## Steps To be completed for each event evaluated.

1 Set-up Data collection in exact same order as the "Data" sheet of this work book. Data should be in this order:
Column A: Date and Time in this format, $\mathrm{mm} / \mathrm{dd} / \mathrm{yy} \mathrm{HH}: \mathrm{MM}: \mathrm{SS}$
Column B: Frequency Hz
Column C: Net Actual Interchange
Column D: Joint Owned Unit dynamic schedule
Column E: Non Conforming Load
Column F: Pumped Hydro
Column G: Ramping units
Column H: Transferred Frequency Response
Column I: Contingent BA Lost load or generatio
Column J: BA Bias Setting
Column K: BA Load
2 Note: Columns D, E, F, G and H are optional data. If you choose not to use these, leave the columns blank. Do not delete the columns. Use the sign ( $+/-$ ) convention defined in FRS Form 1 .
3 Note: Columns $\mathrm{D}, \mathrm{E}, \mathrm{F}, \mathrm{G}$ and H are optional data. If you choose not to use these, leave the columns blank. Do not dest
4 Data must be at 4 second sample rate for the full 25 minute minimum collection period that starts a minimum of two (2) minutes before the event begins and includes a minimum of 15 minutes after the beginning of the event.
The spreadsheet will work with up to 60 minutes of data. Be sure "Data" worksheet is clear of any old data.
If using PI historian as your data source, use "PasteSpecial/Values" to enter data into the spreadsheet. Do not include historian data collection formulas in the data
5 Once data is in place in the "Data" worksheet, determine when the beginning of the event occurred. This is accomplished by knowing the UTC event time from the master event list,
Convert the UTC event time to your PI data time and then scroll through the Data worksheet column B data of frequency and observe when frequency moves from the normal, pre-event frequency.
This will usually be a single change in frequency of 0.008 to 0.010 Hz more or less. Note the row number in the worksheet that this change occurs. In this sample data spreadsheet this occurs in row 237 of the data.
6 Edit cell "C8" of the "Entry Data" worksheet, change the formula in the cell "C8" to reference the row number identified in step 5 above. In the sample data of this workbook this formula is: "=Data!A237"
If the correct row is selected, the "Graph 20 to 52 s " worksheet will indicate the first change in frequency of the event on the center vertical grid line of the graph (Red Trend).
7 Determine the end of the event to be evaluated. Use the same rules that are used for DCS only look at frequency instead of ACE. Scroll down the frequency data in column B of the "Data" worksheet until frequency reaches 60 Hz or the pre-disturbance value. Note the row number in the worksheet that this occurs. In this sample data spreadsheet this occurs in row 323
8 Edit cell "C11" of the "Entry Data" worksheet, change the formula in the cell "C11" to reference the row number identified in step 7 above. In the sample data of this workbook this formula is: "=Data! A323"
In cell "R41" of the "Evaluation" spreadsheet, enter the MW value of the unit(s) that tripped (from the Master Event List). This is only necessary for the "Interconnection" evaluation if you're interested. It is not necessary to do this for the BA evaluation but it will provide a comparison of the BA frequency response as compared to the Interconnection frequency response.
10 Use the "copy" button provided to copy the evaluation and event specific data for the "FRS Form 1" of this field trial. This data is summarized in the correct order on worksheet "Form 1 Summary Data" of this workbook. Use PasteSpecial/Values when pasting the data into FRS Form 1 on the appropriate event row.

## Steps To be completed once at the initial setup of the evaluation spreadsheet for your BA.

A Enter the Balancing Authority name as you want it to appear on the graphs in cell "B1" of the "Entry Data" worksheet. For example: "NYISO".
C Enter your Balancing Authorities Frequency Response Obligation in cell "B2" of the "Entry Data" worksheet. For example: - $80 \mathrm{MW} / 0.1 \mathrm{~Hz}$ (This value could change annually) The time constant is located in cell "L13" of the "Evaluation" spreadsheet and should be edited for the types of generators in your BA. Presently this time constant is set at 0.35
The higher the value of the time constant, the faster the delivery of frequency response is expected. Setting the TC to 1.0 effectively turns off the delay and instantaneous frequency response will be modeled. Do not set higher than 1.0 This time constant is only used in the "Sustained" evaluation and is not used for the Field Trial evaluation of performance to the FRO
A typical setting for this time constant is 0.08 to 0.15 for hydro units, 0.10 to 0.20 for large steam turbines and 0.20 to 0.40 for combustion turbines.
By observing the slope of your "Interchange Actual" on the "Sustained" Graph, adjust the time constant until the initial slope of the "Target" is similar.
When set appropriately, the "Target" trend on the "Sustained" graph will model what Interchange Actual should have done during the event recovery period based on your minimum FRO,
Note: For ease of use, only the necessary worksheets are displayed. If you are interested in viewing graphs and other hidden worksheets, select the "tab" at the bottom, right click, select unhide and select the worksheet you wish to unhide.

## Steps To be completed for each event evaluated.

1 Set-up Data collection in exact same order as the "Data" sheet of this work book. Data should be in this order:
Column A: Date and Time in this format, mm/dd/yy HH:MM:SS
Column B: Frequency Hz
Column C: Net Actual Interchange
Column D: Joint Owned Unit dynamic schedule
Column E: Non Conforming Load
Column F: Pumped Hydro
Column G: Ramping units
Column H: Transferred Frequency Response
Column I: Contingent BA Lost load or generatio
Column J: BA Bias Setting
Column K: BA Load
2 Note: Columns D, E, F, G and H are optional data. If you choose not to use these, leave the columns blank. Do not delete the columns. Use the sign ( $+/-$ ) convention defined in FRS Form 1 .
3 Note: Columns $\mathrm{D}, \mathrm{E}, \mathrm{F}, \mathrm{G}$ and H are optional data. If you choose not to use these, leave the columns blank. Do not der
4 Data must be at 5 second sample rate for the full 25 minute minimum collection period that starts a minimum of two (2) minutes before the event begins and includes a minimum of 15 minutes after the beginning of the event.
The spreadsheet will work with up to 60 minutes of data. Be sure "Data" worksheet is clear of any old data.
If using PI historian as your data source, use "PasteSpecial/Values" to enter data into the spreadsheet. Do not include historian data collection formulas in the data. The data must be numbers not text.
5 Once data is in place in the "Data" worksheet, determine when the beginning of the event occurred. This is accomplished by knowing the UTC event time from the master event list
Convert the UTC event time to your PI data time and then scroll through the Data worksheet column B data of frequency and observe when frequency moves from the normal, pre-event frequency. This will usually be a single change in frequency of 0.008 to 0.010 Hz more or less. Note the row number in the worksheet that this change occurs. In this sample data spreadsheet this occurs in row 190 of the data.
6 Edit cell "C8" of the "Entry Data" worksheet, change the formula in the cell "C8" to reference the row number identified in step 5 above. In the sample data of this workbook this formula is: "=Data! A190" If the correct row is selected, the "Graph 20 to 52 s " worksheet will indicate the first change in frequency of the event on the center vertical grid line of the graph (Red Trend).
7 Determine the end of the event to be evaluated. Use the same rules that are used for DCS only look at frequency instead of ACE. Scroll down the frequency data in column B of the "Data" worksheet until frequency reaches 60 Hz or the pre-disturbance value. Note the row number in the worksheet that this occurs. In this sample data spreadsheet this occurs in row 258
8 Edit cell "C11" of the "Entry Data" worksheet, change the formula in the cell "C11" to reference the row number identified in step 7 above. In the sample data of this workbook this formula is: "=Data! A258"
In cell "R41" of the "Evaluation" spreadsheet, enter the MW value of the unit(s) that tripped (from the Master Event List). This is only necessary for the "Interconnection" evaluation if you're interested. It is not necessary to do this for the BA evaluation but it will provide a comparison of the BA frequency response as compared to the Interconnection frequency response.
10 Use the "copy" button provided to copy the evaluation and event specific data for the "FRS Form 1" of this field trial. This data is summarized in the correct order on worksheet "Form 1 Summary Data" of this workbook. Use PasteSpecial/Values when pasting the data into FRS Form 1 on the appropriate event row.

## Steps To be completed once at the initial setup of the evaluation spreadsheet for your BA.

A Enter the Balancing Authority name as you want it to appear on the graphs in cell "B1" of the "Entry Data" worksheet. For example: "NYISO".
C Enter your Balancing Authorities Frequency Response Obligation in cell "B2" of the "Entry Data" worksheet. For example: - $80 \mathrm{MW} / 0.1 \mathrm{~Hz}$ (This value could change annually) The time constant is located in cell "L13" of the "Evaluation" spreadsheet and should be edited for the types of generators in your BA. Presently this time constant is set at 0.35
The higher the value of the time constant, the faster the delivery of frequency response is expected. Setting the TC to 1.0 effectively turns off the delay and instantaneous frequency response will be modeled. Do not set higher than 1.0 this time constant is only used in the "Sustained" evaluation and is not used for the Field Trial evaluation of performance to the FRO
A typical setting for this time constant is 0.08 to 0.15 for hydro units, 0.10 to 0.20 for large steam turbines and 0.20 to 0.40 for combustion turbines.
By observing the slope of your "Interchange Actual" on the "Sustained" Graph, adjust the time constant until the initial slope of the "Target" is similar.
When set appropriately, the "Target" trend on the "Sustained" graph will model what Interchange Actual should have done during the event recovery period based on your minimum FRO
Note: For ease of use, only the necessary worksheets are displayed. If you are interested in viewing graphs and other hidden worksheets, select the "tab" at the bottom, right click, select unhide and select the worksheet you wish to unhide.

## Note: See "Instruction" tab for more detailed instructions.

| Step 1. | Copy and Paste Event Data into the appropriate cells of the "Data" worksheet. Maintain date and time format of $\mathrm{mm} / \mathrm{dd} / \mathrm{yy} \mathrm{hh}: \mathrm{mm}: \mathrm{ss}$. |
| :---: | :---: |
| Step 2. | Determine Time of $\mathrm{T}(0)$ and edit formula in cell "C8" to reference the correct row of the "Data" worksheet. <br> $T(0)$ is the first change in frequency of about $0.010 \mathrm{~Hz}(10 \mathrm{mHz})$ which should be the first scan of frequency data of the event. |
| Step 3. | Time of Frequency Recovery to 60 Hz or Pre-Perturbation Hz |
| Step 4. | Enter MW output of generator or load that caused event (+ for gen loss, - for load loss) (Value from NERC Event List. If multiple units, enter total MW loss.) If MW loss value is not known, enter a default 1000 MW. |
| Step 5. | Hit the big blue button to copy your data for pasting into FRS Form 1 "BA Event Data" worksheet. <br> Copy Form 2 Data for Pasting into Form 1 |
| Step 6. | Paste data into "FRS Form 1" in the appropriate row on the "BA Event Data" worksheet. |

Step 7. Save this workbook using the following file name format:MyBA_yymmdd_hhmm_FRS_Form2.xlsm
09/10/12 Date yymmdd

## Steps To be completed for each event evaluated.

1 Set-up Data collection in exact same order as the "Data" sheet of this work book. Data should be in this order:
Column A: Date and Time in this format, mm/dd/yy HH:MM:SS
Column B: Frequency Hz
Column C: Net Actual Interchange
Column D: Joint Owned Unit dynamic schedule
Column E: Non Conforming Load
Column F: Pumped Hydro
Column G: Ramping units
Column H: Transferred Frequency Response
Column I: Contingent BA Lost load or generatio
Column J: BA Bias Setting
Column K: BA Load
2 Note: Columns D, E, F, G and H are optional data. If you choose not to use these, leave the columns blank. Do not delete the columns. Use the sign ( $+/-$ ) convention defined in FRS Form 1 .
3 Note: Columns $\mathrm{D}, \mathrm{E}, \mathrm{F}, \mathrm{G}$ and H are optional data. If you choose not to use these, leave the columns blank. Do not der
4 Data must be at 6 second sample rate for the full 25 minute minimum collection period that starts a minimum of two (2) minutes before the event begins and includes a minimum of 15 minutes after the beginning of the event.
The spreadsheet will work with up to 60 minutes of data. Be sure "Data" worksheet is clear of any old data.
If using PI historian as your data source, use "PasteSpecial/Values" to enter data into the spreadsheet. Do not include historian data collection formulas in the data. The data must be numbers not text.
5 Once data is in place in the "Data" worksheet, determine when the beginning of the event occurred. This is accomplished by knowing the UTC event time from the master event list.
Convert the UTC event time to your PI data time and then scroll through the Data worksheet column B data of frequency and observe when frequency moves from the normal, pre-event frequency. This will usually be a single change in frequency of 0.008 to 0.010 Hz more or less. Note the row number in the worksheet that this change occurs. In this sample data spreadsheet this occurs in row 160 of the data.
6 Edit cell "C8" of the "Entry Data" worksheet, change the formula in the cell "C8" to reference the row number identified in step 5 above. In the sample data of this workbook this formula is: "=Data! A160" If the correct row is selected, the "Graph 20 to 52 s " worksheet will indicate the first change in frequency of the event on the center vertical grid line of the graph (Red Trend).
7 Determine the end of the event to be evaluated. Use the same rules that are used for DCS only look at frequency instead of ACE. Scroll down the frequency data in column B of the "Data" worksheet until frequency reaches 60 Hz or the pre-disturbance value. Note the row number in the worksheet that this occurs. In this sample data spreadsheet this occurs in row 217
8 Edit cell "C11" of the "Entry Data" worksheet, change the formula in the cell "C11" to reference the row number identified in step 7 above. In the sample data of this workbook this formula is: "=Data! A217"
In cell "R41" of the "Evaluation" spreadsheet, enter the MW value of the unit(s) that tripped (from the Master Event List). This is only necessary for the "Interconnection" evaluation if your interested. It is not necessary to do this for the BA evaluation but it will provide a comparison of the BA frequency response as compared to the Interconnection frequency response.
10 Use the "copy" button provided to copy the evaluation and event specific data for the "FRS Form 1" of this field trial. This data is summarized in the correct order on worksheet "Form 1 Summary Data" of this workbook. Use PasteSpecial/Values when pasting the data into FRS Form 1 on the appropriate event row.

## Steps To be completed once at the initial setup of the evaluation spreadsheet for your BA.

A Enter the Balancing Authority name as you want it to appear on the graphs in cell "B1" of the "Entry Data" worksheet. For example: "NYISO".
C Enter your Balancing Authorities Frequency Response Obligation in cell "B2" of the "Entry Data" worksheet. For example: - $80 \mathrm{MW} / 0.1 \mathrm{~Hz}$ (This value could change annually) The time constant is located in cell "L13" of the "Evaluation" spreadsheet and should be edited for the types of generators in your BA. Presently this time constant is set at 0.35
The higher the value of the time constant, the faster the delivery of frequency response is expected. Setting the TC to 1.0 effectively turns off the delay and instantaneous frequency response will be modeled. Do not set higher than 1.0 this time constant is only used in the "Sustained" evaluation and is not used for the Field Trial evaluation of performance to the FRO
A typical setting for this time constant is 0.08 to 0.15 for hydro units, 0.10 to 0.20 for large steam turbines and 0.20 to 0.40 for combustion turbines.
A typical setting for this time constant is 0.08 to 0.15 for hydro units, 0.10 to 0.20 for large steam torbars of your "Interchange Actual" on the "Sustained" Graph, adjust the time constant until the initial slope of the "Target" is similar.
When set appropriately, the "Target" trend on the "Sustained" graph will model what Interchange Actual should have done during the event recovery period.
Note: For ease of use, only the necessary worksheets are displayed. If you are interested in viewing graphs and other hidded worksheets, select the "tab" at the bottom, right click, select unhide and select the worksheet you wish to unhide.

## Note: See "Instruction" tab for more detailed instructions.

| Step 1. | Copy and Paste Event Data into the appropriate cells of the "Data" worksheet. Maintain date and time format of $\mathrm{mm} / \mathrm{dd} / \mathrm{yy} \mathrm{hh}: \mathrm{mm}: \mathrm{ss}$. |
| :---: | :---: |
| Step 2. | Determine Time of $\mathrm{T}(0)$ and edit formula in cell "C8" to reference the correct row of the "Data" worksheet. <br> $\mathrm{T}(0)$ is the first change in frequency of about $0.010 \mathrm{~Hz}(10 \mathrm{mHz})$ which should be the first scan of frequency data of the event. |
| Step 3. | Time of Frequency Recovery to 60 Hz or Pre-Perturbation Hz |
| Step 4. | Enter MW output of generator or load that caused event (+ for gen loss, - for load loss) (Value from NERC Event List. If multiple units, enter total MW loss.) If MW loss value is not known, enter a default 1000 MW. |
| Step 5. | Hit the big blue button to copy your data for pasting into FRS Form 1 "BA Event Data" worksheet. <br> Copy Form 2 Data for Pasting into Form 1 |
| Step 6. | Paste data into "FRS Form 1" in the appropriate row on the "BA Event Data" worksheet. |

Step 7. Save this workbook using the following file name format:MyBA_yymmdd_hhmm_FRS_Form2.xlsm
09/10/12 Date yymmdd
2:27 Time hh:ss of T(0)

2 seconds Date: Time of $\mathrm{T}(0)$ Time of Frequency Recovery to 60 Hz or Pre-Perturbation Hz Value A Pre-Perturbation Average Frequency [ $T(-2)$ to $T(-16)]$ Value B Post-Perturbation Average Frequency [ $T(+20$ to $T(+52)$ ]

Pre to Post Perturbation Delta Frequency Actual Value A Pre-Perturbation Average Interchange MW [T(-2 ) to $\mathrm{T}(-16)]$ Value B Post-Perturbation Average Interchange MW [T(+20 to T(+52)]

## Steps To be completed for each event evaluated

1 Set-up Data collection in exact same order as the "Data" sheet of this work book. Data should be in this order:
Column A: Date and Time in this format, $\mathrm{mm} / \mathrm{dd} / \mathrm{yy} \mathrm{HH}: \mathrm{MM}: \mathrm{SS}$
Column B: Frequency Hz
Column C: Total Lost Generation: enter the MW data of the units that tripped as a single generator where the value typically goes to zero at $\mathrm{t}(0)$
Column D: not applicable
Column E: Non Conforming Load
Column F: Pumped Hydro Column G: not applicable Column H: not applicable Column I: not applicable Column J: BA Bias Setting Column K: BA Load

2 Note: Columns D, E, F, G and H are optional data. If you choose not to use these, leave the columns blank. Do not delete the columns. Use the sign ( $+/-$ ) convention defined in FRS Form 1
3 Data compression must be turned off for each data point. Quality data will give you quality results in the evaluation.
4 Data must be at 2 second sample rate for the full 25 minute minimum collection period that starts a minimum of two (2) minutes before the event begins and includes a minimum of 15 minutes after the beginning of the event The spreadsheet will work with larger sample size data.
If using PI historian as your data source, use "PasteSpecial/Values" to enter data into the spreadsheet. Do not include historian data collection formulas in the data
5 Once data is in place in the "Data" worksheet, determine when the beginning of the event occurred. This is accomplished by knowing the UTC event time from the master event list. Convert the UTC event time to your PI data time and then scroll through the Data worksheet column B data of frequency and observe when frequency moves from the normal, pre-event frequency. This will usually be a single change in frequency of 0.008 to 0.010 Hz more or less. Note the row number in the worksheet that this change occurs. In this sample data spreadsheet this occurs in row 469 of the data.
6 Edit cell "C8" of the "Entry Data" worksheet, change the formula in the cell "C8" to reference the row number identified in step 5 above. In the sample data of this workbook this formula is: "=Data!A469"
7 Determine the end of the event to be evaluated. Use the same rules that are used for DCS only look at frequency instead of ACE. Scroll down the frequency data in column B of the "Data" worksheet until frequency reaches 60 Hz or the pre-disturbance value. Note the row number in the worksheet that this occurs. In this sample data spreadsheet this occurs in row 633
8 Edit cell "C11" of the "Entry Data" worksheet, change the formula in the cell "C11" to reference the row number identified in step 7 above. In the sample data of this workbook this formula is: "=Data!A633"
9 In cell "R41" of the "Evaluation" spreadsheet, enter the MW value of the unit(s) that tripped (from the Master Event List). This is only necessary for the "Interconnection" evaluation if you're interested. It is not necessary to do this for the BA evaluation but it will provide a comparison of the BA frequency response as compared to the Interconnection frequency response.
10 Use the "copy" button provided to copy the evaluation and event specific data for the "FRS Form 1" of this field trial. This data is summarized in the correct order on worksheet "Form 1 Summary Data" of this workbook. Use PasteSpecial/Values when pasting the data into FRS Form 1 on the appropriate event row.

## Steps To be completed once at the initial setup of the evaluation spreadsheet for your BA.

A Enter the Balancing Authority name as you want it to appear on the graphs in cell "B1" of the "Entry Data" worksheet. For example: "NYISO"
B Enter your Balancing Authorities Frequency Response Obligation in cell "B2" of the "Entry Data" worksheet. For example: $-80 \mathrm{MW} / 0.1 \mathrm{~Hz}$ (This value could change annually)

## Steps To be completed for each event evaluated

1 Set-up Data collection in exact same order as the "Data" sheet of this work book. Data should be in this order:
Column A: Date and Time in this format, $\mathrm{mm} / \mathrm{dd} / \mathrm{yy}$ HH:MM:SS
Column B: Frequency Hz
Column C: Total Lost Generation: enter the MW data of the units that tripped as a single generator where the value typically goes to zero at $\mathrm{t}(0)$.
Column D: not applicable
Column E: Non Conforming Load
Column F: Pumped Hydro Column G: not applicable Column H: not applicable
Column I: not applicable
Column J: BA Bias Setting
Column K: BA Load
2 Note: Columns D, E, F, G and H are optional data. If you choose not to use these, leave the columns blank. Do not delete the columns. Use the sign ( $+/-$ ) convention defined in FRS Form 1
3 Data compression must be turned off for each data point. Quality data will give you quality results in the evaluation.
4 Data must be at 3 second sample rate for the full 25 minute minimum collection period that starts a minimum of two (2) minutes before the event begins and includes a minimum of 15 minutes after the beginning of the event The spreadsheet will work with larger sample size data.
If using PI historian as your data source, use "PasteSpecial/Values" to enter data into the spreadsheet. Do not include historian data collection formulas in the data. The data must be numbers not text.
5 Once data is in place in the "Data" worksheet, determine when the beginning of the event occurred. This is accomplished by knowing the UTC event time from the master event list. Convert the UTC event time to your PI data time and then scroll through the Data worksheet column B data of frequency and observe when frequency moves from the normal, pre-event frequency. This will usually be a single change in frequency of 0.008 to 0.010 Hz more or less. Note the row number in the worksheet that this change occurs. In this sample data spreadsheet this occurs in row 313 of the data.
6 Edit cell "C8" of the "Entry Data" worksheet, change the formula in the cell "C8" to reference the row number identified in step 5 above. In the sample data of this workbook this formula is: "=Data!A313"
7 Determine the end of the event to be evaluated. Use the same rules that are used for DCS only look at frequency instead of ACE. Scroll down the frequency data in column B of the "Data" worksheet until frequency reaches 60 Hz or the pre-disturbance value. Note the row number in the worksheet that this occurs. In this sample data spreadsheet this occurs in row 424
Edit cell "C11" of the "Entry Data" worksheet, change the formula in the cell "C11" to reference the row number identified in step 7 above. In the sample data of this workbook this formula is: "=Data!A424" Skip for single BA Interconnections.

10 Use the "copy" button provided to copy the evaluation and event specific data for the "FRS Form 1" of this field trial. This data is summarized in the correct order on worksheet "Form 1 Summary Data" of this workbook. Use PasteSpecial/Values when pasting the data into FRS Form 1 on the appropriate event row.

## Steps To be completed once at the initial setup of the evaluation spreadsheet for your BA.

A Enter the Balancing Authority name as you want it to appear on the graphs in cell "B1" of the "Entry Data" worksheet. For example: "NYISO"
B Enter your Balancing Authorities Frequency Response Obligation in cell "B2" of the "Entry Data" worksheet. For example: -80 MW/0.1 Hz (This value could change annually)

| $\mathrm{mm} / \mathrm{dd} / \mathrm{yy}$ hh:mm:ss Time ( T ) | Frequency <br> Hz | Total <br> Lost Generation MW | JOU <br> Dynamic Schedules n/a | NonConforming Load Load (-) MW | $\begin{gathered} \text { Pumped } \\ \text { Hydro } \\ \text { Load (-) Gen (+) } \\ \text { MW } \end{gathered}$ | Ramping Units n/a | Transferred <br> Frequency Response n/a | $\begin{gathered} \text { Contingent } \\ \text { BA } \\ \text { Lost Generation } \\ \mathrm{n} / \mathrm{a} \end{gathered}$ | BA <br> Bias <br> Setting <br> MW/0.1 Hz | BA Load MW |

## Standards Announcement Project 2007-12 Frequency Response Initial Ballot Window and Non-Binding Poll Now Open: Nov. 30 - Dec. 9, 2011

## Available Now

An initial ballot of BAL-003-1 - Frequency Response and Frequency Bias Setting and its associated implementation plan, and a non-binding poll of the associated VRFs and VSLs, are open through 8 p.m. Eastern on Friday, December 9, 2011.

In addition to the standard and implementation plan, the following documents have been posted for stakeholder review and comment:

- Consideration of Comments Report - Provides a summary of the modifications made to the proposed standard and supporting documents based on comments submitted during the formal comment period that ended March 7, 2011
- Frequency Response Standard Background Document - Provides an explanation of each of the proposed requirements; identifies how the proposed standard proposes to address FERC directives from Order 693; and on the last page provides an overview of the field trial (currently in Step 4)
- Attachment A - ERO's Process for assigning a Frequency Response Obligation and Frequency Bias Setting to each Balancing Authority
- Attachment B - ERO's Process for Adjusting Minimum Frequency Bias Setting
- FRS Form 1 (four versions - one for each of the four Interconnections) and FRS Form 2 (seven versions - two to collect data for Interconnections with a single Balancing Authority at two second and three second intervals; five to collect data for Interconnections with multiple Balancing Authorities at two second, three second, four second, five second and six second intervals) - Both Form 1 and Form 2 are proposed for the ERO's use (in conjunction with Attachment A) in determining each Interconnection's necessary amount of Frequency Response for allocation to Balancing Authorities. Instructions are now on the first page of each FRS Form 1 and FRS Form 2
- Mapping Document - Identifies each requirement in the already approved BAL-003-0.1b and identifies how that requirement has been treated in the revisions proposed in BAL-003-1.
- Unofficial comment form in Word format - This is for informal use when compiling responses - the final must be submitted electronically.

## Instructions for Balloting

Members of the ballot pools associated with this project may log in and submit their vote for the standard and opinion for the non-binding poll from the following page:
https://standards.nerc.net/CurrentBallots.aspx

## I nstructions for Commenting

A formal comment period is open through 8 p.m. Eastern on Friday, December 9, 2011. Please use this electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Monica Benson at monica.benson@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page.

## Special Instructions for Submitting Comments with a Ballot

Please note that comments submitted during the formal comment period, the ballot for the standard, and the non-binding poll of VRFs and VSLs all use the same electronic form, and it is NOT necessary for ballot pool members to submit more than one set of comments (one through the electronic form, one with the ballot, and one with the non-binding poll). The drafting team requests that all stakeholders (ballot pool members as well as other stakeholders) submit all comments through the electronic comment form.

Please use this electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Monica Benson at monica.benson@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page.

## Next Steps

The drafting team will consider all comments and determine what changes to make in response to stakeholder input from the comments.

## Background

Frequency Response, a measure of an Interconnection's ability to stabilize frequency immediately following the sudden loss of generation or load, is a critical component to the reliable operation of the bulk power system, particularly during disturbances and restoration. The proposed standard's intent is to collect data needed to accurately analyze existing Frequency Response, set a minimum Frequency Response obligation, provide a uniform calculation of Frequency Bias Settings that transition to values closer to Frequency Response, and encourage coordinated AGC operation. There is evidence of continuing decline in Frequency Response over the past 10 years, but no confirmed reason for the apparent decline. The proposed standard requires entities to provide data so that Frequency Response in each of the Interconnections can be analyzed, and the reasons for the decline in Frequency Response
can be identified. Once Frequency Response has been analyzed and confirmed, requirements can be modified to maintain reliability.

Additional information is available on the project webpage.
A stakeholder interested in following the Frequency Response Standard Drafting Team's development of BAL-003-1 may monitor meeting agendas and notes on the team's "Related Files" web page or may submit a request to join the team's "plus" email list to receive meeting agendas and meeting notes as they are distributed to the team. To join the team's "plus" email list, send a note to sarcomm@nerc.net and include the project's name in the subject line.

## Standards Development Process

The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate. For more information or assistance, please contact Monica Benson at monica.benson@nerc.net.

For more information or assistance, please contact Monica Benson, Standards Process Administrator, at monica.benson@nerc.net or at 404-446-2560.

## Available Now

BAL-003-1 - Frequency Response and Frequency Bias Setting, an implementation plan and several additional associated documents (listed below) have been posted for a formal comment period and initial ballot that will end at 8 p.m. Eastern on Thursday, December 8, 2011. Ballot pools are being formed and the ballot pool windows are open through 8 a.m. Eastern on Wednesday, November 23.

The following associated documents have been posted for stakeholder review and comment:

- Consideration of Comments Report - Provides a summary of the modifications made to the proposed standard and supporting documents based on comments submitted during the formal comment period that ended March 7, 2011
- Frequency Response Standard Background Document - Provides an explanation of each of the proposed requirements; identifies how the proposed standard proposes to address FERC directives from Order 693; and on the last page provides an overview of the field trial (currently in Step 4)
- Attachment A - ERO's Process for assigning a Frequency Response Obligation and Frequency Bias Setting to each Balancing Authority
- Attachment B - ERO's Process for Adjusting Minimum Frequency Bias Setting
- FRS Form 1 (four versions - one for each of the four Interconnections) and FRS Form 2 (seven versions - two to collect data for Interconnections with a single Balancing Authority at two second and three second intervals; five to collect data for Interconnections with multiple Balancing Authorities at two second, three second, four second and five second intervals) Both forms are proposed for the ERO's use (in conjunction with Attachment A) in determining each Interconnection's necessary amount of Frequency Response for allocation to Balancing Authorities. Instructions are now on the first page of each FRS Form 1 and FRS Form 2
- Mapping Document - Identifies each requirement in the already approved BAL-003-0.1b and identifies how that requirement has been treated in the revisions proposed in BAL-003-1.
- Unofficial comment form in Word format - This is for informal use when compiling responses - the final must be submitted electronically

## I nstructions for J oining Ballot Pools for BAL-003-1 and Associated VRFs/ VSLs

Two separate ballot pools are being formed - one ballot pool for Registered Ballot Body (RBB) members interested in balloting of BAL-003-1, and a second for RBB members interested in casting an opinion during the non-binding poll of VRFs and VSLs associated with BAL-003-1. RBB members who join the ballot pool for the standard will not be automatically entered in the ballot pool for the non-binding poll, but must elect to join the second ballot pool.

To join the ballot pool to be eligible to vote in the upcoming ballots and non-binding poll go to: Join Ballot Pool

During the pre-ballot windows, members of the ballot pool may communicate with one another by using their "ballot pool list server." (Once the balloting begins, ballot pool members are prohibited from using the ballot pool list servers.)
The list server for the initial ballot is: bp-2007-12 Freq Resp in@nerc.com Non-Binding Poll list server: bp-2007-12 NB OCT2011 in@nerc.com

## Instructions for Commenting

Please use this electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Monica Benson at monica.benson@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page.

## Next Steps

The drafting team is planning a webinar in November to explain changes to the most recent draft of BAL-003-1. The date and registration information will be announced as soon as the details are finalized. An initial ballot of BAL-003-1 will be conducted beginning on Tuesday, November 29, 2011 through 8 p.m. Eastern on Thursday, December 8, 2011.

## Background

Frequency Response, a measure of an Interconnection's ability to stabilize frequency immediately following the sudden loss of generation or load, is a critical component to the reliable operation of the bulk power system, particularly during disturbances and restoration. The proposed standard's intent is to collect data needed to accurately analyze existing Frequency Response, set a minimum Frequency Response obligation, provide a uniform calculation of Frequency Bias Settings that transition to values closer to Frequency Response, and encourage coordinated AGC operation. There is evidence of continuing decline in Frequency Response over the past 10 years, but no confirmed reason for the apparent decline. The proposed standard requires entities to provide data so that Frequency Response in each of the Interconnections can be analyzed, and the
reasons for the decline in Frequency Response can be identified. Once Frequency Response has been analyzed and confirmed, requirements can be modified to maintain reliability.

## Available Now

BAL-003-1 - Frequency Response and Frequency Bias Setting, an implementation plan and several additional associated documents (listed below) have been posted for a formal comment period and initial ballot that will end at 8 p.m. Eastern on Thursday, December 8, 2011. Ballot pools are being formed and the ballot pool windows are open through 8 a.m. Eastern on Wednesday, November 23.

The following associated documents have been posted for stakeholder review and comment:

- Consideration of Comments Report - Provides a summary of the modifications made to the proposed standard and supporting documents based on comments submitted during the formal comment period that ended March 7, 2011
- Frequency Response Standard Background Document - Provides an explanation of each of the proposed requirements; identifies how the proposed standard proposes to address FERC directives from Order 693; and on the last page provides an overview of the field trial (currently in Step 4)
- Attachment A - ERO's Process for assigning a Frequency Response Obligation and Frequency Bias Setting to each Balancing Authority
- Attachment B - ERO's Process for Adjusting Minimum Frequency Bias Setting
- FRS Form 1 (four versions - one for each of the four Interconnections) and FRS Form 2 (seven versions - two to collect data for Interconnections with a single Balancing Authority at two second and three second intervals; five to collect data for Interconnections with multiple Balancing Authorities at two second, three second, four second and five second intervals) Both forms are proposed for the ERO's use (in conjunction with Attachment A) in determining each Interconnection's necessary amount of Frequency Response for allocation to Balancing Authorities. Instructions are now on the first page of each FRS Form 1 and FRS Form 2
- Mapping Document - Identifies each requirement in the already approved BAL-003-0.1b and identifies how that requirement has been treated in the revisions proposed in BAL-003-1.
- Unofficial comment form in Word format - This is for informal use when compiling responses - the final must be submitted electronically

## I nstructions for J oining Ballot Pools for BAL-003-1 and Associated VRFs/ VSLs

Two separate ballot pools are being formed - one ballot pool for Registered Ballot Body (RBB) members interested in balloting of BAL-003-1, and a second for RBB members interested in casting an opinion during the non-binding poll of VRFs and VSLs associated with BAL-003-1. RBB members who join the ballot pool for the standard will not be automatically entered in the ballot pool for the non-binding poll, but must elect to join the second ballot pool.

To join the ballot pool to be eligible to vote in the upcoming ballots and non-binding poll go to: Join Ballot Pool

During the pre-ballot windows, members of the ballot pool may communicate with one another by using their "ballot pool list server." (Once the balloting begins, ballot pool members are prohibited from using the ballot pool list servers.)
The list server for the initial ballot is: bp-2007-12 Freq Resp in@nerc.com Non-Binding Poll list server: bp-2007-12 NB OCT2011 in@nerc.com

## Instructions for Commenting

Please use this electronic form to submit comments. If you experience any difficulties in using the electronic form, please contact Monica Benson at monica.benson@nerc.net. An off-line, unofficial copy of the comment form is posted on the project page.

## Next Steps

The drafting team is planning a webinar in November to explain changes to the most recent draft of BAL-003-1. The date and registration information will be announced as soon as the details are finalized. An initial ballot of BAL-003-1 will be conducted beginning on Tuesday, November 29, 2011 through 8 p.m. Eastern on Thursday, December 8, 2011.

## Background

Frequency Response, a measure of an Interconnection's ability to stabilize frequency immediately following the sudden loss of generation or load, is a critical component to the reliable operation of the bulk power system, particularly during disturbances and restoration. The proposed standard's intent is to collect data needed to accurately analyze existing Frequency Response, set a minimum Frequency Response obligation, provide a uniform calculation of Frequency Bias Settings that transition to values closer to Frequency Response, and encourage coordinated AGC operation. There is evidence of continuing decline in Frequency Response over the past 10 years, but no confirmed reason for the apparent decline. The proposed standard requires entities to provide data so that Frequency Response in each of the Interconnections can be analyzed, and the
reasons for the decline in Frequency Response can be identified. Once Frequency Response has been analyzed and confirmed, requirements can be modified to maintain reliability.

Additional information is available on the project webpage.
A stakeholder interested in following the Frequency Response Standard Drafting Team's development of BAL-003-1 may monitor meeting agendas and notes on the team's "Related Files" web page or may submit a request to join the team's "plus" email list to receive meeting agendas and meeting notes as they are distributed to the team. To join the team's "plus" e-mail list, send an e-mail to: sarcomm@nerc.com. Please include the drafting team name in your e-mail request.

## Standards Development Process

The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate. For more information or assistance, please contact Monica Benson at monica.benson@nerc.net.

For more information or assistance, please contact Monica Benson, Standards Process Administrator, at monica.benson@nerc.net or at 404-446-2560.

## Standards Announcement

Project 2007-12 Frequency Response

## I nitial Ballot and Non-Binding Poll Results

## Now Available

An initial ballot and non-binding poll of BAL and its implementation plan concluded on December 9, 2011. Voting statistics are listed below, and the Ballot Results webpage provides a link to the detailed initial ballot results.

Initial Ballot Results
Quorum: 93.92\%
Approval: 30.82\%

## Non-Binding Poll Results

89.49\% of those who registered to participate provided an opinion or abstention; $37 \%$ of those who provided an opinion indicated support for the VRFs and VSLs that were proposed.

## Next Steps

The drafting team will consider all comments received during the comment period and ballot.

## Background

Frequency Response, a measure of an Interconnection's ability to stabilize frequency immediately following the sudden loss of generation or load, is a critical component to the reliable operation of the bulk power system, particularly during disturbances and restoration. The proposed standard's intent is to collect data needed to accurately analyze existing Frequency Response, set a minimum Frequency Response obligation, provide a uniform calculation of Frequency Bias Settings that transition to values closer to Frequency Response, and encourage coordinated AGC operation. There is evidence of continuing decline in Frequency Response over the past 10 years, but no confirmed reason for the apparent decline. The proposed standard requires entities to provide data so that Frequency Response in each of the Interconnections can be analyzed, and the reasons for the decline in Frequency Response can be identified. Once Frequency Response has been analyzed and confirmed, requirements can be modified to maintain reliability. Additional information is available on the project webpage.

A stakeholder interested in following the Frequency Response Standard Drafting Team's development of

BAL-003-1 may monitor meeting agendas and notes on the team's "Related Files" webpage or may submit a request to join the team's "plus" email list to receive meeting agendas and meeting notes as they are distributed to the team. To join the team's "plus" email list, send a note to sarcomm@nerc.net and include the project's name in the subject line.

## Standards Development Process

The Standard Processes Manual contains all the procedures governing the standards development process. The success of the NERC standards development process depends on stakeholder participation. We extend our thanks to all those who participate.

Regarding R1, BPA believes that adding additional requirements in R1 by referencing Attachment A does not add clarity. FRO should be a calculation that the BA's can do themselves and included within the standard. Can Form 1 be changed outside of the standard drafting process? BPA doesn't believe that Form 1 should be allowed to be changed outside of the standard drafting process. As drafted, Requirement R1 requires Balancing Authorities or Reserve Sharing Groups (RSGs) to achieve an annual Frequency Response Measure (FRM) that is equal to or more negative than its Frequency Response Obligation (FRO). As RSGs exist today, FRM performance by an RSG is not contemplated in the definition of FRM and appears to apply more towards 'secondary response'. BPA recommends clarifying this concept and possibly including an example in the background document to help explain how this would work. Regarding R2, BPA believes each BA should be able to calculate its own frequency bias setting without ERO validation. The standard can require the BA to use Form 1, if the BA doesn't use Form 1 correctly, then the BA would be in violation of the standard. BPA believes that R3 should include a minimal amount of time (suggesting a couple of hours per year) to allow for testing other modes. Requirement R3 requires each Balancing Authority not receiving Overlap Regulation Service to operate its AGC in Tie Line Bias mode... unless such operation would have an Adverse Reliability Impact on the Balancing Authority's Area. There may be occasions in which an entity needs to perform testing or other instances where it is necessary or desirable to operate in a mode other than Tie Line Bias that does not qualify as an Adverse Reliability Impact, but never the less is necessary or desired. BPA recommends including language that would permit operation other than Tie Line Bias mode provided the Reliability Coordinator was notified. BPA seeks clarification from the drafting team as to whether or not there will be any conflicts between proposed Requirement R3 and the requirements of FERC-approved regional reliability standard BAL-004-WECC-1 - Automatic Time Error Correction. BPA agrees with the concept of R4, however, BPA again disagrees with the ERO validation of the frequency bias setting. BPA believes that reducing frequency bias obligation is detrimental to reliability. It seems that lowering the Minimum Frequency Bias Setting from 1\% to .8\% will result in a lower response, which in turn will lower the natural frequency response. BPA believes that over time, it would seem that this pattern would lead to poorer response. BPA believes that R5 should read "greater than or equal to one of the following" not " at least equal to". The requirement should be a part of Form 1 or included in R2. For variable bias, the minimum percentage should be based on the forecasted month peak.
Yes

No
BPA believes that historian data should be able to be used for evidence.
No
BPA believes that R1 needs to be more clear and concise as to what is being conveyed in the requirement. It is difficult to understand. The proposed VSLs for Requirement R1 treats a BA that did not meet the FRO requirement differently depending on whether or not the Interconnection met the FRO requirement. The obligation of the BA to meet its allocated FRO should be consistent regardless of what the other entities within the interconnection are doing. Suggest removing the interconnection performance from the VSLs and developing four increasing levels of BA failure to meet its FRO. BPA believes that conforming changes to the VSLs would need to be made for any changes to the Requirements as suggested in the comments to the standard.
No
BPA believes that Attachment A adds additional requirements to the standard. Confusion exists between Attachment A and the Background Document. Attachment A states peak load allocation is based on "Projected" Peak Loads and Generation, but the Background Document states it will use "historical" Peak Load and Generation. 3a: it may take longer than 8 seconds in some disturbances. This should be 10 seconds. . 05 Hz Delta F is not low enough for the Western Interconnection, it should be .075 Hz to ensure there is measurable frequency response for the interconnection. Also, under frequency should be set at 59.95 Hz . BPA does not believe there is a reliability need to include over frequency events. 3b: It is unclear if the 18 seconds is setting the $B$ point. If this is the B point, BPA believes it should be changed to 25 seconds for the Western Interconnection. 4. Please define relatively steady and near 60 Hz . 6: For the Western Interconnection, BPA believes this needs to be 10 minutes at the top of the hour. As mid hour scheduling becomes more prevalent, the ramping at
the bottom of the hour will have to be taken into account. FRO for the interconnection: Starting frequency should be the FTL limit. With RBC in place, the frequency is seldom at 60 Hz . BPA understands the theory behind setting the base obligation to the values listed in table 2. BPA would like to know if there were any studies performed to validate setting the FRO for the interconnection to such a low level? BA FRO and frequency bias setting: BPA does not agree with ERO assigning a Frequency Bias setting to each BA. This calculation is indicated as the initial FRO allocation, what is the process for changing it? BPA believes this should go through the standard drafting process for any changes. The calculation should use Peak online capacity, not the installed capacity. This would lead to the denominator being $2 \times$ Peak projected load for the interconnection. BPA has approximately 35,000 MW of installed generation, and has never seen the actual coincidental generation go over $21,000 \mathrm{MW}$. Again, BPA doesn't believe the ERO should be validating the frequency bias setting. It is unclear to BPA how variable bias is being addressed in the standard.

No
BPA understands the concept and we disagree with it. As the ERO continues to lower the required minimum frequency bias setting for an interconnection, the BA's that have frequency response higher than the $1 \%$ will have a higher percentage of the frequency response of the interconnection. Also, this standard is primarily measuring AGC response, not natural frequency response; therefore not lowering the limit is appropriate.
No
BPA believes the form is not easily understood and is overly complicated for what it is trying to accomplish. BPA believes the form might work for an internal evaluation, just not for an external audit. Compliance is based on this form. BPA believes the standard needs to be simplified and possibly returned to a data gathering standard.
BPA believes that an entity is not measuring frequency response from $20-52$ seconds; rather, that the entity is measuring AGC response which is based on the frequency bias term. This leads to a circular argument, because that entity would be using frequency bias setting in AGC to calculate frequency bias setting for the next year. Also, because an entity is measuring AGC response and net interchange and not taking pre-disturbance ACE into account, a BA frequency response may not be reflected in the spreadsheet. Example: If the BA has a positive ACE of 300 MW and the frequency component of ACE during an event is 200MW. Immediately following the disturbance, natural frequency response will drive net interchange up by 200MW. During the time frame being measured ( $20-52 \mathrm{sec}$ ), AGC response will drive the on control generation down by the original 300 MW ACE, which will look like the BA had an opposite response at the interconnections in the amount of 100MW. Form 1: It is unclear in Form 1 how variable bias BA's would implement this standard. There is a note identifying a tab to use, but it is unclear if that is the only requirement for variable bias BA's. In the comment responses to BPA, it was indicated that "the SDT will provide additional and sufficient direction related to variable bias after review of this issue during the field trial." BPA finds this response unacceptable and believes that it needs to be addressed in the standard prior to approval. BPA believes the standard should be easy to understand and implement and should not rely on the judgment of the ERO. BPA believes this standard needs to be simplified. BPA believes this standard is unclear as to if there is an upper limit to the amount of frequency response expected of the Balancing Authorities under this standard. Except for Table 2 in Attachment A, there is no discussion of an amount of Frequency Response expected on a total basis. Balancing Authorities need to know for how many tenths of a hertz they are to respond so they can determine how to plan to meet this requirement. The documents do not appear to provide any boundary on the maximum amount of Frequency Response that a BA will provide, i.e. it is not clear what will happen if an event occurs in the Eastern Interconnection that causes the frequency to drop to less than 59.6 Hz or in the Western Interconnection that causes the frequency to drop to less than 59.5 Hz , or if that event is excluded from the list used to calculate the Balancing Authorities' response or is it included with an expectation that it counts the same as any other event. Without a clear statement of what is expected, including whether there is a limit on that expectation or not, it is unclear what is expected of the Balancing Authorities. Lastly, BPA asks, why are there no requirements on governor installation, settings, and operation for a frequency response standard?

```
Howard F. Illian
Energy Mark, Inc.
```

Yes

No
Comment 1: The timing requirements for implementing the Frequency Bias Setting are not specified for BAs participating in Overlap Regulation Service. The requirements indicate the value that should be used for the Frequency Bias Setting, but they do not indicate when those settings should be implemented. Comment 2: The term "Tie Line Bias mode" in Requirement R3 is not sufficiently defined to make this requirement enforceable. Any operating mode labeled as "Tie Line Bias mode" on an EMS that uses interchange scheduled and frequency error as inputs will meet the standard requirement as stated. This loop-hole exists because the NERC definition of "Tie Line Bias" fails to define the term in enough detail to actually limit AGC operation to the specified mode of operation. One way to improve this requirement would be to redefine Tie Line Bias in the NERC Glossary as a mode that uses the NERC ACE Equation as defined in BAL-001 as the basis for AGC action when the EMS is in Tie Line Bias mode. Comment 3: The standard is silent on how a BA receiving Overlap Regulation Service should set its Frequency Bias Setting. Unless this is explicitly stated, it will be up to the auditors to determine the value of the Frequency Bias Setting for BAs receiving Overlap Regulation Service. Comment 4: In general, the requirements indicate what the responsible BAs should do and when. The requirements do not indicate what the BAs that are not responsible should do and when, ie. how they are relieved from responsibility. This may create problems when the auditors are required to interpret the standards for BAs that have appropriately shifted responsibilites to others.
No
Comment 5: See comments in the non-binding poll.
Yes

Yes

No
Comment 6: "If the ERO cannot identify in a given evaluation period 25 frequency excursion events satisfying the limits specified in criteria 3 below, then similar acceptable events from the previous evaluation period also satisfying listed criteria will be included with the data set by the ERO for determining FRS compliance." I believe that the better alternative in this case would be to use the lesser number of events. This is partly based on the consideration that if there are fewer events, the risk to the interconnection for that year was less that expected, and as a result, evaluation of fewer events will not compromise interconnection reliability. If fewer than 25 events are available in any year, the selection criteria should be adjusted to select more events. Comment 7: There are a number of problems with the use of "median" Frequency Response of the measured events. These problems make a choice other than median preferable. The following comments list some of those problems. Comment 8: The current standard uses average Frequency Response of selected events. This makes the current standard incompatible with the use of median. Comment 9: If a BA reconfigures during a measurement year, that reconfiguration will create a bi-modal distribution of the Frequency Response events. Median is incapable of representing a bi-modal distribution. The use of median will result in a standard that is incapable of measuring compliance effectively for an BA that is reconfigured during a measurement year (Dec 1 thru Nov 30). Comment 10: Any attempt to purchase additional Frequency Response from another BA for a portion of a measurement year will also cause a bi-modal distribution making the purchase of Frequency Response only effective for entire measurement years. Comment 11: Median is a non-linear measurement method. Because it is a non-linear measurement method, there is no valid way to manage partial year measurements. Comment 12: I will offer an alternative to median to the SDT before the end of the development of responses to these comments. Comment 13: The Minimum Frequency Bias Setting and the Frequency Response Obligation are both based on a method that assigns responsibility based on a Peak Load / Peak Generation share of the interconnection. However, the method used to set the Minimum Frequency Bias Setting is different than the method used to determine the Frequency Response Obligation. Using these two different methods could result in the Minimum Frequency Bias Setting being less that the FRO for a BA. The best way to correct this problem is to use that same allocation methodology for determining the FRO and the Minimum Frequency Bias Setting. This can be easily accomplished by modifying R5 to use the

FRO allocation method to determine the Minimum Frequency Bias Setting. This calculation would divide the numerator from the FRO allocation equation, divide it by two and multiply it by the percentage specified in Attachment B. In fact, the current FRS Form 1 uses this equation with projected rather than historic data. The best alternative would be to modify the R5 in the standard to match the FRO allocation method and modify FRS Form 1 to use historic data instead of projected data. This would result in only one set of Peak Load and Peak Generation data throughout the standard, rather than three different sets of data as currently written. When multiple sets of the same or similar data are used within a single standard, it only creates confusion and errors in the result. No
Comment 14: Some of the information in this document concerning the Frequency Bias Setting for BAs participating in Overlap Regulation should be moved to the Supporting Document. This change would help in addressing Comments $3 \& 4$ under Question 2.
Yes
Comment 15: This Yes answer assumes that the SDT addresses Comment 13 under Question 6 in these comments.
Yes

Comment 16: In the Consideration of Comments document, the SDT stated that the regression calculation in FRS Form 1 had been corrected. The regression calculation is still incorrect. Comment 17: Attachment A contains the following statement; "**In the Base Obligation measure for Texas, 1150 MW (Load Resources triggered by Under Frequency Relays at 59.70 Hz ) was reduced from its Contingency Protection Criteria level of 2750 MW to get 229 MW/0.1 Hz. This was reduced to accurately account for designed response from Load Resources within 30 cycles." This load triggered by Under Frequency Relays is a unidirectional response. It responds as frequency drops but does not provide the alternative response as frequency recovers. The result is a continuous frequency response that may be insufficient for increasing frequency events. Additionally, it is only available once even for oscillatory frequency events. This type of response is very useful to supplement the continuous, bidirectional response provided by governors, load and other resources, but its overuse can lead to reliability issues when it is relied upon too much. This standard fails to put any limit on the use of this type of unidirectional, single use resource for meeting the Frequency Response requirements in this standard. Since this kind of Frequency Response is significantly less expensive than continuous, bidirectional response, its inclusion without limitations creates a significant reliability loop hole in this standard. Although, it is unlikely that this problem can be corrected within the current standard development timeline, NERC should initiate investigations that will result in the setting of appropriate limits and valuation of the use of these types of resources before there is significant penetration to comply with this standard. Illustrating this problem is easily done by evaluating an interconnection with 100\% of its Frequency Response provided by unidirectional, step response resources. An interconnection configured in this manner in unstable and cannot survive even a small disturbance. Failure to close this loophole quickly could compromise interconnection reliability. Comment 18: The problem described in Comment 17 exists partially because the FRR SDT has failed to provide a comprehensive definition of Frequency Response as part of this standard. Without a good definition, the default definition becomes "any response that improves the measurement method" as implemented. As with the previous comment, NERC should address this weakness in a timely manner. Otherwise, it may face the undesirable task of disallowing response that improves the measure or modifying the measure to prevent inappropriate abuse. For example, a step load response that occurs 15 seconds after a frequency event will improve the Frequency Response as measured by this standard, but will not contribute to limiting the Arrested Frequency Response and will have little positive affect on reliability.

## Don Mclnnis

Florida Power \& Light Company
Yes

Yes

No

Could not find the Risk Severity Levels in the documents.
No
What is meant by documented formulae for M5? Is a one time snapshoot of the AGC formual sufficien? The concept is ok but this needs clarification of proof.
No
For R1 the low and high level descriptions appear to be identical and the high level is less than the medium risk level. For R3 there should be low, medium, and high levels. One BA not operating to TLB does not jepordize the Interconnection. Additionally, computer failures, database loads etc may require some period where TLB is not in service. Suggestion would be Lower VSL operation off of TLB for more than 5 but $<8$ continuous hours or accumlative during the year of more than $8<16$ hours. Medium VSL would be operation off of TLB for more than 8 but $<16$ continuous hours or accumlative during the year of more than $16<24$ hours. High VSL would be operation off of TLB for more than 16 $<24$ continuous hours or accumlative during the year of more than $36<48$ hours. Severe VLS would be $>24$ continuous hours off of TLB or accumlative of $>48$.
No
In the table on page2 the asterick references a statement that the 59.7 Hz used in Florida is a special protection scheme. This is incorrect. The special protection scheme setting was 59.82 Hz and was done away with in 2005 or earlier. The 59.7 Hz setting used within the FRCC is based on FRCC TWG studies that require this level of setting to protect the state in the event of a separation and to protect nuclear equipment. FPL supports the use of the C(N-2) critiera. Additionally, the reference to the FERC714 report that is currently in the background data should be made part of attachment A not separated. FPL fully agrees with Table 1 The formula used to derive the FRO is inconsistant with the definition used for requirement R5. R5 states that the load is " within the BA's metered boundary". The load used in the formulae is taken from FERC714. The yearly peak demand used in R5 should be the peak monthly load from June, July or August as reported on FERC714 to be compatible with the FRO formula.

## Yes

No
There is no technical justification provided either in the attachment or background data for the initial starting value of $0.8 \%$. This is acceptable but is arbitary. Additionally, the last sentense on page 1 of Attachment B should be changed to read "the ERO must reduce (in absolute value) the minimum Frequency Bias Settings for BA's within that Interconnection, by 0.1 percentage point from its previous annual value, to better match the Frequency Bias Setting to the natural Frequency Response or provide technical justification for not implementing the reduction
Yes

This standard is an excellent start on a very difficult topic and the technical explainations are very sound. Requirement R1 needs to be modificed somewhat as it currently implies that if a BA is a member of a RSG the frequency response obligation automatically assumed to be a RSG obligation. The RSG role may be strictly for reserves with the members of the BA meeting their own FRO. Perhaps a footnote stating that the FRO and reserve obligations can be separated out.

## Carlos J. Macias

FPL
Yes

No
3. - How many seconds of observation for "Delta F"? Does "Point C" in a. refer to "Figure 1 - Classic Frequency Excursion and Recovery" from NERC's Survey Instructions document dated September 1,

2010? If so it should be included in this document along with the added 8 and 18 second time lines being shown. What is a "narrow range" in item b.? 4. - Better define "relatively steady" (i.e. within a specific range and state it?) Also, "near 60.000 Hz " is not precise enough (i.e. if the event begins below 60.000 Hz , what range or time error correction is to be considered acceptable?) Is the "A" value also part of the figure cited in 3? 5. - Is the "B" value also part of the figure cited in 3? 6. Change "should be excluded" to "will be excluded". 7. - Better explain "the cleanest 2 or 3 frequency excursion events" or remove the word "cleanest". Page 2 paragraph 5: Provide specific dates for the "quarterly postings" and where these will be posted (i.e. Internet address or other). Clarify the December 15 ERO annual post date with the dates stated for same posting on Page 3 paragraph 5 and the BA's January 10 deadline. The BA posts 30 days from which date? This is confusing. Page 2 Table 2: What of starting event frequencies that are $<60 \mathrm{~Hz}$ ? Why is the "Highest UFLS" 59.6 when the Florida setting for its load is 59.7? Page 3 FRO equation: Page 4 of the "Frequency Response Standard Background Document, October 2011" also shows this equation but uses different terms. Make the same on both documents. In the Background Document each component of the numerator is explained and reference is made to FERC Form 714 to obtain these values. There is no reference to this form for the denominator values. All of this needs to be made clear with reference to FERC Form 714 on Attachment A.
Yes

Yes
Last paragraph: As stated, would that make the Minimum Frequency Bias Setting $0.7 \%$ of peak load or generation? A numerical example shown would help clarify this paragraph.
No
FRS Form 2 - Two-second Sample Data Instructions tab/worksheet: What is referred to as or meant by the 'master event list'? 4. - Regarding 2 second sample rate for 25 minutes starting 2 minutes before event begins and 15 minutes after it begins, does this add up to 25 minutes or are additional minutes being required for collection? Also, FPL can report frequency at this rate, but can only report load in MW every four seconds. Move to 4 second sample rate. 6-8. - Possible to add button to autopopulate cells C8 and C11 in 'Entry Data' tab from the new column C and cell identifying the desired frequency change time and simplify these steps? 10. - Clarify where the "Copy" button is. Is it the one in the 'Data' tab or worksheet? Entry Data tab/worksheet: Step 6 should also be or be moved to the "Instructions" worksheet. Are the values in column C in the "Data" worksheet labeled "Total Lost Generation" the same as those in column AQ in the "Evaluation" worksheet? If so, why are they not both labeled "Net Actual Interchange"? What is the definition of "Non Conforming Load" in column E?
FRS Form 1 - Eastern Interconnection Instructions tab/worksheet: Step 4 - Send to whom and to what address at NERC?

## Mauricio Guardado

Los Angeles Department of Water and Power
No
LADWP recommends the following change to the definition of Frequency Bias Setting (replace the word "discourage" with the word "prevent"). LADWP believes that this change increases the clarity of the definition: Original A number, either fixed or variable, usually expressed in $\mathrm{MW} / 0.1 \mathrm{~Hz}$, included in a Balancing Authority's Area Control Error equation to account for the Balancing Authority's Frequency Response contribution to the Interconnection, and discourage response withdrawal through secondary control systems. Proposed Change A number, either fixed or variable, usually expressed in MW/0.1 Hz, included in a Balancing Authority's Area Control Error equation to account for the Balancing Authority's Frequency Response contribution to the Interconnection, and prevent response withdrawal through secondary control systems
No
LADWP has a concern with Requirement 3. The requirement should provide allowance for legitimate circumstances when an entity cannot run on Tie Line Bias mode and not have an Adverse Reliability Impact on the Balancing Authority's Area. An entity should not be penalized when these legitimate circumstances occur. LADWP believes that the Frequency Response Standard Background Document, on Page 8, lists examples of legitimate circumstances: - Telemetry problems that lead the operator to believe ACE is sianificantly in error. - The frequencv input to AGC is not reflective of the BA's true
frequency (such as if the control center were operating a local generator and disconnected from the Interconnection). - During restoration (where one BA might be controlling frequency while another to which it is connected is managing interchange between them). - For training purposes. - Many AGC systems will automatically switch to an alternate mode if the EMS determines Tie Line Bias control could lead to problems. LADWP believes that the language in Requirement 4 needs to be clarified and recommends the following change: - R4. Each Balancing Authority that is performing Overlap Regulation Service shall modify its Frequency Bias Setting in its ACE calculation to be equivalent to either (i) the sum of the Frequency Bias Settings of the participating Balancing Authorities as validated by the ERO, or (ii) the Frequency Bias Setting as calculated based on the entire area being combined and thereby represent the Frequency Response for the combined area being controlled.
[Risk Factor: Medium][Time Horizon: Operations Planning] LADWP believes the language in
Requirement 5 needs to be modified to be consistent with that of the second paragraph of Attachment
B. LADWP recommends the addition of "natural frequency response" as a third bullet item to Requirement 5. The revised requirement would read: - R5. In order to ensure adequate control response, each Balancing Authority shall use a monthly average Frequency Bias Setting whose absolute value is at least equal to one of the following: [Risk Factor: Medium ][Time Horizon: Operations Planning] • The minimum percentage of the Balancing Authority Area's estimated yearly Peak Demand within its metered boundary per 0.1 Hz change as specified by the ERO in accordance with Attachment B. - The minimum percentage of the Balancing Authority Area's estimated yearly peak generation for a generation-only Balancing Authority, per 0.1 Hz change as specified by the ERO in accordance with Attachment B. - The natural frequency response Yes
LADWP agrees with the following VRFs: - R1 - Medium - R2 - Medium - R3 - Medium - R4 - Medium R5 - Medium
No
LADWP recommends that the Measures for Requirement 3 and Requirement 5 reflect their comments to Question 2.
No
LADWP recommends that either the VSL for Requirement 3 reflects its comments to Question 2, or that these comments be addressed as an exception in the Measure for Requirement 3.
No
LADWP considers the increase in number of events to analyze (now 25) to be excessive. Previous years analyses typically involved 4-6 events; a permanent five-fold increase is not justified. LADWP suggests reducing the baseline number of events from 25 to 12 per year. Analysis of a larger number of events could be requested on a year-by-year basis if conditions warrant, but should not be mandatory for all regions in all years.

LADWP notes that the document "BAL-003-1 Background Document" seems to be reasonable. Yes
LADWP notes that Attachment B seems to be reasonable
No
LADWP notes that Form 2 is not compatible with prior versions of Excel-it won't even open in Excel 2003 (which is still widely used) -and requests that all spreadsheets and calculation tools developed under 2007-12 be revised to support common software of the past 10 years.
LADWP supports project 2007-12's general approach to frequency response, and is prepared to support the ballot once several problematic details are corrected. LADWP notes that the time allowed to analyze the final "official" set of 25 events for each year, from Dec 15 to Jan 10, is relatively short and coincides with the holiday vacation season. Could this time either be extended by 2-4 weeks or shifted to another part of the year (in addition to reducing the number of events to be analyzed)? LADWP would like to see addressed in the Standard how the case is to be addressed where a BA simply has no frequency response information to provide, as could happen for a small 1-2 generator BA which has its generators out of service for an extended period for maintenance or upgrades.
Assuming the BA purchases frequency response services from another entity during this period, is the BA out of compliance with the proposed Standard simply because it has no data report? And how is its next-year obligation to be computed? These issues should be addressed in the Measures or Additional

Compliance information. If these are issues for "lawyers" as the Standards Drafting Team indicated during the November 14, 2011, webinar then the team should engage a NERC lawyer to resolve them prior to releasing the Standard for ballot.

## Thomas Washburn

FMPP
Yes

No

- R1. Each Balancing Authority (BA) or Reserve Sharing Group (RSG) shall achieve an annual Frequency Response Measure (FRM) (as detailed in Attachment A and calculated on FRS Form 1) that is equal to or more negative than its Frequency Response Obligation (FRO) to ensure that sufficient Frequency Response is provided by each BA or RSG to maintain an adequate level of Frequency Response in the Interconnection. [Risk Factor: Medium ][Time Horizon: Operations Assessment] The BA does not have control over the frequency responsive generation. There needs to be a requirement that the GOP shall set frequency response for the generators as directed by the BA. • R5. In order to ensure adequate control response, each Balancing Authority shall use a monthly average Frequency Bias Setting whose absolute value is \{greater than or ( $<=$ add these words) \} \{at least ( $<=$ delete these words) \} equal to one of the following: [Risk Factor: Medium ][Time Horizon: Operations Planning] • The minimum percentage of the Balancing Authority Area's estimated yearly Peak Demand within its metered boundary per 0.1 Hz change as specified by the ERO in accordance with Attachment B. • The minimum percentage of the Balancing Authority Area's estimated yearly peak generation for a generation-only Balancing Authority, per 0.1 Hz change as specified by the ERO in accordance with Attachment B.

| Yes |  |
| :--- | :--- |
| Yes |  |
|  | Yes |
|  | No |
| - Item 2 should be changed as follows: The ERO will identify at least 25 frequency excursion events in |  |
| each Interconnection for calculating the Frequency Bias Setting and the FRM. If the ERO cannot |  |
| identify in a given evaluation period 25 frequency excursion events satisfying the limits specified in |  |
| criteria 3 below, then similar acceptable events from the previous evaluation period also satisfying |  |
| listed criteria will be included with the data set by the ERO for determining FRS compliance. (as |  |
| written this item could cause double jeopardy for event from the previous period) • Under FRO for the |  |
| Interconnection the first sentence should be changed as follows: "The ERO \{Each Interconnection |  |
| (delete these words) \} will establish target contingency protection criteria for each Interconnection." |  |
| (each Interconnection is not a governing entity) • The footnote under Table 2 of Attachment A should |  |
| be changed as follows: The Eastern Interconnection set point listed is a compromise value for the |  |
| highest UFLS step setting of 59.5Hz used in the east and the \{special protection scheme's (delete |  |
| these words) \} highest UFLS step setting of 59.7Hz used in Florida. It is extremely unlikely that an |  |
| event elsewhere in the Eastern Interconnection would cause the Florida UFLS \{special protection |  |
| scheme (delete these words)\} to "false trip". (this is not a special protection system; it is just an |  |
| UFLS) |  |

## Xcel Energy

Yes

No
R1- It is not clear what is intended by "Reserve Sharing Group" in this context. As RSGs exist today, FRM performance by an RSG is not contemplated in the definition of FRM and appears to apply more towards 'secondary response'. Recommend clarifiying this concept and possibly include an example in the background document to help explain how this would work. R3 - recommend modifying the language to permit AGC out of TLB mode if the RC is notified; also remove the "to ensure coordinated control" as this is not essential for the requirement. Our reasoning behind the suggested change to notification of the RC is that there are occassions where an entity would need to perform testing, etc and it could be argued that testing would not be sufficient justification for meeting the Adverse Reliability Impact definition. Here is proposed revised language: Each Balancing Authority not receiving Overlap Regulation Service shall operate its Automatic Generation Control (AGC) in Tie Line Bias mode, unless the Balancing Authority's Reliability Coordinator has been informed and the duration is [insert time constraint language here].

No
Based on our suggested changes to R3 in response to Question 2, the drafting team should modify M3 to be consistent with the proposed language.
Yes
No
Confusion exists around the "peak load" in that the Attachment A states the allocation is based on Projected Peak Loads and Generation but the Background Document states it will use a historical Peak and Generation to make the allocation. Also, for the BA installed capacity, where does that value come from and does NERC obtain that from FERC form data or does the BA provide that information somewhere specific to this effort? Additionally, there appears to be a difference in how FRO is calculated in Attachment A and what is described in the Background Document. These differences should be reconciled such that both documents address the same approach. If installed capacity is used in the equation, how are variable/intermittent resources (e.g. wind, solar) accounted for? At full capacity?
No
Same comment here as the one in question 6.
No
There could be some confusion caused by the Attachment B due to the use of the word "initially" when the reference is made to the current standard. The drafting team should change the word "initially" to "currently" or strike it to avoid the potential confusion.
Yes
It would be useful if the drafting team could develop a completed form as an example to help entities better understand the methodologies used in the form.
It is not clear if there is an upper limit to the amount of frequency response expected of the Balancing Authorities under this standard. Except for Table 2 in Attachment A, there is no discussion of an amount of FR expected on a total basis. Balancing Authorities need to know for how many tenths of a hertz they are to respond so they can determine how to plan to meet this requirement. The
documents do not appear to provide any boundary on the maximum amount of FR that a BA will provide, i.e. it is not clear what will happen if an event occurs in the Eastern Interconnection that causes the frequency to drop to less than 59.6 Hz (e.g. what if freq dips to 59.0 ? Is the BA expected to provide a limitless amount of frequency response?). Also, is that event excluded from the list used to calculate the Balancing Authorities' response or is it included with an expectation that it counts the same as any other event. Without a clear statement of what is expected, including whether there is a limit on that expectation or not, the Balancing Authorities can not know what is expected of them and therefore can not plan appropriately.

ISO New England Inc
No
The FRM definition should not refer to FORM 1. Also, we offer the following alternative wording for frequency bias setting; "A number, either fixed or variable, usually expressed in MW/0.1 Hz, included in a Balancing Authority's Area Control Error equation to approximate the frequency response provided by the assets within the respective Balancing Authority's area."

## No

We do not agree with placing a requirement on Balancing Authorities, as generators are the main supplier of "discretionary" frequency response. Also, the requirement refers to an attached form, which is not part of the standard and therefore not enforceable.

```
Yes
```

No
The sampling interval needs to be tuned on a per Interconnection basis to support HQTE's characteristics
No
The violation severity levels for R1 seem to be reasonable. However, the technical writing needs to be enhanced for clarity
No
We suggest the SDT to first determine if the materials in the revised Attachment A \& B are "Guideline" or Technical Background", or are they "requirements". If it is the former, then Requirement R1 should not mention Attachment A at all. If it is the latter, then the as-written Attachment A is a mix bag as it on the one hand describes the ERO's process for supporting the Frequency Response Standard (FRS), in other words, the method and criteria it uses to calculate the frequency bias settings and the FRM, and on the other hand the BA's obligations to support this process. We strongly disagree that the latter requirements be imbedded in an attachment, especially one that is supposed to provide the technical background and guideline for another entity which, by the way, is not held responsible for complying with the proposed method. An appendix is not regarded as a mandatory requirement. Additionally, BAL-003-1- Attachment A 1. Criterion 5 needs to be re-written for clarity. 2. Criterion 7 refers to the "cleanest events". Perhaps a statement of what constitutes a "clean event" is needed to avoid possible controversy in the future. 3. The use of 59.6 Hz as the highest UFLS setting seems flawed. It should either be 59.7 Hz as a deliberate choice to protect Florida interests, or, it should be 59.5 Hz without concern for Florida's unique settings. 4. In the last 2 sentences at the end of the section on Frequency Response Obligation, it refers to an Interconnection being able to offer "alternate FRO protection criteria". It seems that the Interconnection should have been an integral part of establishing its obligation. Also, it states that the "ERO will confirm" the "alternate FRO protection criteria". Does this mean the ERO unconditionally approves it, or evaluates with a right of rejection? Please clarify. 5. In the formula for determining the Balancing Authority's FRO allocation, installed capacity is used. Does the industry have a clear and consistent definition for installed capacity? Also, with greater wind energy development, the delivered capacity over longer time horizons will be substantially less than nameplate machine ratings. Also, the background document refers to the use of peak generation instead of installed capacity. Which shall be used? Please clarify. 6. Very recent studies have shown that the $18-52$ second sampling interval does not work well for the Quebec Interconnection, in part due to the excellent and high level of response found in that Interconnection. The standard needs to be modified such that the sampling interval is that which works the best for each individual interconnection. 7. Attachment A needs to define the point A sampling interval.
No
See first comment in 6 above. Also, Frequency Response Standard Background Document - 1. Cite Attachment B in addition to Attachment A in the discussion of requirement 1. 2. The Balancing Authority allocation method specified in this document does not agree with that in Attachment A. 3. Drop the speculation on page 4 that most Balancing Authorities will be compliant. While it may be a commonly held belief by many that there is adequate frequency response right now, that assessment should be made after a targeted level of reliability has been defined and approved. The same comment applies on page 12. 4. On page 6, drop the inappropriate recommendation of aetting
frequency response through supplemental regulation. It is inappropriate to try to substitute a "minute plus" product that is deployed centrally by the Balancing Authority for a "sub-minute" product that is deployed automatically without any Balancing Authority action. When a pseudo-tie is used, changes in the ACE values due to supplemental regulation are unrelated to and not coordinated with the need to deploy frequency response. Not only should this approach not be offered as an alternative, but the FRSDT should actively conduct research to determine if supplemental regulation via a pseudo-tie should be deliberately REMOVED from any actual net interchange calculation that may include it! This comment also applies to the mentioning of supplemental regulation on page 11 as well. 5 . On page 7 , the reference to a 24 hour window on each side of the frequency bias setting implementation date is inconsistent with the wording of the requirement. The requirement says that any time within the designated date is acceptable. 6. On page 8, the inclusion of "for training purposes" as a reason to not operate in tie line bias control should be dropped. This sort of training can be done in a training simulator. Alternatively, if it is determined that it should be supported, then the requirement needs to be reworded to allow it explicitly. 7. On page 14, the sentence: "This approach would only provide feedback for performance during that specific event and would not provide insight into the depth of response or other limitations" is difficult to understand. The paragraph would read better by simply dropping it.
No
We suggest the SDT to first determine if the materials in the revised Attachment A \& B are "Guideline" or Technical Background", or are they "requirements". If it is the former, then Requirement R1 should not mention Attachment A at all. If it is the latter, then the as-written Attachment A is a mix bag as it on the one hand describes the ERO's process for supporting the Frequency Response Standard (FRS), in other words, the method and criteria it uses to calculate the frequency bias settings and the FRM, and on the other hand the BA's obligations to support this process. We strongly disagree that the latter requirements be imbedded in an attachment, especially one that is supposed to provide the technical background and guideline for another entity which, by the way, is not held responsible for complying with the proposed method. An appendix is not regarded as a mandatory requirement.

## Yes

ISO New England will not vote to approve the standard because it fails to place requirements on generators to provide frequency response. There are four substantive problems: - Using 59.6 Hz as an Eastern Interconnection UFLS instead of an actual value of either 59.5 Hz or $59.7 \mathrm{~Hz} \cdot$ Using installed capacity in determining the Frequency Response Obligation - The sampling interval needs to be tuned on a per Interconnection basis to support HQTE's characteristics • Do not advocate the use of supplemental regulation as a method of procuring frequency response Additionally, the SDT must decide on what the purpose of this standard is. If it is to respond to Order 693 then the standard misses the point of defining how often to run Frequency Response Surveys; it does not crisply define the "Interconnection" obligations. If the SDT does want to focus on performance then the issue of who is the default provider must be addressed. As the IRC has noted previously, all BAs do not own the service providers. To create standards that apply to entities that are dependent on other function entities to comply with a standard requirement is of great concern.

| R1: TEP feels that the FRO should be able to be calculated by the BA and that Form 1 changes should be treated via the Standard drafting process. R2: TEP feels that use Form 1 should be required by the Standard. Further, BAs should calculate its own frequency bias setting without ERO intervention. R3: Operating outside Tie Line Bias mode should be allowed during a year to allow for the testing of other modes. R4: Agree with the concept, but without ERO intervention. R5: Should read "greater than or equal to". |  |
| Yes |  |
| No |  |
| It should be clear that historical data may be used to show compliance. |  |
| No |  |
| VSL's could be clearer and simpler. Allowance for the testing of other AGC modes should be considered. |  |
|  | No |

Attachment A creates additional requirements to the BAL-003-1 Standard. The arrested value of frequency observed within 8 seconds may not be long enough in some instances. The delta F in the West should be greater than 0.05 Hz to ensure a measurable frequency response. West Under Frequency should be set at 59.95 Hz . There is no reliability concern for Over Frequency. Does 18 seconds after the start of the disturbance set point B? Pre-disturbance frequency should be relatively steady and near 60.000 Hz is vague. TEP feels that the ERO should not need to validate a BAs frequency bias setting.

## Yes

No
Reducing a BAs frequency bias setting may have an adverse impact on recovering from a frequency event once you get past the first 8-10 seconds. A larger bias will allow for actual and sustained AGC generator responses. Industry focus should be on generator governor response within the first 8-10 seconds.
No
TEP feels that Form 2 is a useful tool for internal BA use and should not be used for compliance purposes.
The BAL-003-1 Standard should be simplified and should not rely on the judgement of the ERO. Thanks to the drafting team for their efforts and for taking on this important aspect of Interconnection reliability.
Dennis Sismaet
Seattle City Light
No
LADWP and SCL recommend the following change (in red) to the definition of Frequency Bias Setting.
LADWP believes that this change increases the clarity of the definition: Original A number, either fixed or variable, usually expressed in MW/0.1 Hz, included in a Balancing Authority's Area Control Error equation to account for the Balancing Authority's Frequency Response contribution to the Interconnection, and discourage response withdrawal through secondary control systems. Proposed Change A number, either fixed or variable, usually expressed in MW/0.1 Hz, included in a Balancing Authority's Area Control Error equation to account for the Balancing Authority's Frequency Response contribution to the Interconnection, and discourage prevent response withdrawal through secondary control systems
No

- LADWP and SCL have a concern with Requirement 3. The requirement should provide allowance for legitimate circumstances when an entity cannot run on Tie Line Bias mode and not have an Adverse Reliability Impact on the Balancing Authority's Area. An entity should not be penalized when these legitimate circumstances occur. LADWP believes that the Frequency Response Standard Background Document, on Page 8, lists examples of legitimate circumstances: - Telemetry problems that lead the operator to believe ACE is significantly in error. - The frequency input to AGC is not reflective of the BA's true frequency (such as if the control center were operating a local generator and disconnected from the Interconnection). - During restoration (where one BA might be controlling frequency while another to which it is connected is managing interchange between them). - For training purposes. Many AGC systems will automatically switch to an alternate mode if the EMS determines Tie Line Bias control could lead to problems. - LADWP and SCL believe that the language in Requirement 4 needs to be clarified and recommends the following change (in red): R4. Each Balancing Authority that is performing Overlap Regulation Service shall modify its Frequency Bias Setting in its ACE calculation to be equivalent to either (i) the sum of the Frequency Bias Settings of the participating Balancing Authorities as validated by the ERO, or (ii) calculate the Frequency Bias Setting as calculated based on the entire area being combined and thereby represent the Frequency Response for the combined area being controlled. [Risk Factor: Medium][Time Horizon: Operations Planning] • LADWP and SCL believes the language in Requirement 5 needs to be modified to be consistent with that of the second paragraph of Attachment B. SCL recommends the addition of "natural frequency response" as a third bullet item to Requirement 5 (in red). The revised requirement would read: R5. In order to ensure adequate control response, each Balancing Authority shall use a monthly average Frequency Bias Settina whose absolute value is at least eaual to one of the followina: [Risk Factor: Medium 1[Time

Horizon: Operations Planning] - The minimum percentage of the Balancing Authority Area's estimated yearly Peak Demand within its metered boundary per 0.1 Hz change as specified by the ERO in accordance with Attachment B. • The minimum percentage of the Balancing Authority Area's estimated yearly peak generation for a generation-only Balancing Authority, per 0.1 Hz change as specified by the ERO in accordance with Attachment B. - The natural frequency response Yes
LADWP and SCL agree with the following VRFs: - R1 - Medium - R2 - Medium - R3 - Medium - R4 Medium - R5 - Medium
No
LADWP and SCL recommend that the Measures for Requirement 3 and Requirement 5 reflect their comments to Question 2.
No
LADWP and SCL recommend that either the VSL for Requirement 3 reflects its comments to Question 2, or that these comments be addressed as an exception in the Measure for Requirement 3.
No

- LADWP and SCL consider the increase in number of events to analyze (now 25) to be excessive. Previous years analyses typically involved 4-6 events; a permanent five-fold increase is not justified. SCL suggests reducing the baseline number of events from 25 to 12 per year. Analysis of a larger number of events could be requested on a year-by-year basis if conditions warrant, but should not be mandatory for all regions in all years.
Yes
- LADWP and SCL note that the document "BAL-003-1 Background Document" seems to be reasonable.
Yes
- LADWP and SCL note that Attachment B seems to be reasonable.

No

- LADWP and SCL note that Form 2 is not compatible with prior versions of Excel-it won't even open in Excel 2003 (which is still widely used)—and requests that all spreadsheets and calculation tools developed under 2007-12 be revised to support common software of the past 10 years.
- LADWP and SCL support project 2007-12's general approach to frequency response, and is prepared to support the ballot once several problematic details are corrected. - LADWP and SCL note that the time allowed to analyze the final "official" set of 25 events for each year, from Dec 15 to Jan 10, is relatively short and coincides with the holiday vacation season. Could this time either be extended by 2-4 weeks or shifted to another part of the year (in addition to reducing the number of events to be analyzed)? • LADWP and SCL would like to see addressed in the Standard how the case is to be addressed where a BA simply has no frequency response information to provide, as could happen for a small 1-2 generator BA which has its generators out of service for an extended period for maintenance or upgrades. Assuming the BA purchases frequency response services from another entity during this period, is the BA out of compliance with the proposed Standard simply because it has no data report? And how is its next-year obligation to be computed? These issues should be addressed in the Measures or Additional Compliance information. If these are issues for "lawyers" as the Standards Drafting Team indicated during the November 14, 2011, webinar then the team should engage a NERC lawyer to resolve them prior to releasing the Standard for ballot. • Finally, SCL points out that the proposed Standard introduces a new obligation on applicable entities to maintain frequency responsive reserves. Although this obligation does not appear to be unreasonable or problematic in general, compliance may prove difficult for some entities and in some localized areas. Progress Energy J im Eckelkamp
No
PGN supports the collective comments of SERC members. We feel that the last phrase of the definition of Frequency Bias Setting is more of an explanation of a function rather than a definition. While the SERC OC Standards Review Group understands the statement, we do not feel it belongs in the definition of the Frequency Bias Setting and a period should be inserted after the word "I nterconnection". Should the definition for Frequency Response Measure (FRM) be specific to the BA,

No
M4: This measure does not read quite right. Something seems to be missing in the part that says: "..showing when Overlap Regulation Service is provided including Frequency Bias Setting calculation to demonstrate compliance with Requirement R4." This part might have read something like: "..showing that when it performed Overlap Regulation Service, it modified its Frequency Bias Setting in its ACE calculation or it calculated the Frequency Bias Setting meeting the conditions specified in Requirement R4."
Yes
We do not have any issues with the VSLs, but wonder if the wording for R1 should have been ".. Reserve Sharing Group's...". Alternatively, the wording after "interconnection's FRO" could be revised to: "...and the Balancing Authority's or the Reserve Sharing Group's FRM was..."
No
Despite the SDT's good faith effort to convert the previous Attachment A into two separate documents (Attachments A and B), the modified Attachment A is problematic. As many commenters indicated, the previous Attachment A, other than the section providing guidance on event selection, appears to be explanatory, contextual, and instructional in content. These aspects are important, but do not rise up to the level of requirements to drive reliability performance/outcome. Attachment A should include only the event selection process and calculations associated with the requirements, including an explanation of what is necessary if variable Frequency Bias Settings are implemented. If other "requirements" need to be specified, such as the reporting time frame stipulated on page 3 of Attachment A, they should be moved to the standard itself but not imbedded in an attachment. We suggest the SDT to first determine if the materials in the revised Attachment A (and Attachment B) are "Guideline" or "Technical Background", or are they "requirements". If it is the former, then Requirement R1 should not mention Attachment A at all. If it is the latter, then the as-written Attachment A is a mix bag as it on the one hand describes the ERO's process for supporting the Frequency Response Standard (FRS) (in other words, the method and criteria it uses to calculate the frequency bias settings and the FRM), and on the other hand the BA's obligations to support this process. We strongly disagree that the latter requirements be imbedded in an attachment, especially one that is supposed to provide the technical background and guideline for another entity which, by the way, is not held responsible for complying with the proposed method. Further, there are no measures developed for the requirements stipulated/imbedded in Attachment A so how can the Responsible Entity (BA, in this case) be assessed for compliance? We suggest the SDT to move those requirements on the BA to the main standard, and turn Attachment A into an appendix describing the calculation process. An appendix is not regarded as a mandatory requirement. Similar comments apply to Attachment B. Finally, the two Attachments are listed in Section F - Associated Documents. This Section is generally used to list reference documents that are NOT standard requirements. We suggest the SDT review and revise this listing depending on its final determination of the status of the two Attachments (or their revisions, where appropriate).
We do not have an opinion on whether or not the Background Document provides sufficient clarity to the development of the standard. We do, however, suggest that the SDT consider our comments in Q6 above, and move some of the information from Attachments A and B to or combine with the Background Document, to provide all the technical basis and background behind the elements stipulated in the requirements.
No
Please see our comments under Q6. In brief, we do not agree with including a process description type of document as part of the standard requirement.
No
If we are not mistaken, Form 2 is added as the last sheet in the Form 1 spreadsheet file. Apart from that, however, there are other sheets added to the previous Form 1. But this Comment form makes no mention of the changes, nor is there a question on the additional information requested. We have a concern over this omission of attention or oversight. Compared to the previous version, Form 1 has been significantly expanded to include not only additional sheets but much more comprehensive data requirements even on the Data Entry sheet itself. This makes data submission a very time-consuming task but the justification for requiring detailed data entry has not been provided. We question the need for such expansion on data entry requirements. We have yet to see the reason for expanding Form 1 in assisting a BA to provide the data needed to comply with the standard, hence we do not
see how adding a Form 2 can help in that regard. We suggest the SDT to look at the basic need for data submission that would suffice to support the FRS reporting process. Where the SDT deems additional data entry sheets to be necessary, it should provide the rationale for expanding from a 2 sheet form into a multiple sheet form for additional data collection.
The proposed implementation plan conflicts with Ontario regulatory practice respecting the effective date of the standard. It is suggested that this conflict be removed by appending to the implementation plan wording, after "applicable regulatory approval" in Section 1.3 and 1.4 of the draft standard, and in the two bullets in the draft implementation plan, to the following effect: ", or as otherwise made effective pursuant to the laws applicable to such ERO governmental authorities." Northeast Power Coordinating Council
Guy Zito
No
The FRM definition should not refer to FORM 1. Also, suggest the following wording for frequency bias setting: "A number, either fixed or variable, usually expressed in MW/0.1 Hz, included in a Balancing Authority's Area Control Error equation to approximate the frequency response provided by the assets within the respective Balancing Authority's area."
No
The requirements should not be directed at Balancing Authorities, as generators are the main supplier of "discretionary" frequency response. Requirement R1 refers to an attached form, which is not part of the standard and therefore not enforceable.
Yes

No
The sampling interval needs to be tuned on a per Interconnection basis to support HQTE's characteristics.
No
The violation severity levels for R1 are reasonable. The technical writing needs to be enhanced for clarity.
No
The SDT has to first determine if the materials in the revised Attachment A \& B are "Guideline" or Technical Background", or are they "requirements". If it is the former, then Requirement R1 should not mention Attachment $A$ at all. If it is the latter, then the as written Attachment $A$ is confusing as it describes the ERO's process for supporting the Frequency Response Standard (FRS) (the method and criteria it uses to calculate the frequency bias settings and the FRM), and at the same time the BA's obligations to support this process. The latter requirements should not be imbedded in an attachment, especially one that is supposed to provide the technical background and guideline for another entity which is not held responsible for complying with the proposed method. An appendix is not regarded as a mandatory requirement. Additionally, regarding BAL-003-1- Attachment A 1. Criterion 5 needs to be re-written for clarity. 2. Criterion 7 refers to "cleanest events". A statement of what constitutes a "clean event" is needed to avoid possible controversy in the future. 3. The use of 59.6 Hz as the highest UFLS setting is flawed. It should either be 59.7 Hz as a deliberate choice to protect Florida interests, or it should be 59.5 Hz without concern for Florida's unique settings. 4. In the last 2 sentences at the end of the section on Frequency Response Obligation, it refers to an Interconnection being able to offer "alternate FRO protection criteria". The Interconnection should have been an integral part of establishing its obligation. It is stated that the "ERO will confirm" the "alternate FRO protection criteria". Does this mean the ERO unconditionally approves it, or evaluates with a right of rejection? Please clarify. 5. In the formula for determining the Balancing Authority's FRO allocation, installed capacity is used. Does the industry have a clear and consistent definition for installed capacity? Also, with greater wind energy development, the delivered capacity over longer time horizons will be substantially less than nameplate machine ratings. The background document refers to the use of peak generation instead of installed capacity. Which shall be used? Please clarify. 6. Recent studies have shown that the 18-52 second sampling interval does not work well for the Quebec Interconnection, in part due to the excellent and high level of response found in that Interconnection. The standard needs to be modified such that the sampling interval is that which works the best for each individual interconnection. 7. Attachment A needs to define the point A
sampling interval.
No
Refer to the first comment in Question 6. For the Frequency Response Standard Background Document - 1. Cite Attachment B in addition to Attachment A in the discussion of requirement R1. 2. The Balancing Authority allocation method specified in this document does not agree with that in Attachment A. 3. Drop the speculation on page 4 that most Balancing Authorities will be compliant. While it may be a commonly held belief by many that there is adequate frequency response right now, that assessment should be made after a targeted level of reliability has been defined and approved. The same comment applies on page 12. 4. On page 6 , drop the inappropriate recommendation of getting frequency response through supplemental regulation. It is inappropriate to try to substitute a "minute plus" product that is deployed centrally by the Balancing Authority for a "sub-minute" product that is deployed automatically without any Balancing Authority action. When a pseudo-tie is used, changes in the ACE values due to supplemental regulation are unrelated to and not coordinated with the need to deploy frequency response. Not only should this approach not be offered as an alternative, but the FRSDT should actively conduct research to determine if supplemental regulation via a pseudo-tie should be deliberately REMOVED from any actual net interchange calculation that may include it. This comment also applies to the mentioning of supplemental regulation on page 11 as well. 5 . On page 7 , the reference to a 24 hour window on each side of the frequency bias setting implementation date is inconsistent with the wording of the standard. The standard states that any time within the designated date is acceptable. 6 . On page 8, the inclusion of "for training purposes" as a reason to not operate in tie line bias control should be dropped. This training can be done in a training simulator. If it is determined that it should be supported, then the requirement needs to be reworded to allow it explicitly. 7. On page 14, the sentence: "This approach would only provide feedback for performance during that specific event and would not provide insight into the depth of response or other limitations" is difficult to understand. The paragraph would read better by simply deleting the sentence.
No
Refer to the first comment in Question 6.
Yes

This standard as written does not place requirements on generators to provide frequency response. There are four substantive problems: • Using 59.6 Hz as an Eastern Interconnection UFLS instead of an actual value of either 59.5 Hz or 59.7 Hz . - Using installed capacity in determining the Frequency Response Obligation. - The sampling interval needs to be tuned on a per Interconnection basis to support HQTE's characteristics. - Do not advocate the use of supplemental regulation as a method of procuring frequency response. It must be decided as to what the purpose of this standard is. If it is to respond to Order 693 then the standard misses the target of defining how often to run Frequency Response Surveys; it does not crisply define the "I nterconnection" obligations. If performance is the focus, then the issue of who is the default provider must be addressed. All BAs do not own the service providers. To create standards that apply to entities that are dependent on other functional entities to comply with a standard requirement is of great concern. FRS Form 1 is listed as being an Associated Document. Will it be attached to the standard? The acronym FRS is used in the standard. FRS should be spelled out before its acronym is used. If FRS Form 1 will not be an appendix or an attachment to the document, then a link should be provided to it, or instructions given on how to find it.

## John Bussman

Associated Electric Cooperative Inc
Yes
The FRO definition incorrectly applies the historically narrow Balancing Authority scope of responsibility, while the FRM definition does not address applicability at all. But the BAL-003-1 Standard itself identifies RSGs (where applicable) and BAs as the Responsible Entities within scope of this standard. For consistency, AECI recommends using "Responsible Entities (e.g. Reserve Sharing Groups - where applicable, and Balancing Authorities)" in both the FRO and FRM definitions. Rationale: This change should help future-proof the definition, should more specific "frequency response" or "spinning reserve" sharing groups later surface within our industry. AECI agrees with the Frequency Bias Setting definition's inclusion of a bit more functionality than typical. We however recommend replacing "to account for the Balancing Authority's Frequency Response contribution to
the Interconnection, and discourage response withdrawal through secondary control systems", with "to support their Frequency Response contribution to the Interconnection". Rationale: Readability, and clarity on the "discouraging withdrawal..." phrase, which should reside in the Background document. Yes

Yes

Yes

Yes
The VSLs appear reasonable for the risk and particularly where they assess higher severity when the BA or RSG Interconnection's performance was sub-standard as well.
Yes

Yes

Yes
This is a very important document, providing bounds and rationale for and future changes, as well as initial settings going into ballot. As such, it is AECI's understanding that, upon going into effect, this BAL-003-1 will utilize these initial settings.

## No

AECI believes the SDT could spare our industry both confusion and inconsistency, by specifying that identified Interconnection Disturbances include both Point A and Point B to the hour, minute, and second. While this introduces some risk of Entities over-automating their data-reports, the benefits for Eastern Interconnection respondents would be tremendous. Cautions and disclaimers should be placed on both Form 1 and Form 2, to assure respondents manually inspect their frequency data and pinpoint the specific inflection-point samples.
SDT Webinar responses, this standard still needs to address: 1) anticipated shifts in an Entity's FRO, due to large changes in base generation or load, and 2) likely non-compliance for single-unit generation-only BAs (R5.2?) Please address prior to second ballot.
Rich Salgo
NV Energy
Yes

No
Requirement 1 seems to be the only one that has any applicability to an RSG; however, it is unclear under what circumstances this requirement applies to an RSG. Suggest changing the R1 to be addressed solely to BA's or alternatively, explain under Applicability section 1.2 what "where applicable" means.
Yes
Medium appears to be reasonable and appropriate.
Yes

No
For R1, suggest that the VSL's not be dependent upon the aggregate performance of the BA's within an interconnection.
No
It is not clear whether the calculation of FRO is to utilize projections of BA load as in Att A, or past data reported in FERC Form 1 as per the Background Document.
Yes
This is a qood reference; however see response to Question 6 in that there appears to be a
discprepancy between Att A and the Background Document with regard to FRO calculation.
No
In Attachment B, it seems unclear whether the initial FB setting is supposed to be $1 \%$ of BA peak load or $0.8 \%$ as shown in the table. In general, I was extremely confused about what the required FB setting should be. R5 indicates a percentage of load found in Att B, but Att B indicates the greater of Natural Frequency Response or $1 \%$ of peak, and then the table that follows indicates $0.8 \%$. At this point, I have no idea what is being stated for the requirement.
Yes

## Thad Ness

## American Electric Power

No
R1: Clarification is needed regarding the responsibility of a BA that is a member of a Reserve Sharing Group. R2 and R3: What does "coordinated control" mean? There no leverage for the BA to require the generator to carry their burden of addressing governor settings or droop settings, yet the BA is obligated to meet some performance measures. This revision adds new performance measure responsibilities on the BA who likely has no direct control over every resource affecting their performance within their footprint. We are not necessarily challenging the performance measures themselves, nor their underlying objectives, however AEP views this as a gap in responsibilities which potentially effects reliability.
Yes

No
It is not clear for R1 what the exact delineations are among Lower, Medium, High, and Severe VSL's. Yes
A frequency response observation should not be used spanning multiple years, or if there does, there should at least be a reset period.

Yes

Yes

Arizona Public Service Company
Janet Smith, Regulatory Affairs Supervisor

1. The specified time interval from 20 seconds to 52 seconds for SEFRD measurement ignores the primary frequency response which happens in first 20 seconds and is responsible for arresting the frequency dip. We suggest using the average over the complete interval of 0 to 52 seconds. 2. The difference between Low and High VSL for R1 is not clear. Similarly the difference between Medium

when TLB is not used. For example, if something happens within our EMS that disables TLB control we are compliant if we document the period as an EMS malfunction?
Yes
We appreciate the effort of the SDT in developing Attachment A. It was very helpful in weeding through BAL-003.
Yes
We appreciate the effort of the SDT in developing the Background Document. It provided insight on how the SDT got the proposed standard to where it is with this posting.
Yes

## Yes

Requirement 5, bullet 2 does not make any allowance for a single generator generator-only BAs. If that BAs generator is out-of-service, the BA cannot satisfy this requirement. This could also apply to other generation-only BAs which have a very limited number of generating units. Also, RSGs/BAs which experience resource changes throughout the year have no mechanism for adjusting their FRO.

```
MRO NSRF
```

## Will Smith

No
The FRM definition: "The median of all the Frequency Response observations reported annually on FRS Form 1" is problematic. It references an FRS Form 1 which is not included in the definition itself but is in fact an attachment to a standard. In the current NERC Glossary of Terms, there is no such precedence that a definition must rely on the requirements or details in a standard for completeness. Additionally, the definition of Frequency Bias Setting should focus on what it is. Balancing Authorities do not supply energy. Suggest revising it to: Frequency Bias Setting A number, either fixed or variable, usually expressed in MW/0.1 Hz, included in a Balancing Authority's Area Control Error equation to approximate the expected natural response provided by the assets within the respective Balancing Authority's area.
No
R1- It is not clear what is intended by "Reserve Sharing Group" in this context. As RSGs exist today, FRM performance by an RSG is not contemplated in the definition of FRM and appears to apply more towards 'secondary response'. Recommend clarifiying this concept and possibly include an example in the background document to help explain how this would work. R2 - Please add the word "range" inbetween the words "date" and "specified". The background document specifies that there is a 72-hour period to implement the FBS setting (See Background document Page 7). R2, as written, does not reflect the period for which an entity may implement the ERO validated Bias into ACE. Also see our comment on \#7 as to the length of the comment period. Question 7 comment is provided to assist the SDT; Note from question 7: (Page 7 (3rd paragraph) of the Background document states "Given the fact that BA's can encounter staffing or EMS change issues coincident with the date the ERO sets for new Frequency Bias Setting implementation, the standard provides a 24 hour window on each side of the target date. 1. The Standard itself does not state this provision ( 24 hour window on each side of target date) as indicated. 2. The SDT accurately addresses the fact that BA's could have EMS or staffing issues during implementation of the ERO validated FBS. The current stated 72-hour window is not long enough for implementation of the FBS as there may be a host of issues that could impact implementation. We suggest that a seven day window be used for implementation of the FBS.) R3 Recommend the term "Adverse Reliability Impact" be removed from Requirement 3. Based on the NERC definition of the term, a smaller entity could never operate its AGC outside of TLB mode due to their impact on the BES not likely to result in "instability or Cascading". To ensure a more consistent and equitable approach when applying this Requirement, recommend the drafting team incorporate the reliability reasons listed within the Background Document into the actual Requirement.
Additionally, the phrase "effectively coordinated control" should be removed as this is not essential to the Requirement and introduces ambiguity in its application. To this end, the following revisions are proposed: R3. Each Balancing Authority not receiving Overlap Regulation Service shall operate its Automatic Generation Control (AGC) in Tie Line Bias mode to ensure effectively coordinated control, unless such operation would have an Adverse Reliability Impact on the Balancing Authority's Area
meets one or more of the following conditions. - Telemetry problems that lead the operator to believe ACE is significantly in error. - The frequency input to AGC is not reflective of the BA's true frequency (such as if the control center were operating a local generator and disconnected from the Interconnection). • During restoration (where one BA might be controlling frequency while another to which it is connected is managing interchange between them). • For training purposes. - Many AGC systems will automatically switch to an alternative mode if the EMS determines Tie Line Bias control could lead to problems. - For single BA Interconnections, Flat Frequency and Tie Line Bias are equivalent. - The Reliability Coordinator has been informed and the duration is [insert time constraint language here]. R5 - Recommend to delete the phrase "In order to ensure control response". Such phrases can be needless causes of debate. If a BA uses one of the bulleted methods but does not get "adequate response" then is the BA non-compliant? What is "adequate response"? Who decides if the response is adequate? Please clarify.
Yes

No
Based on suggested changes to R3 in response to Question 2, the drafting team should modify M3 to be consistent with the proposed language. Additionally, M1 should be revised to not reference a specific Form. The Form may be the format of choice but it should not be an implied requirement. Measures 3 and 4 identify the use of "operating logs" as evidence. Measure 2 identifies hard copy and electronic evidence, "or other evidence". We suggest calling out specifically "operator logs" for M2 also, in case there are system problems in capturing hard copy or electronic evidence during the short time window for implementation.

## No

The proposed VSLs for Requirement R1 treats a BA that did not meet the FRO requirement differently depending on whether or not the Interconnection met the FRO requirement. The obligation of the BA to meet its allocated FRO should be consistent regardless of what the other entities within the interconnection are doing. Suggest removing the interconnection performance from the VSLs and developing four increasing levels of BA failure to meet the FRO.
No
Confusion exists around the "peak load" in that Attachment A states the allocation is based on Projected Peak Loads and Generation but the Background Document states it will use a historical Peak and Generation to make the allocation. Also, for the BA installed capacity, where is that value derived from and does NERC obtain that from FERC form data or does the BA provide that information somewhere specific to this effort? Additionally, there appears to be a difference in how FRO is calculated in Attachment A and what is described in the Background Document. These differences should be reconciled such that both documents address the same approach. If installed capacity is used in the equation, how are variable/intermittent resources (e.g. wind, solar) accounted for? At full capacity? Please clarify. We suggest the SDT clarify if the materials in the revised Attachment A (and Attachment B) are "Guideline" or "Technical Background", or "requirements

## No

the MRO NSRF has restated the same answer as in question 6 on purpose. Confusion exists around the "peak load" in that Attachment A states the allocation is based on Projected Peak Loads and Generation but the Background Document states it will use a historical Peak and Generation to make the allocation. Also, for the BA installed capacity, where is that value derived from and does NERC obtain that from FERC form data or does the BA provide that information somewhere specific to this effort? Additionally, there appears to be a difference in how FRO is calculated in Attachment A and what is described in the Background Document. These differences should be reconciled such that both documents address the same approach. If installed capacity is used in the equation, how are variable/intermittent resources (e.g. wind, solar) accounted for? At full capacity? Please clarify. Page 7 (3rd paragraph) of the Background document states "Given the fact that BA's can encounter staffing or EMS change issues coincident with the date the ERO sets for new Frequency Bias Setting implementation, the standard provides a 24 hour window on each side of the target date. 1) The Standard itself does not state this provision ( 24 hour window on each side of target date) as indicated. 2) The SDT accurately addresses the fact that BA's could have EMS or staffing issues during implementation of the ERO validated FBS. The current stated 72-hour window is not long enough for implementation of the FBS as there may be a host of issues that could impact implementation. We
suggest that a seven day window be used for implementation of the FBS.
No
: There could be some confusion caused by the Attachment B due to the use of the word "initially" when the reference is made to the current standard. The drafting team should change the word "initially" to "currently" or strike it to avoid the potential confusion. The second paragraph of Attachment B (which contains the two bullets): The words "initially $1 \%$ " in the second bullet contradict with the Table 1 on Attachment B, which states "Initial" and " $0.8 \%$ ". Suggest deleting the parenthetical in the second bullet as when BAL-003-1 is effective it would be referencing an old Standard version. If the initial minimum is intended to be $1 \%$ say so in the Table 1.

## Yes

: It would be useful if the drafting team could develop a completed form as an example to help entities better understand the methodologies used in the form
It is not clear if there is an upper limit to the amount of frequency response expected of the Balancing Authorities under this standard. Except for Table 2 in Attachment A, there is no discussion of an amount of FR expected on a total basis. Balancing Authorities need to know for how many tenths of a hertz they are to respond so they can determine how to plan to meet this requirement. The documents do not appear to provide any boundary on the maximum amount of FR that a BA will provide, i.e. it is not clear what will happen if an event occurs in the Eastern Interconnection that causes the frequency to drop to less than 59.6 Hz (e.g. what if freq dips to 59.0 ? Is the BA expected to provide a limitless amount of frequency response?). Also, is that event excluded from the list used to calculate the Balancing Authorities' response or is it included with an expectation that it counts the same as any other event. Without a clear statement of what is expected, including whether there is a limit on that expectation or not, the Balancing Authorities cannot know what is expected of them and therefore cannot plan appropriately. In the first paragraph of R5 delete "at least" and replace with "greater than or". This phrase would now read ".. absolute value is greater than or equal to one of the following:" "Equal to or greater than" accurately identifies the expectation, the current phrasing will lead to confusion and mis-interpretation. Bullet \#1 of R5: The minimum \% is based upon the "estimated yearly Peak Demand". During the NERC webinar it was mentioned that this minimum would move to being based on historical reporting of Peak Demand. Where does the SDT stand on this item? Please provide clarification.
SERC OC Standards Review Group

## Gerald Beckerle

No
We feel that the last phrase of the definition of Frequency Bias Setting is more of an explanation of a function rather than a definition. While the SERC OC Standards Review Group understands the statement, we do not feel it belongs in the definition of the Frequency Bias Setting and a period should be inserted after the word "Interconnection". Should the definition for Frequency Response Measure (FRM) be specific to the BA, similar to the definition for Frequency Response Obligation (FRO)?
No
We feel that the utilization of the term, "Reserve Sharing Group", is not consistent with the definition in the NERC Glossary of Terms, and should be deleted, applicability should be clarified or replaced with a new term, such as "Frequency Response Sharing". R2 exempts BAs participating in Overlap Regulation Service from implementing the Frequency Bias Setting on the date specified by the ERO, and R4 states how the BA performing Overlap Regulation Service will modify its Frequency Bias Setting but does not state when the setting will be implemented. The exemption for BAs participating in Overlap Regulation Service should either be deleted from R2 or language stating the implementation date of the frequency bias setting needs to be included in R4. R4 should clarify that a BA performing Overlap Regulation Service should still be required to operate its AGC in "Tie Line Bias" mode.
Yes
No
See comments in Question 2 regarding utilization of the term "Reserve Sharing Group".
No

See comments in Question 2 regarding utilization of the term "Reserve Sharing Group". VSL for R1: The draft VSLs for R1 uses the summation of FRM for all BAs within an Interconnection as a factor in determining the applicable VSL. This does not seem consistent with R1. R1 is about a single BA and the individual BA's frequency response performance as measured by the FRM for that specific BA. Including the FRM summation of the Interconnection expands R1. It appears that a BA that is noncompliant with R1 could end up with either a Low/Medium or High/Severe VSL based upon the FRO performance of the Interconnection. The FRM performance of the Interconnection is beyond the knowledge and control of a single BA and should not be a determinate of the applicable VSL. Is there a technical basis for selection of the $1 \%, 30 \%$ and $15 \mathrm{MW} / .1 \mathrm{~Hz}$ VSL breakpoints? Does the Lower VSL give a $1 \%$ dead band to a BA's FRO? If so, will this be acceptable to NERC/FERC? VSL for R2: The VSL should reflect the language used in the requirement. R2 says a BA "not participating in Overlap Regulation service shall ....", while the VSL says a BA "not receiving Overlap Regulation Service...." The VSL language is not consistent with the requirement. VSLs for R5: Since Frequency Bias Setting is expressed as a negative value, the terms "absolute value" and "less than" must be used carefully. Wouldn't the "absolute value" of a BA's Frequency Bias Setting always be positive and thus it could never be less than the minimum specified by the ERO (a negative value)? No
The definition of Single Event Frequency Response Data (SEFRD) was struck from the draft standard but still appears in Attachment A. Since R1 of the standard references Attachment A, would the definition of SEFRD still be applicable? If the definition is to be totally struck, we don't think the term should be used in Attachment A.
No
Portions of the Background Document do not appear to be complete or finished. The Background Document should be edited to be consistent with changes made to the standard or other related documents (eg. elimination of the definition of SEFRD and any revisions to the draft BAL-003-1). No
We suggest the SDT consider a term other than "I nitial' in the title for Table 1. We suggest "Proposed Frequency Bias Setting" for Table 1
Yes

We feel that frequency response is a function of a contingency event and the Purpose Statement should recognize this relationship. We suggest the following insertion (in quotation marks) in the Purpose Statement: Purpose: To require sufficient Frequency Response from the Balancing Authority to maintain Interconnection Frequency within predefined bounds by arresting frequency deviations "due to a contingency event" and supporting frequency until the frequency is restored. To provide consistent methods for measuring Frequency Response and determining the Frequency Bias Setting. Southern Company
Antonio Grayson
No
We suggest adding BA to the definition of Frequency Response Measure (FRM), similar to the definition for Frequency Response Obligation (FRO).

Yes

## No

VSL for R2: We suggest the language in the VSL be consistent with the language used in the Requirement. The VSL for R2 says a BA 'not receiving Overlap Regulation Service......' R2 says a BA 'not participating in Overlap Regulation service shall ......' VSLs for R5: Since Frequency Bias Setting is expressed as a negative value, the terms "absolute value" and "less than" must be used carefully. This VSL uses "absolute value" when referring to the BA's Frequency Bias Setting, but does not use "absolute value" when referring to the Frequency Response Obligation, or minimum value specified by the ERO. Consider revising this VSL so that a true comparison can be made.
No

We suggest increasing the delta f for the East to be the same value as the West or larger. The reason for this is that the 0.04 Hz suggested is too close to the governor deadbands of .036 Hz . This would potentially omit frequency response that some units may provide for a larger excursion but not for those close to the deadband.
No
We suggest the Background Document should be edited to be consistent with changes made to the standard or other related documents (eg. Any revisions to draft BAL-003-1 and removal of the definition of SEFRD).
No
We suggest using the words, 'Proposed Frequency Bias Setting' in the Title of Table 1 instead of the word, 'I nitial'.
Yes

We suggest adding the words, 'due to a contigency event', after the word, 'deviations', in the Purpose statement because we feel that frequency response occurs due to a contigency event.
SPP Standards Review Group
Robert Rhodes
Yes

Yes

Yes

Yes

No
The VSLs for R2 are based on 5, 15 and 25 days. What was the justification for these values? Could we just as well use 10, 20 and 30 or some other set of values? In R3, we understand that brief periods of operation outside of TLB control are allowable providing 1) continued operation in TLB control would create ARI on the Interconnection or 2 ) that justification is provided for the periods when TLB is not used. For example, if something happens within our EMS that disables TLB control are we compliant if we document the period as an EMS malfunction?
Yes
We appreciate the effort of the SDT in developing Attachment A. It was very helpful in weeding through BAL-003.
Yes
We also appreciate the effort of the SDT in developing the Background Document. It provided insight on how the SDT got the proposed standard to where it is with this posting.
Yes

Yes

Requirement 5, bullet 2 does not make any allowance for a single generator, generator-only BA. If that BA's generator is out-of-service, the BA cannot satisfy this requirement. This could also apply to other generation-only BAs which have a very limited number of generating units. Also, RSGs/BAs which experience resource changes (permanently removing generation from service) throughout the year have no mechanism for adjusting their FRO during the year.

## H. Steven Myers

ERCOT
No
RE: Frequency Response Obligation (FRO) definition: ERCOT suggests changing "Balancing

Authority's" to "Balancing Authority Area's" as follows: The Balancing Authority Area's share of the required Frequency Response needed for the reliable operation of an Interconnection. A BA that does not own generation resources cannot provide Frequency Response, it can only schedule and dispatch available resources capable of such; . The BA should be responsible for taking action to schedule resources that are capable of frequency response, and monitoring to assure frequency response performance. The GOP (possibly the LSE when demand side performance is involved) must be accountable for performing. However, there is nothing in this requirement to encourage the owner of a resource who chooses not to provide frequency response to come to the table. There is nothing in this standard that uniformly requires all frequency response providers to perform. This is likely to be detrimental to the performance of a BAA and unfairly sanctions those willing to perform to to assure reliability while others are not required to perform.

|  |
| :--- |
| No |
| Measure should be modified to align with revised Requirements per ERCOT's comments on \#1. |
|  |
|  |
| No |
| Refer to comments in \#1. |
| No |

While there is no problem with the calculation involved, it is unclear why the SDT elected to assign a grid performance element in this standard to the ERO, who has no functional (registered) role in grid performance. Since this is a cook-book calculation and transfer of data on frequency performance, why not assign it to the BA?

## Kasia Mihalchuk

## Manitoba Hydro

No
It is not clear why the term "Single Event Frequency Response Data (SEFRD)" has been removed from the standard but is still used and defined in the Background Document and Attachment A.
No
Regarding R1: 1. Neither R1 nor the referenced Attachment A clarifies the FRM requirements for an RSG to comply versus a BA. In particular (i) At p.3, Attachment A states that the ERO is responsible for "annually assigning an FRO and Frequency Bias Setting to each BA." No mention is made of RSGs.
(ii) Attachment A only references RSGs in the context of reporting obligations for Form 1 (at p.4) and
(iii) Compared to BAL-002-0 R1.1, which clearly states that the BA may elect to fulfill its obligation through an RSG and that in such cases the RSG has the same responsibilities as each BA (that is a participant in the RSG). 2. It should be clarified that this requirement applies to a BA, where the BA doesn't belong to an RSG, OR to an RSG. As it is currently drafted, the standard applies to each BA and each RSG. It is redundant in that each BA would need to comply, whether or not they are a member of an RSG that would also be required to comply. Further, the NERC Glossary definition of an RSG is a group of BAs that collectively maintain, allocate and supply operating reserves. No mention is made of the agreement including the sharing or delegation of responsibility related to FRM. Accordingly, the standard should only reference a BA being able to delegate responsibility to an RSG if the RSG Agreement allows for such delegation. 3. R1 does not specify where or how the FRO is determined. Presumably this would be determined by the ERO pursuant to Attachment A. 4. The phrase "to ensure that sufficient Frequency Response ..." should be separated from the requirement as it is (i) not descriptive of the required actions; (ii) redundant with the stated purpose at the beginning of the standard. In general, such a drafting technique should be avoided as it may allow Responsible Entities to argue that a violation has not occurred where the specific action that is described has not been taken, but the purpose referenced in the requirement has been met. Regarding R2: 1. It is not clear from R2 who determines the Frequency Bias Setting for "validation" by the ERO and how the FBS is determined. (Presumably done by the BA in accordance with

Attachment B). Based on Background document, should refer to those "published" by ERO. The BA's FBS may not be validated, and may be modified before posting. 2. Attachment B does not refer to the ERO "validating" FBS. 3. Attachment B refers to an RSG calculating FBS, but the standard does not.

No
It should be clarified that R1 requirement applies to a BA, where the BA doesn't belong to an RSG, or to an RSG. As it is currently drafted, the standard applies to each BA and each RSG. It is redundant in that each BA would need to comply, whether or not they are a member of an RSG that would also be required to comply. Further, the NERC Glossary definition of an RSG is a group of BAs that collectively maintain, allocate and supply operating reserves. No mention is made of the agreement including the sharing or delegation of responsibility related to FRM. Accordingly, the standard should only reference a BA being able to delegate responsibility to an RSG if the RSG Agreement allows for such delegation. No
The Violation Severity Levels for R1 penalize entities more severely depending on how the interconnection as a whole has performed. MH believes that BAs should only be held accountable for issues within their control and that the VSLs for R1 should be revised accordingly.
No

1. p. 2 refers to each "Interconnection" establishing target contingency protection criteria. However, an "I nterconnection" as defined in the NERC Glossary is an electrical system, not a Responsible Entity. This should be revised to clarify which Responsible Entities must establish the protection criteria. 2. Table 2, although entitled "Interconnection Frequency Response Obligations" does not use the term FRO in the Table itself. This terminology should be consistent. 3. There is no clear statement in Attachment A identifying the significance of Table 2. The previous paragraph identifies Table 2 as listing "default targets", but how does this relate to the FRO referenced in R1? 4. The "Note" on p. 2 regarding the ERO being able to use additional events that don't satisfy the criteria is unreasonable as drafted. Since these events are used to calculate the Frequency Bias Setting and FRM (as per p.1, s.2), the selection of events should not be at the unfettered discretion of the ERO. As drafted, no grounds or criteria must be satisfied.

## Yes

Please see MH's response to Question 1 regarding the term Single Event Frequency Response Data. Additionally, the discussion in this document is useful in clarifying the intent of the drafting team, but some of this clarification would best be incorporated into the Standard itself. Ex. RSG requirement on page 6. Also on page 7 Attachment A does not specify what validation is and how it is done.
Attachment A refers to BA providing FBS data to ERO which then validates and publishes. This should be reflected in R2.
Yes

Yes

The Applicability of BAL-003-1 should be clarified. Specifically, Section 1.2 should be changed from "Reserve Sharing Groups (where applicable)" to "Reserve Sharing Group whose intent includes meeting Frequency Response Obligations". Regarding Data Retention: 1. As the standard is currently drafted, both the BA and the RSG would be required to retain data or evidence to show compliance with requirements R1 and M1. It is unclear whether this is the intention, or whether it would be acceptable that just one or the other would maintain such records. 2 . In the first and second paragraph, the reference to 'three calendar years' should be specified to be the 'previous three calendar years'. 3. In the third paragraph, it should be clarified who is required to keep information related to non compliance if the BA belongs to an RSG - the BA or the RSG or both. 4. In the fourth paragraph, it should be clarified for what length of time the last audit records must be retained. Western Electricity Coordinating Council

## Steve Rueckert

Yes

No
Agree with the changes made to this latest version of BAL-003-1. However, additional clarity could be added by addressing the following: R1- It is not clear what is intended by "Reserve Sharing Group". As RSGs exist today, FRM performance by an RSG is not contemplated in the definition of FRM and appears to apply more towards 'secondary response'. Recommend clarifiying this concept and possibly include an example in the background document to help explain how this would work. R3 - There may be occasions in which an entity has a legitimate reason or a need to operate in a mode other than Tie Line Bias but that does not qualify as an Adverse Reliability Impact. Recommend including language that would permit limited operation in a mode other than Tie Line Bias mode provided the Reliability Coordinator was notified. R3 - Has the drafting team considered whether or not the language of Requirement R3 will have any conflict or coordination issue with the FERC-approved regional reliability standards BAL-004-WECC-1 - Automatic Time Error Correction? R5 - Suggest changing the language "at least equal to" to "greater than or equal to" for clarity.

No
The proposed VSLs for Requirement R1 treat a BA that did not meet the FRO requirement differently depending on whether or not the Interconnection met the FRO requirement. The obligation of the BA to meet its allocated FRO should be consistent regardless of what the other entities within the interconnection are doing. Suggest removing the interconnection performance from the VSLs and developing four increasing levels of BA failure to meet its FRO.
No
There is disagreement between Attachment A and the Background Document. Attachment A states peak load allocation is based on "Projected" Peak Loads and Generation, but the Background Document states it will use "historical" Peak Load and Generation. The allocation methodology of FRO among the BAs in the equation on page 3 of Attachment A favors BAs with more load than more installed capacity. Peak load is served but not all installed capacity is always dispatched.
No
See response to question 6.

Reducing frequency bias obligation is detrimental to reliability. Lowering the Minimum Frequency Bias Setting from $1 \%$ to $.8 \%$ (as identified in Table 1, Attachment B) will result in a lower value being used by those Balancing Authorities with a natural frequency response below the current required $1 \%$, which in turn will lower the natural frequency response. Over time it seems this pattern would lead to poorer response. Is there an upper limit to the amount of frequency response expected of the Balancing Authorities? How many tenths of a hertz is a Balancing Authority or Reserve Sharing Group expected to respond to. The documents do not appear to provide any boundary on the maximum amount of Frequency Response that a BA will provide. It is not clear what will happen if an event occurs in the Eastern Interconnection that causes the frequency to drop to less than 59.6 Hz or in the Western Interconnection that causes the frequency to drop to less than 59.5 Hz . Will that event be excluded from the list used to calculate the Balancing Authorities' response? Will it be included with an expectation that it counts the same as any other event? Without a clear statement of what is expected, including whether there is a limit on that expectation or not, it is unclear what is expected of the Balancing Authorities. As Drafted, is there the possibility that a Balancing Authority may fail to meet their FRO if surrounding BAs provide significantly more than required. Can over performers cause average performers to fail when they would have otherwise met their requirement. The documents do not provide guidance on how intermittent or variable generation is to be treated Referencing Attachment A may be adding requirements. You may wish to consider adding language in Requirement R1 that specifically requires the completion of the Attachments or Forms. There are no requirements on governor installation, settings, or operation. Addition of governor operation requirements seems essential for a frequency response standard. Without some sort of governor response to require the individual generators to perform, a Balancing Authority with significant amounts of generation for which it has no control over is at a disadvantage.

## Curtis Crews

No
The language used in the requirements is superfluous. This could result in confusion and incorrect assumptions being made. In R1, the comment within brackets "(as detailed in Attachment A and calculated on FRS Form 1)", is not necessary as it is already part of the FRM definition. We suggest removing this bracketed text from the requirement. Also in R1, the phrase "to ensure that sufficient Frequency Response is provided by each BA or RSG to maintain an adequate level of Frequency response in the Interconnection" is a high level objective that does not add clarity to this requirement. We suggest removing this from the requirement. R2, R3 and R5 use similar language e.g. "to ensure effectively coordinated Tie Line Bias control", "to ensure adequate control response" etc. Although it provides background information, this does not add clarity to the requirement. We suggest removing these from the requirements.

|  |
| :--- |
| No |

These documents not only provide additional clarity but also specify additional requirements, such as FRS Form 1 annual reporting by January 10. All the enforceable requirements should be included in the body of the standard. 1. Attachment A uses the terms "delta F (change in frequency)", "arresting frequency (Point C)", "B Value", "A Value". These terms are not properly defined or described in this document as drafted. The AESO suggests adding a description or definitions for clarity in this document. 2. The standard gives 2 sets of values for Interconnection Frequency Response Obligation in Table 2, (1) Base Obligation and (2) the obligation including $25 \%$ Safety Margin (which seems to be implied by the "contingency protection criterion"). The Attachment A does not specifiy whether the Base Obligation or the $25 \%$ Safety Margin value will be used to allocate the Interconnection FRO to the BAs. Please clarify which value will be used to calculate the BA Frequency Response Obligation (FRO) in the Interconnection FRO allocation formula in Attachment A. 3. The "initial FRO allocation" formula in Attachment A uses Peak Load. The term Peak Load is not used in the standard nor is it a defined term in the NERC Glossary. The standard uses Peak Demand, which is defined in the Glossary Is "Peak Load" synonymous with "Peak Demand"? If so, Peak Demand should be used in the formula instead. Otherwise Peak Load should be clearly defined in this document. 4. Is "Projected" in the FRO allocation formula synonymous with "Forecasted"? If so, Forecasted should be used for consistency. Otherwise "Projected" or the context in which it appears must be defined.
No
The Background Document uses BA Peak Generation in the BA FRO allocation formula. Attachment A uses BA Installed Capacity. The AESO suggests making the two formulae consistent.

Besides the standard, the posting has two attachments, supporting material and two forms. It is not clear how enforcement will be applied given the array of explicit and implicit requirements throughout this package, and the use of undefined terminology, which will be subject to interpretations. In the SDT response to our comments to the first draft of this standard it was stated that "The expectation is events will be selected by the Balancing Authorities. The Balancing Authority may exclude events from consideration for specific conditions such as data quality issues. " Based on the SDT's response, it is our understanding that, for the purpose of the FRM calculation, BAs could exclude or include events based on specific conditions consideration, such as data quality or event suitability (e.g. BA separation from the Interconnection). However, the standard as currently drafted, does not have any provisions to this effect. Please include such provisions in the body of the standard.
Anthony Jablonski
ReliabilityFirst

No

ReliabilityFirst thanks the SDT for their effort on this project. ReliabilityFirst has a number of concerns/questions related to the draft BAL-003-1 VSLs which include the following: 1. General VSL Comment - For consistency with other standards, each VSL should begin with the phrase "The Responsible Entity..." or "The Balancing Authority". This is consistent with the language of the requirement and correctly pinpoints the appropriate responsible entity. 2. VSL R1 Comment - Based on the FERC Guideline \#3 "Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement". ReliabilityFirst suggests the following modification: a. Lower VSL - The Responsible Entity achieved an annual FRM within an Interconnection that was equal to or more negative than the Interconnection's FRO and the Responsible Entity's FRM was less negative than its FRO by more than $1 \%$ but by at most $30 \%$ or $15 \mathrm{MW} / 0.1 \mathrm{~Hz}$, whichever one is the greater deviation from its FRO b. Medium VSL - The Responsible Entity achieved an annual FRM within an Interconnection that was equal to or more negative than the Interconnection's FRO and the Responsible Entity's FRM was less negative than its FRO by more than $30 \%$ or by more than 15 MW/0.1 Hz, whichever one is the greater deviation from its FRO c. High VSL - The responsible entity failed to achieve an annual FRM that is equal to or more negative than its FRO and the Responsible Entity's, FRM was less negative than its FRO by more than $1 \%$ but by at most $30 \%$ or $15 \mathrm{MW} / 0.1 \mathrm{~Hz}$, whichever one is the greater deviation from its FRO d. Severe VSL - The responsible entity failed to achieve an annual FRM that is equal to or more negative than its FRO and the Responsible Entity's FRM was less negative than its FRO by more than $30 \%$ or by more than $15 \mathrm{MW} / 0.1 \mathrm{~Hz}$, whichever one is the greater deviation from its FRO 3. VSL R4 Comment - Based on the FERC Guideline \#3 "Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement". ReliabilityFirst suggests the following modification: a. Example for Lower VSL which should be carried throughout all four VSLs - The Balancing Authority incorrectly modified the Frequency Bias Setting value used in its ACE calculation when providing Overlap Regulation Services with combined footprint setting-error less than $5 \%$ of the validated or calculated value 4. VSL R5 Comment - Based on the FERC Guideline \#3 "Violation Severity Level Assignment Should Be Consistent with the Corresponding Requirement". ReliabilityFirst suggests the following modification: a. Example for Lower VSL which should be carried throughout all four VSLs - The Balancing Authority used a monthly average Frequency Bias Setting whose absolute value was less than or equal to $5 \%$ below the minimum specified by the ERO.

ReliabilityFirst thanks the SDT for their effort on this project. ReliabilityFirst has a number of concerns/questions related to the draft BAL-003-1 standard which include the following: 1. General Comment - ReliabilityFirst is unsure how a Reserve Sharing Group (RSG) would be capable of establishing a correct Frequency Response Measure (FRM) and Frequency Response Obligation (FRO) as a RSG. Frequency Response and Frequency Bias are unique values established for each Balancing Authority (BA), is the intent to require a RSG response to establish and maintain a certain frequency response based upon the members and size of the RSG? From a monitoring perspective and without more guidance it is unclear what or how these values will be determined. 2. General Comment ReliabilityFirst believes the proposed definitions for Frequency Response Measure (FRM) and Frequency Response Obligation (FRO) are unclear. For example, ReliabilityFirst is unclear what is meant by the term "observations" in the FRM definition. ReliabilityFirst also believes the terms "reliable operation of an Interconnection" is ambiguous and seeks further clarification to its meaning. 3. General Comment - ReliabilityFirst recommends including Attachment A, Attachment B, FRS Form 1 and FRS Form 2 into the standard itself. These attachments and forms are referenced in the requirements (and definitions) and therefore should be appropriately embodied within the standard.
4. General Comment - ReliabilityFirst believes the last fragment of words in Requirement R1 through R4 (and first fragment of words in Requirement R5) is more of a justification for the requirement rather than a requirement itself. ReliabilityFirst believes this justification should be moved to a "Rationale Text Box". For example, the first set of words in Requirement R5 states: "In order to ensure adequate control response". This language is really explaining why this requirement is needed. ReliabilityFirst believes this should be removed, further expanded upon and placed in a "Rationale Text Box".
Florida Municipal Power Agency

Frank Gaffney

## No

We thank the SDT for their hard work and diligence in moving this Project forward. However, we have some concerns that cause us to not support the standard in its current form. In general, we believe that there has not been sufficient prudency review for the standard, especially R1, to justify a performance based standard around a Frequency Response Measure. We also believe that the proposed standard does not meet all of the conditions of the Final SAR and Supplemental SAR. The "Final SAR" was to develop methods by which a performance based standard would eventually be developed. The Final SAR states: "The proposed standard's intent is to collect data needed to accurately model existing Frequency Response. There is evidence of continuing decline in Frequency Response in the three Interconnections over the past 10 years, but no confirmed reason for the apparent decline. The proposed standard requires entities to provide data so that Frequency Response in each of the Interconnections can be modeled, and the reasons for the decline in Frequency Response can be identified. Once the reasons for the decline in Frequency Response are confirmed, requirements can be written to control Frequency Response to within defined reliability parameters." BAL-003-1 does not seem to complete the scope of this "Final SAR". For instance, "the reasons for the decline in Frequency Response" were not confirmed to our knowledge; and the field trial is not completed to our knowledge. The Supplemental SAR adds to the scope of the Final SAR: "To provide a minimum Frequency Response Obligation for the Balancing Authority to achieve, methods to obtain Frequency Response and provide a consistent method for calculating the Frequency Bias Setting for a Balancing Authority. In addition, the standard will specify the optimal periodicity of Frequency Response surveys." The Supplemental SAR does not eliminate the pre-requisite contained in the Final SAR to determine the reasons for the decline in frequency response and confirm them before establishing "defined reliability parameters". In addition, the standard does not complete the requirement of the Supplemental SAR to identify "methods to obtain Frequency Response". For instance, neither the BA nor the RSG have authority over governor and other generator settings. There should be a requirement for GOPs to incorporate setting changes directed by the BA, otherwise the standard establishes requirements that BAs and RSGs may not have the authority to achieve. There is no consideration of "footprint" changes of the BA resulting in different allocation from the ERO during a year. The standard and Attachments seem to specify an annual process with due dates in December and J anuary with no allowance for mid-year changes and associated allocation changes. If a standard has a requirement for the ERO, who will audit the ERO for compliance? If the ERO does not meet its obligations, can an entity still be found non-compliant, especially on a schedule basis? Wasn't there an issue of assigning standards to RROs, e.g., the fill-in-the-blank standards? Are there similar issues with assigning requirements to the ERO? Is the ERO a "user, owner or operator" of the BPS under Section 215, e.g., at (b)(1)"... All users, owners and operators of the bulk-power system shall comply with the reliability standards that take effect under this section." We question how this would work from a compliance perspective.

No
On Event Selection Criteria, bullet 2, if 25 events cannot be identified then the ERO can go back in time to the previous year. This creates a double jeopardy to R1 of the standard. It also may include irrelevant data if there have been changes from one year to the next in FRO or Bias settings assigned by the ERO. On Frequency Response Obligation, first paragraph states that "Each Interconnection will establish target contingency protection criteria"; however, the Interconnection is not a decisionmaking body. Does this really mean the ERO will establish FRO for each Interconnection? The single asterisk note for the table on page 2 states: "It is extremely unlikely that an event elsewhere in the Eastern Interconnection would cause the Florida UFLS special protection scheme to "false trip".", "Special protection scheme" should be stricken from this sentence, Florida has just a regional difference in its UFLS program.
No
The document does not discuss how the new reliability parameter will affect BAs

On R5, the wording should be changed from "absolute value is at least equal to" to "absolute value is greater than or equal to"

## Brenda Powell

Constellation Energy Commodities Group
No
The Frequency Response Obligation has two components based on Attachment 1 - an Interconnection FRO and a BA FRO. The proposed definition captures only the BA FRO.

## No

R1 should accommodate agreements between multiple BAs and RSGs in achieving the annual Frequency Response Measure. See proposed modification below: R1. Each Balancing Authority shall achieve an annual Frequency Response Measure (FRM) (as detailed in Attachment A and calculated on FRS Form 1) that is equal to or more negative than its Frequency Response Obligations (FRO) to ensure that sufficient Frequency Response is provided by each BA. Either the Balancing Authority individual FRM, multiple Balancing Authority's FRM per written agreement, or the FRM of the Reserve Sharing Group must be equal to or more negative than the applicable Frequency Response Obligations (FRO) for a single Balancing Authority or the aggregate of multiple Balancing Authorities or RSGs. -In R2, "Each Balancing Authority not participating in Overlap Regulation Service" should state "Each Balancing Authority, not receiving Overlap Regulation, shall implement the appropriate Frequency Bias Setting (fixed or variable,) validated by the ERO, into its Area Control Error (ACE) calculation beginning on the date specified by the ERO to ensure effectively coordinated Tie Line Bias control". -In R3, the explanatory language about why to operate in Tie Line Bias mode should be deleted. See proposed modification below: R3. Each Balancing Authority not receiving Overlap Regulation Service shall operate its Automatic Generation Control (AGC) in Tie Line Bias mode, unless such operation would have an Adverse Reliability Impact on the Balancing Authority's Area. -R5 should be modified to state only that the FBS is specified by the ERO in accordance with Attachment B. As drafted the Requirement is in conflict with Attachment B because the Requirement mandates a minimum and does not allow for a reduction to the minimum but it references Attachment $B$ which is titled "Process for Adjusting Minimum Frequency Bias Setting". See proposed modification below: R5. In order to ensure adequate control response, each Balancing Authority shall use a monthly average Frequency Bias Setting whose absolute value is as specified by the ERO in accordance with Attachment B. -There should be a Requirement specifically stating there is an obligation to complete and submit FRS Form 1 by January 10th each year for clarity. -The requirements should be reordered to reflect the chronology of the process for frequency calculation, implementation and performance measurement. The recommended order is as follows: R5 which defines the minimum Frequency Bias Setting (FBS) for a Balancing Authority R4 which describes how the minimum FBS may be altered through Overlap Regulation Service R2 which identifies the coordination required around implementation R3 which requires operation in Tie Line Bias mode R1 which establishes the performance obligation
Yes

## No

Based on language modifications proposed to the Requirements, the measures should be revisited. No
The language in the VSLs for R1 should be revisited based on the proposed language modifications above and should also clearly look to the FRM of a BA, group of BAs or RSG against the BA FRO not an Interconnection FRO.

## Yes

Additional information relating to defining the FRO for the Interconnection would be helpful as would an example for calculating the BA FRO.
Yes
Should be revisited based on the propposed modifications to the requirements.
No
Should be revisited based on the proposed modifications to the requirements.

by the ERO. On Frequency Response Obligation, first paragraph states that "Each Interconnection will establish target contingency protection criteria"; however, the Interconnection is not a decisionmaking body. Does this really mean the ERO will establish FRO for each Interconnection? The single asterisk note for the table on page 2 states: "It is extremely unlikely that an event elsewhere in the Eastern Interconnection would cause the Florida UFLS special protection scheme to "false trip".", "Special protection scheme" should be stricken from this sentence, Florida has just a regional difference in its UFLS program.

The document does not discuss how the new reliability parameter will affect BAs

On R5, the wording should be changed from "absolute value is at least equal to" to "absolute value is greater than or equal to"

Ameren
No
The Frequency Response Measure (FRM) definition should include which Entity(ies) it applies to, similar to the definition of the FRO.
No
R1. While we agree with the concept of the entire requirement and the determination of the Interconnection Frequency Response Obligation, we believe that the accurate measurement of individual BA's FRM has not yet been demonstrated. This requirement should not be part of the standard (even with the additional 12 months in the effective date) until the field trial demonstrates that each BA's FRM can be consistently calculated to a level that will not create false non-compliance to this requirement. While the calculation methodology in FRS Form 1 looks promising, with the Avalue and $B$-value average periods, we believe successful completion of the field trial is prudent. R5. We were not sure if it was intended for this comment question to include Requirement R5, but have decided to include our comments here. While we agree with the requirement of R5, it should not be at the expense of changing the value of L10 in BAL-001, R2, which has been accepted by FERC in Order 693. An accommodation should be made so that any changes to the Frequency Bias Setting according to BAL-003, R5, should not affect the value of L10 used in BAL-001, R2.
No
This is problematic since for a single BA interconnection these could be argued to be appropriate VRFs, but is different for a multiple BA interconnection, where the risk that a single BA would pose to the interconnection would be Lower.
Yes
With the understanding that any suggested changes to the proposed requirements would come with corresponding changes to their measure.
No
It is not clear how the VSL for R1 uses the "Summation of the BA's FRM", when the requirement is BA or RSG specific.
Yes

Yes

Yes
Considering the comments made regarding R5, in question 2, above, which are: R5. While we agree with the requirement of R5, it should not be at the expense of changing the value of L10 in BAL-001, R2, which has been accepted by FERC in Order 693. An accommodation should be made so that any changes to the Frequency Bias Setting according to BAL-003, R5, should not affect the value of L10 used in BAL-001, R2.
Yes
We aaree that the spreadsheet is meaninaful, but still needs to be vetted throuah the field trial
process, with improvements made based on experience in its use.
While we are in general support of this standard and its requirements we have concerns regarding the following: •The FRM methodology has not been fully vetted through the field trial process. •Adjusting the minimum of the Frequency Bias Setting, while an appropriate adjustment for AGC control in the ACE equation, should not be at the expense of L10 as used in BAL-001, R2. •The absence of any resource specific frequency response requirement in NERC standards is an issue that must be addressed somewhere. As the resource portfolio of our industry changes(expedited by recent EPA rulemaking), the resources used for traditional primary frequency response are becoming a lower percentage of the mix. New resources and existing resources that have not provided primary frequency response need to be incorporated into the available frequency response discussion Michael Brytowski
Great River Energy
Yes

No
R1: Including the Reserve Sharing Group (RSG) in the Frequency Response Obligation is outside of the boundaries of a RSG. Where or how would a Frequency Bias be determined for an RSG to determine their Frequency Response Obligation? Although it is apparent that frequency responds during the implementation of reserves, the intention of a RSG is not to share frequency response, but rather to share Reserves. Additionally, if the Frequency Response Obligation is not met by the RSG how are penalties assessed? Should they be assessed to the group as a whole or strictly to the generators that did not meet their individual obligation? R3: Needs to include verbiage for those circumstances when it would be necessary to run AGC out of TLB such as during necessary testing. The BA should have the option to operate out of TLB for a predetermined amount of time if needed when notification and coordination with the RC has been established.

## Yes

Yes

No
The VSLs on for Requirement R1 set a previously un-established precedent of relying on the performance of other registered entities to establish the severity level of the violation. This is not appropriate. The VSLs should be rewritten to provide further gradations of the violation severity based on the BA's own performance
No
Under item 3 of the Event Selection Criteria section, the delta F and Point C should be described either in this attachment or the "Frequency Response Standard Background Document". While many in industry may understand what these terms mean, history has a way of getting lost with personnel turnover. Furthermore, this would help ensure that the auditors and industry have a duplicate understanding. In the Frequency Response Obligation section on page 2, several items require more description. Further description of why an $\mathrm{N}-2$ event was chosen for the Contingency Protection Criteria should be provided and which $\mathrm{N}-2$ event was selected so that industry can help validate if the correct MW value was selected. Furthermore, the document should clarify if the Contingency Protection Criteria contains the "safety margin". There is a statement in the paragraph before the table that states it does but then the table lists out a separate $25 \%$ "Safety Margin". Thus, it is not clear if the "Safety Margin" is included in the Contingency Protection Criteria value listed in the table or not. "Safety margin" should be changed to "reliability margin". Safety has a specific meaning in the electric industry and its use here is not appropriate. The Base Obligation should be explained. The explanation should include its purpose and origin.
No

We can find no document titled "BAL-003-1 Background Document". We assume this question is referring to the "Frequency Response Standard Background Document" dated October 2011. We do not believe the document provides sufficient clarity. No explanation is provided for why RSG was added to Requirement R1. There are typos contained in the document. On page 6 in NIA, the A should be in subscript. On page 7 in bullet 4 in the first sentence, "The" should be in lowercase Yes

Yes

The Data Retention section requires the BA to retain data or evidence for up to four years. No data that exceeds the audit cycle should be required to be retained. The audit cycle is three years. Si Truc PHAN
Hydro-Quebec TransEnergie
No
The FRM and FRO definitions should precise that it is expressed in $\mathrm{MW} / 0.1 \mathrm{~Hz}$. As for the Frequency Bias Setting definition, as written, would apply only to a multiple BA Interconnection. In a single BA Interconnection, the Frequency Bias translates the frequency error into a MW value that must be dispatched to bring back Frequency to desired value. Since Tie Lines are not controlled through AGC, there is no response withdrawal issue
No
The objective of R2 is that all BA's implement their new Bias Setting at the same time, based on the previous year's data, so that control stays the most effective throughout the Interconnection (Tie-Line Bias). In addition, the new Bias will be in effect all year long. The process is quite simple and straightforward for a fixed Bias Setting. As for Variable Bias Setting, this process is not applicable before the fact since the Bias equation can depend on real-time values that are not known in advance. In addition, the simultaneous Bias implementation is not an issue for a single BA Interconnection. Therefore, we suggest that Requirement 2 applies only to Fixed Bias Setting. Yes

Yes

Yes

No
The Event Selection Criteria should be modified for the Quebec Interconnection. In Table 1, the change in frequency (Delta f) used for Quebec's Event Selection Criteria should be $0,3 \mathrm{~Hz}$ (from point " $A$ " to point " $C$ ") and must last for at least 7 seconds so that we don't measure AGC action. In addition, a criterion should be added by saying that events that recovered within the 20-52 second average period for point "B" should be excluded from analysis.
Yes

No
The methodology proposed to compute the Minimum Frequency Bias Setting (in MW/0,1Hz) could be adverse for the Quebec Interconnection. Hydro-Quebec uses a variable Bias that is calculated based upon which generator is online and it's droop setting. Under light load condition, we might have a Bias setting that would be under (in absolute value) than the FRM which is the median value, even though the Bias setting would reflect the grid's frequency response. This method, as proposed, would mandate us to have a larger Bias that what is really needed. Unlike Eastern Interconnection, we are not over biased. By implementing this new methodology, it would make us over biased. Having a too large Bias could lead to system instability, based on the results of studies from our control specialists. The Minimum Frequency Bias Setting should take into account the wide load span that we can face. For the variable bias, we could express the Minimum Frequency Bias Setting as a function of monthly peak loads, and remove the Natural Freauencv Response term. In addition, there is a aap between

Attachment B and the text in R5. See comment 10 for explanation.

## Yes

There is a gap between R5, Attachment B and Form 1 next year's Bias Setting equation. Requirement 5 states that the average Frequency Bias shall be at least equal to the minimum percentage of BA's peak load or generation. In Attachment B and Form 1, the required Frequency Bias is the maximum (absolute value) between FRM, FRO and peak load+peak gen /2. As stated in comment 8, Hydro-
Quebec is not in favor of adding the FRM into the minimum Frequency Bias requirement, at least for Variable Bias Setting. Due to a good frequency response, this would lead us to have a too high AGC Bias and causing potential reliability problems. In other words, this would lead us to be over-biased, which would not be a good thing for a single BA Interconnection. For a Single BA Interconnection, performance measure CPS 1 tracks the performance of the variable Bias, which is enough to ensure reliability through the Interconnection. Hydro-Quebec therefore recommends the drafting team that Requirement 5 only applies to Multiple BA Interconnection. Another option is that Minimum Frequency Bias Setting could be expressed as a function of monthly peak loads, and remove the Natural Frequency Response term in the minimum Bias setting equation.

## Greg Rowland

Duke Energy
No
Duke Energy would suggest removing "usually" from the Frequency Bias Setting definition, as the value in the ACE equation must be in terms of $\mathrm{MW} / 0.1 \mathrm{~Hz}$ in order for ACE to be correctly calculated. We apologize for missing this point in the last round of comments. Though some would argue that the last phrase of the definition is more of an explanation of a function rather than a definition, we support keeping the phrase inserted, as it should be recognized that the intent is to account for the frequency response contribution AND keep the FBS slightly larger (in magnitude) than the average estimated response, to better discourage withdrawal, which was also recognized by Nathan Cohn. Should the definition for Frequency Response Measure (FRM) be specific to the BA, similar to the definition for Frequency Response Obligation (FRO)?

## No

Duke Energy supports the concept of a group of BAs forming a group to share in Frequency Response however it should be clear that it is an option. We feel that the utilization of the term, "Reserve Sharing Group", is not consistent with the definition in the NERC Glossary of Terms which is specific to sharing of contingency reserves, and should be replaced with a new term, such as "Frequency Response Sharing Group". R4 should clarify that a BA performing Overlap Regulation Service should still be required to operate its AGC in "Tie Line Bias" mode. Though comments are provided below on the Attachments, Duke Energy believes that all NERC Reliability Standards' requirements must reside within the standard itself (which is vetted by the Industry and subject to FERC approval), and not within Attachments that may be revised without Industry review and approval. As noted below and in prior comments, given the secondary control implications of changing the minimum Frequency Bias Setting (FBS), Duke Energy believes that subsequent revisions to the minimum FBS should be vetted through the Standards process. Duke Energy would suggest moving the details of the minimum FBS for each Interconnection into the Standard, and having the implementation plan include annual submittal of a revised minimum FBS based upon the methodology presented in Attachment B for ballot approval by the Industry.
Yes

No
See comments in Question 2 regarding utilization of the term "Reserve Sharing Group".
No
See comments in Question 2 regarding utilization of the term "Reserve Sharing Group".
No
On page 3 of the document it states "For a multiple Balancing Authority Interconnection, the Interconnection Frequency Response Obligation is allocated based upon either the Balancing Authority Peak Demand or peak generation", however, the initial FRO allocation equation shows that the BA
allocation is based upon the sum of the Projected BA Peak Load plus installed capacity, times the Interconnection FRO, and divided by the sum of the Projected Interconnection Peak Load plus Interconnection installed capacity. Is the statement in quotes correct, or is the allocation equation correct? In addition, the equation in Attachment A referencing "installed capacity" conflicts with the equation in the BAL-003-1 Background Document entitled "Frequency Response Standard Background Document" where "Peak Gen" is used. In summary, is the FRO allocation based upon an equation which a) sums the Projected BA Peak Load plus peak generation, b) sums the Projected BA Peak Load plus installed capacity, or c) uses either Projected BA Peak Load OR peak generation? All three options are currently represented in the documentation. Calculation of the FRO for the Eastern Interconnection: Duke Energy agrees with the criteria suggested for the event to be protected (4500 MW), and at this time also agrees with the "compromise" low limit of 59.6 Hz . However, knowing that another Standard is under development which may require hourly assessment of available "frequency responsive reserves", we are trying to determine what impact the choice of this methodology will have on the amount of frequency responsive reserves the industry will have to maintain - enough to cover frequency swings that only occasionally reach down to perhaps 59.9 Hz as we see on the Interconnection today (essentially the allocated FRO for a 0.1 Hz deviation), enough to cover a 4500 MW loss, or whatever we deem appropriate as long as we are compliant to the FRM? We recognize that the Standard Drafting Team cannot answer this question, as the Standard under development is not within the scope of this team, however our comment is meant to illustrate the point that similar to our response to question 8 , it should be recognized that elements of this Standard are tightly coupled to other current and potential Standards, and the impacts must be considered by the Industry.
No
Please see our comments to Question 6. In addition, Duke Energy disagrees with the statement on page 9 that Attachment B will "ensure there is no negative impact on other Standards" - please see our response to Question 8 for additional information.

## No

Duke Energy suggests that the SDT consider a term other than "Initial' in the title for Table 1. We suggest "Proposed Frequency Bias Setting" for Table 1. Notwithstanding our suggestion that the criteria/requirements of the minimum FBS in the Attachment be incorporated into the Standard, Duke Energy has the following concerns with what is proposed: As cited in our comments to Question 8 in the last posting (extensive, so not repeated here), the secondary control measures of CPS1, CPS2 and the draft Balancing Authority ACE Limit (BAAL) are tightly coupled to the Frequency Bias Setting (FBS), and a reduction of the FBS will impact the secondary control requirements placed upon the BA. Noted in our response to Question 7 above, the statement on page 9 in the "BAL-003-1 Background Document"is not correct in stating that Attachment B will "ensure there is no negative impact on other Standards". The gradual reduction of the FBS will proportionally tighten the secondary control limits for each Balancing Authority. Even if the "natural" Frequency Response in the Eastern Interconnection remains unchanged for the next several years, under the process described allowing the ERO to annually adjust the minimum FBS for the Interconnection, the FBS will eventually be reduced to a value approximately $10 \%$ above the calculated response in magnitude, cutting the current CPS1, CPS2 and BAAL limits in the Eastern Interconnection on average by more than half. The current FBS for the Eastern Interconnection is approximately minus $6500 \mathrm{MW} / 0.1 \mathrm{~Hz}$, estimated "natural" Frequency Response is perhaps around minus $2400 \mathrm{MW} / 0.1 \mathrm{~Hz}$. Unlike CPS 1 and BAAL where the measures are based upon the FBS of the BA only, CPS2 (dependent upon the FBS of the BA and the Interconnection) will be significantly limiting to the degree that no change in a BA's own Frequency Response could significantly change its CPS2 limit if the Interconnection FBS drops over time as indicated. At least under CPS1 and the draft BAAL, the BA would have an option of improving its Frequency Response, allowing it to increase its FBS and proportionally the CPS1 and BAAL bounds using the FBS. Conclusion from our last comments submitted: Duke Energy does not believe there is a reliability need pushing the industry to tighten secondary control to the degree discussed above simply as a result of reducing the Frequency Bias Setting. If the calculated Frequency Response of the Interconnection stayed at its current level, what would be the justification for tightening the secondary control requirements of CPS1, CPS2 and the proposed BAAL? Duke Energy supports taking more of the error out of the ACE equation by having the FBS closer to the estimated Frequency Response of the Balancing Authority, however, Duke Energy does not believe the result should be a significant increase in secondary control costs to meet the CPS1, CPS2, or draft BAAL requirements. Duke Energy understands the position placed upon this Standard Drafting Team- the secondary
control and reserve requirements are not under the scope of the team, however, proper consideration has not been given in Attachment B to the impact lowering the FBS will have on the industry in terms of the requirements placed upon the BA for secondary control and reserve requirements - especially for meeting CPS2. The research discussed in our comments to the last posting support that reducing the FBS while under CPS1 and the draft BAAL may be achievable, however a CPS2 bound cut potentially in half or lower will place unreasonable bounds on a BA, requiring control actions even when the BA may be operating in support of the Interconnection frequency. Given the significant impacts discussed, Duke Energy believes that additional provisions must be in place for the Industry to approve each subsequent revision to the calculation of the minimum Frequency Bias Setting, rather than leave it as a decision made only by the ERO.
Yes
Duke Energy appreciates the significant work of the Standard Drafting Team in putting together the draft Standard and extensive supporting documentation. Upon further consideration of the comments above, Duke Energy has concluded that the work of this Standard Drafting Team and that of the Balancing Authority Reliability-Based Control Standard Drafting Team under Project 2010-14 developing the Balancing Authority ACE Limit to replace CPS2, need to presented to the Industry as a package - there is too much at stake to have one Standard impact other Standards to this degree. Done in a vacuum the Industry is faced with the possibility of secondary control bounds being cut in half or more, though there is no reliability need driving such performance requirements. Thank you. ISO/RTO Council Standards Review Committee

(1) In our previous comments, we suggested to drop the definitions for the terms FRM and FRO in favor of providing the needed wording in the standard itself to take care of the specific details. The SDT did not adopt our suggestion with the reason that these definitions will be used by other standards in the future. That's fair enough. However, the FRM definition: "The median of all the Frequency Response observations reported annually on FRS Form $1^{\prime \prime}$ is problematic. It references an FRS Form 1 which is not included in the definition itself but is in fact an Attachment to a standard. In the current NERC Glossary of Terms, there is no such precedence that a definition must rely on the requirements or details in a standard for completeness. Also, it is very cumbersome that when changes are made to FRS Form 1, the definition must be posted for industry comment and balloting, and vice versa. When other standards begin using the term, there will be cross references between standards. This further complicates the update/approval process without any appreciable value. Once again, we strongly urge the SDT to consider dropping these definitions, and have the details fully specified in the standard body itself. This will eliminate that cross reference issue. After all, the definition for FRM is a simple sentence and does not provide any clarity or specific details that cannot be presented by using appropriate wording in a requirement. (2) The definition of Frequency Bias Setting, if retained, should focus on what it is. Balancing Authorities do not supply energy. We suggest to revise it to: Frequency Bias Setting A number, either fixed or variable, usually expressed in MW/0.1 Hz, included in a Balancing Authority's (BA's) Area Control Error (ACE) equation to approximate the expected natural response provided by the assets within the respective Balancing Authority's area.
No
General Comments The SRC offers the following general comment with regard to the SDT's proposed revisions: Gerry Cauley's Results based initiative calls for requirements that focus on performance (i.e. WHAT must be accomplished NOT on WHY it is required or HOW it should be accomplished). The SRC has found that such explanatory statements as the SDT is proposing lead to ambiguities and confusion in the compliance application. Compliance Enforcement agents must consider not just the results but must decide if the action was taken for the given reason. To avoid such confusion, the Results based approach uses reference documents to address such background material while leaving the requirement as a direct mandate. The SRC notes: - All NERC Reliability Standards' requirements must reside within the standard itself (which is vetted by the Industry and subject to FERC approval). - Data requirements are better handled through NERC's Rules of Procedure Section 1600 than by mandating that ad hoc Forms be submitted. - Definitions should be generic, and should be selfcontained (i.e. should not reference an external document). - The decisions reardina alternative
methodologies should be decided by the Industry not by the SDT. The SDT should make its case and ask the Industry for its approval. Regarding Order 693 directives, the SRC notes that there are three directives as follows: (1) To include Levels of Non-Compliance; (2) To determine the appropriate periodicity of frequency response surveys necessary to ensure that Requirement R2 and other requirements of the Reliability Standard are being met, and to modify Measure M1 based on that determination and (3) To define the necessary amount of Frequency Response needed for Reliable Operation for each balancing authority with methods of obtaining and measuring that the frequency response is achieved. The SRC suggests that Directive 2 be handled directly as a mandate that the ERO conduct a fixed number of Frequency Response Surveys for randomly selected events. Discussion of the number and the methodology can be explained in a reference document and leave the specifics to the requirement. Directive 3 is critical to the Industry as it relates to who is the Applicable Entity.
The SDT addresses Directive 3 by mandating Balancing Authorities meet an objective. The directive is to define that Objective, but there is no requirement associated with that Objective. There is an attachment and there are discussions of what "may" be done, but there is no requirement in the Standard itself. The reference to the BA as the provider of Frequency Response (i.e. Primary Control response) runs counter to other FERC directives that mandate obligated entities be able to self-serve or to interchange provision of services. In this case the BA per se has no assets and cannot selfserve, moreover the primary response service providers have no obligations to provide the service, thus the BA potentially could face a situation where there is no physical service to be purchased but there is a federally mandated standard to comply with. The idea of creating a Primary Response Market as some have proposed does not work without an obligation on some entity to physically provide that service. One final note, the SRC points out that the ACE is an error signal used to drive secondary response; it is not a signal to drive primary response. Thus the use of the Frequency Bias setting is not for control, it is for "adjusting" the error measure that is analyzed after the fact. This standard needs: • a requirement on the ERO to compute the Obligation on each Interconnection • a requirement on the ERO to conduct Frequency Response surveys (note the SRC does not support this requirement but believes that it is needed to meet the FERC directive) • a requirement on energy supply assets (both generation and load) to provide primary response (as a function of the Interconnection obligation in the first bullet) The above will allow NERC to comply with the FERC directives in a fashion consistent with the processes and procedures approved by FERC. Specific recommendations: The SRC proposes that R1 be deleted based on the facts that: - It imposes an obligation on an entity that has no capability to comply • There is an internal conflict with imposing penalties on a deterministic basis (compliance with a fixed set of events) for a statistical service (primary response is a function of the assets operating state and not a fixed service of the asset). In any case, all of the words after FRO should be deleted. The words are not needed for the requirement and if left in can become a source of contention between auditors and registered entities. R3-delete the added phrase "mode to effectively coordinate control". The phrase "would have an Adverse Impact on the BA's area" needs further discussion. Who makes the decision that operating on AGC will have adverse impact must be defined. R5 - delete the phrase "In order to ensure control response". Such phrases can be needless causes of debate. If a BA uses one of the bulleted methods but does not get "adequate response" then is the BA non-compliant? What is "adequate response"? Who decides if the response is adequate?
Yes

No
M1: The measure should not be tied to a specific Form. If a BA has the evidence but does not provide it on a given Form, how is the reliability of the Power System impacted? The Form may be the format of choice but it should not be an implied requirement. M4: This measure does not read quite right. Something seems to be missing in the part that says: "..showing when Overlap Regulation Service is provided including Frequency Bias Setting calculation to demonstrate compliance with Requirement R4." This part might have read something like: ". .showing that when it performed Overlap Regulation Service, it modified its Frequency Bias Setting in its ACE calculation or it calculated the Frequency Bias Setting meeting the conditions specified in Requirement R4."

We do not have any issues with the VSLs, but wonder if the wording for R1 should have been ".. Reserve Sharing Group's...". Alternatively, the wording after "interconnection's FRO" could be revised to: "...and the Balancing Authority's or the Reserve Sharing Group's FRM was..."

No
Despite the SDT's good faith effort to convert the previous Attachment A into two separate documents (Attachments A and B), the modified Attachment A is problematic. As many commenters indicated, the previous Attachment A, other than the section providing guidance on event selection, appears to be explanatory, contextual, and instructional in content. These aspects are important, but do not rise up to the level of requirements to drive reliability performance/outcome. Attachment A should include only the event selection process and calculations associated with the requirements, including an explanation of what is necessary if variable Frequency Bias Settings are implemented. If other "requirements" need to be specified, such as the reporting time frame stipulated on P. 3 of Attachment A, they should be moved to the standard itself but not imbedded in an attachment. We suggest that the SDT first determine if the materials in the revised Attachment A (and Attachment B) are "Guideline" or Technical Background", or are they "requirements". If it is the former, then Requirement R1 should not mention Attachment A at all. If it is the latter, then the as-written Attachment A is a mix bag as it on the one hand describes the ERO's process for supporting the Frequency Response Standard (FRS), in other words, the method and criteria it uses to calculate the frequency bias settings and the FRM, and on the other hand the BA's obligations to support this process. We strongly disagree that the latter requirements be imbedded in an attachment, especially one that is supposed to provide the technical background and guideline for another entity which is not held responsible for complying with the proposed method. Further, there are no measures provided for the requirements stipulated/imbedded in Attachment A so how can the Responsible Entity (BA, in this case) be assessed for compliance? We suggest the SDT move those requirements on the BA to the main standard, and turn Attachment A into an appendix describing the calculation process. An appendix is not regarded as a mandatory requirement. Similar comments apply to Attachment B. Moreover, if the Attachments are to be integral to the standards, the terminology "may" must be replaced with "shall". Finally, the two Attachments are listed in Section F - Associated Documents. This Section is generally used to list reference documents that are NOT standard requirements. We suggest the SDT review and revise this listing depending on its final determination of the status of the two Attachments (or their revisions, where appropriate).
We do not have an opinion on whether or not the Background Document provides sufficient clarity to the development of the standard. We do, however, suggest that the SDT consider our comments in Q6, above, and move some of the information from Attachments A and B to or combine with the Background Document, to the Background Document to provide all the technical basis and background behind the elements stipulated in the requirements.
No
Please see our comments under Q6. In brief, we do not agree with including a process description type of document as part of the standard requirement. Process description should be regarded guideline document and not a part of the standard requirement.

## No

If we are not mistaken, Form 2 is added as the last sheet in the Form 1 spreadsheet file. Apart from that, however, there are other sheets added to the previous Form 1. But this Comment form makes no mention of the changes, nor is there a question in the Comment Form asking whether the additional information should be requested. We believe this is a significant change to the standard and many commenters may have missed the opportunity to comment on it. Compared to the previous version, Form 1 has been significantly expanded to include not only additional sheets but much more comprehensive data requirements even on the Data Entry sheet itself. This makes data submission a very time-consuming task but the justification for requiring detailed data entry has not been provided. We question the need for such expansion on data entry requirements. We have yet to see the reason for expanding Form 1 in assisting a BA to provide the data needed to comply with the standard, hence we do not see how adding a Form 2 can help in that regard. We suggest the SDT to keep data requirements to only what is minimally needed to support the FRS reporting process. Where the SDT deems additional data entry sheets to be necessary, it should provide the rationale for expanding from a 2 sheet form into a multiple sheet form for additional data collection. Where the SDT deems the additional data sheet or information not necessary to support FRS reporting, then we suggest the SDT to hide those pages not required for the standard so as to avoid confusion, and/or to remove those analytical pages not directly used in the standard.
Finally, we ask the SDT to clarify what the primary purpose of this standard is. If it is to respond to Order 693 then the standard misses the point of definina how often to run Freauencv Response

Surveys; it does not crisply define the "Interconnection" obligations. If the SDT wants to focus on AGC (which it seems to try to do) then the focus should be on the equations and variables and not on the response performance. If the SDT does want to focus on performance then the issue of who is the default provider must be addressed. As the SRC has noted previously, BAs do not own any generating facilities or service providers. To create standards that apply to entities that are completely dependent on other functional entities (facility owners or service providers) to comply with a requirement is simply improper. The Industry structure has changed but these requirements have not and still assume old industry relationships between BAs and GOs. This issue of who needs to be held responsible for performing the required reliability tasks and services/products must be explicitly cited in the standards and posted for the industry to debate and decide.
ACES Power Marketing Standards Collaborators Jason L. Marshall
Yes
No
Requirement 1 should not apply to a Reserve Sharing Group. Reserve Sharing Groups (RSG) are designed to share Contingency Reserves and/or Operating Reserves not Frequency Response. While these reserves may be frequency responsive, they are not being shared for the purpose of expanding frequency response. Furthermore, while reserve sharing groups may calculate a joint ACE by summing its individual BA ACE values, RSGs do not have a Frequency Bias Setting which is necessary to assess a Frequency Response Obligation.

The VSLs on for Requirement R1 set a previously un-established precedent of relying on the performance of other registered entities to establish the severity level of the violation. This is not appropriate. The VSLs should be rewritten to provide further gradations of the violation severity based on the BA's own performance.
No
Under item 3 of the Event Selection Criteria section, the delta F and Point C should be described either in this attachment or the "Frequency Response Standard Background Document". While many in industry may understand what these terms mean, history has a way of getting lost with personnel turnover. Furthermore, this would help ensure that the auditors and industry have a duplicate understanding. In the Frequency Response Obligation section on page 2, several items require more description. Further description of why an $\mathrm{N}-2$ event was chosen for the Contingency Protection Criteria should be provided and which N-2 event was selected so that industry can help validate if the correct MW value was selected. Furthermore, the document should clarify if the Contingency Protection Criteria contains the "safety margin". There is a statement in the paragraph before the table that states it does but then the table lists out a separate $25 \%$ "Safety Margin". Thus, it is not clear if the "Safety Margin" is included in the Contingency Protection Criteria value listed in the table or not. "Safety margin" should be changed to "reliability margin". Safety has a specific meaning in the electric industry and its use here is not appropriate. The Base Obligation should be explained. The explanation should include its purpose and origin.
No
We can find no document titled "BAL-003-1 Background Document". We assume this question is referring to the "Frequency Response Standard Background Document" dated October 2011. We do not believe the document provides sufficient clarity. No explanation is provided for why RSG was added to Requirement R1. There are typos contained in the document. On page 6 in NIA, the A should be in subscript. On page 7 in bullet 4 in the first sentence, "The" should be in lowercase.
Yes

The Data Retention section requires the BA to retain data or evidence for up to four years. No data that exceeds the audit cycle should be required to be retained. The audit cycle is three years.

## Robert Blohm

Keen Resources Asia Ltd.
No
In the Standard, the definition of Frequency Response Measure (FRM) is statistically wrong. The median is an improper statistical measure of Frequency Response because --it truncates large excursions which are the specific subject of Frequency Response control, not normal operating frequency errors which are self-correcting and are the subject of CPM control; --it is non-linear; and therefore --it is non-summable over the interconnection; in other words, the individual BA medians don't add up to the interconnection median, in complete incompatibility with CPM control which requires summability of BA performances into the interconnection's performance. Moreover, it is mathematically impossible to sum the medians of the BAs in a Reserve Sharing Group (RSG) into the RSG's median: in other words, the RSG's median cannot represent the sum of the medians of its members. The last paragraph on page 5 of the Background Document is patently wrong, invented, and supported in no probability \& statistics literature whatsoever. As a practicing statistician, I hereby give testimony to the utter falsehood of the statement that "In general, statisticians use the median as the best measure of central tendency when a population has outliers." (See http://www.robertblohm.com/BestStatistic.doc for an explanation of "best statistic" which is a highly technical and central topic in modern probability theory and statistics.) Also, "outliers" are falsely and rhetorically claimed to be "noise" when in fact they are the "events" that are the specific subject of Frequency Response. It is well known that they do not "fit" a normal distribution. They are distinct from the normal operating errors that are the subject of CPM control. The paragraph does correctly conclude that the linear regression more accurately incorporates outliers than the median does, although the paragraph uses rhetoric by calling this improvement "skew" as if it is distortionary when, in fact, the median distorts the reality.
Yes

Yes

Yes

Yes

No
The sample pre-selection described in Attachment A, Event Selection, Criteria 2 \& 7, violates the fundamental statistical procedure of unbiased sampling. A population is governed by a single "process" which, when stationary, is represented by a fixed probability distribution. In this case the population is several years of events (which are the subject of Frequency Response), not of normal operating control errors which are the subject of CPM control. A sample is governed by a single process that approximates the process governing the population as the sample gets larger, in this case if it includes several years of data. Samples are measured "as they come", no triage/filtering allowed, and they are called "stratified" when their distribution approximates the population distribution. Unlike normal operating errors, samples of events are not evenly distributed over a year. The attempt in criteria $2 \& 7$ to pre-select only certain events, and not others, in such a way that the selected events occur evenly throughout the year, is papently wrong because it is trying to "fit" events into a process (even distribution over time) that does not govern events, but that instead governs normal operating errors that are the subject of CPM control, not of this Frequency Response standard. In other words, criteria $2 \& 7$ confuse Frequency Response with CPM, and events with normal operating errors. The result is a false, biased sample which destroys the integrity of this standard. Paragraph 4 on page 5 of the Background Document, on the other hand, provides a statistically correct description of event selection without sample pre-selection and should followed instead of the erroneous criteria $2 \& 7$ in Attachment A.
Yes
Paraaraph 4 on page 5 of the Backaround Document provides a statisticallv correct description of
event selection without sample pre-selection and should followed instead of the erroneous criteria 2 \& 7 in Attachment A. The risk-based approach to determining FRM, that the Background Document mentions in paragraph 4 of page 4 is being evaluated by the drafting team for application in this standard, should be considered for deployment as soon as possible to replace the administered method currently proposed in this standard, because the administered method lacks any technical justification. No such justification was ever attempted in the development of this standard. The administrative method of determining FRM is therefore but a highly dubious "quick fix" until the riskbased method is evaluated and implemented. The administrative method is in fact perverse because it discourages BAs from reducing their contribution to frequency error by refusing to reduce the BA's FRO accordingly, and because it encourages BAs to contribute to frequency error without increasing their FRO.
Yes

Yes

As a qualified professional statistician I attest that this standard commits two violations of fundamental statistical best practices: use of a median, and biased sample-preselection, as detailed in my answers to questions 1 and 6.
Sacramento Municipal Utility District (SMUD)

No
As drafted, requirement R1 requires Balancing Authorities or Reserve Sharing Groups (RSGs) to achieve an annual Frequency Response Measure (FRM) that is equal to or more negative than its Frequency Response Obligation (FRO). As RSGs exist today, FRM performance by an RSG is not contemplated in the definition of FRM and appears to apply more towards 'secondary response'. Recommend clarifying this concept and possibly including an example in the background document to help explain how this would work. As drafted, in requirement R3, each Balancing Authority not receiving Overlap Regulation Service to operate its AGC in Tie Line Bias mode... unless such operation would have an Adverse Reliability Impact on the Balancing Authority's Area. There may be occasions in which an entity needs to perform testing or other instances where it is necessary or desirable to operate in a mode other than Tie Line Bias that does not qualify as an Adverse Reliability Impact, but never the less is necessary or desired. Recommend including language that would permit operation other than Tie Line Bias mode provided the Reliability Coordinator was notified. We seek clarification from the drafting team as to whether or not there will be any conflicts between proposed Requirement R3 and the requirements of FERC-approved regional reliability standard BAL-004-WECC-1 - Automatic Time Error Correction.

|  |
| :--- |
|  |
| No |

The standard is unclear as to if there is an upper limit to the amount of frequency response expected of the Balancing Authorities under this standard. Except for Table 2 in Attachment A, there is no discussion of an amount of Frequency Response expected on a total basis. Balancing Authorities need to know for how many tenths of a hertz they are to respond so they can determine how to plan to meet this requirement. The documents do not appear to provide any boundary on the maximum amount of Frequency Response that a BA will provide, i.e. it is not clear what will happen if an event occurs in the Eastern Interconnection that causes the frequency to drop to less than 59.6 Hz or in the Western Interconnection that causes the frequency to drop to less than 59.5 Hz , or if that event is excluded from the list used to calculate the Balancing Authorities' response or is it included with an expectation that it counts the same as any other event. Without a clear statement of what is expected, including whether there is a limit on that expectation or not, it is unclear what is expected of the Balancing Authorities.

## Consideration of Comments

## Project 2007-12 Frequency Response

The Frequency Response Drafting Team thanks all commenters who submitted comments on the first formal posting for Project 2007-12 Frequency Response. This standard was posted for a 45-day public comment period from October 25, 2011 through December 9, 2011. Stakeholders were asked to provide feedback on the standard and associated documents through a special electronic comment form. There were 43 sets of comments, including comments from approximately 133 different people from approximately 86 companies representing all 10 of the Industry Segments as shown in the table on the following pages.

Based on the comments received and the drafting team's discussion of those comments, the drafting team made the following changes to the proposed Standard, definitions, and associated documents:

- Modified the definition for Frequency Response Measure (FRM)
- Modified the definition of Frequency Bias Setting
- Removed the references to Reserve Sharing Groups (RSGs) and replaced them with Frequency Response Sharing Group
- Created a definition for Frequency Response Sharing Group (FRSG)
- Modified Requirement R2 to provide clarity and incorporate Requirement R5
- Created a new Requirement R3 for entities using variable Frequency Bias
- Removed the requirement for operating in Tie Line Bias mode as duplicative of other requirements in other standards
- Removed Requirement R5 and combined it into revised Requirement R2 and new Requirement R3
- Modified Attachment A to provide additional clarity
- Created a Procedure to provide instructions for the ERO to follow in supporting the standard
- Made conforming changes to Measures, Evidence Retention, and VSLs to align with language in the revised requirements
- Re-wrote the Background Document to incorporate additional language for justification of requirements and provide additional clarity
- The SDT is now using the method detailed in the Frequency Response Initiative Report dated September 30, 2012 to calculate the Interconnection Frequency Response Obligation.

There were some minority issues that the team was unable to resolve, including the following:

- A few stakeholders questioned a Requirement for the BA to provide Frequency Response when they typically do not own generation. The SDT explained that the NERC Functional Model and FERC cited the BA as the responsible party for providing Frequency Response and that this was outside the scope of the industry approved SAR. The SDT also stated that there were several different methods available to the BA to provide Frequency Response and that the SDT had included these in the Background Document. The SDT further stated that any entity could submit a SAR addressing this issue to the SC for consideration and that the SDT supported this option.
- A couple of the commenters felt that the median was not the proper method to use for the calculation of the FRM and that the RSG was not fully explained. The SDT stated that the statisticians note that the median is a more accurate measure of central tendency than the mean when analyzing a sample that is small and or where scores vary widely. This is the case when estimating a BA's Frequency Response. The SDT also noted that while the median was not perfect, the median approaches a BA's typical performance after $15-20$ observations and that more observations give a higher confidence in the estimate of the BA's performance.
- Some commenters disagreed with proceeding through development of the standard before the proposed measures have been thoroughly field tested. The SDT stated that it was responding to FERC Directives from Order 693 as well as the FERC Order dated March 18, 2010 which mandated development of a standard addressing the Order 693 directives within six months. FERC later granted an extension to provide a standard addressing these issues by the end of May 2012.

All comments submitted may be reviewed in their original format on the standard's project page:

## Index to Questions, Comments, and Responses

1. The SDT has made minor modifications to the proposed definitions to provide additional clarity. Do you agree that these modifications provide sufficient clarity? If not, please explain in the comment area.10
2. The SDT has made minor modifications to the Requirements R1 through R4 to provide additional clarity. Do you agree that these modifications provide sufficient clarity to comply with the standard? If not, please explain in the comment area. 28
3. The SDT has developed VRFs for the proposed Requirements within this standard. Do you agree
that these VRFs are appropriately set? If not, please explain in the comment area. ..................... 82
4. The SDT has developed Measures for the proposed Requirements within this standard. Do you agree with the proposed Measures in this standard? If not, please explain in the comment area. 86
5. The SDT has developed VSLs for the proposed Requirements within this standard. Do you agree
with these VSLs? If not, please explain in the comment area. ..................................................... 93
6. The SDT divided the previously posted "Attachment A - Background Document" into two documents to provide additional clarity. The first document "Attachment A- Supporting Document" which details the methods used to develop the events to be analyzed, the FRO, FRM and Frequency Bias Setting. Do you agree that the revised Attachment A - Supporting Document provides sufficient clarity on the methodologies to be used? If not, please explain in the comment area 113
7. The SDT has developed a new document titled Attachment B - Process for Adjusting Bias Setting Floor. This document is intended to provide the methodology the ERO will use to reduce the minimum Frequency Bias Setting to become closer to natural Frequency Response. Do you agree that this document provides clear and concise instructions for the ERO to follow? If not, please explain in the comment area. 161
8. The SDT has provided an additional spreadsheet, FRS Form 2, to assist the Balancing Authority in providing the data needed to comply with the proposed standard. Do you agree that this spreadsheet is useful and the instructions are meaningful? If not, please explain in the comment area. 174
9. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard BAL-003-1.184

1. The SDT has made minor modifications to the proposed definitions to provide additional clarity. Do you agree that these modifications provide sufficient clarity? If not, please explain in the comment area.

Summary Consideration: The majority of the commenters felt that the SDT should use the term "prevent" instead of "discourage" in the definition of FRM. The SDT explained that it did not want to use the word "prevent" since the SDT believes that the word would imply that you could stop withdrawal. The SDT does not believe that you can totally stop the withdrawal but you can discourage it.

Many of the commenters did not agree with requiring the BA to provide Frequency Response. The NERC Functional Model and FERC cite the BA as the responsible party for providing Frequency Response. There are several different methods available to the BA to provide Frequency Response and these are included in the Background Document.

A couple of the commenters felt that the median was not the proper method to use for the calculation of the FRM and that the RSG was not fully explained. Statisticians note that the median is a more accurate measure of central tendency than the mean when analyzing a sample that is small and or where scores vary widely. This is the case when estimating a BA's Frequency Response. While the median is not perfect, the median approaches a BA's typical performance after 15-20 observations and more observations give a higher confidence in the estimate of the BA's performance.

Some commenters had concerns about the use of the RSG as a means to provide Frequency Response, and in response the SDT modified the Background Document to further explain how an RSG (now FRSG) could be used to supply Frequency Response. The SDT has defined a new term "Frequency Response Sharing Group (FRSG)" because it believes that using the presently defined term "Reserve Sharing Group" could cause confusion. The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members."

| Organization | Yes or No | Question 1 Comment |
| :--- | :--- | :--- |
| Seattle City Light | Negative | Answer: No. Comments: LADWP and SCL recommend the following change <br> to the definition of Frequency Bias Setting. LADWP believes that this change <br> increases the clarity of the definition: |
| Original A number, either fixed or variable, usually expressed in MW/0.1 Hz, <br> included in a Balancing Authority's Area Control Error equation to account <br> for the Balancing Authority's Frequency Response contribution to the |  |  |

| :--- | :--- | :--- |

| Organization | Yes or No | Question 1 Comment |
| :--- | :---: | :--- | :--- |
| outweigh the effort and cost. <br> Again, the drafting team cannot include requirements beyond the bounds of its SAR. If the commenter(s) believes there is a <br> need for a generator performance obligation, they are encouraged to submit a SAR to that effect. <br> The SDT also believes that the definition you have suggested is basically saying the same thing as the definition the SDT has <br> chosen to use. |  |  |
| Potomac Electric Power Co. | Negative | The proposed new Definitions do not stand alone and are also linked to <br> Attachments. |
| Response: The SDT has modified the definitions to no longer reference any other documents. |  |  |

| Organization | Yes or No | Question 1 Comment |
| :--- | :--- | :--- | :--- |

| Organization | Yes or No | Question 1 Comment |
| :--- | :---: | :--- | :--- |$|$| chosen to use. | No | Duke Energy would suggest removing "usually" from the Frequency Bias <br> Setting definition, as the value in the ACE equation must be in terms of <br> MW/0.1Hz in order for ACE to be correctly calculated. We apologize for <br> missing this point in the last round of comments. Though some would argue <br> that the last phrase of the definition is more of an explanation of a function <br> rather than a definition, we support keeping the phrase inserted, as it <br> should be recognized that the intent is to account for the frequency <br> response contribution AND keep the FBS slightly larger (in magnitude) than <br> the average estimated response, to better discourage withdrawal, which <br> was also recognized by Nathan Cohn. <br> Should the definition for Frequency Response Measure (FRM) be specific to <br> the BA, similar to the definition for Frequency Response Obligation (FRO)? |
| :--- | :--- | :--- | :--- |

| Organization | Yes or No | Question 1 Comment |
| :--- | :--- | :--- | \left\lvert\, \(\left.\begin{array}{l}definition must rely on the requirements or details in a standard for <br>

completeness. Also, it is very cumbersome that when changes are made to <br>
FRS Form 1, the definition must be posted for industry comment and <br>
balloting, and vice versa. When other standards begin using the term, there <br>
will be cross references between standards. This further complicates the <br>
update/maintenance problem without any appreciable value. <br>
Once again, we strongly urge the SDT to consider dropping these definitions, <br>
and have the details fully specified in the standard body. This will eliminate <br>
the cross reference issues. After all, the definition for FRM is a simple <br>
sentence and does not provide any clarity or specific details that cannot be <br>
addressed by providing the appropriate wording in a requirement. <br>
With this cross-reference issue, combined with the issues associated with <br>
Attachments A and B (see our comments under Q6, below), we are unable <br>
to support this standard at this time.\end{array}\right.\right\}\)

| Organization | Yes or No | Question 1 Comment |
| :--- | :--- | :--- | \left\lvert\, \(\left.\begin{array}{l}in other words, the RSG's median cannot represent the sum of the medians <br>

of its members.The last paragraph on page 5 of the Background Document <br>
is patently wrong, invented, and supported in no probability \& statistics <br>
literature whatsoever. As a practicing statistician, I hereby give testimony to <br>
the utter falsehood of the statement that "In general, statisticians use the <br>
median as the best measure of central tendency when a population has <br>
outliers." (See http://www.robertblohm.com/BestStatistic.doc for an <br>
explanation of "best statistic" which is a highly technical and central topic in <br>
modern probability theory and statistics.) Also, "outliers" are falsely and <br>
rhetorically claimed to be "noise" when in fact they are the "events" that <br>
are the specific subject of Frequency Response. It is well known that they <br>
do not "fit" a normal distribution. They are distinct from the normal <br>
operating errors that are the subject of CPM control. The paragraph does <br>
correctly conclude that the linear regression more accurately incorporates <br>
outliers than the median does, although the paragraph uses rhetoric by <br>
calling this improvement "skew" as if it is distortionary when, in fact, the <br>
median distorts the reality.\end{array}\right.\right\}\)

| Organization | Yes or No | Question 1 Comment |

| interconnection. |  |  |
| While not perfect, the median approaches a BA's typical performance after 15-20 observations. More observations give a higher |  |  |
| confidence in the estimate of the BA's performance. |  |  |

Response: The SDT removed the term because it was not being used within the standard itself. It was only being used in the calculation of the FRM. There is no need to create a NERC Glossary defined term if it is not being used in the standard.

| Seattle City Light | No | LADWP and SCL recommend the following change (in red) to the definition <br> of Frequency Bias Setting. LADWP believes that this change increases the <br> clarity of the definition:OriginalA number, either fixed or variable, usually <br> expressed in MW/O.1 Hz, included in a Balancing Authority's Area Control <br> Error equation to account for the Balancing Authority's Frequency Response <br> contribution to the Interconnection, and discourage response withdrawal <br> through secondary control systems.Proposed ChangeA number, either fixed <br> or variable, usually expressed in MW/0.1 Hz, included in a Balancing <br> Authority's Area Control Error equation to account for the Balancing <br> Authority's Frequency Response contribution to the Interconnection, and <br> discourage prevent response withdrawal through secondary control systems |
| :--- | :---: | :--- |
| Response: The SDT disagrees with your definition The SDT considered using the term "prevent" but decided to use the term |  |  |
| "discourage" instead. The SDT believes that the word "prevent" would imply that you could stop withdrawal. The SDT does not |  |  |
| believe that you can totally stop the withdrawal but you can discourage withdrawal. |  |  |$|$| Los Angeles Department of Water <br> and Power | No | LADWP recommends the following change to the definition of Frequency <br> Bias Setting (replace the word "discourage" with the word "prevent"). |
| :--- | :--- | :--- |

| Organization | Yes or No |  |
| :--- | :--- | :--- |

| Organization | Yes or No | Question 1 Comment |
| :--- | :--- | :--- | \left\lvert\, \(\left.\begin{array}{l}The Balancing Authority Area's share of the required Frequency Response <br>

needed for the reliable operation of an Interconnection. <br>
A BA that does not own generation resources cannot provide Frequency <br>
Response, it can only schedule and dispatch available resources capable of <br>
such; . The BA should be responsible for taking action to schedule resources <br>
that are capable of frequency response, and monitoring to assure frequency <br>
response performance. The GOP (possibly the LSE when demand side <br>
performance is involved) must be accountable for performing. However, <br>
there is nothing in this requirement to encourage the owner of a resource <br>
who chooses not to provide frequency response to come to the table. <br>
There is nothing in this standard that uniformly requires all frequency <br>
response providers to perform. This is likely to be detrimental to the <br>
performance of a BAA and unfairly sanctions those willing to perform to to <br>
assure reliability while others are not required to perform.\end{array}\right.\right\}\)

| Organization | Yes or No | Question 1 Comment |
| :---: | :---: | :---: |
| need for a generator performance obligation, they are encouraged to submit a SAR to that effect. |  |  |
| Ameren | No | The Frequency Response Measure (FRM) definition should include which Entity(ies) it applies to, similar to the definition of the FRO. |
| Response: The SDT has modified the definition for FRM to state that is the responsibility of the BA. The definition now read "The median of all the Frequency Response observations reported annually by Balancing Authorities for frequency events specified by the ERO. This will be calculated as MW/0.1Hz." |  |  |
| Constellation Energy Commodities Group | No | The Frequency Response Obligation has two components based on Attachment 1 - an Interconnection FRO and a BA FRO. The proposed definition captures only the BA FRO. |
| Response: The definition is referencing the responsible entity, the BA. The interconnection's FRO is only calculated as the beginning point for the determination of the BA's FRO. |  |  |
| Hydro-Quebec TransEnergie | No | The FRM and FRO definitions should precise that it is expressed in MW/0.1Hz. <br> As for the Frequency Bias Setting definition, as written, would apply only to a multiple BA Interconnection. In a single BA Interconnection, the Frequency Bias translates the frequency error into a MW value that must be dispatched to bring back Frequency to desired value. Since Tie Lines are not controlled through AGC, there is no response withdrawal issue |
| Response: The FRM and FRO definitions have been modified to state MW/0.1Hz. <br> The SDT disagrees. There can be withdrawal on any interconnection that uses a Frequency Bias estimate if that estimate is lower than Frequency Response and other factors are used to determine dispatch, i.e., future load estimate. |  |  |
| Northeast Power Coordinating Council/ISO New England Inc. | No | The FRM definition should not refer to FORM 1. <br> Also, suggest the following wording for frequency bias setting: "A number, |

| Organization | Yes or No | Question 1 Comment |
| :---: | :---: | :---: |
|  |  | either fixed or variable, usually expressed in MW/0.1 Hz, included in a Balancing Authority's Area Control Error equation to approximate the frequency response provided by the assets within the respective Balancing Authority's area." |
| Response: The SDT has modified the definitions to no longer reference any other documents. <br> The definition now read "The median of all the Frequency Response observations reported annually by Balancing Authorities for frequency events specified by the ERO. This will be calculated as MW/0.1Hz." |  |  |
|  |  |  |
| The SDT agrees that the Balancing Authority does not directly supply energy. However, the NERC Functional Model Technical Document identifies the BA as the entity that manages and deploys Frequency Response. This is because a BA controls the amount and distribution of spinning reserves and also has some control over interruptible resources. This is similar to the relationship between the TOP and voltage control. Even though the TOP may not own generators or capacitor banks, the TOP is still responsible for controlling voltage within limits. |  |  |
| The industry-approved Standards Authorization Request (SAR) for BAL-003 did not include a performance obligation for generators. The drafting team is obliged to stay within the bounds of its SAR. |  |  |
| There are two primary reasons the SAR did not apply a performance obligation on generators. First, there are thousands of generators in North America. It would be many times more costly and difficult to implement a standard that measures all generators and verifies performance is properly calculated. Secondly, given the fact that there presently is sufficient frequency response in all Interconnections, the value of implementing a performance obligation on generators at this time would not outweigh the effort and cost. |  |  |
| Again, the drafting team cannot include requirements beyond the bounds of its SAR. If the commenter(s) believes there is a need for a generator performance obligation, they are encouraged to submit a SAR to that effect. |  |  |
| The SDT also believes that the definition you have suggested is basically saying the same thing as the definition the SDT has chosen to use. |  |  |
| MRO NSRF | No | The FRM definition: "The median of all the Frequency Response observations reported annually on FRS Form 1" is problematic. It references an FRS Form 1 which is not included in the definition itself but is in fact an |

| Organization | Yes or No | Question 1 Comment |
| :--- | :--- | :--- | \left\lvert\, \(\left.\begin{array}{ll}\hline attachment to a standard. In the current NERC Glossary of Terms, there is <br>

no such precedence that a definition must rely on the requirements or <br>
details in a standard for completeness. <br>
Additionally, the definition of Frequency Bias Setting should focus on what it <br>
is. Balancing Authorities do not supply energy. Suggest revising it <br>
to:Frequency Bias Setting A number, either fixed or variable, usually <br>
expressed in MW/O.1 Hz, included in a Balancing Authority's Area Control <br>
Error equation to approximate the expected natural response provided by <br>
the assets within the respective Balancing Authority's area.\end{array}\right.\right\}\)

| :---: | :---: | :---: |
| chosen to use. |  |  |
| Alberta Electric System Operator | No | The FRO definition is specific to BAs. The Appendix 1 , which is incorporated in the standard, uses this definition in relation to requirements of the Interconnection. The SDT should consider a revision of this definition that accounts for the requirements of the Interconnection versus the BA obligation to the Interconnection. |
| Response: The definition is referencing the responsible entity, the BA. The Interconnection's FRO is only calculated as the beginning point for the determination of the BA's FRO. |  |  |
| South Carolina Electric and Gas | No | The last phrase of the definition of Frequency Bias Setting is more of an explanation of a function rather than a definition. Therefore, we do not feel it belongs in the definition of the Frequency Bias Setting and a period should be inserted after the word "Interconnection". <br> Should the definition for Frequency Response Measure (FRM) be specific to the BA, similar to the definition for Frequency Response Obligation (FRO)? |
| Response: The SDT thanks you for your suggestion but feels that the statement referenced provides further clarity and has decided to not further modify the definition based on your comments. <br> The SDT has modified the definition for FRM to state that is the responsibility of the BA. The definition now read "The median of all the Frequency Response observations reported annually by Balancing Authorities for frequency events specified by the ERO. This will be calculated as MW/0.1Hz." |  |  |
|  |  |  |
| SERC OC Standards Review Group | No | We feel that the last phrase of the definition of Frequency Bias Setting is more of an explanation of a function rather than a definition. While the SERC OC Standards Review Group understands the statement, we do not feel it belongs in the definition of the Frequency Bias Setting and a period should be inserted after the word "Interconnection". Should the definition for Frequency Response Measure (FRM) be specific to the BA, similar to the |

| Organization | Yes or No | Question 1 Comment |
| :---: | :---: | :---: |
|  |  | definition for Frequency Response Obligation (FRO)? |
| Response: The SDT thanks you for your suggestion but feels that the statement referenced provides further clarity and has decided to not further modify the definition based on your comments. <br> The SDT has modified the definition for FRM to state that is the responsibility of the BA. The definition now read "The median of all the Frequency Response observations reported annually by Balancing Authorities for frequency events specified by the ERO. This will be calculated as MW/0.1Hz." |  |  |
| Southern Company | No | We suggest adding BA to the definition of Frequency Response Measure (FRM), similar to the definition for Frequency Response Obligation (FRO). |
| Response: The SDT has modified the definition for FRM to state that is the responsibility of the BA. The definition now read "The median of all the Frequency Response observations reported annually by Balancing Authorities for frequency events specified by the ERO. This will be calculated as MW/0.1 Hz." |  |  |
| Associated Electric Cooperative Inc | Yes | The FRO definition incorrectly applies the historically narrow Balancing Authority scope of responsibility, while the FRM definition does not address applicability at all. But the BAL-003-1 Standard itself identifies RSGs (where applicable) and BAs as the Responsible Entities within scope of this standard. For consistency, AECI recommends using "Responsible Entities (e.g. Reserve Sharing Groups - where applicable, and Balancing Authorities)" in both the FRO and FRM definitions. Rationale: This change should help future-proof the definition, should more specific "frequency response" or "spinning reserve" sharing groups later surface within our industry. <br> AECl agrees with the Frequency Bias Setting definition's inclusion of a bit more functionality than typical. We however recommend replacing "to account for the Balancing Authority's Frequency Response contribution to the Interconnection, and discourage response withdrawal through secondary control systems", with "to support their Frequency Response contribution to the Interconnection". Rationale: Readability, and clarity on |

| Organization | Yes or No | Question 1 Comment |
| :--- | :--- | :--- |
|  |  | the "discouraging withdrawal..." phrase, which should reside in the <br> Background document. |
| Response: The SDT believes that using the term "Responsible Entities" would cause confusion since different standards could <br> define a Responsible Entity differently. However, the SDT has defined a new term "Frequency Response Sharing Group" <br> because it believes that using the presently defined term "Reserve Sharing Group" could cause confusion. The new definition <br> reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply <br> operating resources required to jointly meet the Frequency Response Obligations of its members." The SDT has decided not to <br> add the term FRSG to the definition for Frequency Response Obligation (FRO). The SDT believes that the FRO is assigned to a BA <br> not the FRSG. The FRSG FRO is a summation of the BA FRO's. <br> The SDT thanks you for your suggestion but feels that the statement referenced provides further clarity and has decided to not <br> further modify the definition based on your comments. |  |  |
| SCE\&G | Affirmative | The last phrase of the definition of Frequency Bias Setting is more of an <br> explanation of a function rather than a definition. Therefore, we do not feel <br> it belongs in the definition of the Frequency Bias Setting and a period should <br> be inserted after the word "Interconnection". <br> Should the definition for Frequency Response Measure (FRM) be specific to |
| the BA, similar to the definition for Frequency Response Obligation (FRO)? |  |  |
| o The utilization of the term, "Reserve Sharing Group", is not consistent |  |  |
| with the definition in the NERC Glossary of Terms, and should be deleted, |  |  |
| applicability should be clarified or replaced with a new term, such as |  |  |
| "Frequency Response Sharing |  |  |

| Organization | Yes or No | Question 1 Comment |

2. The SDT has made minor modifications to the Requirements R1 through R4 to provide additional clarity. Do you agree that these modifications provide sufficient clarity to comply with the standard? If not, please explain in the comment area.

Summary Consideration: The majority of the commenters felt that the use of an RSG as a method for supplying Frequency Response was not fully explained. The SDT modified the Background Document to further explain how an RSG (now FRSG) could be used to supply Frequency Response. The SDT has defined a new term "Frequency Response Sharing Group (FRSG)" because it believes that using the presently defined term "Reserve Sharing Group" could cause confusion. The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members."

Many of the commenters were concerned with the language in Requirement R3 stating that an entity had to be operating in Tie Line Bias mode unless there were adverse affects on the BES. The SDT removed this requirement from the proposed standard since it is duplicative of Requirement R6 and R7 in BAL-005-0.1b.

Many of the commenters did not agree with assigning the BA to provide Frequency Response. The NERC Functional Model and FERC cited the BA as the responsible party for providing Frequency Response. There are several different methods available to the BA to provide Frequency Response included in the Background Document.
A few of the commenters did not agree with lowering the minimum Frequency Bias Setting. Early research by Nathan Cohn on interconnected power system operations found that control is optimum if a BA's Bias Setting is equal to its natural Frequency Response. If there were to be a difference between the two values, it is preferable to be slightly over-biased. The drafting team has proposed to bring Bias Setting and natural Frequency Response more in line. The process to do this is outlined in a Procedure developed by the SDT which replaces Attachment B. The Procedure manages a "go slow" approach to making this happen and includes checks to confirm there are not unexpected influences injected into the CPS-related calculations. Based on concerns raised by the industry, the drafting team has modified the Procedure to make the initial minimum Bias Setting $0.9 \%$ of peak and has included a provision that the ERO will evaluate the impact caused by a change in minimum Bias Setting. The evaluation will look at both frequency performance and impact on CPS-related compliance calculations.
A couple of commenters were concerned that the BA could be responsible to supply an infinite amount of Frequency Response. They felt that a BA could not prepare for this in its planning process. The proposed standard was not clear on this subject and the SDT has added language in the "Event Selection Criteria" section of Attachment A to limit the amount of Frequency Response a BA would be required to provide to be compliant with the standard.

| :---: | :---: | :---: |
| Seattle City Light | Negative | The language in Requirement 4 needs to be clarified and recommends the following change: <br> R4. Each Balancing Authority that is performing Overlap Regulation Service shall modify its Frequency Bias Setting in its ACE calculation to be equivalent to either <br> (i) the sum of the Frequency Bias Settings of the participating Balancing Authorities as validated by the ERO, or <br> (ii) (ii) the Frequency Bias Setting as calculated based on the entire area being combined and thereby represent the Frequency Response for the combined area being controlled. [Risk Factor: Medium][Time Horizon: Operations Planning] |
| Response: The SDT has modified Requirement R4 to use bullets in support of your suggestion. |  |  |
| Public Utility District No. 1 of Douglas County | Negative | 1. Recommend clarifying the language in R1 to include background information as to how RSGs fit into the FRM performance. <br> 2. Recommend R3 language be modified to permit operation in other than tie-line bias mode with the requirement to notify the RC. <br> 3. We have concern about the affect R3 will have on the WECC time error correction standard (BAL-004-WECC-1). <br> 4. Clarification is needed between Attachment A and the Background Document for projected peak and historical peak. <br> 5. We have a concern about the affect of lowering the minimum frequency bias obligation from $1 \%$ to $.8 \%$ and its probable affect on reliability. <br> 6. We have a concern about he upper limit to the amount of frequency response expected from BAs. |
| Response: Comment 1 - The SDT has modified the Background Document to further explain how an RSG (now FRSG) can be used to supply Frequency Response. The SDT has defined a new term "Frequency Response Sharing Group (FRSG)" because it believes |  |  |

Organization
Yes or No

## Question 2 Comment

that using the presently defined term "Reserve Sharing Group" could cause confusion. The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members."

Comment 2 \& 3- The SDT has removed the Requirement R3 from the next version of the proposed standard. This removal was based on industry comments and the belief that it was duplicative with Requirements R6 and R7 in BAL-005-0.1b.

Comment 4 - The SDT has corrected the error between Attachment A and the Background Document.
Comment 5 - Early research by Nathan Cohn² on interconnected power system operations found that control is optimum if a BA's Bias Setting is equal to its natural Frequency Response. If there were to be a difference between the two values, it is preferable to be slightly over-biased.
The drafting team has proposed to bring Bias Setting and natural Frequency Response more in line. The process to do this is outlined in a Procedure developed by the SDT which replaces Attachment B. The Procedure manages a "go slow" approach to making this happen and includes checks to confirm there are not unexpected influences injected into the CPS-related calculations. Based on concerns raised by the industry, the drafting team has modified the Procedure to make the initial minimum Bias Setting $0.9 \%$ of peak and has included a provision that the ERO will evaluate the impact caused by a change in minimum Bias Setting. The evaluation will look at both frequency performance and impact on CPS-related compliance calculations.

Comment 6 - The SDT understands your concern and agrees that this could cause problems with compliance. The SDT has modified Attachment A to include language which puts an upper limit on the amount of Frequency Response required from an entity.

| Potomac Electric Power Co. | Negative | 1)The proposed Requirements do not meet all the FERC directives. <br> 2)The proposed Requirements fail to recognize the fact that not all BAs can provide <br> primary frequency response. |
| :--- | :--- | :--- | :--- |
| 3)The proposed Requirements are not all in the standard. Some are in the |  |  |
| Attachments. |  |  |

[^59]| Organization | Yes or No | Question 2 Comment |
| :--- | :--- | :--- |
| Response: Comment $1-$ The SDT disagrees with you about their meeting all of the FERC directives. Unfortunately your comment <br> does not provide specific information as to what you believe is not being addressed. The SDT has included a section within the |  |  | Background Document which details how this standard is meeting the FERC directives.

Comment 2 - The NERC Functional Model Technical Document identifies the BA as the entity that manages and deploys Frequency Response. This is because a BA controls the amount and distribution of spinning reserves and also has some control over interruptible resources. This is similar to the relationship between the TOP and voltage control. Even though the TOP may not own generators or capacitor banks, the TOP is still responsible for controlling voltage within limits.
The industry-approved Standards Authorization Request (SAR) for BAL-003 did not include a performance obligation for generators. The drafting team is obliged to stay within the bounds of its SAR.
There are two primary reasons the SAR did not apply a performance obligation on generators. First, there are thousands of generators in North America. It would be many times more costly and difficult to implement a standard that measures all generators and verifies performance is properly calculated. Secondly, given the fact that there presently is sufficient frequency response in all Interconnections, the value of implementing a performance obligation on generators at this time would not outweigh the effort and cost.
Again, the drafting team cannot include requirements beyond the bounds of its SAR. If the commenter(s) believes there is a need for a generator performance obligation, they are encouraged to submit a SAR to that effect.
Comment 3 - Unfortunately your comment does not provide enough information as to what parts of the attachments you believe should be in the requirements. However, the SDT has made significant modifications to both Attachment A and Attachment B now a Procedure for the ERO to follow in support of the proposed standard. The SDT believes that the requirements should be succinct and the methodologies to be used should be part of an attachment.

| Seattle City Light | No | o LADWP and SCL have a concern with Requirement 3. The requirement should <br> provide allowance for legitimate circumstances when an entity cannot run on Tie <br> Line Bias mode and not have an Adverse Reliability Impact on the Balancing <br> Authority's Area. An entity should not be penalized when these legitimate <br> circumstances occur. LADWP believes that the Frequency Response Standard <br> Background Document, on Page 8, lists examples of legitimate circumstances:- <br> Telemetry problems that lead the operator to believe ACE is significantly in error.- |

|  |  | the auditors to determine the value of the Frequency Bias Setting for BAs receiving Overlap Regulation Service. <br> Comment 4: In general, the requirements indicate what the responsible BAs should do and when. The requirements do not indicate what the BAs that are not responsible should do and when, ie. how they are relieved from responsibility. This may create problems when the auditors are required to interpret the standards for BAs that have appropriately shifted responsibilites to others. |
| Response: Comment 1 - The SDT believes that Requirement R2 states the timing for implementation of the Frequency Bias Setting. The Requirement R4 is simply to provide the BA with the method for combining the Frequency Bias Settings for providers of Overlap Regulation Service. The Background Document and Attachment A have also been modified to provide further clarity. <br> Comment 2 - The SDT has removed the Requirement R3 from this version of the proposed standard. This removal was based on industry comments and the belief that it was duplicative with Requirements R6 and R7 in BAL-005-0.1b. <br> Comment 3 \& 4 - The SDT does not believe that there is an issue for entities receiving Overlap Regulation Service. However, the SDT has modified the Background document to further clarify this issue. |  |  |
| Duke Energy | No | Duke Energy supports the concept of a group of BAs forming a group to share in Frequency Response however it should be clear that it is an option. We feel that the utilization of the term, "Reserve Sharing Group", is not consistent with the definition in the NERC Glossary of Terms which is specific to sharing of contingency reserves, and should be replaced with a new term, such as "Frequency Response Sharing Group". <br> R4 should clarify that a BA performing Overlap Regulation Service should still be required to operate its AGC in "Tie Line Bias" mode. <br> Though comments are provided below on the Attachments, Duke Energy believes that all NERC Reliability Standards' requirements must reside within the standard itself (which is vetted by the Industry and subject to FERC approval), and not within Attachments that may be revised without Industry review and approval. As noted below and in prior comments, given the secondary control implications of changing |

| Organization | Yes or No | Question 2 Comment |
| :--- | :--- | :--- |
|  |  | the minimum Frequency Bias Setting (FBS), Duke Energy believes that subsequent <br> revisions to the minimum FBS should be vetted through the Standards process. <br> Duke Energy would suggest moving the details of the minimum FBS for each <br> Interconnection into the Standard, and having the implementation plan include <br> annual submittal of a revised minimum FBS based upon the methodology presented <br> in Attachment B for ballot approval by the Industry. |

Response: The SDT has defined a new term "Frequency Response Sharing Group (FRSG)" because it also believes that using the presently defined term "Reserve Sharing Group" could cause confusion. The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members."
The SDT has removed the Requirement R3 from this version of the proposed standard. This removal was based on industry comments and the belief that it was duplicative with Requirements R6 and R7 in BAL-005-0.1b.

Attachments that are referenced within a Requirement are mandatory and enforceable.
Early research by Nathan Cohn ${ }^{4}$ on interconnected power system operations found that control is optimum if a BA's Bias Setting is equal to its natural Frequency Response. If there were to be a difference between the two values, it is preferable to be slightly over-biased.

The drafting team has proposed to bring Bias Setting and natural Frequency Response more in line. The process to do this is outlined in a Procedure developed by the SDT which replaces Attachment B. The Procedure manages a "go slow" approach to making this happen and includes checks to confirm there are not unexpected influences injected into the CPS-related calculations. Based on concerns raised by the industry, the drafting team has modified the Procedure to make the initial minimum Bias Setting $0.9 \%$ of peak and has included a provision that the ERO will evaluate the impact caused by a change in minimum Bias Setting. The evaluation will look at both frequency performance and impact on CPS-related compliance calculations.

[^61]| Organization | Yes or No | Question 2 Comment |
| :---: | :---: | :---: |
|  |  | requirements that focus on performance (i.e. WHAT must be accomplished NOT on WHY it is required or HOW it should be accomplished). The SRC has found that such explanatory statements as the SDT is proposing lead to ambiguities and confusion in the compliance application. Compliance Enforcement agents must consider not just the results but must decide if the action was taken for the given reason. To avoid such confusion, the Results based approach uses reference documents to address such background material while leaving the requirement as a direct mandate.The SRC notes: <br> o All NERC Reliability Standards' requirements must reside within the standard itself (which is vetted by the Industry and subject to FERC approval). <br> o Data requirements are better handled through NERC's Rules of Procedure Section 1600 than by mandating that ad hoc Forms be submitted. <br> o Definitions should be generic, and should be self-contained (i.e. should not reference an external document). <br> o The decisions regarding alternative methodologies should be decided by the Industry not by the SDT. The SDT should make its case and ask the Industry for its approval. <br> Regarding Order 693 directives, the SRC notes that there are three directives as follows: <br> (1) To include Levels of Non-Compliance; <br> (2) To determine the appropriate periodicity of frequency response surveys necessary to ensure that Requirement R2 and other requirements of the Reliability Standard are being met, and to modify Measure M1 based on that determination and <br> (3) To define the necessary amount of Frequency Response needed for Reliable Operation for each balancing authority with methods of obtaining and measuring that the frequency response is achieved. |

| Organization | Yes or No | Question 2 Comment |
| :---: | :---: | :---: |
|  |  | The SRC suggests that Directive 2 be handled directly as a mandate that the ERO conduct a fixed number of Frequency Response Surveys for randomly selected events. Discussion of the number and the methodology can be explained in a reference document and leave the specifics to the requirement. <br> Directive 3 is critical to the Industry as it relates to who is the Applicable Entity. The SDT addresses Directive 3 by mandating Balancing Authorities meet an objective. The directive is to define that Objective, but there is no requirement associated with that Objective. There is an attachment and there are discussions of what "may" be done, but there is no requirement in the Standard itself. The reference to the BA as the provider of Frequency Response (i.e. Primary Control response) runs counter to other FERC directives that mandate obligated entities be able to self-serve or to interchange provision of services. In this case the BA per se has no assets and cannot self-serve, moreover the primary response service providers have no obligations to provide the service, thus the BA potentially could face a situation where there is no physical service to be purchased but there is a federally mandated standard to comply with. The idea of creating a Primary Response Market as some have proposed does not work without an obligation on some entity to physically provide that service. <br> One final note, the SRC points out that the ACE is an error signal used to drive secondary response; it is not a signal to drive primary response. Thus the use of the Frequency Bias setting is not for control, it is for "adjusting" the error measure that is analyzed after the fact.This standard needs: <br> o a requirement on the ERO to compute the Obligation on each Interconnection <br> o a requirement on the ERO to conduct Frequency Response surveys (note the SRC does not support this requirement but believes that it is needed to meet the FERC directive) <br> o a requirement on energy supply assets (both generation and load) to provide primary response (as a function of the Interconnection obligation in the first bullet) |

| Organization | Yes or No | Question 2 Comment |
| :--- | :--- | :--- |

The SDT has modified the definitions to no longer reference any other documents.
The SDT is recommending a certain approach to calculating the FRM. The reference to other methods being evaluated is simply a statement that the SDT believes that further analysis would be beneficial. Any modification to the calculation methodology would require industry approval.

The SDT believes that it is meeting Directive \#2 by requiring at least 20 events to be analyzed each year.
The SDT believes that it is meeting the directive to define the "objective" by creating the BA Frequency Response Obligation (FRO). With regards to the BA being the responsible entity to provide Frequency Response the NERC Functional Model Technical Document identifies the BA as the entity that manages and deploys Frequency Response. This is because a BA controls the amount and distribution of spinning reserves and also has some control over interruptible resources. This is similar to the relationship between the TOP and voltage control. Even though the TOP may not own generators or capacitor banks, the TOP is still responsible for controlling voltage within limits.

The industry-approved Standards Authorization Request (SAR) for BAL-003 did not include a performance obligation for generators. The drafting team is obliged to stay within the bounds of its SAR.
There are two primary reasons the SAR did not apply a performance obligation on generators. First, there are thousands of generators in North America. It would be many times more costly and difficult to implement a standard that measures all generators and verifies performance is properly calculated. Secondly, given the fact that there presently is sufficient frequency response in all Interconnections, the value of implementing a performance obligation on generators at this time would not outweigh the effort and cost.

Again, the drafting team cannot include requirements beyond the bounds of its SAR. If the commenter(s) believes there is a need for a generator performance obligation, they are encouraged to submit a SAR to that effect.
The SDT has been instructed to include a "reliability outcome" within the requirements. The SDT will forward your concerns about the wording to the Standards Committee Quality Review group for consideration.

The ERO is not defined as an applicable entity in the industry approved SAR and therefore it would be inappropriate to include them as an applicable entity.

|  |  | mode and not have an Adverse Reliability Impact on the Balancing Authority's Area. An entity should not be penalized when these legitimate circumstances occur. LADWP believes that the Frequency Response Standard Background Document, on Page 8, lists examples of legitimate circumstances:- Telemetry problems that lead the operator to believe ACE is significantly in error.- The frequency input to AGC is not reflective of the BA's true frequency (such as if the control center were operating a local generator and disconnected from the Interconnection).- During restoration (where one BA might be controlling frequency while another to which it is connected is managing interchange between them).- For training purposes.- Many AGC systems will automatically switch to an alternate mode if the EMS determines Tie Line Bias control could lead to problems. <br> LADWP believes that the language in Requirement 4 needs to be clarified and recommends the following change:- R4. Each Balancing Authority that is performing Overlap Regulation Service shall modify its Frequency Bias Setting in its ACE calculation to be equivalent to either (i) the sum of the Frequency Bias Settings of the participating Balancing Authorities as validated by the ERO, or (ii) the Frequency Bias Setting as calculated based on the entire area being combined and thereby represent the Frequency Response for the combined area being controlled. [Risk Factor: Medium][Time Horizon: Operations Planning] <br> LADWP believes the language in Requirement 5 needs to be modified to be consistent with that of the second paragraph of Attachment B. LADWP recommends the addition of "natural frequency response" as a third bullet item to Requirement 5. The revised requirement would read:- R5. In order to ensure adequate control response, each Balancing Authority shall use a monthly average Frequency Bias Setting whose absolute value is at least equal to one of the following: [Risk Factor: Medium ][Time Horizon: Operations Planning] o The minimum percentage of the Balancing Authority Area's estimated yearly Peak Demand within its metered boundary per 0.1 Hz change as specified by the ERO in accordance with Attachment <br> B. o The minimum percentage of the Balancing Authority Area's estimated yearly peak generation for a generation-only Balancing Authority, per 0.1 Hz change as |

|  |  | Question 2 Comment <br> response |
| Response: The SDT has removed the Requirement R3 from the next version of the proposed standard. This removal was based on <br> industry comments and the belief that it was duplicative with Requirements R6 and R7 in BAL-005-0.1b. <br> The SDT has modified Requirement R4 which now uses bullets in support of your suggestion. |  |  |
| The SDT disagrees with your suggested modification. The SDT believes that your suggested modification could allow for an entity <br> to circumvent the minimum percentage process. However, the SDT has removed Requirement R5 and combined it into <br> Requirement R2 and a new Requirement R3. |  |  |
| MidAmerican Energy Co. | Negative | MidAmerican supports the comments provided by the NSRF. <br> It is not clear if there is an upper limit to the amount of frequency response expected <br> of the Balancing Authorities under this standard. |

| Organization | Yes or No | Question 2 Comment |
| :--- | :--- | :--- | \left\lvert\, \(\left.\begin{array}{l}Frequency Response. While these reserves may be frequency responsive, they are <br>

not being shared for the purpose of expanding frequency response. Furthermore, <br>
while reserve sharing groups may calculate a joint ACE by summing its individual BA <br>
ACE values, RSGs do not have a Frequency Bias Setting which is necessary to assess a <br>
Frequency Response Obligation. <br>
Under item 3 of the Event Selection Criteria section, the delta F and Point C should <br>
be described either in this attachment or the "Frequency Response Standard <br>
Background Document". While many in industry may understand what these terms <br>
mean, history has a way of getting lost with personnel turnover. Furthermore, this <br>
would help ensure that the auditors and industry have a duplicate understanding. <br>
In the Frequency Response Obligation section on page 2, several items require more <br>
description. Further description of why an N-2 event was chosen for the Contingency <br>
Protection Criteria should be provided and which N-2 event was selected so that <br>

industry can help validate if the correct MW value was selected.\end{array}\right.\right\}\)| Furthermore, the document should clarify if the Contingency Protection Criteria |
| :--- | :--- |
| contains the "safety margin". There is a statement in the paragraph before the table |
| that states it does, but then the table lists out a separate 25\% "Safety Margin". Thus, |
| it is not clear if the "Safety Margin" is included in the Contingency Protection Criteria |
| value listed in the table or not. "Safety margin" should be changed to "reliability |
| margin". Safety has a specific meaning in the electric industry and its use here is not |
| appropriate. The Base Obligation should be explained. The explanation should |
| include its purpose and origin. |

Response Obligations of its members."
The SDT agrees with your comment concerning further clarification on certain terms and has made significant modifications to the Background Document and Attachments A and B.

The Data Retention is stated as "the current year plus three calendar years" since it is highly unlikely that an entity will be audited exactly three years after its previous audit. The SDT recognizes that most audits will occur within the year following the third year.

PPL Electric Utilities Corp.;
PPL Generation LLC

The PPL Companies do not support proposed Reliability Standard BAL-003-1 (Frequency Response and Frequency Bias Setting) primarily because PPL believes it inappropriately subjects Reserve Sharing Groups (RSGs) to the proposed requirements. The proposed Applicability provision states that the mandatory reliability requirements would be applicable to (1) Balancing Authorities and (2) Reserve Sharing Groups (where applicable). However, it is unclear how the proposed requirements would be applicable to an RSG. RSGs typically do not provide a mechanism for sharing automatic Frequency Response. The BA Frequency Response Obligation (FRO) is a formula based on BAs and the Interconnection and has nothing to do with RSGs. Rather, RSGs collectively respond to requests for activation of contingency reserves generally after the request is made by a member Balancing Authority. The Standard Drafting Team should therefore remove RSGs from the Applicability section and should remove all other references to RSGs in the proposed standard.

Response: The SDT disagrees that an RSG is not an appropriate mechanism for providing Frequency Response. However the SDT does believe that using the term "Reserve Sharing Group" could cause confusion and has defined a new term "Frequency Response Sharing Group (FRSG)". The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members."
Similar to traditional Reserve Sharing Groups for Contingency Reserves, FRSGs as proposed in this standard , are voluntary organizations whose members determine the terms and conditions of participation. The members of the FRSG would determine how to allocate sanctions among its members. This standard does not mandate the formation of FRSGs, but allows them as a

| :---: | :---: | :---: |
| means to meet one of the FERC's Order No. 693 directives. <br> FRSG performance may be calculated on one of two ways: <br> - Calculate a group $\mathrm{NI}_{\mathrm{A}}$ and measure the group response to all events in the reporting year on a single FRS Form 1, or <br> - Jointly submit the individual BAs' Form 1s, with a summary spreadsheet that sums each participant's individual annual performance. |  |  |
| Progress Energy | No | PGN supports the collective comments of SERC members. We feel that the utilization of the term, "Reserve Sharing Group", is not consistent with the definition in the NERC Glossary of Terms, and should be deleted, applicability should be clarified or replaced with a new term, such as "Frequency Response Sharing". <br> R4 should clarify that a BA performing Overlap Regulation Service should still be required to operate its AGC in "Tie Line Bias" mode |
| Response: The SDT agrees that using the term "Reserve Sharing Group" could cause confusion and has defined a new te "Frequency Response Sharing Group (FRSG)". The new definition reads "A group whose members consist of two or mor Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Fr Response Obligations of its members." <br> The SDT has removed the requirement to operate AGC in Tie Line Bias mode as this requirement was duplicative of the Requirements R6 and R7 in BAL-005-0.1b. |  |  |
| MRO NSRF | No | R1- It is not clear what is intended by "Reserve Sharing Group" in this context. As RSGs exist today, FRM performance by an RSG is not contemplated in the definition of FRM and appears to apply more towards 'secondary response'. Recommend clarifiying this concept and possibly include an example in the background document to help explain how this would work. <br> R2 - Please add the word "range" in-between the words "date" and "specified". The background document specifies that there is a 72-hour period to implement the FBS setting (See Background document Page 7). R2, as written, does not reflect the |

| Organization | Yes or No | Question 2 Comment |
| :---: | :---: | :---: |
|  |  | period for which an entity may implement the ERO validated Bias into ACE. Also see our comment on \#7 as to the length of the comment period. Question 7 comment is provided to assist the SDT; Note from question 7: (Page 7 (3rd paragraph) of the Background document states "Given the fact that BA's can encounter staffing or EMS change issues coincident with the date the ERO sets for new Frequency Bias Setting implementation, the standard provides a 24 hour window on each side of the target date. <br> 1. The Standard itself does not state this provision ( 24 hour window on each side of target date) as indicated. <br> 2. The SDT accurately addresses the fact that BA's could have EMS or staffing issues during implementation of the ERO validated FBS. The current stated 72 -hour window is not long enough for implementation of the FBS as there may be a host of issues that could impact implementation. We suggest that a seven day window be used for implementation of the FBS.) <br> R3 - Recommend the term "Adverse Reliability Impact" be removed from Requirement <br> 3. Based on the NERC definition of the term, a smaller entity could never operate its AGC outside of TLB mode due to their impact on the BES not likely to result in "instability or Cascading". To ensure a more consistent and equitable approach when applying this Requirement, recommend the drafting team incorporate the reliability reasons listed within the Background Document into the actual Requirement. <br> Additionally, the phrase "effectively coordinated control" should be removed as this is not essential to the Requirement and introduces ambiguity in its application. To this end, the following revisions are proposed: <br> R3. Each Balancing Authority not receiving Overlap Regulation Service shall operate its Automatic Generation Control (AGC) in Tie Line Bias mode to ensure effectively coordinated control, unless such operation would have an Adverse Reliability Impact on the Balancing Authority's Area meets one or more of the following conditions. |

| Organization | Yes or No | Question 2 Comment |
| :---: | :---: | :---: |
|  |  | o Telemetry problems that lead the operator to believe ACE is significantly in error. o The frequency input to $A G C$ is not reflective of the $B A^{\prime}$ 's true frequency (such as if the control center were operating a local generator and disconnected from the Interconnection). <br> o During restoration (where one BA might be controlling frequency while another to which it is connected is managing interchange between them). <br> o For training purposes. <br> o Many AGC systems will automatically switch to an alternative mode if the EMS determines Tie Line Bias control could lead to problems. <br> o For single BA Interconnections, Flat Frequency and Tie Line Bias are equivalent. <br> o The Reliability Coordinator has been informed and the duration is [insert time constraint language here]. <br> R5 - Recommend to delete the phrase "In order to ensure control response". Such phrases can be needless causes of debate. If a BA uses one of the bulleted methods but does not get "adequate response" then is the BA non-compliant? What is "adequate response"? Who decides if the response is adequate? Please clarify. |
| Response: The SDT agrees that using the term "Reserve Sharing Group" could cause confusion and has defined a new term "Frequency Response Sharing Group (FRSG). The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members." |  |  |
| Similar to traditional Reserve Sharing Groups for Contingency Reserves, FRSGs as proposed in this standard, are voluntary organizations whose members determine the terms and conditions of participation. | Organization | Yes or No | Question 2 Comment |
| :---: | :---: | :---: |
|  |  | "Process for Adjusting Minimum Frequency Bias Setting". See proposed modification below: <br> R5. In order to ensure adequate control response, each Balancing Authority shall use a monthly average Frequency Bias Setting whose absolute value is as specified by the ERO in accordance with Attachment B.- <br> There should be a Requirement specifically stating there is an obligation to complete and submit FRS Form 1 by January 10th each year for clarity.- <br> The requirements should be re-ordered to reflect the chronology of the process for frequency calculation, implementation and performance measurement. The recommended order is as follows: <br> R5 which defines the minimum Frequency Bias Setting (FBS) for a Balancing Authority <br> R4 which describes how the minimum FBS may be altered through Overlap Regulation Service <br> R2 which identifies the coordination required around implementationR3 which requires operation in Tie Line Bias mode <br> R1 which establishes the performance obligation |
| Response: The SDT does not see anything within the Requirement that would restrict any agreements between multiple BAs and RSGs. However, the SDT has modified the language in Requirement R1 to provide additional clarity. The requirement now reads "Each Balancing Authority or Frequency Response Sharing Group (FRSG) shall achieve an annual Frequency Response Measure (FRM) (as calculated and reported in accordance with Attachment A) that is equal to or more negative than its Frequency Response Obligation (FRO) to ensure that sufficient Frequency Response is provided by each Balancing Authority or FRSG to maintain Interconnection Frequency Response equal to or more negative than the Interconnection Frequency Response Obligation." The SDT has also defined a new term "Frequency Response Sharing Group (FRSG)" because it also believes that using the presently defined term "Reserve Sharing Group" could cause confusion. The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to |  |  |

| Organization | Yes or No |
| :--- | :---: |
| jointly meet the Frequency Response Obligations of its members." 2 Comment |  |
| The SDT has modified Requirement R2 to provide better clarity. The requirement now reads "Each Balancing Authority that is a |  |
| member of a multiple Balancing Authority Interconnection and is not receiving Overlap Regulation Service and uses a fixed Frequency |  |
| Bias Setting shall implement the Frequency Bias Setting determined subject to Attachment A, as validated by the ERO, into its Area |  |
| Control Error (ACE) calculation during the implementation period specified by the ERO and shall use this Frequency Bias Setting until |  |
| directed to change by the ERO to ensure effectively coordinated Tie Line Bias control.". |  |

The SDT has removed Requirement R3 as it is duplicative of Requirements R6 \& R7 in BAL-005-0.1b.
The SDT has removed Requirement R5 and combined it into Requirement R2 and a new Requirement R3. The SDT also believes that Attachment B, now a Procedure for the ERO to follow in supporting the standard, only details the process the ERO is to use when evaluating and making modifications to the minimum Frequency Bias Setting.

The SDT disagrees with your comment concerning an additional requirement for timing of reporting. The SDT believes that this is an administrative issue and is better handled within an attachment. The SDT would also like to note that an attachment when referenced in a requirement becomes mandatory and enforceable.
The SDT thanks you for your suggested ordering for the requirements but believes that the revised proposed standard reflects the proper order in that it sets the goal at beginning of year, calculates performance, reports performance and calculates bias at the end of the year.

| Constellation Energy | Negative | -R1 should accommodate agreements between multiple BAs and RSGs in achieving the annual Frequency Response Measure. See proposed modification below: R1. | Ameren | No | R1.While we agree with the concept of the entire requirement and the <br> determination of the Interconnection Frequency Response Obligation, we believe <br> that the accurate measurement of individual BA's FRM has not yet been <br> demonstrated. This requirement should not be part of the standard (even with the <br> additional 12 months in the effective date) until the field trial demonstrates that |
| :--- | :---: | :--- |

| Organization | Question 2 Comment |
| :--- | :--- | :--- | \left\lvert\, \(\left.\begin{array}{ll}\hline each BA's FRM can be consistently calculated to a level that will not create false non- <br>

compliance to this requirement. While the calculation methodology in FRS Form 1 <br>
looks promising, with the A-value and B-value average periods, we believe successful <br>
completion of the field trial is prudent. <br>
R5. We were not sure if it was intended for this comment question to include <br>
Requirement R5, but have decided to include our comments here. While we agree <br>
with the requirement of R5, it should not be at the expense of changing the value of <br>
L10 in BAL-001, R2, which has been accepted by FERC in Order 693. An <br>
accommodation should be made so that any changes to the Frequency Bias Setting <br>
according to BAL-003, R5, should not affect the value of L10 used in BAL-001, R2.\end{array}\right.\right\}\)

| Organization | Yes or No | Question 2 Comment |
| :--- | :--- | :--- |
|  |  | This revision adds new performance measure responsibilities on the BA who likely <br> has no direct control over every resource affecting their performance within their <br> footprint. We are not necessarily challenging the performance measures themselves, <br> nor their underlying objectives, however AEP views this as a gap in responsibilities <br> which potentially effects reliability. |

Response: The SDT has defined a new term "Frequency Response Sharing Group (FRSG)" to eliminate any confusion with the present d3efined term "Reserve Sharing Group". The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members."

Similar to traditional Reserve Sharing Groups for Contingency Reserves, FRSGs as proposed in this standard , are voluntary organizations whose members determine the terms and conditions of participation. The members of the FRSG would determine how to allocate sanctions among its members. This standard does not mandate the formation of FRSGs, but allows them as a means to meet one of the FERC's Order No. 693 directives.

FRSG performance may be calculated on one of two ways:

- Calculate a group $\mathrm{NI}_{\mathrm{A}}$ and measure the group response to all events in the reporting year on a single FRS Form 1, or
- Jointly submit the individual BAs' Form 1s, with a summary spreadsheet that sums each participant's individual annual performance.

The SDT has been instructed to include a "reliability outcome" within the requirements and therefore included the language "...coordinated control...". The SDT understands that this does not provide any additional clarity for complying with the requirement and could be removed. The SDT will forward your concerns about the wording to the Standards Committee Quality Review group for consideration.
The SDT has removed Requirement R3 as it is duplicative of Requirements R6 \& R7 in BAL-005-0.1b.
The NERC Functional Model Technical Document identifies the BA as the entity that manages and deploys Frequency Response. This is because a BA controls the amount and distribution of spinning reserves and also has some control over interruptible resources. This is similar to the relationship between the TOP and voltage control. Even though the TOP may not own generators or capacitor banks, the TOP is still responsible for controlling voltage within limits.

| Organization | Yes or No | Question 2 Comment |
| :--- | :--- | :--- |

The industry-approved Standards Authorization Request (SAR) for BAL-003 did not include a performance obligation for generators. The drafting team is obliged to stay within the bounds of its SAR.

There are two primary reasons the SAR did not apply a performance obligation on generators. First, there are thousands of generators in North America. It would be many times more costly and difficult to implement a standard that measures all generators and verifies performance is properly calculated. Secondly, given the fact that there presently is sufficient frequency response in all Interconnections, the value of implementing a performance obligation on generators at this time would not outweigh the effort and cost.
Again, the drafting team cannot include requirements beyond the bounds of its SAR. If the commenter(s) believes there is a need for a generator performance obligation, they are encouraged to submit a SAR to that effect.

| Great River Energy | No | R1: Including the Reserve Sharing Group (RSG) in the Frequency Response Obligation <br> is outside of the boundaries of a RSG. Where or how would a Frequency Bias be <br> determined for an RSG to determine their Frequency Response Obligation? Although <br> it is apparent that frequency responds during the implementation of reserves, the <br> intention of a RSG is not to share frequency response, but rather to share Reserves. <br> Additionally, if the Frequency Response Obligation is not met by the RSG how are <br> penalties assessed? Should they be assessed to the group as a whole or strictly to <br> the generators that did not meet their individual obligation? <br> R3: Needs to include verbiage for those circumstances when it would be necessary to <br> run AGC out of TLB such as during necessary testing. The BA should have the option <br> to operate out of TLB for a predetermined amount of time if needed when <br> notification and coordination with the RC has been established. |
| :--- | :--- | :--- |

Response: The SDT has defined a new term "Frequency Response Sharing Group (FRSG)" because it believes that using the presently defined term "Reserve Sharing Group" could cause confusion. The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members."

Similar to traditional Reserve Sharing Groups for Contingency Reserves, FRSGs as proposed in this standard , are voluntary organizations whose members determine the terms and conditions of participation. The members of the FRSG would determine

| Organization | Yes or No | Question 2 Comment |
| :--- | :--- | :--- |

how to allocate sanctions among its members. This standard does not mandate the formation of FRSGs, but allows them as a means to meet one of the FERC's Order No. 693 directives.

FRSG performance may be calculated on one of two ways:

- Calculate a group $\mathrm{NI}_{\mathrm{A}}$ and measure the group response to all events in the reporting year on a single FRS Form 1, or
- Jointly submit the individual BAs' Form 1s, with a summary spreadsheet that sums each participant's individual annual performance.

The SDT has modified the Background Document to further explain how an RSG (now FRSG) can be used to supply Frequency Response.

The SDT has removed Requirement R3 as it is duplicative of Requirements R6 \& R7 in BAL-005-0.1b.

|  |  | standard. <br> BPA believes that R3 should include a minimal amount of time (suggesting a couple of hours per year) to allow for testing other modes. Requirement R3 requires each Balancing Authority not receiving Overlap Regulation Service to operate its AGC in Tie Line Bias mode... unless such operation would have an Adverse Reliability Impact on the Balancing Authority's Area. There may be occasions in which an entity needs to perform testing or other instances where it is necessary or desirable to operate in a mode other than Tie Line Bias that does not qualify as an Adverse Reliability Impact, but never the less is necessary or desired. BPA recommends including language that would permit operation other than Tie Line Bias mode provided the Reliability Coordinator was notified.BPA seeks clarification from the drafting team as to whether or not there will be any conflicts between proposed Requirement R3 and the requirements of FERC-approved regional reliability standard BAL-004-WECC-1 Automatic Time Error Correction. <br> BPA agrees with the concept of R4, however, BPA again disagrees with the ERO validation of the frequency bias setting. <br> BPA believes that reducing frequency bias obligation is detrimental to reliability. It seems that lowering the Minimum Frequency Bias Setting from $1 \%$ to $.8 \%$ will result in a lower response, which in turn will lower the natural frequency response. BPA believes that over time, it would seem that this pattern would lead to poorer response. <br> BPA believes that R5 should read "greater than or equal to one of the following" not "at least equal to". The requirement should be a part of Form 1 or included in R2. For variable bias, the minimum percentage should be based on the forecasted month peak. |
| Response: R1 - The FRO can be estimated by the BA but the actual BA FRO for compliance is based on the BA's footprint and is a function of the Interconnection FRO. |  |  |

| Organization | Yes or No | Question 2 Comment |
| :--- | :--- | :--- |

Modifications the FRS Form 1 would go through the Standard Drafting Process.
The SDT has defined a new term "Frequency Response Sharing Group (FRSG)" because it believes that using the presently defined term "Reserve Sharing Group" could cause confusion. The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members."

Similar to traditional Reserve Sharing Groups for Contingency Reserves, FRSGs as proposed in this standard , are voluntary organizations whose members determine the terms and conditions of participation. The members of the FRSG would determine how to allocate sanctions among its members. This standard does not mandate the formation of FRSGs, but allows them as a means to meet one of the FERC's Order No. 693 directives.

FRSG performance may be calculated on one of two ways:

- Calculate a group $\mathrm{NI}_{\mathrm{A}}$ and measure the group response to all events in the reporting year on a single FRS Form 1, or
- Jointly submit the individual BAs' Form 1s, with a summary spreadsheet that sums each participant's individual annual performance.

The SDT has modified the Background Document to further explain how an RSG (now FRSG) can be used to supply Frequency Response.

R2 - The SDT is interested in the use of good data for the calculations but does not believe that a BA should be penalized for minor data errors. This is why the SDT proposes that the ERO validate the data. In addition, this process is used today.

R3 - The SDT has removed Requirement R3 as it is duplicative of Requirements R6 \& R7 in BAL-005-0.1b.
R4 - Again, this is a process that is in use today. The SDT is not proposing that the ERO modify anything, just proposing that the ERO validate the data being supplied.

R5 - The SDT has removed Requirement R5 and combined it into Requirement R2 and a new Requirement R3. However, the SDT understands your concern with the reduction of the minimum Frequency Bias Setting affecting other performance requirements. The process to do this is outlined in a Procedure developed by the SDT which replaces Attachment B. The Procedure manages a "go slow" approach to making this happen and includes checks to confirm there are not unexpected influences injected into the CPS-related calculations. Based on concerns raised by the industry, the drafting team has modified the Procedure to make the initial minimum Bias Setting $0.9 \%$ of peak and has included a provision that the ERO will evaluate the impact caused by a change

| Organization | Yes or No | Question 2 Comment |
| :---: | :---: | :---: |
| in minimum Bias Setting. The evaluation will look at both frequency performance and impact on CPS-related compliance calculations. |  |  |
| Manitoba Hydro | No | Regarding R1: <br> 1. Neither R1 nor the referenced Attachment A clarifies the FRM requirements for an RSG to comply versus a BA. In particular <br> (i) At p.3, Attachment A states that the ERO is responsible for "annually assigning an FRO and Frequency Bias Setting to each BA." No mention is made of RSGs. <br> (ii) Attachment A only references RSGs in the context of reporting obligations for Form 1 (at p.4) and <br> (iii) Compared to BAL-002-0 R1.1, which clearly states that the BA may elect to fulfill its obligation through an RSG and that in such cases the RSG has the same responsibilities as each BA (that is a participant in the RSG). <br> 2. It should be clarified that this requirement applies to a BA, where the BA doesn't belong to an RSG, OR to an RSG. As it is currently drafted, the standard applies to each BA and each RSG. It is redundant in that each BA would need to comply, whether or not they are a member of an RSG that would also be required to comply. Further, the NERC Glossary definition of an RSG is a group of BAs that collectively maintain, allocate and supply operating reserves. No mention is made of the agreement including the sharing or delegation of responsibility related to FRM. Accordingly, the standard should only reference a BA being able to delegate responsibility to an RSG if the RSG Agreement allows for such delegation. <br> 3. R1 does not specify where or how the FRO is determined. Presumably this would be determined by the ERO pursuant to Attachment A. <br> 4. The phrase "to ensure that sufficient Frequency Response ..." should be separated from the requirement as it is |

| performance. |  |
| The SDT has modified the Background Document to further explain how an RSG (now FRSG) can be used to supply Frequency |  |
| Response. |  |

Comment 3 - The process for determining the FRO is detailed in Attachment A.
Comment 4 - The SDT has been instructed to include a "reliability outcome" within the requirements. The SDT will forward your concerns about the wording to the Standards Committee Quality Review group for consideration.

R2 - Comment 1 - The Frequency Bias Setting is calculated on FRS Form 1. The ERO is only validating the data not calculating the setting. The ERO will be working with the BA to correct any data errors discovered during the validation process. This is a process that is in use today
Comment 2 \& 3 - The SDT has made significant modifications to the Background Document and Attachment A to provide additional clarity. The SDT has added language to Attachment A regarding validation of the BA data. The SDT has removed all references to a FRSG for Frequency Bias Setting. Attachment B has been removed and the information from Attachment B has been incorporated in a Procedure developed by the SDT for the ERO to follow to support this standard.

| NV Energy | No | Requirement 1 seems to be the only one that has any applicability to an RSG; <br> however, it is unclear under what circumstances this requirement applies to an RSG. <br> Suggest changing the R1 to be addressed solely to BA's or alternatively, explain <br> under Applicability section 1.2 what "where applicable" means. |
| :--- | :---: | :--- |

Response: The SDT has defined a new term "Frequency Response Sharing Group (FRSG)" because it believes that using the presently defined term "Reserve Sharing Group" could cause confusion. The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members."

Similar to traditional Reserve Sharing Groups for Contingency Reserves, FRSGs as proposed in this standard , are voluntary organizations whose members determine the terms and conditions of participation. The members of the FRSG would determine how to allocate sanctions among its members. | City of Redding, Oregon Public Utility Commission, BrightSource Energy, Inc., Clark Public Utilities, Avista, Tri-State G \& T Association, Inc.; Deseret Power | Negative | Requirement R3 requires each Balancing Authority not receiving Overlap Regulation Service to operate its AGC in Tie Line Bias mode... unless such operation would have an Adverse Reliability Impact on the Balancing Authority's Area. There may be occasions in which an entity needs to perform testing or other instances where it is necessary or desirable to operate in a mode other than Tie Line Bias that does not qualify as an Adverse Reliability Impact, but never the less is necessary or desired. Recommend including language that would permit operation other than Tie Line Bias mode provided the Reliability Coordinator was notified. |
| Response: The SDT has removed Requirement R3 as it is duplicative of Requirements R6 \& R7 in BAL-005-0.1b. |  |  |
| Alberta Electric System Operator | No | The language used in the requirements is superfluous. This could result in confusion and incorrect assumptions being made. <br> In R1, the comment within brackets "(as detailed in Attachment A and calculated on FRS Form 1)", is not necessary as it is already part of the FRM definition. We suggest removing this bracketed text from the requirement. <br> Also in R1, the phrase "to ensure that sufficient Frequency Response is provided by each BA or RSG to maintain an adequate level of Frequency response in the Interconnection" is a high level objective that does not add clarity to this requirement. We suggest removing this from the requirement. <br> R2, R3 and R5 use similar language e.g. "to ensure effectively coordinated Tie Line Bias control", "to ensure adequate control response" etc. Although it provides background information, this does not add clarity to the requirement. We suggest removing these from the requirements. |
| Response: Based on industry comments the SDT has modified the definition for FRM such that it no longer references any other documents. Therefore, the SDT believes that leaving the reference to Attachment in the standard is prudent, based on advice |  |  |

| Organization | Yes or No |
| :--- | :--- |
| from the standards staff - without a reference to the specific Attachment, the responsible entity can't be held to compliance with <br> the performance identified in that attachment. |  |
| The SDT has been instructed to include a "reliability outcome" within the requirements and therefore included the language you |  |
| are referencing. The SDT understands that this does not provide any additional clarity for complying with the requirement and |  |
| could be removed. The SDT will forward your concerns about the wording to the Standards Committee Quality Review group for |  |
| consideration. |  |

| Hydro-Quebec TransEnergie | No | The objective of R2 is that all BA's implement their new Bias Setting at the same <br> time, based on the previous year's data, so that control stays the most effective <br> throughout the Interconnection (Tie-Line Bias). In addition, the new Bias will be in <br> effect all year long. The process is quite simple and straightforward for a fixed Bias <br> Setting. As for Variable Bias Setting, this process is not applicable before the fact <br> since the Bias equation can depend on real-time values that are not known in <br> advance. In addition, the simultaneous Bias implementation is not an issue for a <br> single BA Interconnection. Therefore, we suggest that Requirement 2 applies only to <br> Fixed Bias Setting. |
| :--- | :--- | :--- |
| Response: The SDT agrees with your comment and has modified Requirement R2 to reflect your concern. The SDT has also added <br> an addition Requirement R3 to address entities using a variable Frequency Bias Setting. |  |  |
| Northeast Power Coordinating <br> Council | No | The requirements should not be directed at Balancing Authorities, as generators are <br> the main supplier of "discretionary" frequency response. Requirement R1 refers to <br> an attached form, which is not part of the standard and therefore not enforceable. |
| Response: The NERC Functional Model Technical Document identifies the BA as the entity that manages and deploys Frequency <br> Response. This is because a BA controls the amount and distribution of spinning reserves and also has some control over <br> interruptible resources. This is similar to the relationship between the TOP and voltage control. Even though the TOP may not <br> own generators or capacitor banks, the TOP is still responsible for controlling voltage within limits. |  |  |
| The industry-approved Standards Authorization Request (SAR) for BAL-003 did not include a performance obligation for |  |  |
| generators. The drafting team is obliged to stay within the bounds of its SAR. |  |  |

| Organization | Yes or No |
| :--- | :--- |
| There are two primary reasons the SAR did not apply a performance obligation on generators. First, there are thousands of |  |
| generators in North America. It would be many times more costly and difficult to implement a standard that measures all |  |
| generators and verifies performance is properly calculated. Secondly, given the fact that there presently is sufficient frequency |  |
| response in all Interconnections, the value of implementing a performance obligation on generators at this time would not |  |
| outweigh the effort and cost. |  |
| Again, the drafting team cannot include requirements beyond the bounds of its SAR. If the commenter(s) believes there is a need |  |
| for a generator performance obligation, they are encouraged to submit a SAR to that effect. |  |
| If an attachment is referenced in a requirement that attachment becomes part of the requirement. The requirement has been |  |
| modified to no longer reference an attached form. |  |

We question how this would work from a compliance perspective.\end{array}\right.\right]\)

| Organization | Yes or No |
| :--- | :--- |$\quad$ Question 2 Comment

The industry-approved Standards Authorization Request (SAR) for BAL-003 did not include a performance obligation for generators. The drafting team is obliged to stay within the bounds of its SAR.
There are two primary reasons the SAR did not apply a performance obligation on generators. First, there are thousands of generators in North America. It would be many times more costly and difficult to implement a standard that measures all generators and verifies performance is properly calculated. Secondly, given the fact that there presently is sufficient frequency response in all Interconnections, the value of implementing a performance obligation on generators at this time would not outweigh the effort and cost.
Again, the drafting team cannot include requirements beyond the bounds of its SAR. If the commenter(s) believes there is a need for a generator performance obligation, they are encouraged to submit a SAR to that effect.

The SDT has also included other methods that a BA can use to provide Frequency Response in the Background Document.
The SDT has added language to Attachment A to address changes in a BA's footprint.
The proposed standard is not putting a requirement on the ERO. There is language in the Attachments to provide additional time for a BA to become compliant if the ERO is late in providing the necessary information. If the ERO does not provide the necessary information then the BA would not be required to modify anything and therefore the last information provided would be that which would be used for compliance purposes.

3. The SDT has developed VRFs for the proposed Requirements within this standard. Do you agree that these VRFs are appropriately set? If not, please explain in the comment area.

Summary Consideration: The majority of the commenters agreed with the VRFs that the SDT has proposed for the requirements within the standard.
One commenter felt the VRFs were too high and that they should have a "lower" VRF. The SDT developed the VRFs using the NERC Violation Risk Factor guidelines approved by FERC. A lower VRF is an administrative type of requirement that, if violated would not be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system; or, a requirement that is administrative in nature and a requirement in a planning time frame that, if violated, would not, under the emergency, abnormal, or restorative conditions anticipated by the preparations, be expected to adversely affect the electrical state or capability of the bulk electric system, or the ability to effectively monitor, control, or restore the bulk electric system. Violation of any of the requirements in the proposed standard could directly affect the electrical state or the capability of the bulk electric system, or the ability to effectively monitor and control the bulk electric system.
Another commenter stated that they could not fine the "Risk Severity Levels" in the standard. The SDT is not sure as to the meaning of this comment. The SDT believes that the commenter may have been mixing two different terms, Violation Risk Factors (VRFs) and Violation Severity Levels (VSLs). The question asked by the SDT was concerning the VRFs. These are located within the body of the Requirement. The VSLs are located towards the end of the proposed standard.

4. The SDT has developed Measures for the proposed Requirements within this standard. Do you agree with the proposed Measures in this standard? If not, please explain in the comment area.

Summary Consideration: Many of the commenters were concerned with the language in Requirement R3 stating that an entity had to be operating in Tie Line Bias mode unless there were adverse affects on the BES and that if the requirement was modified that the measure should be modified. The SDT explained that it had removed this requirement from the proposed standard since they felt it was duplicative of Requirement R6 and R7 in BAL-005-0.1b.

Some commenters objected to the definition for FRM and the Measure referencing another document (FRS Form 1). The SDT explained that it modified the definition for FRM to no longer reference another document. The revised definition reads "The median of all the Frequency Response observations reported annually by Balancing Authorities for frequency events specified by the ERO. This will be calculated as MW/0.1 Hz."

A couple of the commenters had concerns with Requirement R5 in that it should reference "natural Frequency Response" as a third bullet. The SDT has explained that it removed Requirement R5 and combined it into Requirement R2 and a new Requirement R3. The SDT did not include the term "natural Frequency Response" within the standard itself but included it in the Background Document and Attachment A. The SDT felt that this provided additional clarity within the requirement and allowed for further explanation of the term in the Background Document and Attachment A.

Some commenters indicated that the use of an RSG as a method for supplying Frequency Response was not fully explained. The SDT modified the Background Document to further explain how an RSG (now FRSG) could be used to supply Frequency Response. The SDT has defined a new term "Frequency Response Sharing Group (FRSG)" because it believes that using the presently defined term "Reserve Sharing Group" could cause confusion. The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members."
A couple commenters wanted the sampling interval to be tuned on a per Interconnection basis to support HQTE's characteristics. The SDT agreed and explained that it adjusted the event selection criteria to address concerns related to response driving frequency back to pre-event level during the $B$ value measurement period and this adjustment should address their concern.
Organization

| Organization | Yes or No | Question 4 Comment |
| :---: | :---: | :---: |
| Seattle City Light | Negative | Answer: No. Comments: LADWP and SCL recommend that the Measures for Requirement 3 and Requirement 5 reflect their comments to Question 2. |
| Response: The SDT has removed Requirement R3 as it is duplicative of Requirements R6 \& R7 in BAL-005- <br> The SDT has removed Requirement R5 and combined it into Requirement R2 and a new Requirement R3. |  |  |
| Constellation Energy Commodities Group | No | Based on language modifications proposed to the Requirements, the measures should be revisited. |
| Response: The SDT has revised the Measures to align with modifications made to the Requirements. |  |  |
| Xcel Energy | No | Based on our suggested changes to R3 in response to Question 2, the drafting team should modify M3 to be consistent with the proposed language. |
| Response: The SDT has removed Requirement R3 as it is duplicative of Requirements R6 \& R7 in BAL-005-0.1b. |  |  |
| MRO NSRF | No | Based on suggested changes to R3 in response to Question 2, the drafting team should modify M3 to be consistent with the proposed language. <br> Additionally, M1 should be revised to not reference a specific Form. The Form may be the format of choice but it should not be an implied requirement. <br> Measures 3 and 4 identify the use of "operating logs" as evidence. Measure 2 identifies hard copy and electronic evidence, "or other evidence". We suggest calling out specifically "operator logs" for M2 also, in case there are system problems in capturing hard copy or electronic evidence during the short time window for implementation. |
| Response: The SDT has removed Requirement R3 as it is duplicative of Requirements R6 \& R7 in BAL-005-0.1b. |  |  |
| The SDT has modified Measure M1 which no longer references a form but does reference Attachment A to align with the requirement. |  |  |

| Organization | Yes or No | Question 4 Comment |
| :--- | :--- | :--- |

The SDT is only providing examples ("...such as...") of what could be used to reflect compliance. Other evidence can be used as long as it reflects compliance with the standard.

| Bonneville Power <br> Administration | No | BPA believes that historian data should be able to be used for evidence. |
| :--- | :---: | :--- |
| Response: The SDT is only providing examples ("...such as...") of what could be used to reflect compliance. Other evidence can be <br> used as long as it reflects compliance with the standard. The SDT believes that the data from the software program "Historian" <br> could be used to demonstrate compliance.. |  |  |
| Manitoba Hydro | No | It should be clarified that R1 requirement applies to a BA, where the BA doesn't <br> belong to an RSG, or to an RSG. As it is currently drafted, the standard applies to <br> each BA and each RSG. It is redundant in that each BA would need to comply, <br> whether or not they are a member of an RSG that would also be required to comply. <br> Further, the NERC Glossary definition of an RSG is a group of BAs that collectively <br> maintain, allocate and supply operating reserves. No mention is made of the <br> agreement including the sharing or delegation of responsibility related to FRM. <br> Accordingly, the standard should only reference a BA being able to delegate <br> responsibility to an RSG if the RSG Agreement allows for such delegation. |

Response: The SDT has modified the Background Document to further explain how an RSG (now FRSG) can be used to supply Frequency Response. The SDT has modified the Applicability Section to clarify when a BA or FRSG is accountable for compliance.

The SDT has defined a new term "Frequency Response Sharing Group (FRSG)" because it believes that using the presently defined term "Reserve Sharing Group" could cause confusion. The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members."

| Tucson Electric Power | No | It should be clear that historical data may be used to show compliance. |
| :--- | :---: | :--- |

Response: The SDT is only providing examples ("...such as...") of what could be used to reflect compliance. Other evidence can be used as long as it reflects compliance with the standard. The SDT believes that the data used to reflect compliance would have to

5. The SDT has developed VSLs for the proposed Requirements within this standard. Do you agree with these VSLs? If not, please explain in the comment area.

Summary Consideration: Most of the commenters indicated that VSLs for Requirement R1 should not include language tied to whether or not a BA is in a single BA Interconnection or a multi-BA Interconnection. Frequency Response is an Interconnection-wide resource. The proposed VSLs are intended to put multi-BA Interconnections on the same plain as single-BA Interconnections. Consider a small BA whose performance is $70 \%$ of its' FRO. If all other BAs in the Interconnection are compliant, the small BA's performance has negligible impact on reliability, yet would be sanctioned at the same level as a BA who was responsible for its entire Interconnection. It is not rational to sanction this $B A$ the same as a single BA Interconnection that had insufficient Frequency Response. To do otherwise would treat multi-BA Interconnections tens of times more harshly than single BA Interconnections. However, the SDT has added language to the requirement to reference the Interconnection Frequency Response Obligation.

Several commenters did not agree with the VSLs for Requirement R3. The SDT removed Requirement R3 from the revised standard since the requirement was duplicative of Requirement R6 \& R7 in BAL-005-0.1b.

With concerns about the use of the RSG as a means to provide Frequency Response, the SDT modified the Background Document to further explain how an RSG (now FRSG) could be used to supply Frequency Response. The SDT has defined a new term "Frequency Response Sharing Group (FRSG)" because it believes that using the presently defined term "Reserve Sharing Group" could cause confusion. The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members."

| with R6 and R7 in BAL-005-0.1b. | Negative | 1. The BA and interconnection meet the FRO differently. Suggest removing the <br> interconnection performance from the VSL and develop additional levels of BA <br> failure to meet its FRO. |
| Public Utility District No. 1 of <br> Douglas County |  |  |

Response: The drafting team does not agree, but believes an explanation would be helpful.
VSLs are a starting point for the enforcement process. The combination of the VSL and VRF is intended to measure a violation's impact on reliability and thus levy an appropriate sanction. Frequency Response is an interconnection-wide resource. The proposed VSLs are intended to put multi-BA Interconnections on the same plain as single-BA Interconnections.

Consider a small BA that whose performance is $70 \%$ of it's FRO. If all other BAs in the Interconnection are compliant, the small BA's performance has negligible impact on reliability, yet would be sanctioned at the same level as a BA who was responsible for its entire Interconnection. | - Jointly submit the individual BAs' Form 1s, with a summary spreadsheet that sums each participant's individual annual performance. |  |  |
| SERC OC Standards Review Group | No | See comments in Question 2 regarding utilization of the term "Reserve Sharing Group". <br> VSL for R1:The draft VSLs for R1 uses the summation of FRM for all BAs within an Interconnection as a factor in determining the applicable VSL. This does not seem consistent with R1. R1 is about a single BA and the individual BA's frequency response performance as measured by the FRM for that specific BA. Including the FRM summation of the Interconnection expands R1. It appears that a BA that is non-compliant with R1 could end up with either a Low/Medium or High/Severe VSL based upon the FRO performance of the Interconnection. The FRM performance of the Interconnection is beyond the knowledge and control of a single BA and should not be a determinate of the applicable VSL.Is there a technical basis for selection of the $1 \%, 30 \%$ and $15 \mathrm{MW} / .1 \mathrm{~Hz}$ VSL breakpoints? Does the Lower VSL give a $1 \%$ dead band to a BA's FRO? If so, will this be acceptable to NERC/FERC? <br> VSL for R2:The VSL should reflect the language used in the requirement. R2 says a BA "not participating in Overlap Regulation service shall ....", while the VSL says a BA "not receiving Overlap Regulation Service....." The VSL language is not consistent with the requirement. <br> VSLs for R5:Since Frequency Bias Setting is expressed as a negative value, the terms "absolute value" and "less than" must be used carefully. Wouldn't the "absolute value" of a BA's Frequency Bias Setting always be positive and thus it could never be less than the minimum specified by the ERO (a negative value)? |
| Response: With regard to R1, VSLs are a starting point for the enforcement process. The combination of the VSL and VRF is intended to measure a violation's impact on reliability and thus levy an appropriate sanction. Frequency Response is an interconnection-wide resource. The proposed VSLs are intended to put multi-BA Interconnections on the same plain as single-BA Interconnections. |  |  |

| Organization |
| :--- |
| The "Lower" and "Medium" VSLs say that the Interconnection has sufficient Frequency Response but individual BAs are deficient by <br> small or larger amounts respectively. The High and Severe VSLs say the Interconnection does not meet the FRO and assesses <br> sanctions based on whether the BA is deficient by a small or larger amount respectively. However, the SDT has added language to the <br> requirement to reference the Interconnection Frequency Response Obligation. <br> Regarding the 1\%, 30\% and 15MW breakpoints, the 1\% value accommodates rounding error. The 30\% or 15MW/0.1Hz is intended to <br> comparably address both large and small BAs. The drafting team used its judgment in selecting these values and cannot predict what <br> the FERC might accept. <br> The SDT has modified the VSLs for Requirement R2 to correctly match the requirement. <br> The SDT has removed Requirement R5 from the proposed standard and combined it into Requirements R2 and R3. Requirement R2 <br> no longer references "absolute value" and Requirement R3 references "absolute value" only as a comparison to another "absolute <br> value". <br> Western Electricity <br> Coordinating Council <br> No <br> The proposed VSLs for Requirement R1 treat a BA that did not meet the FRO <br> requirement differently depending on whether or not the Interconnection met the <br> FRO requirement. The obligation of the BA to meet its allocated FRO should be <br> consistent regardless of what the other entities within the interconnection are <br> doing. Suggest removing the interconnection performance from the VSLs and <br> developing four increasing levels of BA failure to meet its FRO. |

Organization

Response: The drafting team does not agree, but believes an explanation would be helpful.
VSLs are a starting point for the enforcement process. The combination of the VSL and VRF is intended to measure a violation's impact on reliability and thus levy an appropriate sanction. Frequency Response is an interconnection-wide resource. The proposed VSLs are intended to put multi-BA Interconnections on the same plain as single-BA Interconnections.

Consider a small BA that whose performance is $70 \%$ of it's FRO. If all other BAs in the Interconnection are compliant, the small BA's performance has negligible impact on reliability, yet would be sanctioned at the same level as a BA who was responsible for its entire Interconnection. It is not rational to sanction this BA the same as a single BA Interconnection that had insufficient Frequency Response.

To do otherwise would treat multi-BA Interconnections tens of times more harshly than single BA Interconnections.

The "Lower" and "Medium" VSLs say that the Interconnection has sufficient Frequency Response but individual BAs are deficient by small or larger amounts respectively. The High and Severe VSLs say the Interconnection does not meet the FRO and assesses sanctions based on whether the BA is deficient by a small or larger amount respectively. However, the SDT has added language to the requirement to reference the Interconnection Frequency Response Obligation.

6. The SDT divided the previously posted "Attachment A - Background Document" into two documents to provide additional clarity. The first document "Attachment A- Supporting Document" which details the methods used to develop the events to be analyzed, the FRO, FRM and Frequency Bias Setting. Do you agree that the revised Attachment A - Supporting Document provides sufficient clarity on the methodologies to be used? If not, please explain in the comment area.

Summary Consideration: The majority of the commenters pointed out that there was a discrepancy between Attachment A and the Background Document concerning the methodology used to calculate FRO. The SDT addressed the discrepancy between the two documents to ensure that historical data is used for the allocation of an Interconnection Frequency Response Obligation to the BAs within that Interconnection.
Several of the commenters indicated that the proposed standard did not provide a limit on the amount of Frequency Response that a BA was supposed to provide. The SDT added Paragraph \#8 in Attachment A under the Event Selection Criteria to clarify that events greater than the limit in the criteria would be capped at a certain limit. This translates to a maximum expectation of Frequency Response equal to a Balancing Authority's FRO times the number of 1 Hz shown in Table 2 in Attachment A.
Some commenters were confused about the intent of Attachment A. They indicated that Attachment A was describing both a methodology to select events and providing a background for the process (not a process/methodology). The intent of Attachment A is to describe the process that will be used. There is no intent to require a filing on a certain date and to have the BA prove to the auditor that a filing was made on that date. Rather the requirement is to have an FRM that provides at least the response required of a BA based on it's FRO and provide a high-level overview of the mechanical parts of the process. The drafting team has modified the Requirements and Attachments to address the concerns raised by the comments that requirements were in the Attachments. In order to explain the process, the drafting team believes the information needs to be attached to the standard such that it cannot be changed without input from the industry.

As to the use of the term "may" in the attachment, at this time the drafting team is unable to further restrict the language due to the issues surrounding an individual event. As an example, frequency is scheduled at 60 Hz most of the time. However, when viewed on a graph or an EMS screen, it rarely sits at 60.000 for a long period of time, it fluctuates between 59.995 and 60.005 . The drafting team is unable to say at this time that an event that starts with frequency at 60.005 is materially different than an event that starts at 59.995 . Therefore, the drafting team has attempted to put guidance into the document as to what is pertinent without attempting to be overly restrictive in the selection criteria since there is no support for a restriction at this time. As more experience is gained, the process should be refined. If the refinement is significant enough to require a change to the Attachment A language, the process required to do so would be open to participation of industry and not done without public exposure.

A couple of commenters said that using older data for compliance could cause an entity to be in "double jeopardy". The SDT discussed the concern of double jeopardy several times. At this time, the drafting team believes the issue of noise in individual events and the convergence of measurement of multiple events outweighs the double jeopardy concerns. The drafting team has, however, reduced the minimum number of events in a 12 month period to 20 from 25 but is still recommending that events from a previous year be used for the calculation if this number of events cannot be found in that period.

A few o commenters indicated that the allocation of the FRO to the BAs was a "top down" approach. The SDT agrees with some of the comments made, but not in the conclusion drawn from the individual points. There is not currently an obligation to provide any amount of frequency response to a sudden change in interconnection frequency. The proposed standard addresses this shortcoming in the proposed standard.

The drafting team has also reduced the initial reduction in the minimum Frequency Bias Setting to ensure that the reduction can be studied closely to ensure no detrimental impact on the reliable operation of the Bulk Electric System.

Finally, there is ongoing disagreement in the industry as to whether it is desired to have a minimum Frequency Bias Setting that is significantly greater than the Frequency Response Characteristic.

A couple of commenters questioned whether point B was 18 seconds after the start of the disturbance. The SDT revised the language in the document to provide clarity on the 18 seconds. To the extent that the language is related to a specific definition of steady frequency, this has been worded intentionally to allow the process being developed by the ERO (specifically the Resources Subcommittee and the Frequency Working Group) to be adjusted based on experience that will only be gained through evaluation of actual events over the course of the next few years. Until that experience is gained, there will need to be some leeway in the process. The drafting team believes that the level of guidance provided in Attachment A is appropriate based on the information currently available.

| :--- | :--- | :--- | :--- | \left\lvert\, \(\left.\begin{array}{ll}\hline 0.1 of HZ) and is allocating it among all BAs. The individual BA's allocated FRO is much <br>

lower than what BAs obligations' presently are since the proposed standard lowers <br>
the bar for the BAs. The current approach is definitely superior to what is proposed <br>
since it more closely matches with the characteristic of the system and it protect the <br>
interconnection by requiring larger contribution than proposed standard. <br>
5. The allocation of FRO among the BAs in the interconnection favors the BAs with <br>
more load than more installed capacity\end{array}\right.\right]\)

| Organization | Yes or No | Question 6 Comment |
| :--- | :---: | :---: |
| Response: The studies from the field trial show a convergence of the measurement after approximately 20 to 25 events. Based on <br> the studies, the drafting team believes that a sample size as suggested would be very likely to cause entities to fail inappropriately <br> due to the large amount of noise in the data related to each event. Additionally, there is a desire to ensure that the events picked <br> are not weighted in such a way to cause the measurements to be increased over actual response. The drafting team has <br> attempted to minimize the effort required of the reporting entities by developing the forms needed to calculate the FRM. Finally, <br> the calculation process is being used for more than the previous process, not to mention that the previous process is not clearly <br> defined and therefore not be used consistently across the industry. |  |  |

Alliant Energy Corp. Services, Inc.

Negative Confusion exists around the "peak load" in that Attachment A states the allocastion is based on Projected Peak Loads and Generation but the Background Document states it will use historical Peak and Generation to make the allocation. - There appears to be a difference in how FRO is calculated in Attachment A and what is described in the Background Document. These differences should be reconciled such that both documents address the same approach. If installed capacity is used in the equation in Attachment A, how are variable/intermittent resources (e.g. wind, solar) accounted for? At full capacity of something less - please clarify. -
It is not clear if there is an upper limit to the amount of frequcncy response expected of the BA's under this standard. Except for Table 2 in Attachment A, there is no discussion of an amount of FR expected on a total basis. BA's need to know for how many tenths of a hertz they are to respond so they can determine how to plan to meet the requirements.

Response: The drafting team has addressed the discrepancy between the two documents to ensure that historical data is used for the allocation of an Interconnection Frequency Response Obligation to the BAs within that interconnection.
The drafting team has added a paragraph in the FRM section of Attachment A limiting the amount of Frequency Response for which a BA will be measured for compliance purposes. This translates to a maximum expectation of Frequency Response equal to a Balancing Authority's FRO times the number of . 1 Hz shown in Table 2 in Attachment A.
BrightSource Energy, Inc.;
Clark Public Utilities; Tri-State

Negative Confusion exists between Attachment A and the Background Document. Attachment A states peak load allocation is based on "Projected" Peak Loads and Generation, but

It seems that <br> Lowering the Minimum Frequency Bias Setting from 1\% to .8\% will result in a lower <br> response, which in turn will lower the natural frequency response. Over time it seems <br> this pattern would lead to poorer response. |  |

| Organization | Yes or No | Question 6 Comment |
| :--- | :--- | :--- |

is not withdrawn due to AGC action. With that said, there is currently not an obligation to provide any amount of frequency response to a sudden change in the interconnection's frequency. The proposed standard addresses this shortcoming in the current standard. The drafting team has modified the initial reduction in the minimum Frequency Bias Setting to ensure that the reduction can be studied closely to ensure no detrimental impact on the reliable operation of the Bulk Electric System. Finally, there is ongoing disagreement in the industry as to whether it is desired to have a minimum Frequency Bias Setting that is significantly greater than the Frequency Response Characteristic. Please refer to Order 693 P371 for further information on this issue.

The drafting team has added a paragraph in the FRM section of Attachment A limiting the amount of Frequency Response for which a BA will be measured for compliance purposes. This translates to a maximum expectation of Frequency Response equal to a Balancing Authority's FRO times the number of .1 Hz shown in Table 2 in Attachment A.

The drafting team is operating under the Standard Authorization Requests (SARs) as approved. This drafting team believes that proposing a generator requirement is beyond the scope of the SARs. To the extent that the commenter believes there is a need to have a reliability standard related to generators, the drafting team would suggest that the commenter submit a SAR to begin the development process.

Beaches Energy Services; City of Bartow, Florida; Tampa Electric Co.

Negative
On Event Selection Criteria, bullet 2, if 25 events cannot be identified then the ERO can go back in time to the previous year. This creates a double jeopardy to R1 of the standard. It also may include irrelevant data if there have been changes from one year to the next in FRO or Bias settings assigned by the ERO.

On Frequency Response Obligation, first paragraph states that "Each Interconnection will establish target contingency protection criteria"; however, the Interconnection is not a decision-making body. Does this really mean the ERO will establish FRO for each Interconnection?

The single asterisk note for the table on page 2 states: "It is extremely unlikely that an event elsewhere in the Eastern Interconnection would cause the Florida UFLS special protection scheme to "false trip".", "Special protection scheme" should be stricken from this sentence, Florida has just a regional difference in its UFLS program.

Response: The drafting team has discussed the concern of double jeopardy several times. At this time, the drafting team believes the issue of noise in individual events and the convergence of measurement of multiple events outweighs the double jeopardy

| :---: | :---: | :---: |
|  |  | Instructions document dated September 1, 2010? If so it should be included in this document along with the added 8 and 18 second time lines being shown. What is a "narrow range" in item b.? <br> 4. - Better define "relatively steady" (i.e. within a specific range and state it?) Also, "near 60.000 Hz " is not precise enough (i.e. if the event begins below 60.000 Hz , what range or time error correction is to be considered acceptable?) Is the " $A$ " value also part of the figure cited in 3 ? <br> 5. - Is the " $B$ " value also part of the figure cited in 3 ? <br> 6. - Change "should be excluded" to "will be excluded". <br> 7. - Better explain "the cleanest 2 or 3 frequency excursion events" or remove the word "cleanest". <br> Page 2 paragraph 5: Provide specific dates for the "quarterly postings" and where these will be posted (i.e. Internet address or other). Clarify the December 15 ERO annual post date with the dates stated for same posting on Page 3 paragraph 5 and the BA's January 10 deadline. The BA posts 30 days from which date? This is confusing. <br> Page 2 Table 2: What of starting event frequencies that are $<60 \mathrm{~Hz}$ ? Why is the "Highest UFLS" 59.6 when the Florida setting for its load is 59.7? <br> Page 3 FRO equation: Page 4 of the "Frequency Response Standard Background Document, October 2011" also shows this equation but uses different terms. Make the same on both documents. In the Background Document each component of the numerator is explained and reference is made to FERC Form 714 to obtain these values. There is no reference to this form for the denominator values. All of this needs to be made clear with reference to FERC Form 714 on Attachment A. |
| Response: 3. The SDT has modified the titles of the columns in Table 1 of the Procedure document to clarify what was intended by the table. The Point C value is defined in section 3a. |  |  |

|  |  |  |
| :---: | :---: | :---: |
| 4 - Due to the complicated nature of event evaluation and selection, the drafting team has retained the words "relatively steady" and "near 60 " in the document without providing further clarification or definition. The drafting team believes that the process being developed by NERC (specifically the NERC Resources Subcommittee and the Frequency Working Group) requires some leeway. As more experience in gained, the NERC Resources Subcommittee will attempt to document the process further. <br> 5 - No, the $B$ value is a calculated value not shown in the chart referenced in number 3 above. Additional language has been added in Attachment $A$ to clarify both the $A$ value and the $B$ value. The $A$ and $B$ values are shown on Figure 2 of the Background document as green and red lines, respectively. <br> 6 - The drafting team modified this language. <br> 7 - Due to the complicated nature of event evaluation and selection, the drafting team has retained the word "cleanest" in the document without providing further clarification or definition. The drafting team believes that the process being developed by NERC (specifically the NERC Resources Subcommittee and the Frequency Working Group) requires some leeway. As more experience in gained, the NERC Resources Subcommittee will attempt to document the process further. <br> NERC is developing this part of the process and an area to post this information. The drafting team has put clear language in the attachment requiring at least quarterly posting of events. It is currently the drafting team's expectation that a list of potential events would be posted shortly after they actually occur and a refined list will be made available quarterly. <br> Modifications to Table 2 have been made to clarify what is being used. <br> Attachment A and the Background Document have been modified so that the FRO Allocation equation is the same and the terms are fully explained. |  |  |
|  |  |  |

| Organization | Yes or No | Question 6 Comment |
| :--- | :--- | :--- |
|  |  | Pre-disturbance frequency should be relatively steady and near 60.000 Hz is vague. <br> TEP feels that the ERO should not need to validate a BAs frequency bias setting. |

Response: The drafting team has modified the standard to put the requirements there and use Attachment A to clarify the process.
After further discussion and review of the events in the Western Interconnection Form 1 for 2011, the drafting team has modified the Delta C and Under Frequency values in Table 1.

Based on language in Order 693 P355, the drafting team believes that frequency response is needed in both directions, not just one.

The drafting team has revised the language in the document to provide clarity on the 18 seconds. To the extent that the language related to a specific definition of steady frequency, this has been worded intentionally to allow the process being developed by the ERO (specifically the Resources Subcommittee and the Frequency Working Group) to be adjusted based on experience that will only be gained through evaluation of actual events over the course of the next few years. Until that experience is gained, there will need to be some leeway in the process. The drafting team believes that the level of guidance provided in Attachment A is appropriate based on the information currently available.

Due to level of detail being used to determine the FBS and FRM as well as the interactions between this standard and others, the drafting team disagrees with the commenter and continues to recommend the ERO validate the FBS of each BA.

| Bonneville Power <br> Administration | No | BPA believes that Attachment A adds additional requirements to the standard. <br> Confusion exists between Attachment A and the Background Document. Attachment <br> A states peak load allocation is based on "Projected" Peak Loads and Generation, but <br> the Background Document states it will use "historical" Peak Load and Generation. |
| :--- | :--- | :--- |
|  | 3a: it may take longer than 8 seconds in some disturbances. This should be 10 <br> seconds. . 05 Hz Delta F is not low enough for the Western Interconnection, it should <br> be .075 tz to ensure there is measurable frequency response for the interconnection. <br> Also, under frequency should be set at 59.95 Hz. |  |
| reliability need to include over frequency events. |  |  |

| Organization | Yes or No | Question 6 Comment |
| :---: | :---: | :---: |
|  |  | 3b: It is unclear if the 18 seconds is setting the $B$ point. If this is the $B$ point, BPA believes it should be changed to 25 seconds for the Western Interconnection. <br> 4. Please define relatively steady and near 60 Hz . <br> 6: For the Western Interconnection, BPA believes this needs to be 10 minutes at the top of the hour. As mid hour scheduling becomes more prevalent, the ramping at the bottom of the hour will have to be taken into account. <br> FRO for the interconnection: Starting frequency should be the FTL limit. With RBC in place, the frequency is seldom at 60 Hz . <br> BPA understands the theory behind setting the base obligation to the values listed in table 2. BPA would like to know if there were any studies performed to validate setting the FRO for the interconnection to such a low level? <br> BA FRO and frequency bias setting: BPA does not agree with ERO assigning a Frequency Bias setting to each BA. This calculation is indicated as the initial FRO allocation, what is the process for changing it? BPA believes this should go through the standard drafting process for any changes. The calculation should use Peak online capacity, not the installed capacity. This would lead to the denominator being $2 \times$ Peak projected load for the interconnection. BPA has approximately $35,000 \mathrm{MW}$ of installed generation, and has never seen the actual coincidental generation go over 21,000 MW. <br> Again, BPA doesn't believe the ERO should be validating the frequency bias setting. It is unclear to BPA how variable bias is being addressed in the standard. |
| Response: The drafting team has modified the requirements to address comments. The drafting team believes as modified the requirements are stated in the standard and the process to be used is in the Attachment. |  |  |
| The drafting team has addressed the discrepancy between the two documents to ensure that historical data is used for the allocation of an Interconnection Frequency Response Obligation to the BAs within that interconnection. |  |  |
| The drafting team has revised the language in the document to provide clarity on the 18 seconds. The drafting team has also |  |  |

| Organization | Yes or No | Question 6 Comment |
| :--- | :--- | :--- |

attempted to clarify that the B Value is the average of the scan rate data for the period from 20 to 52 seconds following the start of the event. The event selection criteria will use the frequency approximately 18 seconds (prior to the start of the B Value period) to as frequency level to determine if the change in frequency qualifies as an event for the purposes of this standard. Based on event information for the 12 month period beginning December 2010, the drafting team has modified the frequency levels used for event qualification but did not modify the 18 second frequency point.

To the extent that the language related to a specific definition of steady frequency, this has been worded intentionally to allow the process being developed by the ERO (specifically the Resources Subcommittee and the Frequency Working Group) to be adjusted based on experience that will only be gained through evaluation of actual events over the course of the next few years. Until that experience is gained, there will need to be some leeway in the process. The drafting team believes that the level of guidance provided in Attachment A is appropriate based on the information currently available.

Both the NERC Resources Subcommittee (RS) and the NERC Transmission Issues Subcommittee (TIS) evaluated the level of response needed. The drafting team decided to use the limits determined by the RS over that determined by the TIS after evaluation of both. The documents developed by both of these subcommittees are available on the NERC website under this project (http://www.nerc.com/filez/standards/Frequency Response-RF.html).

The drafting team clarifies that the ERO is not assigning the Frequency Bias Setting. The ERO will review the data to determine that the Frequency Response Measure is correctly determined by the BA and that the Frequency Bias Setting is therefore correct. The expected process is that a subcommittee under NERC will review the Form 1 and Form 2 for each entity to ensure that the BA correctly filled out the form. Assuming the BA has correctly filled out these forms, there is no ERO interaction with the number provided by the BA.
The FRO calculation is being included in the Attachment A to ensure that the process to modify the calculation would need to be open to industry input. It is not appropriate to put it in a requirement since it would not make sense to make a requirement that the FRO be allocated in a certain manner. The proposed methodology uses the average of the historical peak loads (monthly peak) and peak generation (monthly peak) and does not use installed capacity.
The drafting team revised the requirements to separate the variable bias requirement from the fixed bias setting requirement and provide clarity related to what is expected in a variable bias setting.

| :---: | :---: | :---: |
|  |  | will be included with the data set by the ERO for determining FRS compliance." I believe that the better alternative in this case would be to use the lesser number of events. This is partly based on the consideration that if there are fewer events, the risk to the interconnection for that year was less that expected, and as a result, evaluation of fewer events will not compromise interconnection reliability. If fewer than 25 events are available in any year, the selection criteria should be adjusted to select more events. <br> Comment 7: There are a number of problems with the use of "median" Frequency Response of the measured events. These problems make a choice other than median preferable. The following comments list some of those problems. <br> Comment 8: The current standard uses average Frequency Response of selected events. This makes the current standard incompatible with the use of median. <br> Comment 9: If a BA reconfigures during a measurement year, that reconfiguration will create a bi-modal distribution of the Frequency Response events. Median is incapable of representing a bi-modal distribution. The use of median will result in a standard that is incapable of measuring compliance effectively for an BA that is reconfigured during a measurement year (Dec 1 thru Nov 30). <br> Comment 10: Any attempt to purchase additional Frequency Response from another BA for a portion of a measurement year will also cause a bi-modal distribution making the purchase of Frequency Response only effective for entire measurement years. <br> Comment 11: Median is a non-linear measurement method. Because it is a nonlinear measurement method, there is no valid way to manage partial year measurements. <br> Comment 12: I will offer an alternative to median to the SDT before the end of the development of responses to these comments. <br> Comment 13: The Minimum Frequency Bias Setting and the Frequency Response Obligation are both based on a method that assigns responsibility based on a Peak |

| Organization | Yes or No | Question 6 Comment |
| :--- | :--- | :--- | \left\lvert\, \(\left.\begin{array}{l}Load / Peak Generation share of the interconnection. However, the method used to <br>

set the Minimum Frequency Bias Setting is different than the method used to <br>
determine the Frequency Response Obligation. Using these two different methods <br>
could result in the Minimum Frequency Bias Setting being less that the FRO for a BA. <br>
The best way to correct this problem is to use that same allocation methodology for <br>
determining the FRO and the Minimum Frequency Bias Setting. This can be easily <br>
accomplished by modifying R5 to use the FRO allocation method to determine the <br>
Minimum Frequency Bias Setting. This calculation would divide the numerator from <br>
the FRO allocation equation, divide it by two and multiply it by the percentage <br>
specified in Attachment B. In fact, the current FRS Form 1 uses this equation with <br>
projected rather than historic data. The best alternative would be to modify the R5 in <br>
the standard to match the FRO allocation method and modify FRS Form 1 to use <br>
historic data instead of projected data. This would result in only one set of Peak Load <br>
and Peak Generation data throughout the standard, rather than three different sets <br>
of data as currently written. When multiple sets of the same or similar data are used <br>
within a single standard, it only creates confusion and errors in the result.\end{array}\right.\right\}\)

| Organization | Yes or No | Question 6 Comment |
| :---: | :---: | :---: |
| that at this time, minimizing the changes to the current Frequency Bias Setting process provides better comparability for the purpose of evaluating the impacts of reducing the minimum setting requirement. In the alternative, the drafting team feels that allocating the FRM based on historical data provides less room to game the process since the numbers used for allocation can be verified independently. |  |  |
| MRO NSRF | No | Confusion exists around the "peak load" in that Attachment A states the allocation is based on Projected Peak Loads and Generation but the Background Document states it will use a historical Peak and Generation to make the allocation. Also, for the BA installed capacity, where is that value derived from and does NERC obtain that from FERC form data or does the BA provide that information somewhere specific to this effort? Additionally, there appears to be a difference in how FRO is calculated in Attachment A and what is described in the Background Document. These differences should be reconciled such that both documents address the same approach.If installed capacity is used in the equation, how are variable/intermittent resources (e.g. wind, solar) accounted for? At full capacity? Please clarify.We suggest the SDT clarify if the materials in the revised Attachment A (and Attachment B) are "Guideline" or "Technical Background", or "requirements |
| Response: The drafting team has addressed the discrepancy between the two documents to ensure that historical data is used for the allocation of an Interconnection Frequency Response Obligation to the BAs within that interconnection. Installed capacity is not used in the allocation methodology. The proposed methodology uses the average of the historical peak loads (monthly peak) and peak generation (monthly peak) and does not use installed capacity. |  |  |
| Xcel Energy | No | Confusion exists around the "peak load" in that the Attachment A states the allocation is based on Projected Peak Loads and Generation but the Background Document states it will use a historical Peak and Generation to make the allocation. Also, for the BA installed capacity, where does that value come from and does NERC obtain that from FERC form data or does the BA provide that information somewhere specific to this effort? Additionally, there appears to be a difference in how FRO is calculated in Attachment A and what is described in the Background Document. These differences should be reconciled such that both documents address the same |

| ISO/RTO Council Standards Review Committee | No | Despite the SDT's good faith effort to convert the previous Attachment A into two separate documents (Attachments $A$ and $B$ ), the modified Attachment $A$ is problematic. As many commenters indicated, the previous Attachment $A$, other than the section providing guidance on event selection, appears to be explanatory, contextual, and instructional in content. These aspects are important, but do not rise up to the level of requirements to drive reliability performance/outcome. Attachment A should include only the event selection process and calculations associated with the requirements, including an explanation of what is necessary if variable Frequency Bias Settings are implemented. If other "requirements" need to be specified, such as the reporting time frame stipulated on P. 3 of Attachment A, they should be moved to the standard itself but not imbedded in an attachment. We suggest that the SDT first determine if the materials in the revised Attachment A (and Attachment B) are "Guideline" or Technical Background", or are they "requirements". If it is the former, then Requirement R1 should not mention Attachment A at all. If it is the latter, then the as-written Attachment A is a mix bag as it on the one hand describes the ERO's process for supporting the Frequency Response Standard (FRS), in other words, the method and criteria it uses to calculate the frequency bias settings and the FRM, and on the other hand the BA's obligations to support this process. We strongly disagree that the latter requirements be imbedded in an attachment, especially one that is supposed to provide the technical background and guideline for another entity which is not held responsible for complying with the proposed method. Further, there are no measures provided for the requirements stipulated/imbedded in Attachment A so how can the Responsible Entity (BA, in this case) be assessed for compliance?We |

| :---: | :---: | :---: |
|  |  |  |
| Response: The intent of Attachment $A$ is to describe the process that will be used. There is no intent to require a filing on a certain date and to have the BA prove to the auditor that a filing was made on that date. Rather the requirement is to have an FRM that provides at least the response required of a BA based on it's FRO and provide a high-level overview of the mechanical parts of the process. The drafting team has modified the Requirements and Attachments and modified them to address the concerns raised by the comments that requirements were in the Attachments. In order to explain the process, the drafting team believes the information needs to be attached to the standard such that it cannot be changed without input from the industry. As to the use of the term "may" in the attachment, at this time the drafting team is unable to further restrict the language due to the issues surrounding an individual event. As an example, frequency is scheduled at 60 Hz most of the time. However, when viewed on a graph or an EMS screen, it rarely sits at 60.000 for a long period of time, it fluctuates between 59.995 and 60.005 . The drafting team is unable to say at this time that an event that starts with frequency at 60.005 is materially different that an event that starts at 59.995. Therefore, the drafting team has attempted to put guidance into the document as to what is pertinent without attempting to be overly restrictive in the selection criteria since there is no support for a restriction at this time. As more experience is gained, the process should be refined. It the refinement is significant enough to require a change to the Attachment A language, the process required to do so would be open to participation of industry and not done without public exposure. <br> The SDT agrees with your comment about removing the documents from Section F of the proposed standard has made this modification to the standard. <br> In the table on page 2 the asterick references a statement that the 59.7 Hz used in Florida is a special protection scheme. This is incorrect. The special protection scheme setting was 59.82 Hz and was done away with in 2005 or earlier. The 59.7 Hz setting used within the FRCC is based on FRCC TWG studies that require this level of setting to protect the state in the event of a separation and to protect nuclear equipment. FPL supports the use of the $\mathrm{C}(\mathrm{N}-2)$ critiera. Additionally, the reference to the FERC714 report that is currently in the background data should be made part of attachment A not separated. FPL fully agrees with Table 1The formula used to derive the FRO is inconsistant with the definition used for requirement R5. R5 states that the load is " within the BA's metered boundary". The load used in the formulae is taken from FERC714. The yearly peak demand used in R5 should be the peak |  |  |
|  |  |  |

| Organization | Yes or No | Question 6 Comment |
| :--- | :--- | :--- |
|  |  | monthly load from June, July or August as reported on FERC714 to be compatible <br> with the FRO formula. |

Response: The drafting team has removed the reference to the special protection scheme. The drafting team has modified the FRO allocation formula to better explain what is desired. However, the drafting team did not adjust the formula to what is suggested by the commenter.

| NV Energy | No | It is not clear whether the calculation of FRO is to utilize projections of BA load as in <br> Att A, or past data reported in FERC Form 1 as per the Background Document. |
| :--- | :---: | :--- |

Response: The drafting team has addressed the discrepancy between the two documents to ensure that historical data is used for the allocation of an Interconnection Frequency Response Obligation to the BAs within that interconnection. The proposed methodology uses the average of the historical peak loads (monthly peak) and peak generation (monthly peak) and does not use installed capacity.

| Los Angeles Department of <br> Water and Power | No | LADWP considers the increase in number of events to analyze (now 25) to be <br> excessive. Previous years analyses typically involved 4-6 events; a permanent five- <br> fold increase is not justified. LADWP suggests reducing the baseline number of events <br> from 25 to 12 per year. Analysis of a larger number of events could be requested on a <br> year-by-year basis if conditions warrant, but should not be mandatory for all regions <br> in all years. |
| :--- | :--- | :--- |

Response: The studies from the field trial show a convergence of the measurement after approximately 20 to 25 events. Based on the studies, the drafting team believes that a sample size as suggested would be very likely to cause entities to fail inappropriately due to the large amount of noise in the data related to each event. Additionally, there is a desire to ensure that the events picked are not weighted in such a way to cause the measurements to be increased over actual response. The drafting team has attempted to minimize the effort required of the reporting entities by developing the forms needed to calculate the FRM. Finally, the calculation process is being used for more than the previous process, not to mention that the previous process is not clearly defined and therefore not used consistently across the industry.

| JEA Electric | No | On Event Selection Criteria, bullet 2, if 25 events cannot be identified then the ERO |
| :--- | :--- | :--- |

| Organization | Yes or No | Question 6 Comment |
| :---: | :---: | :---: |
| Compliance/Florida Municipal Power Agency |  | can go back in time to the previous year. This creates a double jeopardy to R1 of the standard. It also may include irrelevant data if there have been changes from one year to the next in FRO or Bias settings assigned by the ERO. <br> On Frequency Response Obligation, first paragraph states that "Each Interconnection will establish target contingency protection criteria"; however, the Interconnection is not a decision-making body. Does this really mean the ERO will establish FRO for each Interconnection? <br> The single asterisk note for the table on page 2 states: "It is extremely unlikely that an event elsewhere in the Eastern Interconnection would cause the Florida UFLS special protection scheme to "false trip".", "Special protection scheme" should be stricken from this sentence, Florida has just a regional difference in its UFLS program. |
| Response: The drafting team has discussed the concern of double jeopardy several times. At this time, the drafting team believes the issue of noise in individual events and the convergence of measurement of multiple events outweighs the double jeopardy concerns. After further discussions, the drafting team has reduced the minimum number of events in a 12 month period to 20 from 25 but is still recommending that events from a previous year be used for the calculation if this number of events cannot be found in that period. <br> The drafting team modified the language to clarify that the ERO will set the IFRO. <br> This modification was made. |  |  |
| Duke Energy | No | On page 3 of the document it states "For a multiple Balancing Authority Interconnection, the Interconnection Frequency Response Obligation is allocated based upon either the Balancing Authority Peak Demand or peak generation", however, the initial FRO allocation equation shows that the BA allocation is based upon the sum of the Projected BA Peak Load plus installed capacity, times the Interconnection FRO, and divided by the sum of the Projected Interconnection Peak Load plus Interconnection installed capacity. Is the statement in quotes correct, or is the allocation equation correct? In addition, the equation in Attachment A referencing "installed capacity" conflicts with the equation in the BAL-003-1 |

| Organization | Yes or No | Question 6 Comment |
| :--- | :--- | :--- | \left\lvert\, \(\left.\begin{array}{l}Background Document entitled "Frequency Response Standard Background <br>

Document" where "Peak Gen" is used. In summary, is the FRO allocation based upon <br>
an equation which a) sums the Projected BA Peak Load plus peak generation, b) sums <br>
the Projected BA Peak Load plus installed capacity, or c) uses either Projected BA <br>
Peak Load OR peak generation? All three options are currently represented in the <br>
documentation. <br>
Calculation of the FRO for the Eastern Interconnection: Duke Energy agrees with the <br>
criteria suggested for the event to be protected (4500 MW), and at this time also <br>
agrees with the "compromise" low limit of 59.6 Hz. However, knowing that another <br>
Standard is under development which may require hourly assessment of available <br>
"frequency responsive reserves", we are trying to determine what impact the choice <br>
of this methodology will have on the amount of frequency responsive reserves the <br>
industry will have to maintain - enough to cover frequency swings that only <br>
occasionally reach down to perhaps 59.9 Hz as we see on the Interconnection today <br>
(essentially the allocated FRO for a 0.1Hz deviation), enough to cover a 4500 MW <br>
loss, or whatever we deem appropriate as long as we are compliant to the FRM? We <br>
recognize that the Standard Drafting Team cannot answer this question, as the <br>
Standard under development is not within the scope of this team, however our <br>
comment is meant to illustrate the point that similar to our response to question 8, it <br>
should be recognized that elements of this Standard are tightly coupled to other <br>
current and potential Standards, and the impacts must be considered by the Industry.\end{array}\right.\right\}\)

| Organization | Yes or No | Question 6 Comment |
| :---: | :---: | :---: |
| SERC OC Standards Review Group | No | The definition of Single Event Frequency Response Data (SEFRD) was struck from the draft standard but still appears in Attachment A. Since R1 of the standard references Attachment A, would the definition of SEFRD still be applicable? If the definition is to be totally struck, we don't think the term should be used in Attachment $A$. |
| Response: The SEFRD definition was moved to Attachment A. The SEFRD is used on individual events. The median of a BA's SEFRDs will be used to determine its FRM. Therefore, the drafting team believes it is appropriate to use the definition in the Attachment. Since it is not likely to be used outside of the context of this standard, the drafting team is not proposing to place the definition in the NERC Glossary. |  |  |
| Hydro-Quebec TransEnergie | No | The Event Selection Criteria should be modified for the Quebec Interconnection. In Table 1, the change in frequency (Delta f) used for Quebec's Event Selection Criteria should be $0,3 \mathrm{~Hz}$ (from point " $A$ " to point " $C$ ") and must last for at least 7 seconds so that we don't measure AGC action. In addition, a criterion should be added by saying that events that recovered within the 20-52 second average period for point " $B$ " should be excluded from analysis. |
| Response: The drafting team has modified Attachment A to address these comments. |  |  |
| Keen Resources Asia Ltd. | No | The sample pre-selection described in Attachment A, Event Selection, Criteria 2 \& 7, violates the fundamental statistical procedure of unbiased sampling. A population is governed by a single "process" which, when stationary, is represented by a fixed probability distribution. In this case the population is several years of events (which are the subject of Frequency Response), not of normal operating control errors which are the subject of CPM control. A sample is governed by a single process that approximates the process governing the population as the sample gets larger, in this case if it includes several years of data. Samples are measured "as they come", no triage/filtering allowed, and they are called "stratified" when their distribution approximates the population distribution. Unlike normal operating errors, samples of events are not evenly distributed over a year. The attempt in criteria $2 \& 7$ to preselect only certain events, and not others, in such a way that the selected events |

| Organization | Yes or No | Question 6 Comment |
| :--- | :--- | :--- | \left\lvert\, \(\left.\begin{array}{l}occur evenly throughout the year, is papently wrong because it is trying to "fit" <br>

events into a process (even distribution over time) that does not govern events, but <br>
that instead governs normal operating errors that are the subject of CPM control, not <br>
of this Frequency Response standard. In other words, criteria 2 \& 7 confuse <br>
Frequency Response with CPM, and events with normal operating errors. The result <br>
is a false, biased sample which destroys the integrity of this standard. Paragraph 4 on <br>
page 5 of the Background Document, on the other hand, provides a statistically <br>
correct description of event selection without sample pre-selection and should <br>
followed instead of the erroneous criteria 2 \& 7 in Attachment A.\end{array}\right.\right\}\)

| :---: | :---: | :---: |
|  |  | 3. The use of 59.6 Hz as the highest UFLS setting is flawed. It should either be 59.7 Hz as a deliberate choice to protect Florida interests, or it should be 59.5 Hz without concern for Florida's unique settings. <br> 4. In the last 2 sentences at the end of the section on Frequency Response Obligation, it refers to an Interconnection being able to offer "alternate FRO protection criteria". The Interconnection should have been an integral part of establishing its obligation. It is stated that the "ERO will confirm" the "alternate FRO protection criteria". Does this mean the ERO unconditionally approves it, or evaluates with a right of rejection? Please clarify. <br> 5. In the formula for determining the Balancing Authority's FRO allocation, installed capacity is used. Does the industry have a clear and consistent definition for installed capacity? Also, with greater wind energy development, the delivered capacity over longer time horizons will be substantially less than nameplate machine ratings. The background document refers to the use of peak generation instead of installed capacity. Which shall be used? Please clarify. <br> 6. Recent studies have shown that the 18-52 second sampling interval does not work well for the Quebec Interconnection, in part due to the excellent and high level of response found in that Interconnection. The standard needs to be modified such that the sampling interval is that which works the best for each individual interconnection. <br> 7. Attachment A needs to define the point A sampling interval. |
| Response: The intent of Attachment $A$ is to describe the process that will be used. There is no intent to require a filing on a certain date and to have the BA prove to the auditor that a filing was made on that date. Rather the requirement is to have an FRM that provides at least the response required of a BA based on it's FRO and provide a high-level overview of the mechanical parts of the process. The drafting team has modified the Requirements and Attachments to address the concerns raised by the comments that requirements were in the Attachments. In order to explain the process, the drafting team believes the information needs to be attached to the standard such that it cannot be changed without input from the industry. <br> 1. The drafting team believes that Criterion 5 is clear as written. The comment does not provide any guidance as to what needs |  |  |

| Organization | Yes or No | Question 6 Comment |
| :--- | :--- | :--- |

clarification so no change was made.
2. Due to the complicated nature of event evaluation and selection, the drafting team has retained the word "cleanest" in the document without providing further clarification or definition. The drafting team believes that the process being developed by NERC (specifically the NERC Resources Subcommittee and the Frequency Working Group) requires some leeway. As more experience in gained, the NERC Resources Subcommittee will attempt to document the process further.
3. The drafting team has revised the terminology used to explain the frequency levels proposed. There was not a change to the Eastern Interconnection numbers.
4. An interconnection can recommend a change to the table. As the standards process currently works, that interconnection would need to support its alternative level with data. If the interconnection has a single Regional Reliability Organization, the ERO would typically agree to the alternative assuming it would be more restrictive (in this case a larger response requirement) than the ERO has recommended.
5. The drafting team has addressed the concerns raised by clarifying that historical data is used for the allocation of an Interconnection Frequency Response Obligation to the BAs within that interconnection. Installed capacity is not used in the allocation methodology. The proposed methodology uses the average of the historical peak loads (monthly peak) and peak generation (monthly peak) and does not use installed capacity.
6. The drafting team has modified Attachment A to address concerns with selection of an event where frequency returns to the A Value level during the measurement period. These events will be excluded from the measurement process for all interconnections.
7. The definition of the terms are provided in the background document as well as the formulas in the spreadsheets.

| Sacramento Municipal Utility <br> District (SMUD) | No | The standard is unclear as to if there is an upper limit to the amount of frequency <br> response expected of the Balancing Authorities under this standard. Except for Table <br> 2 in Attachment A, there is no discussion of an amount of Frequency Response <br> expected on a total basis. Balancing Authorities need to know for how many tenths of <br> a hertz they are to respond so they can determine how to plan to meet this <br> requirement. The documents do not appear to provide any boundary on the <br> maximum amount of Frequency Response that a BA will provide, i.e. it is not clear <br> what will happen if an event occurs in the Eastern Interconnection that causes the |
| :--- | :--- | :--- |

| Organization | Yes or No | Question 6 Comment |
| :---: | :---: | :---: |
|  |  | frequency to drop to less than 59.6 Hz or in the Western Interconnection that causes the frequency to drop to less than 59.5 Hz , or if that event is excluded from the list used to calculate the Balancing Authorities' response or is it included with an expectation that it counts the same as any other event. Without a clear statement of what is expected, including whether there is a limit on that expectation or not, it is unclear what is expected of the Balancing Authorities. |
| Response: The drafting team has added a paragraph in the FRM section of Attachment A limiting the amount of Frequency Response for which a BA will be measured for compliance purposes. This translates to a maximum expectation of Frequency Response equal to a Balancing Authority's FRO times the number of . 1 Hz shown in Table 2 in Attachment A. |  |  |
| Western Electricity Coordinating Council | No | There is disagreement between Attachment A and the Background Document. Attachment A states peak load allocation is based on "Projected" Peak Loads and Generation, but the Background Document states it will use "historical" Peak Load and Generation. <br> The allocation methodology of FRO among the BAs in the equation on page 3 of Attachment A favors BAs with more load than more installed capacity. Peak load is served but not all installed capacity is always dispatched. |
| Response: The drafting team has addressed the discrepancy between the two documents to ensure that historical data is used for the allocation of an Interconnection Frequency Response Obligation to the BAs within that interconnection. Installed capacity is not used in the allocation methodology. The proposed methodology uses the average of the historical peak loads (monthly peak) and peak generation (monthly peak) and does not use installed capacity. |  |  |
| Alberta Electric System Operator | No | These documents not only provide additional clarity but also specify additional requirements, such as FRS Form 1 annual reporting by January 10. All the enforceable requirements should be included in the body of the standard. <br> 1. Attachment $A$ uses the terms "delta $F$ (change in frequency)", "arresting frequency (Point C)", "B Value", "A Value". These terms are not properly defined or described in this document as drafted. The AESO suggests adding a description or definitions for |

| Organization | Yes or No | Question 6 Comment |
| :--- | :--- | :--- |$|$| clarity in this document. |
| :--- | :--- |
| 2. The standard gives 2 sets of values for Interconnection Frequency Response |
| Obligation in Table 2, (1) Base Obligation and (2) the obligation including 25\% Safety |
| Margin (which seems to be implied by the "contingency protection criterion"). The |
| Attachment A does not specifiy whether the Base Obligation or the 25\% Safety |
| Margin value will be used to allocate the Interconnection FRO to the BAs. Please |
| clarify which value will be used to calculate the BA Frequency Response Obligation |
| (FRO) in the Interconnection FRO allocation formula in Attachment A. |
| 3. The "initial FRO allocation" formula in Attachment A uses Peak Load. The term |
| Peak Load is not used in the standard nor is it a defined term in the NERC Glossary. |
| The standard uses Peak Demand, which is defined in the Glossary Is "Peak Load" |
| synonymous with "Peak Demand"? If so, Peak Demand should be used in the formula |
| instead. Otherwise Peak Load should be clearly defined in this document. |
| 4. Is "Projected" in the FRO allocation formula synonymous with "Forecasted"? If so, |
| Forecasted should be used for consistency. Otherwise "Projected" or the context in |
| which it appears must be defined. |

| Organization | Yes or No | Question 6 Comment |
| :---: | :---: | :---: |
| methodology uses the average of the historical peak loads (monthly peak) and peak generation (monthly peak) and does not use installed capacity. |  |  |
| Great River Energy/ACES Power Marketing Standards Collaborators | No | Under item 3 of the Event Selection Criteria section, the delta $F$ and Point $C$ should be described either in this attachment or the "Frequency Response Standard Background Document". While many in industry may understand what these terms mean, history has a way of getting lost with personnel turnover. Furthermore, this would help ensure that the auditors and industry have a duplicate understanding. <br> In the Frequency Response Obligation section on page 2, several items require more description. Further description of why an N-2 event was chosen for the Contingency Protection Criteria should be provided and which N-2 event was selected so that industry can help validate if the correct MW value was selected. <br> Furthermore, the document should clarify if the Contingency Protection Criteria contains the "safety margin". There is a statement in the paragraph before the table that states it does but then the table lists out a separate $25 \%$ "Safety Margin". Thus, it is not clear if the "Safety Margin" is included in the Contingency Protection Criteria value listed in the table or not. "Safety margin" should be changed to "reliability margin". Safety has a specific meaning in the electric industry and its use here is not appropriate. The Base Obligation should be explained. The explanation should include its purpose and origin. |
| Response: 1. The definition of the terms are provided in the background document as well as the formulas in the spreadsheets. The drafting team has clarified Table 2 by modifying the titles for each line. |  |  |
| Texas Reliability Entity | No | We have a number of concerns regarding Attachment A which are set forth below: <br> 1. Regarding the formula for "Initial FRO Allocation" on page 3 of Attachment $A$, the terms for "BA installed capacity" and "Interconnection installed capacity" are undefined and could be subject to manipulation and dispute. We suggest that this formula be revised to mirror the calculation based on well-established FERC Form 714 data that is discussed in the Background document, which is based on actual |

| :---: | :---: | :---: |
| 3. The drafting team recommends all events with a frequency deviation that meets the selection criteria should be evaluated. For the entity that lost generation (or load) to initiate the event, the calculation methodology proposed allows adjustments to be made for that event. <br> 4. This modification was made to the Attachment B (now a Procedure). The suggested modifications are shown in Criteria 2 and 7. <br> 5. These two documents have been conformed. <br> 6. The ERO will notify the BAs as to the date the Frequency Bias Setting is to be implemented if they are utilizing a fixed Frequency Bias Setting. |  |  |
| Southern Company | No | We suggest increasing the delta f for the East to be the same value as the West or larger. The reason for this is that the 0.04 Hz suggested is too close to the governor deadbands of .036 Hz . This would potentially omit frequency response that some units may provide for a larger excursion but not for those close to the deadband. |
| Response: The delta f values have been selected to balance the need to have a sufficient number of events for evaluation and the need to have sufficient frequency movement to actually measure response. At this time the drafting team is not modifying the eastern interconnection values based on the event selection process for the period December 2010 through November 2011. |  |  |
| ISO New England Inc | No | We suggest the SDT to first determine if the materials in the revised Attachment A \& $B$ are "Guideline" or Technical Background", or are they "requirements". If it is the former, then Requirement R1 should not mention Attachment A at all. If it is the latter, then the as-written Attachment $A$ is a mix bag as it on the one hand describes the ERO's process for supporting the Frequency Response Standard (FRS), in other words, the method and criteria it uses to calculate the frequency bias settings and the FRM, and on the other hand the BA's obligations to support this process. We strongly disagree that the latter requirements be imbedded in an attachment, especially one that is supposed to provide the technical background and guideline for another entity which, by the way, is not held responsible for complying with the proposed method. An appendix is not regarded as a mandatory requirement. <br> Additionally, BAL-003-1- Attachment A |

| Ameren | Yes |  |

7. The second document "BAL-003-1 Background Document" provides information behind the development of the standard. Do you agree that this new document provides sufficient clarity as to the development of the standard? If not, please explain in the comment area.

Summary Consideration: The majority of the commenters referenced other questions in the comments. The SDT asked them to review the response to those earlier questions.
Several of the commenters pointed out that there was a discrepancy between the Background Document and Attachment A regarding the calculation of the BA FRO. The SDT has corrected the reference so both documents agree. The drafting team is proposing to use historical information rather than forecasted information for the allocation of the Frequency Response Obligation.

Some commenters indicated that Supplemental Regulation Service is not an appropriate method to provide Frequency Response. It is inappropriate to expect supplementary regulation to transfer frequency response successfully. However the SDT does not want to prevent any innovative solution that will transfer frequency response through the use of a pseudo-tie among Balancing Authorities. Also, the SDT believes that Balancing Authorities exchanging supplementary regulation via a pseudo-tie have to be consistent in the removal or inclusion of it in their actual net interchange measurement as well as in all events across the measurement period.

| Organization | Yes or No | Question 7 Comment |
| :--- | :---: | :--- |
| Seattle City Light | Negative | Answer: Yes Comments: o LADWP and SCL note that the document "BAL-003-1 <br> Background Document" seems to be reasonable. |
| Response: Thank you for your comment. |  |  |
| Energy Mark, Inc. | No | Comment 14: Some of the information in this document concerning the Frequency <br> Bias Setting for BAs participating in Overlap Regulation should be moved to the <br> Supporting Document. This change would help in addressing Comments $3 \& 4$ under <br> Question 2. |
| Response: The SDT has added language to Attachment A to address your concern. |  |  |

| Organization | Yes or No | Question 7 Comment |

|  |  | through supplemental regulation. It is inappropriate to try to substitute a "minute plus" product that is deployed centrally by the Balancing Authority for a "sub-minute" product that is deployed automatically without any Balancing Authority action. When a pseudo-tie is used, changes in the ACE values due to supplemental regulation are unrelated to and not coordinated with the need to deploy frequency response. Not only should this approach not be offered as an alternative, but the FRSDT should actively conduct research to determine if supplemental regulation via a pseudo-tie should be deliberately REMOVED from any actual net interchange calculation that may include it. This comment also applies to the mentioning of supplemental regulation on page 11 as well. <br> 5. On page 7, the reference to a 24 hour window on each side of the frequency bias setting implementation date is inconsistent with the wording of the standard. The standard states that any time within the designated date is acceptable. <br> 6. On page 8, the inclusion of "for training purposes" as a reason to not operate in tie line bias control should be dropped. This training can be done in a training simulator. If it is determined that it should be supported, then the requirement needs to be reworded to allow it explicitly. <br> 7. On page 14, the sentence: "This approach would only provide feedback for performance during that specific event and would not provide insight into the depth of response or other limitations" is difficult to understand. The paragraph would read better by simply deleting the sentence. |

Response: Please refer to our response to Question \#6.
Comment 1 - The SDT has modified the Background Document to incorporate your suggested change.
Comment 2 - The SDT has corrected the reference so both documents agree. The drafting team is proposing to use historical information rather than forecasted information for the allocation of the Frequency Response Obligation.
Comment 3 - The SDT has removed the speculative language and replaced it with more appropriate language.
Comment 4 - While the SDT agrees that it is inappropriate to expect supplementary regulation to transfer frequency response

| Great River Energy/ACES <br> Power Marketing Standards <br> Collaborators | No | We can find no document titled "BAL-003-1 Background Document". We assume this <br> question is referring to the "Frequency Response Standard Background Document" <br> dated October 2011. We do not believe the document provides sufficient clarity. No <br> explanation is provided for why RSG was added to Requirement R1.There are typos <br> contained in the document. On page 6 in NIA, the A should be in subscript. On page <br> 7 in bullet 4 in the first sentence, "The" should be in lowercase |
| Response: Your assumption was correct. The drafting team has corrected these typos. |  |  |

| Organization | Yes or No | Question 7 Comment |
| :--- | :---: | :--- | :--- |
| Response: Thank you for your comments. | Yes | Paragraph 4 on page 5 of the Background Document provides a statistically correct <br> description of event selection without sample pre-selection and should followed <br> instead of the erroneous criteria 2 \& 7 in Attachment A. The risk-based approach to <br> determining FRM, that the Background Document mentions in paragraph 4 of page 4 <br> is being evaluated by the drafting team for application in this standard, should be <br> considered for deployment as soon as possible to replace the administered method <br> currently proposed in this standard, because the administered method lacks any <br> technical justification. No such justification was ever attempted in the development <br> of this standard. The administrative method of determining FRM is therefore but a <br> highly dubious "quick fix" until the risk-based method is evaluated and implemented. <br> The administrative method is in fact perverse because it discourages BAs from <br> reducing their contribution to frequency error by refusing to reduce the BA's FRO <br> accordingly, and because it encourages BAs to contribute to frequency error without <br> increasing their FRO. |
| Response: The standard has to be written with what will be used day one. Due to the timeline that NERC has filed with FERC, there |  |  |
| is not enough time to adequately evaluate a second methodology. |  |  |

We do, however, suggest that <br> the SDT consider our comments in Q6, above, and move some of the information <br> from Attachments A and B to or combine with the Background Document, to the <br> Background Document to provide all the technical basis and background behind the <br> elements stipulated in the requirements. |  |
|  |  |  |

8. The SDT has developed a new document titled Attachment B-Process for Adjusting Bias Setting Floor. This document is intended to provide the methodology the ERO will use to reduce the minimum Frequency Bias Setting to become closer to natural Frequency Response. Do you agree that this document provides clear and concise instructions for the ERO to follow? If not, please explain in the comment area.

Summary Consideration: The majority of commenters did not like the word "initially" that was used in the proposed standard. They felt that it caused confusion. The SDT modified the attachment to remove the reference to the word "initially" and added other clarifying language to the document.

Some commenters were concerned with how the calculation of FRO for BAs that have load and generation. The intent was that generation-only BAs would base their settings on generation. Traditional BAs would use load. The SDT revised the table to agree with the proposed standard.

One commenter indicated that the standard was measuring AGC. The SDT disagrees.. There may be some AGC influence in the measurement however the SDT believes that this impact is minor. Based on the data received from the Field Trial, the SDT did not see this phenomenon.

A couple of commenters indicated that the methodology used for calculation of the minimum Frequency Bias Setting could be adverse for a single BA interconnection. The SDT explained that to ensure comparable treatment between BAs with fixed Bias Settings, BAs with a variable Bias Setting report their monthly average Bias for the reporting year. This average will be calculated when frequency is greater than 60.036 Hz or less than 59.964 Hz . The average of the 12 months' Bias values must be equal to or more negative than the Interconnection's minimum Bias Setting.

| :--- | :---: | :--- |
| Seattle City Light | Negative | Answer: Yes Comments: o LADWP and SCL note that Attachment B seems to be <br> reasonable. |
| Response: Thank you for your comment. |  |  |
| Constellation Energy <br> Commodities Group | No | Should be revisited based on the proposed modifications to the requirements. |

| Organization | Yes or No | Question 8 Comment |
| :---: | :---: | :---: |
| Response: The SDT has modified Attachment B, now a Procedure for the ERO to follow in supporting the standard, to reflect modifications to the requirements and suggested changes from the industry. |  |  |
| MRO NSRF | No | : There could be some confusion caused by the Attachment B due to the use of the word "initially" when the reference is made to the current standard. The drafting team should change the word "initially" to "currently" or strike it to avoid the potential confusion. <br> The second paragraph of Attachment B (which contains the two bullets):The words "initially $1 \%$ " in the second bullet contradict with the Table 1 on Attachment B, which states "Initial" and " $0.8 \%$ ". Suggest deleting the parenthetical in the second bullet as when BAL-003-1 is effective it would be referencing an old Standard version. If the initial minimum is intended to be $1 \%$ say so in the Table 1. |
| Response: The SDT has modified Attachment B, now a Procedure for the ERO to follow in supporting the standard, to reflect your suggested changes. |  |  |
| Texas Reliability Entity | No | 1. In Attachment $B$, we suggest removing the paragraph beginning "The $B A$ calculates . . ." because it appears to be background information that conflicts with the methods provided in this version of the standard for determining minimum bias settings. 2 . <br> 2. Attachment B, Table 1 , refers to " $0.8 \%$ of peak load or generation." If a BA has both load and generation, will its minimum Frequency Bias Setting be based on its load, its generation, or can it pick the value that it prefers to use? |
| Response: The SDT agrees and has removed it from the Attachment B, now a Procedure. <br> The SDT intended that generation-only BAs would base their settings on generation. Traditional BAs would use load. We have revised the table to agree with the proposed standard. |  |  |
| Bonneville Power | No | BPA understands the concept and we disagree with it. As the ERO continues to lower the required minimum frequency bias setting for an interconnection, the BA's that |

| Organization | Yes or No | Question 8 Comment |
| :--- | :--- | :--- |
| Administration |  | have frequency response higher than the $1 \%$ will have a higher percentage of the <br> frequency response of the interconnection. <br> Also, this standard is primarily measuring AGC response, not natural frequency <br> response; therefore not lowering the limit is appropriate. |

Response: The SDT believes that you may be mixing the Frequency Bias Setting and Frequency Response Measure. As proposed the FRO will be assigned based upon load and generation as defined in Attachment A. Therefore actual Frequency Response will be required to come from the interconnection on that basis. To the extent an entity has a FRM greater than its Interconnection's minimum Frequency Bias Setting, its Frequency Bias Setting may grow as a percent of the Interconnections total Frequency Bias Setting. However, that is not Frequency Response.
The SDT disagrees with your comment concerning AGC. There may be some AGC influence in the measurement however the SDT believes that this impact is minor. Based on the data received from the Field Trial, the SDT did not see this phenomenon.

| Duke Energy | No | Duke Energy suggests that the SDT consider a term other than "Initial' in the title for <br> Table 1. We suggest "Proposed Frequency Bias Setting" for Table 1. Notwithstanding <br> our suggestion that the criteria/requirements of the minimum FBS in the Attachment <br> be incorporated into the Standard, Duke Energy has the following concerns with what <br> is proposed: <br> As cited in our comments to Question 8 in the last posting (extensive, so not repeated <br> here), the secondary control measures of CPS1, CPS2 and the draft Balancing <br> Authority ACE Limit (BAAL) are tightly coupled to the Frequency Bias Setting (FBS), <br> and a reduction of the FBS will impact the secondary control requirements placed <br> upon the BA. Noted in our response to Question 7 above, the statement on page 9 in <br> the "BAL-003-1 Background Document"is not correct in stating that Attachment B will <br> "ensure there is no negative impact on other Standards". The gradual reduction of the <br> FBS will proportionally tighten the secondary control limits for each Balancing <br> Authority. Even if the "natural" Frequency Response in the Eastern Interconnection <br> remains unchanged for the next several years, under the process described allowing <br> the ERO to annually adjust the minimum FBS for the Interconnection, the FBS will |
| :--- | :--- | :--- |

| Organization | Yes or No | Question 8 Comment |
| :---: | :---: | :---: |
|  |  | eventually be reduced to a value approximately $10 \%$ above the calculated response in magnitude, cutting the current CPS1, CPS2 and BAAL limits in the Eastern Interconnection on average by more than half. The current FBS for the Eastern Interconnection is approximately minus $6500 \mathrm{MW} / 0.1 \mathrm{~Hz}$, estimated "natural" Frequency Response is perhaps around minus $2400 \mathrm{MW} / 0.1 \mathrm{~Hz}$. Unlike CPS1 and BAAL where the measures are based upon the FBS of the BA only, CPS2 (dependent upon the FBS of the BA and the Interconnection) will be significantly limiting to the degree that no change in a BA's own Frequency Response could significantly change its CPS2 limit if the Interconnection FBS drops over time as indicated. At least under CPS1 and the draft BAAL, the BA would have an option of improving its Frequency Response, allowing it to increase its FBS and proportionally the CPS1 and BAAL bounds using the FBS. <br> Conclusion from our last comments submitted: Duke Energy does not believe there is a reliability need pushing the industry to tighten secondary control to the degree discussed above simply as a result of reducing the Frequency Bias Setting. If the calculated Frequency Response of the Interconnection stayed at its current level, what would be the justification for tightening the secondary control requirements of CPS1, CPS2 and the proposed BAAL? Duke Energy supports taking more of the error out of the ACE equation by having the FBS closer to the estimated Frequency Response of the Balancing Authority, however, Duke Energy does not believe the result should be a significant increase in secondary control costs to meet the CPS1, CPS2, or draft BAAL requirements. Duke Energy understands the position placed upon this Standard Drafting Team- the secondary control and reserve requirements are not under the scope of the team, however, proper consideration has not been given in Attachment B to the impact lowering the FBS will have on the industry in terms of the requirements placed upon the BA for secondary control and reserve requirements - especially for meeting CPS2. The research discussed in our comments to the last posting support that reducing the FBS while under CPS1 and the draft BAAL may be achievable, however a CPS2 bound cut potentially in half or lower will place unreasonable bounds on a BA, requiring control actions even when the BA may |

| Yes or No |

| Organization | Yes or No | Question 8 Comment |
| :---: | :---: | :---: |
| Sacramento Municipal Utility District (SMUD) | No | In addition to the requirements, reducing frequency bias obligation results in generation tripping closer to the set point. <br> It seems that Lowering the Minimum Frequency Bias Setting from $1 \%$ to $.8 \%$ will result in a lower response, which in turn will lower the natural frequency response. Over time it seems this pattern would lead to poorer response. |
| Response: The SDT is unsure of what your first comment is attempting to say. Therefore the SDT cannot provide a response to your comment without further clarification. <br> The SDT believes that you may be mixing the Frequency Bias Setting and Frequency Response Measure. As proposed the FRO will be assigned based upon load and generation as defined in Attachment A. Therefore actual Frequency Response will be required to come from the Interconnection on that basis. To the extent an entity has an FRM greater than its Interconnection's minimum Frequency Bias Setting, its Frequency Bias Setting may grow as a percent of the Interconnection's total Frequency Bias Setting. However, that is not Frequency Response. |  |  |
| NV Energy | No | In Attachment B, it seems unclear whether the initial FB setting is supposed to be $1 \%$ of BA peak load or $0.8 \%$ as shown in the table. In general, I was extremely confused about what the required FB setting should be. R5 indicates a percentage of load found in Att B, but Att B indicates the greater of Natural Frequency Response or 1\% of peak, and then the table that follows indicates $0.8 \%$. At this point, I have no idea what is being stated for the requirement. |
| Response: The SDT agrees and has modified the attachment. <br> The SDT intended that generation-only BAs would base their settings on generation. Traditional BAs would use load. We have revised the table to agree with the proposed standard. |  |  |
| Progress Energy | No | PGN supports the collective comments of SERC members. We suggest the SDT consider a term other than "Initial' in the title for Table 1. We suggest "Proposed Frequency Bias Setting" for Table 1 |

| Organization | Yes or No | Question 8 Comment |

| Organization | Yes or No | Question 8 Comment |
| :--- | :--- | :--- | \left\lvert\, \(\left.\begin{array}{l}variable Bias that is calculated based upon which generator is online and it's droop <br>

setting. Under light load condition, we might have a Bias setting that would be under <br>
(in absolute value) than the FRM which is the median value, even though the Bias <br>
setting would reflect the grid's frequency response. This method, as proposed, would <br>
mandate us to have a larger Bias that what is really needed. Unlike Eastern <br>
Interconnection, we are not over biased. By implementing this new methodology, it <br>
would make us over biased. Having a too large Bias could lead to system instability, <br>
based on the results of studies from our control specialists. The Minimum Frequency <br>
Bias Setting should take into account the wide load span that we can face. <br>
For the variable bias, we could express the Minimum Frequency Bias Setting as a <br>
function of monthly peak loads, and remove the Natural Frequency Response term. <br>
In addition, there is a gap between Attachment B and the text in R5. See comment <br>
10 for explanation.\end{array}\right.\right\}\)

| Organization | Yes or No | Question 8 Comment |
| :--- | :---: | :--- |
|  |  | value, to better match the Frequency Bias Setting to the natural Frequency Response <br> or provide technical justification for not implementing the reduction |
| Response: You are correct, the starting value is arbitrary. The SDT did not want to make a one step change to immediately reduce <br> the minimum Frequency Bias Setting to natural Frequency Response. The SDT believes that a multi-year multi-step process would <br> be better and allows for monitoring the effects on other performance standards. <br> The SDT believes that the end result would be the same. The present wording allows for collaboration between the ERO and <br> other entities/groups. The SDT is also concerned with putting a requirement on the ERO within an Attachment when there is not <br> a reliability problem if it were not to happen. |  |  |
| SERC OC Standards Review <br> Group | No | We suggest the SDT consider a term other than "Initial' in the title for Table 1. We <br> suggest "Proposed Frequency Bias Setting" for Table 1 |
| Response: The SDT agrees with your comment and has modified the attachment by removing the word, "initial". |  |  |

| Organization | Yes or No | Question 8 Comment |
| :---: | :---: | :---: |
|  |  | proposed method. An appendix is not regarded as a mandatory requirement. |
| Response: The process is still being developed at NERC but an Attachment would document processes to be utilized without a measurement saying that you failed the standard. |  |  |
| Southern Company | No | We suggest using the words, 'Proposed Frequency Bias Setting' in the Title of Table 1 instead of the word, 'Initial'. |
| Response: The SDT agrees with your comment and has modified the attachment by removing the word, "initial". |  |  |
| ERCOT | No | While there is no problem with the calculation involved, it is unclear why the SDT elected to assign a grid performance element in this standard to the ERO, who has no functional (registered) role in grid performance. Since this is a cook-book calculation and transfer of data on frequency performance, why not assign it to the BA? |
| Response: The Attachment B, now a Procedure for the ERO to follow in supporting the standard, only outlines a process that the ERO is to use when adjusting the minimum Frequency Bias Setting. The Procedure does not place any grid performance requirement on the ERO. The SDT also believes that some authority should have oversight over the minimum setting to prevent abuses and assure fairness. |  |  |
| Seattle City Light | Yes | - LADWP and SCL note that Attachment B seems to be reasonable. |
| Response: The SDT thanks you for your affirmative response and clarifying comment. |  |  |
| Energy Mark, Inc. | Yes | Comment 15: This Yes answer assumes that the SDT addresses Comment 13 under Question 6 in these comments. |
| Response: The SDT thanks you for your affirmative response and clarifying comment. The SDT addressed your Comment \#13 under Question \#6. |  |  |
| Ameren | Yes | Considering the comments made regarding R5, in question 2, above, which are: |

| Organization | Yes or No | Question 8 Comment |
| :---: | :---: | :---: |
|  |  | R5. While we agree with the requirement of R5, it should not be at the expense of changing the value of L10 in BAL-001, R2, which has been accepted by FERC in Order 693. An accommodation should be made so that any changes to the Frequency Bias Setting according to BAL-003, R5, should not affect the value of L10 used in BAL-001, R2. |
| Response: The SDT thanks you for your affirmative response and clarifying comment. However, the SDT disagrees with your comment. Since $L_{10}$ is the function of individual Frequency Bias Settings to the sum of all BA Frequency Bias Settings within an Interconnection and establishes operating boundaries, it would be inappropriate to leave $\mathrm{L}_{10}$ as is when a Frequency Bias Setting changes. |  |  |
| Los Angeles Department of Water and Power | Yes | LADWP notes that Attachment $B$ seems to be reasonable |
| Response: The SDT thanks you for your affirmative response and clarifying comment. |  |  |
| FPL | Yes | Last paragraph: As stated, would that make the Minimum Frequency Bias Setting $0.7 \%$ of peak load or generation? A numerical example shown would help clarify this paragraph. |
| Response: The SDT thanks you for your affirmative response and clarifying comment. The SDT has added an example to the Background Document. |  |  |
| Southwest Power Pool Regional Entity | Yes | Need to clarify that 2012 Bias setting will be based on $1 \%$ of peak load or generation until approval of BAL-003-1 by FERC establishing the $.08 \%$ of peak load or generation minimum threshold. |
| Response: We agree and we have endeavored to do so. The SDT does point out that the proposed minimum for the first year once approved by FERC is $0.9 \%$ not $0.08 \%$. |  |  |
| Associated Electric | Yes | This is a very important document, providing bounds and rationale for and future |

9. The SDT has provided an additional spreadsheet, FRS Form 2, to assist the Balancing Authority in providing the data needed to comply with the proposed standard. Do you agree that this spreadsheet is useful and the instructions are meaningful? If not, please explain in the comment area.

Summary Consideration: Many of the commenters expressed concern with the fact that the Excel Spreadsheets that were required to be used were in a newer version of Excel than their company was presently using. In response, the SDT developed Excel Spreadsheets that are compatible with earlier versions of Excel.

A couple of commenters expressed concern that the Excel Spreadsheets did not contain all of the information necessary to comply with the analysis required (timing of the event (hour, minute, second). Form 1 contains the time of the event including the hour, minute and second for $t(0)$ and a graph of frequency data for each event in the list. The time for each BA'st(0) may vary from this time due to different sample rates of data and physical proximity to the contingency. Since this standard does not identify an "A Point" or "B Point" but calculates an "A Value" and "B Value", providing an exact time for these provides little value. $T(0)$ is the focus of the measurement process and is the first observed change in frequency of the event. Also added to Form 1, the BA can enter the time zone of its data and the time of $t(0)$ will be converted to the correct time in that zone. We agree that the proper selection of $t(0)$ is important. This can be viewed on the "Graph 20 to 52 s " worksheet. When set correctly, the first change in frequency of the event will be exactly in the center of the graph on the vertical grid line.

Some commenters felt that it would be useful if the SDT could develop a completed form as an example to help entities better understand the methodologies used in the form. Form 2 contains actual data for frequency and NAI of an event. Sample data was added for each of the adjustments to demonstrate their use and impact on the analysis.

A couple of commenters question the meaning of "master event list" in FRS Form 2. The "Master event list" refers to the event list contained in each Interconnection's Form 1.

| Organization | Yes or No | Question 9 Comment |
| :--- | :--- | :--- |
| Seattle City Light | Negative | Answer: No Comments: o LADWP and SCL note that Form 2 is not compatible with <br> prior versions of Excel-it won't even open in Excel 2003 (which is still widely used)- <br> and requests that all spreadsheets and calculation tools developed under 2007-12 be <br> revised to support common software of the past 10 years. |

| Organization | Yes or No | Question 9 Comment |

| Response: Excel 2003 versions of all forms have been developed. |  |  |
| Seattle City Light | No | o LADWP and SCL note that Form 2 is not compatible with prior versions of Excel-it won't even open in Excel 2003 (which is still widely used)-and requests that all spreadsheets and calculation tools developed under 2007-12 be revised to support common software of the past 10 years. |
| Response: Excel 2003 versions of all forms have been developed. |  |  |
| Associated Electric Cooperative Inc | No | AECI believes the SDT could spare our industry both confusion and inconsistency, by specifying that identified Interconnection Disturbances include both Point A and Point B to the hour, minute, and second. While this introduces some risk of Entities over-automating their data-reports, the benefits for Eastern Interconnection respondents would be tremendous. Cautions and disclaimers should be placed on both Form 1 and Form 2, to assure respondents manually inspect their frequency data and pinpoint the specific inflection-point samples. |
| Response: Form 1 contains the time of the event including the hour, minute and second for $t(0)$ and a graph of frequency data for each event in the list. The time for each BA's $t(0)$ may vary from this time due to different sample rates of data and physical proximity to the contingency. Since this standard does not identify an "A Point" or "B Point" but calculates an "A Value" and "B Value", providing an exact time for these provides little value. $T(0)$ is the focus of the measurement process and is the first observed change in frequency of the event. Also added to Form 1, the BA can enter the time zone of its data and the time of $\mathrm{t}(0)$ will be converted to the correct time in that zone. We agree that the proper selection of $t(0)$ is important. This can be viewed on the "Graph 20 to 52 s " worksheet. When set correctly, the first change in frequency of the event will be exactly in the center of the graph on the vertical grid line. |  |  |
| Bonneville Power Administration | No | BPA believes the form is not easily understood and is overly complicated for what it is trying to accomplish. BPA believes the form might work for an internal evaluation, just not for an external audit. Compliance is based on this form. BPA believes the standard needs to be simplified and possibly returned to a data gathering standard. |

| Organization | Yes or No | Question 9 Comment |
| :--- | :--- | :--- |
| Red |  |  |

Response: The addition of "Adjustments" to the analysis did add complexity to the Form. These were added based on comments received from the industry on previous postings. Some of these "Adjustments" may be removed as the field trial progresses if they are not utilized. In the latest Form 2, version 6, the multiple time period averages were removed since the final average period was selected based on the results of the first round of the field trial evaluated last fall. However, Form 2 is important to the standard in that it achieves the requirement of measuring frequency response in the same manner for all Interconnections. Returning Form 2 with Form 1 allows validation of the selection of $t(0)$ which is critical for this requirement.
The SDT does not believe that it can revert back to a "data gathering" standard. The SDT is responding to FERC Directives from Order 693 as well as the FERC Order dated March 18, 2010 which mandated development of a standard addressing the Order 693 directives within six months. FERC later granted an extension to provide a standard addressing these issues by the end of May 2012.

| FPL | No | FRS Form 2 - Two-second Sample Datalnstructions tab/worksheet: What is referred <br> to as or meant by the 'master event list'? <br> 4. - Regarding 2 second sample rate for 25 minutes starting 2 minutes before event <br> begins and 15 minutes after it begins, does this add up to 25 minutes or are <br> additional minutes being required for collection? | why are they not both labeled "Net Actual Interchange"? |  |  |
| What is the definition of "Non Conforming Load" in column E? |  |  |

Response: "Master event list" refers to the event list contained in each Interconnection's Form 1.

Organization

## Yes or No

## Question 9 Comment

The inconsistency in the data sample totals has been corrected. The absolute minimum amount of data required for the full analysis is two minutes before the beginning of the event to 15 minutes after the beginning of the event. The calculation rate of "Load" can be at a different rate than the AGC scan rate. The Load data is not used in measuring performance. The variability of Load can impact measured performance and can be observed on the "BA Load Dampening" worksheet graph. On some Interconnections, load dampening can be observed in the data. Using the historian "data sample" collection option, it will fill the spreadsheet with the same value of Load, changing at the calculation rate.

The "auto populate" of cells C8 and C11 is a good idea. A couple BAs did this during the first phase of the field trail. The problem is that the event time of $t(0)$ in column $C$ was set using 2 second scan data in one part of the Interconnection and the beginning of the event may be shifted one or two scans when frequency is scanned less often. This would make this automation difficult for the value in C8. It is critical for the measure for $\mathbf{t}(0)$ be set correctly. The value of $\mathbf{C 1 1}$ is less critical and is not used in the initial primary Frequency Response Measure. It is only used to demonstrate delivery of primary frequency response during the frequency recovery period.
The location of the "Copy" button has been clarified.
Step 6 on the "Data Entry" worksheet was added to the "Instructions" worksheet. The value in column C in the "Data" worksheet labeled "Total Lost Generation" is for single BA Interconnections only. It takes the place of "Net Actual Interchange" for multiple BA Interconnections. Column "AO" on the "Evaluation" worksheet is not the same as the "Contingent BA Lost Generation" data on the "Evaluation" worksheet. The "Contingent BA Lost Generation" data is only used by multiple BA Interconnection BAs not Single BA Interconnections. The "Data" worksheet for the "Single BA Interconnection" Forms has an n/a in columns G, H and I and should not be used by BAs in these Interconnections. This is noted on their "Instructions" worksheet. This should explain why they are not labeled the same.
Non-conforming Load is Load that changes abnormally different than the conventional diurnal load pattern of a Balancing Authority Area. Non-conforming Load becomes significant when the net change within a few minutes is greater than a BA's $L_{10}$ limit. The importance here is that this Load change can be ten times larger than some BAs' FRO and makes measuring the SEFRD inaccurate. An example of non-conforming load would be an arc furnace of a significant size.
Thank you for your comments and the effort to find each of these items.

ISO/RTO Council Standards

## Review Committee

If we are not mistaken, Form 2 is added as the last sheet in the Form 1 spreadsheet file. Apart from that, however, there are other sheets added to the previous Form 1. But this Comment form makes no mention of the changes, nor is there a question in

We believe this is a significant change to the standard and many commenters may <br>
have missed the opportunity to comment on it. Compared to the previous version, <br>
Form 1 has been significantly expanded to include not only additional sheets but <br>
much more comprehensive data requirements even on the Data Entry sheet itself. <br>
This makes data submission a very time-consuming task but the justification for <br>
requiring detailed data entry has not been provided. <br>
We question the need for such expansion on data entry requirements. We have yet <br>
to see the reason for expanding Form 1 in assisting a BA to provide the data needed <br>
to comply with the standard, hence we do not see how adding a Form 2 can help in <br>
that regard. We suggest the SDT to keep data requirements to only what is minimally <br>
needed to support the FRS reporting process. Where the SDT deems additional data <br>
entry sheets to be necessary, it should provide the rationale for expanding from a 2 <br>
sheet form into a multiple sheet form for additional data collection. Where the SDT <br>
deems the additional data sheet or information not necessary to support FRS <br>
reporting, then we suggest the SDT to hide those pages not required for the standard <br>
so as to avoid confusion, and/or to remove those analytical pages not directly used in <br>

the standard.\end{array}\right.\right]\)| Response: The SDT points out that there are no additional data requirements. It is possible that you are seeing more |

| :--- |
| versions. The absolute minimum data needed for this standard is the date/time, frequency and NAI in columns A, B and C of the |
| "Data" worksheet in Form 2. Columns D through I have been totally optional and can be left blank. Column J is the Bias setting in |
| the ACE equation and is important to BAs that utilize variable Bias. Column K, BA Load, was added by the drafting team in the |
| beginning to see if Load Dampening could be measured as this has been done for several years on one Interconnection. Column I |
| of the "Data" worksheet is the only optional data that the BA should use when it is the contingent BA during any of the events |
| evaluated. Utilizing this data will allow the BA's SEFRD to be calculated correctly and give the BA a full sample set for the annual |
| median calculation. Form 2 is necessary to standardize the measurement process on all Interconnections. You are free to hide |
| any analytical worksheets on Form 1 and Form 2. You can do this on your "master" Form 2 and then build each Form 2 for each |
| event using this master. These additional worksheets are available for BAs to utilize if they find that their performance is below |
| the FRO and will aid the analysis of the contributing causes. |

Independent Electricity
No

## System Operator

> If we are not mistaken, Form 2 is added as the last sheet in the Form 1 spreadsheet file. Apart from that, however, there are other sheets added to the previous Form 1 . But this Comment form makes no mention of the changes, nor is there a question on the additional information requested. We have a concern over this omission of attention or oversight. Compared to the previous version, Form 1 has been significantly expanded to include not only additional sheets but much more comprehensive data requirements even on the Data Entry sheet itself. This makes data submission a very time-consuming task but the justification for requiring detailed data entry has not been provided. We question the need for such expansion on data entry requirements. We have yet to see the reason for expanding Form 1 in assisting a BA to provide the data needed to comply with the standard, hence we do not see how adding a Form 2 can help in that regard. We suggest the SDT to look at the basic need for data submission that would suffice to support the FRS reporting process. Where the SDT deems additional data entry sheets to be necessary, it should provide the rationale for expanding from a 2 sheet form into a multiple sheet form for additional data collection.

Response: The SDT points out that there are no additional data requirements. It is possible that you are seeing more spreadsheets due to them being unhidden.

| Organization |
| :--- |
| Form 2 is a separate stand-alone workbook. Form 1 does have a worksheet labeled "BA Form 2 Event Data" that will contain the |
| single event data from each of the BA's Form 2s. Two additional worksheets were added to Form 1 and several worksheets were |
| deleted. The "Time Zone Ref" worksheet was added to allow the ability of the BA to enter the time zone of its data and the |
| spreadsheet will calculate the local time of the event from the UTC time. This was added for the convenience of the BA in |
| collecting the correct data for each event and does not require additional data from the BA. The second worksheet added was a |
| worksheet that displays graphs of frequency for each event and the $t(0)$ selected correctly. This was added to aid the BA with data |
| collection and the selection of t(0) since this seemed to be one of the biggest problems during the first phase of the field trial. This |
| graph worksheet does not require the BA to do anything. It is not used in the analysis and can be deleted. Deleting this |
| worksheet will greatly reduce the size of Form 1. None of the data requirements on Form 1 or Form 2 have changed from previous |
| versions. The absolute minimum data needed for this standard is the date/time, frequency and NAI in columns A, B and C of the |
| "Data" worksheet in Form 2. Columns D through I have been totally optional and can be left blank. Column Jis the Bias setting in |
| the ACE equation and is important to BA's that utilize variable Bias. Column K, BA Load, was added by the drafting team in the |
| beginning to see if Load Dampening could be measured as this has been done for several years on one Interconnection. Column I |
| of the "Data" worksheet is the only optional data that the BA should use when it is the contingent BA during any of the events |
| evaluated. Utilizing this data will allow the BA's SEFRD to be calculated correctly and give the BA a full sample set for the annual |
| median calculation. Form 2 is necessary to standardize the measurement process on all Interconnections. You are free to hide |
| any analytical worksheets on Form 1 and Form 2 . You can do this on your "master" Form 2 and then build each Form 2 for each |
| event using this master. These additional worksheets are available for BAs to utilize if they find that their performance is below |
| the FRO and will aid the analysis of the contributing causes. |

| Los Angeles Department of <br> Water and Power | No | LADWP notes that Form 2 is not compatible with prior versions of Excel-it won't even <br> open in Excel 2003 (which is still widely used)-and requests that all spreadsheets and <br> calculation tools developed under 2007-12 be revised to support common software <br> of the past 10 years. |
| :--- | :---: | :--- |
| Response: Excel 2003 versions of all forms have been developed. |  |  |
| Tucson Electric Power | No | TEP feels that Form 2 is a useful tool for internal BA use and should not be used for <br> compliance purposes. |
| Response: Form 2 is not intended to be used to reflect compliance but rather for consistency in reporting. |  |  |

| Organization | Yes or No | Question 9 Comment |

| Form 2 was developed so consistent analysis of each event could be validated. During the first round of the field trial, many BAs selected the incorrect $t(0)$, some provided data that was filtered or utilized data compression techniques that caused the analysis to be incorrect. With Form 2, the selection of $t(0)$ can be quickly evaluated and data quality reviewed. The proper selection of $t(0)$ can be made and Form 1 corrected providing validated consistent results. |  |  |
| MRO NSRF | Yes | : It would be useful if the drafting team could develop a completed form as an example to help entities better understand the methodologies used in the form |
| Response: All versions of Form 2 contain actual data for frequency and NAI of an event. Sample data was added for each of the adjustments to demonstrate their use and impact on the analysis. |  |  |
| Xcel Energy | Yes | It would be useful if the drafting team could develop a completed form as an example to help entities better understand the methodologies used in the form. |
| Response: All versions of Form 2 contain actual data for frequency and NAI of an event. Sample data was added for each of the adjustments to demonstrate their use and impact on the analysis. |  |  |
| Ameren | Yes | We agree that the spreadsheet is meaningful, but still needs to be vetted through the field trial process, with improvements made based on experience in its use. |
| Response: We completely agree. |  |  |

10. Please provide any other comments (that you have not already provided in response to the questions above) that you have on the draft standard BAL-003-1.

Summary Consideration: Many of the commenters referenced other questions in the comments. The SDT asked them to review the response to those earlier questions rather than repeating the responses here.

Several commenters pointed out that there was a discrepancy between the Background Document and Attachment A regarding the calculation of the BA FRO. The SDT has corrected the reference so both documents agree. The drafting team is proposing to use historical information rather than forecasted information for the allocation of the Frequency Response Obligation.

Several other commenters indicated that Supplemental Regulation Service was not an appropriate method to provide Frequency Response. The SDT agrees that it is inappropriate to expect supplementary regulation to transfer Frequency Response successfully, however the SDT did not want to prevent any innovative solution that will transfer Frequency Response through the use of a pseudo-tie among Balancing Authorities. Also, the SDT believes that Balancing Authorities exchanging Supplementary Regulation via a pseudo-tie have to be consistent in the removal or inclusion of Supplementary Regulation in their actual net interchange measurement as well as in all events across the measurement period.

Many commenters were concerned that the BA could be responsible for supplying an infinite amount of Frequency Response. They indicated that a BA could not prepare for this in its planning process. The SDT agrees that the proposed standard was not clear on this subject and added language in the "Criteria for Selection of Events" section of the revised Attachment A to limit the amount of Frequency Response a BA would be required to provide in order to be compliant with the standard.

Some commenters were concerned with the wording in Requirement R5. They indicated that the wording needed to say "greater than or" instead of "at least". The SDT removed the requirement and combined it with the revised Requirement R2 and the new Requirement R3. The SDT has modified the requirement and believes we have implemented the intent of your suggestion.

Many commenters did not agree with requiring the BA to provide Frequency Response. The NERC Functional Model and FERC both cited the BA as the responsible entity for providing Frequency Response. T There are several different methods available to the BA to provide Frequency Response and the SDT has included these in the Background Document.

Some commenters were concerned with the threshold that the SDT recommended for the Eastern Interconnection. Florida sees a greater change in frequency for a given contingency than for a comparable event elsewhere in the East. This is the reason for the higher first step of UFLS in Florida. Having all Eastern Interconnection Balancing Authorities carry extra frequency responsive reserves to protect against a target minimum frequency of 59.7 Hz would not protect Florida against a contingency inside Florida, but would require the other BAs in the Eastern Interconnection to continuously carry about 4,000 MW of frequency
responsive reserves to protect against a false trip in Florida if frequency fell below 59.7 Hz but over 59.5 Hz . This is a contingency on the order of $7,000 \mathrm{MW}$ or more. The drafting team compromised and gave the entire Interconnection an obligation based on 59.96 Hz .

A few commented did not agree with lowering the minimum Frequency Bias Setting. Early research by Nathan Cohn on interconnected power system operations found that control is optimum if a BA's Bias Setting is equal to its natural Frequency Response. If there were to be a difference between the two values, it is preferable to be slightly over-biased. The drafting team has proposed to bring Bias Setting and natural Frequency Response more in line. The process to do this is outlined in a Procedure developed by the SDT which replaces Attachment B. The Procedure manages a "go slow" approach to making this happen and includes checks to confirm there are not unexpected influences injected into the CPS-related calculations. Based on concerns raised by the industry, the drafting team has modified the Procedure to make the initial minimum Bias Setting 0.9\% of peak and has included a provision that the ERO will evaluate the impact caused by a change in minimum Bias Setting. The evaluation will look at both frequency performance and impact on CPS-related compliance calculations.

Some commenters had concerns about the use of the RSG as a means to provide Frequency Response, and the SDT modified the Background Document to further explain how an RSG (now FRSG) could supply Frequency Response. The SDT has defined a new term "Frequency Response Sharing Group (FRSG)" because it believes that using the presently defined term "Reserve Sharing Group" could cause confusion. The new definition reads "A group whose members consist of two or more Balancing Authorities that collectively maintain, allocate, and supply operating resources required to jointly meet the Frequency Response Obligations of its members."

A couple of commenters indicated that the median was not the proper method to use for the calculation of the FRM. Statisticians note that the median is a more accurate measure of central tendency than the mean when analyzing a sample that is small and or where scores vary widely. This is the case when estimating a BA's Frequency Response. While the median is not perfect, the median approaches a BA's typical performance after 15-20 observations and more observations give a higher confidence in the estimate of the BA's performance.

| Organization | Yes or No | Question 10 Comment |
| :--- | :--- | :--- |
| MRO NSRF | Negative | It is not clear if there is an upper limit to the amount of frequency response expected <br> of the Balancing Authorities under this standard. Except for Table 2 in Attachment A, <br> there is no discussion of an amount of FR expected on a total basis. Balancing <br> Authorities need to know for how many tenths of a hertz they are to respond so they |

| Organization | Yes or No | Question 10 Comment |
| :--- | :--- | :--- |$|$| can determine how to plan to meet this requirement. The documents do not appear |
| :--- |
| to provide any boundary on the maximum amount of FR that a BA will provide, i.e. it |
| is not clear what will happen if an event occurs in the Eastern Interconnection that |
| causes the frequency to drop to less than 59.6 Hz (e.g. what if freq dips to 59.0? Is |
| the BA expected to provide a limitless amount of frequency response?). |
| Also, is that event excluded from the list used to calculate the Balancing Authorities' |
| response or is it included with an expectation that it counts the same as any other |
| event. Without a clear statement of what is expected, including whether there is a |
| limit on that expectation or not, the Balancing Authorities cannot know what is |
| expected of them and therefore cannot plan appropriately. |
| In the first paragraph of R5 delete "at least" and replace with "greater than or". This |
| phrase would now read "...absolute value is greater than or equal to one of the |
| following:" "Equal to or greater than" accurately identifies the expectation, the |
| current phrasing will lead to confusion and mis-interpretation. |
| Bullet \#1 of R5: The minimum \% is based upon the "estimated yearly Peak Demand". |
| During the NERC webinar it was mentioned that this minimum would move to being |
| based on historical reporting of Peak Demand. Where does the SDT stand on this |
| item? Please provide clarification. |

|  |  | population has outliers." (See http://www.robertblohm.com/BestStatistic.doc for an explanation of "best statistic" which is a highly technical and central topic in modern probability theory and statistics.) Also, "outliers" are falsely and rhetorically claimed to be "noise" when in fact they are the "events" that are the specific subject of Frequency Response. It is well known that they do not "fit" a normal distribution. They are distinct from the normal operating errors that are the subject of CPM control. The paragraph does correctly conclude that the linear regression more accurately incorporates outliers than the median does, although the paragraph uses rhetoric by calling this improvement "skew" as if it is distortionary when, in fact, the median distorts the reality. <br> 2. The sample pre-selection described in Attachment A, Event Selection, Criteria 2 \& 7, violates the fundamental statistical procedure of unbiased sampling. A population is governed by a single "process" which, when stationary, is represented by a fixed probability distribution. In this case the population is several years of events (which are the subject of Frequency Response), not of normal operating control errors which are the subject of CPM control. A sample is governed by a single process that approximates the process governing the population as the sample gets larger, in this case if it includes several years of data. Samples are measured "as they come", no triage/filtering allowed, and they are called "stratified" when their distribution approximates the population distribution. Unlike normal operating errors, samples of events are not evenly distributed over a year. The attempt in criteria $2 \& 7$ to preselect only certain events, and not others, in such a way that the selected events occur evenly throughout the year, is papently wrong because it is trying to "fit" events into a process (even distribution over time) that does not govern events, but that instead governs normal operating errors that are the subject of CPM control, not of this Frequency Response standard. In other words, criteria 2 \& 7 confuse Frequency Response with CPM, and events with normal operating errors. The result is a false, biased sample which destroys the integrity of this standard. Paragraph 4 on page 5 of the Background Document, on the other hand, provides a statistically correct description of event selection without sample pre-selection and should |

| Response: Please refer to the earlier questions for the SDTs responses. |  |  |
| AEP, AEP Marketing, AEP Service Corp. | Negative | AEP's negative ballot is primarily due to our concerns regarding R1. Comments are being submitted via electronic form by Thad Ness on behalf of American Electric Power. |
| Response: Please refer to our response for Question \#1. |  |  |
| Alberta Electric System Operator | Negative | Besides the standard, the posting has two attachments, supporting material and two forms. It is not clear how enforcement will be applied given the array of explicit and implicit requirements throughout this package, and the use of undefined terminology, which will be subject to interpretations. <br> In the SDT response to our comments to the first draft of this standard it was stated that "The expectation is events will be selected by the Balancing Authorities. The Balancing Authority may exclude events from consideration for specific conditions |

| Organization | Yes or No | Question 10 Comment |
| :---: | :---: | :---: |
|  |  | such as data quality issues. " Based on the SDT's response, it is our understanding that, for the purpose of the FRM calculation, BAs could exclude or include events based on specific conditions consideration, such as data quality or event suitability (e.g. BA separation from the Interconnection). However, the standard as currently drafted, does not have any provisions to this effect. Please include such provisions in the body of the standard. |
| Response: The drafting team has modified the Requirements and Attachments to address the concerns raised by the comments that requirements were in the Attachments. In order to explain the process, the drafting team believes the information needs to be attached to the standard such that it cannot be changed without input from the industry. |  |  |
| The SDT recognizes that data may not be available for specific events and therefore has provided in FRS Form 1 a means to exclude an event. Additionally if an entity has separated from an Interconnection this could be reason for excluding that event from its FRM calculation since the frequency it would be responding to would not be the Interconnection wide frequency. The risk caused by excluding events is that the measurement process has shown that a limited number of events does not provide suitable calculation. |  |  |
| Ameren Energy Marketing Co.; Ameren Services | Negative | We believe that this is good start to a worthwhile standard, but the following issues need to be addressed in this standard: <br> (1) The FRM methodology has not been fully vetted through the field trial process. <br> (2)Adjusting the minimum of the Frequency Bias Setting, while an appropriate adjustment for AGC control in the ACE equation, should not be at the expense of L10 as used in BAL-001, R2. <br> (3) The absence of any resource specific frequency response requirement in NERC standards is an issue that must be address somewhere. As the resource portfolio of our industry changes(expedited by recent EPA rulemaking), the resources used for traditional primary frequency response are becoming a lower percentage of the mix. New resources and existing resources that have not provided primary frequency response need to be incorporated into the available frequency response discussion. <br> (4) BAL-003 is only applicable for an interconnected system, conditions that are |

| Response: (1) - The issue with measuring Frequency Response is that a BA's calculated performance (as opposed to actual performance) is highly variable event to event. This is particularly true for a single BA in a multi-BA Interconnection. <br> Calculated Frequency Response has a very large noise to signal ratio. A 5,000 MW BA in the Eastern Interconnection typically is only called to contribute about 10-15 MW for the loss of a large unit. Its minute to minute Load changes can easily wash this contribution out. An arithmetic mean or regression analysis will be influenced by noise-induced outliers. <br> Statisticians note that the median is a more accurate measure of central tendency than the mean when analyzing a sample that is small and or where scores vary widely. This is the case when estimating a BA's Frequency Response. <br> A regression would be appropriate if you were trying to forecast "calculated" frequency response for a BA in a multi-BA Interconnection. <br> While not perfect, the median approaches a BA's typical performance after 15-20 observations. More observations give a higher confidence in the estimate of the BA's performance. <br> - The drafting team has proposed to bring Bias Setting and natural Frequency Response more in line. The process to do this is outlined in a Procedure developed by the SDT which replaces Attachment B. The Procedure manages a "go slow" approach to making this happen and includes checks to confirm there are not unexpected influences injected into the CPS-related calculations. Based on concerns raised by the industry, the drafting team has modified the Procedure to make the initial minimum Bias Setting $0.9 \%$ of peak and has included a provision that the ERO will evaluate the impact caused by a change in minimum Bias Setting. The evaluation will look at both frequency performance and impact on CPS-related compliance calculations. <br> (2) - The NERC Functional Model Technical Document identifies the BA as the entity that manages and deploys Frequency Response. This is because a BA controls the amount and distribution of spinning reserves and also has some control over interruptible resources. This is similar to the relationship between the TOP and voltage control. Even though the TOP may not own generators or capacitor banks, the TOP is still responsible for controlling voltage within limits. |  |  |

Question 10 Comment
The industry-approved Standards Authorization Request (SAR) for BAL-003 did not include a performance obligation for generators. The drafting team is obliged to stay within the bounds of its SAR.
There are two primary reasons the SAR did not apply a performance obligation on generators. First, there are thousands of generators in North America. It would be many times more costly and difficult to implement a standard that measures all generators and verifies performance is properly calculated. Secondly, given the fact that there presently is sufficient Frequency Response in all Interconnections, the value of implementing a performance obligation on generators at this time would not outweigh the effort and cost.
Again, the drafting team cannot include requirements beyond the bounds of its SAR. If the commenter(s) believes there is a need for a generator performance obligation, they are encouraged to submit a SAR to that effect.
(3) - The SDT agrees that the issue you cite should not be covered in this standard. The SDT will forward this comment on to the appropriate entity at NERC.

| PJM Interconnection, L.L.C. | Negative | PJM does not believe that the BA should be the entity responsible for the frequency <br> response obligation, moreover the SDT has not sufficiently vetted the issue of <br> applying the response requirements on an entity that cannot provide that service. <br> PJM is concerned that the proposed draft does not explicitly cover the FERC Order <br> 693 directives in the proposed requirements and rather addresses the directives <br> indirectly in the attachments. This matter of mandatory vs. informational <br> attachments must be formally clarified before approval can be given for this <br> approach. <br> PJM does not agree with the additional clarifying phrases being incorporated into the <br> requirements. Explanatory phases should be included as text boxes as proposed in <br> NERC's Risk Based Methodology. |

The industry-approved Standards Authorization Request (SAR) for BAL-003 did not include a performance obligation for generators. The drafting team is obliged to stay within the bounds of its SAR.
There are two primary reasons the SAR did not apply a performance obligation on generators. First, there are thousands of generators in North America. It would be many times more costly and difficult to implement a standard that measures all generators and verifies performance is properly calculated. Secondly, given the fact that there presently is sufficient frequency response in all Interconnections, the value of implementing a performance obligation on generators at this time would not outweigh the effort and cost.

Again, the drafting team cannot include requirements beyond the bounds of its SAR. If the commenter(s) believes there is a need for a generator performance obligation, they are encouraged to submit a SAR to that effect.

Attachments that are referenced within a Requirement are mandatory and enforceable.
The SDT has been instructed to include a "reliability outcome" within the requirements. The SDT will forward your concerns about the wording to the Standards Committee Quality Review group for consideration.

Potomac Electric Power Co.
Negative

The proposed standard is not reliability centered and will not improve reliability. 5) Potomac Electric Power Company supports the comments provided by PJM.
