed to think of in this draft 5.) **Response: The SDT did add the additional qualifier in R1 Bullet 3 for "regulatory.....limitations" to remove any confusion that the allowance of tripping is not just limited to equipment limitations. Also, by NERC standard convention, a "bullet list" allows the entity to select which of the bulleted verbiage applies. Thus, the 3rd bullet would exclude the exceptions that are written in the first or second bullet.** Draft 5 PRC-024 page 14, Attachment 1, Curve Data Points:, Eastern Interconnection, COMMENT: It just seems that even without a fluctxuating frequency profile, the Eastern Interconnection's frequency-bounded curves, functionally-declared within that table's middle-row, can make a calculation for compliance with Requirements R1 & R4 a bit challenging. (Page 17's first bullet#3, providing clarity around evaluating step-wise voltage excursions, provided some insight into what is currently drafted for Requirements R1 and R4 in conjunction with Attachment 1, where these continuous Eastern Interconnection curves are in play, and actual plant performance studies and results are analyzed.) While we expect to evaluate plant performance only around our known discrete plant relay settings, we are a bit concerned for the way this Standard's non-discrete duration-functions might be leveraged against the industry when actual events occur. **Response: Since the Eastern Interconnection curve can be expressed by linear equations, which can be compared to the discrete plant relay settings, the SDT believes there isn't any risk of confusion of expected versus actual relay action during an event.** Draft 5 PRC-024 page 17, Attachment 2, Voltage Ride-Through Curve Clarifications,

Organization	Yes or No	Question 5 Comment
		Curve Details:, Bullet3:, REPLACE: "voltage exceeds", WITH: "voltage first exceeds", RATIONALE: Further clarity as to why duration is only 0.1 seconds in this example. **Response: The SDT has incorporated your suggestions** Draft 5 PRC-024 page 17, Attachment 2, Voltage Ride-through Curve Clarifications, Curve Details:, Bullet4:, REPLACE: "proportion to deviations of frequency below normal ", WITH: "proportion to below-normal deviations within the provided frequency profile", RATIONALE: Clarity that adjustment is made for study-related frequency profiles provided in conjunction with a request, and not for immediately experienced voltage deviations as they occur. **Response: In response to your and other industry comments, the SDT has modified the verbiage in Item 4 to reflect that a) this adjustment is associated with the determination of appropriate volts per hertz protection settings and b) by use of the qualifier "may", that this is a suggestion and not a requirement.** Draft 5 PRC-024 page 17, Attachment 2, Voltage Ride-Through Curve Clarifications, Evaluating Protective Relay Settings:, Bullet 1.c. REPLACE: "terminals).", WITH: "terminals.", RATIONALE: Balanced parentheticals **Response: The SDT has corrected the typo.**
Response: The GVSDT thanks you for your comment. Please see responses above.		
Tacoma Power		Applicability should only be to those units meeting NERC registration criteria. **Response: While the Applicability of Generator Owners conveys that units meeting the NERC registration criteria, and thus the BES, only are subject to the standard, for additional clarity, the SDT has inserted additional explicit language. Specifically, as appropriate, the use of the word "unit(s)" in the requirements was modified to read "applicable unit(s)"** Per Footnote 4, the "point of interconnection means the transmission (high voltage) side of the generator step-up or collector transformer." As the SDT is probably

Organization	Yes or No	Question 5 Comment
		aware, many generator protective relays measure voltage on the generation (low voltage) side of the transformer. It seems that guidance may be needed to reconcile generation (low voltage) side measurements with a standard whose requirements are based upon transmission (high voltage) side voltage. **Response: The SDT recognizes that the voltage ride through curve will have to be reflected through the transformer in order to determine the resulting voltage ride through curve that will be "seen" by the associated relays that are connected to instrument transformers on the generator side. Please reference Attachment 2 (Evaluating Protective Relay Settings section) for additional guidance regarding the assumptions that are expected to be made.** In R2, the phrase "less stringent" may not be clear enough language. For example, could "less stringent" mean 96-104%, rather than 95-105%, which is our assumption? Or, could it mean 94-106%? **Response: The SDT believes that the entire phrase clearly conveys the intent (less stringent voltage relay settings than those required to meet PRC-024 Attachment 2). It is meant to include the time period of the first 4 seconds.** Why are auxiliary systems mentioned in R4 but not in R1, R2, and R5? **Response: The SDT has removed R4. As such, auxiliary systems are no longer mentioned in any of the remaining requirements.** In R5, remove parentheses around "that models the associated unit." The parentheses seem to be inconsistent with similar text in R4. **Response: The SDT implemented your suggestion.** In M2, move 'evidence' to before "that generator voltage..." **Response: The SDT implemented your suggestion.** Attachment 2, Curve Detail 3, may need some better clarification. **Response: The SDT did slightly refine the language for clarity by inserting the word**

Organization	Yes or No	Question 5 Comment
		"first" into the second line (reference response to Associated Electric Cooperative, Inc for Question 5) Regarding Attachment 2, Curve Detail 4, does that mean a GO must base relay settings on the lowest expected frequency deviation? What is an example of how and when Detail 4 should be applied? **Response: The SDT modified the language to reference that an adjustment of the magnitude of the high voltage curve in proportion to deviations of frequency below normal should optionally occur when evaluating volts per hertz settings.** Regarding Attachment 2, Curve Detail 5, by stating "RMS or crest", does this mean that a GO must consider harmonics? Most simulations only consider the fundamental frequency component. In these cases, the per unit crest and RMS voltage should be identical. Clarification is requested. Examples are needed to support the application of Attachment 2, Evaluating Protective Relay Settings. **Response: In that the high-voltage curve establishes the minimum voltage at which a unit may be tripped by its protection, the original wording allowed consideration of the maximum of crest and RMS voltage. Having this provision makes the standard less limiting. There was no requirement for a GO to consider non-fundamental frequency voltages, there was permission to use peak-sensing or RMS-sensing protections (whether implemented via protective relays or via protections as part of controls). The information in Curve Detail 5 poses no burden on the GO, but rather allows a GO to provide better or more effective protection of certain types of equipment, if they choose to do so. To help provide clarity regarding the application of Attachment 2, the SDT revised the chart to provide ride-through durations at the associated voltage points.** R1, R2, and the diagram in Attachment 2 appear to be fairly straightforward. However, the Voltage Ride-Through Curve Clarifications page (last page) seems to confuse, not clarify. This last page seems to undermine the apparent simplicity of the rest of the standard with respect to voltage protective relay settings.

Organization	Yes or No	Question 5 Comment
		Response: The SDT has made a number of refinements to the Voltage Ride-Through Curve clarification page such as a) modified the language to convey in the Curve Detail section Item 4 that an adjustment of the magnitude of the high voltage curve in proportion to deviations of frequency below normal should optionally occur when evaluating volts per hertz settings, and b) modifying the Evaluating Protective Relay Settings section to allowing the responsible entity the ability to assume the most probable loading conditioning, and clarifying that the AVR should be assumed to be in service. In Attachment 2, the Curve Data Points table needs to be updated to reflect the Voltage Ride-Through Time Duration Curve. Tacoma Power appreciates the opportunity to provide comments, and thanks you for consideration of our comments. **Response: The SDT has corrected the Table to reflect that it is applicable up to 4 seconds.**
Response: The GVSDT thanks you for your comment.		
Arizona Public Service Company		APS agreed with the draft Standard however, we voted no because of the Violation Severity Levels (VSL) associated with this Standard. Only 10 days spacing between various levels of the VSL is inappropriate and not justified. A 30 days delay in providing the requested information does not represent a significant reliability risk. In addition, other draft Standards, for example Project 2007-09 MOD and PRC-019, provides a 30 to 90 days separation between various levels of the VSL. In our opinion each VSL severity level should be at least 30 days apart.
Response: The GVSDT thanks you for your comment. The GVSDT agrees and has made the suggested revision to the VSLs.		
Bonneville Power Administration		BPA believes that the standard should combine bullet 3 into bullet 2 in R3.1 (and modify bullet 3 to notify when equipment has been replaced for whatever reason) o Identification of an equipment limitation. o Repair or replacement of the

Organization	Yes or No	Question 5 Comment
		equipment causing the limitation that removes the limitation. o Replacement of the equipment causing the limitation. (modification)
Response: The GVSDT thanks you for your comment. The SDT developed the bullet items during the last posting based on stakeholder comments. The GVST believes that we have achieved stakeholder consensus on this language.		
CenterPoint Energy		CenterPoint Energy does not agree that a Planning Coordinator or a Transmission Planner should be required to provide a voltage or frequency profile at the point of interconnection that is determined by dynamic simulation and, instead, recommends that the voltage or frequency profiles in Attachment 1 and Attachment 2 be referenced. Different types of simulated events will produce different voltage and frequency excursions. Also, even the same type of event will produce different voltage and frequency excursion "profiles" as the system changes over time. Therefore, the voltage or frequency profiles in Attachment 1 and Attachment 2 should be used.
Response: The GVSDT thanks you for your comment. The wording in Requirement R2 gives the Planning Coordinator or Transmission Planner the option to provide a site-specific voltage profile, but does not require that it be done. Requirement R4 contained wording that required the PC or TP to provide a profile to the Generator Owner before asking for an estimate of ride-through time, but Requirement R4 has been removed from the standard.		
Cleco		Cleco is concerned the approach is too prescriptive given the numerous variables associated with generator performance and protection. We recommend the elimination of requirements R1 and R2 in their entirety. **The SDT disagrees with this suggestion. These two requirements form the backbone of this standard. The UFLS standard (PRC-006-1), in particular, refers to PRC-024-1 for information and proper setting of generator frequency protection.** We further recommend requirement R3 be modified so that the generator owner is required to develop a unit capability curve for frequency and voltage based on equipment limitations and protection requirements and provide this information to

Organization	Yes or No	Question 5 Comment
		the appropriate users. This approach emphasizes equipment preservation and safety while retaining predictability of unit performance for system modeling. We would also like an example for how to evaluate Volts/Hertz protection for the proposed voltage curve. **The SDT disagrees that drafting multiple sets of unit capability curves for different frequencies and voltages would be of value. The capability curves are meant for steady state operation, not the transient conditions considered in this standard.**
Response: The GVSDT thanks you for your comment. Please see responses above.		
Kansas City Power & Light		Comment 1;Generator protective relays are connected to the potential transformers on the generator side of the GSU transformer. The interconnection point is defined by the standard on the transmission side of the GSU. The voltage and frequency charts in the attachments are requirements at the interconnection point. Therefore the standard prevents the use of existing generator protective relays for voltage or frequency protection. The standard and attachment charts should be redrafted to represent the interconnect point on the generator side of the GSU so existing multifunction relays can be used for voltage and frequency protection. **The SDT disagrees that the standard prevents the use of existing generator protective relays, but it would require the evaluation of the voltages at the generator terminals that result from the described transmission system voltage excursions based on the specific transformer tap, transformer impedance, and generator reactance. Because of these variables, the SDT does not believe the voltage excursion curves can be described for all generators at the generator terminal level.** Comment 2; Requirement 5 states “Generator Owner shall provide its generator protection trip settings to the Planning Coordinator, etc”. In the context of this standard I would assume that generator protection trip settings would be those settings relative to voltage or frequency protection and for example would not

Organization	Yes or No	Question 5 Comment
		include back up distance settings. The standard should be modified to clarify which generator protective relay settings are required for compliance. **The SDT agrees. The words "… associated with Requirements R1 and R2…" have been added to clarify the scope of the requirement.**
Response: The GVSDT thanks you for your comment. Please see responses above.		
Consumers Energy Company		Consumers Energy is resubmitting our original comments as we feel they still pertain. "Related to undervoltage criteria, the 18 cycle at 45% of generator voltage would put a great deal of strain on the plant auxiliary systems and that may not be something these systems are able to withstand. The same would be true of a fault that produces 65% voltage at the generator terminals for 2 seconds. These comments relate specifically to Consumers Energy. However, it is likely that many others have similar equipment and would have the same issues. Please also note that the proposed standard does not align with ANSI C37.102, IEEE Guide for AC Generator Protection or with the NERC Technical Reference Document entitled Power Plant and Transmission System Protection Coordination." Previous SDT reply - Thank you for your comments. Please note that the voltage levels specified in Attachment 2 are at the point of interconnection to the transmission system. They would not correlate directly with the auxiliary bus voltages, especially if the auxiliaries are unit-connected. The SDT does not believe this proposed standard is in conflict with either the IEEE or the NERC documents cited. Please inform the SDT of the specifics of your concerns." We believe our comments still apply. Specific to the fault that produces 65% voltage at the generator terminals for 2 seconds, plant auxiliary equipment would not be able to withstand such a drop for the specified duration and would fall offline.SDT Reply - The SDT thanks you for your comments. The SDT does not believe this proposed standard is in conflict with either the IEEE or the NERC documents cited. The SDT believes that the wording of R4, "The Generator Owner may develop the estimates based on experience, actual event histories, or sound engineering judgment," will allow the GO to provide an estimate. However, if the GO feels his equipment is not

Organization	Yes or No	Question 5 Comment
		capable of meeting the undervoltage criteria of Attachment 2, then R3 would apply. Also, note that Attachment 2 has been modified for the next draft and now only extends to 4 seconds.
Response: The GVSDT thanks you for your comment. The GVSDT points out that the voltage shown in attachment 2 is at the Point of Interconnection and not at the generator terminals. This is shown in the axis label on the right side of the curve.		
Exelon Corporation and its affiliates		Exelons negative vote is based on the following: Exelon reiterates that nuclear generating units must comply with a rigorous process of evaluation to meet requirements of the Nuclear Regulatory Commission (NRC). The response by the SDT in the Consideration of Comments dated 12/7/12 that "the SDT does not believe extensive studies or dynamic simulations are required to comply with this requirement" does not address the fact that NRC licensed nuclear generating units must also comply with the requirements of the NRC. Exelon again does not agree that 60 calendar days is a reasonable amount of time to perform any such analysis.
Response: The GVSDT thanks you for your comment. The words "regulatory and" have been added in several locations throughout the standard to emphasize the exemptions from the requirements specified in R1 and R2 are allowed for both regulatory limitations and technical equipment limitations. Please review these modifications to R1, R2, and R3. Also, the GVSDT has removed the requirement to provide an estimate of the time duration a unit is expected to remain connected during a voltage or frequency excursion.		
Idaho Power Company		Idaho Power's Power Supply group feels that Requirements 1 through 4 accomplish the purpose of PRC-024 and that Requirement 5 is not necessary and in fact creates an on-going obligation for the generation owner to continually provide relay settings to the Transmission Planner within 60 days of any change to those settings regardless of the relay setting changes impact on reliability and even if the changed settings remain in compliance with R1 and R2 of the standard. However, Idaho Power's System Planning group feels that Requirement 4 is not a sufficient mechanism to collect the desired data and removal of R5 will limit the Planning Authority's ability to request relay modeling data from both Idaho Power and non-Idaho Power Generator

Organization	Yes or No	Question 5 Comment
		Owners. **R4 has been deleted from the draft standard. The relay setting communication requirement (R5, draft 5) is now R4 (draft 6). The scope of relays whose settings may be requested has been clarified in the new R4. The GVSDT does not think that reporting relay setting changes within 60 days of a change is a burden. The TP and PC need to be made aware of the changes as soon as practical.** R5 will make it a compliance obligation for GOs, to provide the required data when requested by a PA/PC or TP in a timely manner, or following a change in relay settings on a generator for which said data had previously been requested. Idaho Power notes the Measure 2 should read: Each Generator Owner shall have evidence that generator voltage protective relays have been set in accordance with Requirement R2 such as dated setting sheets, voltage-time curves, calibration sheets, coordination plots or dynamic simulation studies."Idaho Power comments that reference to the Planning Coordinator entity throughout the PRC-024 standard should be replaced with the term Planning Authority to be consistent with the NERC Glossary of Terms. **Please see version 5 of the NERC Functional Model and the current NERC Glossary of terms, both of which identify the PC as the correct term. The term Authority is being transitioned to Coordinator.**
Response: The GVSDT thanks you for your comment. Please see responses above.		
IRC Standards Review Committee		In order for the industry to support the proposed change to the high frequency trip curve in Attachment 1, we propose that the SDT provide the technical justification and an assessment of the system impacts as a result of the proposed change so operators are aware of and manage the resultant system response. We believe the standards should be based upon actual technical data rather than conditions represented in the IEEE and IEC standards.
Response: The GVSDT thanks you for your comment. Since virtually all generators in North America are built to IEEE C50.13 and/or IEC 60034, the GVSDT believes that, absent the change in the high frequency curve, Generator Owners who decide to set		

Organization	Yes or No	Question 5 Comment
overfrequency protection would claim the exemption allowed under Requirement R3 to set the protection to meet the IEEE or IEC standard. The GVSDT further believes that the NERC reliability standards should respect existing industry technical standards.		
MRO NSRF		In R3, the NSRF recommends that 30 day requirement be replaced with "in a timely manner not to exceed 90 days". This is predicated on the low VRF and low risk of impacting the BES. While some deadlines are necessary in NERC standards, large frequency and voltage excursions are rare and there would be little to no reliability difference if R3 changes were communicated in a time frame longer than 30 days. **The SDT believes that once it has been determined that an additional notification from the GO to the PC and TP is necessary, the 30 days allowed for notification is not burdensome.** In R3, the fourth bullet, delete (cumulative from the first effective date of this standard). This creates an unnecessary compliance tracking burden. Entities must forever memorialize all equipment capability from the effective date of the proposed standard such as 2014. There is no reason to track all possible equipment changes in 2044 back to 2014 to show that a 10% upgrade has not occurred is pieces throughout the years. Transmission and generation upgrades are usually lumped and somewhat large as it is usually cost prohibitive to increase generator capability. The reliability benefit is to recognize when a large change in the limitation occurred, not to track a cumulative 10%. Is the SDT referring to only the limiting element that needs to be tracked? **This bullet has been deleted from the draft standard.**
Response: The GVSDT thanks you for your comment. Please see responses above.		
Avista		Most frequency relays have voltage supervision. There is no voltage supervision requirement for frequency relays specified in the standard. For the voltage relay settings the ride through is given as 9 cycles at 0 volts. Where did the 9 cycles come from?

Organization	Yes or No	Question 5 Comment
Response: The GVSDT thanks you for your comment. The frequency and voltage protection are considered to be different functions so the voltage ride through and frequency ride through are not expected to happen at the same time. It is not the intent of the SDT or this standard to specify the relay design, merely the coordination of the protection settings with the standard or equipment or equipment limitations, whichever is more restrictive. The nine cycle time came from the WECC studies performed relating to the voltage ride through characteristics and FERC Order 661A (Appendix G).		
ReliabilityFirst		ReliabilityFirst votes in the affirmative for this standard because the standard further enhances reliability by ensuring that generating units remain connected during frequency excursions. Even though ReliabilityFirst votes in the affirmative, we offer the following comment for consideration: 1. Requirement R3 Part 3.1 a. To be consistent with the changes made to Requirement R4 and new R5 (removal of Reliability Coordinator and Transmission Operator), ReliabilityFirst recommends removing references to the Reliability Coordinator and Transmission Operator from Requirement R3 Part 3.1 as well. Requirement R3 is long-term planning requirement and communication of the documented equipment limitations to these entities should not be required.
Response: The GVSDT thanks you for your comment. The SDT agrees and has removed the Reliability Coordinator and Transmission Operator from Requirement R3 and the associated VSLs as well as the Purpose Statement.		
seattle city light		Seattle CIty Light, from a GO perspective, will vote NO, because it is unclear the type of data the TP is to provide the GO. Until the TPs agree to and approve acceptable simulations and dynamic models, it is difficult for us to approve this standard.
Response: The GVSDT thanks you for your comment. The SDT has decided to remove Requirement R4 from the standard so any reference in Requirement R4 to the frequency and voltage profiles which were to be provided by the Planning Coordinator or Transmission Planner is no longer valid. Requirement R2 allows the Transmission Planner to provide a less stringent voltage profile than that in Attachment 2 if they feel it is more appropriate.		
Xcel Energy		Suggest improving consistency between R1 and R2 verbiage by addressing the

Organization	Yes or No	Question 5 Comment
		following editorial comments: (a) Not sure why the qualifying phrase "... as a result of voltage excursion (at the point of interconnection)..." is used in R2 but no corresponding qualification is used in R1? If this specificity for voltage excursion is needed in R2, then shouldn't it also be needed for frequency excursions in R1? **A voltage excursion would be location specific and is referenced to the point of interconnection as opposed to the generator terminals where the measurement would be significantly different A frequency excursion is different and may be measured the very nearly the same no matter where it is viewed in the interconnection. For the GO, there would be no difference measuring the frequency either at the generator terminals or at the point of interconnection. For these reasons the qualifying phrase was necessary for Requirement R2.** (b) Re-order the bulleted exceptions under R1 and R2 such that they appear in the same sequence in both requirements - this will make it easier for the uninitiated reader to observe that R1 and R2 share 3 common exceptions and R2 has one additional exception. **The SDT feels that changing the order will add little to the readability, even for the uninitiated and therefore prefer not to change the order and confuse those already initiated.** (c) Readability and comprehension of R2 will be significantly enhanced if it is simplified by splitting it into 2 or more shorter sentences. Its existing structure - a very long, compound sentence of more than 100 words - is not conducive to easy comprehension and is prone to ambiguities in interpretation, leading to compliance confusion. **The SDT agrees and has revised Requirement R2 into multiple sentences for enhanced readability. Requirement R2 now reads in part:** **"Each Generator Owner that has generator voltage protective relaying activated to trip its generating unit(s) shall set its protective relaying such that the voltage**

Organization	Yes or No	Question 5 Comment
		protective relaying does not trip as a result of a voltage excursion (at the point of interconnection) caused by an event on the transmission system external to the generating plant that remains within the "no trip zone" of PRC-024 Attachment 2. If the Transmission Planner allows less stringent voltage relay settings than those required to meet PRC-024 Attachment 2, then the generator owner shall set its protective relaying within the voltage recovery characteristics of a location-specific Transmission Planner's study. Requirement R2 is subject to the following exceptions: ……" (d) R1 states "Each GO.... shall set <such> protective relaying <so> that the.... does not <operate to> trip" whereas R2 states "Each GO..... shall set <its> protective relaying <such> that the.... does not trip". It is hard to detect any good reason for the choice of words <such> and <so> in R1 versus <its> and <such> in R2, or for choosing to say <operate to> trip in R1 versus omitting that phrase in R2. Suggest identical lead-in sentences unless there is a good reason for the variations. **The SDT agrees and has modified the wording in Requirement R1 to match that in Requirement R2 as suggested.**
Response: The GVSDT thanks you for your comment. Please see responses above.		
Oncor Electric Delivery Company LLC		The 60 calendar day requirement in Requirement 5 for a Generator Owner to respond to a written request from its Transmission Planner or Planning Coordinator for generator protection trip settings, is too long. Because of the critical nature of this information, prolonging assessing system coordination can result in an unnecessary risk to the reliability of the Bulk Electric System. Oncor requests that this time requirement be shortened to 30 days.
Response: The GVSDT thanks you for your comment. The SDT considers this standard to be on a unit basis and that 60 days should be adequate for any single unit.		

Organization	Yes or No	Question 5 Comment
Wolverine Power Supply Cooperative, Inc.		The applicability should be restricted to BES generating units, not all units.
Response: The GVSDT thanks you for your comment. While the Applicability of Generator Owners conveys that units meeting the NERC registration criteria, and thus the BES, only are subject to the standard, for additional clarity, the SDT has inserted additional explicit language. Specifically, as appropriate, the use of the word "unit(s)" in the requirements was modified to read "applicable unit(s)"		
Ameren		The SDT has addressed all of our comments by changing several items that improve the standard, and especially important to us was removing R5 & M5. However, the SDT did not alter the VSL from the 10 day escalation for R3 through R5, and used the NERC guidance as their reason. NERC guidance also allows for a population based severity escalation, which we believe is more appropriate for characterizing the severity in situations such as this, and so we recommend using this approach. We suggest allowing up to 5% for Low, 5 to 10% for Moderate, 10 to 15% for High, and greater than 15% for Severe. For example, change the R4 Lower VSL to "The Generator Owner provided an estimate for less than 100% but more than 95% of its units' performance within 60 calendar days of a written request" and change R4 Moderate VSL to "The Generator Owner provided an estimate for 95% or less, but more than 90% of its units' performance within 60 calendar days of a written request."
Response: The GVSDT thanks you for your comment. As a result of other stakeholder comments the SDT has removed Requirement R4. The SDT views this standard on a unit basis and not a fleet basis so the percentage basis would be inappropriate. The SDT however did modify the VSL's for Requirements R3 and R5 (now R4) to match the 30 day escalation in some of the other generator verification standards of Project 2007-09.		
Appelbaum		The VRF for R1 and R2 should be High not Medium. The Drafting team in the VRF justification document states [Start quote] This requirement is similar in concept with both PRC-012-0 Requirement R1 and PRC-023-1 Requirement R1, both of which require protection coordination or settings. These requirements apply to multiple

Organization	Yes or No	Question 5 Comment
		elements while the requirements of PRC-024-1 apply to a single unit. Violation of this requirement by a single generator could not be construed as directly causing or contributing to BES instability, separation or cascading within any time frame. For a single violation to lead to BES instability, separation or cascading would require other standards requirements to be violated.[End Quote] I disagree with the assertion. PRC-023 is violated if one relay is incorrectly set regardless of the number of elements it is protecting. The same applies to PRC-024, a failure to set one relay will effect one generator. Also for PRC-023 a single violation would not lead to BES cascade but that reasoning did not prevent a VRF of High to be established for PRC-023. Applying consistent reasoning to PRC-024 would mean that the single generator argument to reduce the VRF to medium would not apply.
Response: The GVSDT thanks you for your comment. The justification for the VRF must include all of the reasoning and guidelines referenced in the justification document. The VRF's were previously changed from high to low based on the following comment from a previous posting, "We do not believe the VRFs for Requirements R1, R2 and R5 warrant High VRFs. The BES is already operated within each BA and TOP for the loss of a single unit. Tripping of a generator due to a frequency or voltage excursion is an uncommon event that is already planned for. It is highly unlikely that tripping of such a generator or even several generators will lead to instability, system separation or cascading which is required for the VRF to be High. Furthermore, by setting the VRF to High, this increases the potential that every single unit outage could become subject to a Compliance Violation Investigation which is simply not necessary." This comment was accepted by the SDT and since yours was the first and only objection; the SDT believes industry consensus has been achieved.		
American Electric Power		We agree with the overall approach taken, however we are concerned that the standard repeatedly references "protective relaying" while Footnote 1 clarifies that protective relaying could be discrete relays as well as protective functions within control systems. The term "protective relay" is widely accepted amongst engineers as meaning a discrete relay. AEP recommends the SDT utilize the term "protective functions" throughout the standard to clearly identify that the scope of the standard extends beyond discrete relays.AEP recommends that the time allowed to meet R 3.1 be extended to 60 calendar days, aligning it with R4 and R5.

Organization	Yes or No	Question 5 Comment
		The SDT has included the clarification in Footnote 1 to point out that the use of protective relaying as intended in this standard includes those functions that might not normally be recognized as "protective relaying". The SDT purposely did not use the term "protective functions" throughout so as not create confusion over other protective functions found in control systems such as overspeed trips that might be found in turbine controls. AEP recommends R4 and R5 be revised to read "within 60 calendar days or an agreed upon schedule". The data sought by the PC or Transmission Planner might be quite large for some utilities. In this case, it would be advantageous to allow the GO to work with the requesting party to develop a timeline that meets the needs of the requesting party without being overly burdensome to the GO. We believe the intent of the SDT in requiring the GO to provide updates on any previously requested trip settings in R5 was to ensure that the PC and TP are notified of any changes to the R1 and R2 applicable trips. If this is accurate, we suggest revising R5 to require the GO to update the PC and TP within 60 days of installation of new trips or changes to existing trips to which R1 and R2 applies, not solely those trip settings previously requested by the PC and TP. Doing so removes the obligation of the GO to track which trip settings were part of a previous request. This change will also eliminate the possibility of the TP or PC not being made aware of a newly installed applicable trip within a timely fashion. **The SDT has decided to eliminate R4 from the standard, which is perceived to be your primary concern, due to other stakeholder comments. The Requirement in R5 to submit settings that should already be on file within 60 days is not considered by the SDT to be burdensome.** Should the 10 percent generator nameplate capacity increase stipulation in the last (fourth) bullet point under R3.1 be removed? We do not see that the stipulation is relevant to the question of what limitation is causing a given generating unit to not satisfy R1 or R2 criteria. Perhaps the point should read as follows: "Modification or upgrade of the equipment causing the limitation that removes or changes the

Organization	Yes or No	Question 5 Comment
		limitation.” **The SDT agrees and has removed the referenced bullet from Requirement R 3.1.** With reference to R4, would it make sense for the TP or PC to specify Attachments 1 and 2 as the profiles for the purpose of collecting time duration estimates, or should the term “profile” instead be “trajectory”? From the viewpoint of the TP or PC, receiving duration estimates with respect to the Attachments would be advantageous, particularly when coordinating generator off-nominal frequency tripping with UFLS. However, a single duration estimate seems more compatible with a frequency or voltage trajectory. Which is the SDT’s intent? **As a result of stakeholder comments the SDT has decided to eliminate Requirement R4 from the standard.**
Response: The GVSDT thanks you for your comment. Please see responses above.		
Ingleside Cogeneration LP		While we were pleased to see the removal of R5 from PRC-024, there is still some question as to the basic necessity for this standard, PRC-001, now PRC-027, requires extensive coordination of protection system relay setting between GOs and TOs. Interconnection agreements also require following voltage schedules, etc. This is a case of over regulation and potential conflicts between standards, something Paragraph 81 initiative is supposed to oppose. Also, there is no explicit FERC directive that requires this standard.
Response: The GVSDT thanks you for your comment. As stated in the purpose, this standard is intended to “Ensure Generator Owners set their generator protective relays such that generating units remain connected during defined frequency and voltage excursions.” and is not for the coordination of protection settings among entities (PRC-001.1). There is no approved PRC-027but even its draft is primarily related to coordination of interconnected elements. Industry determined in the SAR, as a result of the Phase III and IV testing that the standard was needed. Standards are not usually directed by FERC but determined by SAR’s.		
Liberty Electric Power LLC		Yes. First, the standard as presented is greatly improved from the prior version. The hard work of the SDT is apparent. However, there still are a few issues which should

Organization	Yes or No	Question 5 Comment
		be resolved with the standard. First, the 10% trigger for removing exemptions is too low. GE markets products for their gas turbines which can raise output more than 10% through software changes. This could place a turbine into no exemptions space while it still contained blades subject to failure at frequencies within the no trip zone. The 10% threshold should be raised or the standard reworded to note that software changes do not trigger the requirement. **The SDT agrees and, with the elimination of R5 from the previous revision, has decided that the 10% trigger found in Requirement R 3.1 no longer applies. Therefore the bullet containing the 10% trigger has been eliminated from the standard.** Secondly, the phrase "manufacturers advisory" is too vague. One reasonable person may read the phrase as "a statement in the OEM materials which places limits on the frequencies the machine can tolerate", while another reasonable person would define it as "a specific bulletin or technical information letter which advises of a finding about the equipment". GE 7FA OEM documents, for example, state that the turbine is "very sensitive to abnormal frequencies" and that recommendations "should be carefully studied and followed". Would this document, coupled with an engineer determining an overfrequency relay setting of 60.5 with 60 cycle delay, be enough to allow that setting? Would something like this be subject to individual auditor determination? If the latter is true, the wording should be changed, as requirements should clearly guide the entity in making a determination of the allowable action. **We have revised the word "advisory" to "advice" to help clarify the issue and address your concern.** Finally, if a steam turbine which is driven by steam generated from gas turbine exhaust is required to trip within the no-trip zone due to equipment limitations, does this allow those gas turbines to trip within the no trip zone also, in order to prevent damage to the steam turbine condenser? Can their protective settings for overfrequency be set at the same point as the required steam turbine settings, or

Organization	Yes or No	Question 5 Comment
		would an entity have to add logic to their system to trip in response to the activation of the steam turbine overfrequency trip instead of their own overfrequency relay? **The standard in no way suggests that the unit should be operated in a manner which is detrimental to the equipment. An exemption would include any part of the unit (gas turbines in a combined cycle unit for this case) that should be tripped to protect the equipment if it is a documented limitation.**
Response: The GVSDT thanks you for your comment. Please see responses above.		

END OF REPORT

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. SAR posted for comment (April 20–May 21, 2007).
2. Revised SAR and response to comments posted (July 5, 2007).
3. Revised SAR and response to comments approved by SC (June 14, 2007).
4. SDT appointed on August 18, 2007.
5. Draft 1 MOD-026-1 was posted for a 45-day comment period from February 17 – April 2, 2009.
6. Draft 2 MOD-026-1 was posted for a 45-day concurrent comment and ballot period from June 15 – August 1, 2011.
7. Draft 3 of MOD-026-1 was posted for a 30-day concurrent comment and successive ballot period from February 29 – March 29, 2012.

Proposed Action Plan and Description of Current Draft:

This is the fourth draft of the standard and includes Time Horizons, Data Retention, Violation Risk Factors, and Violation Severity Levels. This fourth posting is for a 30-day comment and successive ballot period.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Develop responses to comments and develop fourth version of draft standard.	April– July 2012
2. Post response to comments and fourth version draft revision of standard for 30-day comment and successive ballot period.	October – November 2012
3. Develop responses to successive ballot comments.	December 2012 - January 2013
4. Post response to comments and conduct recirculation ballot.	February 2013
5. BOT adoption.	March 2012
6. File with regulatory authorities.	April 2013

A. Introduction

1. Title: Verification of Models and Data for Generator Excitation Control System or Plant Volt/Var Control Functions

2. Number: MOD-026-1

3. Purpose: To verify that the generator excitation control system or plant volt/var control function[1] model (including the power system stabilizer model and the impedance compensator model) and the model parameters used in dynamic simulations accurately represent the generator excitation control system or plant volt/var control function behavior when assessing Bulk Electric System (BES) reliability.

4. Applicability:

4.1. Functional Entities:

4.1.1 Generator Owner

4.1.2 Transmission Planner

4.2. Facilities:

For the purpose of the requirements contained herein, Facilities that are directly connected to the Bulk Electric System (BES) will be collectively referred as an "applicable unit" that meet the following:

4.2.1 Generation in the Eastern or Quebec Interconnections with the following characteristics:

4.2.1.1 Individual generating unit greater than 100 MVA (gross nameplate rating).

4.2.1.2 Individual generating plant consisting of multiple generating units that are directly connected at a common BES bus with total generation greater than 100 MVA (gross aggregate nameplate rating).

4.2.2 Generation in the Western Interconnection with the following characteristics:

4.2.2.1 Individual generating unit greater than 75 MVA (gross nameplate rating).

4.2.2.2 Individual generating plant consisting of multiple generating units that are directly connected at a common BES bus with total generation greater than 75 MVA (gross aggregate nameplate rating).

---

[1] Excitation control system or plant volt/var control function:

a. For individual synchronous machines, the generator excitation control system includes the generator, exciter, voltage regulator, impedance compensation and power system stabilizer.

b. For an aggregate generating plant, the volt/var control system includes the voltage regulator & reactive power control system controlling and coordinating plant voltage and associated reactive capable resources.

4.2.3 Generation in the ERCOT Interconnection with the following characteristics:

4.2.3.1 Individual generating unit greater than 50 MVA (gross nameplate rating).

4.2.3.2 Individual generating plant consisting of multiple generating units that are directly connected at a common BES bus with total generation greater than 75 MVA (gross aggregate nameplate rating).

4.2.4 For all Interconnections:

- A technically justified[2] unit that meets NERC registry criteria but is not otherwise included in the above Applicability sections 4.2.1, 4.2.2, or 4.2.3 and is requested by the Transmission Planner.

5. Effective Date:

5.1. For Requirements R1, and R3 through R6, the first day of the first calendar quarter beyond the date that this standard is approved by applicable regulatory authorities or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities. In those jurisdictions where regulatory approval is not required, the standard shall become effective on the first day of the first calendar quarter beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

5.2. For Requirement R2, 30 percent of the entity's applicable unit gross MVA for each Interconnection on the first day of the first calendar quarter that is four years following applicable regulatory approval or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, or in those jurisdictions where no regulatory approval is required, on the first day of the first calendar quarter that is four years following NERC Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

5.3. For Requirement R2, 50 percent of the entity's applicable unit gross MVA for each Interconnection on first day of the first calendar quarter that is six years following applicable regulatory approval or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, or in those jurisdictions where no regulatory approval is required, on the first day of the first calendar quarter that is six years following NERC Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

5.4. For Requirement R2, 100 percent of the entity's applicable unit gross MVA for each Interconnection on the first day of the first calendar quarter that is 10 years

[2] Technical justification is achieved by the Transmission Planner demonstrating that the simulated unit or plant response does not match the measured unit or plant response.

following applicable regulatory approval or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, or in those jurisdictions where no regulatory approval is required, on the first day of the first calendar quarter that is 10 years following NERC Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

B. Requirements

R1. Each Transmission Planner shall provide the following requested information to the Generator Owner within 90 calendar days of receiving a written request : *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

- Instructions on how to obtain the list of excitation control system or plant volt/var control function models that are acceptable to the Transmission Planner for use in dynamic simulation,
- Instructions on how to obtain the dynamic excitation control system or plant volt/var control function model library block diagrams and/or data sheets for models that are acceptable to the Transmission Planner, or
- Model data for any of the Generator Owner's existing applicable unit specific excitation control system or plant volt/var control function contained in the Transmission Planner's dynamic database from the current (in-use) models, including generator MVA base.

R2. Each Generator Owner shall provide for each applicable unit, a verified generator excitation control system or plant volt/var control function model, including documentation and data (as specified in Part 2.1) to its Transmission Planner in accordance with the periodicity specified in MOD-026 Attachment 1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

2.1. Each applicable unit's model shall be verified by the Generator Owner using one or more models acceptable to the Transmission Planner. Verification for individual units less than 20 MVA (gross nameplate rating) in a generating plant (per Section 4.2.1.2, 4.2.2.2, or 4.2.3.2) may be performed using either individual unit or aggregate unit model(s), or both. Each verification shall include the following:

2.1.1. Documentation demonstrating the applicable unit's model response matches the recorded response for a voltage excursion from either a staged test or a measured system disturbance,

2.1.2. Manufacturer, model number (if available), and type of the excitation control system including, but not limited to static, AC brushless, DC rotating, and/or the plant volt/var control function (if installed),

2.1.3. Model structure and data including, but not limited to reactance, time constants, saturation factors, total rotational inertia, or equivalent data for the generator,

2.1.4. Model structure and data for the excitation control system, including the closed loop voltage regulator if a closed loop voltage regulator is installed or the model structure and data for the plant volt/var control function system,

2.1.5. Compensation settings (such as droop, line drop, differential compensation), if used, and

2.1.6. Model structure and data for power system stabilizer, if so equipped.

R3. Each Generator Owner shall provide a written response to its Transmission Planner within 90 calendar days of receiving one of the following items for an applicable unit:

- Written notification from its Transmission Planner (in accordance with Requirement R6) that the excitation control system or plant volt/var control function model is not usable,
- Written comments from its Transmission Planner identifying technical concerns with the verification documentation related to the excitation control system or plant volt/var control function model, or
- Written comments and supporting evidence from its Transmission Planner indicating that the simulated excitation control system or plant volt/var control function model response did not match the recorded response to a transmission system event.

The written response shall contain either the technical basis for maintaining the current model, the model changes, or a plan to perform model verification[3] (in accordance with Requirement R2). *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

R4. Each Generator Owner shall provide revised model data or plans to perform model verification[4] (in accordance with Requirement R2) for an applicable unit to its Transmission Planner within 180 calendar days of making changes to the excitation control system or plant volt/var control function that alter the equipment response characteristic.[5] *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

---

[3] If verification is performed, the 10-year period as outlined in MOD-026 Attachment 1 is reset.

[4] Ibid

[5] Exciter, voltage regulator, plant volt/var or power system stabilizer control replacement including software alterations that alter excitation control system equipment response, plant digital control system addition or replacement, plant digital control system software alterations that alter excitation control system equipment response, plant volt/var function equipment addition or replacement (such as static var systems, capacitor banks, individual unit excitation systems, etc), a change in the voltage control mode (such as going from power factor control to automatic voltage control, etc), exciter, voltage regulator, impedance compensator, or power system stabilizer settings change. Automatic changes in settings that occur due to changes in operating mode do not apply to Requirement R4.

R5. Each Generator Owner shall provide a written response to its Transmission Planner, within 90 calendar days following receipt of a technically justified[6] unit request from the Transmission Planner to perform a model review of a unit or plant that includes one of the following: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

- Details of plans to verify the model (in accordance with Requirement R2), or
- Corrected model data including the source of revised model data such as discovery of manufacturer test values to replace generic model data or updating of data parameters based on an on-site review of the equipment.

R6. Each Transmission Planner shall provide a written response to the Generator Owner within 90 calendar days of receiving the verified excitation control system or plant volt/var control function model information in accordance with Requirement R2 that the model is usable (meets the criteria specified in Parts 6.1 through 6.3) or is not usable.

6.1. The excitation control system or plant volt/var control function model initializes to compute modeling data without error,

6.2. A no-disturbance simulation results in negligible transients, and

6.3. For an otherwise stable simulation, a disturbance simulation results in the excitation control and plant volt/var control function model exhibiting positive damping.

If the model is not usable, the Transmission Planner shall provide a technical description of why the model is not usable. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

C. Measures

M1. The Transmission Planner must have and provide the dated request for instructions or data, the transmitted instructions or data, and dated evidence of a written transmittal (e.g., electronic mail message, postal receipt, or confirmation of facsimile) as evidence that it provided the request within 90 calendar days in accordance with Requirement R1.

M2. The Generator Owner must have and provide dated evidence it verified each generator excitation control system or plant volt/var control function model according to Part 2.1 for each applicable unit and a dated transmittal (e.g., electronic mail message, postal receipt, or confirmation of facsimile) as evidence it provided the model, documentation, and data to its Transmission Planner, in accordance with Requirement R2.

M3. Evidence for Requirement R3 must include the Generator Owner's dated written response containing the information identified in Requirement R3 and dated evidence

[6] Technical justification is achieved by the Transmission Planner demonstrating that the simulated unit or plant response does not match the measured unit or plant response.

of transmittal (e.g., electronic mail message, postal receipt, or confirmation of facsimile) of the response.

M4. Evidence for Requirement R4 must include, for each of the Generator Owner's applicable units for which system changes specified in Requirement R4 were made, a dated revised model data or plans to perform a model verification and dated evidence (e.g., electronic mail message, postal receipt, or confirmation of facsimile) it provided the revised model and data or plans within 180 calendar days of making changes.

M5. Evidence for Requirement R5 must include the Generator Owner's dated written response containing the information identified in Requirement R5 and dated evidence (e.g., electronic mail message, postal receipt, or confirmation of facsimile) it provided a written response within 90 calendar days following receipt of a technically justified request.

M6. Evidence of Requirement R6 must include, for each model received, the dated response indicating the model was usable or not usable according to the criteria specified in Parts 6.1 through 6.3 and for a model that is not usable, a technical description; and dated evidence of transmittal (e.g., electronic mail message, postal receipt, or confirmation of facsimile) that the Generator Owner was notified within 90 calendar days of receipt of model information.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

The Regional Entity shall serve as the Compliance Enforcement Authority unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional entity approved by FERC or other applicable governmental authority shall serve as the CEA.

1.2. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Generator Owner and Transmission Planner shall each keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Transmission Planner shall retain the information/data request and provided response evidence of Requirements R1 and R6, Measures M1 and M6 for three calendar years from the date the document was provided.

- The Generator Owner shall retain the latest excitation control system or plant volt/var control function model verification evidence of Requirement R2, Measure M2.
- The Generator Owner shall retain the information/data request and provided response evidence of Requirements R3 through R5, and Measures M3 through M5 for three calendar years from the date the document was provided.

If a Generator Owner or Transmission Planner is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete or approved or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaints

1.4. Additional Compliance Information

None

2. Violation Severity Levels

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The Transmission Planner provided the instructions and data to the Generator Owner more than 90 calendar days but less than or equal to 120 calendar days of receiving a written request.	The Transmission Planner provided the instructions and data to the Generator Owner more than 120 calendar days but less than or equal to 150 calendar days of receiving a written request.	The Transmission Planner provided the instructions and data to the Generator Owner more than 150 calendar days but less than or equal to 180 calendar days of receiving a written request.	The Transmission Planner failed to provide the instructions and data to the Generator Owner within 180 calendar days of receiving a written request.
R2	The Generator Owner provided its verified model(s), including documentation and data to its Transmission Planner after the timeframe specified in MOD-026 Attachment 1 but less than or equal to 90 calendar days late; OR The Generator Owner provided the Transmission Planner verified models that omitted one of the six Parts identified in Requirement R2, Parts 2.1.1 through 2.1.6.	The Generator Owner provided its verified model(s), including documentation and data to its Transmission Planner more than 90 calendar days but less than or equal to 180 calendar days late as specified by the periodicity timeframe in MOD-026 Attachment 1. OR The Generator Owner provided the Transmission Planner verified models that omitted two of the six Parts identified in Requirement R2, Parts 2.1.1 through 2.1.6.	The Generator Owner provided its verified model(s), including documentation and data to its Transmission Planner more than 180 calendar days but less than or equal to 270 calendar days late as specified by the periodicity timeframe in MOD-026 Attachment 1. OR The Generator Owner provided the Transmission Planner verified models that omitted three of the six Parts identified in Requirement R2, Parts 2.1.1 through 2.1.6.	The Generator Owner provided its verified model(s), including documentation and data more than 270 calendar days late to its Transmission Planner in accordance with the periodicity specified in MOD-026 Attachment 1. OR The Generator Owner failed to use model(s) acceptable to the Transmission Planner as specified in Requirement R2, Part 2.1. OR The Generator Owner provided the Transmission Planner verified model(s) but omitted four or more of the six parts identified in Requirement R2, Subparts 2.1.1 through 2.1.6.

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL
R3	The Generator Owner provided a written response more than 90 calendar days but less than or equal to 120 calendar days of receiving written notice.	The Generator Owner provided a written response more than 120 calendar days but less than or equal to 150 calendar days of receiving written notice.	The Generator Owner provided a written response more than 150 calendar days but less than or equal to 180 calendar days of receiving written notice.	The Generator Owner failed to provide a written response within 180 calendar days of receiving written notice. OR The Generator Owner's written response failed to contain either the technical basis for maintaining the current model, or a list of future model changes, or a plan to perform another model verification.
R4	The Generator Owner provided revised model data or plans to perform model verification more than 180 calendar days but less than or equal to 210 calendar days of making changes to the excitation control system or plant volt/var control function that altered the equipment response characteristic.	The Generator Owner provided revised model data or plans to perform model verification more than 210 calendar days but less than or equal to 240 calendar days of making changes to the excitation control system or plant volt/var control function that altered the equipment response characteristic.	The Generator Owner provided revised model data or plans to perform model verification more than 240 calendar days but less than or equal to 270 calendar days of making changes to the excitation control system or plant volt/var control function that altered the equipment response characteristic.	The Generator Owner failed to provide revised model data or failed to provide plans to perform model verification within 270 calendar days of making changes to the excitation control system or plant volt/var control function that altered the equipment response characteristic.
R5	The Generator Owner provided a written response more than 90 calendar days but less than or equal to 120 calendar days to the Transmission Planner following receipt of a technically justified request to perform a model review of an applicable unit.	The Generator Owner provided a written response more than 120 calendar days but less than or equal to 150 calendar days to the Transmission Planner following receipt of a technically justified request to perform a model review of an applicable unit.	The Generator Owner provided a written response more than 150 calendar days but less than or equal to 180 calendar days to the Transmission Planner following receipt of a technically justified request to perform a model review of an applicable unit.	The Generator Owner failed to provide a written response to the Transmission Planner within 180 calendar days following receipt of a technically justified request to perform a model review of an applicable unit. OR The Generator Owner’s written response failed to include one of the sub bullets of Requirement R5

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL
R6	The Transmission Planner provided a written response to the Generator Owner indicating whether the model is usable or not usable; including a technical description if the model is not usable, more than 90 calendar days but less than or equal to 120 calendar days of receiving verified model information.	The Transmission Planner provided a written response to the Generator Owner indicating whether the model is usable or not usable; including a technical description if the model is not usable, more than 120 calendar days but less than or equal to 150 calendar days of receiving the verified model information. OR The Transmission Planner's written response omitted confirmation for one of the specified model criteria listed in Requirement R6, Parts 6.1 through 6.3.	The Transmission Planner provided a written response to the Generator Owner indicating whether the model is usable or not usable; including a technical description if the model is not usable, more than 150 calendar days but less than or equal to 180 calendar days of receiving the verified model information. OR The Transmission Planner's written response omitted confirmation for two of the specified model criteria listed in Requirement R6, Parts 6.1 through 6.3.	The Transmission Planner failed to provide a written response to the Generator Owner within 180 calendar days of receiving the verified model information. OR The Transmission Planner's written response omitted confirmation for all specified model criteria listed in Requirement R6, Parts 6.1 through 6.3.

MOD-026 Attachment 1 Excitation Control System or Plant Volt/Var Function Model Verification Periodicity		
Row Number	**Verification Condition**	**Required Action**
1	Establishing the initial verification date for an applicable unit. (Requirement R2)	Transmit the verified model, documentation and data to the Transmission Planner on or before the Effective Date. Row 4 applies when calculating generation fleet compliance during the 10-year implementation period. See Section A5 for Effective Dates.
2	Subsequent verification for an applicable unit. (Requirement R2)	Transmit the verified model, documentation and data to the Transmission Planner on or before the 10-year anniversary of the last transmittal (per Note 1).
3	Initial verification for a new applicable unit or for an existing applicable unit with new excitation control system or plant volt/var control function equipment installed. (Requirement R2)	Transmit the verified model, documentation and data to the Transmission Planner within 365 calendar days after the commissioning date.

MOD-026 Attachment 1

Excitation Control System or Plant Volt/Var Function Model Verification Periodicity

Row Number	Verification Condition	Required Action
4	Existing applicable unit that is equivalent to another unit(s) at the same physical location. AND Each applicable unit has the same MVA nameplate rating. AND The nameplate rating is ≤ 350 MVA. AND Each applicable unit has the same components and settings. AND The model for one of these equivalent applicable units has been verified. (Requirement R2)	Document circumstance with a written statement and include with the verified model, documentation and data provided to the Transmission Planner for the verified equivalent unit. Verify a different equivalent unit during each 10-year verification period. Applies to Row 1 when calculating generation fleet compliance during the 10-year implementation period.
5	The Generator Owner has submitted a verification plan. (Requirement R3, R4 or R5)	Transmit the verified model, documentation and data to the Transmission Planner within 365 calendar days after the submittal of the verification plan.

MOD-026 Attachment 1 Excitation Control System or Plant Volt/Var Function Model Verification Periodicity		
Row Number	**Verification Condition**	**Required Action**
6	New or existing applicable unit does not include an active closed loop voltage or reactive power control function. (Requirement R2)	Requirement 2 is met with a written statement to that effect transmitted to the Transmission Planner. Perform verification per the periodicity specified in Row 3 for a “New Generating Unit” (or new equipment) only if active closed loop function is established. See Footnote 1 (see Section A.3) for clarification of what constitutes an active closed loop function for both conventional synchronous machines (reference Footnote 1a) and aggregate generating plants (reference Footnote 1b).
7	Existing applicable unit has a current average net capacity factor over the most recent three calendar years, beginning on January 1 and ending on December 31 of 5% or less. (Requirement R2)	Requirement 2 is met with a written statement to that effect transmitted to the Transmission Planner. At the end of this 10-year timeframe, the current average three year net capacity factor (for years 8, 9, and 10) can be examined to determine if the capacity factor exemption can be declared for the next 10-year period. If not eligible for the capacity factor exemption, then model verification must be completed within 365 calendar days of the date the capacity factor exemption expired. For the definition of net capacity factor, refer to Appendix F of the GADS Data Reporting Instructions on the NERC website.

MOD-026 Attachment 1 Excitation Control System or Plant Volt/Var Function Model Verification Periodicity		
Row Number	**Verification Condition**	**Required Action**

NOTES:

NOTE 1: Establishing the recurring 10-year unit verification period start date:

The start date is the actual date of submittal of a verified model to the Transmission Planner for the most recently performed unit verification.

NOTE 2: Consideration for early compliance:

Existing generator excitation control system or plant volt/var control function model verification is sufficient for demonstrating compliance for a 10-year period from the actual transmittal date if either of the following applies:

- The Generator Owner has a verified model that is compliant with the applicable regional policies, guidelines or criteria existing at the time of model verification.
- The Generator Owner has an existing verified model that is compliant with the requirements of this standard.

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. SAR posted for comment (April 20–May 21, 2007).
2. Revised SAR and response to comments posted (July 5, 2007).
3. Revised SAR and response to comments approved by SC (June 14, 2007).
4. SDT appointed on August 18, 2007.
5. Draft 1 MOD-026-1 was posted for a 45-day comment period from February 17 – April 2, 2009.
6. Draft 2 MOD-026-1 was posted for a 45-day concurrent comment and ballot period from June 15 – August 1, 2011.
7. Draft 3 of MOD-026-1 was posted for a 30-day concurrent comment and successive ballot period from February 29 – March 29, 2012.

Proposed Action Plan and Description of Current Draft:

This is the fourth draft of the standard and includes Time Horizons, Data Retention, Violation Risk Factors, and Violation Severity Levels. This fourth posting is for a 30-day comment and successive ballot period.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Develop responses to comments and develop fourth version of draft standard.	April– July 2012
2. Post response to comments and fourth version draft revision of standard for 30-day comment and successive ballot period.	October – November 2012
3. Develop responses to successive ballot comments.	December 2012 - January 2013
4. Post response to comments and conduct recirculation ballot.	February 2013
5. BOT adoption.	March 2012
6~~7~~. File with regulatory authorities.	April 2013

A. Introduction

1. **Title:** Verification of Models and Data for Generator Excitation Control System or Plant Volt/Var Control Functions

2. **Number:** MOD-026-1

3. **Purpose:** To verify that the generator excitation control system or plant volt/var control function[1] model (including the power system stabilizer model and the impedance compensator model) and the model parameters used in dynamic simulations accurately represent the generator excitation control system or plant volt/var control function behavior when assessing Bulk Electric System (BES) reliability.

4. **Applicability:**

4.1. Functional Entities:

4.1.1 Generator Owner

4.1.2 Transmission Planner

4.2. Facilities:

For the purpose of the requirements contained herein, Facilities that are directly connected to the Bulk Electric System (BES) will be collectively referred to as an “applicable unit” that meet the following:

4.2.1 Generation in the Eastern or Quebec Interconnections with the following characteristics:

4.2.1.1 Individual generating unit greater than 100 MVA (gross nameplate rating).

4.2.1.2 Individual generating plant consisting of multiple generating units that are directly connected at a common BES bus with total generation greater than 100 MVA (gross aggregate nameplate rating).

4.2.2 Generation in the Western Interconnection with the following characteristics:

4.2.2.1 Individual generating unit greater than 75 MVA (gross nameplate rating).

4.2.2.2 Individual generating plant consisting of multiple generating units that are directly connected at a common BES bus with total generation greater than 75 MVA (gross aggregate nameplate rating).

---

[1] Excitation control system or plant volt/var control function:

a. For individual synchronous machines, the generator excitation control system includes the generator, exciter, voltage regulator, impedance compensation and power system stabilizer.

b. For an aggregate generating plant, the volt/var control system includes the voltage regulator & reactive power control system controlling and coordinating plant voltage and associated reactive capable resources.

4.2.3 Generation in the ERCOT Interconnection with the following characteristics:

4.2.3.1 Individual generating unit greater than 50 MVA (gross nameplate rating).

4.2.3.2 Individual generating plant consisting of multiple generating units that are directly connected at a common BES bus with total generation greater than 75 MVA (gross aggregate nameplate rating).

4.2.4 For all Interconnections:

- A technically justified[2] unit that meets NERC registry criteria but is not otherwise included in the above Applicability sections 4.2.1, 4.2.2, or 4.2.3 and is requested by the Transmission Planner.

5. Effective Date:

5.1. For Requirements R1, and R3 through R6, the first day of the first calendar quarter beyond the date that this standard is approved by applicable regulatory authorities or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities. In those jurisdictions where regulatory approval is not required, the standard shall become effective on the first day of the first calendar quarter beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

5.2. For Requirement R2, 30 percent of the entity's applicable unit gross MVA for each Interconnection on the first day of the first calendar quarter that is four years following applicable regulatory approval or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, or in those jurisdictions where no regulatory approval is required, on the first day of the first calendar quarter that is four years following NERC Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

5.3. For Requirement R2, 50 percent of the entity's applicable unit gross MVA for each Interconnection on first day of the first calendar quarter that is six years following applicable regulatory approval or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, or in those jurisdictions where no regulatory approval is required, on the first day of the first calendar quarter ~~thirty~~ that is six years following NERC Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

5.4. For Requirement R2, 100 percent of the entity's applicable unit gross MVA for each Interconnection on the first day of the first calendar quarter that is 10 years

[2] Technical justification is achieved by the Transmission Planner demonstrating that the simulated unit or plant response does not match the measured unit or plant response.

following applicable regulatory approval or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, or in those jurisdictions where no regulatory approval is required, on the first day of the first calendar quarter that is 10 years following NERC Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

B. Requirements

R1. Each Transmission Planner shall provide ~~one or more of~~ the following requested information to the~~to its requesting~~ Generator Owner within 90 calendar days of receiving a written request : *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

- Instructions on how to obtain the list of excitation control system or plant volt/var control function models that are acceptable to the Transmission Planner for use in dynamic simulation,
- Instructions on how to obtain the dynamic excitation control system or plant volt/var control function model library block diagrams and/or data sheets for models that are acceptable to the Transmission Planner, or
- Model data for any of the Generator Owner's existing applicable unit specific excitation control system or plant volt/var control function contained in the Transmission Planner's dynamic database from the current (in-use) models, including generator MVA base.

R2. Each Generator Owner shall provide for each applicable unit, a verified generator excitation control system or plant volt/var control function model, including documentation and data (as specified in Part 2.1) to its Transmission Planner in accordance with the periodicity specified in MOD-026 Attachment 1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

2.1. Each applicable unit's model shall be verified by the Generator Owner using one or more models acceptable to the Transmission Planner. Verification ~~of an~~for individual units less than 20 MVA (gross nameplate rating) in a generating plant (per Section 4.2.1.2, 4.2.2.2, or 4.2.3.2) may be performed using either individual unit or ~~plant~~ aggregate unit model(s), or both. Each verification shall include the following:

2.1.1. Documentation demonstrating the applicable unit's model response matches the recorded response for a voltage excursion from either a staged test or a measured system disturbance,

2.1.2. Manufacturer, model number (if available), and type of the excitation control system ~~or plant volt/var control function installed~~ including, but not limited to static, AC brushless, DC rotating, and/or the plant volt/var control function (if installed),

2.1.3. Model structure and data including, but not limited to reactance, time constants, saturation factors, total rotational inertia, or equivalent data for the generator,

2.1.4. Model structure and data for the excitation control system, including the closed loop voltage regulator if a closed loop voltage regulator is installed or the model structure and data for the plant volt/var control function system,

2.1.5. Compensation settings (such as droop, line drop, differential compensation), if used, and

2.1.6. Model structure and data for power system stabilizer, if so equipped.

R3. Each Generator Owner shall provide a written response to its Transmission Planner within 90 calendar days of receiving one of the following items for an applicable unit:

- Written notification from its Transmission Planner (in accordance with Requirement R6) that the excitation control system or plant volt/var control function model is not usable,
- Written comments from its Transmission Planner identifying technical concerns with the verification documentation related to the excitation control system or plant volt/var control function model, or
- Written comments and supporting evidence from its Transmission Planner indicating that the simulated excitation control system or plant volt/var control function model response did not match the recorded response to a transmission system event.

The written response shall contain either the technical basis for maintaining the current model, the model changes, or a plan to perform model verification[3] (in accordance with Requirement R2). *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

R4. Each Generator Owner shall provide revised model data or plans to perform model verification[4] (in accordance with Requirement R2) for an applicable unit to its Transmission Planner within 180 calendar days of making changes to the excitation control system or plant volt/var control function that alter the equipment response characteristic.[5] *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

[3] If verification is performed, the 10-year period as outlined in MOD-026 Attachment 1 is reset.

[4] Ibid

[5] Exciter, voltage regulator, plant volt/var or power system stabilizer control replacement including software alterations that alter excitation control system equipment response, plant digital control system addition or replacement, plant digital control system software alterations that alter excitation control system equipment response, plant volt/var function equipment addition or replacement (such as static var systems, capacitor banks, individual unit excitation systems, etc), a change in the voltage control mode (such as going from power factor control to automatic voltage control, etc), exciter, voltage regulator, impedance compensator, or power system stabilizer settings change. Automatic changes in settings that occur due to changes in operating mode do not apply to Requirement R4.

R5. Each Generator Owner shall provide a written response to its Transmission Planner, within 90 calendar days following receipt of a technically justified[6] unit request from the Transmission Planner to perform a model review of a unit or plant that includes one of the following: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

- Details of plans to verify the model (in accordance with Requirement R2), or
- Corrected model data including the source of revised model data such as discovery of manufacturer test values to replace generic model data or updating of data parameters based on an on-site review of the equipment.

R6. Each Transmission Planner shall provide a written response to~~notify~~ the Generator Owner within 90 calendar days of receiving the verified excitation control system or plant volt/var control function model information in accordance with Requirement R2 that the model is usable (meets the criteria specified in Parts 6.1 through 6.3) or is not usable. ~~If the model is not usable, the Transmission Planner shall provide a technical description of why the model is not usable. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*~~

6.1. The excitation control system or plant volt/var control function model initializes to compute modeling data without error,

6.2. A no-disturbance simulation results in negligible transients, and

6.3. For an otherwise stable simulation, a disturbance simulation results in the excitation control and plant volt/var control function model exhibiting positive damping.

If the model is not usable, the Transmission Planner shall provide a technical description of why the model is not usable. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

C. Measures

M1. The Transmission Planner must have and provide the dated request for instructions or data, the transmitted instructions or data, and dated evidence of a written transmittal (e.g., electronic mail message, postal receipt, or confirmation of facsimile) as evidence that it provided the request within 90 calendar days in accordance with Requirement R1.

M2. The Generator Owner must have and provide dated evidence it verified each generator excitation control system or plant volt/var control function model according to Part 2.1 for each applicable unit and a dated transmittal (e.g., electronic mail message, postal receipt, or confirmation of facsimile) as evidence it provided the model, documentation, and data to its Transmission Planner, in accordance with Requirement R2.

[6] Technical justification is achieved by the Transmission Planner demonstrating that the simulated unit or plant response does not match the measured unit or plant response.

M3. Evidence for Requirement R3 must include the Generator Owner's dated written response containing the information identified in Requirement R3 and dated evidence of transmittal (e.g., electronic mail message, postal receipt, or confirmation of facsimile) of the response.

M4. Evidence for Requirement R4 must include, for each of the Generator Owner's applicable units for which system changes specified in Requirement R4 were made, a dated revised model data or plans to perform a model verification and dated evidence (e.g., electronic mail message, postal receipt, or confirmation of facsimile) it provided the revised model and data or plans within 180 calendar days of making changes.

M5. Evidence for Requirement R5 must include the Generator Owner's dated written response containing the information identified in Requirement R5 and dated evidence (e.g., electronic mail message, postal receipt, or confirmation of facsimile) it provided a written response within 90 calendar days following receipt of a technically justified request.

M6. Evidence of Requirement R6 must include, for each model received, the dated response indicating the model was usable or not usable according to the criteria specified in Parts 6.1 through 6.3 and for a model that is not usable, a technical description; and dated evidence of transmittal (e.g., electronic mail message, postal receipt, or confirmation of facsimile) that the Generator Owner was notified within 90 calendar days of receipt of model information.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

The Regional Entity shall serve as the Compliance Enforcement Authority unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional entity approved by FERC or other applicable governmental authority shall serve as the CEA.

1.2. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Generator Owner and Transmission Planner shall each keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Transmission Planner shall retain the information/data request and provided response evidence of Requirements R1 and R6, Measures M1 and M6 for three calendar years from the date the document was provided.
- The Generator Owner shall retain the latest excitation control system or plant volt/var control function model verification evidence of Requirement R2, Measure M2.
- The Generator Owner shall retain the information/data request and provided response evidence of Requirements R3 through R5, and Measures M3 through M5 for three calendar years from the date the document was provided.

If a Generator Owner or Transmission Planner is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete or approved or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaints

1.4. Additional Compliance Information

None

2. Violation Severity Levels

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The Transmission Planner provided the instructions and data to the Generator Owner more than 90 calendar days but less than or equal to 120 calendar days of receiving a written request.	The Transmission Planner provided the instructions and data to the Generator Owner more than 120 calendar days but less than or equal to 150 calendar days of receiving a written request.	The Transmission Planner provided the instructions and data to the Generator Owner more than 150 calendar days but less than or equal to 180 calendar days of receiving a written request.	The Transmission Planner failed to provide the instructions and data to the Generator Owner within 180 calendar days of receiving a written request.
R2	The Generator Owner provided its verified model(s), including documentation and data to its Transmission Planner after the timeframe specified in MOD-026 Attachment 1 but less than or equal to 90 calendar days late; OR The Generator Owner provided the Transmission Planner verified models that omitted one of the six Parts identified in Requirement R2, Parts 2.1.1 through 2.1.6.	The Generator Owner provided its verified model(s), including documentation and data to its Transmission Planner more than 90 calendar days but less than or equal to 180 calendar days late as specified by the periodicity timeframe in MOD-026 Attachment 1. OR The Generator Owner provided the Transmission Planner verified models that omitted two of the six Parts identified in Requirement R2, Parts 2.1.1 through 2.1.6.	The Generator Owner provided its verified model(s), including documentation and data to its Transmission Planner more than 180 calendar days but less than or equal to 270 calendar days late as specified by the periodicity timeframe in MOD-026 Attachment 1. OR The Generator Owner provided the Transmission Planner verified models that omitted three of the six Parts identified in Requirement R2, Parts 2.1.1 through 2.1.6.	The Generator Owner provided its verified model(s), including documentation and data more than 270 calendar days late to its Transmission Planner in accordance with the periodicity specified in MOD-026 Attachment 1. OR The Generator Owner failed to use model(s) acceptable to the Transmission Planner as specified in Requirement R2, Part 2.1. OR The Generator Owner provided the Transmission Planner verified model(s) but omitted four or more of the six parts identified in Requirement R2, Subparts 2.1.1 through 2.1.6.

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL
R3	The Generator Owner provided a written response more than 90 calendar days but less than or equal to 120 calendar days of receiving written notice.	The Generator Owner provided a written response more than 120 calendar days but less than or equal to 150 calendar days of receiving written notice.	The Generator Owner provided a written response more than 150 calendar days but less than or equal to 180 calendar days of receiving written notice.	The Generator Owner failed to provide a written response within 180 calendar days of receiving written notice. OR The Generator Owner's written response failed to contain either the technical basis for maintaining the current model, or a list of future model changes, or a plan to perform another model verification.
R4	The Generator Owner provided revised model data or plans to perform model verification more than 180 calendar days but less than or equal to 210 calendar days of making changes to the excitation control system or plant volt/var control function that altered the equipment response characteristic.	The Generator Owner provided revised model data or plans to perform model verification more than 210 calendar days but less than or equal to 240 calendar days of making changes to the excitation control system or plant volt/var control function that altered the equipment response characteristic.	The Generator Owner provided revised model data or plans to perform model verification more than 240 calendar days but less than or equal to 270 calendar days of making changes to the excitation control system or plant volt/var control function that altered the equipment response characteristic.	The Generator Owner failed to provide revised model data or failed to provide plans to perform model verification within 270 calendar days of making changes to the excitation control system or plant volt/var control function that altered the equipment response characteristic.
R5	The Generator Owner provided a written response more than 90 calendar days but less than or equal to 120 calendar days to the Transmission Planner following receipt of a technically justified request to perform a model review of an applicable unit.	The Generator Owner provided a written response more than 120 calendar days but less than or equal to 150 calendar days to the Transmission Planner following receipt of a technically justified request to perform a model review of an applicable unit.	The Generator Owner provided a written response more than 150 calendar days but less than or equal to 180 calendar days to the Transmission Planner following receipt of a technically justified request to perform a model review of an applicable unit.	The Generator Owner failed to provide a written response to the Transmission Planner within 180 calendar days following receipt of a technically justified request to perform a model review of an applicable unit. OR The Generator Owner's written response failed to include one of the sub bullets of Requirement R5

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL
R6	The Transmission Planner provided a written response to the Generator Owner indicating whether the model is usable or not usable; including a technical description if the model is not usable, more than 90 calendar days but less than or equal to 120 calendar days of receiving verified model information.	The Transmission Planner provided a written response to the Generator Owner indicating whether the model is usable or not usable; including a technical description if the model is not usable, more than 120 calendar days but less than or equal to 150 calendar days of receiving the verified model information. OR The Transmission Planner's written response omitted confirmation for one of the specified model criteria listed in Requirement R6, Parts 6.1 through 6.3.	The Transmission Planner provided a written response to the Generator Owner indicating whether the model is usable or not usable; including a technical description if the model is not usable, more than 150 calendar days but less than or equal to 180 calendar days of receiving the verified model information. OR The Transmission Planner's written response omitted confirmation for two of the specified model criteria listed in Requirement R6, Parts 6.1 through 6.3.	The Transmission Planner failed to provide a written response to the Generator Owner within 180 calendar days of receiving the verified model information. OR The Transmission Planner's written response omitted confirmation for all specified model criteria listed in Requirement R6, Parts 6.1 through 6.3.

MOD-026 Attachment 1 Excitation Control System or Plant Volt/Var Function Model Verification Periodicity		
Row Number	**Verification Condition**	**Required Action**
1	Establishing the initial verification date for an applicable unit. (Requirement R2)	Transmit the verified model, documentation and data to the Transmission Planner on or before the Effective Date. Row 4 applies when calculating generation fleet compliance during the 10-year implementation period. See Section A5 for Effective Dates.
2	Subsequent verification for an applicable unit. (Requirement R2)	Transmit the verified model, documentation and data to the Transmission Planner on or before the 10-year anniversary of the last transmittal (per Note 1).
3	Initial verification for a new applicable unit or for an existing applicable unit with new excitation control system or plant volt/var control function equipment installed. (Requirement R2)	Transmit the verified model, documentation and data to the Transmission Planner within 365 calendar days after the commissioning date.

MOD-026 Attachment 1 Excitation Control System or Plant Volt/Var Function Model Verification Periodicity		
Row Number	**Verification Condition**	**Required Action**
4	Existing applicable unit that is equivalent to another unit(s) at the same physical location. AND Each applicable unit has the same MVA nameplate rating. AND The nameplate rating is ≤ 350 MVA. AND Each applicable unit has the same components and settings. AND The model for one of these equivalent applicable units has been verified. (Requirement R2)	Document circumstance with a written statement and include with the verified model, documentation and data provided to the Transmission Planner for the verified equivalent unit. Verify a different equivalent unit during each 10-year verification period. Applies to Row 1 when calculating generation fleet compliance during the 10-year implementation period.
5	The Generator Owner has submitted a verification plan. (Requirement R3, R4 or R5)	Transmit the verified model, documentation and data to the Transmission Planner within 365 calendar days after the submittal of the verification plan.

MOD-026 Attachment 1 Excitation Control System or Plant Volt/Var Function Model Verification Periodicity		
Row Number	**Verification Condition**	**Required Action**
6	New or existing applicable unit does not include an active closed loop voltage or reactive power control function. (Requirement R2)	Requirement 2 is met with a written statement to that effect transmitted to the Transmission Planner. Perform verification per the periodicity specified in Row 3 for a “New Generating Unit” (or new equipment) only if active closed loop function is established. See Footnote 1 (see Section A.3) for clarification of what constitutes an active closed loop function for both conventional synchronous machines (reference Footnote 1a) and aggregate generating plants (reference Footnote 1b).
7	Existing applicable unit has a current average net capacity factor over the most recent three calendar years, beginning on January 1 and ending on December 31 of 5% or less. (Requirement R2)	Requirement 2 is met with a written statement to that effect transmitted to the Transmission Planner. At the end of this 10-year timeframe, the current average three year net capacity factor (for years 8, 9, and 10) can be examined to determine if the capacity factor exemption can be declared for the next 10-year period. If not eligible for the capacity factor exemption, then model verification must be completed within 365 calendar days of the date the capacity factor exemption expired. For the definition of net capacity factor, refer to Appendix F of the GADS Data Reporting Instructions on the NERC website.

MOD-026 Attachment 1 Excitation Control System or Plant Volt/Var Function Model Verification Periodicity		
Row Number	**Verification Condition**	**Required Action**

NOTES:

NOTE 1: Establishing the recurring 10-year unit verification period start date:

The start date is the actual date of submittal of a verified model to the Transmission Planner for the most recently performed unit verification.

NOTE 2: Consideration for early compliance:

Existing generator excitation control system or plant volt/var control function model verification is sufficient for demonstrating compliance for a 10-year period from the actual transmittal date if either of the following applies:

- The Generator Owner has a verified model that is compliant with the applicable regional policies, guidelines or criteria existing at the time of model verification.
- The Generator Owner has an existing verified model that is compliant with the requirements of this standard.

Applicable Entities

Generator Owner
Transmission Planner

For the purpose of this standard, the following Facilities are considered, "applicable units."

Units or plants that meet the following:

Generating units connected to the Eastern or Quebec Interconnections with the following characteristics:

- Individual generating unit greater than 100 MVA (gross nameplate rating) directly connected to the Bulk Electric System.
- Each generating plant consisting of multiple units that are directly connected to the Bulk Electric System at a common bus with total generation greater than 100 MVA (gross aggregate rating).

Generating units connected to the Western Interconnection with the following characteristics:

- Individual generating unit greater than 75 MVA (gross nameplate rating) directly connected to the Bulk Electric System.

- Each generating plant consisting of multiple units that are directly connected to the Bulk Electric System at a common bus with total generation greater than 75 MVA (gross aggregate rating).

Generating units connected to the ERCOT Interconnection with the following characteristics:

- Individual generating unit greater than 50 MVA (gross nameplate rating) directly connected to the Bulk Electric System.
- Each generating plant / Facility consisting of multiple units that are connected to the Bulk Electric System at a common bus with total generation greater than 75 MVA (gross aggregate rating).

For all Interconnections:

- Any technically justified[1] unit that meets NERC registry criteria and is requested by the Transmission Planner.

Conforming Changes to Other Standards

None

Effective Dates

In those jurisdictions where regulatory approval is required:

- Each responsible entity shall ensure compliance with Requirements R1, and R3 through R6 By the first day of the first calendar quarter following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.
- Each Generator Owner shall ensure at least 30 percent of its applicable unit gross MVA per Interconnection are compliant with Requirement R2 by the first day of the first calendar quarter, four years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.
- Each Generator Owner shall ensure at least 50 percent of its applicable unit gross MVA per Interconnection are compliant with Requirement R2 by the first day of the first calendar quarter, six years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.
- Each Generator Owner shall ensure 100 percent of its applicable unit gross MVA are compliant with Requirement R2 By the first day of the first calendar quarter, 10 years

[1] Technical justification is achieved by demonstrating that the simulated unit or plant response does not match the measured unit or plant response.

following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

In those jurisdictions where no regulatory approval is required:

- Each responsible entity shall ensure compliance with Requirements R1, and R3 through R6 by the first day of the first calendar quarter following Board of Trustees adoption.
- Each Generator Owner shall ensure at least 30 percent of its applicable unit gross MVA per Interconnection is compliant with Requirement R2 by the first day of the first calendar quarter, four years following Board of Trustees adoption.
- Each Generator Owner shall ensure at least 50 percent of its applicable unit gross MVA per Interconnection is compliant with Requirement R2 By the first day of the first calendar quarter, six years following Board of Trustees adoption.
- Each Generator Owner shall ensure 100 percent of its applicable unit gross MVA is compliant with Requirement R2 By the first day of the first calendar quarter, 10 years following Board of Trustees adoption.

Consideration for Early Compliance

Existing excitation control system and plant volt/var control model verification is sufficient for demonstrating compliance for a 10 year period from the actual verification date if either of the following applies:

- The Generator Owner has a verified model that is compliant with the applicable regional entity policies, guidelines or criteria existing at the time of model verification, or
- The Generator Owner has an existing verified model that is compliant with the requirements of this standard.

Justification

This phased implementation supports the 10 year cycle for the collection of generator response data necessary for required verifications and typical generating unit outage schedules.

When a Generator Owner has verified its Excitation Control System and Plant Volt/Var Control model(s) in compliance with its regional entity requirements 10 years or less prior to the approval date of this Standard, these verifications are deemed sufficient for demonstrating compliance with this Standard for a ten year period from the date of the aforementioned verification.

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. SAR posted for comment (April 20–May 21, 2007).
2. Revised SAR and response to comments posted.
3. Revised SAR and response to comments approved by SC (June 14, 2007).
4. SDT appointed (August 18, 2007).
5. First Draft of MOD-024-2 was posted for comment January 18 – February 18, 2010. MOD-024-2 was later combined with MOD-025-1 to form MOD-025-2.
6. Posted first draft of standard for a 30 day comment period June 15 –July 15, 2011
7. Posted second draft of standard for 45-day concurrent formal comment period and initial ballot February 29 – March 16, 2012.
8. Posted third draft of standard for 30-day concurrent formal comment period and initial ballot September 28 – October 31, 2012.

Proposed Action Plan and Description of Current Draft:

This is the third draft of the proposed standard including Time Horizons, Data Retention, Violation Risk Factors, and Violation Severity Levels; and is being submitted for a 30-day concurrent formal comment period and successive ballot.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Post responses to comments and conduct recirculation ballot.	December 2012
2. BOT adoption.	February 2013
3. File with regulatory authorities.	April 2013

A. Introduction

1. **Title:** Verification and Data Reporting of Generator Real and Reactive Power Capability and Synchronous Condenser Reactive Power Capability

2. **Number:** MOD-025-2

3. **Purpose:** To ensure that accurate information on generator gross and net Real and Reactive Power capability and synchronous condenser Reactive Power capability is available for planning models used to assess Bulk Electric System (BES) reliability.

4. **Applicability:**

   4.1. Functional entities

   4.1.1 Generator Owner

   4.1.2 Transmission Owner that owns synchronous condenser(s)

   4.2. Facilities:

   For the purpose of this standard, the term, "applicable Facility" shall mean any one of the following:

   4.2.1 Individual generating unit greater than 20 MVA (gross nameplate rating) directly connected to the Bulk Electric System.

   4.2.2 Synchronous condenser greater than 20 MVA (gross nameplate rating) directly connected to the Bulk Electric System.

   4.2.3 Generating plant/Facility greater than 75 MVA (gross aggregate nameplate rating) directly connected to the Bulk Electric System.

5. **Effective Date:**

   5.1. In those jurisdictions where regulatory approval is required[1]:

   5.1.1 By the first day of the first calendar quarter, two calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified at least 40 percent of its applicable Facilities.

   5.1.2 By the first day of the first calendar quarter, three calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified at least 60 percent of its applicable Facilities.

[1] Wind Farm Verification - If an entity has two wind sites, and verification of one site is complete, the entity is 50% complete regardless of the number of turbines at each site. A wind site is a group of wind turbines connected at a common point of interconnection or utilizing a common aggregate control system.

5.1.3 By the first day of the first calendar quarter, four calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified at least 80 percent of its applicable Facilities.

5.1.4 By the first day of the first calendar quarter, five calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified 100 percent of its applicable Facilities.

5.2. In those jurisdictions where regulatory approval is not required[2]:

5.2.1 By the first day of the first calendar quarter, two calendar years following Board of Trustees approval, each Generator Owner and Transmission Owner shall have verified at least 40 percent of its applicable Facilities.

5.2.2 By the first day of the first calendar quarter, three calendar years following Board of Trustees approval, each Generator Owner and Transmission Owner shall have verified at least 60 percent of its applicable Facilities.

5.2.3 By the first day of the first calendar quarter, four calendar years following Board of Trustees approval, each Generator Owner and Transmission Owner shall have verified at least 80 percent of its applicable Facilities.

5.2.4 By the first day of the first calendar quarter, five calendar years following Board of Trustees approval, each Generator Owner and Transmission Owner shall have verified 100 percent of its applicable Facilities.

Note: The verification percentage above is based on the number of applicable units owned.

[2] Wind farm verification - If an entity has two wind sites, and verification of one site is complete, the entity is 50% complete regardless of the number of turbines at each site. A wind site is a group of wind turbines connected at a common point of interconnection or utilizing a common aggregate control system.

Requirements

R1. Each Generator Owner shall provide its Transmission Planner with verification of the Real Power capability of its applicable Facilities as follows: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

1.1. Verify the Real Power capability of its generating units in accordance with Attachment 1.

1.2. Submit a completed Attachment 2 (or a form containing the same information as identified in Attachment 2) to its Transmission Planner within 90 calendar days of either (i) the date the data is recorded for a staged test; or (ii) the date the data is selected for verification using historical operational data.

R2. Each Generator Owner shall provide its Transmission Planner with verification of the Reactive Power capability of its applicable Facilities as follows: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

2.1. Verify, in accordance with Attachment 1, (i) the Reactive Power capability of its generating units and (ii) the Reactive Power capability of its synchronous condenser units.

2.2. Submit a completed Attachment 2 (or a form containing the same information as identified in Attachment 2) to its Transmission Planner within 90 calendar days of either (i) the date the data is recorded for a staged test; or (ii) the date the data is selected for verification using historical operational data.

R3. Each Transmission Owner shall provide its Transmission Planner with verification of the Reactive Power capability of its applicable Facilities as follows: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

3.1. Verify, in accordance with Attachment 1, the Reactive Power capability of its synchronous condenser units.

3.2. Submit a completed Attachment 2 (or a form containing the same information as identified in Attachment 2) to its Transmission Planner within 90 calendar days of either (i) the date the data is recorded for a staged test; or (ii) the date the data is selected for verification using historical operational data.

B. Measures

M1. Each Generator Owner will have evidence that it performed the verification, such as a completed Attachment 2 or the Generator Owner form with the same information or dated information collected and used to complete attachments, and will have evidence that it submitted the information within 90 days to its Transmission Planner; such as dated electronic mail messages or mail receipts in accordance with Requirement R1.

M2. Each Generator Owner will have evidence that it performed the verification, such as a completed Attachment 2 or the Generator Owner form with the same information, or dated information collected and used to complete attachments and will have evidence that it submitted the information within 90 days to its Transmission Planner; such as dated electronic mail messages or mail receipts in accordance with Requirement R2.

M3. Each Transmission Owner will have evidence that it performed the verification, such as a completed Attachment 2 or the Transmission Owner form with equivalent information or dated information collected and used to complete attachments, and will have evidence that it submitted the information within 90 days to its Transmission Planner; such as dated electronic mail messages or mail receipts in accordance with Requirement R3.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

The Regional Entity shall serve as the Compliance enforcement authority unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional entity approved by FERC or other applicable governmental authority shall serve as the CEA.

1.2. Evidence Retention

The following evidence retention periods identify a period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention specified below is shorter than the time since the last compliance audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Generator Owner and Transmission Owner shall each keep the data or evidence to show compliance as identified below, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Generator Owner shall retain the latest MOD-025 Attachment 2 and the data behind Attachment 2 or Generator Owner form with equivalent information and submittal evidence for Requirements R1 and R2, Measures M1 and M2 for the time period since the last compliance audit.
- The Transmission Owner shall retain the latest MOD-025 Attachment 2 and the data behind Attachment 2 or Transmission Owner form with equivalent information and submittal evidence for Requirement R3, Measure M3 for the time period since the last compliance audit.

If a Generator Owner or Transmission Owner is found noncompliant, it shall keep information related to the noncompliance until mitigation is complete or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

1.4. Additional Compliance Information

None

2. Violation Severity Levels

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The Generator Owner verified and recorded the Real Power capability of its applicable generating unit, but submitted the data to its Transmission Planner more than 90 calendar days, but within 120 calendar days, of the date the data is recorded for a staged test or the date the data is selected for verification using historical operational data. OR The Generator Owner verified the Real Power capability, per Attachment 1 and submitted the data but was missing 1 to less than or equal to 33 percent of the data.	The Generator Owner verified and recorded the Real Power capability of its applicable generating unit, but submitted the data to its Transmission Planner more than 120 calendar days, but within 150 calendar days, of the date the data is recorded for a staged test or the date the data is selected for verification using historical operational data. OR The Generator Owner verified the Real Power capability, per Attachment 1 and submitted the data but was missing more than 33 to 66 percent of the data.	The Generator Owner verified and recorded the Real Power capability of its applicable generating unit, but submitted the data to its Transmission Planner more than 150 calendar days, but within 180 calendar days, of the date the data is recorded for a staged test or the date the data is selected for verification using historical operational data. OR The Generator Owner verified the Real Power capability, per Attachment 1 and submitted the data but was missing from 67 to 99 percent of the data. OR	The Generator Owner verified and recorded the Real Power capability of its applicable generating unit, but submitted the data to its Transmission Planner more than 180 calendar days of the date the data is recorded for a staged test or the date the data is selected for verification using historical operational data. OR The Generator Owner failed to verify the Real Power capability, per Attachment 1 of an applicable generating unit. OR The Generator Owner performed the Real Power verification per Attachment 1, “Periodicity for conducting a new verification” item

	OR The Generator Owner performed the Real Power verification per Attachment 1, "Periodicity for conducting a new verification" item 1 or item 2 (5 year requirement) but did so in more than 66 calendar months but less than or equal to 69 months. OR The Generator Owner performed the Real Power verification per Attachment 1, "Periodicity for conducting a new verification" item 1, 2 or 3 (12 calendar month requirement) but did so in more than 12 calendar months but less than or equal to 13 calendar months.	OR The Generator Owner performed the Real Power verification per Attachment 1, "Periodicity for conducting a new verification" item 1 or item 2 (5 year requirement) but did so in more than 69 calendar months but less than or equal to 72 months. OR The Generator Owner performed the Real Power verification per Attachment 1, "Periodicity for conducting a new verification" item 1, 2 or 3 (12 calendar month requirement) but did so in more than 13 calendar months but less than or equal to 14 calendar months.	The Generator Owner performed the Real Power verification per Attachment 1, "Periodicity for conducting a new verification" item 1 or item 2 (5 year requirement) but did so in more than 72 calendar months but less than or equal to 75 months. OR The Generator Owner performed the Real Power verification per Attachment 1, "Periodicity for conducting a new verification" item 1, 2 or 3 (12 calendar month requirement) but did so in more than 14 calendar months but less than or equal to 15 calendar months.	1 or item 2 (5 year requirement) but did so in more than 75 calendar months. OR The Generator Owner performed the Real Power verification per Attachment 1, "Periodicity for conducting a new verification" item 1, 2 or 3 (12 calendar month requirement) but did so in more than 15 calendar months.

Version History

Version	Date	Action	Change Tracking
Version 1	12/1/2005	1. Changed tabs in footer. 2. Removed comma after 2004 in “Development Steps Completed,” #1. 3. Changed incorrect use of certain hyphens (-) to “en dash” (–) and “em dash (—).” 4. Added “periods” to items where appropriate. 5. Changed apostrophes to “smart” symbols. 6. Changed “Timeframe” to “Time Frame” in item D, 1.2. 7. Lower cased all instances of “regional” in section D.3. 8. Removed the word “less” after 94% in section 3.4. Level 4.	01/20/06
Version 2	TBD	Revised per SAR for Project 2007-09 and combined with MOD-024-1	TBD

MOD-025 Attachment 1 – Verification of Generator Real and Reactive Power Capability and Synchronous Condenser Reactive Power Capability

Periodicity for conducting a new verification:

The periodicity for performing Real and Reactive Power capability verification is as follows:

1. For staged verification; verify each applicable Facility at least every five years (with no more than 66 calendar months between verifications), or within 12 calendar months of the discovery of a change that affects its Real Power or Reactive Power capability by more than 10 percent of the last reported verified capability and is expected to last more than six months. The first verification for each applicable Facility under this standard must be a staged test.
2. For verification using operational data; verify each applicable Facility at least every five years (with no more than 66 calendar months between verifications), or within 12 calendar months following the discovery that its Real Power or Reactive Power capability has changed by more than 10 percent of the last reported verified capability and is expected to last more than six months. If data for different points is recorded on different days, designate the earliest of those dates as the verification date, and report that date as the verification date on MOD-025, Attachment 2 for periodicity purposes.
3. For either verification method, verify each new applicable Facility within 12 calendar months of its commercial operation date. Existing units that have been in long term shut down and have not been tested for more than five years shall be verified within 12 calendar months.

It is intended that Real Power testing be performed at the same time as full load Reactive Power testing, however separate testing is allowed for this standard. For synchronous condensers, perform only the Reactive Power capability verifications as specified below.

If the Reactive Power capability is verified through test, it is to be scheduled at a time advantageous for the unit being verified to demonstrate its Reactive Power capabilities while the Transmission Operator takes measures to maintain the plant's system bus voltage at the scheduled value or within acceptable tolerance of the scheduled value.

Verification specifications for applicable Facilities:

1. For generating units of 20 MVA or less that are part of a plant greater than 75 MVA in aggregate, record data either on an individual unit basis or as a group. Perform verification individually for every generating unit or synchronous condenser greater than 20 MVA (gross nameplate rating).

2. Verify with all auxiliary equipment needed for expected normal operation in service for both the Real Power and Reactive Power capability verification. Perform verification with the automatic voltage regulator in service for the Reactive Power capability

verification. Operational data from within the two years prior to the verification date is acceptable for the verification of either the Real Power or the Reactive Power capability, as long as a) that operational data meets the criteria in 2.1 through 2.4 below and b) the operational data demonstrates at least 90 percent of a previously staged test that demonstrated at least 50 percent of the Reactive capability shown on the associated thermal capability curve (D-curve). If the previously staged test was unduly restricted (so that it did not demonstrate at least 50 percent of the associated thermal capability curve) by unusual generation or equipment limitations (e.g., capacitor or reactor banks out of service), then the next verification will be by another staged test, not operational data:

2.1. Verify Real Power capability and Reactive Power capability over-excited (lagging) of all applicable Facilities at the applicable Facilities' normal (not emergency) expected maximum Real Power output at the time of the verifications.

2.1.1 Verify synchronous generating unit's maximum real power and lagging reactive power for a minimum of one hour.

2.1.2 Verify variable generating units, such as wind, solar, and run of river hydro, at the maximum Real Power output the variable resource can provide at the time of the verification. Perform verification of Reactive Power capability of wind turbines and photovoltaic inverters with at least 90 percent of the wind turbines or photovoltaic inverters at a site on-line. If verification of wind turbines or photovoltaic inverter Facility cannot be accomplished meeting the 90 percent threshold, document the reasons the threshold was not met and test to the full capability at the time of the test. Reschedule the test of the facility within six months of being able to reach the 90 percent threshold. Maintain, as steady as practical, Real and Reactive Power output during verifications.

2.2. Verify Reactive Power capability of all applicable Facilities, other than wind and photovoltaic, for maximum overexcited (lagging) and under-excited (leading) reactive capability for the following conditions:

2.2.1 At the minimum Real Power output at which they are normally expected to operate collect maximum leading and lagging reactive values as soon as a limit is reached.

2.2.2 At maximum Real Power output collect maximum leading reactive values as soon as a limit is reached.

2.2.3 Nuclear Units are not required to perform Reactive Power verification at minimum Real Power output.

2.3. For hydrogen-cooled generators, perform the verification at normal operating hydrogen pressure.

2.4. Calculate the Generator Step-Up (GSU) transformer losses if the verification measurements are taken from the high side of the GSU transformer. GSU

transformer real and reactive losses may be estimated, based on the GSU impedance, if necessary.

3. Record the following data for the verifications specified above:

3.1. The value of the gross Real and Reactive Power generating capabilities at the end of the verification period.

3.2. The voltage schedule provided by the Transmission Operator, if applicable.

3.3. The voltage at the high and low side of the GSU and/or system interconnection transformer(s) at the end of the verification period. If only one of these values is metered, the other may be calculated.

3.4. The ambient conditions, if applicable, at the end of the verification period that the Generator Owner requires to perform corrections to Real Power for different ambient conditions such as:

- Ambient air temperature
- Relative humidity
- Cooling water temperature
- Other data as determined to be applicable by the Generator Owner to perform corrections for ambient conditions.

3.5. The date and time of the verification period, including start and end time in hours and minutes.

3.6. The existing GSU and/or system interconnection transformer(s) voltage ratio and tap setting.

3.7. The GSU transformer losses (real or reactive) if the verification measurements were taken from the high side of the GSU transformer.

3.8. Whether the test data is a result of a staged test or if it is operational data.

4. Develop a simplified key one-line diagram (refer to MOD-025, Attachment 2) showing sources of auxiliary Real and Reactive Power and associated system connections for each unit verified. Include GSU and/or system Interconnection and auxiliary transformers. Show Reactive Power flows, with directional arrows.

4.1. If metering does not exist to measure specific Reactive auxiliary load(s), provide an engineering estimate and associated calculations. Transformer Real and Reactive Power losses will also be estimates or calculations. Only output data are required when using a computer program to calculate losses or loads.

5. If an adjustment is requested by the Transmission Planner, then develop the relationships between test conditions and generator output so that the amount of Real Power that can be expected to be delivered from a generator can be determined at different conditions, such as peak summer conditions. Adjust MW values tested to the ambient conditions specified by the Transmission Planner upon request and submit them to the Transmission Planner within 90 days of the request or the date the data was recorded/selected whichever is later.

Note 1: Under some transmission system conditions, the data points obtained by the Mvar verification required by the standard will not duplicate the manufacturer supplied thermal capability curve (D-curve). However, the verification required by the standard, even when conducted under these transmission system conditions, may uncover applicable Facility limitations; such as rotor thermal instability, improper tap settings or voltage ratios, inaccurate AVR operation, etc., which could be further analyzed for resolution. The Mvar limit level(s) achieved during a staged test or from operational data may not be representative of the unit's reactive capability for extreme system conditions. See Note 2.

Note 2: While not required by the standard, it is desirable to perform engineering analyses to determine expected applicable Facility capabilities under less restrictive system voltages than those encountered during the verification. Even though this analysis will not verify the complete thermal capability curve (D-curve), it provides a reasonable estimate of applicable Facility capability that the Transmission Planner can use for modeling.

Note 3: The Reactive Power verification is intended to define the limits of the unit's Reactive Power capabilities. If a unit has no leading capability, then it should be reported with no leading capability; or the minimum lagging capability at which it can operate.

Note 4: Synchronous Condensers only need to be tested at two points (one over-excited point and one under-excited point) since they have no Real Power output.

MOD-025 Attachment 2

One-line Diagram, Table, and Summary for Verification Information Reporting

Note: If the configuration of the applicable Facility does not lend itself to the use of the diagram, tables, or summaries for reporting the required information, changes may be made to this form, provided that all required information (identified in MOD-025, Attachment 1) is reported.

Verification Data

Provide data by unit or Facility, as appropriate

Data Type	Data Recorded	Last Verification (Previous Data; will be blank for the initial verification)
Gross Reactive Power Capability (*Mvar)		
Aux Reactive Power (*Mvar)		
Net Reactive Power Capability (*Mvar) equals Gross Reactive Power Capability (*Mvar) minus Aux Reactive Power connected at the same bus (*Mvar) minus tertiary Reactive Power connected at the same bus(*Mvar)		
Gross Real Power Capability (*MW)		
Aux Real Power (*MW)		
Net Real Power Capability (*MW) equals Gross Real Power Capability (*MW) minus Aux Real Power connected at the same bus (*MW) minus tertiary Real Power connected at the same bus(*MW)		
* Note: Enter values at the end of the verification period.		
GSU losses (only required if verification measurements are taken on the high side of the GSU - Mvar)		

Summary of Verification

- Date of Verification _________,Verification Start Time _____, Verification End Time ______
- Scheduled Voltage _______________
- Transformer Voltage Ratio: GSU ______, Unit Aux _____, Station Aux _____, Other Aux _____
- Transformer Tap Setting: GSU ______, Unit Aux _____, Station Aux _____, Other Aux _____
- Ambient conditions at the end of the verification period:

  Air temperature: _________

  Humidity: _________

  Cooling water temperature: _________

  Other data as applicable: _________

- Generator hydrogen pressure at time of test (if applicable) _____________

Date that data shown in last verification column in table above was taken _____________

Remarks :

Note: If the verification value did not reach the thermal capability curve (D-curve), describe the reason.

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. SAR posted for comment (April 20–May 21, 2007).
2. Revised SAR and response to comments posted.
3. Revised SAR and response to comments approved by SC (June 14, 2007).
4. SDT appointed (August 18, 2007).
5. First Draft of MOD-024-2 was posted for comment January 18 – February 18, 2010. MOD-024-2 was later combined with MOD-025-1 to form MOD-025-2.
6. Posted first draft of standard for a 30 day comment period June 15 –July 15, 2011
7. Posted second draft of standard for 45-day concurrent formal comment period and initial ballot February 29 – March 16, 2012.
8. ~~7.~~ Posted third draft of standard for 30-day concurrent formal comment period and initial ballot September 28 – October 31, 2012.

Proposed Action Plan and Description of Current Draft:

This is the third draft of the proposed standard including Time Horizons, Data Retention, Violation Risk Factors, and Violation Severity Levels; and is being submitted for a 30-day concurrent formal comment period and successive ballot.

Future Development Plan:

Anticipated Actions	Anticipated Date
~~1. Develop responses to comments and develop third version draft standard.~~	~~April - July 2012~~
~~2. Post response to comments and conduct successive ballot.~~	~~October-November 2012~~
~~3. Develop responses to ballot comments.~~	~~December 2012 – January 2013~~
1~~4~~. Post responses to comments and conduct recirculation ballot.	December ~~February~~ 2012~~3~~
1~~5~~. BOT adoption.	February~~March~~ 2013
1~~6~~. File with regulatory authorities.	April 2013

A. Introduction

1. **Title:** Verification and Data Reporting of Generator Real and Reactive Power Capability and Synchronous Condenser Reactive Power Capability

2. **Number:** MOD-025-2

3. **Purpose:** To ensure that accurate information on generator gross and net Real and Reactive Power capability and synchronous condenser Reactive Power capability is available for planning models used to assess Bulk Electric System (BES) reliability.

4. **Applicability:**

4.1. Functional entities

4.1.1 Generator Owner

4.1.2 Transmission Owner that owns synchronous condenser(s)

4.2. Facilities:

For the purpose of this standard, the term, "applicable Facility" shall mean any one of the following:

4.2.1 Individual generating unit greater than 20 MVA (gross nameplate rating) directly connected to the Bulk Electric System.

4.2.2 Synchronous condenser greater than 20 MVA (gross nameplate rating) directly connected to the Bulk Electric System.

4.2.3 Generating plant/Facility greater than 75 MVA (gross aggregate nameplate rating) directly connected to the Bulk Electric System.

5. **Effective Date:**

5.1. In those jurisdictions where regulatory approval is required[1]:

5.1.1 By the first day of the first calendar quarter, two calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified at least 40 percent of its applicable Facilities.

5.1.2 By the first day of the first calendar quarter, three calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified at least 60 percent of its applicable Facilities.

[1] Wind Farm Verification - If an entity has two wind sites, and verification of one site is complete, the entity is 50% complete regardless of the number of turbines at each site. A wind site is a group of wind turbines connected at a common point of interconnection or utilizing a common aggregate control system.

5.1.3 By the first day of the first calendar quarter, four calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified at least 80 percent of its applicable Facilities.

5.1.4 By the first day of the first calendar quarter, five calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified 100 percent of its applicable Facilities.

5.2. In those jurisdictions where regulatory approval is not required[2]:

5.2.1 By the first day of the first calendar quarter, two calendar years following Board of Trustees approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified at least 40 percent of its applicable Facilities.

5.2.2 By the first day of the first calendar quarter, three calendar years following Board of Trustees approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified at least 60 percent of its applicable Facilities.

5.2.3 By the first day of the first calendar quarter, four calendar years following Board of Trustees approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified at least 80 percent of its applicable Facilities.

5.2.4 By the first day of the first calendar quarter, five calendar years following Board of Trustees approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified 100 percent of its applicable Facilities.

Note: The verification percentage above is based on the number of applicable units owned.

[2] Wind ~~F~~farm ~~V~~verification - If an entity has two wind sites, and verification of one site is complete, the entity is 50% complete regardless of the number of turbines at each site. A wind site is a group of wind turbines connected at a common point of interconnection or utilizing a common aggregate control system.

Requirements

R1. Each Generator Owner shall provide its Transmission Planner with verification of the Real Power capability of its applicable Facilities as follows: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

1.1. Verify the Real Power capability of its generating units in accordance with Attachment 1.

1.2. Submit a completed Attachment 2 (or a form containing the same information as identified in Attachment 2) to its Transmission Planner within 90 calendar days of either (i) the date the data is recorded for a staged test; or (ii) the date the data is selected for verification using historical operational data.

R2. Each Generator Owner shall provide its Transmission Planner with verification of the Reactive Power capability of its applicable Facilities as follows: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

2.1. Verify, in accordance with Attachment 1, (i) the Reactive Power capability of its generating units, and ~~shall verify~~(ii) the Reactive Power capability of its synchronous condenser units~~ in accordance with Attachment 1~~.

2.2. Submit a completed Attachment 2 (or a form containing the same information as identified in Attachment 2) to its Transmission Planner within 90 calendar days of either (i) the date the data is recorded for a staged test; or (ii) the date the data is selected for verification using historical operational data.

R3. Each Transmission Owner shall provide its Transmission Planner with verification of the Reactive Power capability of its applicable Facilities as follows: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

3.1. Verify, in accordance with Attachment 1, the Reactive Power capability of its synchronous condenser units~~ in accordance with Attachment 1~~.

3.2. Submit a completed Attachment 2 (or a form containing the same information as identified in Attachment 2) to its Transmission Planner within 90 calendar days of either (i) the date the data is recorded for a staged test; or(ii) the date the data is selected for verification using historical operational data.

B. Measures

M1. Each Generator Owner will have evidence that it performed the verification, such as a completed Attachment 2 or the Generator Owner form with the same information or dated information collected and used to complete attachments, and will have evidence that it submitted the information within 90 days to its Transmission Planner; such as dated electronic mail messages or mail receipts in accordance with Requirement R1.

M2. Each Generator Owner will have evidence that it performed the verification, such as a completed Attachment 2 or the Generator Owner form with the same information, or dated information collected and used to complete attachments and will have evidence that it submitted the information within 90 days to its Transmission Planner; such as dated electronic mail messages or mail receipts in accordance with Requirement R2.

M3. Each Transmission Owner will have evidence that it performed the verification, such as a completed Attachment 2 or the Transmission Owner form with equivalent information or dated information collected and used to complete attachments, and will have evidence that it submitted the information within 90 days to its Transmission Planner; such as dated electronic mail messages or mail receipts in accordance with Requirement R3.

C. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

The Regional Entity shall serve as the Compliance enforcement authority unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional entity approved by FERC or other applicable governmental authority shall serve as the CEA.

1.2. Evidence Retention

The following evidence retention periods identify a period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention specified below is shorter than the time since the last compliance audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Generator Owner and Transmission Owner shall each keep the data or evidence to show compliance as identified below, unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Generator Owner shall retain the latest MOD-025 Attachment 2 and the data behind Attachment 2 or Generator Owner form with equivalent information and submittal evidence for Requirements R1 and R2, Measures M1 and M2 for the time period since the last compliance audit.
- The Transmission Owner shall retain the latest MOD-025 Attachment 2 and the data behind Attachment 2 or Transmission Owner form with equivalent information and submittal evidence for Requirement R3, Measure M3 for the time period since the last compliance audit.

If a Generator Owner or Transmission Owner is found noncompliant, it shall keep information related to the noncompliance until mitigation is complete or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

1.4. Additional Compliance Information

None

Version 1	12/1/2005	1. Changed tabs in footer. 2. Removed comma after 2004 in "Development Steps Completed," #1. 3. Changed incorrect use of certain hyphens (-) to "en dash" (–) and "em dash (—)." 4. Added "periods" to items where appropriate. 5. Changed apostrophes to "smart" symbols. 6. Changed "Timeframe" to "Time Frame" in item D, 1.2. 7. Lower cased all instances of "regional" in section D.3. 8. Removed the word "less" after 94% in section 3.4. Level 4.	01/20/06
Version 2	TBD	Revised per SAR for Project 2007-09 and combined with MOD-024-1	TBD

MOD-025 Attachment 1 – Verification of Generator Real and Reactive Power Capability and Synchronous Condenser Reactive Power Capability

Periodicity for conducting a new verification:

The periodicity for performing Real and Reactive Power capability verification is as follows:

1. For staged verification; verify each applicable Facility at least every five years (with no more than 66 calendar months between verifications), or within 12 calendar months of the discovery of a change that affects its Real Power or Reactive Power capability by more than 10 percent of the last reported verified capability and is expected to last more than six months. The first verification for each applicable Facility under this standard must be a staged test.
2. For verification using operational data; verify each applicable Facility at least every five years (with no more than 66 calendar months between verifications), or within 12 calendar months following the discovery that its Real Power or Reactive Power capability has changed by more than 10 percent of the last reported verified capability and is expected to last more than six months. If data for different points is recorded on different days, designate the earliest of those dates as the verification date, and report that date as the verification date on MOD-025, Attachment 2 for periodicity purposes.
3. For either verification method, verify each new applicable Facility within 12 calendar months of its commercial operation date. Existing units that have been in long term shut down and have not been tested for more than five years shall be verified within 12 calendar months.

It is intended that Real Power testing be performed at the same time as full ~~Load~~ load Reactive Power testing, however separate testing is allowed for this standard. For synchronous condensers, perform only the Reactive Power capability verifications as specified below.

If the Reactive Power capability is verified through test, ~~the Generator Owner shall schedule the test with its Transmission Operator. The test shall~~ it is to be scheduled at a time advantageous for the unit being verified to demonstrate its Reactive Power capabilities while the Transmission Operator takes measures to maintain the plant's system bus voltage at the scheduled value or within acceptable tolerance of the scheduled value.

Verification specifications for applicable Facilities:

1. For generating units of 20 MVA or less that are part of a plant greater than 75 MVA in aggregate, record data either on an individual unit basis or as a group. Perform verification individually for every generating unit or synchronous condenser greater than 20 MVA (gross nameplate rating).

2. Verify with all auxiliary equipment needed for expected normal operation in service for both the Real Power and Reactive Power capability verification. Perform verification with the automatic voltage regulator in service for the Reactive Power capability verification~~ (see Note 3 if the automatic voltage regulator is not available)~~. Operational data from within the two years prior to the verification date is acceptable for the verification of either the Real Power or the Reactive Power capability, as long as a) that operational data meets the criteria in 2.1 through 2.4 below and b) the operational data demonstrates at least 90 percent of a previously staged test that demonstrated at least 50 percent of the Reactive capability shown on the associated thermal capability curve (D-curve). If the previously staged test was unduly restricted (so that it did not demonstrate at least 50 percent of the associated thermal capability curve) by unusual generation or equipment limitations (e.g., capacitor or reactor banks out of service), then the next verification ~~shall~~ will be by another staged test, not operational data:

2.1. Verify Real Power capability and Reactive Power capability over-excited (lagging) of all applicable Facilities at the applicable Facilities' normal (not emergency) expected maximum Real Power output at the time of the verifications.

2.1.1 Verify synchronous generating unit's maximum real power and lagging reactive power for a minimum of one hour.

2.1.2 Verify variable generating units, such as wind, solar, and run of river hydro, at the maximum Real Power output the variable resource can provide at the time of the verification. Perform verification of Reactive Power capability of wind turbines and photovoltaic inverters with at least 90 percent of the wind turbines or photovoltaic inverters at a site on-line. If verification of wind turbines or photovoltaic inverter Facility cannot be accomplished meeting the 90 percent threshold, document the reasons the threshold was not met and test to the full capability at the time of the test. Reschedule the test of the facility within six months of being able to reach the 90 percent threshold. Maintain, as steady as practical, Real and Reactive Power output during verifications.

2.2. Verify Reactive Power capability of all applicable Facilities, other than wind and photovoltaic, for maximum overexcited (lagging) and under-excited (leading) reactive capability for the following conditions:

2.2.1 At the minimum Real Power output at which they are normally expected to operate collect maximum leading and lagging reactive values as soon as a limit is reached.

2.2.2 At maximum Real Power output collect maximum leading reactive values as soon as a limit is reached.

2.2.3 Nuclear Units are not required to perform Reactive Power verification at minimum Real Power output.

2.3. For hydrogen-cooled generators, perform the verification at normal operating hydrogen pressure.

2.4. Calculate the Generator Step-Up (GSU) transformer losses if the verification measurements are taken from the high side of the GSU transformer. GSU

transformer real and reactive losses may be estimated, based on the GSU impedance, if necessary.

3. Record the following data for the verifications specified above:

3.1. The value of the gross Real and Reactive Power generating capabilities at the end of the verification period.

3.2. The voltage schedule provided by the Transmission Operator, if applicable.

3.3. The voltage at the high and low side of the GSU and/or system interconnection transformer(s) at the end of the verification period. If only one of these values is metered, the other may be calculated.

3.4. The ambient conditions, if applicable, at the end of the verification period that the Generator Owner requires to perform corrections to Real Power for different ambient conditions such as:

- Ambient air temperature
- Relative humidity
- Cooling water temperature
- Other data as determined to be applicable by the Generator Owner to perf~~r~~orm corrections for ambient conditions.

3.5. The date and time of the verification period, including start and end time in hours and minutes.

3.6. The existing GSU and/or system interconnection transformer(s) voltage ratio and tap setting.

3.7. The GSU transformer losses (real or reactive) if the verification measurements were taken from the high side of the GSU transformer.

3.8. Whether the test data is a result of a staged test or if it is operational data.

4. Develop a simplified key one-line diagram (refer to MOD-025, Attachment 2) showing sources of auxiliary Real and Reactive Power and associated system connections for each unit verified. Include GSU and/or system Interconnection and auxiliary transformers. Show Reactive Power flows, with directional arrows.

4.1. If metering does not exist to measure specific Reactive auxiliary ~~L~~load(s), provide an engineering estimate and associated calculations. Transformer Real and Reactive Power losses will also be estimates or calculations. Only output data are required when using a computer program to calculate losses or loads.

5. If an adjustment is requested by the Transmission Planner, then develop the relationships between test conditions and generator output so that the amount of Real Power that can be expected to be delivered from a generator can be determined at different conditions, such as peak summer conditions~~, can be determined~~. Adjust MW values tested to the ambient conditions specified by the Transmission Planner upon request and submit them to the Transmission Planner within 90 days of the request or the date the data was recorded/selected whichever is later.

Note 1: Under some transmission system conditions, the data points obtained by the Mvar verification required by the standard will not duplicate the manufacturer supplied thermal capability curve (D-curve). However, the verification required by the standard, even when conducted under these transmission system conditions, may uncover applicable Facility limitations; such as rotor thermal instability, improper tap settings or voltage ratios, inaccurate AVR operation, etc., which could be further analyzed for resolution. The Mvar limit level(s) achieved during a staged test or from operational data may not be representative of the unit's reactive capability for extreme system conditions. See Note 2.

Note 2: While not required by the standard, it is desirable to perform engineering analyses to determine expected applicable Facility capabilities under less restrictive system voltages than those encountered during the verification. Even though this analysis will not verify the complete thermal capability curve (D-curve), it provides a reasonable estimate of applicable Facility capability that the Transmission Planner can use for modeling.

~~Note 3: It is desired that the automatic voltage regulator be in service when testing a generator's reactive capability. If an automatic voltage regulator is not installed on the unit to be tested, or is not available at the time of the test, exercise extra caution not to exceed the operating limits of the generator.~~

Note 3~~4~~: The Reactive Power verification is intended to define the limits of the unit's Reactive Power capabilities. If a unit has no leading capability, then it should be reported with no leading capability; or the minimum lagging capability at which it can operate.

Note 4~~5~~: Synchronous Condensers only need to be tested at two points (one over-excited point and one under-excited point) since they have no Real Power output.

MOD-025 Attachment 2

One-line Diagram, Table, and Summary for Verification Information Reporting

Note: If the configuration of the applicable Facility does not lend itself to the use of the diagram, tables, or summaries for reporting the required information, changes may be made to this form, provided that all required information (identified in MOD-025, Attachment 1) is reported.

Company: **Reported By (name):**

Effective Dates

In those jurisdictions where regulatory approval is required:

- By the first day of the next calendar quarter, two calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO

governmental authorities, each Generator Owner and Transmission Owner shall have verified at least 40 percent of its applicable units.

- By the first day of the next calendar quarter, three calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified at least 60 percent of its applicable units.
- By the first day of the next calendar quarter, four calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified at least 80 percent of its applicable units.
- By the first day of the next calendar quarter, five calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified 100 percent of its applicable units.

In those jurisdictions where regulatory approval is not required:

- By the first day of the next calendar quarter, two calendar years following Board of Trustees approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified at least 40 percent of its applicable units.
- By the first day of the next calendar quarter, three calendar years following Board of Trustees approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified at least 60 percent of its applicable units.
- By the first day of the next calendar quarter, four calendar years following Board of Trustees approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified at least 80 percent of its applicable units.
- By the first day of the next calendar quarter, five calendar years following Board of Trustees approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified 100 percent of its applicable units.

The Implementation Plan phasing proposed is designed to allow large entities with dozens of units requiring verification an adequate amount of time to obtain resources and conduct testing to become fully compliant with standard requirements. The phase in period is set at five years with expectation at least 20 percent of an entities' applicable units will be verified annually with full compliance achieved by the end of the five year period. The 20 percent annual increment threshold was also selected to ensure that small entities with few units have incentive to become fully compliant in a timely manner and not delay verification of its applicable units until the fifth year of the phasing period.

Wind Farm Verification - If an entity has two wind sites, and verification of one site is complete, the entity is 50% complete regardless of the number of turbines at each site. A wind site is a group of wind turbines connected at a common point of interconnection or utilizing a common aggregate control system.

It is the intent of *ReliabilityFirst* to perform a review of both the MOD-024-RFC-01 and MOD-025-RFC-01 standards upon NERC Board of Trustees approval of the associated NERC MOD-025-2 standard. The purpose of the review would be to ensure that any duplicative requirements or any requirements which are less restrictive or do not add additional detail will be considered for retirement. The steps outlined in the *ReliabilityFirst* Reliability Standards Development Procedure will be followed for any such revisions or retirements.

Retirements

MOD-024-1 - Verification of Generator Gross and Net Real Power Capability and MOD-025-1 - Verification of Generator Gross and Net Reactive Power Capability should both be retired at midnight of the day immediately prior to the Effective Date of MOD-025-2 in the particular jurisdiction in which the new standard is becoming effective.

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. SAR posted for comment (April 20–May 21, 2007).
2. Revised SAR and response to comments posted (July 5, 2007).
3. Revised SAR and response to comments approved by SC (June 14, 2007).
4. SDT appointed on (August 18, 2007).
5. Posted first draft of standard for a 30 day comment period June 15 –July 15, 2011
6. Posted second draft of standard for 45-day concurrent formal comment period and initial ballot February 29 – March 16, 2012.
7. Posted second draft of standard for 30-day concurrent formal comment period and successive ballot September 28 – October 31, 2012.

Proposed Action Plan and Description of Current Draft:

This is the third draft of the proposed standard including Time Horizons, Data Retention, Violation Risk Factors, and Violation Severity Levels; and is being submitted for a 45-day concurrent formal comment period and successive ballot.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. BOT adoption.	February 2013
2. File with regulatory authorities.	April 2013

A. Introduction

1. **Title:** Verification of Models and Data for Turbine/Governor and Load Control or Active Power/Frequency Control Functions

2. **Number:** MOD-027-1

3. **Purpose:** To verify that the turbine/governor and load control or active power/frequency control[1] model and the model parameters, used in dynamic simulations that assess Bulk Electric System (BES) reliability, accurately represent generator unit real power response to system frequency variations.

4. **Applicability:**

4.1. Functional entities

4.1.1 Generator Owner

4.1.2 Transmission Planner

4.2. Facilities

For the purpose of the requirements contained herein, Facilities that are directly connected to the Bulk Electric System (BES) will be collectively referred to as an "applicable unit" that meet the following:

4.2.1 Generation in the Eastern or Quebec Interconnections with the following characteristics:

4.2.1.1 Individual generating unit greater than 100 MVA (gross nameplate rating).

4.2.1.2 Individual generating plant consisting of multiple generating units that are directly connected at a common BES bus with total generation greater than 100 MVA (gross aggregate nameplate rating).

4.2.2 Generation in the Western Interconnection with the following characteristics:

4.2.2.1 Individual generating unit greater than 75 MVA (gross nameplate rating).

4.2.2.2 Individual generating plant consisting of multiple generating units that are directly connected at a common BES bus with total generation greater than 75 MVA (gross aggregate nameplate rating).

4.2.3 Generation in the ERCOT Interconnection with the following characteristics:

---

[1] Turbine/governor and load control or active power/frequency control:

a. Turbine/governor and load control applies to conventional synchronous generation.

b. Active power/frequency control applies to inverter connected generators (often found at variable energy plants).

4.2.3.1 Individual generating unit greater than 50 MVA (gross nameplate rating).

4.2.3.2 Individual generating plant consisting of multiple generating units that are directly connected at a common BES bus with total generation greater than 75 MVA (gross aggregate nameplate rating).

5. Effective Date:

5.1. For Requirements R1, and R3 through R5, the first day of the first calendar quarter beyond the date that this standard is approved by applicable regulatory authorities or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities. In those jurisdictions where regulatory approval is not required, the standard shall become effective on the first day of the first calendar quarter beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

5.2. For Requirement R2, 30 percent of the entity's applicable unit gross MVA for each Interconnection on the first day of the first calendar quarter that is four years following applicable regulatory approval or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, or in those jurisdictions where no regulatory approval is required, on the first day of the first calendar quarter that is four years following NERC Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

5.3. For Requirement R2, 50 percent of the entity's applicable unit gross MVA for each Interconnection on first day of the first calendar quarter that is six years following applicable regulatory approval or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, or in those jurisdictions where no regulatory approval is required, on the first day of the first calendar quarter that is six years following NERC Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

5.4. For Requirement R2, 100 percent of the entity's applicable unit gross MVA for each Interconnection on the first day of the first calendar quarter that is 10 years following applicable regulatory approval or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, or in those jurisdictions where no regulatory approval is required, on the first day of the first calendar quarter that is 10 years following NERC Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

B. Requirements

R1. Each Transmission Planner shall provide the following requested information to the Generator Owner within 90 calendar days of receiving a written request: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

- Instructions on how to obtain the list of turbine/governor and load control or active power/frequency control system models that are acceptable to the Transmission Planner for use in dynamic simulation,
- Instructions on how to obtain the dynamic turbine/governor and load control or active power/frequency control function model library block diagrams and/or data sheets for models that are acceptable to the Transmission Planner, or
- Model data for any of the Generator Owner's existing applicable unit specific turbine/governor and load control or active power/frequency control system contained in the Transmission Planner's dynamic database from the current (in-use) models.

R2. Each Generator Owner shall provide, for each applicable unit, a verified turbine/governor and load control or active power/frequency control model, including documentation and data (as specified in Part 2.1) to its Transmission Planner in accordance with the periodicity specified in MOD-027 Attachment 1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

2.1. Each applicable unit's model shall be verified by the Generator Owner using one or more models acceptable to the Transmission Planner. Verification for individual units rated less than 20 MVA (gross nameplate rating) in a generating plant (per Section 4.2.1.2, 4.2.2.2, or 4.2.3.2) may be performed using either individual unit or aggregate unit model(s) or both. Each verification shall include the following:

2.1.1. Documentation comparing the applicable unit's MW model response to the recorded MW response for either:

- A frequency excursion from a system disturbance that meets MOD-027 Attachment 1 Note 1 with the applicable unit on-line,
- A speed governor reference change with the applicable unit on-line, or
- A partial load rejection test,[2]

2.1.2. Type of governor and load control or active power control/frequency control[1] equipment,

[2] Differences between the control mode tested and the final simulation model must be identified, particularly when analyzing load rejection data. Most controls change gains or have a set point runback which takes effect when the breaker opens. Load or set point controls will also not be in effect once the breaker opens. Some method of accounting for these differences must be presented if the final model is not validated from on-line data under the normal operating conditions under which the model is expected to apply

2.1.3. A description of the turbine (e.g. for hydro turbine - Kaplan, Francis, or Pelton; for steam turbine - boiler type, normal fuel type, and turbine type; for gas turbine - the type and manufacturer; for variable energy plant - type and manufacturer),

2.1.4. Model structure and data for turbine/governor and load control or active power/frequency control, and

2.1.5. Representation of the real power response effects of outer loop controls (such as operator set point controls, and load control but excluding AGC control) that would override the governor response (including blocked or nonfunctioning governors or modes of operation that limit Frequency Response), if applicable.

R3. Each Generator Owner shall provide a written response to its Transmission Planner within 90 calendar days of receiving one of the following items for an applicable unit.

- Written notification, from its Transmission Planner (in accordance with Requirement R5) that the turbine/governor and load control or active power/frequency control model is not "usable,"
- Written comments from its Transmission Planner identifying technical concerns with the verification documentation related to the turbine/governor and load control or active power/frequency control model, or
- Written comments and supporting evidence from its Transmission Planner indicating that the simulated turbine/governor and load control or active power/frequency control response did not approximate the recorded response for three or more transmission system events.

The written response shall contain either the technical basis for maintaining the current model, the model changes, or a plan to perform model verification[3] (in accordance with Requirement R2). *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

R4. Each Generator Owner shall provide revised model data or plans to perform model verification[4] (in accordance with Requirement R2) for an applicable unit to its Transmission Planner within 180 calendar days of making changes to the turbine/governor and load control or active power/frequency control system that alter the equipment response characteristic[5]. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

R5. Each Transmission Planner shall provide a written response to the Generator Owner within 90 calendar days of receiving the turbine/governor and load control or active power/frequency control system verified model information in accordance with

---

[3] If verification is performed, the 10 year period as outlined in MOD-027 Attachment 1 is reset.

[4] Ibid.

[5] Control replacement or alteration including software alterations or plant digital control system addition or replacement, plant digital control system software alterations that alter droop, and/or dead band, and/or frequency response and/or a change in the frequency control mode (such as going from droop control to constant MW control, etc).

Requirement R2 that the model is usable (meets the criteria specified in Parts 5.1 through 5.3) or is not usable.

5.1. The turbine/governor and load control or active power/frequency control function model initializes to compute modeling data without error,

5.2. A no-disturbance simulation results in negligible transients, and

5.3. For an otherwise stable simulation, a disturbance simulation results in the turbine/governor and load control or active power/frequency control model exhibiting positive damping.

If the model is not usable, the Transmission Planner shall provide a technical description of why the model is not usable. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

C. Measures

M1. The Transmission Planner must have and provide the dated request for instructions or data, the transmitted instruction or data, and dated evidence of a written transmittal (e.g., electronic mail message, postal receipt, or confirmation of facsimile) as evidence that it provided the request within 90 calendar days in accordance with Requirement R1.

M2. The Generator Owner must have and provide dated evidence it verified each generator turbine/governor and load control or active power/frequency control model according to Part 2.1 for each applicable unit and a dated transmittal (e.g., electronic mail message, postal receipt, or confirmation of facsimile) as evidence it provided the model, documentation, and data to its Transmission Planner, in accordance with Requirement R2.

M3. Evidence for Requirement R3 must include the Generator Owner's dated written response containing the information identified in Requirement R3 and dated evidence of transmittal (e.g., electronic mail message, postal receipt, or confirmation of facsimile) of the response.

M4. Evidence for Requirement R4 must include, for each of the Generator Owner's applicable units for which system changes specified in Requirement R4 were made, dated revised model data or dated plans to perform a model verification and dated evidence of transmittal (e.g., electronic mail message, postal receipt, or confirmation of facsimile) within 180 calendar days of making changes.

M5. Evidence of Requirement R5 must include, for each model received, the dated response indicating the model was usable or not usable according to the criteria specified in Parts 5.1 through 5.3 and for a model that is not useable, a technical description is the model is not usable, and dated evidence of transmittal (e.g., electronic mail messages, postal receipts, or confirmation of facsimile) that the Generator Owner was notified within 90 calendar days of receipt of model information in accordance with Requirement R5.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

The Regional Entity shall serve as the Compliance Enforcement Authority unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional entity approved by FERC or other applicable governmental authority shall serve as the CEA.

1.2. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Generator Owner and Transmission Planner shall each keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Transmission Planner shall retain the information/data request and provided response evidence of Requirements R1 and R5, Measures M1 and M5 for 3 calendar years from the date the document was provided.
- The Generator Owner shall retain the latest turbine/governor and load control or active power/frequency control system model verification evidence of Requirement R2, Measure M2.
- The Generator Owner shall retain the information/data request and provided response evidence of Requirements R3, and R4 Measures M3 and M4 for 3 calendar years from the date the document was provided.

If a Generator Owner or Transmission Planner is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

1.4. Additional Compliance Information

None

2. Violation Severity Levels

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The Transmission Planner provided the instructions and data to the Generator Owner more than 90 calendar days but less than or equal to 120 calendar days of receiving a written request.	The Transmission Planner provided the instructions and data to the Generator Owner more than 120 calendar days but less than or equal to 150 calendar days of receiving a written request.	The Transmission Planner provided the instructions and data to the Generator Owner more than 150 calendar days but less than or equal to 180 calendar days of receiving a written request.	The Transmission Planner failed to provide the instructions and data to the Generator Owner within 180 calendar days of receiving a written request.
R2	The Generator Owner provided its verified model(s) to its Transmission Planner after the periodicity timeframe specified in MOD-027 Attachment 1 but less than or equal to 90 calendar days late; OR The Generator Owner provided the Transmission Planner a verified model that omitted one of the five Parts identified in Requirement R2, Subparts 2.1.1, through 2.1.5.	The Generator Owner provided its verified model(s) to its Transmission Planner more than 90 calendar days but less than or equal to 180 calendar days late as specified by the periodicity timeframe in MOD-027 Attachment 1; OR The Generator Owner provided the Transmission Planner a verified model that omitted two of the five Parts identified in Requirement R2, Subparts 2.1.1, through 2.1.5.	The Generator Owner provided its verified model(s) to its Transmission Planner more than 180 calendar days but less than or equal to 270 calendar days late as specified by the periodicity timeframe in MOD-027 Attachment 1; OR The Generator Owner provided the Transmission Planner verified models that omitted three of the five Parts identified in Requirement R2, Subparts 2.1.1, through 2.1.5.	The Generator Owner provided its verified model(s) more than 270 calendar days late to its Transmission Planner in accordance with the periodicity specified in MOD-027 Attachment 1; OR The Generator Owner failed to use model(s) acceptable to the Transmission Planner as specified in Requirement R2, Part 2.1; OR The Generator Owner provided the Transmission Planner verified model(s) that omitted four or more of the five Parts identified in Requirement R2, Subparts 2.1.1, through 2.1.5.

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL
R3	The Generator Owner provided a written response more than 90 calendar days but less than or equal to 120 calendar days of receiving written notice.	The Generator Owner provided a written response more than 120 calendar days but less than or equal to 150 calendar days of receiving written notice.	The Generator Owner provided a written response more than 150 calendar days but less than or equal to 180 calendar days of receiving written notice.	The Generator Owner failed to provide a written response within 180 calendar days of receiving written notice; OR The Generator Owner's written response failed to contain either the technical basis for maintaining the current model, or a list of future model changes, or a plan to perform another model verification.
R4	The Generator Owner provided revised model data or plans to perform model verification more than 180 calendar days but less than or equal to 210 calendar days of making changes to the turbine/governor and load control or active power/frequency control system that alter the equipment response characteristic.	The Generator Owner provided revised model data or plans to perform model verification more than 210 calendar days but less than or equal to 240 calendar days of making changes to the turbine/governor and load control or active power/frequency control system that alter the equipment response characteristic.	The Generator Owner provided revised model data or plans to perform model verification more than 240 calendar days but less than or equal to 270 calendar days of making changes to the turbine/governor and load control or active power/frequency control system that alter the equipment response characteristic.	The Generator Owner failed to provide revised model data or failed to provide plans to perform model verification within 270 calendar days of making changes to the turbine/governor and load control or active power/frequency control system that altered the equipment response characteristic.

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL
R5	The Transmission Planner provided a written response to the Generator Owner indicating whether the model is usable or not usable, including a technical description if the model is not usable, more than 90 calendar days but less than or equal to 120 calendar days of receiving verified model information;	The Transmission Planner provided a written response to the Generator Owner indicating whether the model is usable or not usable, including a technical description if the model is not usable, more than 120 calendar days but less than or equal to 150 calendar days of receiving the verified model information; OR The Transmission Planner's written response omitted confirmation for one of the specified model criteria listed in Requirement R5, Parts 5.1 through 5.3.	The Transmission Planner provided a written response to the Generator Owner indicating whether the model is usable or not usable, including a technical description if the model is not usable, more than 150 calendar days but less than or equal to 180 calendar days of receiving the verified model information; OR The Transmission Planner's written response omitted confirmation for two of the specified model criteria listed in Requirement R5, Parts 5.1 through 5.3.	The Transmission Planner failed to provide a written response to the Generator Owner within 180 calendar days of receiving the verified model information; OR The Transmission Planner provided a written response without including confirmation of all specified model criteria listed in Requirement R5, Parts 5.1 through 5.3.

MOD-027 Attachment 1

Turbine/Governor and Load Control or Active Power/Frequency Control Model Periodicity

Row Number	Verification Condition	Required Action
1	Establishing the initial verification date for an applicable unit. (Requirement R2)	Transmit the verified model, documentation and data to the Transmission Planner on or before the Effective Date. Row 5 applies when calculating generation fleet compliance during the 10year implementation period. See Section A5 for Effective Dates.
2	Subsequent verification for an applicable unit. (Requirement R2)	Transmit the verified model, documentation and data to the Transmission Planner on or before the 10-year anniversary of the last transmittal (per Note 2).
3	Applicable unit is not subjected to a frequency excursion per Note 1 by the date otherwise required to meet the dates per Rows 1, 2, 4, or 6. (This row is only applicable if a frequency excursion from a system disturbance that meets Note 1 is selected for the verification method and the ability to record the applicable unit's real power response to a frequency excursion is installed and expected to be available). (Requirement R2)	Requirement 2 is met with a written statement to that effect transmitted to the Transmission Planner. Transmit the verified model, documentation and data to the Transmission Planner on or before 365 calendar days after a frequency excursion per Note 1 occurs and the recording equipment captures the applicable unit's real power response as expected.
4	Initial verification for a new applicable unit or for an existing applicable unit with new turbine/governor and load control or active power/frequency control equipment installed. (Requirement R2)	Transmit the verified model, documentation and data to the Transmission Planner within 365 calendar days after the commissioning date.

MOD-027 Attachment 1 Turbine/Governor and Load Control or Active Power/Frequency Control Model Periodicity		
Row Number	**Verification Condition**	**Required Action**
5	Existing applicable unit that is equivalent to another applicable unit(s) at the same physical location; AND Each applicable unit has the same MVA nameplate rating; AND The nameplate rating is ≤ 350 MVA; AND Each applicable unit has the same components and settings; AND The model for one of these equivalent applicable units has been verified. (Requirement R2)	Document circumstance with a written statement and include with the verified model, documentation and data provided to the Transmission Planner for the verified equivalent unit. Verify a different equivalent unit during each 10-year verification period. Applies to Row 1 when calculating generation fleet compliance during the 10-year implementation period.
6	The Generator Owner has submitted a verification plan. (Requirement R3 or R4)	Transmit the verified model, documentation and data to the Transmission Planner within 365 calendar days after the submittal of the verification plan.

MOD-027 Attachment 1

Turbine/Governor and Load Control or Active Power/Frequency Control Model Periodicity

Row Number	Verification Condition	Required Action
7	Applicable unit is not responsive to both over and under frequency excursion events (The applicable unit does not operate in a frequency control mode, except during normal start up and shut down, that would result in a turbine/governor and load control or active power/frequency control mode response.); OR Applicable unit either does not have an installed frequency control system or has a disabled frequency control system. (Requirement R2)	Requirement 2 is met with a written statement to that effect transmitted to the Transmission Planner. Perform verification per the periodicity specified in Row 4 for a "New Generating Unit" (or new equipment) only if responsive control mode operation for connected operations is established.
8	Existing applicable unit has a current average net capacity factor over the most recent three calendar years, beginning on January 1 and ending on December 31 of 5% or less. (Requirement R2)	Requirement 2 is met with a written statement to that effect transmitted to the Transmission Planner. At the end of this 10 calendar year timeframe, the current average three year net capacity factor (for years 8, 9, and 10) can be examined to determine if the capacity factor exemption can be declared for the next 10 calendar year period. If not eligible for the capacity factor exemption, then model verification must be completed within 365 calendar days of the date the capacity factor exemption expired. For the definition of net capacity factor, refer to Appendix F of the GADS Data Reporting Instructions on the NERC website.

MOD-027 Attachment 1

Turbine/Governor and Load Control or Active Power/Frequency Control Model Periodicity

Row Number	Verification Condition	Required Action

NOTES:

NOTE 1: Unit model verification frequency excursion criteria:

- $\geq$ 0.05 hertz deviation (nadir point) from scheduled frequency for the Eastern Interconnection with the applicable unit operating in a frequency responsive mode
- $\geq$ 0.10 hertz deviation (nadir point) from scheduled frequency for the ERCOT and Western Interconnections with the applicable unit operating in a frequency responsive mode
- $\geq$ 0.15 hertz deviation (nadir point) from scheduled frequency for the Quebec Interconnection with the applicable unit operating in a frequency responsive mode

NOTE 2: Establishing the recurring ten year unit verification period start date:

- The start date is the actual date of submittal of a verified model to the Transmission Planner for the most recently performed unit verification.

NOTE 3: Consideration for early compliance:

Existing turbine/governor and load control or active power/frequency control model verification is sufficient for demonstrating compliance for a 10 year period from the actual transmittal date if either of the following applies:

- The Generator Owner has a verified model that is compliant with the applicable regional policies, guidelines or criteria existing at the time of model verification
- The Generator Owner has an existing verified model that is compliant with the requirements of this standard

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. SAR posted for comment (April 20–May 21, 2007).
2. Revised SAR and response to comments posted (July 5, 2007).
3. Revised SAR and response to comments approved by SC (June 14, 2007).
4. SDT appointed on (August 18, 2007).
5. Posted first draft of standard for a 30 day comment period June 15 –July 15, 2011
6. Posted second draft of standard for 45-day concurrent formal comment period and initial ballot February 29 – March 16, 2012.

Proposed Action Plan and Description of Current Draft:

This is the third draft of the proposed standard including Time Horizons, Data Retention, Violation Risk Factors, and Violation Severity Levels; and is being submitted for a 45-day concurrent formal comment period and successive ballot.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Develop responses to ballot comments.	April - July 2012
2. Post response to comments and third version draft revision of standard for 30-day comment and successive ballot period.	October - November 2012
3. Develop responses to ballot comments.	December 2012 – January 2013
4. Post responses to comments and conduct recirculation ballot.	February 2013
5. BOT adoption.	March 2013
6. File with regulatory authorities.	April 2013

A. Introduction

1. **Title:** Verification of Models and Data for Turbine/Governor and Load Control or Active Power/Frequency Control Functions

2. **Number:** MOD-027-1

3. **Purpose:** To verify that the turbine/governor and load control or active power/frequency control[1] model and the model parameters, used in dynamic simulations that assess Bulk Electric System (BES) reliability, accurately represent generator unit real power response to system frequency variations.

4. **Applicability:**

4.1. Functional entities

4.1.1 Generator Owner

4.1.2 Transmission Planner

4.2. Facilities

For the purpose of the requirements contained herein, Facilities that are directly connected to the Bulk Electric System (BES) will be collectively referred to as an "applicable unit" that meet the following:

4.2.1 Generation in the Eastern or Quebec Interconnections with the following characteristics:

4.2.1.1 Individual generating unit greater than 100 MVA (gross nameplate rating).

4.2.1.2 Individual generating plant consisting of multiple generating units that are directly connected at a common BES bus with total generation greater than 100 MVA (gross aggregate nameplate rating).

4.2.2 Generation in the Western Interconnection with the following characteristics:

4.2.2.1 Individual generating unit greater than 75 MVA (gross nameplate rating).

4.2.2.2 Individual generating plant consisting of multiple generating units that are directly connected at a common BES bus with total generation greater than 75 MVA (gross aggregate nameplate rating).

4.2.3 Generation in the ERCOT Interconnection with the following characteristics:

[1] Turbine/governor and load control or active power/frequency control:

a. Turbine/governor and load control applies to conventional synchronous generation.

b. Active power/frequency control applies to inverter connected generators (often found at variable energy plants).

4.2.3.1 Individual generating unit greater than 50 MVA (gross nameplate rating).

4.2.3.2 Individual generating plant consisting of multiple generating units that are directly connected at a common BES bus with total generation greater than 75 MVA (gross aggregate nameplate rating).

5. Effective Date:

5.1. For Requirements R1, and R3 through R5~~6~~, the first day of the first calendar quarter beyond the date that this standard is approved by applicable regulatory authorities or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities. In those jurisdictions where regulatory approval is not required, the standard shall become effective on the first day of the first calendar quarter beyond the date this standard is approved by the NERC Board of Trustees, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

5.2. For Requirement R2, 30 percent of the entity's applicable unit gross MVA for each Interconnection on the first day of the first calendar quarter that is four years following applicable regulatory approval or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, or in those jurisdictions where no regulatory approval is required, on the first day of the first calendar quarter that is four years following NERC Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

5.3. For Requirement R2, 50 percent of the entity's applicable unit gross MVA for each Interconnection on first day of the first calendar quarter that is six years following applicable regulatory approval or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, or in those jurisdictions where no regulatory approval is required, on the first day of the first calendar quarter ~~thirty~~ that is six years following NERC Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

5.4. For Requirement R2, 100 percent of the entity's applicable unit gross MVA for each Interconnection on the first day of the first calendar quarter that is 10 years following applicable regulatory approval or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, or in those jurisdictions where no regulatory approval is required, on the first day of the first calendar quarter that is 10 years following NERC Board of Trustees adoption or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

B. Requirements

R1. Each Transmission Planner shall provide ~~one or more of~~ the following ~~to its requesting~~ requested information to the Generator Owner within 90 calendar days of receiving a written request: *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

- Instructions on how to obtain the list of turbine/governor and load control or active power/frequency control system models that are acceptable to the Transmission Planner for use in dynamic simulation,
- Instructions on how to obtain the dynamic turbine/governor and load control or active power/frequency control function model library block diagrams and/or data sheets for models that are acceptable to the Transmission Planner, or
- Model data for any of the Generator Owner's existing applicable unit specific turbine/governor and load control or active power/frequency control system contained in the Transmission Planner's dynamic database from the current (in-use) models.

R2. Each Generator Owner shall provide, for each applicable unit, a verified turbine/governor and load control or active power/frequency control model, including documentation and data (as specified in Part 2.1) to its Transmission Planner in accordance with the periodicity specified in MOD-027 Attachment 1. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

2.1. Each applicable unit's model shall be verified by the Generator Owner using one or more models acceptable to the Transmission Planner. Verification ~~of~~ for~~an~~ individual units rated less than 20 MVA (gross nameplate rating) in a generating plant (per Section 4.2.1.2, 4.2.2.2, or 4.2.3.2) may be performed using either individual unit or ~~plant~~ aggregate unit model(s) or both. Each verification shall include the following:

2.1.1. Documentation comparing the applicable unit's MW model response to the recorded MW response for either:

- A frequency excursion from a system disturbance that meets MOD-027 Attachment 1 Note 1 with the applicable unit on-line,
- A speed governor reference change with the applicable unit on-line, or
- A partial load rejection test,[2]

2.1.2. Type of governor and load control or active power control/frequency control[1] equipment,

[2] Differences between the control mode tested and the final simulation model must be identified, particularly when analyzing load rejection data. Most controls change gains or have a set point runback which takes effect when the breaker opens. Load or set point controls will also not be in effect once the breaker opens. Some method of accounting for these differences must be presented if the final model is not validated from on-line data under the normal operating conditions under which the model is expected to apply

2.1.3. A description of the turbine (e.g. for hydro turbine - Kaplan, Francis, or Pelton; for steam turbine - boiler type, normal fuel type, and turbine type; for gas turbine - the type and manufacturer; for variable energy plant - type and manufacturer),

2.1.4. Model structure and data for turbine/governor and load control or active power/frequency control, and

2.1.5. Representation of the real power response effects of outer loop controls (such as operator set point controls, and load control but excluding AGC control) that would override the governor response (including blocked or nonfunctioning governors or modes of operation that limit Frequency Response), if applicable.

R3. Each Generator Owner shall provide a written response to its Transmission Planner within 90 calendar days of receiving one of the following items for an applicable unit.

- Written notification, from its Transmission Planner (in accordance with Requirement R5) that the turbine/governor and load control or active power/frequency control model is not "usable,"
- Written comments from its Transmission Planner identifying technical concerns with the verification documentation related to the turbine/governor and load control or active power/frequency control model, or
- Written comments and supporting evidence from its Transmission Planner indicating that the simulated turbine/governor and load control or active power/frequency control response did not approximate the recorded response for three or more transmission system events.

The written response shall contain either the technical basis for maintaining the current model, the model changes, or a plan to perform model verification[3] (in accordance with Requirement R2). *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

R4. Each Generator Owner shall provide revised model data or plans to perform model verification[4] (in accordance with Requirement R2) for an applicable unit to its Transmission Planner within 180 calendar days of making changes to the turbine/governor and load control or active power/frequency control system that alter the equipment response characteristic[5]. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

R5. Each Transmission Planner shall provide a written response to~~notify~~ the Generator Owner within 90 calendar days of receiving the turbine/governor and load control or active power/frequency control system verified model information in accordance with

[3] If verification is performed, the 10 year period as outlined in MOD-027 Attachment 1 is reset.

[4] Ibid.

[5] Control replacement or alteration including software alterations or plant digital control system addition or replacement, plant digital control system software alterations that alter droop, and/or dead band, and/or frequency response and/or a change in the frequency control mode (such as going from droop control to constant MW control, etc).

Requirement R2 that the model is usable (meets the criteria specified in Parts 5.1 through 5.3) or is not usable~~; and shall include a technical description if the model is not usable that includes the following: [Violation Risk Factor: Medium] [Time Horizon: Operations Planning]~~.

5.1. The turbine/governor and load control or active power/frequency control function model initializes to compute modeling data without error,

5.2. A no-disturbance simulation results in negligible transients, and

5.3. For an otherwise stable simulation, a disturbance simulation results in the turbine/governor and load control or active power/frequency control model exhibiting positive damping.

If the model is not usable, the Transmission Planner shall provide a technical description of why the model is not usable. *[Violation Risk Factor: Medium] [Time Horizon: Operations Planning]*

C. Measures

M1. The Transmission Planner must have and provide the dated request for instructions or data, the transmitted instruction or data, and dated evidence of a written transmittal (e.g., electronic mail message, postal receipt, or confirmation of facsimile) as evidence that it provided the request within 90 calendar days in accordance with Requirement R1.

M2. The Generator Owner must have and provide dated evidence it verified each generator turbine/governor and load control or active power/frequency control model according to Part 2.1 for each applicable unit and a dated transmittal (e.g., electronic mail message, postal receipt, or confirmation of facsimile) as evidence it provided the model, documentation, and data to its Transmission Planner, in accordance with Requirement R2.

M3. Evidence for Requirement R3 must include the Generator Owner's dated written response containing the information identified in Requirement R3 and dated evidence of transmittal (e.g., electronic mail message, postal receipt, or confirmation of facsimile) of the response.

M4. Evidence for Requirement R4 must include, for each of the Generator Owner's applicable units for which system changes specified in Requirement R4 were made, dated revised model data or dated plans to perform a model verification and dated evidence of transmittal (e.g., electronic mail message, postal receipt, or confirmation of facsimile) within 180 calendar days of making changes.

M5. Evidence of Requirement R5 must include, for each model received, the dated response indicating the model was usable or not usable according to the criteria specified in Parts 5.1 through 5.3 and for a model that is not useable, a technical description is the model is not usable, and dated evidence of transmittal (e.g., electronic mail messages, postal receipts, or confirmation of facsimile) that the Generator Owner was notified within 90 calendar days of receipt of model information in accordance with Requirement R5.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

The Regional Entity shall serve as the Compliance Enforcement Authority unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional entity approved by FERC or other applicable governmental authority shall serve as the CEA.

1.2. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Generator Owner and Transmission Planner shall each keep data or evidence to show compliance as identified below unless directed by its Compliance Enforcement Authority to retain specific evidence for a longer period of time as part of an investigation:

- The Transmission Planner shall retain the information/data request and provided response evidence of Requirements R1 and R5, Measures M1 and M5 for 3 calendar years from the date the document was provided.
- The Generator Owner shall retain the latest turbine/governor and load control or active power/frequency control system model verification evidence of Requirement R2, Measure M2.
- The Generator Owner shall retain the information/data request and provided response evidence of Requirements R3, and R4 Measures M3 and M4 for 3 calendar years from the date the document was provided.

If a Generator Owner or Transmission Planner is found non-compliant, it shall keep information related to the non-compliance until mitigation is complete and approved or for the time specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

1.4. Additional Compliance Information

None

2. Violation Severity Levels

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The Transmission Planner provided the instructions and data to the Generator Owner more than 90 calendar days but less than or equal to 120 calendar days of receiving a written request.	The Transmission Planner provided the instructions and data to the Generator Owner more than 120 calendar days but less than or equal to 150 calendar days of receiving a written request.	The Transmission Planner provided the instructions and data to the Generator Owner more than 150 calendar days but less than or equal to 180 calendar days of receiving a written request.	The Transmission Planner failed to provide the instructions and data to the Generator Owner within 180 calendar days of receiving a written request.
R2	The Generator Owner provided its verified model(s) to its Transmission Planner after the periodicity timeframe specified in MOD-027 Attachment 1 but less than or equal to 90 calendar days late; OR The Generator Owner provided the Transmission Planner a verified model that omitted one of the five Parts identified in Requirement R2, Subparts 2.1.1, through 2.1.5.	The Generator Owner provided its verified model(s) to its Transmission Planner more than 90 calendar days but less than or equal to 180 calendar days late as specified by the periodicity timeframe in MOD-027 Attachment 1; OR The Generator Owner provided the Transmission Planner a verified model that omitted two of the five Parts identified in Requirement R2, Subparts 2.1.1, through 2.1.5.	The Generator Owner provided its verified model(s) to its Transmission Planner more than 180 calendar days but less than or equal to 270 calendar days late as specified by the periodicity timeframe in MOD-027 Attachment 1; OR The Generator Owner provided the Transmission Planner verified models that omitted three of the five Parts identified in Requirement R2, Subparts 2.1.1, through 2.1.5.	The Generator Owner provided its verified model(s) more than 270 calendar days late to its Transmission Planner in accordance with the periodicity specified in MOD-027 Attachment 1; OR The Generator Owner failed to use model(s) acceptable to the Transmission Planner as specified in Requirement R2, Part 2.1; OR The Generator Owner provided the Transmission Planner verified model(s) that omitted four or more of the five Parts identified in Requirement R2, Subparts 2.1.1, through 2.1.5.

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL
R3	The Generator Owner provided a written response more than 90 calendar days but less than or equal to 120 calendar days of receiving written notice.	The Generator Owner provided a written response more than 120 calendar days but less than or equal to 150 calendar days of receiving written notice.	The Generator Owner provided a written response more than 150 calendar days but less than or equal to 180 calendar days of receiving written notice.	The Generator Owner failed to provide a written response within 180 calendar days of receiving written notice; OR The Generator Owner's written response failed to contain either the technical basis for maintaining the current model, or a list of future model changes, or a plan to perform another model verification.
R4	The Generator Owner provided revised model data or plans to perform model verification more than 180 calendar days but less than or equal to 210 calendar days of making changes to the turbine/governor and load control or active power/frequency control system that alter the equipment response characteristic.	The Generator Owner provided revised model data or plans to perform model verification more than 210 calendar days but less than or equal to 240 calendar days of making changes to the turbine/governor and load control or active power/frequency control system that alter the equipment response characteristic.	The Generator Owner provided revised model data or plans to perform model verification more than 240 calendar days but less than or equal to 270 calendar days of making changes to the turbine/governor and load control or active power/frequency control system that alter the equipment response characteristic.	The Generator Owner failed to provide revised model data or failed to provide plans to perform model verification within 270 calendar days of making changes to the turbine/governor and load control or active power/frequency control system that altered the equipment response characteristic.

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL
R5	The Transmission Planner provided a written response to the Generator Owner indicating whether the model is usable or not usable, including a technical description if the model is not usable, more than 90 calendar days but less than or equal to 120 calendar days of receiving verified model information;	The Transmission Planner provided a written response to the Generator Owner indicating whether the model is usable or not usable, including a technical description if the model is not usable, more than 120 calendar days but less than or equal to 150 calendar days of receiving the verified model information; OR The Transmission Planner's written response omitted confirmation for one of the specified model criteria listed in Requirement R5, Parts 5.1 through 5.3.	The Transmission Planner provided a written response to the Generator Owner indicating whether the model is usable or not usable, including a technical description if the model is not usable, more than 150 calendar days but less than or equal to 180 calendar days of receiving the verified model information; OR The Transmission Planner's written response omitted confirmation for two of the specified model criteria listed in Requirement R5, Parts 5.1 through 5.3.	The Transmission Planner failed to provide a written response to the Generator Owner within 180 calendar days of receiving the verified model information; OR The Transmission Planner provided a written response without including confirmation of all specified model criteria listed in Requirement R5, Parts 5.1 through 5.3.

MOD-027 Attachment 1 Turbine/Governor and Load Control or Active Power/Frequency Control Model Periodicity		
Row Number	**Verification Condition**	**Required Action**
1	Establishing the initial verification date for an applicable unit. (Requirement R2)	Transmit the verified model, documentation and data to the Transmission Planner on or before the Effective Date. Row 5 applies when calculating generation fleet compliance during the 10year implementation period. See Section A5 for Effective Dates.
2	Subsequent verification for an applicable unit. (Requirement R2)	Transmit the verified model, documentation and data to the Transmission Planner on or before the 10-year anniversary of the last transmittal (per Note 2).
3	Applicable unit is not subjected to a frequency excursion per Note 1 by the date otherwise required to meet the dates per Rows 1, 2, 4, or 6. (This row is only applicable if a frequency excursion from a system disturbance that meets Note 1 is selected for the verification method and the ability to record the applicable unit's real power response to a frequency excursion is installed and expected to be available). (Requirement R2)	Requirement 2 is met with a written statement to that effect transmitted to the Transmission Planner. Transmit the verified model, documentation and data to the Transmission Planner on or before 365 calendar days after a frequency excursion per Note 1 occurs and the recording equipment captures the applicable unit's real power response as expected.
4	Initial verification for a new applicable unit or for an existing applicable unit with new turbine/governor and load control or active power/frequency control equipment installed. (Requirement R2)	Transmit the verified model, documentation and data to the Transmission Planner within 365 calendar days after the commissioning date.

MOD-027 Attachment 1

Turbine/Governor and Load Control or Active Power/Frequency Control Model Periodicity

Row Number	Verification Condition	Required Action
5	Existing applicable unit that is equivalent to another applicable unit(s) at the same physical location; AND Each applicable unit has the same MVA nameplate rating; AND The nameplate rating is ≤ 350 MVA; AND Each applicable unit has the same components and settings; AND The model for one of these equivalent applicable units has been verified. (Requirement R2)	Document circumstance with a written statement and include with the verified model, documentation and data provided to the Transmission Planner for the verified equivalent unit. Verify a different equivalent unit during each 10-year verification period. Applies to Row 1 when calculating generation fleet compliance during the 10-year implementation period.
6	The Generator Owner has submitted a verification plan. (Requirement R3 or R4)	Transmit the verified model, documentation and data to the Transmission Planner within 365 calendar days after the submittal of the verification plan.

MOD-027 Attachment 1 Turbine/Governor and Load Control or Active Power/Frequency Control Model Periodicity		
Row Number	**Verification Condition**	**Required Action**
7	Applicable unit is not responsive to both over and under frequency excursion events (The applicable unit does not operate in a frequency control mode, except during normal start up and shut down, that would result in a turbine/governor and load control or active power/frequency control mode response.); OR Applicable unit either does not have an installed frequency control system or has a disabled frequency control system. (Requirement R2)	Requirement 2 is met with a written statement to that effect transmitted to the Transmission Planner. Perform verification per the periodicity specified in Row 4 for a "New Generating Unit" (or new equipment) only if responsive control mode operation for connected operations is established.
8	Existing applicable unit has a current average net capacity factor over the most recent three calendar years, beginning on January 1 and ending on December 31 of 5% or less. (Requirement R2)	Requirement 2 is met with a written statement to that effect transmitted to the Transmission Planner. At the end of this 10 calendar year timeframe, the current average three year net capacity factor (for years 8, 9, and 10) can be examined to determine if the capacity factor exemption can be declared for the next 10 calendar year period. If not eligible for the capacity factor exemption, then model verification must be completed within 365 calendar days of the date the capacity factor exemption expired. For the definition of net capacity factor, refer to Appendix F of the GADS Data Reporting Instructions on the NERC website.

MOD-027 Attachment 1 Turbine/Governor and Load Control or Active Power/Frequency Control Model Periodicity		
Row Number	**Verification Condition**	**Required Action**

NOTES:

NOTE 1: Unit model verification frequency excursion criteria:

- ≥ 0.05 hertz deviation (nadir point) from scheduled frequency for the Eastern Interconnection with the applicable unit operating in a frequency responsive mode
- ≥ 0.10 hertz deviation (nadir point) from scheduled frequency for the ERCOT and Western Interconnections with the applicable unit operating in a frequency responsive mode
- ≥ 0.15 hertz deviation (nadir point) from scheduled frequency for the Quebec Interconnection with the applicable unit operating in a frequency responsive mode

NOTE 2: Establishing the recurring ten year unit verification period start date:

- The start date is the actual date of submittal of a verified model to the Transmission Planner for the most recently performed unit verification.

NOTE 3: Consideration for early compliance:

Existing turbine/governor and load control or active power/frequency control model verification is sufficient for demonstrating compliance for a 10 year period from the actual transmittal date if either of the following applies:

- The Generator Owner has a verified model that is compliant with the applicable regional policies, guidelines or criteria existing at the time of model verification
- The Generator Owner has an existing verified model that is compliant with the requirements of this standard

Applicable Entities

Generator Owner
Transmission Planner

For the purpose of this standard, the following Facilities are considered, "applicable units." Units or plants that meet the following:

Generating units connected to the Eastern or Quebec Interconnections with the following characteristics:

- Individual generating unit greater than 100 MVA (gross nameplate rating) directly connected to the Bulk Electric System.
- Each generating plant or generating Facility consisting of multiple units that are connected to the Bulk Electric System at a common bus with total generation greater than 100 MVA (gross aggregate rating).

Generating units connected to the Western Interconnection with the following characteristics:

- Individual generating unit greater than 75 MVA (gross nameplate rating) directly connected to the Bulk Electric System.

- Each generating plant or generating Facility consisting of multiple units that are connected to the Bulk Electric System at a common bus with total generation greater than 75 MVA (gross aggregate rating).

Generating units connected to the ERCOT Interconnection with the following characteristics:

- Individual generating unit greater than 50 MVA (gross nameplate rating) directly connected to the Bulk Electric System.
- Each generating plant or generating Facility consisting of multiple units that are connected to the Bulk Electric System at a common bus with total generation greater than 75 MVA (gross aggregate rating).

Conforming Changes to Other Standards
None

Effective Dates

In those jurisdictions where regulatory approval is required:

- Each responsible entity shall ensure compliance with Requirements R1, and R3 through R5 by the first day of the first calendar quarter following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.
- Each Generator Owner shall ensure at least 30 percent of its applicable unit gross MVA per Interconnection are compliant with Requirement R2 by the first day of the first calendar quarter, four years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.
- Each Generator Owner shall ensure at least 50 percent of its applicable unit gross MVA per Interconnection are compliant with Requirement R2 by the first day of the first calendar quarter, six years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.
- Each Generator Owner shall ensure at least 100 percent of its applicable unit gross MVA per Interconnection are compliant with Requirement R2 by the first day of the first calendar quarter, 10 years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities.

In those jurisdictions where no regulatory approval is required:

- Each responsible entity shall ensure compliance with Requirements R1, and R3 through R5 by the first day of the first calendar quarter following Board of Trustees adoption.

- Each Generator Owner shall ensure at least 30 percent of its applicable unit gross MVA per Interconnection are compliant with Requirement R2 by the first day of the first calendar quarter, four years following Board of Trustees adoption.
- Each Generator Owner shall ensure at least 50 percent of its applicable unit gross MVA per Interconnection are compliant with Requirement R2 by the first day of the first calendar quarter, six years following Board of Trustees adoption.
- Each Generator Owner shall ensure at least 100 percent of its applicable unit gross MVA per Interconnection are compliant with Requirement R2 by the first day of the first calendar quarter, 10 years following Board of Trustees adoption.

Justification

This phased implementation supports the ten year cycle for the collection of generator response data necessary for required verifications and typical generating unit outage schedules, and it also provides ample time for Generator Owners to either purchase new recording equipment as required or to make necessary modifications to existing recording equipment (frequency triggers, length of recordings for frequency excursions, additional event storage capacity, etc).

Consideration for Early Compliance

Existing turbine/governor and load control or active power/frequency control model verification is sufficient for demonstrating compliance for a ten year period from the actual verification date if either of the following applies:

- The Generator Owner has a verified model that is compliant with the applicable regional entity policies, guidelines or criteria existing at the time of model verification.
- The Generator Owner has an existing verified model that is compliant with the requirements of this standard.

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. SAR posted for comment (April 20–May 21, 2007).
2. Revised SAR and response to comments posted.
3. Revised SAR and response to comments approved by SC (June 14, 2007).
4. SDT appointed on (August 18, 2007).
5. Posted first draft of standard for a 30 day comment period June 15 –July 15, 2011
6. Draft 2 of PRC-019-1 was posted for a 45 day concurrent comment and ballot period from February 29 – April 16, 2012.
7. Draft 3 of PRC-019-1 was posted for a 30 day concurrent comment and ballot period from September 28 – October 31, 2012.

Proposed Action Plan and Description of Current Draft:

This is the third draft of the proposed standard including Time Horizons, Data Retention, Violation Risk Factors, and Violation Severity Levels; and is being submitted for a 30-day concurrent formal comment period and successive ballot.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Post responses to comments and conduct recirculation ballot.	December 2012
2. BOT adoption.	February 2013
3. File with regulatory authorities.	April 2013

A. Introduction

1. **Title:** Coordination of Generating Unit or Plant Capabilities, Voltage Regulating Controls, and Protection

2. **Number:** PRC-019-1

3. **Purpose:** To verify coordination of generating unit Facility or synchronous condenser voltage regulating controls, limit functions, equipment capabilities and Protection System settings.

4. **Applicability:**

   4.1. Functional Entities

   4.1.1 Generator Owner

   4.1.2 Transmission Owner that owns synchronous condenser(s)

   4.2. Facilities

   For the purpose of this standard, the term, "applicable Facility" shall mean any one of the following:

   4.2.1 Individual generating unit greater than 20 MVA (gross nameplate rating) directly connected to the Bulk Electric System.

   4.2.2 Individual synchronous condenser greater than 20 MVA (gross nameplate rating) directly connected to the Bulk Electric System.

   4.2.3 Generating plant/ Facility consisting of one or more units that are connected to the Bulk Electric System at a common bus with total generation greater than 75 MVA (gross aggregate nameplate rating).

   4.2.4 Any generator, regardless of size, that is a blackstart unit material to and designated as part of a Transmission Operator's restoration plan.

5. **Effective Date:**

   5.1. In those jurisdictions where regulatory approval is required:

   5.1.1 By the first day of the first calendar quarter, two calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified at least 40 percent of its applicable Facilities.

   5.1.2 By the first day of the first calendar quarter, three calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified at least 60 percent of its applicable Facilities.

   5.1.3 By the first day of the first calendar quarter, four calendar years following applicable regulatory, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, approval each

Generator Owner and Transmission Owner shall have verified at least 80 percent of its applicable Facilities.

5.1.4 By the first day of the first calendar quarter, five calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified 100 percent of its applicable Facilities.

5.2. In those jurisdictions where regulatory approval is not required:

5.2.1 By the first day of the first calendar quarter, two calendar years following Board of Trustees approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified at least 40 percent of its applicable Facilities.

5.2.2 By the first day of the first calendar quarter, three calendar years following Board of Trustees approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified at least 60 percent of its applicable Facilities.

5.2.3 By the first day of the first calendar quarter, four calendar years following Board of Trustees approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified at least 80 percent of its applicable Facilities.

5.2.4 By the first day of the first calendar quarter, five calendar years following Board of Trustees approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified 100 percent of its applicable Facilities.

B. Requirements

R1. At a maximum of every five calendar years, each Generator Owner and Transmission Owner with applicable Facilities shall coordinate the voltage regulating system controls, (including in-service[1] limiters and protection functions) with the applicable equipment capabilities and settings of the applicable Protection System devices and functions. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

1.1. Assuming the normal automatic voltage regulator control loop and steady-state system operating conditions, verify the following coordination items for each applicable Facility:

[1] Limiters or protection functions that are installed and activated on the generator or synchronous condenser.

1.1.1. The in-service limiters are set to operate before the Protection System of the applicable Facility in order to avoid disconnecting the generator unnecessarily.

1.1.2. The applicable in-service Protection System devices are set to operate to isolate or de-energize equipment in order to limit the extent of damage when operating conditions exceed equipment capabilities or stability limits.

R2. Within 90 calendar days following the identification or implementation of systems, equipment or setting changes that will affect the coordination described in Requirement R1, each Generator Owner and Transmission Owner with applicable Facilities shall perform the coordination as described in Requirement R1. These possible systems, equipment or settings changes include, but are not limited to the following *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*:

- Voltage regulating settings or equipment changes;
- Protection System settings or component changes;
- Generating or synchronous condenser equipment capability changes; or
- Generator or synchronous condenser step-up transformer changes.

C. Measures

M1. Each Generator Owner and Transmission Owner with applicable Facilities will have evidence (such as examples provided in PRC-019 Section G) that it coordinated the voltage regulating system controls, including in-service[2] limiters and protection functions, with the applicable equipment capabilities and settings of the applicable Protection System devices and functions as specified in Requirement R1. This evidence should include dated documentation that demonstrates the coordination was performed.

M2. Each Generator Owner and Transmission Owner with applicable Facilities will have evidence of the coordination required by the events listed in Requirement R2. This evidence should include dated documentation that demonstrates the specified intervals in Requirement R2 have been met.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

The Regional Entity shall serve as the Compliance enforcement authority unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional entity approved by FERC or other applicable governmental authority shall serve as the CEA.

[2] Limiters or protection functions that are installed and activated on the generator or synchronous condenser.

1.2. Evidence Retention

The following evidence retention periods identify a period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention specified below is shorter than the time since the last compliance audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Generator Owner and Transmission Owner shall retain evidence of compliance with Requirements R1 and R2, Measures M1 and M2 for six years.

If a Generator Owner or Transmission Owner is found non-compliant, the entity shall keep information related to the non-compliance until mitigation is complete and approved or for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last periodic audit report and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

1.4. Additional Compliance Information

None

2. Violation Severity Levels

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	The Generator Owner or Transmission Owner coordinated equipment capabilities, limiters, and protection specified in Requirement R1 more than 5 calendar	The Generator Owner or Transmission Owner coordinated equipment capabilities, limiters, and protection specified in Requirement R1 more than 5 calendar	The Generator Owner or Transmission Owner coordinated equipment capabilities, limiters, and protection specified in Requirement R1 more than 5 calendar	The Generator Owner or Transmission Owner failed to coordinate equipment capabilities, limiters, and protection specified in Requirement R1 within 5 calendar

	years but less than or equal to 5 calendar years plus 4 months after the previous coordination.	years plus 4 months but less than or equal to 5 calendar years plus 8 months after the previous coordination.	years plus 8 months but less than or equal to 5 calendar years plus 12 months after the previous coordination.	years plus 12 months after the previous coordination.
R2	The Generator Owner or Transmission Owner coordinated equipment capabilities, limiters, and protection specified in Requirement R1 more than 90 calendar days but less than or equal to 100 calendar days following the identification or implementation of a change in equipment or settings that affected the coordination.	The Generator Owner or Transmission Owner coordinated equipment capabilities, limiters, and protection specified in Requirement R1 more than 100 calendar days but less than or equal to 110 calendar days following the identification or implementation of a change in equipment or settings that affected the coordination.	The Generator Owner or Transmission Owner coordinated equipment capabilities, limiters, and protection specified in Requirement R1 more than 110 calendar days but less than or equal to 120 calendar days following the identification or implementation of a change in equipment or settings that affected the coordination.	The Generator Owner or Transmission Owner failed to coordinate equipment capabilities, limiters, and protection specified in Requirement R1 within 120 calendar days following the identification or implementation of a change in equipment or settings that affected the coordination.

E. Regional Variances

None.

G. Reference

Examples of Coordination

The evidence of coordination associated with Requirement R1 may be in the form of:

- P-Q Diagram (Example in Attachment 1), or
- R-X Diagram (Example in Attachment 2), or
- Inverse Time Diagram (Example in Attachment 3) or,
- Equivalent tables or other evidence

This evidence should include the equipment capabilities and the operating region for the limiters and protection functions

Equipment limits, types of limiters and protection functions which could be coordinated include (but are not limited to):

- Field over-excitation limiter and associated protection functions.
- Inverter over current limit and associated protection functions.
- Field under-excitation limiter and associated protection functions.
- Generator or synchronous condenser reactive capabilities.
- Volts per hertz limiter and associated protection functions.
- Stator over-voltage protection system settings.
- Generator and transformer volts per hertz capability.
- Time vs. field current or time vs. stator current.

NOTE: This listing is for reference only. This standard does not require the installation or activation of any of the above limiter or protection functions.

For this example, the Steady State Stability Limit (SSSL) is the limit to synchronous stability in the under-excited region with fixed field current.

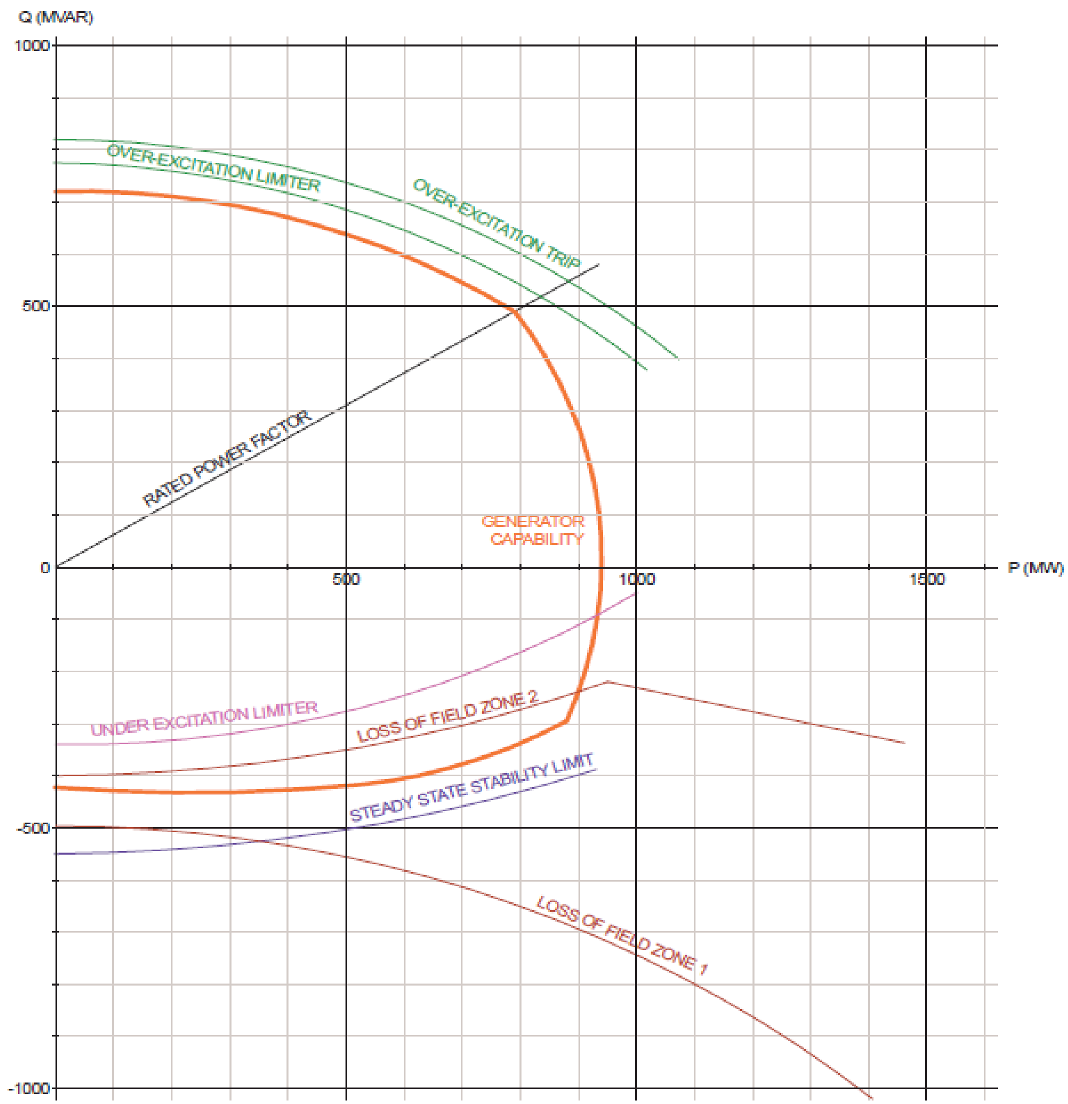
On a P-Q diagram using X_d as the direct axis saturated synchronous reactance of the generator, X_s as the equivalent reactance between the generator terminals and the "infinite bus" including the reactance of the generator step-up transformer and V_g as the generator terminal voltage (all values in per-unit), the SSSL can be calculated as an arc with the center on the Q axis with the magnitude of the center and radius described by the following equations

$$C = V^2_g/2*(1/X_s-1/X_d)$$
$$R = V^2_g/2*(1/X_s+1/X_d)$$

On an R-X diagram using X_d as the direct axis saturated synchronous reactance of the generator, and X_s as the equivalent reactance between the generator terminals and the "infinite bus" including the reactance of the generator step-up transformer the SSSL is an arc with the center on the X axis with the center and radius described by the following equations:

$$C = (X_d-X_s)/2$$
$$R = (X_d+X_s)/2$$

Section G Attachment 1 – Example of Capabilities, Limiters and Protection on a P-Q Diagram at nominal voltage and frequency



Section G Attachment 2 – Example of Capabilities, Limiters, and Protection on an R-X Diagram at nominal voltage and frequency

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. SAR posted for comment (April 20–May 21, 2007).
2. Revised SAR and response to comments posted.
3. Revised SAR and response to comments approved by SC (June 14, 2007).
4. SDT appointed on (August 18, 2007).
5. Posted first draft of standard for a 30 day comment period June 15 –July 15, 2011
6. Draft 2 of PRC-019-1 was posted for a 45 day concurrent comment and ballot period from February 29 – April 16, 2012.
~~6.~~ Draft 3 of PRC-019-1 was posted for a 30 day concurrent comment and ballot period from September 28 – October 31, 2012.

Proposed Action Plan and Description of Current Draft:

This is the third draft of the proposed standard including Time Horizons, Data Retention, Violation Risk Factors, and Violation Severity Levels; and is being submitted for a 30-day concurrent formal comment period and successive ballot.

Future Development Plan:

Anticipated Actions	Anticipated Date
~~1. Develop responses to comments and develop third version draft standard.~~	~~April - July 2012~~
~~2. Post response to comments and conduct successive ballot.~~	~~October-November 2012~~
~~3. Develop responses to ballot comments.~~	~~December 2012 – January 2013~~
1~~4~~. Post responses to comments and conduct recirculation ballot.	~~February~~ December 2012~~3~~
5. BOT adoption.	~~March~~ February 2013
6. File with regulatory authorities.	April 2013

A. Introduction

1. **Title:** Coordination of Generating Unit or Plant Capabilities, Voltage Regulating Controls, and Protection
2. **Number:** PRC-019-1
3. **Purpose:** To verify coordination of generating unit Facility or synchronous condenser voltage regulating controls, limit functions, equipment capabilities and Protection System settings.
4. **Applicability:**

4.1. Functional Entities

4.1.1 Generator Owner

4.1.2 Transmission Owner that owns synchronous condenser(s)

4.2. Facilities

For the purpose of this standard, the term, "applicable Facility" shall mean any one of the following:

4.2.1 Individual generating unit greater than 20 MVA (gross nameplate rating) directly connected to the Bulk Electric System.

4.2.2 Individual synchronous condenser greater than 20 MVA (gross nameplate rating) directly connected to the Bulk Electric System.

4.2.3 Generating plant/ Facility consisting of one or more units that are connected to the Bulk Electric System at a common bus with total generation greater than 75 MVA (gross aggregate nameplate rating).

4.2.4 Any generator, regardless of size, that is a blackstart unit material to and designated as part of a Transmission Operator's restoration plan.

5. **Effective Date:**

5.1. In those jurisdictions where regulatory approval is required:

5.1.1 By the first day of the first calendar quarter, two calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified at least 40 percent of its applicable Facilities.

5.1.2 By the first day of the first calendar quarter, three calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified at least 60 percent of its applicable Facilities.

5.1.3 By the first day of the first calendar quarter, four calendar years following applicable regulatory, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, approval each

Generator Owner and Transmission Owner shall have verified at least 80 percent of its applicable Facilities.

5.1.4 By the first day of the first calendar quarter, five calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified 100 percent of its applicable Facilities.

5.2. In those jurisdictions where regulatory approval is not required:

5.2.1 By the first day of the first calendar quarter, two calendar years following Board of Trustees approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities each Generator Owner and Transmission Owner shall have verified at least 40 percent of its applicable Facilities.

5.2.2 By the first day of the first calendar quarter, three calendar years following Board of Trustees approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified at least 60 percent of its applicable Facilities.

5.2.3 By the first day of the first calendar quarter, four calendar years following Board of Trustees approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified at least 80 percent of its applicable Facilities.

5.2.4 By the first day of the first calendar quarter, five calendar years following Board of Trustees approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified 100 percent of its applicable Facilities.

B. Requirements

R1. At a maximum of every five calendar years, each Generator Owner and Transmission Owner with applicable Facilities shall coordinate the voltage regulating system controls, (including in-service~~-~~[1] limiters and protection functions) with the applicable equipment capabilities and settings of the applicable Protection System devices and functions. *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

1.1. Assuming the normal automatic voltage regulator ~~AVR~~ control loop and ~~system~~ steady-state system operating conditions, verify the following coordination items for each applicable Facility:

[1] Limiters or protection functions that are installed and activated on the generator or synchronous condenser.

1.1.1. The in-service limiters are set to operate before the Protection System of the applicable Facility in order to avoid disconnecting the generator unnecessarily.

1.1.2. The applicable~~,~~ in-service Protection System devices are set to operate to ~~,~~ isolate or de-energize equipment~~,~~ in order to limit the extent of damage when operating conditions exceed equipment capabilities or stability limits.

R2. Within 90 calendar days following the identification or implementation of systems, equipment or setting changes that will affect the coordination described in Requirement R1, each Generator Owner and Transmission Owner with applicable Facilities shall perform the coordination as described in Requirement R1. These possible systems, equipment or settings changes include, but are not limited to the following *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*:

- Voltage regulating settings or equipment changes
- Protection System settings or component changes
- Generating or synchronous condenser equipment capability changes, or
- Generator or synchronous condenser step-up transformer changes.

C. Measures

M1. Each Generator Owner and Transmission Owner with applicable Facilities will have evidence (such as examples provided in PRC-019 Section G) that it coordinated the voltage regulating system controls, including in-service~~-~~[2] limiters and protection functions, with the applicable equipment capabilities and settings of the applicable Protection System devices and functions as specified in Requirement R1. This evidence should include dated documentation that demonstrates the coordination was performed.

M2. Each Generator Owner and Transmission Owner with applicable Facilities will have evidence of the coordination ~~review~~ required by the events listed in Requirement R2. This evidence should include dated documentation that demonstrates the specified intervals in Requirement R2 have been met.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

The Regional Entity shall serve as the Compliance enforcement authority unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases the ERO or a Regional entity approved by FERC or other applicable governmental authority shall serve as the CEA.

[2] Limiters or protection functions that are installed and activated on the generator or synchronous condenser.

1.2. Evidence Retention

The following evidence retention periods identify a period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention specified below is shorter than the time since the last compliance audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Generator Owner and Transmission Owner shall retain evidence of compliance with Requirements R1 and R2, Measures M1 and M2 for six years.

If a Generator Owner or Transmission Owner is found non-compliant, the entity shall keep information related to the non-compliance until mitigation is complete and approved or for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last periodic audit report and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

1.4. Additional Compliance Information

None

2. Violation Severity Levels

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL

Examples of Coordination

The evidence of coordination associated with Requirement R1 may be in the form of:

- P-Q Diagram (Example in Section G Attachment 1), or
- R-X Diagram (Example in Section G Attachment 2), or
- Inverse Time Diagram (Example in Section G Attachment 3) or,
- Equivalent tables or other evidence

This evidence should include the equipment capabilities and the operating region for the limiters and protection functions

Equipment limits, types of limiters and protection functions which could be coordinated include (but are not limited to):

- Field over-excitation limiter and associated protection functions.
- Inverter over current limit and associated protection functions.
- Field under-excitation limiter and associated protection functions.
- Generator or synchronous condenser reactive capabilities.
- Volts per hertz limiter and associated protection functions.
- Stator over-voltage protection system settings.
- Generator and transformer volts per hertz capability.
- Time vs. field current or time vs. stator current.
- ~~Converter over-temperature limiter and associated protection function.~~

NOTE: This listing is for reference only. This standard does not require the installation or activation of any of the above limiter or protection functions.

For this example, the Steady State Stability Limit (SSSL) is the limit to synchronous stability in the under-excited region with fixed field current.

On a P-Q diagram using X_d as the direct axis saturated synchronous reactance of the generator, X_s as the equivalent reactance between the generator terminals and the “infinite bus” including the reactance of the generator step-up transformer and V_g as the generator terminal voltage (all values in per-unit), the SSSL can be calculated as an arc with the center on the Q axis with the magnitude of the center and radius described by the following equations

$$C = V^2{}_g/2*(1/X_s-1/X_d)$$

$$R = V^2{}_g/2*(1/X_s+1/X_d)$$

On an R-X diagram using X_d as the direct axis saturated synchronous reactance of the generator, and X_s as the equivalent reactance between the generator terminals and the “infinite bus” including the reactance of the generator step-up transformer the SSSL is an arc with the center on the X axis with the center and radius described by the following equations:

$$C = (X_d-X_s)/2$$

$$R = (X_d+X_s)/2$$

Applicable Entities

Generator Owner
Transmission Owner that owns synchronous condenser(s)

Applicable Facilities

For the purpose of this standard, the term, "applicable Facility" shall mean any of the following:

- Individual generating unit greater than 20 MVA (gross nameplate rating) directly connected to the Bulk Electric System;
- Individual synchronous condenser greater than 20 MVA (gross nameplate rating) directly connected to the Bulk Electric System;
- Generating plant/Facility consisting of one or more units that are connected to the Bulk Electric System at a common bus with total generation greater than 75 MVA (gross aggregate nameplate rating);
- Any generator, regardless of size, that is a blackstart unit material to and designated as part of a Transmission Operator's restoration plan.

Conforming Changes to Other Standards
None

Effective Dates
PRC-019-1 shall become effective as follows:

In those jurisdictions where regulatory approval is required:

- By the first day of the first calendar quarter, two calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified at least 40 percent of its applicable Facilities.
- By the first day of the first calendar quarter, three calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified at least 60 percent of its applicable Facilities.
- By the first day of the first calendar quarter, four calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified at least 80 percent of its applicable Facilities.
- By the first day of the first calendar quarter, five calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified 100 percent of its applicable Facilities.

In those jurisdictions where regulatory approval is not required:

- By the first day of the first calendar quarter, two calendar years following Board of Trustees approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified at least 40 percent of its applicable Facilities.
- By the first day of the first calendar quarter, three calendar years following Board of Trustees approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified at least 60 percent of its applicable Facilities.
- By the first day of the first calendar quarter, four calendar years following Board of Trustees approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified at least 80 percent of its applicable Facilities.

- By the first day of the first calendar quarter, five calendar years following Board of Trustees approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner and Transmission Owner shall have verified 100 percent of its applicable Facilities.

Justification for Phasing:

The coordination activities in this standard (PRC-019-1) are most effectively performed just prior to the performance of a reactive capability test, as required by MOD-025-2. Hence, the SDT has followed the same implementation schedule in PRC-019-1 as defined in MOD-025-2.

Violation Risk Factor and Violation Severity Level Assignments

Project 2007-09 Generator Verification

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in MOD-026-1 — Verification of Models and Data for Generator Excitation Control System and Plant Volt/Var Control Functions.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

Justification for Assignment of Violation Risk Factors

The Generator Verification Standard Drafting Team applied the following NERC criteria when proposing VRFs for the requirements under this project:

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

The SDT also considered consistency with the FERC Violation Risk Factor Guidelines for setting VRFs:[1]

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:[2]

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

Guideline (2) — Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) — Consistency among Reliability Standards

---

[1] North American Electric Reliability Corp., 119 FERC ¶ 61,145, order on reh'g and compliance filing, 120 FERC ¶ 61,145 (2007) ("VRF Rehearing Order").

[2] Id. at footnote 15.

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

The following discussion addresses how the SDT considered FERC's VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's Reliability Standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and therefore concentrated its approach on the reliability impact of the requirements.

VRF for MOD-026-1:
There are six requirements in MOD-026-1. Four requirements were assigned a "Lower" VRF while the remaining two were assigned a "Medium" VRF.

VRF for MOD-026-1, Requirement R1:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R1 does not contain Parts. Requirement obligations include actions similar in scope to actions specified in Requirement R6; and all standard requirements specify either an Operations Planning or a Long-term Planning Time Horizon.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar to MOD-004-1, Requirement R9 that has an approved Lower VRF. This requirement is also similar to draft standard MOD-027-1 Requirement R1 which also specifies a Lower VRF.
- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to provide requested information is a requirement that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Therefore the assigned "Lower" VRF is appropriate.

- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R1 high risk objective is to provide requested information. This requirement is administrative in nature for providing instructions and data used for performing model verification. The “Lower” VRF assigned is based on the high risk objective specified.

VRF for MOD-026-1, Requirement R2:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R2 contains Parts specifying supporting obligations for satisfying the main requirement. The VRFs are only applied at the Requirement level and each Requirement Part is treated equally. Requirement obligations include actions similar in scope to actions specified in Requirement R1 and R6; and all standard requirements specify either an Operations Planning or a Long-term Planning Time Horizon.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar with MOD-010-0 and MOD-012-0 Requirements R1 and R2 that have approved VRFs of Medium. This requirement is also similar to draft standard MOD-027-1 Requirement R2 which also specifies a Medium VRF.
- FERC Guideline 4 — Consistency with NERC’s Definition of the VRF Level selected exists. Failure to verify models in the Long-term Planning Time Horizon is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Therefore the assigned “Medium” VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R2 high risk objective is to verify models per specified periodicity. Requirement Parts and obligations are lower risk elements that ensure main requirement completeness which are administrative in nature consisting of documentation, information revision obligation and submission requirements. The “Medium” VRF assigned is based on the high risk objective specified.

VRF for MOD-026-1, Requirement R3:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R3 does not contain Parts. Requirement obligations include actions similar in scope to actions specified in Requirement R1 and R6; and all standard requirements specify either an Operations Planning or a Long-term Planning Time Horizon.

- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar to MOD-004-1, Requirement R7 and R8 that has an approved Lower VRF. This requirement is also similar to draft standard MOD-027-1 Requirement R3 which also specifies a Lower VRF.
- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to verify models in the Long-term Planning Time Horizon is a requirement that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Therefore the assigned "Lower" VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R3 high risk objective is to provide a written response after receiving notice. The Requirement is administrative in nature consisting of documentation, information revision obligation and submission requirements. The "Lower" VRF assigned is based on the high risk objective specified.

VRF for MOD-026-1, Requirement R4:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R4 does not contain Parts. Requirement obligations include actions similar in scope to actions specified in Requirement R1 and R6; and all standard requirements specify either an Operations Planning or a Long-term Planning Time Horizon.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar to MOD-004-1, Requirement R1 and R2 that has an approved Lower VRF. This requirement is also similar to draft standard MOD-027-1 Requirement R4 which also specifies a Lower VRF.
- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to verify models in the Long-term Planning Time Horizon is a requirement that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Therefore the assigned "Lower" VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R4 high risk objective is to provide revised data after making changes to equipment. The Requirement is administrative in nature consisting of documentation, information revision obligation and submission requirements. The "Lower" VRF assigned is based on the high risk objective specified.

VRF for MOD-026-1, Requirement R5:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R5 contains Parts specifying supporting obligations for satisfying the main requirement. The VRFs are only applied at the Requirement level and each Requirement Part is treated equally. Requirement obligations include actions similar in scope to actions specified in Requirement R1 and R6; and all standard requirements specify either an Operations Planning or a Long-term Planning Time Horizon.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar to MOD-004-1, Requirement R7 and R8 that has an approved Lower VRF. This requirement is also similar to draft standard MOD-027-1 Requirement R3 which also specifies a Lower VRF.
- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to verify models in the Long-term Planning Time Horizon is a requirement that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Therefore the assigned "Lower" VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R5 high risk objective is to provide a written response after receiving a request. Requirement Parts and obligations are lower risk elements that ensure main requirement completeness which are administrative in nature consisting of documentation, information revision obligation and submission requirements. The "Lower" VRF assigned is based on the high risk objective specified.

VRF for MOD-026-1, Requirement R6:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R6 contains Parts specifying supporting obligations for satisfying the main requirement. The VRFs are only applied at the Requirement level and each Requirement Part represents an obligation for ensuring main requirement completeness. Requirement obligations include actions similar in scope to actions specified in Requirement R1; and all standard requirements specify either an Operations Planning or a Long-term Planning Time Horizon.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar with MOD-010-0 and MOD-012-0 Requirements R1 and R2 that have approved VRFs of Medium. This requirement is also similar to draft standard MOD-027-1 Requirement R5 which also specifies a Medium VRF.
- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to identify if a model is useable or not is a requirement that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to

effectively monitor, control, or restore the bulk electric system. Therefore the assigned "Medium" VRF is appropriate.

- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R6 high risk objective is to verify if the model is useable or not. Requirement Parts and obligations are lower risk elements that ensure main requirement completeness which are administrative in nature consisting of documentation and submission requirements. The "Medium" VRF assigned is based on the high risk objective specified.

Justification for Assignment of Violation Severity Levels:

In developing the VSLs for the standards under this project, the SDT anticipated the evidence that would be reviewed during an audit, and developed its VSLs based on the noncompliance an auditor may find during a typical audit. The SDT based its assignment of VSLs on the following NERC criteria:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

FERC's VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in MOD-026-1 meet the FERC Guidelines for assessing VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.

Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

VSLs for MOD-026-1 Requirement R1:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R1.	The NERC VSL guidelines are satisfied by incorporating increments for tardiness VSL elements. The SDT has determined a 30 day "Increments for Tardiness" period is appropriate for standard VSLs proposed.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's incorporate the increments for tardiness methodology. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on timeliness of the action specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action and if information submission is timely. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

VSLs for MOD-026-1 Requirement R2:

R#	Compliance with NERC Revised VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R2.	The NERC VSL guidelines are satisfied by incorporating increments for tardiness with completeness of information required for the main Requirement action. The SDT has determined a 30 day "Increments for Tardiness" period is appropriate for standard VSLs proposed.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's consider completeness of listed parts deemed to possess equal reliability weight and also increments for tardiness. Binary requirements are categorized as severe. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on binary performance, and both completeness and timeliness of the actions and obligations specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action and if information submission is complete. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

VSLs for MOD-026-1 Requirement R3:

R#	Compliance with NERC Revised VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R3.	The NERC VSL guidelines are satisfied by incorporating increments for tardiness VSL elements for the main Requirement action. Actions and obligations specified in the Requirement Parts incorporate a binary element, consideration for omitting required information. The SDT has determined a 30 day "Increments for Tardiness" period is appropriate for standard VSLs proposed.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's are a combination of a binary element and increments for tardiness. Binary requirements are categorized as severe. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on binary performance, and both completeness and timeliness of the actions and obligations specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action and if information submission is both complete and provided in a timely manner. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

VSLs for MOD-026-1 Requirement R4:

R#	Compliance with NERC Revised VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R4.	The NERC VSL guidelines are satisfied by incorporating increments for tardiness VSL elements for the main Requirement action. The SDT has determined a 30 day "Increments for Tardiness" period is appropriate for standard VSLs proposed.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's utilize increments for tardiness rationale. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on timeliness of the actions and obligations specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action and if information submission is complete and provided in a timely manner. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

VSLs for MOD-026-1 Requirement R5:

R#	Compliance with NERC Revised VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R5.	The NERC VSL guidelines are satisfied by incorporating equal multiple parts criteria VSL elements for the main Requirement action. Actions and obligations specified in the Requirement Parts also incorporate increments for tardiness consideration. The SDT has determined a 30 day "Increments for Tardiness" period is appropriate for standard VSLs proposed.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's are a combination of completeness of listed parts deemed to possess equal reliability weight and also increments for tardiness. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on both completeness and timeliness of the actions and obligations specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action and if information submission is both complete and provided in a timely manner. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

VSLs for MOD-026-1 Requirement R6:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R6.	The NERC VSL guidelines are satisfied by incorporating increments for tardiness VSL elements for the Main Requirement action. Actions specified in the Requirement Parts incorporate completeness of the actions and obligations specified. The SDT has determined a 30 day "Increments for Tardiness" period is appropriate for standard VSLs proposed.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's are a combination of completeness of listed parts and also increments for tardiness. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on both completeness and timeliness of the actions and obligations specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action and if information submission is both complete provided in a timely manner. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

Violation Risk Factor and Violation Severity Level Assignments

Project 2007-09 Generator Verification

This document provides the drafting team's justification for assignment of Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) for each requirement in MOD-025-2 — Verification and Data Reporting of Generator Real and Reactive Power Capability.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability standards, as defined in the ERO Sanction Guidelines.

Justification for Assignment of Violation Risk Factors

The Generator Verification Standard drafting team applied the following NERC criteria when proposing VRFs for the requirements under this project:

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures; or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could; under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to Bulk Electric System instability, separation, or a cascading sequence of failures; or could place the Bulk Electric System at an unacceptable risk of instability, separation, or cascading failures; or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the Bulk Electric System; or the ability to effectively monitor and control the Bulk Electric System. However, violation of a medium-risk requirement is unlikely to lead to Bulk Electric System instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could; under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the Bulk Electric System; or the ability to effectively monitor, control, or restore the Bulk Electric System. However, violation of a medium-risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to Bulk Electric System instability, separation, or cascading failures; nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the Bulk Electric System; or the ability to effectively monitor and control the Bulk Electric System; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System; or the ability to effectively monitor, control; or restore the Bulk Electric System. A planning requirement that is administrative in nature.

The SDT also considered consistency with the FERC Violation Risk Factor Guidelines for setting VRFs:[1]

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk Power System:[2]

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup Facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and Facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical Facilities
- Appropriate use of transmission Loading relief

Guideline (2) — Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) — Consistency among Reliability Standards

---

[1] North American Electric Reliability Corp., 119 FERC ¶ 61,145, order on reh'g and compliance filing, 120 FERC ¶ 61,145 (2007) ("VRF Rehearing Order").

[2] Id. at footnote 15.

The Commission expects the assignment of Violation Risk Factors corresponding to requirements that address similar reliability goals in different reliability standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation

Where a single requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such requirements must not be watered down to reflect the lower risk level associated with the less important objective of the reliability standard.

The following discussion addresses how the SDT considered FERC's VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4; whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's reliability standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance; and, therefore, concentrated its approach on the reliability impact of the requirements.

VRF for MOD-025-2:

There are three requirements in MOD-025-2. Each requirement was assigned a "Medium" VRF.

VRF for MOD-025-2, Requirement R1:

- FERC Guideline 2 — Consistency within a reliability standard exists. Each Requirement in MOD-025-1 is assigned a "Medium" VRF. Requirement R1 is similar in scope to Requirements R2 and R3. Each requirement is to perform a verification of capability.
- FERC Guideline 3 — Consistency among reliability standards exists. This requirement is similar with MOD-010-0 and MOD-012-0 Requirements R1 and R2 in concept and they have approved Medium VRFs. A primary difference being MOD-010-0 and MOD-012-0 require data submission for all Facilities, and not merely a single unit, as specified in this standard.
- FERC Guideline 4 — Consistency with NERC's definition of the VRF level selected exists. Failure to verify models in the long-term planning time horizon is a requirement in a planning time frame that, if violated, could, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System; or the ability to effectively monitor, control, or restore the Bulk Electric System. Therefore, the assigned "Medium" VRF is appropriate.

- FERC Guideline 5 — Treatment of requirements that co-mingle more than one obligation is satisfactory. The Requirement R1 risk objective is to verify capability. The risk objectives are administrative in nature, consisting of recording and submission requirements for planning studies. The “Medium” VRF assigned is based on the risk objective specified.

VRF for MOD-025-2, Requirement R2:

- FERC Guideline 2 — Consistency within is similar in scope to Requirements R1 and R3. Each Requirement is to perform a verification of capability.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar with MOD-010-0 and MOD-012-0 Requirements R1 and R2 in concept, and they have approved Medium VRFs. A primary difference being MOD-010-0 and MOD-012-0 require data submission for all Facilities, and not merely a single unit as specified in this standard.
- FERC Guideline 4 — Consistency with NERC’s Definition of the VRF Level selected exists. Failure to verify models is a requirement in a planning time frame that, if violated, could, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the Bulk Electric System; or the ability to effectively monitor, control, or restore the Bulk Electric System. Therefore, the assigned “Medium” VRF is appropriate.
- FERC Guideline 5 — Treatment of requirements that co-mingle more than one obligation is satisfactory. The Requirement R1 risk objective is to verify capability. The risk objectives are administrative in nature, consisting of recording and submission requirements for planning studies. The “Medium” VRF assigned is based on the risk objective specified.

VRF for MOD-025-2, Requirement R3:

- FERC Guideline 2 — Consistency within a reliability standard exists. Each requirement in MOD-025-1 is assigned a “Medium” VRF. Requirement R3 is similar in scope to Requirements R1 and R2.
- FERC Guideline 3 — Consistency among reliability standards exists. This requirement is similar with MOD-010-0 and MOD-012-0, Requirements R1 and R2, in concept and they have approved Medium VRFs. A primary difference being MOD-010-0 and MOD-012-0 require data submission for all Facilities, and not merely a single unit, as specified in this standard.
- FERC Guideline 4 — Consistency with NERC’s definition of the VRF level selected exists. Failure to verify models in the long-term planning time horizon is a requirement in a planning time frame that, if violated, could, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or

capability of the Bulk Electric System; or the ability to effectively monitor, control, or restore the Bulk Electric System. Therefore, the assigned “Medium” VRF is appropriate.

- FERC Guideline 5 — Treatment of requirements that co-mingle more than one obligation is satisfactory. The Requirement R3 risk objective is to verify capability. The risk objectives are administrative in nature, consisting of recording and submission requirements for planning studies. The “Medium” VRF assigned is based on the risk objective specified.

Justification for Assignment of Violation Severity Levels:

In developing the VSLs for the standards under this project, the SDT anticipated the evidence that would be reviewed during an audit, and developed its VSLs based on the noncompliance an auditor may find during a typical audit. The SDT based its assignment of VSLs on the following NERC criteria:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance. The performance or product measured has significant value, as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance, or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement, or the product delivered cannot be used in meeting the intent of the requirement.

FERC's VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in MOD-025-2 meet the FERC Guidelines for assessing VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of noncompliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of noncompliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.

Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

Unless otherwise stated in the requirement, each instance of noncompliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VSLs for MOD-025-2 Requirement R1:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R1	The NERC VSL guidelines are satisfied by identifying noncompliance based on the obligation to verify capability and provide data within certain timeframes. The VSLs account for increments of tardiness and incomplete data submissions.	Standard requirements have been significantly revised since MOD-025-1 was approved. Proposed VSL's are binary with additional consideration for the obligation to submit information in a timely fashion; whereas, MOD-025-1 levels of noncompliance only considered completeness of submitted information. As drafted, proposed VSL's raise the current level of compliance.	Proposed VSL's identify noncompliance based on the obligation to verify capability and provide data within certain timeframes. The VSLs account for increments of tardiness and incomplete data submissions. Proposed VSL language does not include ambiguous terms, and ensure uniformity and consistency in the determination of penalties based on binary performance and obligation information submission timeliness.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action, and if information is provided in a timely manner. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation, and not a cumulative violation methodology.

VSLs for MOD-025-2 Requirement R2:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R2	The NERC VSL guidelines are satisfied by identifying noncompliance based on the obligation to verify capability and provide data within certain timeframes. The VSLs account for increments of tardiness and incomplete data submissions.	Standard requirements have been significantly revised since MOD-025-1 was approved. Proposed VSL's are binary with additional consideration for the obligation to submit information in a timely fashion; whereas, MOD-025-1 levels of noncompliance only considered completeness of submitted information. As drafted, proposed VSL's raise the current level of compliance.	Proposed VSL's identify noncompliance based on the obligation to verify capability and provide data within certain timeframes. The VSLs account for increments of tardiness and incomplete data submissions. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on binary performance and obligation information submission timeliness.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action and if information is provided in a timely manner. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

VSLs for MOD-025-2 Requirement R3:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R3.	The NERC VSL guidelines are satisfied by identifying noncompliance based on the obligation to verify capability and provide data within certain timeframes. The VSLs account for increments of tardiness and incomplete data submissions.	Standard requirements have been significantly revised since MOD-025-1 was approved. Proposed VSL's are binary with additional consideration for the obligation to submit information in a timely fashion; whereas, MOD-025-1 levels of noncompliance only considered completeness of submitted information. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on binary performance and obligation information submission timeliness.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action and if information is provided in a timely manner. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

Violation Risk Factor and Violation Severity Level Assignments

Project 2007-09 Generator Verification

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in MOD-027-1 — Verification of Models and Data for Turbine/Governor and Load Control or Active Power/Frequency Control Functions.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

Justification for Assignment of Violation Risk Factors

The Generator Verification Standard Drafting Team applied the following NERC criteria when proposing VRFs for the requirements under this project:

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

The SDT also considered consistency with the FERC Violation Risk Factor Guidelines for setting VRFs:[1]

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:[2]

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

Guideline (2) — Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) — Consistency among Reliability Standards

---

[1] North American Electric Reliability Corp., 119 FERC ¶ 61,145, order on reh'g and compliance filing, 120 FERC ¶ 61,145 (2007) ("VRF Rehearing Order").
[2] Id. at footnote 15.

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level

Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation

Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

The following discussion addresses how the SDT considered FERC's VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's Reliability Standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and therefore concentrated its approach on the reliability impact of the requirements.

VRF for MOD-027-1:

There are five requirements in MOD-027-1. Three requirements were assigned a "Lower" VRF while the remaining two were assigned a "Medium" VRF.

VRF for MOD-027-1, Requirement R1:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R1 does not contain Parts. Requirement obligations include actions similar in scope to actions specified in Requirement R5; and all standard requirements specify a Long-term Planning Time Horizon.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar with MOD-004-1, Requirement R9 that has an approved Lower VRF. This requirement is also similar to draft standard MOD-026-1 Requirement R1 which also specifies a Lower VRF.
- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to provide requested information is a requirement that is administrative in nature for the planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Therefore the assigned "Lower" VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R1 high risk objective is to provide requested information. This

requirement is administrative in nature for providing instructions and data used for performing model verification. The “Lower” VRF assigned is based on the high risk objective specified.

VRF for MOD-027-1, Requirement R2:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R2 contains Parts specifying supporting obligations for satisfying the main requirement. The VRFs are only applied at the Requirement level and each Requirement Part is treated equally. Requirement obligations include actions similar in scope to actions specified in Requirement R1 and R5; and all standard requirements specify a Long-term Planning Time Horizon.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar with MOD-010-0 and MOD-012-0 Requirements R1 and R2 which have an approved VRF of Medium. This requirement is also similar to draft standard MOD-026-1 Requirement R2 which also specifies a Medium VRF.
- FERC Guideline 4 — Consistency with NERC’s Definition of the VRF Level selected exists. Failure to verify models in the Long-term Planning Time Horizon is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Therefore the assigned “Medium” VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R2 high risk objective is to verify models per specified periodicity. Requirement Parts and obligations are lower risk elements that ensure main requirement completeness which are administrative in nature consisting of documentation, information revision obligation and submission requirements. The “Medium” VRF assigned is based on the high risk objective specified.

VRF for MOD-027-1, Requirement R3:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R3 does not contains Parts. Requirement obligations include actions similar in scope to actions specified in Requirement R1 and R5; and all standard requirements specify a Long-term Planning Time Horizon.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar to MOD-004-1, Requirement R7 and R8 that has an approved Lower VRF. This requirement is also similar to draft standard MOD-026-1 Requirement R3 which also specifies a Lower VRF.
- FERC Guideline 4 — Consistency with NERC’s Definition of the VRF Level selected exists. Failure to verify models in the Long-term Planning Time Horizon is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or

capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Therefore the assigned "Lower" VRF is appropriate.

- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R3 high risk objective is to provide a written response after receiving notice. The Requirement is administrative in nature consisting of documentation, information revision obligation and submission requirements. The "Lower" VRF assigned is based on the high risk objective specified.

VRF for MOD-027-1, Requirement R4:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R4 does not contain Parts. Requirement obligations include actions similar in scope to actions specified in Requirement R1 and R5; and all standard requirements specify a Long-term Planning Time Horizon.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar to MOD-004-1, Requirement R1 and R2 that has an approved Lower VRF. This requirement is also similar to draft standard MOD-026-1 Requirement R4 which also specifies a Lower VRF.
- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to verify models in the Long-term Planning Time Horizon is a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Therefore the assigned "Lower" VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R4 high risk objective is to provide revised data after making changes to equipment. The Requirement is administrative in nature consisting of documentation, information revision obligation and submission requirements. The "Lower" VRF assigned is based on the high risk objective specified.

VRF for MOD-027-1, Requirement R5:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R5 contains Parts specifying supporting obligations for satisfying the main requirement. The VRFs are only applied at the Requirement level and each Requirement Part represents an obligation for ensuring main requirement completeness. Requirement obligations include actions similar in scope to actions specified in Requirement R1; and all standard requirements specify a Long-term Planning Time Horizon.

- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar with MOD-010-0 and MOD-012-0 Requirements R1 and R2 that have approved VRFs of Medium. This requirement is also similar to draft standard MOD-026-1 Requirement R6 which also specifies a Medium VRF.
- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to identify if a model is useable or not is a requirement that is administrative in nature for the planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Therefore the assigned "Medium" VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R5 high risk objective is to verify if the model is useable or not. Requirement Parts and obligations are lower risk elements that ensure main requirement completeness which are administrative in nature consisting of documentation and submission requirements. The "Medium" VRF assigned is based on the high risk objective specified.

Justification for Assignment of Violation Severity Levels:

In developing the VSLs for the standards under this project, the SDT anticipated the evidence that would be reviewed during an audit, and developed its VSLs based on the noncompliance an auditor may find during a typical audit. The SDT based its assignment of VSLs on the following NERC criteria:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

FERC's VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in MOD-027-1 meet the FERC Guidelines for assessing VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.

Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VSLs for MOD-027-1 Requirement R1:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R1.	The NERC VSL guidelines are satisfied by incorporating increments for tardiness VSL elements. The SDT has determined a 30 day "Increments for Tardiness" period is appropriate for standard VSLs proposed.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's incorporate the increments for tardiness methodology. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on timeliness of the action specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action and if information submission is timely. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

VSLs for MOD-027-1 Requirement R2:

R#	Compliance with NERC Revised VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R2.	The NERC VSL guidelines are satisfied by incorporating increments for tardiness VSL elements for the main Requirement action. The SDT has determined a 30 day “Increments for Tardiness” period is appropriate for standard VSLs proposed.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL’s consider completeness of listed parts deemed to possess equal reliability weight and also increments for tardiness. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on binary performance, and both completeness and timeliness of the actions and obligations specified.	Proposed VSL’s do not expand on what is required in the requirement. The VSL’s assigned only consider performing required action and if information submission is complete. Proposed VSL’s are consistent with the requirement.	Proposed VSL’s are based on a single violation and not a cumulative violation methodology.

VSLs for MOD-027-1 Requirement R3:

R#	Compliance with NERC Revised VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R3.	The NERC VSL guidelines are satisfied by incorporating increments for tardiness VSL elements for the main Requirement action. Actions and obligations specified in the Requirement Parts incorporate a binary element, consideration for omitting required information. The SDT has determined a 30 day "Increments for Tardiness" period is appropriate for standard VSLs proposed.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's are a combination of a binary element and increments for tardiness. Binary requirements are categorized as severe. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on binary performance, and both completeness and timeliness of the actions and obligations specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action and if information submission is both complete and provided in a timely manner. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

VSLs for MOD-027-1 Requirement R4:

R#	Compliance with NERC Revised VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R4.	The NERC VSL guidelines are satisfied by incorporating increments for tardiness VSL elements for the main Requirement action. The SDT has determined a 30 day “Increments for Tardiness” period is appropriate for standard VSLs proposed.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL’s utilize increments for tardiness rationale. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on timeliness of the actions and obligations specified.	Proposed VSL’s do not expand on what is required in the requirement. The VSL’s assigned only consider performing required action and if information submission is complete and provided in a timely manner. Proposed VSL’s are consistent with the requirement.	Proposed VSL’s are based on a single violation and not a cumulative violation methodology.

VSLs for MOD-027-1 Requirement R5:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R5.	The NERC VSL guidelines are satisfied by incorporating increments for tardiness VSL elements for the Main Requirement action. Actions specified in the Requirement Parts incorporate completeness of the actions and obligations specified. The SDT has determined a 30 day "Increments for Tardiness" period is appropriate for standard VSLs proposed.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's are a combination of completeness of listed parts and also increments for tardiness. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on both completeness and timeliness of the actions and obligations specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action and if information submission is both complete provided in a timely manner. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

Violation Risk Factor and Violation Severity Level Assignments

Project 2007-09 Generator Verification

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in PRC-019-1 — Coordination of Generating Unit or Plant Capabilities, Voltage Regulating Controls and Protection

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

Justification for Assignment of Violation Risk Factors

The Generator Verification Standard Drafting Team applied the following NERC criteria when proposing VRFs for the requirements under this project:

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

The SDT also considered consistency with the FERC Violation Risk Factor Guidelines for setting VRFs:[1]

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:[2]

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

Guideline (2) — Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) — Consistency among Reliability Standards

[1] North American Electric Reliability Corp., 119 FERC ¶ 61,145, order on reh'g and compliance filing, 120 FERC ¶ 61,145 (2007) ("VRF Rehearing Order").
[2] Id. at footnote 15.

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

The following discussion addresses how the SDT considered FERC's VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's Reliability Standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and therefore concentrated its approach on the reliability impact of the requirements.

VRF for PRC-019-1:
There are two requirements in PRC-019-1 and both have been assigned a "Medium" VRF.

VRF for PRC-019-1, Requirement R1:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirements R1 and R2 specify that the responsible entity must verify coordination for applicable Facilities. The standard requirements specify a Long-term Planning Time Horizon and both are assigned a "Medium" VRF.
- FERC Guideline 3 — Consistency among Reliability Standards exists. Requirement R1 is similar in concept with both PRC-012-0 Requirement R1 and PRC-023-1 Requirement R1, both of which require protection coordination or settings. These requirements apply to multiple elements while the requirements of PRC-019-1 apply to a single unit, synchronous condenser or plant. Violation of this requirement by a single generator could not be construed as directly causing or contributing to BES instability, separation or cascading within any time frame. For a single violation to lead to BES instability, separation or cascading would require other standards requirements to be violated. This requirement is assigned a "Medium" VRF.
- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to periodically verify voltage regulation controls, limiters and protection coordinated with unit

and synchronous condenser coordination in the Long-term Planning Time Horizon is a requirement in the planning time frame that, if violated, is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. Therefore the assigned "Medium" VRF is appropriate.

- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R1 and Part 1.1 have a reliability objective to verify voltage regulation controls, limiters and protection coordinated with unit and synchronous condenser coordination. Failure to verify the coordination for a single applicable Facility is unlikely to, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. The "Medium" VRF assigned is based on the reliability objective specified.

VRF for PRC-019-1, Requirement R2:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirements R1 and R2 specify that the responsible entity must verify coordination for applicable Facilities. The standard requirements specify a Long-term Planning Time Horizon and both are assigned a "Medium" VRF.
- FERC Guideline 3 — Consistency among Reliability Standards exists. Requirement R2 is similar in concept with both PRC-010-0 Requirement R1 and PRC-014-0 Requirement R1, both of which require 5-year verification of protection coordination or settings. These requirements apply to multiple elements while the requirements of PRC-019-1 apply to a single unit, synchronous condenser or plant. Violation of this requirement by a single generator could not be construed as directly causing or contributing to BES instability, separation or cascading within any time frame. For a single violation to lead to BES instability, separation or cascading would require other standards requirements to be violated. This requirement is assigned a "Medium" VRF.
- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to verify coordination following setting changes affecting unit or synchronous condenser coordination in the Long-term Planning Time Horizon is a requirement that, if violated, is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition Therefore the assigned "Medium" VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R2 has a high reliability objective to specify the periodicity for verifying voltage regulation controls, limiters and protection coordinated with unit and synchronous condenser coordination following a change to equipment settings. Failure to verify the coordination for a single applicable Facility is unlikely to, under emergency, abnormal,

or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. . The “Medium” VRF assigned is based on the high risk objective specified.

Justification for Assignment of Violation Severity Levels:

In developing the VSLs for the standards under this project, the SDT anticipated the evidence that would be reviewed during an audit, and developed its VSLs based on the noncompliance an auditor may find during a typical audit. The SDT based its assignment of VSLs on the following NERC criteria:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

FERC's VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in PRC-019-1 meet the FERC Guidelines for assessing VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a “binary” type requirement must be a “Severe” VSL.

Do not use ambiguous terms such as “minor” and “significant” to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

VSLs for PRC-019-1 Requirement R1:

R#	Compliance with NERC Revised VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R1.	The NERC VSL guidelines are satisfied by identifying noncompliance based on the obligation to verify coordination within a certain timeframe. VSLs account for increments of tardiness.	This is a new Requirement and does not have a prior level of compliance.	The proposed VSLs are based on increments of tardiness for completing the required verifications. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on binary performance, and completeness of the actions and obligations specified.	Proposed VSLs do not expand on what is required in the requirement. The VSLs assigned only consider performing required action per the procedure specified by listed parts. Proposed VSLs are consistent with the requirement.	Proposed VSLs are based on a single violation and not a cumulative violation methodology.

VSLs for PRC-019-1 Requirement R2:

R#	Compliance with NERC Revised VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R2.	The NERC VSL guidelines are satisfied by identifying noncompliance based on the obligation to verify coordination within a certain timeframe. VSLs account for increments of tardiness.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSLs are based on increments of tardiness for competing required verifications. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on binary performance, and completeness of the actions and obligations specified.	Proposed VSLs do not expand on what is required in the requirement. The VSLs assigned only consider performing required action per the procedure specified by listed parts. Proposed VSLs are consistent with the requirement.	Proposed VSLs are based on a single violation and not a cumulative violation methodology.

Project 2007-09 Generator Verification Consideration of Issues and Directives

Project 2007-09 Generator Verification — MOD-024 and MOD-025		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
Clarify requirement R2 that specifies that the regional reliability organization shall provide generator gross and net real power capability verification within 30 calendar days of approval. The confusion centers on “approval” and when the 30-day period starts. 1311. We repeat our concern that Requirement R2, which specifies that the “regional reliability organization shall provide generator gross and net real power capability verification within 30 calendar days of approval,” is not clear. The requirement lacks a definition of what approval is required and when the 30-day period starts. Therefore, we direct the ERO to modify this Reliability Standard by adding information that will clarify this requirement.	MOD-024-1; FERC Order 693	The GVSDT has combined MOD-024 and MOD-025 into a single standard. The original R2 from MOD-024 maps to Requirements R1 and R2 of the proposed MOD-025-2. Fill in the blank components of the standard have been eliminated and the Generator Owner must report the required data to its Transmission Planner. R1. Each Generator Owner shall provide its Transmission Planner with verification of the Real Power capability of its applicable Facilities as follows: [Violation Risk Factor: Medium] [Time Horizon: Long-term Planning] 1.1. Verify the Real Power capability of its generating units in accordance with Attachment 1. 1.2. Submit a completed Attachment 2 (or a form containing the same information as identified in Attachment 2) to its Transmission Planner within 90 calendar days of either (i) the date the data is recorded for a staged test; or (ii) the date the data is selected for verification using historical

Project 2007-09 Generator Verification — MOD-024 and MOD-025		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		operational data. R2. Each Generator Owner shall provide its Transmission Planner with verification of the Reactive Power capability of its applicable Facilities as follows: [Violation Risk Factor: Medium] [Time Horizon: Long-term Planning] 2.1. Verify, in accordance with Attachment 1, (i) the Reactive Power capability of its generating units and (ii) the Reactive Power capability of its synchronous condenser units. 2.2. Submit a completed Attachment 2 (or a form containing the same information as identified in Attachment 2) to its Transmission Planner within 90 calendar days of either (i) the date the data is recorded for a staged test; or (ii) the date the data is selected for verification using historical operational data. R3. Each Transmission Owner shall provide its Transmission Planner with verification of the Reactive Power capability of its applicable Facilities as follows: [Violation Risk Factor: Medium] [Time Horizon: Long-term Planning] 3.1. Verify, in accordance with Attachment 1, the Reactive Power capability of its synchronous condenser units.

Project 2007-09 Generator Verification — MOD-024 and MOD-025		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		3.2. Submit a completed Attachment 2 (or a form containing the same information as identified in Attachment 2) to its Transmission Planner within 90 calendar days of either (i) the date the data is recorded for a staged test; or (ii) the date the data is selected for verification using historical operational data.
Document test conditions and the relationships between test conditions and generator output so that the amount of power that can be expected to be delivered from a generator at different conditions can be determined. 1309. The Commission remains concerned that the Reliability Standard is not sufficiently clear because it does not define the test conditions and methodologies for calculating de-rating factors. The Commission does not agree with APPA that NERC should consider modifying this Reliability Standard to provide requirements for this information on an Interconnection-wide basis, in the same manner that IRO-006-3 sets the requirements for transmission loading relief in each Interconnection. We believe, however, that while the overall methodology for verification of generator gross and net real power	MOD-024-1; FERC Order 693	The GVSDT has combined MOD-024 and MOD-025 into a single standard. Fill in the blank components of the standard have been eliminated and the Generator Owner must report the required data to its Transmission Planner, including test conditions. Section 3 of Attachment is: 3. Record the following data for the verifications specified above: 3.1. The value of the gross Real and Reactive Power generating capabilities at the end of the verification period. 3.2. The voltage schedule provided by the Transmission Operator, if applicable. 3.3. The voltage at the high and low side of the GSU and/or system interconnection transformer(s) at the end of the verification period. If only one of these values is metered, the other may be calculated.

Project 2007-09 Generator Verification — MOD-024 and MOD-025		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
capability should be the same, test conditions (such as ambient temperature, river water temperature, etc.) can vary. 1310. In the NOPR, the Commission stated that the Reliability Standard could be improved by defining test conditions, e.g., ambient temperature, river water temperature, and methodologies for calculating de-rating factors for conditions such as higher ambient temperatures than the test temperature. With the test information and methodologies, the generator output that can be expected to be available at forecasted weather conditions can be determined. The Commission agrees with Northern Indiana that testing all units at the same time is not feasible. However, the Commission did not propose simultaneous testing. Rather, we direct the ERO to develop appropriate requirements to document test conditions and the relationships between test conditions and generator output so that the amount of power that can be expected to be delivered from a generator at different conditions, such as peak summer conditions, can be determined. Similarly, we respond to Constellation that any modification of the Levels of Non-Compliance in this Reliability Standard should		3.4. The ambient conditions, if applicable, at the end of the verification period that the Generator Owner requires to perform corrections to Real Power for different ambient conditions such as: • Ambient air temperature • Relative humidity • Cooling water temperature • Other data as determined to be applicable by the Generator Owner to perform corrections for ambient conditions.3.5.The date and time of the verification period, including start and end time in hours and minutes. 3.6. The existing GSU and/or system Interconnection transformer(s) voltage ratio and tap setting. 3.7. The GSU transformer losses (real or reactive) if the verification measurements were taken from the high side of the GSU transformer. 3.8. Whether the test data is a result of a staged test or if it is operational data.

Project 2007-09 Generator Verification — MOD-024 and MOD-025		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
be reviewed in the ERO Reliability Standards development process.		
Review MOD-024 and MOD-025 concurrently to transition to uniform North American standards.	MOD-024-1, Fill-in-the-blank team	The GVSDT has combined MOD-024 and MOD-025 into a single standard, MOD-025-2.
Remove the fill-in-the-blank aspects (correct reference to "…Regional Reliability Organization's procedures…").	MOD-024-1, Fill-in-the-blank team	The GVSDT has combined MOD-024 and MOD-025 into a single standard. Fill in the blank components of the standard have been eliminated and the Generator Owner must report the required data to its Transmission Planner. See Requirements R1 and R2 above.
Goal is uniform North American standards for real and reactive power verification. Look at regional requirements and identify the best practice, commonalities and differences, and whether differences are needed for reliability.	MOD-024-1, Fill-in-the-blank team	The GVSDT has combined MOD-024 and MOD-025 into a single standard. Fill in the blank components of the standard have been eliminated and the Generator Owner must report the required data to its Transmission Planner. See Requirements R1 and R2 above.
No requirement for the RRO to demonstrate that its procedures result in accurate information of gross and net real power capability of generators for steady state models	MOD-024-1; Phase III/IV Team	The GVSDT has combined MOD-024 and MOD-025 into a single standard. Fill in the blank components of the standard have been eliminated and all required testing and data information is contained in Attachment 1 of the proposed MOD-025-2.
It is not clear in R3 to whom the Generator Owner will report the information.	MOD-024-1; Phase III/IV Team	The GVSDT has combined MOD-024 and MOD-025 into a single standard. The original R3 from MOD-024 maps to Requirements R1 and R2 of the proposed MOD-025-2. Fill in the blank

Project 2007-09 Generator Verification — MOD-024 and MOD-025		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		components of the standard have been eliminated and the Generator Owner must report the required data to its Transmission Planner. See Requirements R1 and R2 above.
Non compliance levels are too strict. A small utility with 15-20 units will be L4 noncompliant if they miss one unit	MOD-024-1; Phase III/IV Team	The Standard now utilizes Violation Risk Factors, Time Horizons and Violation Severity Levels. The issue is addressed through the CMEP. The standard is written such that each generator must be tested. Failure to test a single unit results in a single violation for a requirement.
Provide clarity where the Planning Authority is mentioned	MOD-024-1, Team Comments	The GVSDT has written the requirements such that the Transmission Planner receives the information from the Generator Owner.
Require verification of reactive power capability at multiple points over a unit's operating range. 1321. We disagree with commenters that verifying generator reactive capability is a particularly difficult issue. The capability of generators to produce reactive power is essential for real-time analysis and planning. The Reliability Standard addressing this issue requires a generator to verify reactive capability only at the unit's full MW loading. However, other than baseload units, most generating units rarely operate at full MW loading. It is unclear what reactive capability is available	MOD-025-1, FERC Order 693	Attachment 1 of MOD-025-2 addresses this directive. 2. Verify with all auxiliary equipment needed for expected normal operation in service for both the Real Power and Reactive Power capability verification. Perform verification with the automatic voltage regulator in service for the Reactive Power capability verification. Operational data from within the two years prior to the verification date is acceptable for the verification of either the Real Power or the Reactive Power capability, as long as that operational data meets the criteria in 2.1 through 2.5 below. A Reactive capability test must demonstrate at least 90 percent of a previously staged test that demonstrated at least 50 percent of the Reactive capability

Project 2007-09 Generator Verification — MOD-024 and MOD-025		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
throughout a unit's real power (MW) operating range. Therefore, we believe a clearer standard would require a verification of MVAR capability throughout a unit's real power (MW) operating range. However, we share concern with several commenters that such a requirement for all generators may not be necessary. Therefore, we adjust the proposal in the NOPR and direct the ERO to modify MOD-025-1 to require verification of reactive power capability at multiple points over a unit's operating range.		shown on the associated thermal capability curve (D-curve). If the previously staged test was unduly restricted by unusual generation or equipment limitations (e.g., capacitor or reactor banks out of service), then the next verification will be by another staged test, not operational data: 2.1. Verify Real Power capability and Reactive Power capability over-excited (lagging) of all applicable Facilities at the applicable Facilities' normal (not emergency) expected maximum Real Power output at the time of the verifications. 2.1.1 Verify synchronous generating unit's maximum real power and lagging reactive power for a minimum of one hour. 2.1.2 Verify variable generating units, such as wind, solar, and run of river hydro, at the maximum Real Power output the variable resource can provide at the time of the verification. Perform verification of Reactive Power capability of wind turbines and photovoltaic inverters with at least 90 percent of the wind turbines or photovoltaic inverters at a site on-line. If verification of wind turbines or photovoltaic inverter Facility cannot be accomplished meeting the 90 percent threshold, document the reasons the threshold was not met and test to the full capability at the time of the test. Reschedule the test of the facility within six months of being able to reach the 90 percent threshold. Maintain, as steady as practical, Real and Reactive Power output during verifications.

Project 2007-09 Generator Verification — MOD-024 and MOD-025		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		2.2. Verify Reactive Power capability of all applicable Facilities, other than wind and photovoltaic, for maximum overexcited (lagging) and under-excited (leading) reactive capability for the following conditions: 2.2.1 At the minimum Real Power output at which they are normally expected to operate collect maximum leading and lagging reactive values as soon as a limit is reached. 2.2.2 At maximum Real Power output collect maximum leading reactive values as soon as a limit is reached. 2.2.3 Nuclear Units are not required to perform Reactive Power verification at minimum Real Power output. 2.3. For hydrogen-cooled generators, perform the verification at normal operating hydrogen pressure. 2.4. Calculate the Generator Step-Up (GSU) transformer losses if the verification measurements are taken from the high side of the GSU transformer. GSU transformer real and reactive losses may be estimated, based on the GSU impedance, if necessary.
Clarify requirement R2 that specifies that the regional reliability organization shall provide generator gross and net reactive power capability verification within 30 calendar days of approval. The confusion centers on “approval” and when the 30-day period starts.	MOD-025-1, FERC Order 693	The GVSDT has combined MOD-024 and MOD-025 into a single standard. The original R2 from MOD-024 maps to Requirement R1 of the proposed MOD-025-2. Fill in the blank components of the standard have been eliminated and the Generator Owner must report the required data to its Transmission Planner. See

Project 2007-09 Generator Verification — MOD-024 and MOD-025		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
1322. We maintain the concern we expressed in the NOPR that Requirement R2 provides that the “regional reliability organization shall provide generator gross and net reactive power capability verification within 30 calendar days of approval” and note that it is not clear what approval is required and when the 30-day period starts. We direct the ERO to provide clarification on this requirement.		Requirements R1, R2 and R3 above.
Remove the fill-in-the-blank aspects (correct reference to “… Regional Reliability Organization’s procedures…”).	MOD-025-1, Fill-in-the-blank Team	The GVSDT has combined MOD-024 and MOD-025 into a single standard. Fill in the blank components of the standard have been eliminated and all required testing and data information is contained in Attachment 1 of the proposed MOD-025-2.
Refer to MOD-024.	MOD-025-1, Fill-in-the-blank Team	The GVSDT has combined MOD-024 and MOD-025 into a single standard, MOD-025-2.
Review MOD-024 and MOD-025 concurrently to transition to uniform North American standards	MOD-025-1, Fill-in-the-blank Team	The GVSDT has combined MOD-024 and MOD-025 into a single standard, MOD-025-2.
These standards do not provide for uniform testing of generator capability. The determination of which units are tested, how frequently they are tested, and the criteria used for determining capability are left	MOD-025-1, Phase III/IV Team	The GVSDT has combined MOD-024 and MOD-025 into a single standard. Fill in the blank components of the standard have been eliminated and all required testing and data information is contained in Attachment 1 of the proposed MOD-025-2.

Project 2007-09 Generator Verification — MOD-024 and MOD-025		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
to individual regions.		
R1.5.1: The benefit of verifying maximum capability of generators to absorb VArs at seasonal real power generation capability is unclear, particularly if this standard applies to virtually all generators. For the vast majority of units, the need to absorb VArs occurs during low-load conditions, when unit real power production is below maximum capability and the unit's ability to absorb VArs is greater. Therefore, the single datum for unit VAr absorption capability determined pursuant to this standard seems to be of little practical use, except for relatively few generators in a limited set of circumstances.	MOD-025-1, Phase III/IV Team	The Standard no longer references "seasonal capability." Attachment 1 of MOD-025-2 describes the required testing. 2. Verify with all auxiliary equipment needed for expected normal operation in service for both the Real Power and Reactive Power capability verification. Perform verification with the automatic voltage regulator in service for the Reactive Power capability verification. Operational data from within the two years prior to the verification date is acceptable for the verification of either the Real Power or the Reactive Power capability, as long as that operational data meets the criteria in 2.1 through 2.5 below. A Reactive capability test must demonstrate at least 90 percent of a previously staged test that demonstrated at least 50 percent of the Reactive capability shown on the associated thermal capability curve (D-curve). If the previously staged test was unduly restricted by unusual generation or equipment limitations (e.g., capacitor or reactor banks out of service), then the next verification will be by another staged test, not operational data: 2.1. Verify Real Power capability and Reactive Power capability over-excited (lagging) of all applicable Facilities at the applicable Facilities' normal (not emergency) expected maximum Real Power output at the time of the verifications. 2.1.1 Verify synchronous generating unit's maximum real power

		and lagging reactive power for a minimum of one hour. 2.1.2 Verify variable generating units, such as wind, solar, and run of river hydro, at the maximum Real Power output the variable resource can provide at the time of the verification. Perform verification of Reactive Power capability of wind turbines and photovoltaic inverters with at least 90 percent of the wind turbines or photovoltaic inverters at a site on-line. If verification of wind turbines or photovoltaic inverter Facility cannot be accomplished meeting the 90 percent threshold, document the reasons the threshold was not met and test to the full capability at the time of the test. Reschedule the test of the facility within six months of being able to reach the 90 percent threshold. Maintain, as steady as practical, Real and Reactive Power output during verifications. 2.2. Verify Reactive Power capability of all applicable Facilities, other than wind and photovoltaic, for maximum overexcited (lagging) and under-excited (leading) reactive capability for the following conditions: 2.2.1 At the minimum Real Power output at which they are normally expected to operate collect maximum leading and lagging reactive values as soon as a limit is reached. 2.2.2 At maximum Real Power output collect maximum leading reactive values as soon as a limit is reached. 2.2.3 Nuclear Units are not required to perform Reactive Power

Project 2007-09 Generator Verification — MOD-024 and MOD-025		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		verification at minimum Real Power output. 2.3. For hydrogen-cooled generators, perform the verification at normal operating hydrogen pressure. 2.4. Calculate the Generator Step-Up (GSU) transformer losses if the verification measurements are taken from the high side of the GSU transformer. GSU transformer real and reactive losses may be estimated, based on the GSU impedance, if necessary.
It is not clear in R3 to whom the Generator Owner will report the information.	MOD-025-1, Phase III/IV Team	The GVSDT has combined MOD-024 and MOD-025 into a single standard. The original R3 from MOD-024 maps to Requirement R1 of the proposed MOD-025-2. Fill in the blank components of the standard have been eliminated and the Generator Owner must report the required data to its Transmission Planner. Please see Requirements R1, R2 and R3 above.
Non compliance levels are too strict. A small utility with 15-20 units will be L4 noncompliant if they miss one unit.	MOD-025-1, Phase III/IV Team	The Standard now utilizes Violation Risk Factors, Time Horizons and Violation Severity Levels. The issue is addressed through the CMEP. The standard is written such that each generator must be tested. Failure to test a single unit results in a single violation for a requirement.
Severity of non-compliance should be based on the percentage of the generator owner's total generation capability comprised of units required to be verified, rather than on the percentage (number)	MOD-025-1, Phase III/IV Team	The Standard now utilizes Violation Risk Factors, Time Horizons and Violation Severity Levels. The issue is addressed through the CMEP. The standard is written such that each generator must be tested. Failure to test a single unit results in a single violation for

Project 2007-09 Generator Verification — MOD-024 and MOD-025		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
of generating units. Exempt units should be excluded from the total generation capability for determining level of non-compliance.		a requirement.
There is no clear reason for regional variations in capability testing. A generator in Georgia does not have more or less capability than an identical unit applied across the Florida line, despite the fact that one is in SERC and the other in FRCC.	MOD-025-1, Phase III/IV Team	The GVSDT has combined MOD-024 and MOD-025 into a single standard. Fill in the blank components of the standard as well as regional variances have been eliminated and all required testing and data information is contained in Attachment 1 of the proposed MOD-025-2.
Fundamental guidelines outlining some basic requirements (e.g., all units over 20 MW shall be tested annually under conditions that permit full net output of the unit for normal operation) are lacking.	MOD-025-1, Phase III/IV Team	The GVSDT has combined MOD-024 and MOD-025 into a single standard. All required testing and data information is contained in Attachment 1 of the proposed MOD-025-2.
Provide clarity where the Planning Authority is mentioned	MOD-025-1; Team Comments	The GVSDT has written the requirements such that the Transmission Planner receives the information from the Generator Owner.

Project 2007-09 Generator Verification Consideration of Issues and Directives

Project 2007-09 Generator Verification — MOD-024 and MOD-025		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
Clarify requirement R2 that specifies that the regional reliability organization shall provide generator gross and net real power capability verification within 30 calendar days of approval. The confusion centers on “approval” and when the 30-day period starts. 1311. We repeat our concern that Requirement R2, which specifies that the “regional reliability organization shall provide generator gross and net real power capability verification within 30 calendar days of approval,” is not clear. The requirement lacks a definition of what approval is required and when the 30-day period starts. Therefore, we direct the ERO to modify this Reliability Standard by adding information that will clarify this requirement. ~~Document test conditions and the relationships between test conditions and generator output so that the amount of power that can be expected to be delivered from a generator at different conditions~~	MOD-024-1; FERC Order 693	The GVSDT has combined MOD-024 and MOD-025 into a single standard. The original R2 from MOD-024 maps to Requirements R1 and R2 of the proposed MOD-025-2. Fill in the blank components of the standard have been eliminated and the Generator Owner must report the required data to its Transmission Planner. R1. Each Generator Owner shall provide its Transmission Planner with verification of the Real Power capability of its applicable Facilities as follows: [Violation Risk Factor: Medium] [Time Horizon: Long-term Planning] 1.1. Verify the Real Power capability of its generating units in accordance with Attachment 1. 1.2. Submit a completed Attachment 2 (or a form containing the same information as identified in Attachment 2) to its Transmission Planner within 90 calendar days of either (i) the date the data is recorded for a staged test; or (ii) the date the data is selected for verification using historical

GSU transformer. 3.8. Whether the test data is a result of a staged test or if it is operational data.
Review MOD-024 and MOD-025 concurrently to transition to uniform North American standards.	MOD-024-1, Fill-in-the-blank team	The GVSDT has combined MOD-024 and MOD-025 into a single standard, MOD-025-2.
Remove the fill-in-the-blank aspects (correct reference to "…Regional Reliability Organization's procedures…").	MOD-024-1, Fill-in-the-blank team	The GVSDT has combined MOD-024 and MOD-025 into a single standard. Fill in the blank components of the standard have been eliminated and the Generator Owner must report the required data to its Transmission Planner. See Requirements R1 and R2 above.
Goal is uniform North American standards for real and reactive power verification. Look at regional requirements and identify the best practice, commonalities and differences, and whether differences are needed for reliability.	MOD-024-1, Fill-in-the-blank team	The GVSDT has combined MOD-024 and MOD-025 into a single standard. Fill in the blank components of the standard have been eliminated and the Generator Owner must report the required data to its Transmission Planner. See Requirements R1 and R2 above.

Project 2007-09 Generator Verification — MOD-024 and MOD-025		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
No requirement for the RRO to demonstrate that its procedures result in accurate information of gross and net real power capability of generators for steady state models	MOD-024-1; Phase III/IV Team	The GVSDT has combined MOD-024 and MOD-025 into a single standard. Fill in the blank components of the standard have been eliminated and all required testing and data information is contained in Attachment 1 of the proposed MOD-025-2.
It is not clear in R3 to whom the Generator Owner will report the information.	MOD-024-1; Phase III/IV Team	The GVSDT has combined MOD-024 and MOD-025 into a single standard. The original R3 from MOD-024 maps to Requirements R1 and R2 of the proposed MOD-025-2. Fill in the blank components of the standard have been eliminated and the Generator Owner must report the required data to its Transmission Planner. See Requirements R1 and R2 above.
Non compliance levels are too strict. A small utility with 15-20 units will be L4 noncompliant if they miss one unit	MOD-024-1; Phase III/IV Team	The Standard now utilizes Violation Risk Factors, Time Horizons and Violation Severity Levels. The issue is addressed through the CMEP. The standard is written such that each generator must be tested. Failure to test a single unit results in a single violation for a requirement.
Provide clarity where the Planning Authority is mentioned	MOD-024-1, Team Comments	The GVSDT has written the requirements such that the Transmission Planner receives the information from the Generator Owner.
Require verification of reactive power capability at multiple points over a unit's operating range. 1321. We disagree with commenters that verifying	MOD-025-1, FERC Order 693	Attachment 1 of MOD-025-2 addresses this directive. 2. Verify with all auxiliary equipment needed for expected normal operation in service for both the Real Power and Reactive

Project 2007-09 Generator Verification — MOD-024 and MOD-025		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
generator reactive capability is a particularly difficult issue. The capability of generators to produce reactive power is essential for real-time analysis and planning. The Reliability Standard addressing this issue requires a generator to verify reactive capability only at the unit's full MW loading. However, other than baseload units, most generating units rarely operate at full MW loading. It is unclear what reactive capability is available throughout a unit's real power (MW) operating range. Therefore, we believe a clearer standard would require a verification of MVAR capability throughout a unit's real power (MW) operating range. However, we share concern with several commenters that such a requirement for all generators may not be necessary. Therefore, we adjust the proposal in the NOPR and direct the ERO to modify MOD-025-1 to require verification of reactive power capability at multiple points over a unit's operating range.		Power capability verification. Perform verification with the automatic voltage regulator in service for the Reactive Power capability verification~~ (see Note 3 if the automatic voltage regulator is not available).~~. Operational data from within the two years prior to the verification date is acceptable for the verification of either the Real Power or the Reactive Power capability, as long as that operational data meets the criteria in 2.1 through 2.5 below. A Reactive capability test must demonstrate at least 90 percent of a previously staged test that demonstrated at least 50 percent of the Reactive capability shown on the associated thermal capability curve (D-curve). If the previously staged test was unduly restricted by unusual generation or equipment limitations (e.g., capacitor or reactor banks out of service), then the next verification ~~shall~~will be by another staged test, not operational data: 2.1. Verify Real Power capability and Reactive Power capability over-excited (lagging) of all applicable Facilities at the applicable Facilities' normal (not emergency) expected maximum Real Power output at the time of the verifications. 2.1.1 Verify synchronous generating unit's maximum real power and lagging reactive power for a minimum of one hour. 2.1.2 Verify variable generating units, such as wind, solar, and run of river hydro, at the maximum Real Power output the variable resource can provide at the time of the verification.

Project 2007-09 Generator Verification — MOD-024 and MOD-025		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		Perform verification of Reactive Power capability of wind turbines and photovoltaic inverters with at least 90 percent of the wind turbines or photovoltaic inverters at a site on-line. If verification of wind turbines or photovoltaic inverter Facility cannot be accomplished meeting the 90 percent threshold, document the reasons the threshold was not met and test to the full capability at the time of the test. Reschedule the test of the facility within six months of being able to reach the 90 percent threshold. Maintain, as steady as practical, Real and Reactive Power output during verifications. 2.2. Verify Reactive Power capability of all applicable Facilities, other than wind and photovoltaic, for maximum overexcited (lagging) and under-excited (leading) reactive capability for the following conditions: 2.2.1 At the minimum Real Power output at which they are normally expected to operate collect maximum leading and lagging reactive values as soon as a limit is reached. 2.2.2 At maximum Real Power output collect maximum leading reactive values as soon as a limit is reached. 2.2.3 Nuclear Units are not required to perform Reactive Power verification at minimum Real Power output. 2.3. For hydrogen-cooled generators, perform the verification at normal operating hydrogen pressure.

Project 2007-09 Generator Verification — MOD-024 and MOD-025		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		2.4. Calculate the Generator Step-Up (GSU) transformer losses if the verification measurements are taken from the high side of the GSU transformer. GSU transformer real and reactive losses may be estimated, based on the GSU impedance, if necessary.
Clarify requirement R2 that specifies that the regional reliability organization shall provide generator gross and net reactive power capability verification within 30 calendar days of approval. The confusion centers on "approval" and when the 30-day period starts. 1322. We maintain the concern we expressed in the NOPR that Requirement R2 provides that the "regional reliability organization shall provide generator gross and net reactive power capability verification within 30 calendar days of approval" and note that it is not clear what approval is required and when the 30-day period starts. We direct the ERO to provide clarification on this requirement.	MOD-025-1, FERC Order 693	The GVSDT has combined MOD-024 and MOD-025 into a single standard. The original R2 from MOD-024 maps to Requirement R1 of the proposed MOD-025-2. Fill in the blank components of the standard have been eliminated and the Generator Owner must report the required data to its Transmission Planner. See Requirements R1, R2 and R3 above.
Remove the fill-in-the-blank aspects (correct reference to "… Regional Reliability Organization's procedures…").	MOD-025-1, Fill-in-the-blank Team	The GVSDT has combined MOD-024 and MOD-025 into a single standard. Fill in the blank components of the standard have been eliminated and all required testing and data information is contained in Attachment 1 of the proposed MOD-025-2.
Refer to MOD-024.	MOD-025-1, Fill-	The GVSDT has combined MOD-024 and MOD-025 into a single

Project 2007-09 Generator Verification — MOD-024 and MOD-025		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
	in-the-blank Team	standard, MOD-025-2.
Review MOD-024 and MOD-025 concurrently to transition to uniform North American standards	MOD-025-1, Fill-in-the-blank Team	The GVSDT has combined MOD-024 and MOD-025 into a single standard, MOD-025-2.
These standards do not provide for uniform testing of generator capability. The determination of which units are tested, how frequently they are tested, and the criteria used for determining capability are left to individual regions.	MOD-025-1, Phase III/IV Team	The GVSDT has combined MOD-024 and MOD-025 into a single standard. Fill in the blank components of the standard have been eliminated and all required testing and data information is contained in Attachment 1 of the proposed MOD-025-2.
R1.5.1: The benefit of verifying maximum capability of generators to absorb VArs at seasonal real power generation capability is unclear, particularly if this standard applies to virtually all generators. For the vast majority of units, the need to absorb VArs occurs during low-load conditions, when unit real power production is below maximum capability and the unit's ability to absorb VArs is greater. Therefore, the single datum for unit VAr absorption capability determined pursuant to this standard seems to be of little practical use, except for relatively few generators in a limited set of circumstances.	MOD-025-1, Phase III/IV Team	The Standard no longer references "seasonal capability." Attachment 1 of MOD-025-2 describes the required testing. 2. Verify with all auxiliary equipment needed for expected normal operation in service for both the Real Power and Reactive Power capability verification. Perform verification with the automatic voltage regulator in service for the Reactive Power capability verification~~ (see Note 3 if the automatic voltage regulator is not available).~~. Operational data from within the two years prior to the verification date is acceptable for the verification of either the Real Power or the Reactive Power capability, as long as that operational data meets the criteria in 2.1 through 2.5 below. A Reactive capability test must demonstrate at least 90 percent of a previously staged test that

Project 2007-09 Generator Verification — MOD-024 and MOD-025		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		demonstrated at least 50 percent of the Reactive capability shown on the associated thermal capability curve (D-curve). If the previously staged test was unduly restricted by unusual generation or equipment limitations (e.g., capacitor or reactor banks out of service), then the next verification ~~shall~~will be by another staged test, not operational data: 2.1. Verify Real Power capability and Reactive Power capability over-excited (lagging) of all applicable Facilities at the applicable Facilities' normal (not emergency) expected maximum Real Power output at the time of the verifications. 2.1.1 Verify synchronous generating unit's maximum real power and lagging reactive power for a minimum of one hour. 2.1.2 Verify variable generating units, such as wind, solar, and run of river hydro, at the maximum Real Power output the variable resource can provide at the time of the verification. Perform verification of Reactive Power capability of wind turbines and photovoltaic inverters with at least 90 percent of the wind turbines or photovoltaic inverters at a site on-line. If verification of wind turbines or photovoltaic inverter Facility cannot be accomplished meeting the 90 percent threshold, document the reasons the threshold was not met and test to the full capability at the time of the test. Reschedule the test of the facility within six months of being able to reach the 90 percent threshold. Maintain, as steady as practical, Real and Reactive Power output

Issue or Directive	**Source**	**Consideration of Issue or Directive**
		during verifications. 2.2. Verify Reactive Power capability of all applicable Facilities, other than wind and photovoltaic, for maximum overexcited (lagging) and under-excited (leading) reactive capability for the following conditions: 2.2.1 At the minimum Real Power output at which they are normally expected to operate collect maximum leading and lagging reactive values as soon as a limit is reached. 2.2.2 At maximum Real Power output collect maximum leading reactive values as soon as a limit is reached. 2.2.3 Nuclear Units are not required to perform Reactive Power verification at minimum Real Power output. 2.3. For hydrogen-cooled generators, perform the verification at normal operating hydrogen pressure. 2.4. Calculate the Generator Step-Up (GSU) transformer losses if the verification measurements are taken from the high side of the GSU transformer. GSU transformer real and reactive losses may be estimated, based on the GSU impedance, if necessary.
It is not clear in R3 to whom the Generator Owner will report the information.	MOD-025-1, Phase III/IV Team	The GVSDT has combined MOD-024 and MOD-025 into a single standard. The original R3 from MOD-024 maps to Requirement R1 of the proposed MOD-025-2. Fill in the blank components of the standard have been eliminated and the Generator Owner

Project 2007-09 Generator Verification — MOD-024 and MOD-025		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		must report the required data to its Transmission Planner. Please see Requirements R1, R2 and R3 above.
Non compliance levels are too strict. A small utility with 15-20 units will be L4 noncompliant if they miss one unit.	MOD-025-1, Phase III/IV Team	The Standard now utilizes Violation Risk Factors, Time Horizons and Violation Severity Levels. The issue is addressed through the CMEP. The standard is written such that each generator must be tested. Failure to test a single unit results in a single violation for a requirement.
Severity of non-compliance should be based on the percentage of the generator owner's total generation capability comprised of units required to be verified, rather than on the percentage (number) of generating units. Exempt units should be excluded from the total generation capability for determining level of non-compliance.	MOD-025-1, Phase III/IV Team	The Standard now utilizes Violation Risk Factors, Time Horizons and Violation Severity Levels. The issue is addressed through the CMEP. The standard is written such that each generator must be tested. Failure to test a single unit results in a single violation for a requirement.
There is no clear reason for regional variations in capability testing. A generator in Georgia does not have more or less capability than an identical unit applied across the Florida line, despite the fact that one is in SERC and the other in FRCC.	MOD-025-1, Phase III/IV Team	The GVSDT has combined MOD-024 and MOD-025 into a single standard. Fill in the blank components of the standard as well as regional variances have been eliminated and all required testing and data information is contained in Attachment 1 of the proposed MOD-025-2.
Fundamental guidelines outlining some basic requirements (e.g., all units over 20 MW shall be tested annually under conditions that permit full net	MOD-025-1, Phase III/IV Team	The GVSDT has combined MOD-024 and MOD-025 into a single standard. All required testing and data information is contained in Attachment 1 of the proposed MOD-025-2.

Issue or Directive	**Source**	**Consideration of Issue or Directive**
output of the unit for normal operation) are lacking.		
Provide clarity where the Planning Authority is mentioned	MOD-025-1; Team Comments	The GVSDT has written the requirements such that the Transmission Planner receives the information from the Generator Owner.

A. Introduction

1. **Title:** **Verification of Generator Gross and Net Real Power Capability**

2. **Number:** MOD-024-1

3. **Purpose:** To ensure accurate information on generator gross and net Real Power capability is available for steady-state models used to assess Bulk Electric System reliability.

4. **Applicability**

   4.1. Regional Reliability Organization.

   4.2. Generation Owner.

5. **Effective Dates:**

   Requirement 1 and Requirement 2 **—** April 1, 2006.

   Requirement 3 — January 1, 2007.

B. Requirements

R1. The Regional Reliability Organization shall establish and maintain procedures to address verification of generator gross and net Real Power capability. These procedures shall include the following:

- **R1.1.** Generating unit exemption criteria including documentation of those units that are exempt from a portion or all of these procedures.
- **R1.2.** Criteria for reporting generating unit auxiliary loads.
- **R1.3.** Acceptable methods for model and data verification, including any applicable conditions under which the data should be verified. Such methods can include use of manufacturer data, commissioning data, performance tracking, and testing, etc.
- **R1.4.** Periodicity and schedule of model and data verification and reporting.
- **R1.5.** Information to be verified and reported:
  - **R1.5.1.** Seasonal gross and net Real Power generating capabilities.
  - **R1.5.2.** Real power requirements of auxiliary loads.
  - **R1.5.3.** Method of verification, including date and conditions.

R2. The Regional Reliability Organization shall provide its generator gross and net Real Power capability verification and reporting procedures, and any changes to those procedures, to the Generator Owners, Generator Operators, Transmission Operators, Planning Authorities, and Transmission Planners affected by the procedure within 30 calendar days of the approval.

R3. The Generator Owner shall follow its Regional Reliability Organization's procedures for verifying and reporting its gross and net Real Power generating capability per R1.

C. Measures

M1. The Regional Reliability Organization shall have available for inspection the procedures for the verification and reporting of generator gross and net Real Power capability in accordance with R1.

M2. The Regional Reliability Organization shall have evidence that its procedures, and any revisions to those procedures, for verification and reporting of generator gross and net Real Power capability were provided to affected Generator Owners, Generator Operators,

Transmission Operators, Planning Authorities, and Transmission Planners within 30 calendar days of approval.

M3. The Generator Owner shall have evidence it provided verified information of its generator gross and net Real Power capability, consistent with that Regional Reliability Organization's procedures.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

For Regional Reliability Organization: NERC

For Generator Owner: Regional Reliability Organization.

1.2. Compliance Monitoring Period and Reset Time Frame

One calendar year.

1.3. Data Retention

The Regional Reliability Organization shall retain both the current and previous versions of the procedures.

The Generator Owner shall retain information from the most current and prior verification.

The Compliance Monitor shall retain any audit data for three years.

1.4. Additional Compliance Information

The Regional Reliability Organization and Generator Owner shall each demonstrate compliance through self-certification or audit (periodic, as part of targeted monitoring or initiated by complaint or event), as determined by the Compliance Monitor.

2. Levels of Non-Compliance for Regional Reliability Organization:

2.1. Level 1: There shall be a level one non-compliance if either of the following conditions is present:

2.1.1 Procedures did not meet one of the following requirements: R1.1, R1.2, R1.4

2.1.2 No evidence that procedures were distributed as required in R2.

2.2. Level 2: There shall be a level two non-compliance if **both** of the following conditions are present:

2.2.1 Procedures did not meet two of the following requirements: R1.1, R1.2, R1.4

2.2.2 No evidence that procedures were distributed as required in R2.

2.3. Level 3: Procedures did not meet R1.3.

2.4. Level 4: Procedures did not meet either R1.5.1, R1.5.2 or R1.5.3

3. Levels of Non-Compliance for Generator Owner:

3.1. Level 1: Complete, verified generator data were provided for 98% or more but less than 100% of a generator owner's units as required by the regional procedures.

3.2. Level 2: Complete, verified generator data were provided for than 96% or more, but less than 98% of a generator owner’s units as required by the regional procedures.

3.3. Level 3: Complete, verified generator data were provided for 94% or more, but less than 96% of a generator owner’s units as required by the regional procedures.

3.4. Level 4: Complete, verified generator data were provided for less than 94% of a generator owner’s units as required by the regional procedures.

E. Regional Differences

None identified.

Version History

Version	Date	Action	Change Tracking
Version 1	12/01/05	1. Changed tabs in footer. 2. Removed comma after 2004 in “Development Steps Completed,” #1. 3. Changed incorrect use of certain hyphens (-) to “en dash” (–) and “em dash (—).” 4. Added “periods” to items where appropriate. 5. Changed apostrophes to “smart” symbols. 6. Changed “Timeframe” to “Time Frame” in item D, 1.2. 7. Lower cased all instances of “regional” in section D.3. 8. Removed the word “less” after 94% in section 3.4. Level 4.	01/20/06

A. Introduction

1. Title: **Verification of Generator Gross and Net Reactive Power Capability**

2. Number: MOD-025-1

3. Purpose: To ensure accurate information on generator gross and net Reactive Power capability is available for steady-state models used to assess Bulk Electric System reliability.

4. Applicability

4.1. Regional Reliability Organization.

4.2. Generator Owner.

5. Effective Dates:

Requirement 1 and Requirement 2 — January 1, 2007

Requirement 3:

January 1, 2008 — 1st 20% compliant

January 1, 2009 — 2nd 20% compliant

January 1, 2010 — 3rd 20% compliant

January 1, 2011 — 4th 20% compliant

January 1, 2012 — 5th 20% compliant

B. Requirements

R1. The Regional Reliability Organization shall establish and maintain procedures to address verification of generator gross and net Reactive Power capability. These procedures shall include the following:

R1.1. Generating unit exemption criteria including documentation of those units that are exempt from a portion or all of these procedures.

R1.2. Criteria for reporting generating unit auxiliary loads.

R1.3. Acceptable methods for model and data verification, including any applicable conditions under which the data should be verified. Such methods can include use of commissioning data, performance tracking, engineering analysis, testing, etc.

R1.4. Periodicity and schedule of model and data verification and reporting.

R1.5. Information to be reported:

R1.5.1. Verified maximum gross and net Reactive Power capability (both lagging and leading) at Seasonal Real Power generating capabilities as reported in accordance with Reliability Standard MOD-024 Requirement 1.5.1.

R1.5.2. Verified Reactive Power limitations, such as generator terminal voltage limitations, shorted rotor turns, etc.

R1.5.3. Verified Reactive Power of auxiliary loads.

R1.5.4. Method of verification, including date and conditions.

R2. The Regional Reliability Organization shall provide its generator gross and net Reactive Power capability verification and reporting procedures, and any changes to those procedures, to the

Generator Owners, Generator Operators, Transmission Operators, Planning Authorities, and Transmission Planners affected by the procedure within 30 calendar days of the approval.

R3. The Generator Owner shall follow its Regional Reliability Organization's procedures for verifying and reporting its gross and net Reactive Power generating capability per R1.

C. Measures

M1. The Regional Reliability Organization shall have available for inspection the procedures for the verification and reporting of generator gross and net Reactive Power capability in accordance with R1.

M2. The Regional Reliability Organization shall have evidence that its procedures, and any revisions to these procedures, for verification and reporting of generator gross and net Reactive Power capability were provided to affected Generator Owners, Generator Operators, Transmission Operators, Planning Authorities, and Transmission Planners within 30 calendar days of approval.

M3. The Generator Owner shall have evidence it provided verified information of its generator gross and net Reactive Power capability, consistent with that Regional Reliability Organization's procedures.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Monitoring Responsibility

For Regional Reliability Organization: NERC.

For Generator Owner: Regional Reliability Organization.

1.2. Compliance Monitoring Period and Reset Timeframe

One calendar year.

1.3. Data Retention

The Regional Reliability Organization shall retain both the current and previous version of the procedures.

The Generator Owner shall retain information from the most current and prior verification.

The Compliance Monitor shall retain any audit data for three years.

1.4. Additional Compliance Information

The Regional Reliability Organization and Generator Owner shall each demonstrate compliance through self-certification or audit (periodic, as part of targeted monitoring or initiated by complaint or event), as determined by the Compliance Monitor.

2. Levels of Non-Compliance for Regional Reliability Organization:

2.1. Level 1: There shall be a level one non-compliance if either of the following conditions is present:

2.1.1 Procedures did not meet one of the following requirements: R1.1, R1.2 or R1.4.

2.1.2 No evidence that procedures were distributed as required in R2.

2.2. Level 2: Procedures did not meet two or three of the following requirements: R1.1, R1.2 or R1.4.

2.3. Level 3: Procedures did not meet R1.3.

2.4. Level 4: Procedures did not meet R1.5.1, R1.5.2, R1.5.3, or R1.5.4.

3. Levels of Non-Compliance for Generator Owner:

3.1. Level 1: Complete, verified generator data were provided for 98% or more but less than 100% of a Generator Owner’s units as required by the regional procedures.

3.2. Level 2: Complete, verified generator data were provided for than 96% or more, but less than 98% of a Generator Owner’s units as required by the regional procedures.

3.3. Level 3: Complete, verified generator data were provided for 94% or more, but less than 96% of a Generator Owner’s units as required by the regional procedures.

3.4. Level 4: Complete, verified generator data were provided for less than 94% less of a Generator Owner’s units as required by the regional procedures.

E. Regional Differences

None identified.

Version History

Version	Date	Action	Change Tracking
Version 1	12/01/05	1. Changed tabs in footer. 2. Removed comma after 2004 in “Development Steps Completed,” #1. 3. Changed incorrect use of certain hyphens (-) to “en dash” (–) and “em dash (—).” 4. Added “periods” to items where appropriate. 5. Changed apostrophes to “smart” symbols. 6. Changed “Timeframe” to “Time Frame” in item D, 1.2. 7. Lower cased all instances of “regional” in section D.3.	01/20/06

MOD-024-1 DRAFT Mapping Document

MOD-024-1 Mapping to Proposed NERC Reliability Standard MOD-025-2		
Standard MOD-024-1 NERC Board Approved	**Comment**	**Proposed Standard MOD-025-2**
1. Number: MOD-024-1	Proposed standard will cover MOD-025-1 content and will include requirements from MOD-024-1.	**1. Number:** MOD-025-2
2. Title: Verification of Generator Gross and Net Real Power Capability.	Data Reporting has been added to reflect related requirements in the proposed Standard. Real has been added to include requirements from MOD-024-1.	**2. Title:** Verification and Data Reporting of Generator Real and Reactive Power Capability and Synchronous Condenser Reactive Power Capability.
3. Purpose: To ensure accurate information on generator gross and net Real Power capability is available for steady-state models used to assess Bulk Electric System reliability.	The Purpose has been modified to ensure that planning entities have accurate generator Real and Reactive Power capability data.	**3. Purpose:** To ensure accurate information on generator gross and net Real and Reactive Power capability and synchronous condenser Reactive Power capability is available for planning models used to assess Bulk Electric System (BES) reliability.

MOD-024-1 Mapping to Proposed NERC Reliability Standard MOD-025-2		
Standard MOD-024-1 NERC Board Approved	**Comment**	**Proposed Standard MOD-025-2**
4. Applicability: **4.1.** Regional Reliability Organization. **4.2.** Generation Owner.	Regional Reliability Organization applicability is eliminated and functional entity responsibility is defined. Facility Applicability has been added.	**4. Applicability:** **4.1 Functional entities** 4.1.1 Generator Owner 4.1.2 Transmission Owner that owns synchronous condenser **4.2 Facilities:** For the purpose of this standard, the term, "applicable Facility" shall mean any one of the following: 4.2.1 Individual generating unit greater than 20 MVA (gross nameplate rating) directly connected to the Bulk Electric System. 4.2.2 Synchronous condenser greater than 20 MVA (gross nameplate rating) directly connected to the Bulk Electric System. 4.2.3 Generating plant/Facility greater than 75 MVA (gross aggregate nameplate rating) directly connected to the Bulk Electric System.
R1. The Regional Reliability	Regional applicability is	**Requirements R1, R2 and R3** defines the verification and data

Organization shall establish and maintain procedures to address verification of generator gross and net Real Power capability. These procedures shall include the following:	eliminated and functional entity responsibility is defined. Verification, including reporting, is addressed throughout proposed Standard.	reporting previously addressed by regional procedures. These requirements are detailed in the following mapping.
R1.1. Generating unit exemption criteria including documentation of those units that are exempt from a portion or all of these procedures.	Exemption criteria are addressed by Section 4.2, Applicability**,** which follows the Registry Criteria.	**4.2 Facilities:** 4.2.1 For the purpose of this standard, the term, “applicable Facility” shall mean any one of the following: 4.2.1 Individual generating unit greater than 20 MVA (gross nameplate rating) directly connected to the Bulk Electric System. 4.2.2 Synchronous condenser greater than 20 MVA (gross nameplate rating) directly connected to the Bulk Electric System. 4.2.3 Generating plant/Facility greater than 75 MVA (gross aggregate nameplate rating) directly connected to the Bulk Electric System

MOD-024-1 Mapping to Proposed NERC Reliability Standard MOD-025-2		
Standard MOD-024-1 NERC Board Approved	**Comment**	**Proposed Standard MOD-025-2**
R1.2. Criteria for reporting generating unit auxiliary loads.	**Requirement R1** references **Attachment 1.** **Attachment 1**, Section 4 refers to Attachment 2, which is a reporting form or the basis for developing a more specialized form that provides all the auxiliary information required by the Standard.	R1. Each Generator Owner shall provide its Transmission Planner with verification of the Real Power capability of its applicable Facilities as follows: [Violation Risk Factor: Medium] [Time Horizon: Long-term Planning] 1.1. Verify the Real Power capability of its generating units in accordance with Attachment 1. 1.2. Submit a completed Attachment 2 (or a form containing the same information as identified in Attachment 2) to its Transmission Planner within 90 calendar days of either (i) the date the data is recorded for a staged test or (ii) the date the data is selected for verification using historical operational data.
R1.3. Acceptable methods for model and data verification, including any applicable conditions under which the data should be verified. Such methods can include use of manufacturer data, commissioning data, performance tracking, and testing, etc.	**Requirement R1** references **Attachment 1.** Section 2 of **Attachment 1** prescribes the details of how the verification should be performed.	R1. Each Generator Owner shall provide its Transmission Planner with verification of the Real Power capability of its applicable Facilities as follows: [Violation Risk Factor: Medium] [Time Horizon: Long-term Planning] 1.1. Verify the Real Power capability of its generating units in accordance with Attachment 1. 1.2. Submit a completed Attachment 2 (or a form containing the same information as identified in Attachment 2) to its Transmission Planner within 90 calendar days of either (i) the date the data is recorded for a staged test

Project 2007-09 Generator Verification
MOD-025-1 DRAFT Mapping Document

MOD-025-1 Mapping to Proposed NERC Reliability Standard MOD-025-2		
Standard MOD-025-1 NERC Board Approved	**Comment**	**Proposed Standard MOD-025-2**
1. Number: MOD-025-1	Proposed standard will cover MOD-025-1 content and will include requirements from MOD-024-1.	**1. Number:** MOD-025-2
2. Title: Verification of Generator Gross and Net Reactive Power Capability	Data Reporting has been added to reflect related requirements in the proposed Standard. Real has been added to include requirements from MOD-024-1.	**2. Title:** Verification and Data Reporting of Generator Real and Reactive Power Capability and Synchronous Condenser Reactive Power Capability
3. Purpose: To ensure accurate information on generator gross and net Reactive Power capability is available for steady-state models used to assess Bulk Electric System reliability.	The Purpose has been modified to ensure that planning entities have accurate generator Real and Reactive Power capability data.	**3. Purpose:** To ensure accurate information on generator gross and net Real and Reactive Power capability and synchronous condenser Reactive Power capability is available for planning models used to assess Bulk Electric System (BES) reliability.

MOD-025-1 Mapping to Proposed NERC Reliability Standard MOD-025-2		
Standard MOD-025-1 NERC Board Approved	**Comment**	**Proposed Standard MOD-025-2**
4. Applicability: **4.1.** Regional Reliability Organization. **4.2.** Generation Owner.	Regional Reliability Organization applicability is eliminated and functional entity responsibility is defined. Facility Applicability has been added.	**4. Applicability:** **4.1 Functional entities** 4.1.1 Generator Owner 4.1.2 Transmission Owner that owns synchronous condenser **4.2 Facilities:** For the purpose of this standard, the term, "applicable Facility" shall mean any one of the following: 4.2.1 Individual generating unit greater than 20 MVA (gross nameplate rating) directly connected to the Bulk Electric System. 4.2.2 Synchronous condenser greater than 20 MVA (gross nameplate rating) directly connected to the Bulk Electric System. 4.2.3 Generating plant/Facility greater than 75 MVA (gross aggregate nameplate rating) directly connected to the Bulk Electric System.
R1. The Regional Reliability Organization	Regional applicability is	**Requirements R1, R2 and R3** defines the verification and data

MOD-025-1 Mapping to Proposed NERC Reliability Standard MOD-025-2

Standards Announcement

Project 2007-09 Generator Verification – MOD-025-2, MOD-026-1, MOD-027-1 and PRC-019-1

Recirculation Ballots are now open through 8 p.m. Friday, December 21, 2012

Now Available

A recirculation ballot window for each of the following four standards and the associated implementation plans is now open through **8 p.m. Eastern on Friday, December 21, 2012**:

- **MOD-025-2** – Verification and Data Reporting of Generator Real and Reactive Power Capability and Synchronous Condenser Reactive Power Capability (please note that the implementation plan for this standard retires MOD-024-1 in addition to MOD-025-1),
- **MOD-026-1** – Verification of Models and Data for Generator Excitation Control Systems Functions and Plant Volt/Var Control Functions,
- **MOD-027-1** – Verification of Models and Data for Turbine/Governor and Load Control or Active Power/Frequency Control Functions, and
- **PRC-019-1** – Coordination of Generating Unit or Plant Capabilities, Voltage Regulating Controls, and Protection.

After considering stakeholder comments from the formal comment period and successive ballot that ended on October 31, 2012, the drafting team made no substantive changes to the Requirements of the standards, but did make some clarifying changes as summarized in each of the Consideration of Comments posted on the project page.

The other standard in this project, PRC-024-1, has been posted for a 30-day comment period and successive ballot ending on January 11, 2013 and was sent in a separate announcement.

Instructions

In the recirculation ballot, votes are counted by exception. Only members of the ballot pool may cast a ballot; all ballot pool members may change their previously cast votes. A ballot pool member who failed to cast a ballot during the last ballot window may cast a ballot in the recirculation ballot window. If a ballot pool member does not participate in the recirculation ballot, that member's vote cast in the previous ballot will be carried over as that member's vote in the recirculation ballot.

Members of the ballot pools associated with this project may log in and submit their vote for each of the standards by clicking here.

Next Steps

Voting results will be posted and announced after the ballot window closes. If approved, the standards will be submitted to the Board of Trustees for adoption and then filed with the appropriate regulatory authorities.

Background

The purpose of Project 2007-09 - Generator Verification - is to ensure that: 1) generators will not trip off-line during specified voltage and frequency excursions or as a result of improper coordination between generator-protective relays and generator voltage regulator controls and limit functions (such coordination will include the generating unit's capabilities); and 2) that generator models accurately reflect the generator's capabilities and operating characteristics.

The standard drafting team (SDT) for Project 2007-09 - Generator Verification - based part of its work on two existing NERC Board-approved standards, MOD-024-1 — Verification of Generator Gross and Net Real Power Capability and MOD-025-1 — Verification of Generator Gross and Net Reactive Power Capability. The drafting team moved the Requirements of MOD-024-1 into MOD-025-2, and recommends retiring MOD-024-1 and incorporated industry comments to make improvements to the standards.

The drafting team has also based its work on four draft standards developed by the Phase III & IV SDT that were field tested by four Regions from mid 2006 through mid 2007:

- PRC-019-1 — Coordination of Generator Voltage Regulator Controls with Unit Capabilities and Protection
- PRC-024-1 — Generator Performance During Frequency and Voltage Excursions
- MOD-026-1 — Verification of Models and Data for Generator Excitation Control System Functions
- MOD-027-1 — Verification of Generator Unit Frequency Response

These standards were revised and posted for subsequent comment periods. The drafting team incorporated industry feedback to improve the standards and has posted them for a concurrent comment and ballot period.

Additional information is available on the project page.

NERC

Standards Process

The [Standard Processes Manual] contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

Project 2007-09 Generator Verification
MOD-025-2, MOD-026-1, MOD-027-1 and PRC-019-1

Recirculation Ballots Results

Now Available

A recirculation ballot for each of the following four standards and the associated implementation plans concluded at **8 p.m. Eastern on Friday, December 21, 2012**:

- **MOD-025-2** – Verification and Data Reporting of Generator Real and Reactive Power Capability and Synchronous Condenser Reactive Power Capability (please note that the implementation plan for this standard retires MOD-024-1 in addition to MOD-025-1),
- **MOD-026-1** – Verification of Models and Data for Generator Excitation Control Systems Functions and Plant Volt/Var Control Functions,
- **MOD-027-1** – Verification of Models and Data for Turbine/Governor and Load Control or Active Power/Frequency Control Functions, and
- **PRC-019-1** – Coordination of Generating Unit or Plant Capabilities, Voltage Regulating Controls, and Protection.

The other standard in this project, PRC-024-1, is currently posted for a 30-day comment period and successive ballot ending on January 11, 2013.

Voting statistics are listed below, and the Ballot Results page provides a link to the detailed results.

Standard	Approval
MOD-025-2	Quorum: 86.89% Approval: 73.06%
MOD-026-1	Quorum: 79.00% Approval: 79.36%
MOD-027-1	Quorum: 86.68% Approval: 74.27%

PRC-019-1	Quorum: 85.87% Approval: 73.63%

Next Steps

The standards will be presented to the Board of Trustees for adoption and then filed with the appropriate regulatory authorities.

Background

The purpose of Project 2007-09 - Generator Verification - is to ensure that: 1) generators will not trip off-line during specified voltage and frequency excursions or as a result of improper coordination between generator-protective relays and generator voltage regulator controls and limit functions (such coordination will include the generating unit's capabilities); and 2) that generator models accurately reflect the generator's capabilities and operating characteristics.

The standard drafting team (SDT) for Project 2007-09 - Generator Verification - based part of its work on two existing NERC Board-approved standards, MOD-024-1 — Verification of Generator Gross and Net Real Power Capability and MOD-025-1 — Verification of Generator Gross and Net Reactive Power Capability. The drafting team moved the Requirements of MOD-024-1 into MOD-025-2, and recommends retiring MOD-024-1 and incorporated industry comments to make improvements to the standards.

The drafting team has also based its work on four draft standards developed by the Phase III & IV SDT that were field tested by four Regions from mid 2006 through mid 2007:

- PRC-019-1 — Coordination of Generator Voltage Regulator Controls with Unit Capabilities and Protection
- PRC-024-1 — Generator Performance During Frequency and Voltage Excursions
- MOD-026-1 — Verification of Models and Data for Generator Excitation Control System Functions
- MOD-027-1 — Verification of Generator Unit Frequency Response

These standards were revised and posted for subsequent comment periods. The drafting team incorporated industry feedback to improve the standards and has posted them for a concurrent comment and ballot period.

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. SAR posted for comment (April 20–May 21, 2007).
2. Revised SAR and response to comments posted.
3. Revised SAR and response to comments approved by SC (June 14, 2007).
4. SDT appointed on (August 18, 2007).
5. Initial draft of PRC-024-1 was posted for a 45 day formal comment period (February 17 – April 2, 2009).
6. Draft 2 of PRC-024-1 was posted for a 45 day concurrent comment and ballot period from June 15 – August 1, 2011.
7. Draft 3 of PRC-024-1 was posted for a 30 day concurrent comment and successive ballot period from February 29 – March 29, 2012.
8. Draft 4 of PRC-024-1 was posted for a 30 day concurrent comment and successive ballot period from September 28 – October 31, 2012.
9. Draft 5 of PRC-024-1 was posted for a 30 day concurrent comment and successive ballot period from December 12, 2012 – January 11, 2013.

Proposed Action Plan and Description of Current Draft:

This is the sixth draft of the standard and includes Time Horizons, Data Retention, Violation Risk Factors, and Violation Severity Levels. This sixth posting is for a 30-day comment and successive ballot period.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Develop responses to comments and develop sixth version draft standard.	January 2013
2. Post response to comments and conduct successive ballot.	February 2013
3. Develop responses to ballot comments.	March 2013

4. Post responses to comments and conduct recirculation ballot.	April 2013
5. BOT adoption.	May 2013
6. File with regulatory authorities.	June 2013

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None

A. Introduction

1. **Title:** Generator Frequency and Voltage Protective Relay Settings

2. **Number:** **PRC-024-1**

3. **Purpose:** Ensure Generator Owners set their generator protective relays such that generating units remain connected during defined frequency and voltage excursions.

4. **Applicability:**

   4.1. Generator Owner

5. **Effective Date:**

   5.1. In those jurisdictions where regulatory approval is required:

   5.1.1 By the first day of the first calendar quarter, two calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner shall have verified at least 40 percent of its Facilities are fully compliant with Requirements R1, R2, R3, and R4.

   5.1.2 By the first day of the first calendar quarter, three calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner shall have verified at least 60 percent of its Facilities are fully compliant with Requirements R1, R2, R3, and R4.

   5.1.3 By the first day of the first calendar quarter, four calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner shall have verified at least 80 percent of its Facilities are fully compliant with Requirements R1, R2, R3, and R4.

   5.1.4 By the first day of the first calendar quarter, five calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner shall have verified 100 percent of its Facilities are fully compliant with Requirements R1, R2, R3, and R4.

   5.2. In those jurisdictions where regulatory approval is not required:

   5.2.1 By the first day of the first calendar quarter, two calendar years following Board of Trustees approval, each Generator Owner shall have verified at least 40 percent of its Facilities are fully compliant with Requirements R1, R2, R3, and R4.

5.2.2 By the first day of the first calendar quarter, three calendar years following Board of Trustees approval, each Generator Owner shall have verified at least 60 percent of its Facilities are fully compliant with Requirements R1, R2, R3, and R4.

5.2.3 By the first day of the first calendar quarter, four calendar years following Board of Trustees approval, each Generator Owner shall have verified at least 80 percent of its Facilities are fully compliant with Requirements R1, R2, R3, and R4.

5.2.4 By the first day of the first calendar quarter, five calendar years following Board of Trustees approval, each Generator Owner shall have verified 100 percent of its Facilities are fully compliant with Requirements R1, R2, R3, and R4.

B. Requirements

R1. Each Generator Owner that has generator frequency protective relaying[1] activated to trip its applicable generating unit(s) shall set its protective relaying such that the frequency protective relaying does not trip the applicable generating unit(s) within the "no trip zone" of PRC-024 Attachment 1, subject to the following exceptions: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

- Generating unit(s) may trip if the protective functions (such as out-of-step functions or loss-of-field functions) operate due to an impending or actual loss of synchronism or due to instability in power conversion control equipment.
- Generating unit(s) may trip if clearing a system fault necessitates disconnecting (a) generating unit(s).
- Generating unit(s) may trip within a portion of the "no trip zone" of PRC-024 Attachment 1 for documented and communicated regulatory or equipment limitations in accordance with Requirement R3.

R2. Each Generator Owner that has generator voltage protective relaying[1] activated to trip its applicable generating unit(s) shall set its protective relaying such that the voltage protective relaying does not trip as a result of a voltage excursion (at the point of interconnection[2]) caused by an event on the transmission system external to the generating plant that remains within the "no trip zone" of PRC-024 Attachment 2. If the Transmission Planner allows less stringent voltage relay settings than those required to meet PRC-024 Attachment 2, then the Generator Owner shall set its protective relaying within the voltage recovery characteristics of a location-specific Transmission Planner's study. Requirement R2 is subject to the following exceptions: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

- Generating unit(s) may trip in accordance with a Special Protection System (SPS) or Remedial Action Scheme (RAS).
- Generating unit(s) may trip if clearing a system fault necessitates disconnecting (a) generating unit(s).
- Generating unit(s) may trip by action of protective functions (such as out-of-step functions or loss-of-field functions) that operate due to an impending or actual loss

---

[1] Each Generator Owner is not required to have frequency or voltage protective relaying (including but not limited to frequency and voltage protective functions for discrete relays, volts per hertz relays evaluated at nominal frequency, multi-function protective devices or protective functions within control systems that directly trip or provide tripping signals to the generator based on frequency or voltage inputs) installed or activated on its unit.

[2] For the purposes of this standard, point of interconnection means the transmission (high voltage) side of the generator step-up or collector transformer.

of synchronism or, for asynchronous generating units, due to instability in power conversion control equipment.

- Generating unit(s) may trip within a portion of the "no trip zone" of PRC-024 Attachment 2 for documented and communicated regulatory or equipment limitations in accordance with Requirement R3.

R3. Each Generator Owner shall document each known regulatory or equipment limitation[3] that prevents an applicable generating unit from meeting the relay setting criteria in Requirements R1 or R2 including (but not limited to) study results, experience from an actual event, or manufacturer's advice. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

3.1. The Generator Owner shall communicate the documented regulatory or equipment limitation, or the removal of a previously documented regulatory or equipment limitation, to its Planning Coordinator and Transmission Planner within 30 calendar days of any of the following:

- Identification of a regulatory or equipment limitation.
- Repair of the equipment causing the limitation that removes the limitation.
- Replacement of the equipment causing the limitation with equipment that removes the limitation.
- Creation or adjustment of an equipment limitation caused by consumption of the cumulative turbine life-time frequency excursion allowance.

R4. Each Generator Owner shall provide its applicable generator protection trip settings associated with Requirements R1 and R2 to the Planning Coordinator or Transmission Planner that models the associated unit within 60 calendar days of receipt of a written request for the data and within 60 calendar days of any change to those previously requested trip settings unless directed by the requesting Planning Coordinator or Transmission Planner that the reporting of relay setting changes is not required. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

C. Measures

M1. Each Generator Owner shall have evidence that generator frequency protective relays have been set in accordance with Requirement R1 such as dated setting sheets, calibration sheets or other documentation.

M2. Each Generator Owner shall have evidence that generator voltage protective relays have been set in accordance with Requirement R2 such as dated setting sheets, voltage-time

[3] Excludes limitations that are caused by the setting capability of the generator frequency and voltage protective relays themselves but does not exclude limitations originating in the equipment that they protect.

curves, calibration sheets, coordination plots, dynamic simulation studies or other documentation.

M3. Each Generator Owner shall have evidence that it has documented and communicated any known regulatory or equipment limitations (excluding limitations noted in footnote 3) that resulted in an exception to Requirements R1 or R2 in accordance with Requirement R3 such as a dated email or letter that contains such documentation as study results, experience from an actual event, or manufacturer's advisory.

M4. Each Generator Owner shall have evidence that it communicated generator protective relay settings in accordance with Requirement R4, such as dated e-mails, correspondence or other evidence and copies of any requests it has received for that information.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

The Regional Entity shall serve as the Compliance Enforcement Authority (CEA) unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases, the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.

1.2. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Generator Owner shall retain evidence of compliance with Requirement R1 through R4, Measures M1 through M4; for 3 years or until the next audit, whichever is longer.

If a Generator Owner is found non-compliant, the Generator Owner shall keep information related to the non-compliance until mitigation is complete and approved for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

1.4. Additional Compliance Information

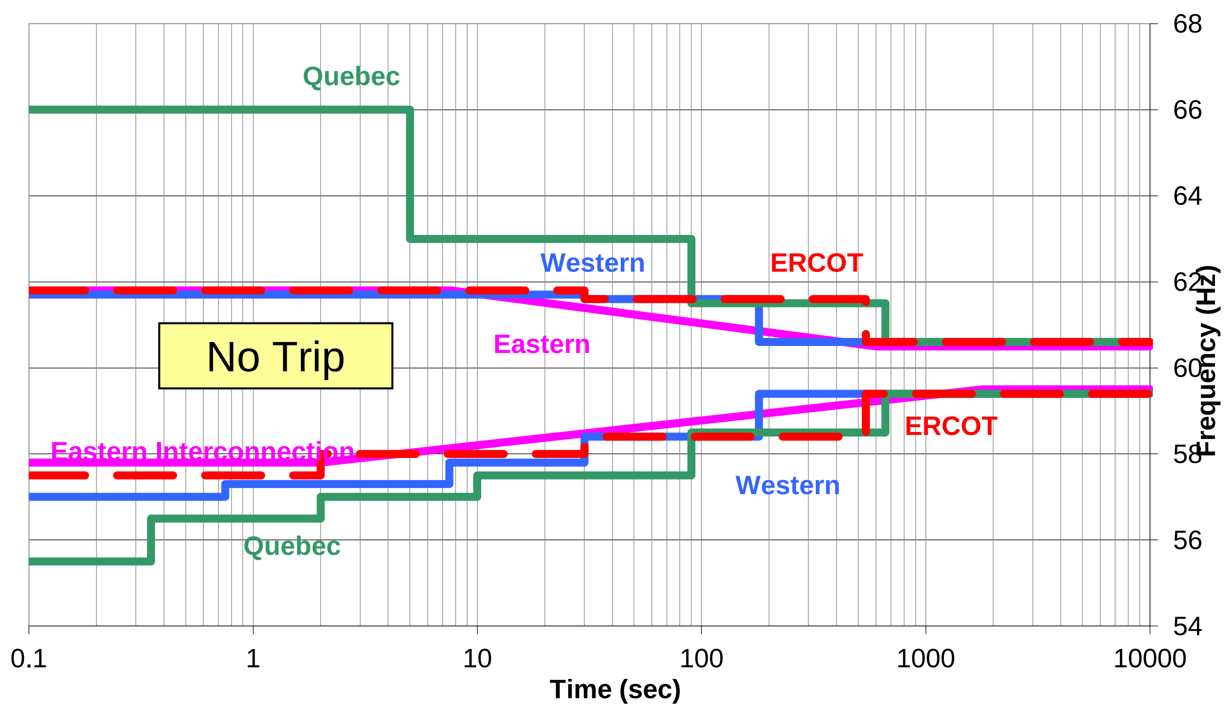
OFF NOMINAL FREQUENCY CAPABILITY CURVE



Curve Data Points:

Eastern Interconnection

High Frequency Duration		Low Frequency Duration	
Frequency (Hz)	**Time (Sec)**	**Frequency (Hz)**	**Time (sec)**
≥61.8	Instantaneous trip	≤57.8	Instantaneous trip
≥60.5	$10^{(90.935-1.45713*f)}$	≤59.5	$10^{(1.7373*f-100.116)}$
<60.5	Continuous operation	> 59.5	Continuous operation

Western Interconnection

High Frequency Duration		Low Frequency Duration	
Frequency (Hz)	Time (Sec)	Frequency (Hz)	Time (sec)
≥61.7	Instantaneous trip	≤57.0	Instantaneous trip
≥61.6	30	≤57.3	0.75
≥60.6	180	≤57.8	7.5
<60.6	Continuous operation	≤58.4	30
		≤59.4	180
		>59.4	Continuous operation

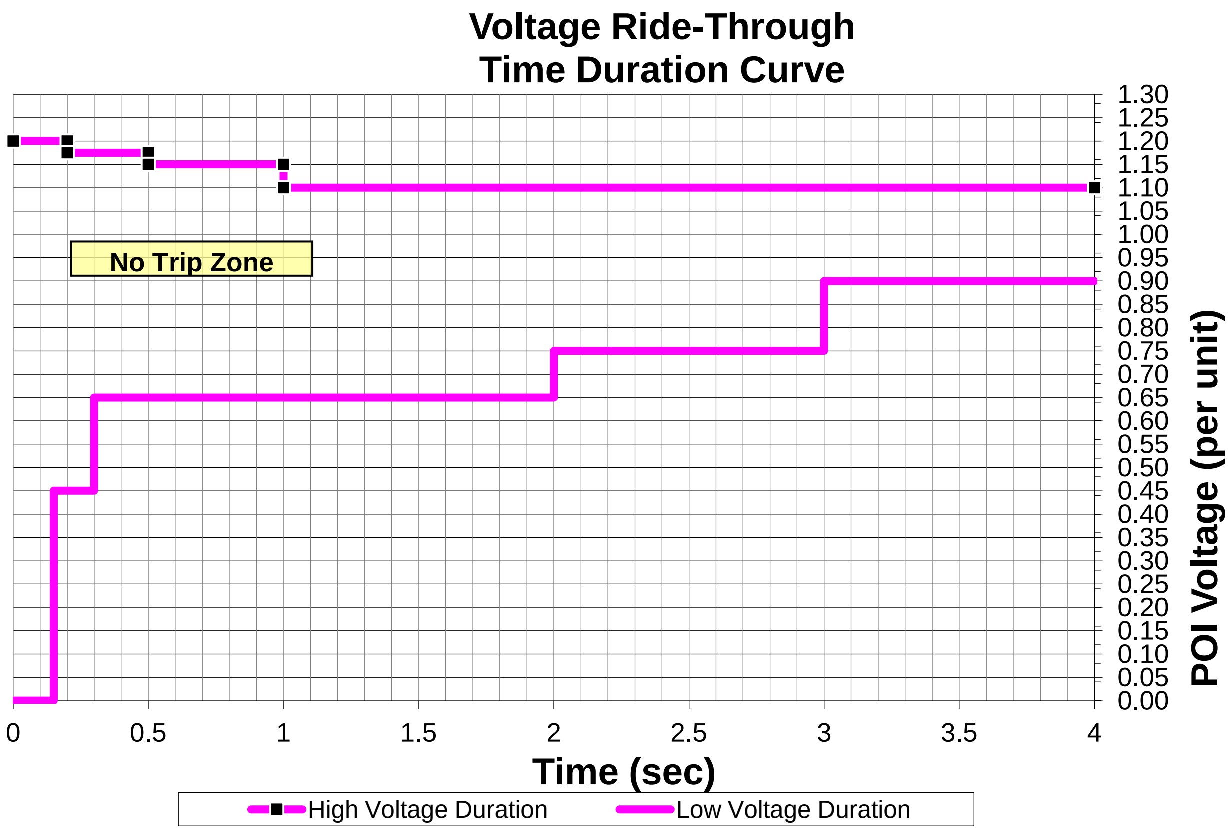
Quebec Interconnection

High Frequency Duration		Low Frequency Duration	
Frequency (Hz)	Time (Sec)	Frequency (Hz)	Time (Sec)
>66.0	Instantaneous trip	<55.5	Instantaneous trip
≥63.0	5	≤56.5	0.35
≥61.5	90	≤57.0	2
≥60.6	660	≤57.5	10
<60.6	Continuous operation	≤58.5	90
		≤59.4	660
		>59.4	Continuous operation

ERCOT Interconnection

High Frequency Duration		Low Frequency Duration	
Frequency (Hz)	Time (Sec)	Frequency (Hz)	Time (sec)
≥61.8	Instantaneous trip	≤57.5	Instantaneous trip
≥61.6	30	≤58.0	2
≥60.6	540	≤58.4	30
<60.6	Continuous operation	≤59.4	540
		>59.4	Continuous operation

PRC-024— Attachment 2



Ride Through Duration:

High Voltage Ride Through Duration		Low Voltage Ride Through Duration	
Voltage (pu)	Time (sec)	Voltage (pu)	Time (sec)
≥1.200	Instantaneous trip	<0.45	0.15
≥1.175	0.20	<0.65	0.30
≥1.15	0.50	<0.75	2.00
≥1.10	1.00	<0.90	3.00

Voltage Ride-Through Curve Clarifications

Curve Details:

1. The per unit voltage base for these curves is the nominal operating voltage specified by the Transmission Planner in the analysis of the reliability of the Interconnected Transmission Systems at the point of interconnection to the Bulk Electric System (BES).
2. The curves depicted were derived based on three-phase transmission system zone 1 faults with Normal Clearing not exceeding 9 cycles. The curves apply to voltage excursions regardless of the type of initiating event.
3. The envelope within the curves represents the cumulative voltage duration at the point of interconnection with the BES. For example, if the voltage first exceeds 1.15 pu at 0.3 seconds after a fault, does not exceed 1.2 pu voltage, and returns below 1.15 pu at 0.4 seconds, then the cumulative time the voltage is above 1.15 pu voltage is 0.1 seconds and is within the no trip zone of the curve.
4. The curves depicted assume system frequency is 60 Hertz. When evaluating Volts/Hertz protection, you may adjust the magnitude of the high voltage curve in proportion to deviations of frequency below 60 Hz.
5. Voltages in the curve assume minimum fundamental frequency phase-to-ground or phase-to-phase voltage for the low voltage duration curve and the greater of maximum RMS or crest phase-to-phase voltage for the high voltage duration curve.

Evaluating Protective Relay Settings:

1. Use either the following assumptions or loading conditions that are believed to be the most probable for the unit under study to evaluate voltage protection relay setting calculations on the static case for steady state initial conditions:
   a. All of the units connected to the same transformer are online and operating.
   b. All of the units are at full nameplate real-power output.
   c. Power factor is 0.95 lagging (i.e. supplying reactive power to the system) as measured at the generator terminals.
   d. The automatic voltage regulator is in automatic voltage control mode.
2. Evaluate voltage protection relay settings assuming that additional installed generating plant reactive support equipment (such as static VAr compensators, synchronous condensers, or capacitors) is available and operating normally.
3. Evaluate voltage protection relay settings accounting for the actual tap settings of transformers between the generator terminals and the point of interconnection.

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. SAR posted for comment (April 20–May 21, 2007).
2. Revised SAR and response to comments posted.
3. Revised SAR and response to comments approved by SC (June 14, 2007).
4. SDT appointed on (August 18, 2007).
5. Initial draft of PRC-024-1 was posted for a 45 day formal comment period (February 17 – April 2, 2009).
6. Draft 2 of PRC-024-1 was posted for a 45 day concurrent comment and ballot period from June 15 – August 1, 2011.
7. Draft 3 of PRC-024-1 was posted for a 30 day concurrent comment and successive ballot period from February 29 – March 29, 2012.
8. Draft 4 of PRC-024-1 was posted for a 30 day concurrent comment and successive ballot period from September 28 – October 31, 2012.
9. ~~8.~~ Draft 5 of PRC-024-1 was posted for a 30 day concurrent comment and successive ballot period from December 12, 2012 – January 11, 2013.

Proposed Action Plan and Description of Current Draft:

This is the sixth~~fifth~~ draft of the standard and includes Time Horizons, Data Retention, Violation Risk Factors, and Violation Severity Levels. This sixth~~fifth~~ posting is for a 30-day comment and successive ballot period.

Future Development Plan:

Anticipated Actions	Anticipated Date
1. Develop responses to comments and develop sixth ~~fifth~~ version draft standard.	~~December 2012~~ January 2013
2. Post response to comments and conduct successive ballot.	February ~~December~~ 2013~~2~~

3. Develop responses to ballot comments.	March~~January~~ 2013
4. Post responses to comments and conduct recirculation ballot.	April~~January~~ 2013
5. BOT adoption.	May~~February~~ 2013
6. File with regulatory authorities.	June~~March~~ 2013

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None

A. Introduction

1. **Title:** Generator Frequency and Voltage Protective Relay Settings ~~Performance During Frequency and Voltage Excursions~~

2. **Number:** **PRC-024-1**

3. **Purpose:** Ensure Generator Owners set their generator protective relays such that generating units remain connected during defined frequency and voltage excursions. ~~and ensure expected generating unit performance during frequency and voltage excursions is communicated to Reliability Coordinators, Planning Coordinators, Transmission Operators and Transmission Planners for accurate system modeling.~~

4. **Applicability:**

   4.1. Generator Owner

5. **Effective Date:**

   5.1. In those jurisdictions where regulatory approval is required:

   5.1.1 By the first day of the first calendar quarter, two calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner shall have verified at least 40 percent of its Facilities are fully compliant with Requirements R1, R2, R3, and R4~~, and R5~~.

   5.1.2 By the first day of the first calendar quarter, three calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner shall have verified at least 60 percent of its Facilities are fully compliant with Requirements R1, R2, R3, and R4~~, and R5~~.

   5.1.3 By the first day of the first calendar quarter, four calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner shall have verified at least 80 percent of its Facilities are fully compliant with Requirements R1, R2, R3, and R4~~, and R5~~.

   5.1.4 By the first day of the first calendar quarter, five calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner shall have verified 100 percent of its Facilities are fully compliant with Requirements R1, R2, R3, and R4~~, and R5~~.

   5.2. In those jurisdictions where regulatory approval is not required:

5.2.1 By the first day of the first calendar quarter, two calendar years following Board of Trustees approval, each Generator Owner shall have verified at least 40 percent of its Facilities are fully compliant with Requirements R1, R2, R3, and R4~~, and R5~~.

5.2.2 By the first day of the first calendar quarter, three calendar years following Board of Trustees approval, each Generator Owner shall have verified at least 60 percent of its Facilities are fully compliant with Requirements R1, R2, R3, and R4~~, and R5~~.

5.2.3 By the first day of the first calendar quarter, four calendar years following Board of Trustees approval, each Generator Owner shall have verified at least 80 percent of its Facilities are fully compliant with Requirements R1, R2, R3, and R4~~, and R5~~.

5.2.4 By the first day of the first calendar quarter, five calendar years following Board of Trustees approval, each Generator Owner shall have verified 100 percent of its Facilities are fully compliant with Requirements R1, R2, R3, and R4~~, and R5~~.

B. Requirements

R1. Each Generator Owner that has generator frequency protective relaying[1] activated to trip its applicable generating unit(s) shall set ~~such~~ its protective relaying such~~o~~ that the frequency protective relaying does not ~~operate to~~ trip the applicable generating unit(s) within the "no trip zone" of PRC-024 Attachment 1, subject to the following exceptions: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

- Generating unit(s) may trip if the protective functions (such as out-of-step functions or loss-of-field functions) operate due to an impending or actual loss of synchronism or due to instability in power conversion control equipment.
- Generating unit(s) may trip if clearing a system fault necessitates disconnecting (a)~~the~~ generating unit(s).
- Generating unit(s) may trip within a portion of the "no trip zone" of PRC-024 Attachment 1 for documented and communicated regulatory or equipment limitations in accordance with Requirement R3.

R2. Each Generator Owner that has generator voltage protective relaying[1] activated to trip its applicable generating unit(s) shall set its protective relaying such that the voltage protective relaying does not trip as a result of a voltage excursion (at the point of interconnection[2]) caused by an event on the transmission system external to the generating plant that remains within the "no trip zone" of PRC-024 Attachment 2. If the Transmission Planner allows less stringent voltage relay settings than those required to meet PRC-024 Attachment 2, then the Generator Owner shall set~~or~~ its protective relaying within the voltage recovery characteristics of a location-specific Transmission Planner's study. ~~if the Transmission Planner allows less stringent voltage relay settings than those required to meet PRC-024 Attachment 2~~ Requirement R2 is subject to the following exceptions~~-~~: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

- Generating unit(s) may trip in accordance with a Special Protection System (SPS) or Remedial Action Scheme (RAS).
- Generating unit(s) may trip if clearing a system fault necessitates disconnecting (a) generating unit(s).

---

[1] Each Generator Owner is not required to have frequency or voltage protective relaying (including but not limited to frequency and voltage protective functions for discrete relays, volts per hertz relays evaluated at nominal frequency, multi-function protective devices or protective functions within control systems that directly trip or provide tripping signals to the generator based on frequency or voltage inputs) installed or activated on its unit.

[2] For the purposes of this standard, point of interconnection means the transmission (high voltage) side of the generator step-up or collector transformer.

- Generating unit(s) may trip by action of protective functions (such as out-of-step functions or loss-of-field functions) that operate due to an impending or actual loss of synchronism or, for asynchronous generating units, due to instability in power conversion control equipment.
- Generating unit(s) may trip within a portion of the "no trip zone" of PRC-024 Attachment 2 for documented and communicated regulatory or equipment limitations in accordance with Requirement R3.

R3. Each Generator Owner shall document each known regulatory or equipment limitation[3] that prevents an applicable generating unit from meeting the relay setting criteria in Requirements R1 or R2 including (but not limited to) study results, experience from an actual event, or manufacturer's advice~~sory~~. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*~~.~~

3.1. The Generator Owner shall communicate the documented regulatory or equipment limitation, or the removal of a previously documented regulatory or equipment limitation, to its ~~Reliability Coordinator,~~ Planning Coordinator~~, Transmission Operator~~ and Transmission Planner within 30 calendar days of any of the following:

- Identification of a~~n~~ regulatory or equipment limitation.
- Repair of the equipment causing the limitation that removes the limitation.
- Replacement of the equipment causing the limitation with equipment that removes the limitation.
- Creation or adjustment of an equipment limitation caused by consumption of the cumulative turbine life-time frequency excursion allowance.
- ~~Modification or upgrade of the equipment causing the limitation that results in an increase of generator nameplate capacity rating greater than 10 percent (cumulative from the first effective date of this Standard).~~

~~**R4.** Within 60 calendar days of receipt of a written request from a Planning Coordinator or Transmission Planner, each Generator Owner shall provide an estimate of the time duration which the generating unit(s) will remain connected (including the performance of the auxiliary systems) if the unit(s) were to experience a frequency or voltage excursion. The voltage or frequency profile at the point of interconnection is provided by a Planning Coordinator or Transmission Planner that models the associated generating unit(s) and which has requested the time duration estimate.~~

[3] Excludes limitations that are caused by the setting capability of the generator frequency and voltage protective relays themselves but does not exclude limitations originating in the equipment that they protect.

~~If the Generator Owner expects the generating unit(s) will remain connected for the duration of the profile of the excursion provided, the estimate should indicate the generating unit(s) is not expected to trip. The Generator Owner may develop the estimates based on experience, actual event histories, or sound engineering judgment. Detailed generating unit(s) performance studies are not required to develop the estimate. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*~~

~~R5.~~R4. Each Generator Owner shall provide its applicable generator protection trip settings associated with Requirements R1 and R2 to the Planning Coordinator or Transmission Planner ~~(~~that models the associated unit~~),~~ within 60 calendar days of receipt of a written request for the data~~,~~ and within 60 calendar days of any change to those previously requested trip settings unless ~~otherwise~~ directed by the requesting Planning Coordinator or Transmission Planner that the reporting of relay setting changes is not required. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

C. Measures

M1. Each Generator Owner shall have evidence that generator frequency protective relays have been set in accordance with Requirement R1 such as dated setting sheets, calibration sheets~~,~~ or other documentation.

M2. Each Generator Owner shall have evidence that generator voltage protective relays have been set in accordance with Requirement R2 ~~evidence~~ such as dated setting sheets, voltage-time curves, calibration sheets, coordination plots, ~~or~~ dynamic simulation studies or other documentation.

M3. Each Generator Owner shall have evidence that it has documented and communicated any known regulatory or equipment limitations (excluding limitations noted in footnote 3~~that are caused by generator frequency and voltage protective relays~~) that resulted in an exception to Requirements R1 or R2 in accordance with Requirement R3 such as a dated email or letter that contains such documentation as study results, experience from an actual event, or manufacturer's advisory.

~~**M4.** Each Generator Owner shall have evidence that an estimate of the time duration of its existing generating unit(s) as a result of a frequency excursion or voltage excursion has been communicated in accordance with Requirement R4, such as a copy of the estimate of time duration report and correspondence, such as dated e-mails, or other documentation and copies of any requests it has received for that information.~~

~~M5.~~M4. Each Generator Owner shall have evidence that it communicated generator protective relay settings ~~to a requesting entity within 60 calendar days of a request or change in setting(s)~~ in accordance with Requirement R4~~5~~, such as dated e-mails, correspondence or other evidence and copies of any requests it has received for that information.~~.~~

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

The Regional Entity shall serve as the Compliance Enforcement Authority (CEA) unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases, the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.

1.2. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Generator Owner shall retain evidence of compliance with Requirement R1 through R4~~5~~, Measures M1 through M4~~5~~; for 3 years or until the next audit, whichever is longer.

If a Generator Owner is found non-compliant, the Generator Owner shall keep information related to the non-compliance until mitigation is complete and approved for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Voltage Ride-Through Curve Clarifications

Curve Details:

1. The per unit voltage base for these curves is the nominal operating voltage specified by the Transmission Planner in the analysis of the reliability of the Interconnected Transmission Systems at the point of interconnection to the Bulk Electric System (BES).
2. The curves depicted were derived based on three-phase transmission system zone 1 faults with Normal Clearing not exceeding 9 cycles. The curves apply to voltage excursions regardless of the type of initiating event.
3. The envelope within the curves represents the cumulative voltage duration at the point of interconnection with the BES. For example, if the voltage first exceeds 1.15 pu at 0.3 seconds after a fault, does not exceed 1.2 pu voltage, and returns below 1.15 pu at 0.4 seconds, then the cumulative time the voltage is above 1.15 pu voltage is 0.1 seconds and is within the no trip zone of the curve.
4. The curves depicted assume system frequency is 60 Hertz. When evaluating Volts/Hertz protection, you may ~~A~~adjust the magnitude of the high voltage curve in proportion to deviations of frequency below 60 Hz. ~~normal.~~
5. Voltages in the curve assume minimum fundamental frequency phase-to-ground or phase-to-phase voltage for the low voltage duration curve and the greater of maximum RMS or crest phase-to-phase voltage for the high voltage duration curve.

Evaluating Protective Relay Settings:

1. Use either the following assumptions or loading conditions that are believed to be the most probable for the unit under study to evaluate voltage protection relay setting calculations on the static case for steady state initial conditions:
   a. All of the units connected to the same transformer are online and operating.~~,~~
   b. All of the units are at full nameplate real-power output.
   c. Power factor is 0.95 lagging (i.e. supplying reactive power to the system) as measured at the generator terminals~~)~~.
   ~~c.~~d. The automatic voltage regulator is in automatic voltage control mode.
2. Evaluate voltage protection relay settings assuming that additional installed generating plant reactive support equipment (such as static VAr compensators, synchronous condensers, or capacitors) is available and operating normally.
3. Evaluate voltage protection relay settings accounting for the actual tap settings of transformers between the generator terminals and the point of interconnection.

Implementation Plan

Project 2007-09 Generator Verification

Implementation Plan for PRC-024-1, Generator Frequency and Voltage Protective Relay Settings

Approvals Required

PRC-024-1 – Generator Frequency and Voltage Protective Relay Settings.

According to its Implementation Plan, PRC-006-1, Requirement R4 (see project 2007-01, Underfrequency Load Shedding) does not become effective until PRC-024-1 becomes effective. Upon the effective date of PRC-024-1, R4 of PRC-006-1 will also go into effect.

Prerequisite Approvals

None

Revisions to Glossary Terms

None

Applicable Entities

Generator Owner

Conforming Changes to Other Standards

None

Effective Dates

In those jurisdictions where regulatory approval is required:

- By the first day of the first calendar quarter, two calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner shall have verified at least 40 percent of its applicable Facilities are fully compliant with Requirements R1, R2, R3, and R4.

- By the first day of the first calendar quarter, three calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to

such ERO governmental authorities, each Generator Owner shall have verified at least 60 percent of its applicable Facilities are fully compliant with Requirements R1, R2, R3, and R4.

- By the first day of the first calendar quarter, four calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner shall have verified at least 80 percent of its applicable Facilities are fully compliant with Requirements R1, R2, R3, and R4.

- By the first day of the first calendar quarter, five calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner shall have verified 100 percent of its applicable Facilities are fully compliant with Requirements R1, R2, R3, and R4.

In those jurisdictions where regulatory approval is not required:

- By the first day of the first calendar quarter, two calendar years following Board of Trustees approval, each Generator Owner shall have verified at least 40 percent of its applicable Facilities are fully compliant with Requirements R1, R2, R3, and R4.

- By the first day of the first calendar quarter, three calendar years following Board of Trustees approval, each Generator Owner shall have verified at least 60 percent of its applicable Facilities are fully compliant with Requirements R1, R2, R3, and R4.

- By the first day of the first calendar quarter, four calendar years following Board of Trustees approval, each Generator Owner shall have verified at least 80 percent of its applicable Facilities are fully compliant with Requirements R1, R2, R3, and R4.

- By the first day of the first calendar quarter, five calendar years following Board of Trustees approval, each Generator Owner shall have verified 100 percent of its applicable Facilities are fully compliant with Requirements R1, R2, R3, and R4.

Retirements

None

Justification of Phasing

Requirements R1, R2, R3, and R4 involve evaluation of existing protection system settings and equipment capabilities. Typically, generator protection system setting changes are made during scheduled generator outages. The Implementation Plan allows a five-year window for these changes to be made which corresponds to typical outage cycles. Generating units that have outage cycles that extend longer than five years are not typically base loaded and offer opportunities to effect protection system settings changes during economic shut down periods.

Unoffical Comment Form

Project 2007-09 Generator Verification PRC-024-1 Generator Frequency and Voltage Protective Relay Settings

Instructions

Please **DO NOT** use this form for commenting. Please use the electronic comment form to submit comments on the proposed revisions to PRC-024-1. Comments must be submitted by by 8 p.m. ET **Monday, February 25, 2013**. If you have questions please contact Stephen Crutchfield at stephen.crutchfield@nerc.net or by telephone at 609-651-9455.

Background Information

The Generator Verification Standard Drafting Team posted PRC-024-1 - Generator Frequency and Voltage Protective Relay Settings, from December 12, 2012 through January 11, 2013 for a 30-day concurrent comment/successive ballot period. The GVSDT received valuable feedback from stakeholders regarding improvements to the standard. Many of the suggested edits were incorporated into the revised standard.

The vast majority of stakeholders agreed with the removal of R5 from the standard. Several stakeholders suggested that there were issues with R4. These commenters pointed out that the requirement was ambiguous and provided no discernible reliability benefit while subjecting entities to potential compliance violations for making optimistic estimations. Stakeholders believe that the use of language such as "sound engineering judgment" is subject to interpretation and vague. Based on these comments, the GVSDT removed R4 from the standard. PRC-024-1 is now a relay setting standard.

Minority issue: Under FERC Order 661A, the wind industry is currently subject to more stringent voltage and frequency ride-through standards than other generation types, and keeping PRC-024 as a generator performance standard would have helped to level the playing field in this regard. The proposed draft of PRC-024 does not accomplish this. The GVSDT points out that the requirements contained in FERC Order 661A are enforced through Generator Interconnection Agreements and not NERC Standards.

A large majority of stakeholders agreed with the change made to Attachment 1. Some stakeholders questioned the potential impact this change might make due to the elimination of the margin between the allowable UFLS overshoot and the generator overfrequency trip setpoints. The GVSDT pointed out that setting overfrequency tripping at this point would be allowed under the previous curve as a technically-based exemption under Requirement R3 and the change made removes a conflict with internationally-recognized technical standards.

Most stakeholders agreed with the revisions to the voltage ride-through curves in Attachment 2. Several stakeholders had concerns with the low voltage ride-through criteria being lowered to 85% for the 3-4 second interval. Stakeholders pointed out that transmission systems are designed to operate between 90% to 110% and not down to 85% and as such we do not expect generators to ride through voltages as low as 85% for an extended period of time. The GVSDT agrees with these comments and has revised the voltage ride-through chart 85% voltage level to the original 90%. This is due to removing all generator loadability relays from PRC-024 allowing the relay setting criteria for loadability to be in PRC-025. The 85% point-of-interconnection voltage for relay loadability for transmission and generation relays remains in their respective standards (PRC-023 for transmission and PRC-025 for generator). The majority of commentators agreed with the removal of loadability relays from PRC-024. The majority of comments expressed agreement with the removal of loadability relays from PRC-024. One commentator recommended that the Generator Relay Loadability drafting team vet the removal of these relay types from Footnote 1. The GVSDT had previous discussions with that drafting team and they concurred with the revision to PRC-024.

Stakeholders provided valuable input regarding suggested improvements to language within the standard. Based on these comments, the following improvements were made to the draft standard:

- Removed R4 from the standards because of ambiguous language and dubious reliability benefit.
- Revised the title of the standard to “Generator Frequency and Voltage Protective Relay Settings” and the Purpose Statement to “Ensure Generator Owners set their generator protective relays such that generating units remain connected during defined frequency and voltage excursions.
- Revised “generating unit(s)” to “applicable generating unit(s)” to reflect that the standard only applies to units that meet the registry criteria.
- Revised language of R1 to match that of R2.
- Added “regulatory or” language regarding limitations to reflect that NERC, environmental or regulatory requirements may cause a limitation in generator performance.
- Revised R2 so that the sentences were shorter and easier to read.
- Removed the last bullet from R3 and added and new bullet referencing frequency impacts on turbines as follows: “Creation or adjustment of an equipment limitation caused by consumption of the cumulative turbine life-time frequency excursion allowance.”
- Revised R5 (now R4) to indicate that the trip settings to be provided are only those “associated with Requirements R1 and R2” and not all relays.
- Revised the measures based on requirement revisions.
- Updated the VSLs for R3 and R4 to allow 30 day increments between levels rather than the original 10 days. This comports with other standards developed under this project.
- Updated the table in Attachment 2 (this was missed in the previous revision).

- Made clarifying revisions to “Voltage Ride-Through Curve Clarifications” on the last page of the standard.
- Clarified Footnote 3 to: “Excludes limitations that are caused by the setting capability of the generator frequency and voltage protective relays themselves but does not exclude limitations originating in the equipment that they protect.”

Questions

1. The GVSDT has removed Requirement R4 from the standard. Stakeholders suggested that the requirement was ambiguous and provided no discernible reliability benefit while subjecting entities to potential compliance violations for making optimistic estimations. Stakeholders believe that the use of language such as “sound engineering judgment” is subject to interpretation and vague. Do you agree with this revision? If not, please explain in the comment area below.

   ☐ Yes

   ☐ No

   Comments:

2. Do you have any other comment, not expressed in question above, for the GVSDT?

   Comments:

Project 2007-09 Generator Verification Consideration of Issues and Directives

Project 2007-09 Generator Verification — PRC-024-1		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
Paragraph 1787 states "… the Commission directs the ERO to modify the Reliability Standard to explicitly require either that all generators are capable of riding through the same set of Category B and C contingencies, as required by wind generators in Order No. 661, or that those generators that cannot ride through be simulated as tripping. "	FERC Order 693; Paragraph 1787	The GVSDT believes that Requirement R2 and the voltage ride through curves in PRC-024 Attachment 2 accomplish this. While the curves were developed based on three phase normally cleared faults located at a generating plant substation (the most severe condition for generating equipment), the curves cover voltages depressed as low as 0.65 per unit for two seconds, which the GVSDT feels will cover the Category B and C events of concern to the Commission. Requirement R3 allows an exemption from portions of the ride through curves in PRC-024 Attachments 1 and 2 for documented regulatory or technical reasons, but directs those generators to communicate that limitation to the PC and TP so its performance can be modeled correctly.
Paragraph 1787 also states "… the Commission agrees that NRC requirements should be used when implementing the Reliability Standards."	FERC Order 693; Paragraph 1787	The GVSDT believes that Requirement R3 allows NRC requirements to supersede portions of the voltage and frequency ride through criteria in PRC-024-1. This Requirement allows generators an exemption from portions of the ride through curves for documented regulatory limitations. The GVSDT

Project 2007-09 Generator Verification — PRC-024-1		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
		believes that NRC requirements qualify as regulatory limitations for the purposes of this standard.

Project 2007-09 Generator Verification Consideration of Issues and Directives

Project 2007-09 Generator Verification — PRC-024-1		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
Paragraph 1787 states "… the Commission directs the ERO to modify the Reliability Standard to explicitly require either that all generators are capable of riding through the same set of Category B and C contingencies, as required by wind generators in Order No. 661, or that those generators that cannot ride through be simulated as tripping. "	FERC Order 693; Paragraph 1787	The GVSDT believes that Requirement R2 and the voltage ride through curves in PRC-024 Attachment 2 accomplish this. While the curves were developed based on three phase normally cleared faults located at a generating plant substation (the most severe condition for generating equipment), the curves cover voltages depressed as low as 0.65 per unit for two seconds, which the GVSDT feels will cover the Category B and C events of concern to the Commission. Requirement R3 allows an exemption from portions of the ride through curves in PRC-024 Attachments 1 and 2 for documented regulatory or technical reasons, but directs those generators to communicate that limitation to the PC and TP so its performance can be modeled correctly. ~~In addition, Requirement R4 allows the PC or TP to request an estimate of performance (ride through duration) from the GO for a defined excursion. The estimate would cover process upsets to the generating equipment that might result in a delayed trip, even if the generator protection itself did not cause a trip.~~

Project 2007-09 Generator Verification — PRC-024-1		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
Paragraph 1787 also states "… the Commission agrees that NRC requirements should be used when implementing the Reliability Standards."	FERC Order 693; Paragraph 1787	The GVSDT believes that Requirement R3 allows NRC requirements to supersede portions of the voltage and frequency ride through criteria in PRC-024-1. This Requirement allows generators an exemption from portions of the ride through curves for documented regulatory ~~technical~~ limitations. The GVSDT believes that NRC requirements qualify as regulatory ~~technical~~ limitations for the purposes of this standard.

Violation Risk Factor and Violation Severity Level Assignments

Project 2007-09 Generator Verification

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in PRC-024-1 — Generator Frequency and Voltage Protective Relay Settings.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

Justification for Assignment of Violation Risk Factors

The Generator Verification Standard Drafting Team applied the following NERC criteria when proposing VRFs for the requirements under this project:

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

The SDT also considered consistency with the FERC Violation Risk Factor Guidelines for setting VRFs:[1]

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:[2]

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

Guideline (2) — Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) — Consistency among Reliability Standards

[1] North American Electric Reliability Corp., 119 FERC ¶ 61,145, order on reh'g and compliance filing, 120 FERC ¶ 61,145 (2007) ("VRF Rehearing Order").
[2] Id. at footnote 15.

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

The following discussion addresses how the SDT considered FERC's VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's Reliability Standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and therefore concentrated its approach on the reliability impact of the requirements.

VRF for PRC-024-1:
There are four requirements in PRC-024-1. Two of the Requirements (R1 and R2) were assigned a "Medium" VRF and the remaining two requirements were assigned a "Lower" VRF.

VRF for PRC-024-1, Requirement R1:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R1 contains Parts specifying conditions for satisfying the main requirement. The VRFs are only applied at the Requirement level and each Requirement Part is treated equally. Requirement obligations include actions similar in scope to actions specified in Requirement R2 which were assigned a "Medium" VRF.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar in concept with both PRC-012-0 Requirement R1 and PRC-023-1 Requirement R1, both of which require protection coordination or settings. These requirements apply to multiple elements while the requirements of PRC-024-1 apply to a single unit. Violation of this requirement by a single generator could not be construed as directly causing or contributing to BES instability, separation or cascading within any time frame. For a single violation to lead to BES instability, separation or cascading would require other standards requirements to be violated. This requirement is assigned a "Medium" VRF.

- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to ensure a proper frequency "no-trip" operating window is a requirement in the planning time frame that, if violated, is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. Therefore the assigned "Medium" VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R1 reliability objective is to ensure a proper frequency "no-trip" operating window. Requirement Parts are lower risk condition elements that establish main requirement criteria for completeness. The "Medium" VRF assigned is based on the reliability objective specified.

VRF for PRC-024-1, Requirement R2:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R2 contains Parts specifying conditions for satisfying the main requirement. The VRFs are only applied at the Requirement level and each Requirement Part is treated equally. Requirement obligations include actions similar in scope to actions specified in Requirement R1 which were assigned a "Medium" VRF.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar in concept with both PRC-012-0 Requirement R1 and PRC-023-1 Requirement R1, both of which require protection coordination or settings. These requirements apply to multiple elements while the requirements of PRC-024-1 apply to a single unit. Violation of this requirement by a single generator could not be construed as directly causing or contributing to BES instability, separation or cascading within any time frame. For a single violation to lead to BES instability, separation or cascading would require other standards requirements to be violated. This requirement is assigned a "Medium" VRF.
- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to ensure proper voltage "no-trip" criteria is a requirement in the planning time frame that, if violated, is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. Therefore the assigned "Medium" VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R2 reliability objective is to ensure proper voltage "no-trip" criteria. Requirement Parts are lower risk condition elements that establish main requirement criteria for completeness. The "Medium" VRF assigned is based on the reliability objective specified.

VRF for PRC-024-1, Requirements R3:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R3 contains Parts specifying response expectation and limitation reset conditions for satisfying the main requirement. The VRFs are only applied at the Requirement level and each Requirement Part is treated equally.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar in concept with PRC-006-0 Requirement R1 which specifies documentation requirements. In addition, as is generally the case with reliability standard VRF definitions for documentation and administrative requirements, this requirement is assigned a "Lower" VRF.
- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to document limitations preventing compliance is a requirement that is administrative in nature for the planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Therefore the assigned "Lower" VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R3 reliability objective is to document limitations preventing compliance. Requirement Parts and obligations are lower risk elements that ensure main requirement completeness which are administrative in nature consisting of response submission and limitation reset condition requirements. The "Lower" VRF assigned is based on the reliability objective specified.

VRF for PRC-024-1, Requirement R4:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R4 does not contain Parts. Requirement obligations specify the type of response and response time frame to be observed.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar in concept with both PRC-007-0 Requirement R3 and PRC-010-0 Requirement R2, both of which require providing information within a specified time frame on request. In addition, as is generally the case with reliability standard VRF definitions for documentation and administrative requirements, this requirement is assigned a “Lower” VRF.
- FERC Guideline 4 — Consistency with NERC’s Definition of the VRF Level selected exists. Failure to provide setting and limitation information as requested is a requirement that is administrative in nature for the planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Therefore the assigned “Lower” VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R4 reliability objective is to provide setting and limitation information as requested. Requirement obligations are lower risk condition elements administrative in nature for ensuring the main requirement is satisfied in a timely manner. The “Lower” VRF assigned is based on the reliability objective specified.

Justification for Assignment of Violation Severity Levels:

In developing the VSLs for the standards under this project, the SDT anticipated the evidence that would be reviewed during an audit, and developed its VSLs based on the noncompliance an auditor may find during a typical audit. The SDT based its assignment of VSLs on the following NERC criteria:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

FERC's VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in PRC-024-1 meet the FERC Guidelines for assessing VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.

Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VSLs for PRC-024-1 Requirement R1:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R1.	The NERC VSL guidelines are satisfied by incorporating binary VSL elements.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's are a combination of binary elements and are categorized as severe. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on binary performance, and timeliness of the actions and obligations	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action per the conditions specified by listed parts. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

VSLs for PRC-024-1 Requirement R2:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R2.	The NERC VSL guidelines are satisfied by incorporating binary VSL elements.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's are a combination of binary elements and are categorized as severe. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on binary performance, and timeliness of the actions and obligations specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action per the conditions specified by listed parts. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

VSLs for PRC-024-1 Requirement R3:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R3.	The NERC VSL guidelines are satisfied by incorporating increments for tardiness elements.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's incorporate the increments for tardiness methodology. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on timeliness of the action specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action in a timely manner including response obligation and reset conditions specified by listed parts. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

VSLs for PRC-024-1 Requirement R4:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R4.	The NERC VSL guidelines are satisfied by incorporating increments for tardiness elements.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's incorporate the increments for tardiness methodology. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on timeliness of the action specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action in a timely manner. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

Violation Risk Factor and Violation Severity Level Assignments

Project 2007-09 Generator Verification

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in PRC-024-1 — Generator Frequency and Voltage Protective Relay Settings~~Generator Performance During Frequency and Voltage Excursions~~.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

Justification for Assignment of Violation Risk Factors

The Generator Verification Standard Drafting Team applied the following NERC criteria when proposing VRFs for the requirements under this project:

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement

A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

The SDT also considered consistency with the FERC Violation Risk Factor Guidelines for setting VRFs:[1]

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report

The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:[2]

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

Guideline (2) — Consistency within a Reliability Standard

The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) — Consistency among Reliability Standards

[1] North American Electric Reliability Corp., 119 FERC ¶ 61,145, order on reh'g and compliance filing, 120 FERC ¶ 61,145 (2007) ("VRF Rehearing Order").

[2] Id. at footnote 15.

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

The following discussion addresses how the SDT considered FERC's VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's Reliability Standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and therefore concentrated its approach on the reliability impact of the requirements.

VRF for PRC-024-1:

There are four ~~five~~ requirements in PRC-024-1. Two of the Requirements (R1~~,~~ and R2) were assigned a "Medium" VRF and the remaining two~~hree~~ requirements were assigned a "Lower" VRF.

VRF for PRC-024-1, Requirement R1:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R1 contains Parts specifying conditions for satisfying the main requirement. The VRFs are only applied at the Requirement level and each Requirement Part is treated equally. Requirement obligations include actions similar in scope to actions specified in Requirement R2~~ and R5, both of~~ which were assigned a "Medium" VRF.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar in concept with both PRC-012-0 Requirement R1 and PRC-023-1 Requirement R1, both of which require protection coordination or settings. These requirements apply to multiple elements while the requirements of PRC-024-1 apply to a single unit. Violation of this requirement by a single generator could not be construed as directly causing or contributing to BES instability, separation or cascading within any time frame. For a single violation to lead to BES instability, separation or cascading would require other standards requirements to be violated. This requirement is assigned a "Medium" VRF.

- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to ensure a proper frequency "no-trip" operating window is a requirement in the planning time frame that, if violated, is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. ~~.~~ Therefore the assigned "Medium" VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R1 reliability objective is to ensure a proper frequency "no-trip" operating window. Requirement Parts are lower risk condition elements that establish main requirement criteria for completeness. The "Medium" VRF assigned is based on the reliability objective specified.

VRF for PRC-024-1, Requirement R2:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R2 contains Parts specifying conditions for satisfying the main requirement. The VRFs are only applied at the Requirement level and each Requirement Part is treated equally. Requirement obligations include actions similar in scope to actions specified in Requirement R1 ~~and R5, both of~~ which were assigned a "Medium" VRF.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar in concept with both PRC-012-0 Requirement R1 and PRC-023-1 Requirement R1, both of which require protection coordination or settings. These requirements apply to multiple elements while the requirements of PRC-024-1 apply to a single unit. Violation of this requirement by a single generator could not be construed as directly causing or contributing to BES instability, separation or cascading within any time frame. For a single violation to lead to BES instability, separation or cascading would require other standards requirements to be violated. This requirement is assigned a "Medium" VRF.
- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to ensure proper voltage "no-trip" criteria is a requirement in the planning time frame that, if violated, is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. Therefore the assigned "Medium" VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R2 reliability objective is to ensure proper voltage "no-trip" criteria. Requirement Parts are lower risk condition elements that establish main requirement criteria for completeness. The "Medium" VRF assigned is based on the reliability objective specified.

VRF for PRC-024-1, Requirements R3:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R3 contains Parts specifying response expectation and limitation reset conditions for satisfying the main requirement. The VRFs are only applied at the Requirement level and each Requirement Part is treated equally.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar in concept with PRC-006-0 Requirement R1 which specifies documentation requirements. In addition, as is generally the case with reliability standard VRF definitions for documentation and administrative requirements, this requirement is assigned a "Lower" VRF.
- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to document limitations preventing compliance is a requirement that is administrative in nature for the planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Therefore the assigned "Lower" VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R3 reliability objective is to document limitations preventing compliance. Requirement Parts and obligations are lower risk elements that ensure main requirement completeness which are administrative in nature consisting of response submission and limitation reset condition requirements. The "Lower" VRF assigned is based on the reliability objective specified.

~~**VRF for PRC-024-1, Requirement R4:**~~

- ~~FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R4 contains Parts that are procedural in nature defining criteria associated with the main requirement. The VRFs are only applied at the Requirement level and each Requirement Part is treated equally.~~
- ~~FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement requires an estimate of performance and is somewhat similar in concept with both PRC-009-0 Requirement R1 and PRC-014-0 Requirement R2, both of which reference protection analysis or assessment for determining adequacy. In addition, as is generally the case with reliability standard VRF definitions for analysis & assessment planning type requirements, this requirement is assigned a "Lower" VRF.~~
- ~~FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to estimate performance during a frequency or voltage excursion is a requirement that is administrative in nature for the planning time frame that, if violated, would not, under the~~

~~emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Therefore the assigned "Lower" VRF is appropriate.~~

- ~~FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R4 reliability objective is to estimate performance during a frequency or voltage excursion. Requirement Parts and obligations are lower risk procedure based criteria for the main requirement. The "Lower" VRF assigned is based on the reliability objective specified.~~

VRF for PRC-024-1, Requirement R4~~5~~:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R4~~5~~ does not contain Parts. Requirement obligations specify the type of response and response time frame to be observed.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar in concept with both PRC-007-0 Requirement R3 and PRC-010-0 Requirement R2, both of which require providing information within a specified time frame on request. In addition, as is generally the case with reliability standard VRF definitions for documentation and administrative requirements, this requirement is assigned a "Lower" VRF.
- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to provide setting and limitation information as requested is a requirement that is administrative in nature for the planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Therefore the assigned "Lower" VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R4~~5~~ reliability objective is to provide setting and limitation information as requested. Requirement obligations are lower risk condition elements administrative in nature for ensuring the main requirement is satisfied in a timely manner. The "Lower" VRF assigned is based on the reliability objective specified.

Justification for Assignment of Violation Severity Levels:

In developing the VSLs for the standards under this project, the SDT anticipated the evidence that would be reviewed during an audit, and developed its VSLs based on the noncompliance an auditor may find during a typical audit. The SDT based its assignment of VSLs on the following NERC criteria:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

FERC's VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in PRC-024-1 meet the FERC Guidelines for assessing VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a "binary" type requirement must be a "Severe" VSL.

Do not use ambiguous terms such as "minor" and "significant" to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the "default" for penalty calculations.

VSLs for PRC-024-1 Requirement R1:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R1.	The NERC VSL guidelines are satisfied by incorporating binary VSL elements.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's are a combination of binary elements and are categorized as severe. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on binary performance, and timeliness of the actions and obligations	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action per the conditions specified by listed parts. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

VSLs for PRC-024-1 Requirement R2:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R2.	The NERC VSL guidelines are satisfied by incorporating binary VSL elements.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's are a combination of binary elements and are categorized as severe. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on binary performance, and timeliness of the actions and obligations specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action per the conditions specified by listed parts. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

VSLs for PRC-024-1 Requirement R3:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R3.	The NERC VSL guidelines are satisfied by incorporating increments for tardiness elements.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's incorporate the increments for tardiness methodology. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on timeliness of the action specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action in a timely manner including response obligation and reset conditions specified by listed parts. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

~~***VSLs for PRC-024-1 Requirement R4:***~~

~~R#~~	~~Compliance with NERC VSL Guidelines~~	~~Guideline 1~~ ~~Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance~~	~~Guideline 2~~ ~~Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties~~ ~~Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent~~ ~~Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language~~	~~Guideline 3~~ ~~Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement~~	~~Guideline 4~~ ~~Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations~~
~~R4.~~	~~The NERC VSL guidelines are satisfied by incorporating increments for tardiness.~~	~~This is a new Requirement and does not have a prior level of compliance.~~	~~Proposed VSL's reflect increments for tardiness. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on binary performance, and both completeness and timeliness of the actions and obligations specified.~~	~~Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action in a timely manner per the procedure criteria specified by listed parts. Proposed VSL's are consistent with the requirement.~~	~~Proposed VSL's are based on a single violation and not a cumulative violation methodology.~~

VSLs for PRC-024-1 Requirement R~~4~~5:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R4~~6~~.	The NERC VSL guidelines are satisfied by incorporating increments for tardiness elements.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's incorporate the increments for tardiness methodology. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on timeliness of the action specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action in a timely manner. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

Standards Announcement

Project 2007-09 Generator Verification
PRC-024-1

Successive Ballot and Non-Binding Poll is now open through February 25, 2013

Now Available

A successive ballot of **PRC-024-1** and non-binding poll of the associated Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs) is now open **through 8 p.m. Eastern on Monday, February 25, 2013.**

Instructions
Members of the ballot pools associated with this project may log in and submit their vote for the standard and non-binding poll of the associated VRFs and VSLs by clicking here.

Next Steps
The ballot results will be announced and posted on the project page. The drafting team will consider all comments received during the formal comment period and, if needed, make revisions to the standard. If the comments do not show the need for significant revisions, the standard will proceed to a recirculation ballot.

Background
The purpose of Project 2007-09 - Generator Verification is to ensure that: 1) generators will not trip off-line during specified voltage and frequency excursions or as a result of improper coordination between generator-protective relays and generator voltage regulator controls and limit functions (such coordination will include the generating unit's capabilities); and 2) that generator models accurately reflect the generator's capabilities and operating characteristics.

The standard drafting team (SDT) for Project 2007-09 - Generator Verification - based part of its work on two existing NERC Board-approved standards, MOD-024-1 — Verification of Generator Gross and Net Real Power Capability and MOD-025-1 — Verification of Generator Gross and Net Reactive Power Capability. The drafting team moved the Requirements of MOD-024-1 into MOD-025-2, and recommends retiring MOD-024-1 and incorporated industry comments to make improvements to the standards.

The drafting team has also based its work on four draft standards developed by the Phase III & IV SDT that were field tested by four Regions from mid 2006 through mid 2007:

- PRC-019-1 — Coordination of Generator Voltage Regulator Controls with Unit Capabilities and Protection
- PRC-024-1 — Generator Performance During Frequency and Voltage Excursions
- MOD-026-1 — Verification of Models and Data for Generator Excitation Control System Functions
- MOD-027-1 — Verification of Generator Unit Frequency Response

Standards Process

The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance, please contact Wendy Muller,
Standards Development Administrator, at wendy.muller@nerc.net or at 404-446-2560.

Standards Announcement

Project 2007-09 Generator Verification
PRC-024-1

Formal Comment Period: January 25, 2013 – February 25, 2013

Upcoming:
Successive Ballot and Non-Binding Poll: February 15, 2013 – February 25, 2013

Now Available

A 30-day formal comment period is open for **PRC-024-1** – Generator Performance During Frequency and Voltage Excursions through **8 p.m. Eastern on Monday, February 25, 2013**.

A successive ballot of **PRC-024-1** and non-binding poll of the associated VRFs and VSLs will be conducted beginning on **Friday, February 15, 2013 through 8 p.m. Eastern on Monday, February 25, 2013.**

The remaining four standards (MOD-025-2, MOD-026-1, MOD-027-1 and PRC-019-1) in this project passed the recirculation ballot on December 21, 2012 and will be presented to the NERC Board of Trustees for adoption at its February meeting.

Instructions for Commenting

A formal comment period for **PRC-024-1** is open through **8 p.m. Eastern on Monday, February 25, 2013.** Please use this electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Monica Benson at monica.benson@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page.

Next Steps

A successive ballot of PRC-024-1 and non-binding poll of the associated VRFs and VSLs will be conducted from February 15, 2013 through February 25, 2013.

Background

The purpose of Project 2007-09 - Generator Verification is to ensure that: 1) generators will not trip off-line during specified voltage and frequency excursions or as a result of improper coordination between generator-protective relays and generator voltage regulator controls and limit functions (such coordination will include the generating unit's capabilities); and 2) that generator models accurately reflect the generator's capabilities and operating characteristics.

The standard drafting team (SDT) for Project 2007-09 - Generator Verification - based part of its work on two existing NERC Board-approved standards, MOD-024-1 — Verification of Generator Gross and Net Real Power Capability and MOD-025-1 — Verification of Generator Gross and Net Reactive Power Capability. The drafting team moved the Requirements of MOD-024-1 into MOD-025-2, and recommends retiring MOD-024-1 and incorporated industry comments to make improvements to the standards.

The drafting team has also based its work on four draft standards developed by the Phase III & IV SDT that were field tested by four Regions from mid 2006 through mid 2007:

- PRC-019-1 — Coordination of Generator Voltage Regulator Controls with Unit Capabilities and Protection

American Electric Power
Yes
AEP recommends that the time allowed to meet R 3.1 be extended to 60 calendar days, aligning it with R4, thereby making the timing requirements of the standard more consistent throughout. R2: Regarding the language “If the Transmission Planner allows less stringent voltage relay settings than those required to meet PRC-024 Attachment 2, then the Generator Owner shall set its protective relaying”, we believe the intent is to allow the GO to set its protective relaying within the PRC-024 no-trip zone and remain compliant so long as the Transmission Planner’s less stringent requirements is met. However it is not made explicitly clear by doing so that one would still be fully compliant with PRC-024. We recommend making this explicitly clear within R2. Suggest rewording the first sentence of R2 to state the following: “Each Generator Owner that has generator voltage protective relaying activated to trip its applicable generating unit(s) shall set its protective relaying such that the voltage protective relaying does not trip the applicable generating unit(s) as a result of a voltage excursion (at the point of interconnection) that remains within the “no trip zone” of PRC-024 Attachment 2 caused by an event on the transmission system external to the generating plant.”
Individual
Nazra Gladu
Manitoba Hydro
Yes
(1) R2 – are the words ‘the applicable generating units’ missing after the word ‘trip’ in the third

line? this would make the language consistent with the wording of R1. (2) R2- are the words ‘of a location specific Transmission Planner’s study’ precise enough to know for certain what characteristics are being referred to and compliance measured? (3) R3 – is the word ‘known’ precise enough to know for certain what characteristics are being referred to and compliance measured? (4) R3, 3.1 – there is no notification requirement with respect to any modifications or upgrades that may remove the limitation – this seems to be a gap. (5) M3 – the word ‘documentation’ should be changed to ‘information’. (6) M4 – does not seem to track the wording of R4 – measure should be that it ‘provided applicable generator protection trip settings’…….and the word ‘information’ should be ‘data’. (7) Compliance – same comment as previous re: use of the acronym CEA. (8) VSLs, R1 and R2 – the way these requirements are worded it makes it seem as though the violation is that the GO has no documented limitation – that is not the violation, that would be a violation of R3. The violation for these two requirements would be a failure to set its relaying within the criteria of R1/R2. (9) VSLs, R2 – doesn’t contemplate new change to language of R2 re: TP standards. (10) VSLs, R3 – the timeline doesn’t address any change other than the identification of the limitation, i.e. but the timeline could run from repair, replacement. (11) VSLs, R4 – some refer to a ‘written request’ and some refer to a ‘written request for the data’ – these should be made consistent with the requirement language.

CenterPoint Energy
CenterPoint Energy remains concerned with truncating the Voltage Ride-Through Time Duration Curve (Attachment 2) at 4 seconds due to coordination with undervoltage load shedding systems (UVLS). For coordination of UVLS with any generator voltage protective relays, CenterPoint Energy recommends the curve be extended to at least 10 seconds at 0.90 per unit POI Voltage. CenterPoint Energy does not believe such a change would be controversial, as the GVSDT states in the Consideration of Comments (Draft 5) that “Stakeholders pointed out that transmission systems are designed to operate between 90% to

110%.”

Regarding Footnote 1 for R1, are protective functions within control systems that measure frequency from a non-electrical input such as speed sensors, included as "protective relaying"? Please clarify that this standard pertains only to generator protective functions that respond exclusively to voltage and/or frequency, but not current. Please adjust Attachment 1 Eastern Interconnection frequency data point exponents on page 13 so that they are completely visible. Please verify for Attachment 2 Voltage Curve that continuous operation is expected greater than 0.90 pu. and less than 1.10 pu.

R4 as it was rewritten in draft 6 seems like a redundant sub requirement of PRC-001 R3. The type of protection described in R2 and R3 falls already in the “coordination” required category described in the NERC Technical Reference Document, “Power Plant and Transmission System Protection Coordination” Revision 1 – July 2010 http://www.nerc.com/docs/pc/spctf/Gen%20Prot%20Coord%20Rev1%20Final%2007-30-2010.pdf Furthermore the requirement fails to specify the accountability and responsibilities of the Transmission Planner/Transmission Operator in the “coordination” process in order to approve the relay setting changes. R4 should be eliminated or merged into PRC-001 R3 to avoid redundancies per FERC’s instructions on eliminating redundancies.
PRC-024-1 previous draft placed the burden of complying with the standard solely on the GO.

This new draft places the bulk of ensuring compliance on the GO while providing a different criteria or “exemption” given by the Transmission Planner. If that is the case, the Planner should have a joint obligation to ensure the GO/GOP is successful in meeting and achieving compliance spelled out in the standard. Additionally, the Planner would be the best party capable of determining “which voltage protective relaying setting does not trip as a result of a voltage excursion (at the point of interconnection) caused by an event on the transmission system external to the generating plant that remains within the “no trip zone” of PRC-024 Attachment 2. Applicability of the standard should also include the Transmission Planner. R2 also lacks a mechanism(how the study is initiated and why, study request timeframe, study response timeframe, etc) whereby the Transmission Planner provides the “less stringent” voltage protection requirements so the GO can then determine when they need to follow Attachment 2 or the Planner’s study or have the Planner determine the criteria first. The requirement should be clearer and more details should be added. R3 objectives state that the GO shall provide equipment limitations to the Planner within 30 days of a request or change. PRC-024-1 R3 does not provide any value when MOD-010, MOD-012 and MOD-025, MOD-026 and MOD-027 appear to address these issues. R3 needs to be clarified with more details to avoid possible redundancies with the MOD standards.

Yes. For generators without frequency or voltage protective relaying, R1 and R2 respectively do not require these relays to be installed per footnote 1. However, R3 could be interpreted to require generators without such relaying to be required to comply with R3 because it applies to a generator limitation that “prevents an applicable generating unit from meeting the relay

setting criteria in Requirements R1 or R2 including (but not limited to) study results, experience from an actual event, or manufacturer's advice." We have received an e-mail from the drafting team NERC coordinator for this project that this is NOT the intent of R3 – R3 is only intended to apply to generators that HAVE frequency and/or voltage protective relaying installed. We ask that the SDT confirm this understanding. If this is the SDT's intent we recommend that R3 be clarified as follows: Each Generator Owner shall document each known regulatory or equipment limitation3 that prevents an applicable generating unit WITH GENERATOR FREQUENCY OR VOLTAGE PROTECTIVE RELAYS from meeting the relay setting criteria in Requirements R1 or R2 including (but not limited to) study results, experience from an actual event, or manufacturer's advice. Alternative wording to clarify R3's intent that it does not apply to generators witout frequency or voltage protective relaying would be acceptable.

It is not completely clear how to implement Requirement R2 given the information contained in Attachment 2. Specifically, clarification is requested on the following two issues. A. In Attachment 2, what issue is Curve Detail 3 intended to address? Is it suggesting that definite-time voltage elements should be used, instead of inverse time elements, unless detailed analysis is performed? It is not clear if Curve Detail 3 is intended to afford entities additional flexibility or to require them to conduct more detailed analysis. B. In Attachment 2, is the section titled "Evaluating Protective Relay Settings" intended to determine the per unit voltage base, at the generator terminals, for the Voltage Ride-Through Time Duration Curve? Under Measurement M3, change "manufacturer's advisory" to "manufacturer's advice" to be consistent with Requirement R3. In Attachments 1 and 2, do the "no trip zones" include the lines? In other words, for the Western Interconnection, if a frequency element was set to 57.2 Hz, would an operating time of 0.75 seconds be acceptable per the standard, or does the operating time have to be above 0.75 seconds? (A similar question could be asked for the Voltage Ride-Through Time Duration Curve.) In Attachment 2, under "Evaluating Protective Relay Settings," change "use either the following…" to "use either of the following…"

FOR: Requirement R1, REPLACE: "the frequency protective relaying" WITH: "that generator frequency protective relaying" RATIONALE: SDT intent, with the subordinate bulleted exceptions, appears to provide for exception of necessary overriding conditions within the "no trip zone" for which the "generator frequency protective relaying" is permitted to necessarily go ahead an trip the unit. This suggested change is an attempt to strengthen the linkage between the qualifying R1 "has generator frequency protective relaying activated...", and those bulleted exceptions in order to calm industry concern that those bullets form the only permissible set of unit protective relaying conditions that are allowed to trip the trip (protect) the unit and its underlying equipment when operating within the units' "no trip zone" of frequency conditions. FOR: Requirement R2 REPLACE: "the voltage protective relaying" WITH: "that generator voltage protective relaying" RATIONALE: Basically the same as outlined for the suggested R1 change above, but for voltage rather than frequency. FOR: Appendix 2 (graph) CHANGE: (raise the graph's 0 pu for 0.15 sec) TO: (15 pu for 0.15 sec, along with an appropriate footnote for consideration of preexisting equipment capability) RATIONALE: While the SDT cites FERC ORDER 661A and Appendix G in support of this value, FERC's paragraph 31 ruling agrees with NERC's proposed considerations they earlier discussed. NERC's proposal includes consideration for earlier-purchased wind turbines and their voltage ride-through capabilities, as well as provision for NERC to use their normal process to revise the ride-through capability. AECI believes the SDT should work to build industry consensus on an overall minimum voltage ride-through, or at least afford our industry the same considerations cited for wind turbines.

Oncor Electric Delivery Company
N/A
The 60 calendar day requirement in R4 requiring a Generator Owner to provide its applicable generator protection trip settings to the Planning Coordinator or Transmission Planner within 60 calendar days of receipt of a written request for the data, and within 60 calendar days of any change to those previously requested trip settings is too long. Settings that affect the performance of a system need to be communicated as quickly as possible and because of the critical nature of this data, prolonging system coordination could result in an unnecessary risk to the reliability of the Bulk Electric System. Oncor respectfully requests this time requirement be shortened to 30 days.
Individual
Michelle R D'Antuono
Ingleside Cogeneration LP
Yes
Ingleside Cogeneration agrees with the removal of R4. Our experience has been that ambiguities in reliability requirements force Compliance Enforcement Authorities to provide their own interpretations. This may result in uneven enforcement of the criteria or the development of a Compliance Application Notice, neither of which instill a sense of fairness in the process. Our hope is that the industry develop its own methods to predict voltage and frequency ride-through performance – which would be voluntary and supported by NERC experts.
Ingleside Cogeneration would like to point out that there are already 30 in-effect PRC and MOD standards – with at least four other project teams actively developing new modeling and Protection System requirements. In almost every case, the reliability intent is to ensure that

interconnected entities openly share relay settings, models, and operating information that reduces the risk to the greater whole. However, we do not believe that there is compelling evidence that adherence to these reliability standards correlates to improved reliability – therefore, the addition of one more PRC standard will not reduce BES risk. It is time to consider a more effective regulatory model to address generation/transmission coordination – one that recognizes that the subject matter is extraordinarily complex, with nearly more exceptions than commonalities. The focus would move from the enforcement of global mandates which do not always apply, to ensuring that GOs, PCs, and TPs are continually working the tradeoffs between BES stability and the threat to equipment damage. In this venue, NERC could serve as an expert arbiter to help resolve differences – a role that we believe will lead to the structural improvements necessary to reach our shared reliability goals.

Kansas City Power & Light
Yes
This standard should apply to voltage protection and frequency protection only. It should not apply to volts/hertz or other generator protective elements. Volts/Hertz is specifically intended to protect transformers and generators from damage and the setting is based on the capability of those elements. The SDT has given guidance on Evaluating Protective Relay Settings however this creates a situation where protective settings might appear to be in conflict with the standard and during an audit a study or documentation must be presented to prove the relay setting on the generator side of the GSU is actually in compliance with the standard on the transmission side of the GSU based on the study documentation. Standard Requirements should be straight forward so compliance can be proved with the least amount of effort and documentation. The SDT should use the guidance on Evaluating Protective Relay Settings and produce Voltage Ride Through Time Duration curves on the generator side of the GSU because that is where the voltage source is for the existing generator protective relays.
Group
ACES Standard Collaborators
Jason Marshall
Yes
(1) We continue to be concerned that this standard is inconsistent with the stated vision of NERC regarding the transformation of the compliance process. As the standard is written, it has the potential to become another zero-defect standard in which compliance is paper driven and does little to support reliability. Because plants have lots of equipment, how will the auditor know that frequency and protective relay settings have been set according to the standard without first ensuring they have identified the appropriate relays to review? We can envision them wanting to see the list of all protective relays so that they can first verify that all voltage and frequency relays have been identified and then the list of settings based on this subset.

Furthermore, the language of the standard concerns us that a registered entity will be expected to provide evidence for any unit that trips to prove that it did not trip because of frequency or voltage protective relaying if the voltage and frequency remained within the associated envelopes of performance in the standard. (2) We are concerned that compliance with the standard will be inappropriately enforced based on the actual performance of a unit. The purpose statement says that the generator should “remain connected during frequency and voltage excursions”. Based on this purpose, we would be concerned that compliance with the standard would be assessed based on whether the generator rode through voltage and frequency excursions within the performance envelopes defined in the standard. This would be an inappropriate outcome because the requirements in the standard compel relay settings based on assumptions stated in the “Evaluating Protective Relay Settings” section of Attachment 2. If system conditions did not match the assumptions, how could the GO be held accountable? We believe that standard should make crystal clear that compliance is not to be assessed on actual performance because no GO can guarantee its units will ride through all voltage and frequency excursions defined in the performance envelope in the standard if the conditions vary from the assumptions. While we understand the drafting team did attempt to clarify this with a modification to the “Evaluating Protective Relay Settings” section in Attachment 2, the clarification is not enough. It only makes a statement about the assumptions to be used not how compliance should be assessed. We suggest application guidelines should be written to clearly describe how compliance would be met. We also suggest that an RSAW be developed to allow industry to provide feedback on compliance concerns. Finally, we recommend that the VSLs be modified to address these compliance concerns and to ensure consistency throughout the standard. (3) We continue to believe that requirements R3 and R4 are the types of requirements that the P81 project is attempting to retire. Both of these requirements fit more than one criteria in the project. Both are communication and documentation requirements and do little to support reliability by themselves. While we agree the GO needs to communicate equipment limitations, this type of requirement is administrative in nature and results in excessive paperwork burdens that NERC will monitor and enforce using a zero defect methodology. If it was necessary to have a requirement for every detail that needs to occur to plan and operate the electric grid, we would have millions of requirements. Part of the reason for these P81 criteria is to avoid the need to monitor compliance for every little detail like this. Furthermore, the VSLs associated with both requirements demonstrate that the requirements do little to support reliability. They anticipate the only violation is that compliance will be late. There are other options and alternatives that NERC and the Regions could utilize to ensure that the GO is communicating equipment limitations. At this point, we do not believe the drafting team has provided enough technical support to justify this type of requirement. (4) We continue to believe that the data retention period is too long and may cover time periods that include prior relay settings that are no longer relevant. What reliability benefit is provided by a Generator Owner retaining settings that are no longer valid? The proposed language compels the GO to retain data for six years which means that a GO may have retained evidence for settings that are no longer used. While the drafting team indicated that it used NERC boilerplate language in establishing the data retention period, there is nothing that requires the drafting team to use this language

requiring the data retention period to match the audit period. In contradiction, section 3.1.4.2 of Appendix 4C- Compliance Monitoring and Enforcement Program of the NERC Rules of Procedure is very clear that reliability standards may have a data retention period that is less than the audit period. Furthermore, countless standards use other data retention periods where it makes sense. For example, TOP-003-2 uses 90 days for one of the requirements based on the sheer volume of the data. The bottom line question should be: “Does a six year data retention period and the associated resources dedicating to maintaining this data for that long support reliability?” The answer is no and, thus, it should be changed. We recommend the data retention state that only the current relay settings should be retained. (5) The VSLs for R1 and R2 do not anticipate the situation where there is no equipment or regulatory limits. This could be remedied by making “and” into “and/or” in the VSLs. (6) Thank you for the opportunity to comment.

Bret Galbraith
Seminole Electric
The proposed PRC-024-1 Attachment 1 “Off Nominal Frequency Capability Curve” lists a table and plots a “No Trip Zone” for the Eastern Interconnection that inherently includes the FRCC Region. Currently, the FRCC Region has its own Generator Coordination Requirements document that sets out frequency capability curves that conflict with what is stated in Attachment 1 for the Eastern Interconnection. Seminole believes that Attachment 1 should take into consideration the specific frequency trip settings that the FRCC has listed in the FRCC’s internal compliance handbook, which can easily be submitted to NERC (if NERC does not already have access to this information). Requiring the FRCC to abide by these general Eastern Interconnection frequency trip settings may cause instability to the FRCC Region due to the FRCC’s peninsular geography, and therefore, Seminole reasons that a specific frequency capability curve, i.e., “no trip zone,” should be designated for the FRCC Region. In addition, underfrequency relays have been applied for years with a frequency setting and a timer for each setting, to provide for a step, piecewise underfrequency shedding plan. The proposed NERC frequency chart uses a linear characteristic with multiple frequencies and multiple differing times. Even the best available technology today does not support the NERC linear frequency chart.

I think adding the word “applicable” before the word “generator”, without defining applicable, is irresponsible and will lead to more confusion. I think in this case the word “applicable” may be being used as synonymous with the word “significant”. WECC requires dynamic model verification for all units 20 MVA or larger connected at voltages 60 kV and above. This is because WECC members have learned over the years learned to recognize the significant role that smaller size generators play in system response and stability. Also, the WECC MVWG (Modeling and Validation Work Group) is currently performing a study to determine what is the minimum size generator for which model testing and verification needs to be completed. Also, within the next few years, there will be thousands of MWs of PV solar plants on-line in Central California, a large percentage of which will be small, 20 MW plants. We see about 2,500 MW of 20 MW PV units in the queue for the SGIP, SGIP-TC, WDAT, Clusters 1&2, and Clusters 3&4 in California, all coming on-line between now and 2017. Also, past WECC studies over the years of major outages have shown that generators, and indeed loads, below 100 kV, have played a major role in the impact of outages. In fact, the most accurate duplication of the 1996 outage and more recent outages that the WECC MVWG has simulated, have shown that the accuracy of the simulated results of actual system outages is highly affected by the accuracy of the modeled system below 100 kV. So I think it is very important to define what an “applicable” generator is for this standard, and I would recommend any generator 20 MVA or greater, connected at 60 kV or above.

Consideration of Comments

Generator Verification Project 2007-09
March 14, 2013

The Generator Verification Drafting Team thanks all commenters who submitted comments on the proposed revisions to PRC-024-1. This standard was posted for a 30-day public comment period from January 25, 2013 through February 25, 2013. Stakeholders were asked to provide feedback on the standard and associated documents through a special electronic comment form. There were 29 sets of comments, including comments from approximately 90 different people from approximately 63 companies representing 7 of the 10 Industry Segments as shown in the table on the following pages.

All comments submitted may be reviewed in their original format on the standard's project page.

If you feel that your comment has been overlooked, please let us know immediately. Our goal is to give every comment serious consideration in this process! If you feel there has been an error or omission, you can contact the Vice President and Director of Standards, Mark Lauby, at 404-446-2560 or at mark.lauby@nerc.net. In addition, there is a NERC Reliability Standards Appeals Process.[1]

Summary Consideration:

The GVSDT received a few excellent comments from stakeholders regarding clarifying revisions that would make the standard better. Based on these comments, the GVSDT made the following clarifying revisions to the standard:

- Added page numbers to first section of the standard.
- Added the word "generator" before "frequency protective relaying" (second line) in Requirement R1 and before "voltage protective relaying" (second line) in Requirement R2 so that the language mirrored the first line of each requirement.
- Added the phrase "for asynchronous generating units" to the first bullet of Requirement R1 to match the language in the analogous bullet 3 in Requirement R2.
- Added the phrase "the applicable generating unit(s)" to the third line of Requirement R2 to match the language in Requirement R1.
- Added the phrase "with generator frequency or voltage protective relays" to the second line of Requirement R3 to clarify the language.

[1] The appeals process is in the Standard Processes Manual: http://www.nerc.com/files/Appendix_3A_StandardsProcessesManual_20120131.pdf

- Made minor revisions to Measures M3 and M4 to better conform with the language of the associated requirements.
- Removed mention of the Measures from the second paragraph of the Data Retention Section.
- Rearranged the wording of the VSLs for Requirement R1 and R2 to more accurately reflect the exceptions applicable under Requirement R3.
  - R1: The Generator Owner that has frequency protection activated to trip a generating unit, failed to set its generator frequency protective relaying so that it does not trip within the criteria listed in Requirement R1 unless there is a documented and communicated regulatory or equipment limitation per Requirement R3.
  - R2: The Generator Owner with voltage protective relaying activated to trip a generating unit, failed to set its voltage protective relaying so that it does not trip as a result of a voltage excursion at the point of interconnection, caused by an event external to the plant per the criteria specified in Requirement R2 unless there is a documented and communicated regulatory or equipment limitation per Requirement R3.
- Removed "for the data" from the end of the Severe VSL for Requirement R4 to have the language of each VSL align.
- Fixed an error in the text box identifying the "No Trip Zone" in Attachment 1.

Index to Questions, Comments, and Responses

1. The GVSDT has removed Requirement R4 from the standard. Stakeholders suggested that the requirement was ambiguous and provided no discernible reliability benefit while subjecting entities to potential compliance violations for making optimistic estimations. Stakeholders believe that the use of language such as "sound engineering judgment" is subject to interpretation and vague. Do you agree with this revision? If not, please explain in the comment area below. .... 9~~8~~
2. Do you have any other comment, not expressed in questions above, for the GVSDT? .... 13~~12~~

1. **The GVSDT has removed Requirement R4 from the standard. Stakeholders suggested that the requirement was ambiguous and provided no discernible reliability benefit while subjecting entities to potential compliance violations for making optimistic estimations. Stakeholders believe that the use of language such as "sound engineering judgment" is subject to interpretation and vague. Do you agree with this revision? If not, please explain in the comment area below.**

Summary Consideration: The vast majority of stakeholders agreed with the revision to the standard. One stakeholder suggested that the Requirement should be eliminated or merged into PRC-001 to avoid redundancy. The GVSDT does not believe that there is a redundancy. PRC-001 R3.1 requires each Generator Operator to coordinate all new protective systems and all protective system changes with its Transmission Operator and Host Balancing Authority. PRC-024, R4 requires each Generator Owner to provide its applicable generator protection trip settings associated with Requirements R1 and R2 to the Planning Coordinator or Transmission Planner that models the associated unit, within 60 calendar days of receipt of a written request for the data, and within 60 calendar days of any change to those previously requested trip settings unless otherwise directed by the requesting Planning Coordinator or Transmission Planner.

Organization	Yes or No	Question 1 Comment
Entergy Services, Inc. (Transmission)	No	R4 as it was rewritten in draft 6 seems like a redundant sub requirement of PRC-001 R3. The type of protection described in R2 and R3 falls already in the "coordination" required category described in the NERC Technical Reference Document, "Power Plant and Transmission System Protection Coordination" Revision 1 - July 2010 http://www.nerc.com/docs/pc/spctf/Gen%20Prot%20Coord%20Rev1%20Final%2007-30-2010.pdf Furthermore the requirement fails to specify the accountability and responsibilities of the Transmission Planner/Transmission Operator in the "coordination" process in order to approve the relay setting changes. R4 should be eliminated or merged into PRC-001 R3 to avoid redundancies per FERC's instructions on eliminating redundancies.
Response: The GVSDT thanks you for your comment. As stated in the purpose, this standard is intended to "Ensure Generator Owners set their generator protective relays such that generating units remain connected during defined frequency and voltage		

Organization	Yes or No	Question 1 Comment
excursions" and is not for the coordination of protection settings among entities (PRC-001-1). There is no approved PRC-027 but even its draft is primarily related to coordination of interconnected elements for faults. Industry determined in the SAR, as a result of the Phase III and IV testing that the standard was needed. The GVSDT feels the two requirements are not the same. PRC-001 R3.1 requires each Generator Operator to coordinate all new protective systems and all protective system changes with its Transmission Operator and Host Balancing Authority. PRC-024, R4 requires each Generator Owner to provide its applicable generator protection trip settings associated with Requirements R1 and R2 to the Planning Coordinator or Transmission Planner that models the associated unit, within 60 calendar days of receipt of a written request for the data, and within 60 calendar days of any change to those previously requested trip settings unless otherwise directed by the requesting Planning Coordinator or Transmission Planner.		
Modesto Irrigation District	No	
Ingleside Cogeneration LP	Yes	Ingleside Cogeneration agrees with the removal of R4. Our experience has been that ambiguities in reliability requirements force Compliance Enforcement Authorities to provide their own interpretations. This may result in uneven enforcement of the criteria or the development of a Compliance Application Notice, neither of which instill a sense of fairness in the process. Our hope is that the industry develop its own methods to predict voltage and frequency ride-through performance - which would be voluntary and supported by NERC experts.
Response: The GVSDT thanks you for your comment.

2. **Do you have any other comment, not expressed in questions above, for the GVSDT?**

Summary Consideration: The GVSDT received a few excellent comments from stakeholders regarding clarifying revisions that would make the standard better. Based on these comments, the GVSDT made the following clarifying revisions to the standard:

- **Added page numbers to the first section of the standard.**
- **Added the word "generator" before "frequency protective relaying" (second line) in Requirement R1 and before "voltage protective relaying" (second line) in Requirement R2 so that the language mirrored the first line of each requirement.**
- **Added the phrase "for asynchronous generating units" to the first bullet of Requirement R1 to match the language in the analogous bullet 3 in Requirement R2.**
- **Added the phrase "the applicable generating unit(s)" to the third line of Requirement R2 to match the language in Requirement R1.**
- **Added the phrase "with generator frequency or voltage protective relays" to the second line of Requirement R3 to clarify the language.**
- **Made minor revisions to Measures M3 and M4 to better align with the language of the associated requirements.**
- **Removed mention of the measures from the second paragraph of the Data Retention Section.**
- **Rearranged the wording of the VSLs for Requirement R1 and R2 to more accurately reflect the exceptions applicable under Requirement R3.**
  - **R1: The Generator Owner that has frequency protection activated to trip a generating unit, failed to set its generator frequency protective relaying so that it does not trip within the criteria listed in Requirement R1 unless there is a documented and communicated regulatory or equipment limitation per Requirement R3.**
  - **R2: The Generator Owner with voltage protective relaying activated to trip a generating unit, failed to set its voltage protective relaying so that it does not trip as a result of a voltage excursion at the point of interconnection, caused by an event external to the plant per the criteria specified in Requirement R2 unless there is a documented and communicated regulatory or equipment limitation per Requirement R3.**
- **Removed "for the data" from the end of the Severe VSL for Requirement R4 to have the language of each VSL align.**

- **Fixed an error in the text box identifying the "No Trip Zone" in Attachment 1.**

Organization	Question 2 Comment
Manitoba Hydro	(1) R2 - are the words 'the applicable generating units' missing after the word 'trip' in the third line? this would make the language consistent with the wording of R1. **Response: The GVSDT has added the phrase to clarify R2 as suggested. Also, the GVSDT notes that the first bullet of R1 and the third bullet of R2 had minor language differences. These were intended to be the same and the GVSDT has revised the first bullet in R1 to match the language in R2 by adding the phrase "..for asynchronous generating units.."** (2) R2- are the words 'of a location specific Transmission Planner's study' precise enough to know for certain what characteristics are being referred to and compliance measured? **Response: The GVSDT believes that the wording is clear. The Transmission Planner determines what study is required to specify less stringent voltage relay settings than those required to meet PRC-024, Attachment 2.** (3) R3 - is the word 'known' precise enough to know for certain what characteristics are being referred to and compliance measured? **Response: The GVSDT believes that the wording is clear. If an entity does not "know" about a limitation, they will not be able to document or communicate the limitation.** (4) R3, 3.1 - there is no notification requirement with respect to any modifications or upgrades that may remove the limitation - this seems to be a gap. **Response: The GVSDT believes that "modifications or upgrades" are covered under "repair" and "replacement". The GVSDT believes that any change in equipment limitation stated in R3.1 triggers communication to the Planning Coordinator or Transmission planner.** (5) M3 - the word 'documentation' should be changed to 'information'. **Response: The GVSDT believes 'documentation' is appropriate since the requirement is to**

Organization	Question 2 Comment
	"document" limitations. (6) M4 - does not seem to track the wording of R4 - measure should be that it 'provided applicable generator protection trip settings'.......and the word 'information' should be 'data'. **Response: The GVSDT has made the revision as suggested to have the measure more closely match the requirement.** (7) Compliance - same comment as previous re: use of the acronym CEA. **Response: The acronym is spelled out in the first line of item 1.1.** (8) VSLs, R1 and R2 - the way these requirements are worded it makes it seem as though the violation is that the GO has no documented limitation - that is not the violation, that would be a violation of R3. The violation for these two requirements would be a failure to set its relaying within the criteria of R1/R2. **Response: The GVSDT has revised the wording of the VSL as follows:** **R1. The Generator Owner that has frequency protection activated to trip a generating unit, failed to set its generator frequency protective relaying so that it does not trip within the criteria listed in Requirement R1 unless there is a documented and communicated regulatory or equipment limitation per Requirement R3.** **R2. The Generator Owner with voltage protective relaying activated to trip a generating unit, failed to set its voltage protective relaying so that it does not trip as a result of a voltage excursion at the point of interconnection, caused by an event external to the plant per the criteria specified in Requirement R2 unless there is a documented and communicated regulatory or equipment limitation per Requirement R3.** (9) VSLs, R2 - doesn't contemplate new change to language of R2 re: TP standards. **Response: The GVSDT believes that the VSL encompasses any voltage profile whether it is Attachment 2 or one provided by the Transmission Planner.** (10) VSLs, R3 - the timeline doesn't address any change other than the identification of the

Organization	Question 2 Comment
	limitation, i.e. but the timeline could run from repair, replacement. **Response: The GVSDT feels it is appropriate to tie the timeline to when the limitation was identified. The GVSDT believes that regardless of the time for repair and/or replacement is not the underlying concept in the VSL but communicating the limitation after its identification.** (11) VSLs, R4 - some refer to a 'written request' and some refer to a 'written request for the data' - these should be made consistent with the requirement language. **Response: The GVSDT has made the VSLs consistent by removing "for the data" from the Severe VSL.**
Response: The GVSDT thanks you for your comment. Please see responses above.	

ACES Standard Collaborators	(1) We continue to be concerned that this standard is inconsistent with the stated vision of NERC regarding the transformation of the compliance process. As the standard is written, it has the potential to become another zero-defect standard in which compliance is paper driven and does little to support reliability. Because plants have lots of equipment, how will the auditor know that frequency and protective relay settings have been set according to the standard without first ensuring they have identified the appropriate relays to review? We can envision them wanting to see the list of all protective relays so that they can first verify that all voltage and frequency relays have been identified and then the list of settings based on this subset. Furthermore, the language of the standard concerns us that a registered entity will be expected to provide evidence for any unit that trips to prove that it did not trip because of frequency or voltage protective relaying if the voltage and frequency remained within the associated envelopes of performance in the standard. **Response: The GVSDT thanks you for your comment. The standard is limited to the generator frequency or voltage protective relaying and is not applicable to other relays. The GVSDT believes that Requirement R1 and R2 are precise in that only generator voltage and frequency protective relays are involved. By definition, Protective Relays have voltage and/or current input and narrows the scope of R1 and R2. It is the Generator Owner's responsibility to determine which generator Protective Relay should be involved in the standard. There is no performance requirement in the standard that calls for a Generator Owner to prove that it did not trip for any transmission event.** (2) We are concerned that compliance with the standard will be inappropriately enforced based on the actual performance of a unit. The purpose statement says that the generator should "remain connected during frequency and voltage excursions". Based on this purpose, we would be concerned that compliance with the standard would be assessed based on whether the generator rode through voltage and frequency excursions within the performance envelopes defined in the standard. This would be an inappropriate outcome because the requirements in the standard compel relay settings based on assumptions stated in the "Evaluating Protective Relay Settings" section of Attachment 2. If system conditions did not match the assumptions, how could the GO be held accountable? We believe that standard should make crystal clear that compliance is not to be assessed on actual performance because no GO can guarantee its units will ride through all voltage and frequency excursions defined in the performance envelope in the

	standard if the conditions vary from the assumptions. While we understand the drafting team did attempt to clarify this with a modification to the "Evaluating Protective Relay Settings" section in Attachment 2, the clarification is not enough. It only makes a statement about the assumptions to be used not how compliance should be assessed. We suggest application guidelines should be written to clearly describe how compliance would be met. We also suggest that an RSAW be developed to allow industry to provide feedback on compliance concerns. Finally, we recommend that the VSLs be modified to address these compliance concerns and to ensure consistency throughout the standard. **Response: The GVSDT thanks you for your comments. The GVSDT believes that the standard is now abundantly clear that it is only a relay setting standard and it is not a generator performance standard. The GVSDT believes that the requirements set forth in the standard only call for the Generator Owner to sets its generator protective relaying per the Attachments or, in the case of R2, a less stringent voltage profile provided by the Transmission Planner and provide others information on limitations. Your suggestions regarding development of application guidelines and an RSAW will be provided to the appropriate NERC staff.** (3) We continue to believe that requirements R3 and R4 are the types of requirements that the P81 project is attempting to retire. Both of these requirements fit more than one criteria in the project. Both are communication and documentation requirements and do little to support reliability by themselves. While we agree the GO needs to communicate equipment limitations, this type of requirement is administrative in nature and results in excessive paperwork burdens that NERC will monitor and enforce using a zero defect methodology. If it was necessary to have a requirement for every detail that needs to occur to plan and operate the electric grid, we would have millions of requirements. Part of the reason for these P81 criteria is to avoid the need to monitor compliance for every little detail like this. Furthermore, the VSLs associated with both requirements demonstrate that the requirements do little to support reliability. They anticipate the only violation is that compliance will be late. There are other options and alternatives that NERC and the Regions could utilize to ensure that the GO is communicating equipment limitations. At this point, we do not believe the drafting team has provided enough technical support to justify this type of requirement. **Response: The GVSDT thanks you for your comment. The GVSDT believes that R3 and R4 are necessary for reliability and appropriate. The SDT has reviewed the criteria for removing**

	requirements per Paragraph 81 and determined that the requirements of PRC-024 do not meet the applicable criteria. In order to be considered for removal, a requirement has to meet Item A as well as at least one part of Item B (see P81 team criteria document, provided in that project's Technical White Paper). The requirements of PRC-024 do not meet Item A and therefore are not eligible for inclusion in P81 process. (4) We continue to believe that the data retention period is too long and may cover time periods that include prior relay settings that are no longer relevant. What reliability benefit is provided by a Generator Owner retaining settings that are no longer valid? The proposed language compels the GO to retain data for six years which means that a GO may have retained evidence for settings that are no longer used. While the drafting team indicated that it used NERC boilerplate language in establishing the data retention period, there is nothing that requires the drafting team to use this language requiring the data retention period to match the audit period. In contradiction, section 3.1.4.2 of Appendix 4C- Compliance Monitoring and Enforcement Program of the NERC Rules of Procedure is very clear that reliability standards may have a data retention period that is less than the audit period. Furthermore, countless standards use other data retention periods where it makes sense. For example, TOP-003-2 uses 90 days for one of the requirements based on the sheer volume of the data. The bottom line question should be: "Does a six year data retention period and the associated resources dedicating to maintaining this data for that long support reliability?" The answer is no and, thus, it should be changed. We recommend the data retention state that only the current relay settings should be retained. **Response: The GVSDT thanks you for your comment. The GVSDT believes the data retention requirements are necessary to enable verification of compliance from one period to the next.** (5) The VSLs for R1 and R2 do not anticipate the situation where there is no equipment or regulatory limits. This could be remedied by making "and" into "and/or" in the VSLs. **Response: The GVSDT revised the VSLs for R1 and R2 to address your concern.** (6) Thank you for the opportunity to comment.

Response: The GVSDT thanks you for your comment. Please see responses above.

Ameren	(1)On page 8, please delete "Measure M1 through M4" from the second paragraph of D.1.2 Data Retention. We understand that the entity must comply with the Requirements but the Measures should not expand the scope of reliability standard requirements. **Response: The GVSDT has removed the measures as suggested for clarity.** (2)We request that the GVSDT add page numbers in the footer of the standard. **Response: We have added page numbers as requested.**
Response: The GVSDT thanks you for your comment. Please see responses above.	
American Electric Power	AEP recommends that the time allowed to meet R 3.1 be extended to 60 calendar days, aligning it with R4, thereby making the timing requirements of the standard more consistent throughout. **Response: The GVSDT does not believe that the two requirements are linked and therefore the timing requirements can be different. R4 allows for additional time because it deals with a request from another entity.** R2: Regarding the language "If the Transmission Planner allows less stringent voltage relay settings than those required to meet PRC-024 Attachment 2, then the Generator Owner shall set its protective relaying", we believe the intent is to allow the GO to set its protective relaying within the PRC-024 no-trip zone and remain compliant so long as the Transmission Planner's less stringent requirements is met. However it is not made explicitly clear by doing so that one would still be fully compliant with PRC-024. We recommend making this explicitly clear within R2.Suggest rewording the first sentence of R2 to state the following: "Each Generator Owner that has generator voltage protective relaying activated to trip its applicable generating unit(s) shall set its protective relaying such that the voltage protective relaying does not trip the applicable generating unit(s) as a result of a voltage excursion (at the point of interconnection) that remains within the "no trip zone" of PRC-024 Attachment 2 caused by an event on the transmission system external to the generating plant." **Response: The GVSDT believes the existing wording makes it clear that the GO may set its protective relaying based on a less stringent requirement if so allowed by the Transmission Planner.**

<table>
<tr><td colspan="2">Response: The GVSDT thanks you for your comment. Please see responses above.</td></tr>
<tr><td>CenterPoint Energy</td><td>CenterPoint Energy remains concerned with truncating the Voltage Ride-Through Time Duration Curve (Attachment 2) at 4 seconds due to coordination with undervoltage load shedding systems (UVLS). For coordination of UVLS with any generator voltage protective relays, CenterPoint Energy recommends the curve be extended to at least 10 seconds at 0.90 per unit POI Voltage. CenterPoint Energy does not believe such a change would be controversial, as the GVSDT states in the Consideration of Comments (Draft 5) that “Stakeholders pointed out that transmission systems are designed to operate between 90% to 110%.”</td></tr>
<tr><td colspan="2">Response: The GVSDT thanks you for your comment. The team has coordinated our voltage curve and time points with the drafting team working on PRC-025, Generator Relay Loadability. The voltage characteristics in PRC-025 deal with steady state conditions, which we have coordinated at 4 seconds. At that point, the voltage excursion has ended for applicability to PRC-024.</td></tr>
<tr><td>Associated Electric Cooperative, Inc. - JRO00088</td><td>FOR: Requirement R1,REPLACE: "the frequency protective relaying" WITH: "that generator frequency protective relaying" RATIONALE: SDT intent, with the subordinate bulleted exceptions, appears to provide for exception of necessary overriding conditions within the "no trip zone" for which the "generator frequency protective relaying" is permitted to necessarily go ahead an trip the unit. This suggested change is an attempt to strengthen the linkage between the qualifying R1 "has generator frequency protective relaying activated...", and those bulleted exceptions in order to calm industry concern that those bullets form the only permissible set of unit protective relaying conditions that are allowed to trip the trip (protect) the unit and its underlying equipment when operating within the units' "no trip zone" of frequency conditions.

Response: The GVSDT has made the suggested revision for clarity.

FOR: Requirement R2REPLACE: "the voltage protective relaying" WITH: "that generator voltage protective relaying" RATIONALE: Basically the same as outlined for the suggested R1 change above, but for voltage rather than frequency.

Response: The GVSDT has made the suggested revision for clarity.

FOR: Appendix 2 (graph)CHANGE: (raise the graph's 0 pu for 0.15 sec)TO: (15 pu for 0.15 sec, along with an appropriate footnote for consideration of preexisting equipment capability)RATIONALE: While the SDT cites FERC ORDER 661A and Appendix G in support of this</td></tr>
</table>

	value, FERC's paragraph 31 ruling agrees with NERC's proposed considerations they earlier discussed. NERC's proposal includes consideration for earlier-purchased wind turbines and their voltage ride-through capabilities, as well as provision for NERC to use their normal process to revise the ride-through capability. AECI believes the SDT should work to build industry consensus on an overall minimum voltage ride-through, or at least afford our industry the same considerations cited for wind turbines. **Response: The GVSDT believes that industry consensus has been achieved with respect to the elements of this standard. The standard had been posted six times and balloted five times.**
Response: The GVSDT thanks you for your comment. Please see responses above.	
Modesto Irrigation District	I think adding the word "applicable" before the word "generator", without defining applicable, is irresponsible and will lead to more confusion. I think in this case the word "applicable" may be being used as synonymous with the word "significant". WECC requires dynamic model verification for all units 20 MVA or larger connected at voltages 60 kV and above. This is because WECC members have learned over the years learned to recognize the significant role that smaller size generators play in system response and stability. Also, the WECC MVWG (Modeling and Validation Work Group) is currently performing a study to determine what is the minimum size generator for which model testing and verification needs to be completed. Also, within the next few years, there will be thousands of MWs of PV solar plants on-line in Central California, a large percentage of which will be small, 20 MW plants. We see about 2,500 MW of 20 MW PV units in the queue for the SGIP, SGIP-TC, WDAT, Clusters 1&2, and Clusters 3&4 in California, all coming on-line between now and 2017.Also, past WECC studies over the years of major outages have shown that generators, and indeed loads, below 100 kV, have played a major role in the impact of outages. In fact, the most accurate duplication of the 1996 outage and more recent outages that the WECC MVWG has simulated, have shown that the accuracy of the simulated results of actual system outages is highly affected by the accuracy of the modeled system below 100 kV. So I think it is very important to define what an "applicable" generator is for this standard, and I would recommend any generator 20 MVA or greater, connected at 60 kV or above.
Response: The GVSDT thanks you for your comment. The word "applicable" means any generator that meets the NERC registry criteria.	

Ingleside Cogeneration LP	Ingleside Cogeneration would like to point out that there are already 30 in-effect PRC and MOD standards - with at least four other project teams actively developing new modeling and Protection System requirements. In almost every case, the reliability intent is to ensure that interconnected entities openly share relay settings, models, and operating information that reduces the risk to the greater whole. However, we do not believe that there is compelling evidence that adherence to these reliability standards correlates to improved reliability - therefore, the addition of one more PRC standard will not reduce BES risk. It is time to consider a more effective regulatory model to address generation/transmission coordination - one that recognizes that the subject matter is extraordinarily complex, with nearly more exceptions than commonalities. The focus would move from the enforcement of global mandates which do not always apply, to ensuring that GOs, PCs, and TPs are continually working the tradeoffs between BES stability and the threat to equipment damage. In this venue, NERC could serve as an expert arbiter to help resolve differences - a role that we believe will lead to the structural improvements necessary to reach our shared reliability goals.
Response: The GVSDT thanks you for your comment. We would like to mention that the current version of PRC-006 (Underfrequency Load Shedding) depends on PRC-024 to ensure that Generator Operators set their frequency protection to coordinate with UFLS programs or make the appropriate notifications for those cases where that can't be accomplished. The GVSDT suggests that you bring your ideas to the attention of the Standards Committee by submitting a new SAR. The concepts you discuss are outside the scope of this SDT.	
City of Tacoma, Tacoma Public Utilities, Tacoma Power	It is not completely clear how to implement Requirement R2 given the information contained in Attachment 2. Specifically, clarification is requested on the following two issues. A. In Attachment 2, what issue is Curve Detail 3 intended to address? Is it suggesting that definite-time voltage elements should be used, instead of inverse time elements, unless detailed analysis is performed? It is not clear if Curve Detail 3 is intended to afford entities additional flexibility or to require them to conduct more detailed analysis. **Response: Detail 3 is meant to clarify that the curves in Attachment 2 are demonstrating cumulative time above or below the defined voltage levels instead of a voltage-time envelope. When analyzing an event, you cannot simply overlay a recorded voltage trace on top of Attachment 2, but rather determine the cumulative time the voltage was above or below the**

	defined voltages (as expressed in the Detail 3 example). The GVSDT does not mean to suggest the use of any particular type of protection timing. B. In Attachment 2, is the section titled "Evaluating Protective Relay Settings" intended to determine the per unit voltage base, at the generator terminals, for the Voltage Ride-Through Time Duration Curve? **Response: The section "Evaluating Protective Relay Settings" does not specify the per unit voltage base. That is specified in Curve Detail #1.** Under Measurement M3, change "manufacturer's advisory" to "manufacturer's advice" to be consistent with Requirement R3. **Response: The GVSDT agrees and will change the wording in Measurement M3 to say "manufacturer's advice".** In Attachments 1 and 2, do the "no trip zones" include the lines? In other words, for the Western Interconnection, if a frequency element was set to 57.2 Hz, would an operating time of 0.75 seconds be acceptable per the standard, or does the operating time have to be above 0.75 seconds? (A similar question could be asked for the Voltage Ride-Through Time Duration Curve.) **Response: In Attachment 1 the "no trip zone" does not include the lines. The GVSDT apologizes that the text box with that clarification was improperly sized and hid those words in the most recently published version. The GVSDT will correct the error in the next posting. In Attachment 2 the "no trip zone" does include the lines since doing otherwise would allow tripping for transmission voltages of 0.0 per unit during a fault.** In Attachment 2, under "Evaluating Protective Relay Settings," change "use either the following..." to "use either of the following..." **Response: The GVSDT believes the wording is correct as published. The intent is that the evaluator "…use either the following assumptions…" (i.e. the four assumptions listed) "…or loading conditions that are believed to be the most probable…"**
Response: The GVSDT thanks you for your comment. Please see responses above.	
Entergy Services, Inc.	PRC-024-1 previous draft placed the burden of complying with the standard solely on the GO. This new draft places the bulk of ensuring compliance on the GO while providing a different criteria or

(Transmission)	“exemption” given by the Transmission Planner. If that is the case, the Planner should have a joint obligation to ensure the GO/GOP is successful in meeting and achieving compliance spelled out in the standard. Additionally, the Planner would be the best party capable of determining “which voltage protective relaying setting does not trip as a result of a voltage excursion (at the point of interconnection) caused by an event on the transmission system external to the generating plant that remains within the “no trip zone” of PRC-024 Attachment 2. Applicability of the standard should also include the Transmission Planner. **Response: The GVSDT disagrees that the Transmission Planner should be included as an Applicable entity since their activities are optional, not mandatory. With regard to the evaluation of the performance of the generator Protection System, the standard does not prevent the Generator Owner from requesting assistance from the Transmission Planner. However, as the owner of the Protection System, the Generator Owner is responsible for ensuring that an evaluation is performed.** R2 also lacks a mechanism(how the study is initiated and why, study request timeframe, study response timeframe, etc) whereby the Transmission Planner provides the “less stringent” voltage protection requirements so the GO can then determine when they need to follow Attachment 2 or the Planner’s study or have the Planner determine the criteria first. The requirement should be clearer and more details should be added. **Response: The provision of a “less stringent” location-specific voltage profile is solely at the option of the Transmission Planner. As such, the GVSDT does not believe it would be appropriate to specify a mechanism for this activity.** R3 objectives state that the GO shall provide equipment limitations to the Planner within 30 days of a request or change. PRC-024-1 R3 does not provide any value when MOD-010, MOD-012 and MOD-025, MOD-026 and MOD-027 appear to address these issues. R3 needs to be clarified with more details to avoid possible redundancies with the MOD standards. **Response: Requirement R3 does not address “requests”. The GVSDT does not see any redundancy between the generator frequency and voltage protection settings of interest in this standard and the requirements of MOD-010, MOD-025, MOD-026, or MOD-027. The reporting requirements of MOD-012 are determined by the “Regional Reliability Organizations” in MOD-013, which may or may not overlap with PRC-024.**

Response: The GVSDT thanks you for your comment. Please see responses above.	
Detroit Edison	Regarding Footnote 1 for R1, are protective functions within control systems that measure frequency from a non-electrical input such as speed sensors, included as "protective relaying"? **Response: The intent of the GVSDT is that the scope of protective functions be consistent with those defined as part of a generator protection system in PRC-005.** Please clarify that this standard pertains only to generator protective functions that respond exclusively to voltage and/or frequency, but not current. **Response: The GVSDT believes that this is adequately clear as written in footnote 1. …" within control systems that directly trip or provide tripping signals to the generator based on frequency or voltage inputs…".** Please adjust Attachment 1 Eastern Interconnection frequency data point exponents on page 13 so that they are completely visible. Please verify for Attachment 2 Voltage Curve that continuous operation is expected greater than 0.90 pu. and less than 1.10 pu. **Response: The exponents in the Attachment 1 data table for the Eastern Interconnection in the clean version of PRC-024 published on the NERC website appear visible to the GVSDT. PRC-024 only defines how the Generator Owner should set generator protection to address excursions. Settings for steady state operation are not defined by this standard.**
Response: The GVSDT thanks you for your comment. Please see responses above.	
Oncor Electric Delivery Company	The 60 calendar day requirement in R4 requiring a Generator Owner to provide its applicable generator protection trip settings to the Planning Coordinator or Transmission Planner within 60 calendar days of receipt of a written request for the data, and within 60 calendar days of any change to those previously requested trip settings is too long. Settings that affect the performance of a system need to be communicated as quickly as possible and because of the critical nature of this data, prolonging system coordination could result in an unnecessary risk to the reliability of the Bulk Electric System. Oncor respectfully requests this time requirement be shortened to 30 days.
Response: The GVSDT thanks you for your comment. The GVSDT had to balance opinions that the reporting period is too short	

with those that it is too long and believes 60 days is a reasonable compromise. The GVSDT considers this standard to be on a unit basis and that 60 days should be adequate for any single unit.	
Seminole Electric	The proposed PRC-024-1 Attachment 1 "Off Nominal Frequency Capability Curve" lists a table and plots a "No Trip Zone" for the Eastern Interconnection that inherently includes the FRCC Region. Currently, the FRCC Region has its own Generator Coordination Requirements document that sets out frequency capability curves that conflict with what is stated in Attachment 1 for the Eastern Interconnection. Seminole believes that Attachment 1 should take into consideration the specific frequency trip settings that the FRCC has listed in the FRCC's internal compliance handbook, which can easily be submitted to NERC (if NERC does not already have access to this information). Requiring the FRCC to abide by these general Eastern Interconnection frequency trip settings may cause instability to the FRCC Region due to the FRCC's peninsular geography, and therefore, Seminole reasons that a specific frequency capability curve, i.e., "no trip zone," should be designated for the FRCC Region. In addition, underfrequency relays have been applied for years with a frequency setting and a timer for each setting, to provide for a step, piecewise underfrequency shedding plan. The proposed NERC frequency chart uses a linear characteristic with multiple frequencies and multiple differing times. Even the best available technology today does not support the NERC linear frequency chart.
Response: The GVSDT thanks you for your comment. The GVSDT received the UFLS data points for PRC-006 for the FRCC Region as well as others. We developed the frequency curve contained in Attachment 1 of PRC-024 to coordinate with PRC-006 to have generators remain on-line so that the UFLS program can shed load to return frequency to near-nominal or nominal frequency. PRC-024 is a new, continent-wide reliability standard that sets the "no trip zones" for all generators in an Interconnection. By meeting the criteria in PRC-024, FRCC region generators will remain on-line for a period of time that ensures operation of the UFLS system resulting in greater stability for the region. The Implementation Plan allows for a five-year, phased implementation of the relay settings. **Please note that your second paragraph addresses UFLS set points. The curves in PRC-024 only deal with generator relay settings and provide the "no trip zone" for operation during off-nominal frequency conditions.**	
Kansas City Power & Light	This standard should apply to voltage protection and frequency protection only. It should not apply to volts/hertz or other generator protective elements. Volts/Hertz is specifically intended to

	protect transformers and generators from damage and the setting is based on the capability of those elements. The SDT has given guidance on Evaluating Protective Relay Settings however this creates a situation where protective settings might appear to be in conflict with the standard and during an audit a study or documentation must be presented to prove the relay setting on the generator side of the GSU is actually in compliance with the standard on the transmission side of the GSU based on the study documentation. Standard Requirements should be straight forward so compliance can be proved with the least amount of effort and documentation. The SDT should use the guidance on Evaluating Protective Relay Settings and produce Voltage Ride Through Time Duration curves on the generator side of the GSU because that is where the voltage source is for the existing generator protective relays.
Response: The GVSDT thanks you for your comment. **Volts/Hertz relays are applicable under this standard because they respond to system voltage excursions. These relays are to be evaluated at 60 Hz (see item 4 under Curve Details for Attachment 2). When evaluating Volts/Hertz protection, you may adjust the magnitude of the high voltage curve in proportion to deviations of frequency below 60 Hz.** **The GVSDT does not believe that there is any conflict between the "Evaluating Protective Relay Settings" section in Attachment 2. The GVSDT has provided this information at the request of stakeholders during pervious postings and has made revisions for clarity. The GVSDT believes that stakeholder consensus has been achieved with respect to this language.**	
Public Service Enterprise Group	Yes. For generators without frequency or voltage protective relaying, R1 and R2 respectively do not require these relays to be installed per footnote 1. However, R3 could be interpreted to require generators without such relaying to be required to comply with R3 because it applies to a generator limitation that "prevents an applicable generating unit from meeting the relay setting criteria in Requirements R1 or R2 including (but not limited to) study results, experience from an actual event, or manufacturer's advice." We have received an e-mail from the drafting team NERC coordinator for this project that this is NOT the intent of R3 - R3 is only intended to apply to generators that HAVE frequency and/or voltage protective relaying installed. We ask that the SDT confirm this understanding. If this is the SDT's intent we recommend that R3 be clarified as follows: Each Generator Owner shall document each known regulatory or equipment limitation3 that prevents an applicable generating unit WITH GENERATOR FREQUENCY OR VOLTAGE

	PROTECTIVE RELAYS from meeting the relay setting criteria in Requirements R1 or R2 including (but not limited to) study results, experience from an actual event, or manufacturer's advice. Alternative wording to clarify R3's intent that it does not apply to generators without frequency or voltage protective relaying would be acceptable.
Response: The GVSDT thanks you for your comment. This is the intent of the SDT. The wording you suggested has been added to R3 to clarify this intention. The SDT believes that this addition does not substantially change the requirement, but will merely enhance the understanding. The GVSDT feels that if there are no relays activated that can trip the unit under R1 or R2 then relay setting under R3 should not be an issue.	

END OF REPORT

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. SAR posted for comment (April 20–May 21, 2007).
2. Revised SAR and response to comments posted.
3. Revised SAR and response to comments approved by SC (June 14, 2007).
4. SDT appointed on (August 18, 2007).
5. Initial draft of PRC-024-1 was posted for a 45 day formal comment period (February 17 – April 2, 2009).
6. Draft 2 of PRC-024-1 was posted for a 45 day concurrent comment and ballot period from June 15 – August 1, 2011.
7. Draft 3 of PRC-024-1 was posted for a 30 day concurrent comment and successive ballot period from February 29 – March 29, 2012.
8. Draft 4 of PRC-024-1 was posted for a 30 day concurrent comment and successive ballot period from September 28 – October 31, 2012.
9. Draft 5 of PRC-024-1 was posted for a 30 day concurrent comment and successive ballot period from December 12, 2012 – January 11, 2013.
10. Draft 6 of PRC-024-1 was posted for a 30 day concurrent comment and successive ballot period from January 25 through February 28, 2013.

Proposed Action Plan and Description of Current Draft:

This is the seventh draft of the standard and includes Time Horizons, Data Retention, Violation Risk Factors, and Violation Severity Levels. This sixth posting is for a 10-day recirculation ballot period.

Future Development Plan:

Anticipated Actions	Anticipated Date
5. BOT adoption.	May 2013
6. File with regulatory authorities.	June 2013

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None

A. Introduction

1. **Title:** Generator Frequency and Voltage Protective Relay Settings

2. **Number:** **PRC-024-1**

3. **Purpose:** Ensure Generator Owners set their generator protective relays such that generating units remain connected during defined frequency and voltage excursions.

4. **Applicability:**

   4.1. Generator Owner

5. **Effective Date:**

   5.1. In those jurisdictions where regulatory approval is required:

   5.1.1 By the first day of the first calendar quarter, two calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner shall have verified at least 40 percent of its Facilities are fully compliant with Requirements R1, R2, R3, and R4.

   5.1.2 By the first day of the first calendar quarter, three calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner shall have verified at least 60 percent of its Facilities are fully compliant with Requirements R1, R2, R3, and R4.

   5.1.3 By the first day of the first calendar quarter, four calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner shall have verified at least 80 percent of its Facilities are fully compliant with Requirements R1, R2, R3, and R4.

   5.1.4 By the first day of the first calendar quarter, five calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner shall have verified 100 percent of its Facilities are fully compliant with Requirements R1, R2, R3, and R4.

   5.2. In those jurisdictions where regulatory approval is not required:

   5.2.1 By the first day of the first calendar quarter, two calendar years following Board of Trustees approval, each Generator Owner shall have verified at least 40 percent of its Facilities are fully compliant with Requirements R1, R2, R3, and R4.

5.2.2 By the first day of the first calendar quarter, three calendar years following Board of Trustees approval, each Generator Owner shall have verified at least 60 percent of its Facilities are fully compliant with Requirements R1, R2, R3, and R4.

5.2.3 By the first day of the first calendar quarter, four calendar years following Board of Trustees approval, each Generator Owner shall have verified at least 80 percent of its Facilities are fully compliant with Requirements R1, R2, R3, and R4.

5.2.4 By the first day of the first calendar quarter, five calendar years following Board of Trustees approval, each Generator Owner shall have verified 100 percent of its Facilities are fully compliant with Requirements R1, R2, R3, and R4.

B. Requirements

R1. Each Generator Owner that has generator frequency protective relaying[1] activated to trip its applicable generating unit(s) shall set its protective relaying such that the generator frequency protective relaying does not trip the applicable generating unit(s) within the "no trip zone" of PRC-024 Attachment 1, subject to the following exceptions: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

- Generating unit(s) may trip if the protective functions (such as out-of-step functions or loss-of-field functions) operate due to an impending or actual loss of synchronism or, for asynchronous generating units, due to instability in power conversion control equipment.
- Generating unit(s) may trip if clearing a system fault necessitates disconnecting (a) generating unit(s).
- Generating unit(s) may trip within a portion of the "no trip zone" of PRC-024 Attachment 1 for documented and communicated regulatory or equipment limitations in accordance with Requirement R3.

R2. Each Generator Owner that has generator voltage protective relaying[1] activated to trip its applicable generating unit(s) shall set its protective relaying such that the generator voltage protective relaying does not trip the applicable generating unit(s) as a result of a voltage excursion (at the point of interconnection[2]) caused by an event on the transmission system external to the generating plant that remains within the "no trip zone" of PRC-024 Attachment 2. If the Transmission Planner allows less stringent voltage relay settings than those required to meet PRC-024 Attachment 2, then the Generator Owner shall set its protective relaying within the voltage recovery characteristics of a location-specific Transmission Planner's study. Requirement R2 is subject to the following exceptions: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

- Generating unit(s) may trip in accordance with a Special Protection System (SPS) or Remedial Action Scheme (RAS).
- Generating unit(s) may trip if clearing a system fault necessitates disconnecting (a) generating unit(s).

---

[1] Each Generator Owner is not required to have frequency or voltage protective relaying (including but not limited to frequency and voltage protective functions for discrete relays, volts per hertz relays evaluated at nominal frequency, multi-function protective devices or protective functions within control systems that directly trip or provide tripping signals to the generator based on frequency or voltage inputs) installed or activated on its unit.

[2] For the purposes of this standard, point of interconnection means the transmission (high voltage) side of the generator step-up or collector transformer.

- Generating unit(s) may trip by action of protective functions (such as out-of-step functions or loss-of-field functions) that operate due to an impending or actual loss of synchronism or, for asynchronous generating units, due to instability in power conversion control equipment.
- Generating unit(s) may trip within a portion of the "no trip zone" of PRC-024 Attachment 2 for documented and communicated regulatory or equipment limitations in accordance with Requirement R3.

R3. Each Generator Owner shall document each known regulatory or equipment limitation[3] that prevents an applicable generating unit with generator frequency or voltage protective relays from meeting the relay setting criteria in Requirements R1 or R2 including (but not limited to) study results, experience from an actual event, or manufacturer's advice. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

3.1. The Generator Owner shall communicate the documented regulatory or equipment limitation, or the removal of a previously documented regulatory or equipment limitation, to its Planning Coordinator and Transmission Planner within 30 calendar days of any of the following:

- Identification of a regulatory or equipment limitation.
- Repair of the equipment causing the limitation that removes the limitation.
- Replacement of the equipment causing the limitation with equipment that removes the limitation.
- Creation or adjustment of an equipment limitation caused by consumption of the cumulative turbine life-time frequency excursion allowance.

R4. Each Generator Owner shall provide its applicable generator protection trip settings associated with Requirements R1 and R2 to the Planning Coordinator or Transmission Planner that models the associated unit within 60 calendar days of receipt of a written request for the data and within 60 calendar days of any change to those previously requested trip settings unless directed by the requesting Planning Coordinator or Transmission Planner that the reporting of relay setting changes is not required. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

C. Measures

M1. Each Generator Owner shall have evidence that generator frequency protective relays have been set in accordance with Requirement R1 such as dated setting sheets, calibration sheets or other documentation.

---

[3] Excludes limitations that are caused by the setting capability of the generator frequency and voltage protective relays themselves but does not exclude limitations originating in the equipment that they protect.

M2. Each Generator Owner shall have evidence that generator voltage protective relays have been set in accordance with Requirement R2 such as dated setting sheets, voltage-time curves, calibration sheets, coordination plots, dynamic simulation studies or other documentation.

M3. Each Generator Owner shall have evidence that it has documented and communicated any known regulatory or equipment limitations (excluding limitations noted in footnote 3) that resulted in an exception to Requirements R1 or R2 in accordance with Requirement R3 such as a dated email or letter that contains such documentation as study results, experience from an actual event, or manufacturer's advice.

M4. Each Generator Owner shall have evidence that it communicated applicable generator protective relay trip settings in accordance with Requirement R4, such as dated e-mails, correspondence or other evidence and copies of any requests it has received for that information.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

The Regional Entity shall serve as the Compliance Enforcement Authority (CEA) unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases, the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.

1.2. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Generator Owner shall retain evidence of compliance with Requirement R1 through R4; for 3 years or until the next audit, whichever is longer.

If a Generator Owner is found non-compliant, the Generator Owner shall keep information related to the non-compliance until mitigation is complete and approved for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

1.4. Additional Compliance Information

None

2. Violation Severity Levels

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	N/A	N/A	N/A	The Generator Owner that has frequency protection activated to trip a generating unit, failed to set its generator frequency protective relaying so that it does not trip within the criteria listed in Requirement R1 unless there is a documented and communicated regulatory or equipment limitation per Requirement R3.
R2	N/A	N/A	N/A	The Generator Owner with voltage protective relaying activated to trip a generating unit, failed to set its voltage protective relaying so that it does not trip as a result of a voltage excursion at the point of interconnection, caused by an event external to the plant per the criteria specified in Requirement R2 unless there is a documented and communicated regulatory or equipment limitation per Requirement R3.
R3	The Generator Owner documented the known non-protection system equipment limitation that prevented it from meeting the criteria in Requirement R1 or R2 and communicated the documented limitation to its Planning Coordinator and Transmission Planner	The Generator Owner documented the known non-protection system equipment limitation that prevented it from meeting the criteria in Requirement R1 or R2 and communicated the documented limitation to its Planning Coordinator and Transmission Planner	The Generator Owner documented the known non-protection system equipment limitation that prevented it from meeting the criteria in Requirement R1 or R2 and communicated the documented limitation to its Planning Coordinator and Transmission Planner	The Generator Owner failed to document any known non-protection system equipment limitation that prevented it from meeting the criteria in Requirement R1 or R2. OR The Generator Owner

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL
	more than 30 calendar days but less than or equal to 60 calendar days of identifying the limitation.	more than 60 calendar days but less than or equal to 90 calendar days of identifying the limitation.	more than 90 calendar days but less than or equal to 120 calendar days of identifying the limitation.	failed to communicate the documented limitation to its Planning Coordinator and Transmission Planner within 120 calendar days of identifying the limitation.
R4	The Generator Owner provided its generator protection trip settings more than 60 calendar days but less than or equal to 90 calendar days of any change to those trip settings. OR The Generator Owner provided trip settings more than 60 calendar days but less than or equal to 90 calendar days of a written request.	The Generator Owner provided its generator protection trip settings more than 90 calendar days but less than or equal to 120 calendar days of any change to those trip settings. OR The Generator Owner provided trip settings more than 90 calendar days but less than or equal to 120 calendar days of a written request.	The Generator Owner provided its generator protection trip settings more than 120 calendar days but less than or equal to 150 calendar days of any change to those trip settings. OR The Generator Owner provided trip settings more than 120 calendar days but less than or equal to 150 calendar days of a written request.	The Generator Owner failed to provide its generator protection trip settings within 150 calendar days of any change to those trip settings. OR The Generator Owner failed to provide trip settings within 150 calendar days of a written request.

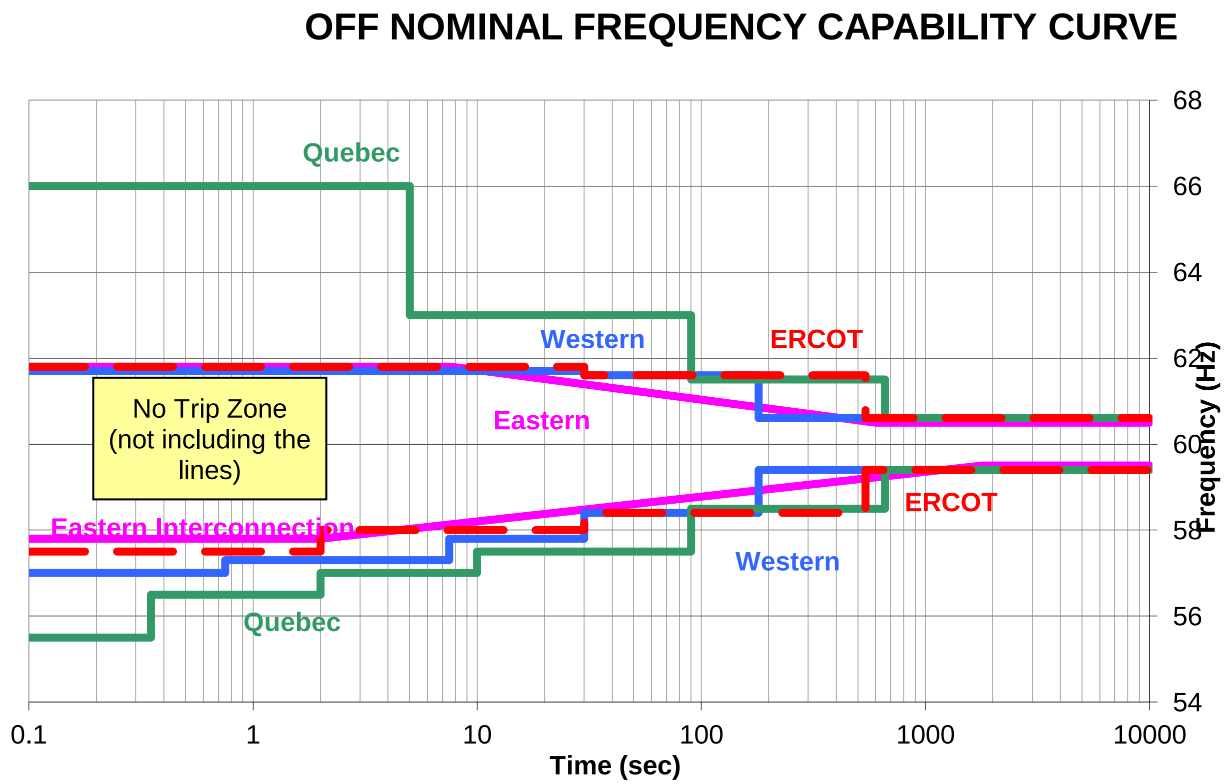
PRC-024 — Attachment 1



Curve Data Points:

Eastern Interconnection

High Frequency Duration		Low Frequency Duration	
Frequency (Hz)	**Time (Sec)**	**Frequency (Hz)**	**Time (sec)**
≥61.8	Instantaneous trip	≤57.8	Instantaneous trip
≥60.5	$10^{(90.935-1.45713*f)}$	≤59.5	$10^{(1.7373*f-100.116)}$
<60.5	Continuous operation	> 59.5	Continuous operation

Western Interconnection

High Frequency Duration		Low Frequency Duration	
Frequency (Hz)	Time (Sec)	Frequency (Hz)	Time (sec)
≥61.7	Instantaneous trip	≤57.0	Instantaneous trip
≥61.6	30	≤57.3	0.75
≥60.6	180	≤57.8	7.5
<60.6	Continuous operation	≤58.4	30
		≤59.4	180
		>59.4	Continuous operation

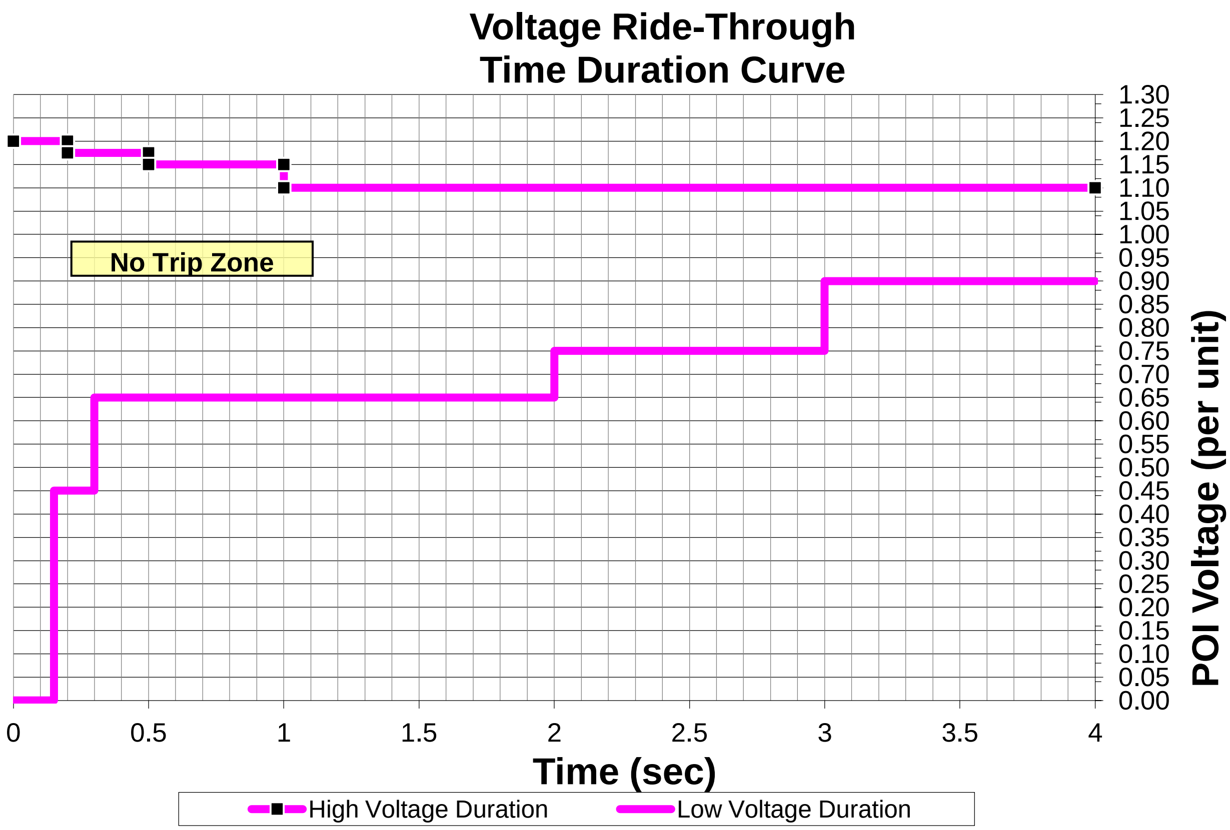
Quebec Interconnection

High Frequency Duration		Low Frequency Duration	
Frequency (Hz)	Time (Sec)	Frequency (Hz)	Time (Sec)
>66.0	Instantaneous trip	<55.5	Instantaneous trip
≥63.0	5	≤56.5	0.35
≥61.5	90	≤57.0	2
≥60.6	660	≤57.5	10
<60.6	Continuous operation	≤58.5	90
		≤59.4	660
		>59.4	Continuous operation

ERCOT Interconnection

High Frequency Duration		Low Frequency Duration	
Frequency (Hz)	Time (Sec)	Frequency (Hz)	Time (sec)
≥61.8	Instantaneous trip	≤57.5	Instantaneous trip
≥61.6	30	≤58.0	2
≥60.6	540	≤58.4	30
<60.6	Continuous operation	≤59.4	540
		>59.4	Continuous operation

PRC-024— Attachment 2



Ride Through Duration:

High Voltage Ride Through Duration		Low Voltage Ride Through Duration	
Voltage (pu)	Time (sec)	Voltage (pu)	Time (sec)
≥1.200	Instantaneous trip	<0.45	0.15
≥1.175	0.20	<0.65	0.30
≥1.15	0.50	<0.75	2.00
≥1.10	1.00	<0.90	3.00

Voltage Ride-Through Curve Clarifications

Curve Details:

1. The per unit voltage base for these curves is the nominal operating voltage specified by the Transmission Planner in the analysis of the reliability of the Interconnected Transmission Systems at the point of interconnection to the Bulk Electric System (BES).
2. The curves depicted were derived based on three-phase transmission system zone 1 faults with Normal Clearing not exceeding 9 cycles. The curves apply to voltage excursions regardless of the type of initiating event.
3. The envelope within the curves represents the cumulative voltage duration at the point of interconnection with the BES. For example, if the voltage first exceeds 1.15 pu at 0.3 seconds after a fault, does not exceed 1.2 pu voltage, and returns below 1.15 pu at 0.4 seconds, then the cumulative time the voltage is above 1.15 pu voltage is 0.1 seconds and is within the no trip zone of the curve.
4. The curves depicted assume system frequency is 60 Hertz. When evaluating Volts/Hertz protection, you may adjust the magnitude of the high voltage curve in proportion to deviations of frequency below 60 Hz.
5. Voltages in the curve assume minimum fundamental frequency phase-to-ground or phase-to-phase voltage for the low voltage duration curve and the greater of maximum RMS or crest phase-to-phase voltage for the high voltage duration curve.

Evaluating Protective Relay Settings:

1. Use either the following assumptions or loading conditions that are believed to be the most probable for the unit under study to evaluate voltage protection relay setting calculations on the static case for steady state initial conditions:
    a. All of the units connected to the same transformer are online and operating.
    b. All of the units are at full nameplate real-power output.
    c. Power factor is 0.95 lagging (i.e. supplying reactive power to the system) as measured at the generator terminals.
    d. The automatic voltage regulator is in automatic voltage control mode.
2. Evaluate voltage protection relay settings assuming that additional installed generating plant reactive support equipment (such as static VAr compensators, synchronous condensers, or capacitors) is available and operating normally.
3. Evaluate voltage protection relay settings accounting for the actual tap settings of transformers between the generator terminals and the point of interconnection.

Standard Development Roadmap

This section is maintained by the drafting team during the development of the standard and will be removed when the standard becomes effective.

Development Steps Completed:

1. SAR posted for comment (April 20–May 21, 2007).
2. Revised SAR and response to comments posted.
3. Revised SAR and response to comments approved by SC (June 14, 2007).
4. SDT appointed on (August 18, 2007).
5. Initial draft of PRC-024-1 was posted for a 45 day formal comment period (February 17 – April 2, 2009).
6. Draft 2 of PRC-024-1 was posted for a 45 day concurrent comment and ballot period from June 15 – August 1, 2011.
7. Draft 3 of PRC-024-1 was posted for a 30 day concurrent comment and successive ballot period from February 29 – March 29, 2012.
8. Draft 4 of PRC-024-1 was posted for a 30 day concurrent comment and successive ballot period from September 28 – October 31, 2012.
9. Draft 5 of PRC-024-1 was posted for a 30 day concurrent comment and successive ballot period from December 12, 2012 – January 11, 2013.

~~9.~~10. Draft 6 of PRC-024-1 was posted for a 30 day concurrent comment and successive ballot period from January 25 through February 28, 2013.

Proposed Action Plan and Description of Current Draft:

This is the ~~sixth~~ seventh draft of the standard and includes Time Horizons, Data Retention, Violation Risk Factors, and Violation Severity Levels. This sixth posting is for a ~~30~~10-day ~~comment and successive~~recirculation ballot period.

Future Development Plan:

Anticipated Actions	Anticipated Date
~~1. Develop responses to comments and develop sixth version draft standard.~~	~~January 2013~~

~~2. Post response to comments and conduct successive ballot.~~	~~February 2013~~
~~3. Develop responses to ballot comments.~~	~~March 2013~~
~~4. Post responses to comments and conduct recirculation ballot.~~	~~April 2013~~
5. BOT adoption.	May 2013
6. File with regulatory authorities.	June 2013

Definitions of Terms Used in Standard

This section includes all newly defined or revised terms used in the proposed standard. Terms already defined in the Reliability Standards Glossary of Terms are not repeated here. New or revised definitions listed below become approved when the proposed standard is approved. When the standard becomes effective, these defined terms will be removed from the individual standard and added to the Glossary.

None

A. Introduction

1. **Title:** Generator Frequency and Voltage Protective Relay Settings
2. **Number:** **PRC-024-1**
3. **Purpose:** Ensure Generator Owners set their generator protective relays such that generating units remain connected during defined frequency and voltage excursions.
4. **Applicability:**
   - **4.1.** Generator Owner
5. **Effective Date:**
   - **5.1.** In those jurisdictions where regulatory approval is required:
     - **5.1.1** By the first day of the first calendar quarter, two calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner shall have verified at least 40 percent of its Facilities are fully compliant with Requirements R1, R2, R3, and R4.
     - **5.1.2** By the first day of the first calendar quarter, three calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner shall have verified at least 60 percent of its Facilities are fully compliant with Requirements R1, R2, R3, and R4.
     - **5.1.3** By the first day of the first calendar quarter, four calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner shall have verified at least 80 percent of its Facilities are fully compliant with Requirements R1, R2, R3, and R4.
     - **5.1.4** By the first day of the first calendar quarter, five calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner shall have verified 100 percent of its Facilities are fully compliant with Requirements R1, R2, R3, and R4.
   - **5.2.** In those jurisdictions where regulatory approval is not required:
     - **5.2.1** By the first day of the first calendar quarter, two calendar years following Board of Trustees approval, each Generator Owner shall have verified at least 40 percent of its Facilities are fully compliant with Requirements R1, R2, R3, and R4.

5.2.2 By the first day of the first calendar quarter, three calendar years following Board of Trustees approval, each Generator Owner shall have verified at least 60 percent of its Facilities are fully compliant with Requirements R1, R2, R3, and R4.

5.2.3 By the first day of the first calendar quarter, four calendar years following Board of Trustees approval, each Generator Owner shall have verified at least 80 percent of its Facilities are fully compliant with Requirements R1, R2, R3, and R4.

5.2.4 By the first day of the first calendar quarter, five calendar years following Board of Trustees approval, each Generator Owner shall have verified 100 percent of its Facilities are fully compliant with Requirements R1, R2, R3, and R4.

B. Requirements

R1. Each Generator Owner that has generator frequency protective relaying[1] activated to trip its applicable generating unit(s) shall set its protective relaying such that the generator frequency protective relaying does not trip the applicable generating unit(s) within the "no trip zone" of PRC-024 Attachment 1, subject to the following exceptions: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

- Generating unit(s) may trip if the protective functions (such as out-of-step functions or loss-of-field functions) operate due to an impending or actual loss of synchronism or, for asynchronous generating units, due to instability in power conversion control equipment.
- Generating unit(s) may trip if clearing a system fault necessitates disconnecting (a) generating unit(s).
- Generating unit(s) may trip within a portion of the "no trip zone" of PRC-024 Attachment 1 for documented and communicated regulatory or equipment limitations in accordance with Requirement R3.

R2. Each Generator Owner that has generator voltage protective relaying[1]~~[1]~~ activated to trip its applicable generating unit(s) shall set its protective relaying such that the generator voltage protective relaying does not trip the applicable generating unit(s) as a result of a voltage excursion (at the point of interconnection[2]) caused by an event on the transmission system external to the generating plant that remains within the "no trip zone" of PRC-024 Attachment 2. If the Transmission Planner allows less stringent voltage relay settings than those required to meet PRC-024 Attachment 2, then the Generator Owner shall set its protective relaying within the voltage recovery characteristics of a location-specific Transmission Planner's study. Requirement R2 is subject to the following exceptions: *[Violation Risk Factor: Medium] [Time Horizon: Long-term Planning]*

- Generating unit(s) may trip in accordance with a Special Protection System (SPS) or Remedial Action Scheme (RAS).
- Generating unit(s) may trip if clearing a system fault necessitates disconnecting (a) generating unit(s).

---

[1] Each Generator Owner is not required to have frequency or voltage protective relaying (including but not limited to frequency and voltage protective functions for discrete relays, volts per hertz relays evaluated at nominal frequency, multi-function protective devices or protective functions within control systems that directly trip or provide tripping signals to the generator based on frequency or voltage inputs) installed or activated on its unit.

[2] For the purposes of this standard, point of interconnection means the transmission (high voltage) side of the generator step-up or collector transformer.

- Generating unit(s) may trip by action of protective functions (such as out-of-step functions or loss-of-field functions) that operate due to an impending or actual loss of synchronism or, for asynchronous generating units, due to instability in power conversion control equipment.
- Generating unit(s) may trip within a portion of the "no trip zone" of PRC-024 Attachment 2 for documented and communicated regulatory or equipment limitations in accordance with Requirement R3.

R3. Each Generator Owner shall document each known regulatory or equipment limitation[3] that prevents an applicable generating unit with generator frequency or voltage protective relays from meeting the relay setting criteria in Requirements R1 or R2 including (but not limited to) study results, experience from an actual event, or manufacturer's advice. *[Violation Risk Factor: Lower] [Time Horizon: Long-term Planning]*

3.1. The Generator Owner shall communicate the documented regulatory or equipment limitation, or the removal of a previously documented regulatory or equipment limitation, to its Planning Coordinator and Transmission Planner within 30 calendar days of any of the following:

- Identification of a regulatory or equipment limitation.
- Repair of the equipment causing the limitation that removes the limitation.
- Replacement of the equipment causing the limitation with equipment that removes the limitation.
- Creation or adjustment of an equipment limitation caused by consumption of the cumulative turbine life-time frequency excursion allowance.

R4. Each Generator Owner shall provide its applicable generator protection trip settings associated with Requirements R1 and R2 to the Planning Coordinator or Transmission Planner that models the associated unit within 60 calendar days of receipt of a written request for the data and within 60 calendar days of any change to those previously requested trip settings unless directed by the requesting Planning Coordinator or Transmission Planner that the reporting of relay setting changes is not required. *[Violation Risk Factor: Lower] [Time Horizon: Operations Planning]*

C. Measures

M1. Each Generator Owner shall have evidence that generator frequency protective relays have been set in accordance with Requirement R1 such as dated setting sheets, calibration sheets or other documentation.

[3] Excludes limitations that are caused by the setting capability of the generator frequency and voltage protective relays themselves but does not exclude limitations originating in the equipment that they protect.

M2. Each Generator Owner shall have evidence that generator voltage protective relays have been set in accordance with Requirement R2 such as dated setting sheets, voltage-time curves, calibration sheets, coordination plots, dynamic simulation studies or other documentation.

M3. Each Generator Owner shall have evidence that it has documented and communicated any known regulatory or equipment limitations (excluding limitations noted in footnote 3) that resulted in an exception to Requirements R1 or R2 in accordance with Requirement R3 such as a dated email or letter that contains such documentation as study results, experience from an actual event, or manufacturer's advice~~sory~~.

M4. Each Generator Owner shall have evidence that it communicated applicable generator protective relay trip settings in accordance with Requirement R4, such as dated e-mails, correspondence or other evidence and copies of any requests it has received for that information.

D. Compliance

1. Compliance Monitoring Process

1.1. Compliance Enforcement Authority

The Regional Entity shall serve as the Compliance Enforcement Authority (CEA) unless the applicable entity is owned, operated, or controlled by the Regional Entity. In such cases, the ERO or a Regional Entity approved by FERC or other applicable governmental authority shall serve as the CEA.

1.2. Data Retention

The following evidence retention periods identify the period of time an entity is required to retain specific evidence to demonstrate compliance. For instances where the evidence retention period specified below is shorter than the time since the last audit, the Compliance Enforcement Authority may ask an entity to provide other evidence to show that it was compliant for the full time period since the last audit.

The Generator Owner shall retain evidence of compliance with Requirement R1 through R4~~, Measures M1 through M4~~; for 3 years or until the next audit, whichever is longer.

If a Generator Owner is found non-compliant, the Generator Owner shall keep information related to the non-compliance until mitigation is complete and approved for the time period specified above, whichever is longer.

The Compliance Enforcement Authority shall keep the last audit records and all requested and submitted subsequent audit records.

1.3. Compliance Monitoring and Assessment Processes

Compliance Audit

Self-Certification

Spot Checking

Compliance Investigation

Self-Reporting

Complaint

1.4. Additional Compliance Information

None

2. Violation Severity Levels

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL
R1	N/A	N/A	N/A	The Generator Owner that has frequency protection activated to trip a generating unit, ~~has no documented and communicated regulatory or equipment limitation per Requirement R3 and~~ failed to set its generator frequency protective relaying so that it does not trip within the criteria listed in Requirement R1 unless there is a documented and communicated regulatory or equipment limitation per Requirement R3.
R2	N/A	N/A	N/A	The Generator Owner with voltage protective relaying activated to trip a generating unit, ~~has no documented and communicated regulatory or equipment limitation per Requirement R3 and~~ failed to set its voltage protective relaying so that it does not trip as a result of a voltage excursion at the point of interconnection, caused by an event external to the plant per the criteria specified in Requirement R2 unless there is a documented and communicated regulatory or equipment limitation per Requirement R3.

R #	Lower VSL	Moderate VSL	High VSL	Severe VSL
R3	The Generator Owner documented the known non-protection system equipment limitation that prevented it from meeting the criteria in Requirement R1 or R2 and communicated the documented limitation to its Planning Coordinator and Transmission Planner more than 30 calendar days but less than or equal to 60 calendar days of identifying the limitation.	The Generator Owner documented the known non-protection system equipment limitation that prevented it from meeting the criteria in Requirement R1 or R2 and communicated the documented limitation to its Planning Coordinator and Transmission Planner more than 60 calendar days but less than or equal to 90 calendar days of identifying the limitation.	The Generator Owner documented the known non-protection system equipment limitation that prevented it from meeting the criteria in Requirement R1 or R2 and communicated the documented limitation to its Planning Coordinator and Transmission Planner more than 90 calendar days but less than or equal to 120 calendar days of identifying the limitation.	The Generator Owner failed to document any known non-protection system equipment limitation that prevented it from meeting the criteria in Requirement R1 or R2. OR The Generator Owner failed to communicate the documented limitation to its Planning Coordinator and Transmission Planner within 120 calendar days of identifying the limitation.
R4	The Generator Owner provided its generator protection trip settings more than 60 calendar days but less than or equal to 90 calendar days of any change to those trip settings. OR The Generator Owner provided trip settings more than 60 calendar days but less than or equal to 90 calendar days of a written request.	The Generator Owner provided its generator protection trip settings more than 90 calendar days but less than or equal to 120 calendar days of any change to those trip settings. OR The Generator Owner provided trip settings more than 90 calendar days but less than or equal to 120 calendar days of a written request.	The Generator Owner provided its generator protection trip settings more than 120 calendar days but less than or equal to 150 calendar days of any change to those trip settings. OR The Generator Owner provided trip settings more than 120 calendar days but less than or equal to 150 calendar days of a written request.	The Generator Owner failed to provide its generator protection trip settings within 150 calendar days of any change to those trip settings. OR The Generator Owner failed to provide trip settings within 150 calendar days of a written request.~~ for the data.~~

≥1.200	Instantaneous trip	<0.45	0.15
≥1.175	0.20	<0.65	0.30
≥1.15	0.50	<0.75	2.00
≥1.10	1.00	<0.90	3.00

Voltage Ride-Through Curve Clarifications

Curve Details:

1. The per unit voltage base for these curves is the nominal operating voltage specified by the Transmission Planner in the analysis of the reliability of the Interconnected Transmission Systems at the point of interconnection to the Bulk Electric System (BES).
2. The curves depicted were derived based on three-phase transmission system zone 1 faults with Normal Clearing not exceeding 9 cycles. The curves apply to voltage excursions regardless of the type of initiating event.
3. The envelope within the curves represents the cumulative voltage duration at the point of interconnection with the BES. For example, if the voltage first exceeds 1.15 pu at 0.3 seconds after a fault, does not exceed 1.2 pu voltage, and returns below 1.15 pu at 0.4 seconds, then the cumulative time the voltage is above 1.15 pu voltage is 0.1 seconds and is within the no trip zone of the curve.
4. The curves depicted assume system frequency is 60 Hertz. When evaluating Volts/Hertz protection, you may adjust the magnitude of the high voltage curve in proportion to deviations of frequency below 60 Hz.
5. Voltages in the curve assume minimum fundamental frequency phase-to-ground or phase-to-phase voltage for the low voltage duration curve and the greater of maximum RMS or crest phase-to-phase voltage for the high voltage duration curve.

Evaluating Protective Relay Settings:

1. Use either the following assumptions or loading conditions that are believed to be the most probable for the unit under study to evaluate voltage protection relay setting calculations on the static case for steady state initial conditions:
    a. All of the units connected to the same transformer are online and operating.
    b. All of the units are at full nameplate real-power output.
    c. Power factor is 0.95 lagging (i.e. supplying reactive power to the system) as measured at the generator terminals.
    d. The automatic voltage regulator is in automatic voltage control mode.
2. Evaluate voltage protection relay settings assuming that additional installed generating plant reactive support equipment (such as static VAr compensators, synchronous condensers, or capacitors) is available and operating normally.
3. Evaluate voltage protection relay settings accounting for the actual tap settings of transformers between the generator terminals and the point of interconnection.

Implementation Plan

Project 2007-09 Generator Verification

Implementation Plan for PRC-024-1, Generator Frequency and Voltage Protective Relay Settings

Approvals Required

PRC-024-1 – Generator Frequency and Voltage Protective Relay Settings.

According to its Implementation Plan, PRC-006-1, Requirement R4 (see project 2007-01, Underfrequency Load Shedding) does not become effective until PRC-024-1 becomes effective. Upon the effective date of PRC-024-1, R4 of PRC-006-1 will also go into effect.

Prerequisite Approvals

Revisions to Glossary Terms

None

Applicable Entities

Generator Owner

Conforming Changes to Other Standards

None

Effective Dates

In those jurisdictions where regulatory approval is required:

- By the first day of the first calendar quarter, two calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner shall have verified at least 40 percent of its applicable Facilities are fully compliant with Requirements R1, R2, R3, and R4.

- By the first day of the first calendar quarter, three calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to

such ERO governmental authorities, each Generator Owner shall have verified at least 60 percent of its applicable Facilities are fully compliant with Requirements R1, R2, R3, and R4.

- By the first day of the first calendar quarter, four calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner shall have verified at least 80 percent of its applicable Facilities are fully compliant with Requirements R1, R2, R3, and R4.

- By the first day of the first calendar quarter, five calendar years following applicable regulatory approval, or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities, each Generator Owner shall have verified 100 percent of its applicable Facilities are fully compliant with Requirements R1, R2, R3, and R4.

In those jurisdictions where regulatory approval is not required:

- By the first day of the first calendar quarter, two calendar years following Board of Trustees approval, each Generator Owner shall have verified at least 40 percent of its applicable Facilities are fully compliant with Requirements R1, R2, R3, and R4.

- By the first day of the first calendar quarter, three calendar years following Board of Trustees approval, each Generator Owner shall have verified at least 60 percent of its applicable Facilities are fully compliant with Requirements R1, R2, R3, and R4.

- By the first day of the first calendar quarter, four calendar years following Board of Trustees approval, each Generator Owner shall have verified at least 80 percent of its applicable Facilities are fully compliant with Requirements R1, R2, R3, and R4.

- By the first day of the first calendar quarter, five calendar years following Board of Trustees approval, each Generator Owner shall have verified 100 percent of its applicable Facilities are fully compliant with Requirements R1, R2, R3, and R4.

Retirements

None

Justification of Phasing

Requirements R1, R2, R3, and R4 involve evaluation of existing protection system settings and equipment capabilities. Typically, generator protection system setting changes are made during scheduled generator outages. The Implementation Plan allows a five-year window for these changes to be made which corresponds to typical outage cycles. Generating units that have outage cycles that extend longer than five years are not typically base loaded and offer opportunities to effect protection system settings changes during economic shut down periods.

Project 2007-09 Generator Verification Consideration of Issues and Directives

Project 2007-09 Generator Verification — PRC-024-1		
Issue or Directive	**Source**	**Consideration of Issue or Directive**
Paragraph 1787 states "… the Commission directs the ERO to modify the Reliability Standard to explicitly require either that all generators are capable of riding through the same set of Category B and C contingencies, as required by wind generators in Order No. 661, or that those generators that cannot ride through be simulated as tripping."	FERC Order 693; Paragraph 1787	The GVSDT believes that Requirement R2 and the voltage ride through curves in PRC-024 Attachment 2 accomplish this. While the curves were developed based on three phase normally cleared faults located at a generating plant substation (the most severe condition for generating equipment), the curves cover voltages depressed as low as 0.65 per unit for two seconds, which the GVSDT feels will cover the Category B and C events of concern to the Commission. Requirement R3 allows an exemption from portions of the ride through curves in PRC-024 Attachments 1 and 2 for documented regulatory or technical reasons, but directs those generators to communicate that limitation to the PC and TP so its performance can be modeled correctly.
Paragraph 1787 also states "… the Commission agrees that NRC requirements should be used when implementing the Reliability Standards."	FERC Order 693; Paragraph 1787	The GVSDT believes that Requirement R3 allows NRC requirements to supersede portions of the voltage and frequency ride through criteria in PRC-024-1. This Requirement allows generators an exemption from portions of the ride through curves for documented regulatory limitations. The GVSDT believes that NRC requirements qualify as regulatory limitations for the purposes of this standard.

NORTH AMERICAN ELECTRIC
RELIABILITY CORPORATION

Violation Risk Factor and Violation Severity Level Assignments

Project 2007-09 Generator Verification

This document provides the drafting team's justification for assignment of violation risk factors (VRFs) and violation severity levels (VSLs) for each requirement in PRC-024-1 — Generator Frequency and Voltage Protective Relay Settings.

Each primary requirement is assigned a VRF and a set of one or more VSLs. These elements support the determination of an initial value range for the Base Penalty Amount regarding violations of requirements in FERC-approved Reliability Standards, as defined in the ERO Sanction Guidelines.

Justification for Assignment of Violation Risk Factors

The Generator Verification Standard Drafting Team applied the following NERC criteria when proposing VRFs for the requirements under this project:

High Risk Requirement

A requirement that, if violated, could directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly cause or contribute to bulk electric system instability, separation, or a cascading sequence of failures, or could place the bulk electric system at an unacceptable risk of instability, separation, or cascading failures, or could hinder restoration to a normal condition.

Medium Risk Requirement

A requirement that, if violated, could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system. However, violation of a medium risk requirement is unlikely to lead to bulk electric system instability, separation, or cascading failures; or, a requirement in a planning time frame that, if violated, could, under emergency, abnormal, or restorative conditions anticipated by the preparations, directly and adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. However, violation of a medium risk requirement is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition.

Lower Risk Requirement
A requirement that is administrative in nature and a requirement that, if violated, would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. A planning requirement that is administrative in nature.

The SDT also considered consistency with the FERC Violation Risk Factor Guidelines for setting VRFs:[1]

Guideline (1) — Consistency with the Conclusions of the Final Blackout Report
The Commission seeks to ensure that Violation Risk Factors assigned to Requirements of Reliability Standards in these identified areas appropriately reflect their historical critical impact on the reliability of the Bulk-Power System.

In the VSL Order, FERC listed critical areas (from the Final Blackout Report) where violations could severely affect the reliability of the Bulk-Power System:[2]

- Emergency operations
- Vegetation management
- Operator personnel training
- Protection systems and their coordination
- Operating tools and backup facilities
- Reactive power and voltage control
- System modeling and data exchange
- Communication protocol and facilities
- Requirements to determine equipment ratings
- Synchronized data recorders
- Clearer criteria for operationally critical facilities
- Appropriate use of transmission loading relief

Guideline (2) — Consistency within a Reliability Standard
The Commission expects a rational connection between the sub-Requirement Violation Risk Factor assignments and the main Requirement Violation Risk Factor assignment.

Guideline (3) — Consistency among Reliability Standards

[1] North American Electric Reliability Corp., 119 FERC ¶ 61,145, order on reh'g and compliance filing, 120 FERC ¶ 61,145 (2007) ("VRF Rehearing Order").
[2] Id. at footnote 15.

The Commission expects the assignment of Violation Risk Factors corresponding to Requirements that address similar reliability goals in different Reliability Standards would be treated comparably.

Guideline (4) — Consistency with NERC's Definition of the Violation Risk Factor Level
Guideline (4) was developed to evaluate whether the assignment of a particular Violation Risk Factor level conforms to NERC's definition of that risk level.

Guideline (5) — Treatment of Requirements that Co-mingle More Than One Obligation
Where a single Requirement co-mingles a higher risk reliability objective and a lesser risk reliability objective, the VRF assignment for such Requirements must not be watered down to reflect the lower risk level associated with the less important objective of the Reliability Standard.

The following discussion addresses how the SDT considered FERC's VRF Guidelines 2 through 5. The team did not address Guideline 1 directly because of an apparent conflict between Guidelines 1 and 4. Whereas Guideline 1 identifies a list of topics that encompass nearly all topics within NERC's Reliability Standards and implies that these requirements should be assigned a "High" VRF, Guideline 4 directs assignment of VRFs based on the impact of a specific requirement to the reliability of the system. The SDT believes that Guideline 4 is reflective of the intent of VRFs in the first instance and therefore concentrated its approach on the reliability impact of the requirements.

VRF for PRC-024-1:
There are four requirements in PRC-024-1. Two of the Requirements (R1 and R2) were assigned a "Medium" VRF and the remaining two requirements were assigned a "Lower" VRF.

VRF for PRC-024-1, Requirement R1:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R1 contains Parts specifying conditions for satisfying the main requirement. The VRFs are only applied at the Requirement level and each Requirement Part is treated equally. Requirement obligations include actions similar in scope to actions specified in Requirement R2 which were assigned a "Medium" VRF.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar in concept with both PRC-012-0 Requirement R1 and PRC-023-1 Requirement R1, both of which require protection coordination or settings. These requirements apply to multiple elements while the requirements of PRC-024-1 apply to a single unit. Violation of this requirement by a single generator could not be construed as directly causing or contributing to BES instability, separation or cascading within any time frame. For a single violation to lead to BES instability, separation or cascading would require other standards requirements to be violated. This requirement is assigned a "Medium" VRF.

- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to ensure a proper frequency "no-trip" operating window is a requirement in the planning time frame that, if violated, is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. Therefore the assigned "Medium" VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R1 reliability objective is to ensure a proper frequency "no-trip" operating window. Requirement Parts are lower risk condition elements that establish main requirement criteria for completeness. The "Medium" VRF assigned is based on the reliability objective specified.

VRF for PRC-024-1, Requirement R2:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R2 contains Parts specifying conditions for satisfying the main requirement. The VRFs are only applied at the Requirement level and each Requirement Part is treated equally. Requirement obligations include actions similar in scope to actions specified in Requirement R1 which were assigned a "Medium" VRF.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar in concept with both PRC-012-0 Requirement R1 and PRC-023-1 Requirement R1, both of which require protection coordination or settings. These requirements apply to multiple elements while the requirements of PRC-024-1 apply to a single unit. Violation of this requirement by a single generator could not be construed as directly causing or contributing to BES instability, separation or cascading within any time frame. For a single violation to lead to BES instability, separation or cascading would require other standards requirements to be violated. This requirement is assigned a "Medium" VRF.
- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to ensure proper voltage "no-trip" criteria is a requirement in the planning time frame that, if violated, is unlikely, under emergency, abnormal, or restoration conditions anticipated by the preparations, to lead to bulk electric system instability, separation, or cascading failures, nor to hinder restoration to a normal condition. Therefore the assigned "Medium" VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R2 reliability objective is to ensure proper voltage "no-trip" criteria. Requirement Parts are lower risk condition elements that establish main requirement criteria for completeness. The "Medium" VRF assigned is based on the reliability objective specified.

VRF for PRC-024-1, Requirements R3:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R3 contains Parts specifying response expectation and limitation reset conditions for satisfying the main requirement. The VRFs are only applied at the Requirement level and each Requirement Part is treated equally.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar in concept with PRC-006-0 Requirement R1 which specifies documentation requirements. In addition, as is generally the case with reliability standard VRF definitions for documentation and administrative requirements, this requirement is assigned a "Lower" VRF.
- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to document limitations preventing compliance is a requirement that is administrative in nature for the planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Therefore the assigned "Lower" VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R3 reliability objective is to document limitations preventing compliance. Requirement Parts and obligations are lower risk elements that ensure main requirement completeness which are administrative in nature consisting of response submission and limitation reset condition requirements. The "Lower" VRF assigned is based on the reliability objective specified.

VRF for PRC-024-1, Requirement R4:

- FERC Guideline 2 — Consistency within a Reliability Standard exists. Requirement R4 does not contain Parts. Requirement obligations specify the type of response and response time frame to be observed.
- FERC Guideline 3 — Consistency among Reliability Standards exists. This requirement is similar in concept with both PRC-007-0 Requirement R3 and PRC-010-0 Requirement R2, both of which require providing information within a specified time frame on request. In addition, as is generally the case with reliability standard VRF definitions for documentation and administrative requirements, this requirement is assigned a "Lower" VRF.
- FERC Guideline 4 — Consistency with NERC's Definition of the VRF Level selected exists. Failure to provide setting and limitation information as requested is a requirement that is administrative in nature for the planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Therefore the assigned "Lower" VRF is appropriate.
- FERC Guideline 5 — Treatment of Requirements that Co-mingle More Than One Obligation is satisfactory. The Requirement R4 reliability objective is to provide setting and limitation information as requested. Requirement obligations are lower risk condition elements administrative in nature for ensuring the main requirement is satisfied in a timely manner. The "Lower" VRF assigned is based on the reliability objective specified.

Justification for Assignment of Violation Severity Levels:

In developing the VSLs for the standards under this project, the SDT anticipated the evidence that would be reviewed during an audit, and developed its VSLs based on the noncompliance an auditor may find during a typical audit. The SDT based its assignment of VSLs on the following NERC criteria:

Lower	Moderate	High	Severe
Missing a minor element (or a small percentage) of the required performance The performance or product measured has significant value as it almost meets the full intent of the requirement.	Missing at least one significant element (or a moderate percentage) of the required performance. The performance or product measured still has significant value in meeting the intent of the requirement.	Missing more than one significant element (or is missing a high percentage) of the required performance or is missing a single vital component. The performance or product has limited value in meeting the intent of the requirement.	Missing most or all of the significant elements (or a significant percentage) of the required performance. The performance measured does not meet the intent of the requirement or the product delivered cannot be used in meeting the intent of the requirement.

FERC's VSL guidelines are presented below, followed by an analysis of whether the VSLs proposed for each requirement in PRC-024-1 meet the FERC Guidelines for assessing VSLs:

Guideline 1: Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance

Compare the VSLs to any prior levels of non-compliance and avoid significant changes that may encourage a lower level of compliance than was required when levels of non-compliance were used.

Guideline 2: Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties

A violation of a “binary” type requirement must be a “Severe” VSL.

Do not use ambiguous terms such as “minor” and “significant” to describe noncompliant performance.

Guideline 3: Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement

VSLs should not expand on what is required in the requirement.

Guideline 4: Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations

. . . unless otherwise stated in the requirement, each instance of non-compliance with a requirement is a separate violation. Section 4 of the Sanction Guidelines states that assessing penalties on a per violation per day basis is the “default” for penalty calculations.

VSLs for PRC-024-1 Requirement R1:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R1.	The NERC VSL guidelines are satisfied by incorporating binary VSL elements.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's are a combination of binary elements and are categorized as severe. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on binary performance, and timeliness of the actions and obligations	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action per the conditions specified by listed parts. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

VSLs for PRC-024-1 Requirement R2:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R2.	The NERC VSL guidelines are satisfied by incorporating binary VSL elements.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's are a combination of binary elements and are categorized as severe. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on binary performance, and timeliness of the actions and obligations specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action per the conditions specified by listed parts. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

VSLs for PRC-024-1 Requirement R3:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R3.	The NERC VSL guidelines are satisfied by incorporating increments for tardiness elements.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's incorporate the increments for tardiness methodology. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on timeliness of the action specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action in a timely manner including response obligation and reset conditions specified by listed parts. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

VSLs for PRC-024-1 Requirement R4:

R#	Compliance with NERC VSL Guidelines	Guideline 1 Violation Severity Level Assignments Should Not Have the Unintended Consequence of Lowering the Current Level of Compliance	Guideline 2 Violation Severity Level Assignments Should Ensure Uniformity and Consistency in the Determination of Penalties Guideline 2a: The Single Violation Severity Level Assignment Category for "Binary" Requirements Is Not Consistent Guideline 2b: Violation Severity Level Assignments that Contain Ambiguous Language	Guideline 3 Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement	Guideline 4 Violation Severity Level Assignment Should Be Based on A Single Violation, Not on A Cumulative Number of Violations
R4.	The NERC VSL guidelines are satisfied by incorporating increments for tardiness elements.	This is a new Requirement and does not have a prior level of compliance.	Proposed VSL's incorporate the increments for tardiness methodology. Proposed VSL language does not include ambiguous terms and ensure uniformity and consistency in the determination of penalties based on timeliness of the action specified.	Proposed VSL's do not expand on what is required in the requirement. The VSL's assigned only consider performing required action in a timely manner. Proposed VSL's are consistent with the requirement.	Proposed VSL's are based on a single violation and not a cumulative violation methodology.

Standards Announcement

Project 2007-09 Generator Verification
PRC-024-1

Recirculation Ballot is now open through Wednesday, March 27, 2013

Now Available

A recirculation ballot of **PRC-024-1** is now open **through 8 p.m. Eastern on Wednesday, March 27, 2013**.

Background information for this project can be found on the project page.

Instructions
In the recirculation ballot, votes are counted by exception. Only members of the ballot pool may cast a ballot; all ballot pool members may change their previously cast votes. A ballot pool member who failed to cast a ballot during the last ballot window may cast a ballot in the recirculation ballot window. If a ballot pool member does not participate in the recirculation ballot, that member's vote cast in the previous ballot will be carried over as that member's vote in the recirculation ballot.

Members of the ballot pool associated with this project may log in and submit their vote for the standard by clicking here.

Next Steps
Voting results will be posted and announced after the ballot window closes. If approved, the standard will be submitted to the Board of Trustees for adoption and then filed with the appropriate regulatory authorities.

Standards Process

The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

For more information or assistance, please contact Wendy Muller,
Standards Development Administrator, at wendy.muller@nerc.net or at 404-446-2560.

Standard Drafting Team Roster for NERC Standards Development Project 2007-09

Project 2007-09 Generator Verification

Standard Drafting Team

Name and Title	Company and Address	Contact Info	Bio
Lee Y. Taylor - Chair System Operations Manager	Southern Company Services, Inc. 600 North 18th Street P.O. Box 2641 Birmingham, Alabama 35291	(205) 257-7467 ltaylor@ southernco.com	Lee has a Bachelor of Electrical Engineering degree from Auburn University, and a M.S.E.E degree from the University of Alabama at Birmingham, and has over 30 years experience with Southern Company. Upon graduation from Auburn, he joined the Power Delivery Department of Alabama Power Company. He was a part time Adjunct Professor at the University of Alabama at Birmingham from 1987 to 1992. In 1988, he joined Southern Company Services where he worked in the Electrical Engineering Services Department and the Energy Management System Services Department. From 1996 – 2008, Lee worked in the Transmission Planning Department where he was involved in reactive planning and voltage control and stability studies for the Southern Company grid. Lee also was a member of the NERC System Planning, Design, and Studies Team in support of the 2003 Northeast blackout investigation. Currently, Lee is the System Operations Manager responsible for the Operations Planning group in the Bulk Power Operations department. The Operations Planning group provides support to Southern Company's Power Coordination Center which monitors and ensures bulk power transmission network security for Southern Company on a 24x7 basis. Mr. Taylor is a registered Professional Engineer in the State of Alabama.
David Kral – Vice-Chair Principal Engineer	Xcel Energy, Inc. 1518 Chestnut Avenue N. Minneapolis, Minnesota 55403	(612) 630-4266 david.s.kral@ xcelenergy.com	David Kral is a Principal Engineer in the Technical Resources & Compliance Department of Xcel Energy. He supports the generating plants in Xcel's Northern States Power (NSP) operating company on issues with generators and the electrical auxiliary systems. In particular, David provides expertise on excitation systems and generator protection. David also serves as a liaison with the Transmission area of NSP on technical issues. David is the Chairman of the Midwest Reliability Organization (MRO) Generator Testing Working Group. Prior to his 36-year career at NSP, David served for three years in the U. S. Peace Corps as a volunteer in the Rural Electrification Program in Ecuador. David received his Bachelor of Science in Electrical Engineering from the University of Kansas.
Ken Stenroos - Vice-chair General Manager	Florida Power & Light Co. 700 Universe Boulevard Juno Beach, Florida	(561) 691-2545 ken.stenroos@ fpl.com	Ken Stenroos is the General Manager of Technical Services for Steam Turbine Generators and Electrical Equipment for NextEra Energy Power Generation's 40 GW fleet. In his 27 year career with NextEra, Ken has held positions of increasing responsibility throughout Power Generation, both in

	33408		the field and in the central organization. Ken holds a Bachelor of Science in Electrical Engineering from the University of Florida, and is a Licensed Professional Engineer. In addition to working on the NERC standards, Ken has also been an author and reviewer on several IEEE standards, and is a past member of the Synchronous Machinery Committee of the IEEE.
Bajarang (Baj) L. Agrawal Engineering Manager	Arizona Public Service Co. P. O. Box 53933 Phoenix, Arizona 85072-3933	(602)371-6386 bajarang.agrawal@aps.com	Dr. Baj L. Agrawal: Ph.D., University of Arizona, Tucson. Dr. Agrawal is Enginering Manager at Arizona Public Service Co., where he has worked since 1974. He has extensive experience in the analysis, control and testing of subsynchronous resonance, power system dynamics modeling and simulation, and field testing of generators. He has co-authored many papers on subsynchronous resonance analysis and power system testing and has co-authored a book on subsynchronous resonance. Dr. Agrawal is an IEEE fellow and is a registered professional engineer.
Donald G. Davies Chief Senior Engineer	Western Electricity Coordinating Council 155 North 400 West, Suite 200 Salt Lake City, Utah 84103	(801) 883-6844 donald@wecc.biz	Donald Davies is the Western Electricity Coordinating Council's (WECC's) chief senior engineer. He is WECC's power flow and dynamic stability modeling expert, Donald joined Western Systems Coordinating Council (WSCC) in 1983. The WSCC merged in April 2002 with the Western Regional Transmission Association (WRTA) and the Southwestern Regional Transmission Association (SWRTA) to form WECC. Donald has held positions of increasing responsibility in the areas of planning and technical support. For several years he was part of the WECC System Review Work Group and helped compile WECC's Study Program Annual Report, documenting the results of power flow and stability studies. Donald currently participates in WECC's Modeling and Validation Work Group and the Joint Synchronized Information Subcommittee. During 2004, Donald was recognized as a co-author of a paper titled "A New Thermal Governor Modeling Approach in the WECC" which received the IEEE Power Engineering Society's PES Prize Paper Award. He chaired the WECC task force that gathered data to improve the governor representation in simulation studies. Donald Davies received the Bachelor of Science and Master of Engineering degrees from Brigham Young University, Provo, UT, in 1978.
Les Hajagos Director/Senior Engineer	Kestrel Power Engineering Ltd 312 Bowling Green Court Mississauga, Ontario	(905)272-2191 les@ kestrelpower.com	Les M. Hajagos received his Bachelor of Applied Science in Electrical Engineering in 1985 and his Master's degree in 1987 both from the University of Toronto and is a registered Professional Engineer in the Province of Ontario. Since 1988 he has worked mainly in the analysis, design, testing and modeling

	L4Z2T1		and providing training courses on generators, turbines and power system control equipment and power system loads, first at Ontario Hydro, and since 2000 as one of the principals at Kestrel Power Engineering. He is an active member of the IEEE Power Engineering Society where he is chair of the Excitation System Performance and Modeling working group and past chair of the Generator Model Validation task force.
Gary Humphries Generator Excitation SME	Duke Energy Carolina P.O. Box 1244 Charlotte, North Carolina 28201	(704) 382-3363 gary.humphries@ duke-energy.com	After receiving an A.A.S.-ET degree from Central Piedmont Community College (Charlotte, NC), Gary began his 26 year career with Duke Energy in the Transmission Substation department. In 1991 Mr. Humphries moved to the Generation Department to perform commissioning, maintenance, and calibration activities on generator excitation controls equipment - AVRs and Static exciters. He also helped implement a system to document excitation system settings and the associated coordination of these systems with generator protection relays. Gary supported excitation systems on all Duke Generation facilitates including hydro/pumped storage, nuclear, fossil and CT/CC plants. Since 2002 Mr. Humphries has held the position of Generator Excitation System Subject Matter Expert (SME), being responsible for the technical review of procurement specifications, the engineering and technical support of commissioning and maintenance activities on excitation control equipment for Duke Energy's generation fleet. Beginning in 2004, Gary began providing technical guidance and training to engineering and operations staff on the requirements of SERC/NERC standards pertaining to generation facilities. Gary contributed to the development of Duke Energy's dynamic model validation program and was a co-recipient of the EPRI Technology Transfer award for their extensive use of the EPRI Power Plant Parameter Derivation (PPPD) software to comply with SERC regional criteria related to AVR/Exciter Dynamic model validations.
Venkat S. Kolluri Manager, Transmission Planning	Entergy Corporation 639 Loyola Avenue L-ENT-6K New Orleans, Louisiana 70113	(504) 576-4045 vkollur@ entergy.com	Sharma Kolluri (SM' 86) has a MSEE from West Virginia University, Morgantown and MBA from University of Dayton. He worked for AEP Service Corporation in Columbus, Ohio from 1977 through 1984 in the Bulk Transmission Planning Group. In 1984 he joined Entergy Services Inc, where he is currently the Manager of Transmission Planning. Sharma has over 30 years of experience in Planning and Operations area and is actively involved in several IEEE subcommittees, NERC Standards Development Task Forces and EPRI. His main areas of interest are power system planning and operations, voltage and dynamic stability and reactive power planning. Sharma was selected as IEEE Fellow in 2010 for making innovative contributions in the voltage stability area.

Gary Kruempel	MidAmerican Energy Co. 4299 NW Urbandale Drive P.O. Box 657 Des Moines, Iowa 50303	(515) 281-2510 gekruempel@ midamerican.com	Gary Kruempel is Compliance Director for the Energy Supply department of MidAmerican Energy Company. Gary has been at MidAmerican Energy Company for over 37 years. He began his career on the engineering team for a nuclear plant planned to be built in central Iowa. He then worked on the commissioning team for a coal fired generating plant. Following that he was a part of a generation engineer department first as an engineer, then senior engineer, and a manager for a number of years. While in generation engineering, the group was involved in the project management and commissioning of a combustion turbine peaking plant and a combined cycle plant. Gary then was a general manager responsible for the operational management of the MidAmerican gas-fired, oil-fired, wind generation as well as its LNG storage facilities. Gary received his Bachelor of Science degree in Engineering Science from Iowa State University and his Masters of Science in Electrical Engineering also from Iowa State University. After graduating from Iowa State, he served in the U.S. Navy nuclear submarine service for six years.
Daniel J. Leonard	GE Energy 1 River Road Building 53, Room 341 Schenectady, New York 12345-6000	(518) 385-0165 daniel1.leonard@ ge.com	Daniel J. Leonard received an A.A. in Engineering from Berkshire Community College, Pittsfield, MA in 1988. He received a B.S. and M.S. in Electrical and Computer Engineering from Clarkson University, Potsdam, NY in 1990 and 1992, respectively. In the summers of his undergraduate education Mr. Leonard worked at the Westinghouse Power Equipment Department in Greentree, PA and the New York Power Pool in Guilderland, NY. Mr. Leonard joined GE in 1991 where he is presently a Managing Director in the Energy Consulting organization. His work at GE has focused on power system dynamics, power plant test, simulation and analysis. Mr. Leonard is a registered professional engineer in the state of New York. He was recipient of the 1992 IEEE/PES T. Burke Hayes Student Prize Paper Award, and is a member of IEEE PES.
Jason MacDowell Manager – Thermal & Renewables	GE Energy Management 1 River Road B53-310A Schenectady, New York 12345	(518) 385 2416 jason.macdowell@ ge.com	Jason MacDowell is Principal Engineer and Manager of the Thermal and Renewable Power Projects segment of GE's Energy Consulting organization. He has an Electrical Engineering degree from Clarkson University ('99) and MBA from Union University ('13). He has expertise in interconnecting renewable generation into the bulk power system, renewable plant design, dynamic modeling, model validation and performance testing of thermal and renewable plants as well as power system protection. He has lectured and provided consultation regarding growth and interconnection of renewable energy systems to many governments, grid companies, generation owners and universities around America and Asia and Europe, and has contributed to the drafting of multiple grid codes and

			standards worldwide specifically addressing renewable generation. He spent over two years living and working in Beijing, China, providing consultation to Chinese policy makers, utilities, generation owners and design institutes to develop higher levels of wind energy penetration and to provide solutions for sub-synchronous resonance. Mr. MacDowell is an instructor of GE's PSEC protective relaying and renewable energy courses and of UVIG's Short Course on Interconnection and Performance of Variable Generation. He has authored or co-authored over 35 technical publications and standards, is a member of IEEE, of NERC Integration of Variable Generation Task Force (IVGTF) and a balloting member of NERC Generator Verification Standards Drafting Team (GVSDT). He also serves as the Chair of IEEE Std. 551-2006, "The Violet Book - Calculating Short Circuit Currents in Industrial and Commercial Power Systems."
Craig Quist Director Transmission Development & Planning	PacifiCorp 1407 W. North Temple Suite 275 Salt Lake City, Utah 84116	(801) 220-4264 craig.quist@ pacificorp.com	Craig Quist joined the PacifiCorp Transmission Planning department in February 2001. Because of his broad system planning background, he has been assigned to coordinate and evaluate wind farms that requested interconnection with the PacifiCorp transmission system. He has been directly involved with the analysis of many existing and proposed wind farms in Oregon, Wyoming, Idaho and Utah. Because of his demonstrated understanding of advanced power system modeling tools, he has evaluated every aspects of wind farm integration with transmission systems. In 2007, Craig was promoted to the position of Manager of Transmission Development & Planning at PacifiCorp and in 2012 was promoted to Director of Transmission Development & Planning – East Side at PacifiCorp. Previously, Craig held senior level transmission planning positions at Nevada Power Company and Western Electricity Coordinating Council - Technical Staff, and was the Lead Power Systems Analyst for Leeds & Northrup Systems. While at Nevada Power, he testified before the Nevada Public Utilities Commission concerning implementation of FERC's Order 888 and 889 rules. Additionally, Craig has testified before the FERC concerning wind generation integration issues and has made technical presentations at AWEA (American Wind Energy Association), UWIG (Utility Wind Integration Group) and American Super Conductor (AMSC) wind generation conferences. Craig received a BSEE degree from the University of Utah in 1973 and has completed graduate level power systems engineering courses from the University of Utah and University of Colorado, Boulder. Craig is a registered professional engineer in the both the states of Utah and Nevada, and is a member of the Institute of Electrical and Electronics Engineers (IEEE). He is currently a member of the

			WECC Technical Studies Subcommittee and is Chairman of the WECC Wind Generation Task Force.
Balbir S. Sandhu Generation Reliability Compliance Engineer	Manitoba Hydro 360 Portage Place (20) Winnipeg, Manitoba R3C 2P4	(204)360-3408 bssandhu@ hydro.mb.ca	Retired
William D Shultz Engineering Manager	Southern Company Generation 42 Inverness Center Parkway Mail Bin B425 Birmingham AL 35242	(205) 992-5526 wdshultz@ southernco.com	Bill Shultz is presently Engineering Manager, Electrical Services and Field Support, Technical Services of Southern Company Generation. He has 29 years of experience in Generating Plant Technical Services, including protective equipment application, start-up commissioning, and maintenance of protective relaying and control systems for electric power generating plants. His work experience includes the commissioning and maintenance of the control and protection of static excitation systems, variable speed drives, and emergency generation. He is active in Southern Company reliability standards compliance efforts as well as being involved in regional and national organizations responsible for utility reliability standards. He holds a BSEE from the University of Tennessee, a MSEE from Auburn University, and is a registered Professional Engineer in the State of Alabama.
Vladimir Stanisic Senior Engineer	BC Hydro Edmonds A02 6911 Southpoint Drive, Burnaby, BC, V3N 4X8	(604) 515-8793 vladimir.stanisic@ bchydro.com	Retired
Chifong Thomas Senior Director, Transmission and Strategy	BrightSource Energy, Inc. 1999 Harrison Street, Suite 2150 Oakland, California 94612	(510) 250-8166 cthomas@ brightsourceenergy.com	Chifong Thomas is the Senior Director, Transmission and Strategy at BrightSource Energy, Inc., where she manages transmission interconnections for the development of utility scale solar thermal power plants ranging from 200 MW to 1,000 MW. She has more than 40 years of electric utility experience, more than 37 of which in electric transmission planning for the Pacific Gas and Electric Company (PG&E) transmission system from 60 kV to 500 kV. She has both conducted and supervised transmission planning studies to develop plans for the PG&E transmission system. She has served as expert witness in various regulatory and judicial forums; and participated in developing planning methodologies, processes and criteria for PG&E and the Western Electricity Coordinating Council (WECC). She is the past secretary of the WECC Planning Coordination Committee and past chair of the WECC Technical Studies Subcommittee. She also served on the Technical Advisory Committee (Electrical Engineering) to the California Board of Registration for Professional Engineers and Land Surveyors. Ms Thomas holds a Bachelor of Science Degree in Electrical

			Engineering from Washington State University and is a registered Electrical Engineer in the State of California. She is also a senior member of the Institute of Electrical and Electronics Engineers (IEEE).
Edward J. Wingard Engineering, Projects and Field Services	American Electric Power 1 Riverside Plaza Columbus, Ohio 43215	(614) 716-1296 ejwingard@ aep.com	Ed Wingard holds a bachelor's degree in electrical engineering from Gannon University. Ed is responsible for the inspection, testing and maintenance recommendations, including design basis documents, of generators' motors and excitation systems throughout the AEP system. He also is responsible for the recommendation and implementation of all aspects of related system upgrade projects. Ed has more than 32 years of experience with American Electric Power and has previously worked for the General Electric Co. in their Small DC Motor and Generator Department. Ed has previously had responsibility at AEP for motors, batteries and battery monitoring systems, synchronous condensers, generator auxiliary systems and generator monitoring systems. He has extensive experience in developing and delivering technical training at AEP sites and also has delivered training for other utilities and at manufacturer's facilities. Ed has been involved with NERC Planning Standards and Compliance for more than 14 years.
David Youngblood Generation Planning Lead for Advocacy Support	Luminant Energy 500 N Akard St, Dallas Texas 75201	(903) 360-6601 David.youngblood @luminant.com	David has an Electrical Engineering degree from The University of Texas at Arlington, an MBA from The University of Texas at Tyler, and is a registered Professional Engineer in the State of Texas with more than 40 years of experience in the utility industry, working for Luminant and its predecessor companies. David's early career was concentrated in transmission system protection and involved transmission system studies, relay coordination, field support, and event analysis. For the last 30 years, David has served Luminant Power as an electrical SME and was the supervisor of field support and relay testing for generating facilities. These responsibilities include the management of plant and plant switchyard relay conceptual design, calculation of relay settings, responsible for all AVR, PSS and excitation system testing, analysis of relay operations and reporting, coordination of SPS review and installation, and providing comments for proposed NERC standards under development and ERCOT protocol revision requests. David currently serves as the Lead for Advocacy Support, dedicating his resources and extensive experience to working with Standards Development projects.
Stephen Crutchfield Standards Developer	North American Electric Reliability Corporation 3343 Peachtree Road, NE 4th Floor East Tower – Suite 400	609-651-9455 Stephen.crutchfield @nerc.net	Stephen Crutchfield is the NERC Staff Coordinator for Project 2007-09, Generator Verification. Stephen began his career with NERC in May 2007. Prior to joining NERC, Stephen was a Project Manager with Shaw Energy Delivery Services, managing engineering and construction projects in the substation and transmission line fields.

	Atlanta, GA 30326		Stephen's background also includes experience with PJM as Manager of RTO Integration, working on the operations and markets integration of new members (AEP, ComEd, Dayton, Dominion and Duquesne) into PJM and southern seams operations issues with Progress Energy, Duke and TVA. Stephen also helped lead the team that was developing GridSouth in the dual roles of Organization Architect and Manager of Customer Support. Prior to GridSouth, Stephen was the Manager of Power System Operations Training at Progress Energy where he spent over 10 years training System Operators and Engineers. Overall, Stephen was with Progress Energy for 16 years. Stephen received his Bachelor of Arts in Physics from the University of Virginia and Masters of Science in Electrical Engineering from North Carolina State University. Stephen holds a Master of Science in Management degree, also from North Carolina State University.
